Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Nsta
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Nsta
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP Nsta Statistics (Stats)

Properties	Operational
Description	This group contains aggregate statistical data incorporating statistics from all *Nsta Connection*s.
Mib	Nsta

ATTRIBUTE Nsta aal2PacketsDropped (pktsDrop)

Access	Read only
Description	This attribute counts the number of packets received on unconfigured CIDs. The *Brag cidList* holds all valid CIDs. Any packets received on a CID which is not valid will be dropped and counted. The counter wraps to 0 when it exceeds its maximum value. This attribute is not displayed if there is a *Vgs* component under the *Nsta* component.
Mib	Nsta
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta aal2LastDroppedPacketId (lastDropPktId)

Access	Read only
Description	This attribute indicates the VPI, VCI and CID (AAL2 Channel ID) of the last dropped AAL2 packet received on an unprovisioned CID. The value is displayed in the format vpi.vci.cid. This attribute is not displayed if there is a *Vgs* component under the *Nsta* component.
Mib	Nsta
Values	Integer Sequence (0..65535; 0..255; 0..255)
Default	No default

Description	*Nsta/n Connection/n* This component represents an *Nsta* connection. When AAL5 is used there are two ATM VCCs associated with each *Nsta* connection. One ATM VCC is used to carry voice and one is used to carry CCS information. When AAL2 is used the CCS information can either be transported over the same ATM VCC as the voice data or transported over a separate ATM VCC. User provisionable basic rate services are defined in the *BasicRateGroup (Brag)* component. There is only one instance of *Brag* per *Conn*.

GROUP Nsta Conn CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Nsta

ATTRIBUTE Nsta Conn customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

Copyright © 2006, Nortel Nortel Confidential

	An operator CID of 0 is used to identify the Network Manager (referred to as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.
Mib	Nsta
Values	Decimal (0; 1..8191)
Default	0

GROUP Nsta Conn Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioning data for the *Connection*.
Mib	Nsta

ATTRIBUTE Nsta Conn holdOverTime (hoTime)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum period of time before a partially filled ATM cell is scheduled for transmission. It is also referred to as “combined use timer” (Timer_CU), in the ITU-T I.363.2. The holdover time affects the packet delay and the bandwidth used by the connection. The longer the delay the higher the bandwidth efficiency of the ATM connection and vice versa. The holdover time is rounded to the nearest multiple of 0.125 milliseconds.
Mib	Nsta
Values	Decimal (0.500..15.875)
Units	msec
Default	2.000

ATTRIBUTE Nsta Conn pcrHighCongThreshold (phct)

Access	Read and write
Description	This attribute specifies the cell rate above which the most severe congestion management measures are invoked. This threshold is defined as a percentage of PCR defined in *AtmIf Vcc Tm*. The PCR and SCR thresholds are combined to give an overall congestion state which is used to determine a congestion management measure. The value of this threshold must be set to a higher value than *pcrLowCongThreshold*.
Mib	Nsta
Values	Decimal (50..100)

Copyright © 2006, Nortel Nortel Confidential

Units	%
Default	90

ATTRIBUTE Nsta Conn pcrLowCongThreshold (plct)

Access	Read and write
Description	This attribute specifies the upper cell rate threshold of normally acceptable operation for the PCR-based congestion control mechanism. In the region between this threshold and *pcrHighCongThreshold* mild congestion management measures are invoked. This threshold is defined as a percentage of PCR defined in *AtmIf Vcc Tm.* The PCR and SCR thresholds are combined to give an overall congestion state which is used to determine a congestion management measure. The value of this threshold must be set to a lower value than *pcrHighCongThreshold*.
Mib	Nsta
Values	Decimal (10..100)
Units	%
Default	80

ATTRIBUTE Nsta Conn scrHighCongThreshold (shct)

Access	Read and write
Description	This attribute specifies the lower threshold of the upper region of operation relative to SCR defined in *AtmIf Vcc Tm*. This attribute is defined as a percentage of the expected number of cells received in *scrTrafficManagementInterval* at SCR. The PCR and SCR thresholds are combined to give an overall congestion state which is used to determine a congestion management measure, for example down speeding. The value of this threshold must be set to a higher value than *scrLowCongThreshold*.
Mib	Nsta
Values	Decimal (100..150)
Units	%
Default	125

ATTRIBUTE Nsta Conn scrLowCongThreshold (slct)

Access	Read and write
Description	This attribute specifies the upper threshold of the lowest region of operation relative to SCR defined in *AtmIf Vcc Tm*. This attribute is defined as a percentage of the expected number of cells received in *scrTrafficManagementInterval* at SCR. The PCR and SCR thresholds are combined to give an overall congestion

Copyright © 2006, Nortel Nortel Confidential

	state which is used to determine a congestion management measure, for example down speeding. This threshold must be set to a lower value than *scrHighCongThreshold*.
Mib	Nsta
Values	Decimal (50..100)
Units	%
Default	75

ATTRIBUTE Nsta Conn scrHighBurstCongestionThreshold (shbct)

Access	Read and write
Description	This attribute specifies the lower threshold of the upper region for accumulated SCR burst count. It is defined as a percentage of the cell burst limit which is defined in *AtmIf Vcc Tm*. The PCR and SCR thresholds are combined to give an overall congestion state which is used to determine a congestion management measure, for example down speeding. This threshold must be set to a higher value than *scrLowBurstCongestionThreshold.*
Mib	Nsta
Values	Decimal (50..100)
Units	%
Default	90

ATTRIBUTE Nsta Conn scrLowBurstCongestionThreshold (slbct)

Access	Read and write
Description	This attribute specifies the upper threshold for the normally safe region for accumulated SCR burst count. It is defined as a percentage of the cell burst limit defined in *AtmIf Vcc Tm*. The PCR and SCR thresholds are combined to give an overall congestion state which is used to determine a congestion management measure, for example down speeding. This threshold must be set to a lower value than *scrHighBurstCongestionThreshold*.
Mib	Nsta
Values	Decimal (0..100)
Units	%
Default	70

ATTRIBUTE Nsta Conn basicTrafficManagementInterval (basTrafManInt)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies how often the cell rate is sampled by the PCR congestion management algorithm. The time interval should be short enough so that the system responds quickly to PCR violation. It must however be long enough to allow the voice system to react to changes and for those changes to stabilize before the next sample. If the specified value is not a multiple of 50, the nearest multiple of 50 milliseconds is used as the sample interval.
Mib	Nsta
Values	Decimal (50..500)
Units	msec
Default	100

ATTRIBUTE Nsta Conn scrTrafficManagementInterval (scrTrafManInt)

Access	Read and write
Description	This attribute specifies the time interval over which the cell rate is sampled by the SCR congestion management algorithm. It is defined as a multiplier of *basicTrafficManagementInterval*. The time interval should be set low relative to the maximum permitted burst duration so that the system meets SCR traffic criteria and maintains the required frame relay QOS on the link. It should however be long enough to avoid unnecessary downspeeding due to very transient load conditions.
Mib	Nsta
Values	Decimal (1..5)
Default	2

ATTRIBUTE Nsta Conn networkLogLaw (nLaw)

Access	Read and write
Description	This attribute specifies the G711 log law to use on the network wide side of an NSTA trunk. If set to ***autoConfigure***, then the value used is derived from the type of TDM interface: ***muLaw*** is used for *DS1* trunks, and ***aLaw*** is used for *E1* trunks. For *E1* trunks, ***muLaw*** is not permitted.
Mib	Nsta
Values	autoConfigure muLaw aLaw
Default	autoConfigure

Copyright © 2006, Nortel Nortel Confidential

GROUP Nsta Conn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Nsta

ATTRIBUTE Nsta Conn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Nsta
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Conn operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Nsta
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Conn usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Nsta
Values	idle active (activ) busy
Default	idle

GROUP Nsta Conn Operational (Oper)

Properties	Operational
Description	This group contains status information about the *Connection*.
Mib	Nsta

ATTRIBUTE Nsta Conn aal2CpLossStatus (cpLossStatus)

Access	Read only
Description	This attribute indicates whether an AAL2 common part sublayer alarm has been raised. It is set to ***loss*** if start field errors persist for more than 2 seconds. It is set to ***noLoss*** when start field errors have been absent for at least 10 seconds.
Mib	Nsta
Values	noLoss loss
Default	No default

GROUP Nsta Conn Statistics (Stats)

Properties	Operational
Description	This group contains statistical data for a *Connection*.

Copyright © 2006, Nortel Nortel Confidential

Mib	Nsta

ATTRIBUTE Nsta Conn aal2StartFieldErrors (sfErr)

Access	Read only
Description	This attribute counts the cells received with an AAL2 Common Part Sublayer Protocol Data Unit (CPS-PDU) Start Field error. A Start Field error includes a cell with a parity error or a cell in which the packet pointed-to by the offset field (OSF) has a packet HEC error. The counter will wrap to zero when it reaches its maximum value.
Mib	Nsta
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Conn aal2SequenceErrors (seqErr)

Access	Read only
Description	This attribute counts the cells received with an unexpected AAL2 Common Part Sublayer Protocol Data Unit (CPS-PDU) sequence number. The counter will wrap to zero when it reaches its maximum value.
Mib	Nsta
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Nsta Conn BasicRateGroup (Brag)

Instance	Decimal (0..159999)
Groups	GROUP Nsta Conn Brag Provisioned (Prov) GROUP Nsta Conn Brag Operational (Oper) GROUP Nsta Conn Brag OsiState (State)
Scope	Device
Description	*Nsta/n Conn/n BasicRateGroup/n* This component defines a *BasicRateGroup* (*Brag*), comprising the 64k timeslots relayed either by a linked *Chan* component or a CES connection to a *Pap* subcomponent. All timeslots within a *Brag* have the same trunking services provisioned against them (for example, silence

Copyright © 2006, Nortel Nortel Confidential

suppression).
There is only one instance of *Brag* per *Conn*.

Common Verbs	Help List Display Add DELete

GROUP Nsta Conn Brag Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *BasicRateGroup* component.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag interfaceName (intName)

Access	Read and write
Criticality	Process
Description	This attribute specifies which *Chan* component contains the timeslots for the *Brag*. The *Chan* component must be provisioned on a 2pDS3cAal FP or a 32pE1Aal FP. This attribute must be empty if a *NstaBragPassiveAccessPoint* subcomponent is present.
Mib	Nsta
Values	Link (Service, applicationFramerName)
Default	No default

ATTRIBUTE Nsta Conn Brag ccdTimeslotList (ccdList)

Access	Read and write
Criticality	Process
Description	This attribute specifies the timeslots that will be transported as clear channel data when active within the *Brag* component. If the *interfaceName* attribute is not empty each timeslot specified in this list must be provisioned in the linked *Chan* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Nsta
Set of	Decimal (1..31)
Default	No default

ATTRIBUTE Nsta Conn Brag bufferSize (bufSize)

Access	Read and write
Criticality	Process
Description	This attribute specifies the capacity of the packet delay variation (PDV) buffer in milliseconds of data. To ensure that PDV can be tolerated, it is necessary to delay the transmission of initial packets received until a threshold is reached. When this threshold is reached packets are transmitted across the TDM network. The length of this delay is defined by *pdvt* and *bufferSize* attributes where the amount of data played out to the TDM network in the time specified by *pdvt* is equal to the time of the initial delay. There should be enough data in the reassembly buffer to allow transmission for a period of time defined by the *pdvt* before buffer underflow occurs due to the next delayed packet. The *bufferSize* is the number of milliseconds worth of buffer space that is allocated to accommodate packet delay variation (or jitter). A large buffer size reduces the probability of buffer overflow, thus reduces packet loss. The *bufferSize* attribute value and *pdvt* attribute value should be chosen appropriately to match the ATM network performance. The value must be greater than the value of *pdvt*, usually twice the value.
Mib	Nsta
Values	Decimal (5..100)
Units	msec
Default	40

ATTRIBUTE Nsta Conn Brag packetDelayVariationTolerance (pdvt)

Access	Read and write
Criticality	Process
Description	This attribute specifies the initial delay in milliseconds before any data is transmitted (normally set to be the mid-point of the reassembly buffer). This attribute, together with the *bufferSize* attribute, can be configured to optimize the jitter tolerance versus absolute delay performance.
Mib	Nsta
Values	Decimal (5..50)
Units	msec
Default	20

ATTRIBUTE Nsta Conn Brag silenceDetectionHangOverTime (silDetTime)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the time for which a silent timeslot's speech path is left on before being suppressed. This helps to prevent clipping at the end of words.
Mib	Nsta
Values	Decimal (30..500)
Units	msec
Default	200

ATTRIBUTE Nsta Conn Brag lossIntegrationPeriod (intPeriod)

Access	Read and write
Description	This attribute specifies the interval of time for which a loss of packet condition must persist before the *packetLossStatus* is set to ***loss*** on a *BasicRateChannel* component.
Mib	Nsta
Values	Decimal (1..60)
Units	seconds
Default	2

ATTRIBUTE Nsta Conn Brag lossClearPeriod (clrPeriod)

Access	Read and write
Description	This attribute specifies the interval of time for which a loss of packets condition must be absent before the *packetLossStatus* is set to ***noLoss*** on a *BasicRateChannel* component.
Mib	Nsta
Values	Decimal (1..600)
Units	seconds
Default	10

ATTRIBUTE Nsta Conn Brag ingressGain (iGain)

Access	Read and write
Description	This attribute specifies the gain applied on the TDM ingress side to balance the network loss plan.
Mib	Nsta
Values	Signed (-12..12)

Copyright © 2006, Nortel Nortel Confidential

Units	dB
Default	0

ATTRIBUTE Nsta Conn Brag egressGain (eGain)

Access	Read and write
Description	This attribute is the gain applied on the TDM egress side to balance the network loss plan.
Mib	Nsta
Values	Signed (-12..12)
Units	dB
Default	0

ATTRIBUTE Nsta Conn Brag echoCancellation (eCan)

Access	Read and write
Description	This attribute enables or disables echo cancellation. The value of this attribute will determine whether echo cancellation will be on or off when a 2100Hz tone is detected. ***g165Mode*** - Enables echo cancellation except when a 2100Hz tone with phase reversal is detected. ***alwaysOn*** - Enables echo cancellation regardless of whether a 2100Hz tone is detected. ***g164Mode*** - Disables echo cancellation only when a 2100Hz tone is detected, regardless of phase reversal. ***disabled*** - Disables echo cancellation.
Mib	Nsta
Values	g165Mode disabled alwaysOn g164Mode
Default	g165Mode

ATTRIBUTE Nsta Conn Brag minimumEchoReturnLoss (minEchoRetLoss)

Access	Read and write
Description	This attribute specifies the minimum echo return loss that can be expected on the line.
Mib	Nsta
Values	Decimal (0; 3; 6)
Units	dB
Default	6

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Conn Brag **echoCancelComfortNoiseGeneration (eCanComNoiseGen)**

Access	Read and write
Description	The attribute enables or disables comfort noise generation for the echo cancellation feature. This attribute has no effect if *echoCancellation* is ***disabled***.
Mib	Nsta
Values	enabled disabled
Default	enabled

ATTRIBUTE Nsta Conn Brag **faxIdleSuppression (faxSup)**

Access	Read and write
Description	This attribute enables or disables fax idle suppression.
Mib	Nsta
Values	enabled disabled
Default	enabled

ATTRIBUTE Nsta Conn Brag **silenceSuppression (silSup)**

Access	Read and write
Description	This attribute specifies when silence suppression is performed. A value of ***onCongestion*** indicates that silence suppression will be on only during periods of congestion on the ATM connection. A value of ***enabled*** indicates that silence suppression will be on at all times. A value of ***disabled*** indicates that silence suppression will never be on.
Mib	Nsta
Values	enabled disabled onCongestion
Default	enabled

ATTRIBUTE Nsta Conn Brag **silenceSuppressionThreshold (silSupThresh)**

Access	Read and write
Description	This attribute specifies the level in dBm0 above which silence suppression is not performed.
Mib	Nsta
Values	Signed (-60..-40)

Copyright © 2006, Nortel Nortel Confidential

Default	-40

ATTRIBUTE Nsta Conn Brag maxVoiceRate (maxVRate)

Access	Read and write
Description	This attribute selects the encoding algorithm to be used for voice channels within the *Brag* under normal conditions transmitted along the ATM connection, (when no 2100 Hz tone is detected, and there is no ATM connection congestion). This attribute must be set to a higher or equal bandwidth than the *minVoiceRate* attribute.
Mib	Nsta
Values	64kG711 32kG726 24kG726 16kG726 8kG729AB
Default	32kG726

ATTRIBUTE Nsta Conn Brag minVoiceRate (minVRate)

Access	Read and write
Description	This attribute selects the encoding algorithm to be used for voice channels within the *Brag* when the ATM capacity carrying the *Conn* component is congested. When the number of channels with voiceband data is less than or equal to *voicebandDataMaxChannels* then this attribute has no affect on those voiceband data channels. When the number of voiceband data channels exceeds *voicebandDataMaxChannels* this attributes rate will be applied to the excess channels during congestion. This attribute must be set to a lower or equal bandwidth than the *maxVoiceRate* attribute.
Mib	Nsta
Values	64kG711 32kG726 24kG726 16kG726 8kG729AB
Default	16kG726

ATTRIBUTE Nsta Conn Brag tone2100Rate (toneRate)

Access	Read and write
Description	This attribute selects the encoding algorithm to be used for AAL2 channels within the *Brag* on which 2100Hz tone is detected (regardless of phase reversal).

Copyright © 2006, Nortel Nortel Confidential

Mib	Nsta
Values	64kG711 32kG726
Default	64kG711

ATTRIBUTE Nsta Conn Brag ccsClearDataMaxChannels (clrDataMaxChan)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of channels permitted to transport clear data during congestion.
Mib	Nsta
Values	Decimal (0..31)
Default	0

ATTRIBUTE Nsta Conn Brag voicebandDataMaxChannels (vbdMaxChan)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of voice band data channels permitted at modem rate during congestion.
Mib	Nsta
Values	Decimal (0..31)
Default	12

ATTRIBUTE Nsta Conn Brag tdmLogLaw (tLaw)

Access	Read and write
Description	This attribute specifies the G711 log law to use on the TDM side of an NSTA trunk. If set to ***autoConfigure***, then the actual value used is derived from the facility, namely ***muLaw*** would be used for *DS1* trunks, while ***aLaw*** would be used by *E1* trunks.
Mib	Nsta
Values	autoConfigure muLaw aLaw
Default	autoConfigure

ATTRIBUTE Nsta Conn Brag tdmResponseForFailures (tdmRsp)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies how the *Brag* responds to ATM failures. The possible values are: ***tc*** - trunk conditioning is transmitted in the TDM egress direction, ***ais*** - AIS is transmitted in the TDM egress direction.
Mib	Nsta
Values	tc ais
Default	ais

ATTRIBUTE Nsta Conn Brag dtmfTransport (dtmf)

Access	Read and write
Description	This attribute specifies how DTMF tones are handled and is required because the ***8kG729AB*** rate cannot reliably transport DTMF tones. If the voice compression rate is ***8kG729AB*** then an attribute value of ***upspeed*** will increase the rate to ***64kG711*** upon detection of DTMF tones. If the voice compression rate is not ***8kG729AB*** then the attribute value should be ***disabled*** which causes DTMF tones to be treated as normal voice traffic and encoded at the current voice rate.
Mib	Nsta
Values	disabled upspeed
Default	No default

ATTRIBUTE Nsta Conn Brag trafficChannelIdentifierList (cidList)

Access	Read and write
Criticality	Process
Description	This attribute specifies AAL2 Channel Identifiers (CIDs) to be used for the timeslots within the *BasicRateGroup*. The lowest numbered timeslot corresponds to the first CID in the list, with further timeslots moving up the *cidList*. The *cidList* does not have to be in numerical order. The number of CIDs in the list must equal the number of bearer channel timeslots intended for user traffic. If the *Brag* component is linked to a *Chan* component, via the *interfaceName* attribute, then an empty list means that the value used is derived from the TDM trunk, namely: DS1 with CCS:8-30 DS1 without CCS:8-31 E1 with CCS:8-37 E1 without CCS:8-38

Copyright © 2006, Nortel Nortel Confidential

	If a *PassiveAccessPoint* subcomponent is present under the *Brag* component then this attribute must be provisioned with a non empty value.
Mib	Nsta
List of	Decimal (8..255)
Default	No default

GROUP Nsta Conn Brag Operational (Oper)

Properties	Operational
Description	This group contains attributes which indicate the causes of any *BasicRateGroup* failure.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag failureCause (failCause)

Access	Read only
Description	This attribute indicates the cause for a *Brag* failure. The failure cause messages are: ***serviceChanNotReady*** - this failure cause message occurs if the TDM connection is not present. ***atmConnectionNotReady*** - the ATM *Lp* is down, or waiting for it to establish communication. ***operatorLock*** - this failure message occurs when a dependent component is locked by the operator. ***internalError*** - an internal error, which can not be determined has occurred. ***outOfResource*** - not enough hardware resource to handle current capacity. ***vspNotReady*** - the VSP card is down, or waiting for it to establish communication. ***activating*** - component creation is currently in progress. ***farEndFailure*** - A far end failure has occurred that has been reported locally. ***none*** - no failure.
Mib	Nsta
Values	none serviceChanNotReady atmConnectionNotReady operatorLock internalError outOfResource vspNotReady activating farEndFailure
Default	none

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Conn Brag **tdmResponse (tRsp)**

Access	Read only
Description	This attribute indicates the current response to ATM failures. The possible values are: ***tc*** - trunk condition is transmitted in the TDM egress direction. ***ais*** - AIS is transmitted in the TDM egress direction. ***unknown*** - there is an error condition which can not be determined. ***none*** - there are currently no ATM failures. ***rai*** - RAI is transmitted in the TDM egress direction.
Mib	Nsta
Values	tc ais unknown none rai
Default	none

GROUP Nsta Conn Brag **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Nsta
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Conn Brag operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Nsta
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Conn Brag usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Nsta
Values	idle active (activ) busy
Default	idle

COMPONENT Nsta Conn Brag ChannelAssocSignalingTransport (Cast)

Groups	GROUP Nsta Conn Brag Cast Provisioned (Prov) GROUP Nsta Conn Brag Cast Operational (Oper)

Copyright © 2006, Nortel Nortel Confidential

Scope	Device
Description	*Nsta/n Conn/n Brag/n ChannelAssocSignalingTransport* This optional component handles the transport of the Channel Associated Signaling (CAS) for the *BasicRateGroup*. When a *Cast* component is provisioned beneath a *Brag*, CAS signaling bits for all timeslots in the group are transported within AAL2 packets via the *Brag*'s ATM connection. This component is mutually exclusive with the *CommonChannelSignalingTransport (Ccst*) component.
Mib	Nsta
Common Verbs	Help List Display Add DELete

GROUP Nsta Conn Brag Cast Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *ChannelAssocSignalingTransport* component.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag Cast casMonitoring (casMonitor)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether or not the CAS signaling bits for the timeslots in the group will be monitored. If *casMonitoring* is ***disabled*** then idle channel suppression will not be performed.
Mib	Nsta
Values	enabled disabled
Default	enabled

ATTRIBUTE Nsta Conn Brag Cast signalingBits (sigBits)

Access	Read and write
Criticality	Process
Description	This attributes specifies whether AB or ABCD signaling is used.
Mib	Nsta
Values	AB ABCD

Copyright © 2006, Nortel Nortel Confidential

Default	ABCD

ATTRIBUTE Nsta Conn Brag Cast **ingressIdle (iIdle)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the AB or ABCD bit pattern, received from the TDM interface direction, that is to be interpreted as an idle signal. For ***AB*** signaling the first two bits must be the same as the second two bits. If *casMonitoring* is ***disabled*** then the value set in this attribute is ignored. Each bit can either be 0, 1 or X, where X indicates no preference.
Mib	Nsta
Values	String (4, ASCII)
Default	0000

ATTRIBUTE Nsta Conn Brag Cast **egressIdle (eIdle)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the AB or ABCD bit pattern, received from the ATM interface direction, that is to be interpreted as an idle signal. For ***AB*** signaling the first two bits must be the same as the second two bits. If *casMonitoring* is ***disabled*** then the value set in this attribute is ignored. Each bit can either be 0, 1 or X, where X indicates no preference.
Mib	Nsta
Values	String (4, ASCII)
Default	0000

ATTRIBUTE Nsta Conn Brag Cast **disconnectTime (disTime)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the time in milliseconds for which the ingress idle and the egress idle pattern, provisioned in the *ingressIdle* and *egressIdle* attributes, must persist before they are interpreted as valid disconnect signals.

Copyright © 2006, Nortel Nortel Confidential

If *casMonitoring* is ***disabled*** then the value set in this attribute is ignored.

The value of this attribute is rounded to the nearest 100 ms.

Mib	Nsta
Values	Decimal (100..30000)
Units	msec
Default	500

GROUP Nsta Conn Brag Cast **Operational (Oper)**

Properties	Operational
Description	This group contains the status information for the *ChannelAssociatedSignalingTransport* component.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag Cast **signalingProcessingBlock (sigProcBlock)**

Access	Read only
Description	This attribute indicates which *ProcessingBlock* is processing the AAL2 trunk CAS signaling bits.
Mib	Nsta
Values	The name of the component
Default	No default

COMPONENT Nsta Conn Brag **CommonChannelSignalingTransport (Ccst)**

Groups	GROUP Nsta Conn Brag Ccst Provisioned (Prov) GROUP Nsta Conn Brag Ccst Aal2Statistics (Aal2Stats) GROUP Nsta Conn Brag Ccst Operational (Oper)
Scope	Device
Description	*Nsta/n Conn/n Brag/n CommonChannelSignalingTransport* This optional component handles the transport of D Channel data for the basic rate group. When a *Ccst* component is provisioned beneath a *Brag*, all valid HDLC frames within the channel smaller than 512 octets in size are transported transparently. The adaptation layer type used is determined by the value provisioned with the *aalType* attribute. Since D channel data include Common Channel signaling (CCS)

GROUP Nsta Conn Brag Brac OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag Brac adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Nsta
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Conn Brag Brac **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Nsta
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Conn Brag Brac **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Nsta
Values	idle active (activ) busy
Default	idle

GROUP Nsta Conn Brag Brac **Operational (Oper)**

Properties	Operational
Description	This group contains status information about the *BasicRateChannel*.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag Brac **timeslots (tSlots)**

Access	Read only
Description	This attribute indicates the timeslots carried within the *Brac* on the AAL2 connection.

Copyright © 2006, Nortel Nortel Confidential

Mib	Nsta
Set of	Decimal (1..31)
Default	No default

ATTRIBUTE Nsta Conn Brag Brac **packetLossStatus (pktStat)**

Access	Read only
Description	This attribute indicates packet loss status. The possible values are: ***loss*** - a state change notification is sent when a buffer underflow condition persists for the period defined by the *Brag* component *packetLossIntegrationPeriod* attribute. ***noLoss*** - the buffer underflow condition is absent for the period defined by the *Brag* component *packetLossClearPeriod* attribute. ***notApplicable*** - the connection is not established.
Mib	Nsta
Values	noLoss loss notApplicable
Default	No default

ATTRIBUTE Nsta Conn Brag Brac **echoCancellationStatus (eCanStat)**

Access	Read only
Description	This attribute indicates the status of echo cancellation. The possible values are: ***active*** - echo cancellation is currently being performed. ***inactive*** - echo cancellation is not currently being performed. ***disabled*** - the *echoCancellation* attribute in the *Brag* component is set to ***disabled***. ***notApplicable*** - the connection is not established.
Mib	Nsta
Values	active inactive disabled notApplicable
Default	No default

ATTRIBUTE Nsta Conn Brag Brac **faxIdleSuppressionStatus (faxStat)**

Access	Read only
Description	This attribute indicates the status of fax idle suppression. The possible values are: ***disabled*** - the *faxIdleSuppression* attribute in the *Brag* component is set to ***disabled***, or if the call using this *Brac* is not a fax call. If the *faxIdleSuppression* attribute in the *Brag* component is set to ***enabled***

Copyright © 2006, Nortel Nortel Confidential

and the call using this *Brac* is a fax call then it is set to ***active*** if fax idle suppression is currently being performed, so there is a fax idle period in the ingress direction. Otherwise it is set to ***inactive*** if fax idle suppression is not currently being performed, so there is a fax active period in the ingress direction. It displays ***notApplicable*** when the connection is not established and the *callStatus* attribute is set to ***idle***.

Mib — Nsta

Values
active
inactive
disabled
notApplicable

Default — No default

ATTRIBUTE Nsta Conn Brag Brac silenceSuppressionStatus (silStat)

Access — Read only

Description

This attribute indicates the status of silence suppression.
It is set to ***disabled*** if the *silenceSuppression* attribute in the *Brag* component is set to ***disabled***, or if the call using this *Brac* is not a voice call.
It is set to ***active*** if the *silenceSuppression* attribute in the *Brag* component is set to ***enabled*** and the call using this *Brac* is a voice call.
If the *silenceSuppression* attribute in the *Brag* component is set to ***onCongestion*** and the call using this *Brac* is a voice call then it is set to ***active*** if silence suppression feature is currently active for this *Brac*. Otherwise it is set to ***inactive***.
When this attribute is set to ***active*** voice packets will not be transmitted towards ATM network during silence periods. It displays ***notApplicable*** when the connection is not established and the *callStatus* attribute is set to ***idle***.

Properties	Operational
Description	This group indicates the status information for the *PassiveAccessPoint* component.
Mib	Nsta

ATTRIBUTE Nsta Conn Brag Pap **svcStatus (status)**

Access	Read only
Description	This attribute indicates the status of the SVC connection. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component.
Mib	Nsta
Values	connecting connected idle
Default	No default

ATTRIBUTE Nsta Conn Brag Pap **remoteAddress (address)**

Access	Read only
Description	This attribute indicates the ATM address of the remote AAL1 CES endpoint. If a connection is not established, the attribute value is blank.

Copyright © 2006, Nortel Nortel Confidential

Mib	Nsta
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Nsta Conn Brag Pap remoteChannelDetail (channelDetail)

Access	Read only
Description	This attribute indicates the configuration of the remote AAL1 CES endpoint. If a connection is not established, the attribute value is blank.
Mib	Nsta
Values	String (0..81, ASCII)
Default	No default

ATTRIBUTE Nsta Conn Brag Pap remoteChannelStatus (rCStatus)

Access	Read only
Description	This attribute indicates the operational status of the remote AAL1 CES endpoint. The ***up*** status indicates that there are no TDM ingress fault conditions. The ***down*** status indicates the TDM interface has detected an ingress fault condition. The ***rai*** status indicates an ingress RAI at the TDM interface. The ***unknown*** status indicates the AAL1 CES connection is not present.
Mib	Nsta
Values	up down rai unknown
Default	No default

ATTRIBUTE Nsta Conn Brag Pap lastTearDownCause

Access	Read only
Description	This attribute indicates the cause code in the last call release message that contained the CAUSE information element. Note that the call must have been successfully established before being torn down. Under initial condition, a zero cause code is displayed.
Mib	Nsta
Values	Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Conn Brag Pap **lastTearDownDiagnostic**

Access	Read only
Description	This attribute indicates the diagnostic code in the last call release message. The diagnostic code is contained in the CAUSE information element. A diagnostic code is always accompanied by the cause code. Note that the call must have been successfully established before being torn down. Under initial condition, the value is empty.
Mib	Nsta
Values	String (0..8, ASCII)
Default	No default

COMPONENT Nsta Conn Brag **AtmConnection (AtmCon)**

Groups	GROUP Nsta Conn Brag AtmCon Operational (Oper)
Scope	Device
Description	An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed.
Mib	Nsta
Common Verbs	Help List Display

Scope	Device
Description	*Nsta/n Vgs Control/n ActiveAccessPoint* *Nsta/n Vgs IpMConn ActiveAccessPoint* *Nsta/n Conn/n ActiveAccessPoint* This component defines ATM SVC originating and terminating information pertinent to those subcomponents in the *Nsta* hierarchy which require dynamic links into the ATM network but have no addressing information. An *Aap* is responsible for maintaining calls to a remote address in the ATM network.
Mib	Nsta
Common Verbs	Help List Display Add DELete

VERB Restart **Nsta Conn Aap**

Impact	Service
Description	*Restart Nsta/n Vgs Control/n ActiveAccessPoint* *Restart Nsta/n Vgs IpMConn ActiveAccessPoint* *Restart Nsta/n Conn/n ActiveAccessPoint* This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection is released first. This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP **Nsta Conn Aap** **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains provisioning data for the *Aap* component.
Mib	Nsta

ATTRIBUTE **Nsta Conn Aap** **atmServiceCategory (service)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specified the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable bit rate service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a *peakCellRate*, *sustainedCellRate*, and *maximumBurstSize*. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. The non real-time variable bit rate service may support statistical multiplexing of connections. If the parent of the *Aap* is a *Ctrl* component then the default value of *atmServiceCategory* attribute is ***nrtVariableBitRate***; it may not take the value ***rtVariableBitRate***. If the parent of the *Aap* is an *IpMConn* or *Conn* component then the default value of *atmServiceCategory* attribute is ***rtVariableBitRate***; it may not take the value ***nrtVariableBitRate***.
Mib	Nsta
Values	constantBitRate (cbr) rtVariableBitRate (rtVbr) nrtVariableBitRate (nrtVbr)
Default	No default

ATTRIBUTE Nsta Conn Aap peakCellRate (pcr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the peak cell rate of the ATM connection.
Mib	Nsta

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Nsta Conn Aap **sustainedCellRate (scr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the sustained cell rate of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Nsta
Values	Decimal (0..2147483647)
Units	cell/s
Default	0

ATTRIBUTE Nsta Conn Aap **maximumBurstSize (mbs)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum burst size, at the peak cell rate, of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Nsta
Values	Decimal (0..2147483647)
Units	cells
Default	0

ATTRIBUTE Nsta Conn Aap **retryLimit (limit)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of consecutive unsuccessful setup attempts before further attempts are abandoned. If this limit is reached, management action is required (restart the connection attempts with the *Restart* verb). A value of zero indicates no limit; attempts will continue indefinitely until a successful connection is established.

Mib	Nsta
Values	Decimal (0..65535)
Default	0

GROUP Nsta Conn Aap AapAddressessProv (AapAddrProv)

Properties	Provisioned
Description	This group contains NSAP address provisioning data.
Mib	Nsta

ATTRIBUTE Nsta Conn Aap expectedRemoteAddress (expectedAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the expected remote address information for an incoming setup request. If *expectedRemoteAddress* is not empty, only matching addresses in incoming setup are considered for acceptance. If *expectedRemoteAddress* is less than 40 characters long, the remote address must match the value in *expectedRemoteAddress* to be accepted. If *expectedRemoteAddress* is empty, connection requests are accepted from any remote address.
Mib	Nsta
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Nsta Conn Aap localAddress (localAddr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the access point's ATM address. If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) is provisioned, a default value for *localAddress* based on the *nodePrefix* is provided. If a default cannot be generated the operator is forced to set a value for this attribute. Alternatively, the *ModuleData nodePrefix* attribute may be provisioned, and this access point component then deleted and re-added.
Mib	Nsta
Values	String (1..44, AESANsapAddress)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Conn Aap addressToCall (addrToCall)

Access	Read and write
Criticality	Component
Description	This attribute specifies the list of remote NSAP addresses which this component can call. At least one address must be provisioned. For the *ControlConnection* component in switched VoATM and VoIP and for the *IpMediaStreamConnection* application the remote end is a router. It is required to be able to establish SVCs to different routers. Therefore, the *addressToCall* attribute is a list of remote addresses. The first SVC call is sent to the first address listed in the *addressToCall* attribute. If the setup fails or the call is established but fails at a later time, the system attempts to set up a connection to next address listed in the *addressToCall* attribute. If a failure occurs when using the last address in the list, the system attempts to setup a connection to the first address in the list and then continues as before.
Mib	Nsta
List of	String (1..44, AESANsapAddress)
List Size	3
Default	No default

GROUP Nsta Conn Aap Operational (Oper)

Properties	Operational
Description	This group contains operational status information for the *Aap* component.
Mib	Nsta

ATTRIBUTE Nsta Conn Aap svcStatus (status)

Access	Read only
Description	This attribute indicates the status of the SVC connection. When this attribute has the value ***initializing***, it indicates that the component is initializing when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has

Copyright © 2006, Nortel Nortel Confidential

	just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed,*** it indicates that an error occurred while sending a release message to the network (as a consequence of a Delete request) while the component was in ***connecting*** state.
Mib	Nsta
Values	initializing connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Nsta Conn Aap lastSetupFailureCause (failCause)

Access	Read only
Description	This attribute indicates the cause code in the last call release message following an unsuccessful call setup attempt. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. If no call setup attempts have failed, this attribute has a value of 0.
Mib	Nsta
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Conn Aap lastSetupFailureDiagnostic (failDiag)

Access	Read only
Description	This attribute indicates the diagnostic code in the last call release message following an unsuccessful call setup attempt. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If no call setup attempts have failed, this attribute is an empty string.
Mib	Nsta
Values	String (0..8, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Conn Aap retryTimeRemaining (timer)

Access	Read only
Description	This attribute indicates the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt is made. When the value reaches 0 an attempt will be made to establish the connection. When the timer is not running this attribute has a value of 0.
Mib	Nsta
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Nsta Conn Aap retryFailures (failures)

Access	Read only
Description	This attribute counts the number of consecutive failed connection attempts. This counter is reset to 0 whenever a connection is successfully established or the connection is restarted using the *Restart* verb. The counter wraps to zero when the maximum value is exceeded.
Mib	Nsta
Values	Decimal (0..2147483647)
Default	No default

VERB Restart **Nsta Conn SpvcAp**

Impact Service

Description *Restart Nsta/n Vgs Control/n SpvcAccessPoint*
Restart Nsta/n Vgs IpMConn SpvcAccessPoint
Restart Nsta/n Conn/n SpvcAccessPoint

This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute.

This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached.

This command may also be used when a connection has been established, in which case the connection is released first.

This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP **Nsta Conn SpvcAp** **Provisioned (Prov)**

Properties Provisioned

Description This group contains provisioning data for the *SpvcAp* component.

Mib Nsta

ATTRIBUTE **Nsta Conn SpvcAp** **atmServiceCategory (service)**

Access Read and write

Criticality Component

Description This attribute specifies the ATM service category for SVCs.

The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered

Copyright © 2006, Nortel Nortel Confidential

appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application.

The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable bit rate service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a *peakCellRate*, *sustainedCellRate*, and *maximumBurstSize*. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. The non real-time variable bit rate service may support statistical multiplexing of connections.

If the parent of the *SpvcAp* is a *Ctrl* component then the default value of *atmServiceCategory* attribute is ***nrtVariableBitRate***; it may not take the value ***rtVariableBitRate***. If the parent of the *SpvcAp* is an *IpMConn* component then the default value of *atmServiceCategory* attribute is ***rtVariableBitRate***; it may not take the value ***nrtVariableBitRate***.

ATTRIBUTE Nsta Conn SpvcAp svcStatus (status)

Access	Read only
Description	This attribute specifies the status of the SVC connection. When this attribute has the value ***initializing***, it indicates that the component is initializing when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* for consecutive connection set up attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed,*** it indicates that an error occurred while sending a release message to the network (as a consequence of a *Delete* request) while the component was in ***connecting*** state.
Mib	Nsta

Values	initializing connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Nsta Conn SpvcAp lastSetupFailureCause (failCause)

Access	Read only
Description	This attribute contains the cause code in the last call release message following an unsuccessful call set up attempt. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	Nsta
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Conn SpvcAp lastSetupFailureDiagnostic (failDiag)

Access	Read only
Description	This attribute contains the diagnostic code in the last call release message following an unsuccessful call set up attempt. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code.
Mib	Nsta
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Nsta Conn SpvcAp retryTimeRemaining (timer)

Access	Read only
Description	This attribute indicates the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt is made. When the value reaches ***0*** an attempt will be made to establish the connection. When the timer is not running a value of ***0*** is returned.
Mib	Nsta
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Nsta Conn SpvcAp retryFailures (failures)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of consecutive failed connection attempts. This counter is reset to ***0*** whenever a connection is successfully established or the connection is restarted using the *Restart* verb. The counter wraps to ***0*** when the maximum value is exceeded.
Mib	Nsta
Values	Decimal (0..2147483647)
Default	No default

GROUP Nsta Conn SpvcAp **AccessPointOper (ApOper)**

Properties	Operational
Description	This group contains operational information regarding the end point of the connection. This group is common to all types of access points.
Mib	Nsta

ATTRIBUTE Nsta Conn SpvcAp **remoteAddress (rAddr)**

Access	Read only
Criticality	Component
Description	This attribute indicates the address of the remote end point. If a connection is currently established, it will contain the NSAP address of the remote end point. If a connection is not established, the *remoteAddress* attribute has the value ***unknown***.
Mib	Nsta
Values	String (7..40, ASCII)
Default	No default

ATTRIBUTE Nsta Conn SpvcAp **lastTearDownCause (cause)**

Access	Read only
Description	This attribute indicates the cause code in the last call release message that contained the CAUSE information element. Note that the call must have been successfully established before being torn down. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	Nsta
Values	Decimal (0..255)
Default	No default

GROUP Nsta Vgs CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Vgs

ATTRIBUTE Nsta Vgs customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Vgs
Values	Decimal (0; 1..8191)
Default	0

GROUP Nsta Vgs Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *Vgs* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs gatewayAtmAddress (addr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM address of this gateway. This address is used for identifying this gateway to remote gateways. A change in the value of this attribute causes all current calls to be dropped. If the *nodePrefix* attribute has been provisioned in the *ModuleData* component, a default value for *gatewayAtmAddress* will be generated by the system, otherwise the *gatewayAtmAddress* will default to an empty string.

Copyright © 2006, Nortel Nortel Confidential

This attribute is only relevant when one of the following features is provisioned:

vgsAtm
vgsAtmDc
vgsAtmG729

Mib — Vgs

Values — String (0..44, AESANsapAddress)

Default — No default

ATTRIBUTE Nsta Vgs hostname (name)

Access — Read and write

Criticality — Component

Description — This attribute specifies the hostname to identify this gateway. The value provisioned for this gateway should match the value provisioned in its associated controller.

This attribute must be unique within the group of gateways controlled by the controller. A change in the value of this attribute causes all current calls to be dropped.

This attribute must have a maximum of fifteen characters if a *Vgcp* component exists under the *Vgs*.

Mib — Vgs

Values — String (1..255, ASCII)

Default — No default

ATTRIBUTE Nsta Vgs defaultPacketLogLaw (muALaw)

Access — Read and write

Description — This attribute specifies whether the digitizing scheme is mu law or A law.

For Voice over IP, this attribute defines the log law to use at call setup. For Voice over ATM, this attribute defines a default which can be overridden by the *packetLogLaw* attribute of individual *AtmTConn* components at call setup. This attribute may be changed without impacting existing calls.

The value provisioned can be overridden by per call values signaled by the controller in the CRCX (create connection) and MDCX (modify connection) messages.

There is no relationship between this attribute and the *tdmLogLaw* attribute of the *Brag* component.

Copyright © 2006, Nortel Nortel Confidential

	This attribute must be set to ***useAsProfile*** for a ***VoIP*** feature provisioned in the ***featureList*** and to either ***ALaw*** or ***MuLaw*** for a ***VoATM*** feature.
Mib	Vgs
Values	muLaw aLaw useAsProfile
Default	aLaw

ATTRIBUTE Nsta Vgs defaultIpMediaDsf (defDsf)

Access	Read and write
Description	This attribute specifies the default Differentiated Service Field (DSF) value for all voice packets transmitted on all *IpMConn* components. This attribute is ignored by *CtrlConn* and *AtmTConn* components.
Mib	Vgs
Values	Decimal (0..63)
Default	46

ATTRIBUTE Nsta Vgs remoteMfDeviceIpAddress (remMfIp)

Access	Read and write
Description	This attribute specifies the IP address of an associated Remote SGCP/MF IWF to which SGCP commands (against endpoints provisioned as MF) will be relayed. This attribute is only applicable to *IpMConn* components and is ignored by *CtrlConn* and *AtmTConn* components.
Mib	Vgs
Values	IP address
Default	No default

ATTRIBUTE Nsta Vgs remoteMfDeviceUdpPort (remMfUdp)

Access	Read and write
Description	This attribute specifies the UDP port of an associated Remote SGCP/MF IWF to which SGCP commands (against endpoints provisioned as MF) will be relayed. This attribute is only applicable to *IpMConn* components and is ignored by *CtrlConn* and *AtmTConn* components.
Mib	Vgs
Values	Decimal (1..65535)
Default	2427

GROUP Nsta Vgs Operational (Oper)

Properties Operational

Description This group contains operational data for the *Nsta Vgs* component.

Mib Vgs

ATTRIBUTE Nsta Vgs activeConnections (connActive)

Access Read only

Description This attribute indicates the current number of active media connections.

Mib Vgs

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE Nsta Vgs connectionsSetup (connSetup)

Access Read only

Description This attribute counts the media connections successfully established by this gateway *Vgs* component and acknowledged to the Controller.

The value wraps to ***0*** when the maximum value is exceeded.

Mib Vgs

Values Decimal (0..4294967295)

Default No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs disabledAtmTrunks (disTrunks)

Access	Read only
Description	This attribute indicates the current number of *AtmTConn* components under the *Vgs* that are disabled. This attribute is only applicable when the ***vgsAtm***, ***vgsAtmDc*** or ***vgsAtmG729*** feature is provisioned. If any other feature is provisioned, this attribute is filtered.
Mib	Vgs
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Nsta Vgs remoteMfDeviceStatus (remMfStatus)

Access	Read only
Description	This attribute indicates the status of the connection to the remote MF signaling device. The value ***connected*** indicates that the connection is enabled. The value ***notConnected*** indicates that the connection is disabled.
Mib	Vgs
Values	connected notConnected
Default	notConnected

ATTRIBUTE Nsta Vgs faxConnectionsSetup (faxSetup)

Access	Read only
Description	This attribute counts the connections which are identified as carrying fax modem traffic. The counter wraps to ***0*** when it reaches its maximum value. The counter will also be reset to ***0*** if the *Vsp* component is locked. This attribute is filtered on the ***12mVspAal*** and ***Vsp2*** cards.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs nonFaxVbdConnectionsSetup (vbdSetup)

Access	Read only
Description	This attribute counts the connections which are identified as carrying non fax modem traffic. The counter wraps to ***0*** when it reaches its maximum

Copyright © 2006, Nortel Nortel Confidential

value. The counter will also be reset to ***0*** if the *Vsp* component is locked.

This attribute is filtered on the ***12mVspAal*** and ***Vsp2*** cards.

Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs emergencyCalls (emCalls)

Access	Read only
Description	This attribute counts the emergency calls currently in progress. The controller determines whether a call is for emergency purposes, and instructs the gateway via the control protocol. This attribute is only relevant if the H.248 protocol is in use. If any other protocol is used, this attribute is filtered.
Mib	Vgs
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Nsta Vgs congestedSeconds (congSec)

Access	Read only
Description	This attribute counts the seconds that new media connection requests have been rejected because the Gateway was busy. The counter wraps to ***0*** when it exceeds the maximum value. This attribute is filtered on the ***12mVspAal*** card.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs overloadRejectedCommands (olRejCom)

Access	Read only
Description	This attribute counts the control protocol commands that were rejected due to input message buffer overload. The counter wraps to ***0*** when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Nsta Vgs Statistics (Stats)

Properties	Operational
Description	This group stores the connection statistics for the *VGS* component. Note these attributes are filtered based on VSP card type as they are not applicable on ***12mVspAal*** and ***Vsp2*** cards.
Mib	Vgs

ATTRIBUTE Nsta Vgs connectionsLostToPacketNwLoss (clPkt)

Access	Read only
Description	This attribute counts the connections lost to Gateway-detectable network failures. This includes: - individual connection media integrity time-outs. - bulk connection loss due to *ATM VCC* failure or release or associated component deprovisioning. - bulk connection loss due to local IP media link failure or associated component deprovisioning.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs connectionsLostToTdmPortLoss (clTdm)

Access	Read only
Description	This attribute counts the connections lost to TDM port failure, internal failures or TDM port deletion since component creation. The counter wraps to ***0*** when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs activeConnectionsAvg (connAvg)

Access	Read only
Description	This attribute counts the average number of connections over the time interval given by *Nsta/n Vgs timeInterval*.The values are sampled every 1 second.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs activeConnectionsMax (connMax)

Access	Read only
Description	This attribute counts the maximum number of connections at any point over the time interval given by *Nsta/n Vgs timeInterval.*
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs activeConnectionsMin (connMin)

Access	Read only
Description	This attribute counts the minimum number of connections at any point over the time interval given by *Nsta/n Vgs timeInterval*.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs timeInterval

Access	Read only
Description	This attribute indicates the number of minutes into the statistical sampling period for which *activeConnectionsAvg*, *activeConnectionsMin* and *activeConnectionsMax* are measured. As per any time interval attribute, this resets to 0 on the quarter hour.
Mib	Vgs
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Nsta Vgs evrcConnectionsSetup (evrcSetup)

Access	Read only
Description	This attribute counts the number of EVRC media connections successfully established by this gateway Vgs component.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs evrc0ConnectionsSetup (evrc0Setup)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of EVRC0 (Header Free EVRC) media connections successfully stablished by this gateway Vgs component.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs trfoConnectionsSetup (trfoSetup)

Access	Read only
Description	This attribute counts the number of TrFO connections successfully established by this gateway Vgs component.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs connectionsLostToTrfoFailure (clTrfoFail)

Access	Read only
Description	This attribute counts the number of connections lost due to TrFO failure since component creation.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Nsta Vgs BasicRateGroup (Brag)

Instance	Decimal (0..127)
Groups	GROUP Nsta Vgs Brag Provisioned (Prov) GROUP Nsta Vgs Brag OsiState (State) GROUP Nsta Vgs Brag Operational (Oper) GROUP Nsta Vgs Brag CommonOp (ComOp)
Scope	Device
Description	*Nsta/n Vgs BasicRateAccessGroup/n* This component represents a number of TDM connections from the Voice Services function processor to the TDM network. The TDM connections are all associated with the same TDM interface. This component defines default processing for all TDM connections. For each connection, this default processing may be overridden by the controller. The *V5Link* subcomponent is mutually exclusive of the

Copyright © 2006, Nortel Nortel Confidential

AnnouncementLanguage subcomponent.

The *V5Link*, *Q921* and *Cas* subcomponents are mutually exclusive of each other.

Mib	Vgs

ATTRIBUTE Nsta Vgs Brag interfaceName (intName)

Access	Read and write
Criticality	Process
Description	This attribute specifies a link to a *Chan* component, which in turn specifies the timeslots for the *Brag*.
Mib	Vgs
Values	Link (Service, applicationFramerName)
Default	No default

ATTRIBUTE Nsta Vgs Brag tdmLogLaw (muALaw)

Access	Read and write
Criticality	Component
Description	This attribute specifies the G711 *tdmLogLaw* to use on the TDM side of an NSTA trunk. If set to ***aLaw***, Alaw companding is used. If set to ***autoConfigured***, then the actual value used is derived from the facility, namely ***muLaw*** would be used for *DS1* trunks, while ***aLaw*** would

Copyright © 2006, Nortel Nortel Confidential

be used by *E1* trunks.

For *E1* trunks, a value of ***muLaw*** is not recommended.

Mib: Vgs

Values:
muLaw
aLaw
autoConfigured

Default: autoConfigured

ATTRIBUTE Nsta Vgs Brag bufferSize (bufSize)

Access: Read and write

Criticality: Process

Description: This attribute specifies the capacity of the packet delay variation (PDV) buffer in milliseconds of data.

To ensure that PDV can be tolerated it is necessary to initialize the system with a reserve of information in the buffer used to reassemble data for transmission across the TDM network. The size of this reserve is defined by the *pdvt* and *bufferSize* attributes. The amount of data played out to the TDM network(in time equal to the value of the *pdvt* attribute*)* is equal to the size of the initialization reserve. There should be enough data in the reassembly buffer to allow transmission for a period of time defined by the *pdvt* attribute before buffer underflow due to the next delayed packet occurs.

If the ***VgsIp, VgsIpG729, VgsIpGe***, or ***VgsIpG729Ge*** feature have been provisioned the default *bufferSize* will be ***60ms*** otherwise the *bufferSize* will be ***50ms***.

The value should always be greater than two times the value of the *pdvt* attribute plus the maximum packet size, except on a ***2pGeMmSrVsp3*** card where it need only be greater than or equal to two times the *pdvt*. The maximum packet size is 20ms for ***VgsIp***, ***VgsIpG729*** and ***VgsIpG729Ge*** features and 10ms for all other features.

If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used.

If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.

This attribute has no effect if the *packetDelayVariationTolerance* attribute is set to ***adaptive***.

Mib: Vgs

Values:
Decimal (5..100)
sameAsProfile

Copyright © 2006, Nortel Nortel Confidential

Units	msec
Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag packetDelayVariationTolerance (pdvt)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum packet arrival jitter in milliseconds that the reassembly process will tolerate in the packet stream without producing errors on the TDM interface. This attribute together with the *bufferSize* attribute, can be configured to optimize the jitter versus absolute delay tradeoff in various network configurations. The value should always be less than the value of the *bufferSize* attribute minus the maximum packet size divided by two, except on a ***2pGeMmSrVsp3*** card where it need only be less than or equal to the *bufferSize* divided by two. The maximum packet size is 20ms for ***VgsIp***, ***VgsIpG729, VgsIpGe*** and ***VgsIpG729Ge*** features and 10ms for all other features. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***. If set to ***adaptive***, the hardware attempts to minimise the absolute delay while allowing for the maximum packet arrival jitter encountered. This value is only supported on the following cards: ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3***, ***2pVS***.
Mib	Vgs
Values	Decimal (5..50) sameAsProfile adaptive
Units	msec
Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag lossIntegrationPeriod (intPeriod)

Access	Read and write
Description	This attribute specifies the interval of time in seconds for which a loss of packet condition must persist before the corresponding call is dropped. A

Copyright © 2006, Nortel Nortel Confidential

value of ***0*** specifies that packet loss integration is disabled and therefore call connections are not suspended after packet loss.

If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used.

If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.

Mib	Vgs
Values	Decimal (0..50) sameAsProfile
Units	seconds
Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag ingressGain (iGain)

Access	Read and write
Description	This attribute specifies the gain applied on the TDM ingress side to balance the network loss plan.
Mib	Vgs
Values	Signed (-12..12)
Units	dB
Default	0

ATTRIBUTE Nsta Vgs Brag egressGain (eGain)

Access	Read and write
Description	This attribute specifies the gain applied on the TDM egress side to balance the network loss plan.
Mib	Vgs
Values	Signed (-12..12)
Units	dB
Default	0

ATTRIBUTE Nsta Vgs Brag echoCancellation (eCan)

Access	Read and write
Description	This attribute specifies whether echo cancellation is enabled or disabled. The value of this attribute will determine whether echo cancellation will be on or off when a 2100Hz tone is detected. Note that the gateway controller may override this attribute on a call by call

Copyright © 2006, Nortel Nortel Confidential

basis to activate or deactivate echo cancellation**.**

g165Mode - Enables echo cancellation except when a 2100Hz tone with phase reversal is detected.

alwaysOn - Enables echo cancellation regardless of whether a 2100Hz tone is detected.

g164Mode - Disables echo cancellation only when a 2100Hz tone is detected, regardless of phase reversal.

disabled - Disables echo cancellation.

The values ***alwaysOn*** and ***g164Mode*** are not permitted on a ***2pGeMmSrVsp3*** card.

Mib	Vgs
Values	g165Mode disabled alwaysOn g164Mode
Default	g165Mode

ATTRIBUTE Nsta Vgs Brag minimumEchoReturnLoss (minEchoRetLoss)

Access	Read and write
Description	This attribute specifies the minimum echo return loss that can be expected on the line.
Mib	Vgs
Values	Decimal (0; 3; 6)

ATTRIBUTE Nsta Vgs Brag echoCancelComfortNoiseGeneration (eCanComNoiseGen)

Access	Read and write
Description	The attribute specifies whether comfort noise generation for the echo cancellation feature is enabled or disabled. This attribute has no effect if *echoCancellation* is ***disabled*** through provisioning or through 2100 Hz tone detection.
Mib	Vgs
Values	enabled disabled
Default	enabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Brag defaultVoiceRate (defVRate)

Access	Read and write
Description	This attribute specifies the default coding algorithm to be used under normal conditions (when no 2100 Hz tone is detected). For each connection, this default coding algorithm can be overridden by the controller. When the VSP card type is ***2pGeMmSrVsp3*** or ***2pOC3ChSmIrVsp3***, and the ***vgsAtm*** or ***vgsAtmG729*** feature is provisioned, the value must be ***64kG711, 24kG726*** or ***32kG726***. For all other usages, the following restrictions apply: If the provisioned feature is ***vgsAtm*** or ***vgsAtmDc*** then either ***64kG711*** or ***32kG726*** may be provisioned. For the feature ***vgsIp*** or ***vgsIpGe*** only ***64kG711*** may be provisioned. For feature ***vgsIpG729*** or ***vgsIpG729Ge*** either ***64kG711*** or ***8kG729*** may be provisioned. For feature ***vgsAtmG729*** any of ***64kG711***,***32kG726*** and ***8kG729*** may be provisioned. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	64kG711 32kG726 24kG726 8kG729 sameAsProfile
Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag tone2100Rate (toneRate)

Access	Read and write
Description	This attribute specifies the coding algorithm to be used for timeslots within the *Brag* component on which 2100 Hz tone is detected (phase reversal may or may not be detected). This attribute takes precedence over the *defaultVoiceRate* attribute. This attribute must be set to ***64kG711*** when using IP transport. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	64kG711 32kG726 sameAsProfile
Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag silenceDetectionHangOverTime (silDetTime)

Access	Read and write
Description	This attribute specifies the time in milliseconds for which the speech path is left on before being suppressed when a timeslot is silent. This helps to prevent clipping at the end of words. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	Decimal (30..500) sameAsProfile
Units	msec
Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag silenceSuppression (silSup)

Access	Read and write
Description	This attribute specifies whether silence suppression is performed. A value of ***enabled*** indicates that silence suppression is performed as default. For each connection this default can be overridden by the controller. A value of ***disabled*** indicates that silence suppression is not performed under any circumstances. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	enabled disabled sameAsProfile

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag silenceSuppressionThreshold (silSupThresh)

Access	Read and write
Description	This attribute specifies the level above which silence suppression is not performed. A value in the range -39 to -36 dBm0 is only permitted on a ***2pGeMmSrVsp3*** card. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	Signed (-60..-36) sameAsProfile
Units	dBm0
Default	sameAsProfile

ATTRIBUTE Nsta Vgs Brag signalingType (sigType)

Access	Read and write
Criticality	Process
Description	This attribute specifies the signaling type of the trunks within the *Brag* component. ***unsignaled*** performs no additional signaling. ***mfRemote*** performs MF signaling to a remote call server. This attribute must be set to ***unsignaled*** when using ATM transport.
Mib	Vgs
Values	unsignaled mfRemote
Default	unsignaled

ATTRIBUTE Nsta Vgs Brag echoCancellationTailLength (eCanTail)

Access	Read and write
Description	This attribute specifies the echo cancellation tail length applied to all timeslots in this *Brag*. A value of 32ms should be used for networks with an echo round trip delay of up to 32 ms, and a value of 48 ms should be used for networks with an

Copyright © 2006, Nortel Nortel Confidential

echo round trip delay of 32 to 48 ms.
The use of 48 ms for round trip delays of less than 32 ms is not advised.
The use of 64 ms is reserved for the ***2pGeMmSrVsp3*** card.

If set to ***autoConfigure*** the actual value used depends on card type. If the card type is ***12mVspAal*** or ***Vsp2***, the echo cancellation tail length is set to 32 ms. If the card type is ***2pGeMmSrVsp3***, the echo cancellation tail length is set to 64 ms.

This attribute must be set to ***32*** or ***autoConfigure*** when a *Nsta/n Conn/n BasicRateGroup/n* component is provisioned and when running on a ***12mVspAal*** card.

This attribute must be set to ***32***, ***48*** or ***autoConfigure*** when using a ***Vsp2*** card.

This attribute must be set to ***128*** or ***autoConfigure*** when using a ***2pGeMmSrVsp3*** card.

Mib	Vgs
Values	autoConfigure 32 48 64 128
Units	msec
Default	autoConfigure

ATTRIBUTE Nsta Vgs Brag toneset (toneset)

Access	Read and write
Description	This attribute specifies the tone set available to the controller. The possible values are: ***sameAsVgs*** - Use the *defaultToneset* attribute from the *Vgs* component ***argentina*** - Use the tone set for Argentina. ***australia -*** Use the tone set for Australia. ***austria*** - Use the tone set for Austria. ***belgium*** - Use the tone set for Belgium. ***bolivia*** - Use the tone set for Bolivia. ***brazil -*** Use the tone set for Brazil. ***brazilCustom1 -*** Use the tone set for Brazil.Custom1 ***canadaUsa*** - Use the tone set for Canada and the USA. ***chile*** - Use the tone set for Chile. ***china*** - Use the tone set for China. ***custom1*** - Use the tone set patched for Custom1. ***custom2*** - Use the tone set patched for Custom2. ***custom3*** - Use the tone set patched for Custom3.

Default sameAsVgs

ATTRIBUTE Nsta Vgs Brag minimumDtmfPowerLevel

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the value of the minimum power level at which DTMF digits must be detected. This value is used to allow for different specification for different administrations. This attribute is ignored if the *DigitCollection* component is not present under the parent *Vgs*. This attribute must be a multiple of 3 on a ***2pGeMmSrVsp3*** card.
Mib	Vgs
Values	Signed (-30..-22)
Units	dBm0
Default	-27

ATTRIBUTE Nsta Vgs Brag digitTransport

Access	Read and write
Description	This attribute specifies the method by which digit tones are transported. If ***64kG711***, then G.729 voice channels will upspeed to send ***64kG711*** packets when DTMF is detected. If ***sendAsVoice***, DTMF is encoded using currently selected codec. If ***squelch,*** during the playback of a digit, silence is sent over the voice path, encoded at the current encoding rate. If ***relay***, this value enables negotiation of mutual support for the relay of DTMF tones as RFC2833 VoIP packets. Should this negotiation fail then behavior is the same as for ***64kG711***. A value of ***relay*** is only valid on a ***2pGeMmSrVsp3*** card. If the *Sw Lpt featureList* attribute contains ***vgsAtm***, ***vgsAtmDc*** or ***vgsIp*** and the card type is not ***2pGeMmSrVsp3***, this attribute is ignored and ***sendAsVoice*** will be the digit tone transport method. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	sendAsVoice 64kG711 squelch relay sameAsProfile
Default	sameAsProfile

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Brag **vbdTransport**

Access	Read and write
Description	This attribute specifies the method by which voiceband data tones are transported. If ***useTone2100Rate***, then G.729 voice channels will upspeed to send ***64kG711*** packets when VBD is detected regardless of whether or not the remote gateway has indicated support for this codec. If ***useTone2100RateIfNegotiated***, then G.729 voice channels will upspeed to send ***64kG711*** packets when VBD is detected only when the remote gateway has indicated support for this codec. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	useTone2100RateIfNegotiated useTone2100Rate sameAsProfile
Default	sameAsProfile

GROUP Nsta Vgs Brag **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs Brag **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Vgs

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Nsta Vgs Brag operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Vgs

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Nsta Vgs Brag usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

COMPONENT Nsta Vgs Brag UdpHdlcTransport (Uht)

Instance	Decimal (1..31)
Groups	GROUP Nsta Vgs Brag Uht Provisioned (Prov) GROUP Nsta Vgs Brag Uht OsiState (State) GROUP Nsta Vgs Brag Uht HdlcStatistics (HdlcStats) GROUP Nsta Vgs Brag Uht Operational (Oper)
Scope	Device
Description	*Nsta/n Vgs Brag/n UdpHdlcTransport/<timeslot>* This optional component provides the transport of HDLC D Channel data over UDP to a remote signaling device.

Copyright © 2006, Nortel Nortel Confidential

When a *UdpHdlcTransport* component is provisioned under a *Brag*, all valid HDLC frames within the timeslot smaller than 512 octets in size are transported transparently over UDP. HDLC frames greater than 512 octets in size are discarded.

The local address for UDP datagrams is provided by the *udpPortConnection* link to a *UdpPort* component. The destination address is provided by the controller over the relevant control protocol.

All HDLC frames received are transmitted to the IP network when a destination address has been provided by the controller. Frames received before the controller has provided the destination address are discarded.

All data received within UDP datagrams from the local IP address and UDP port are transmitted as HDLC frames.

The instance number of the *UdpHdlcTransport* component specifies the TDM timeslot within the basic rate group that is carrying the HDLC frames. This timeslot must be included in the *timeslots* attribute of the *Channel* component linked to the parent *Brag* component.

There is a maximum of one *UdpHdlcTransport* component per *Brag*, and a maximum of 10 *UdpHdlcTransport* components per *Vgs* component hierarchy.

The *UdpHdlcTransport* component is mutually exclusive with *V5Link* subcomponent of *Brag*.

Default	No default

ATTRIBUTE Nsta Vgs Brag Q921 linkStatus

Access	Read only
Description	This attribute indicates the status of the link. The possible values are: ***up***, ***down***.
Mib	Vgs
Values	up down
Default	No default

COMPONENT Nsta Vgs Brag V5Link (V5Link)

Groups	GROUP Nsta Vgs Brag V5Link Provisioned (Prov) GROUP Nsta Vgs Brag V5Link Operational (Oper)
Scope	Device
Description	*Nsta/n Vgs Brag/n V5Link* The *V5Link* component provides the capability to send V5.2 link identification signaling to the TDM interface. It also provides attributes to store timer values and maximum values for counters required by the V5.2 protocol for any C-channel subcomponents (*LapV5* component). The *V5Link* component can be added when the TDM interface named as the *Brag interfaceName* is to support any V5.2 signaling. The *V5Link* component is mutually exclusive with the *Q921*, *AnnouncementLanguage* and *UdpHdlcTransport* subcomponents of the *Brag*. If *V5Link* is provisioned, none of the others may be provisioned on the same *Brag*. Another *Brag* on the same *Vgs* may support one of the other services. The channel component specified as the *interfaceName* of the *Brag* which has a *V5Link* subcomponent must belong to an E1. Timeslots 1 to 31 must belong to the channel; none can be omitted.

Copyright © 2006, Nortel Nortel Confidential

If this component is provisioned, a *V5ua* component must also be provisioned under the same *Vgs*.

GROUP Nsta Vgs Brag V5Link Provisioned (Prov)

Properties Provisioned

Description This group contains the provisioning attributes for the *Nsta/n Vgs Brag/n V5Link* component.

Mib Vgs

ATTRIBUTE Nsta Vgs Brag V5Link t200

Access Read and write

Description This attribute specifies the maximum time allowed between the transmission of a layer 2 frame and the receipt of an acknowledgement from the user. This is the acknowledgement timer (T200). The value is rounded to the nearest 0.5 second.

Mib Vgs

Values Decimal (0.5..5.0)

Units seconds

Default 1.0

ATTRIBUTE Nsta Vgs Brag V5Link t203

Access Read and write

Description This attribute specifies the maximum time without frame exchange during multiple frame operations.

Expiry of this timer leads to a "keep-alive" polling RR or RNR frame being transmitted to ensure that the remote layer 2 entity is still active.

Mib Vgs

Values Decimal (10..300)

Units seconds

Default 10

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Brag V5Link **n200**

Access	Read and write
Description	This attribute specifies the maximum number of retransmissions of a layer 2 frame.
Mib	Vgs
Values	Decimal (1..8)
Default	3

ATTRIBUTE Nsta Vgs Brag V5Link **n201**

Access	Read and write
Description	This attribute specifies the maximum length of an information field.
Mib	Vgs
Values	Decimal (4..260)
Units	octets
Default	260

ATTRIBUTE Nsta Vgs Brag V5Link **maxOutstandingFrames**

Access	Read and write
Description	This attribute specifies the maximum number of sequentially numbered I frames (k) that may be unacknowledged at any given time after which no new frames are transmitted unless as part of an error recovery procedure.
Mib	Vgs
Values	Decimal (1..127)
Default	7

GROUP Nsta Vgs Brag V5Link **Operational (Oper)**

Properties	Operational
Description	This group contains operational attributes of the *Nsta/n Vgs Brag/n V5Link* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Brag V5Link **interfaceId**

Access	Read only
Description	This attribute indicates the V5UA protocol link identifier for this *V5Link*. The value displayed here is the expected value of the V5UA interface identifier for this particular *Brag*. Any V5UA messages received by the *V5ua* with this specific interface identifier are processed by this *V5Link*. If the interface identifier received in a V5UA message does not match the interface identifier of any *V5Link* associated with this *Vgs*, the message is

Copyright © 2006, Nortel Nortel Confidential

discarded.
The value for this attribute is automatically generated.

Mib Vgs

Values Hex (H.0..H.ffffffff)

Default No default

COMPONENT Nsta Vgs Brag V5Link LapV5 (LapV5)

Instance Decimal (15; 16; 31)

Groups GROUP Nsta Vgs Brag V5Link LapV5 OsiState (State)
GROUP Nsta Vgs Brag V5Link LapV5 Operational (Oper)

Scope Device

Description *Nsta/n Vgs Brag/n V5Link LapV5/<timeslot number>*
Nsta/n Vgs MgV5Link/n LapV5/n
This component represents a Link Access Protocol (LAP) entity for the V5.2 C-channel.
The instance value is the specific timeslot used by the C-channel on the associated E1.
The *LapV5* is provisioned whenever the indicated timeslot is to be used either for carrying V5.2 messaging (as an active C-channel) or when it is to be in a “stand-by” mode to provide an alternate C-channel, used if the active C-channel fails.
A *V5Link* does not need to have any C-channels, so it is legitimate to have a *V5Link* component with no *LapV5* subcomponents. However, there can be no more that three *LapV5* subcomponents, since the standards explicitly state that only timeslots 15, 16, and 31 may be used for C-channels.

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Vgs
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Vgs
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: Vgs

Values:
idle
active (activ)
busy

Default: idle

GROUP Nsta Vgs Brag V5Link LapV5 Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *Nsta/n Vgs Brag/n V5Link LapV5/<timeslot>* component.

Mib: Vgs

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 interfaceId

Access: Read only

Criticality: Component

Description: This attribute indicates the V5UA protocol link identifier for this *LapV5*. The value displayed here is the expected value of the V5UA interface identifier for this particular C-channel. Any V5UA messages received by the *V5ua* with this specific interface identifier are processed by this *LapV5*. If the interface identifier received in a V5UA message does not match the interface identifier of any *LapV5* associated with this *Vgs*, the message is discarded.

The format of the *LapV5* interface identifier and that of the *V5Link* interface identifier are closely related. The *LapV5* interface identifier is equal to the interface identifier of its parent *V5Link*, plus the timeslot number. Therefore, the lowest 5 bits of the interface identifier are either 0 (for the *V5Link*), 15, 16, or 31 (for the C-channels).

Mib: Vgs

Values: Hex (H.0..H.ffffffff)

Default: No default

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 txFrames

Access: Read only

Description: This attribute counts the frames transmitted towards the TDM interface since the component was activated. This includes retransmitted frames.

Copyright © 2006, Nortel Nortel Confidential

The counter wraps to 0 when its maximum value is exceeded.

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **rxFrames**

Access Read only

Description This attribute counts the frames received from the TDM interface since the component was activated. This includes errored frames.

The counter wraps to 0 when its maximum value is exceeded.

Mib Vgs

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **erroredFrames**

Access Read only

Description This attribute counts the frames received from the TDM interface with errors since the component was activated.
Note that the errored frames counted here do not include all errors. According to V5.2 standards, short frames (under the minimum required length) and some other errors are discarded without reporting them to upper levels of the V5.2 stack.

The counter wraps to 0 when its maximum value is exceeded.

Mib Vgs

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **retransmittedFrames**

Access Read only

Description This attribute counts retransmission attempts.

The peer layer 2 must respond to an I frame within the protocol timer interval provisioned as *t200* seconds. If the peer layer 2 fails to acknowledge a frame prior to the expiry of the timer and there have not been *n200* retransmissions yet, the *LapV5* retransmits the unacknowledged frame and increments *retransmittedFrames*.

If there have been sufficient retransmission attempts to reach the provisioned *n200* limit, the C-channel attempts to re-establish, and the *n200Exhausted* increments.

Copyright © 2006, Nortel Nortel Confidential

The counter wraps to 0 when its maximum value is exceeded.

Mib: Vgs

Values: Decimal (0..4294967295)

Default: No default

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **n200Exhausted**

Access: Read only

Description: This attribute counts the number of times that the retransmission limit specified by the *n200* attribute was exceeded on this C-channel (*LapV5*). Each time the limit is reached, the counter is incremented and the *LapV5* re-establishes the C-channel.

The counter wraps to 0 when its maximum value is exceeded.

Mib: Vgs

Values: Decimal (0..4294967295)

Default: No default

ATTRIBUTE Nsta Vgs Brag V5Link LapV5 **activeDataLinkProtocols**

Access: Read only

Description: This attribute indicates the set of V5.2 protocols currently established on C-channel.

The following protocols ate supported:
protection (***prot***) - This protocol provides the capability to enable stand-by C-channels when the active C-channels fail
link - This protocol provides the capability to enable and disable E1 links, as well as provide Link Identification procedure messaging.
control (***ctrl***) - This protocol provides the capability to enable and disable user terminals (sets).
bcc - This protocol provides the capability to allocate specific B channels on indicated E1 links t a call.
pstn - This protocol provides the capability to signla user terminal events from the terminal to the network and responses back to the terminal.

VERB Ping Nsta Vgs Ctrl

Impact: Passive

Description: *Ping -ipAddr(IP Address) Nsta/n Vgs ControlConnection/n*

This command causes an ICMP echo request to be sent to the host specified by the *ipAddr* option. If a response is received for the request, a second request is sent; if no response is received for the first request, no further request is sent.

The remote IP host must respond to an ICMP ping request within 5 seconds of the request being generated.

This is intended for testing network connections at the IP level. Only one *Ping* command per component is allowed to be in progress at any one time.

GROUP Nsta Vgs Ctrl Provisioned (Prov)

ATTRIBUTE Nsta Vgs Ctrl Spd inPackets (ip)

Access	Read only
Description	This attribute counts the packets processed by all the inbound security policies under this component, including discarded packets. The value is aggregated from individual inbound policies. The count wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Vgs Ctrl Spd **inSpdDiscards (isd)**

Access	Read only
Description	This attribute counts the inbound packets discarded by the security policy database because there is no matching security policy. The count wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Spd **inPolicyDiscards (ipd)**

Access	Read only
Description	This attribute counts the inbound packets discarded by any policy or associated security association. The count wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Spd **inSaLookupFailures (isl)**

Access	Read only
Description	This attribute counts the packets discarded because the Security Parameter Index (SPI) in the packet is unknown. The count wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

GROUP Nsta Vgs Ctrl Spd Policy Selectors

Properties Provisioned

Description This group contains the selector attributes of the *Policy* component. These attributes specify the criteria that a packet must match for the policy to be applied.

Mib Vgs

ATTRIBUTE Nsta Vgs Ctrl Spd Policy protocol (proto)

Access Read and write

Description This attribute specifies the layer 4 (transport) protocol to which the policy applies. The values are as follows:
- ***any***: any protocol
- ***icmp***: Internet Control Message Protocol
- ***udp***: User Datagram Protocol

When the *action* attribute value is ***apply***, this attribute must be set to ***udp***.

Mib Vgs

Values Decimal (2..16; 18..49; 52..255)
any
icmp
udp

Default any

ATTRIBUTE Nsta Vgs Ctrl Spd Policy srcPort (sPort)

Access Read and write

Description This attribute specifies the source UDP port number for traffic flows to which the policy applies. A value of ***any*** specifies that any port number matches the policy.

If the *protocol* attribute value is ***icmp***, then this attribute must be set to ***any***.

Copyright © 2006, Nortel Nortel Confidential

If the *action* attribute value is ***apply***, then this attribute must be set to ***2944***.

Mib Vgs

Values Decimal (1..499; 501..65535)
any

Default any

ATTRIBUTE Nsta Vgs Ctrl Spd Policy **dstPort (dPort)**

Access Read and write

Description This attribute specifies the destination UDP port number for traffic flows to which the policy applies. A value of ***any*** specifies that any port number matches the policy.

If the *protocol* attribute value is ***icmp***, then this attribute must be set to ***any***.

If the *action* attribute value is ***apply***, then this attribute must be set to ***2944***.

Mib Vgs

Values Decimal (1..499; 501..65535)
any

Default any

ATTRIBUTE Nsta Vgs Ctrl Spd Policy **direction**

Access Read and write

Description This attribute specifies the direction of the policy. The value can be one of the following:
- ***inbound***: this policy corresponds to an entry in the inbound security policy database (SPD), as referred to in RFC 2401. IPSec traffic received is matched against inbound policies.
- ***outbound***: this policy corresponds to an entry in the outbound SPD, as referred to in RFC 2401. Locally generated traffic is matched against outbound policies.

Mib Vgs

Values inbound
outbound

Default outbound

ATTRIBUTE Nsta Vgs Ctrl Spd Policy **srcIpAddress (sAddr)**

Access Read and write

Description This attribute specifies the source IPv4 address for traffic flows to which the policy applies.

Copyright © 2006, Nortel Nortel Confidential

	The address can be a host address, a range or a wildcard: - To specify a host address, specify one value, which is the host address. - To specify a range of IPv4 addresses, specify two values, which are the lower and upper bounds of the range. The order does not matter. - To specify a wildcard, leave the list empty. A value of ***0.0.0.0*** is not permitted.
Mib	Vgs
List of	IP address
List Size	2
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Spd Policy **dstIpAddress (dAddr)**

Access	Read and write
Description	This attribute specifies the destination IPv4 address for traffic flows to which the policy applies. The address can be a host address, a range or a wildcard: - To specify a host address, specify one value, which is the host address. - To specify a range of IP addresses, specify two values, which are the lower and upper bounds of the range. The order does not matter. - To specify a wildcard, leave the list empty. A value of ***0.0.0.0*** is not permitted.

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Policy* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl Spd Policy **action**

Access	Read and write
Description	This attribute specifies the action to be taken when a packet is received that matches the selectors for this policy. The value can be one of the following: - ***discard***: the packet is to be discarded. - ***bypass***: no security is to be applied to the packet. Instead the packet is forwarded as usual. - ***apply***: the security service specified by the *Sa* subcomponent is applied

Copyright © 2006, Nortel Nortel Confidential

	to the packet. If this attribute takes the value of ***apply***, it is recommended that an instance of *Vr Ip Spd Policy* with the *action* attribute set to ***apply*** is also provisioned.
Mib	Vgs
Values	discard bypass apply
Default	bypass

Description	This group contains the provisionable attributes for the *IkeProposal* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl Spd IProp mode

Access	Read and write
Description	This attribute defines the method used in Phase One of the IKE negotiation. The only possible enumeration is: - ***main***: provides identity protection.
Mib	Vgs
Values	main
Default	main

ATTRIBUTE Nsta Vgs Ctrl Spd IProp softLifetime

Access	Read and write
Description	An SA is created with a fixed time to live, as specified by the *saTimeToLive* attribute of component *IkeSecurityAssociation*. The SA must be renegotiated before that *saTimeToLive* value expires. This attribute specifies a percentage of the *IkeSecurityAssociation saTimeToLive* attribute value. The corresponding time value (which is

Copyright © 2006, Nortel Nortel Confidential

*softLifetime*saTimeToLive*/100 seconds) specifies when renegotiation of the SA should commence.

Mib	Vgs
Values	Decimal (75..95)
Units	%
Default	75

ATTRIBUTE Nsta Vgs Ctrl Spd IProp **associatedIkePolicies**

Access	Read only
Description	This attribute lists all the *IkePolicy* components that are associated with this component.
Mib	Vgs

Description	This group contains the provisionable attributes for the *IkeTransform* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl Spd IProp ITrans **authMethod**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the authentication method used in IKE's Phase One negotiation. The only possible enumeration is: - ***preshared***: pre-shared symmetric keys.
Mib	Vgs
Values	preshared
Default	preshared

ATTRIBUTE Nsta Vgs Ctrl Spd IProp ITrans **encryptAlgorithm**

Access	Read and write
Description	This attribute specifies the encryption algorithm proposed to be offered. The following encryption algorithms are supported: - ***des***: Data Encryption Standard (DES); - ***3des***: encryption using DES three times.
Mib	Vgs
Values	des 3des
Default	des

ATTRIBUTE Nsta Vgs Ctrl Spd IProp ITrans **hashAlgorithm**

Access	Read and write
Description	This attribute specifies the hash algorithm to be used. The following hash algorithms are supported: - ***md5***: Message Digest; - ***sha1***: Secure Hash Algorithm.
Mib	Vgs
Values	sha1 md5
Default	sha1

ATTRIBUTE Nsta Vgs Ctrl Spd IProp ITrans **diffieHellmanGroup**

Access	Read and write
Description	This attribute specifies the group within which the DH exchange is negotiated. There are two groups supported: - ***gp1***: uses modulus of a 768 bit prime number; - ***gp2***: uses modulus of a 1024 bit prime number.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	gp1 gp2
Default	gp2

ATTRIBUTE Nsta Vgs Ctrl Spd IProp ITrans saTimeToLive

Access	Read and write
Description	This attribute specifies the time-to-live of an IKE SA negotiated using this transform.
Mib	Vgs
Values	Decimal (1800..172800)
Units	seconds
Default	86400

COMPONENT Nsta Vgs Ctrl NailedUpAdaptionPoint (Nap)

VERB Restart Nsta Vgs Ctrl Aap

Impact	Service
Description	*Restart Nsta/n Vgs Control/n ActiveAccessPoint* *Restart Nsta/n Vgs IpMConn ActiveAccessPoint* *Restart Nsta/n Conn/n ActiveAccessPoint* This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection is released first. This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP Nsta Vgs Ctrl Aap **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains provisioning data for the *Aap* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl Aap **atmServiceCategory (service)**

Access	Read and write
Criticality	Component
Description	This attribute specified the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable bit rate service may support statistical multiplexing of real time sources.

Copyright © 2006, Nortel Nortel Confidential

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a *peakCellRate*, *sustainedCellRate*, and *maximumBurstSize*. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. The non real-time variable bit rate service may support statistical multiplexing of connections.

If the parent of the *Aap* is a *Ctrl* component then the default value of *atmServiceCategory* attribute is ***nrtVariableBitRate***; it may not take the value ***rtVariableBitRate***. If the parent of the *Aap* is an *IpMConn* or *Conn* component then the default value of *atmServiceCategory* attribute is ***rtVariableBitRate***; it may not take the value ***nrtVariableBitRate***.

Mib	Vgs
Values	constantBitRate (cbr) rtVariableBitRate (rtVbr) nrtVariableBitRate (nrtVbr)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Aap **peakCellRate (pcr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the peak cell rate of the ATM connection.
Mib	Vgs
Values	Decimal (1..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Aap **sustainedCellRate (scr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the sustained cell rate of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cell/s

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Nsta Vgs Ctrl Aap **maximumBurstSize (mbs)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum burst size, at the peak cell rate, of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cells
Default	0

ATTRIBUTE Nsta Vgs Ctrl Aap **retryLimit (limit)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of consecutive unsuccessful setup attempts before further attempts are abandoned. If this limit is reached, management action is required (restart the connection attempts with the *Restart* verb). A value of zero indicates no limit; attempts will continue indefinitely until a successful connection is established.
Mib	Vgs
Values	Decimal (0..65535)
Default	0

GROUP Nsta Vgs Ctrl Aap **AapAddressessProv (AapAddrProv)**

Properties	Provisioned
Description	This group contains NSAP address provisioning data.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl Aap **expectedRemoteAddress (expectedAddr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the expected remote address information for an incoming setup request. If *expectedRemoteAddress* is not empty, only matching addresses in incoming setup are considered for acceptance.

Copyright © 2006, Nortel Nortel Confidential

If *expectedRemoteAddress* is less than 40 characters long, the remote address must match the value in *expectedRemoteAddress* to be accepted.

If *expectedRemoteAddress* is empty, connection requests are accepted from any remote address.

Mib	Vgs
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Nsta Vgs Ctrl Aap localAddress (localAddr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the access point's ATM address. If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) is provisioned, a default value for *localAddress* based on the *nodePrefix* is provided. If a default cannot be generated the operator is forced to set a value for this attribute. Alternatively, the *ModuleData nodePrefix* attribute may be provisioned, and this access point component then deleted and re-added.
Mib	Vgs
Values	String (1..44, AESANsapAddress)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Aap addressToCall (addrToCall)

Access	Read and write
Criticality	Component
Description	This attribute specifies the list of remote NSAP addresses which this component can call. At least one address must be provisioned. For the *ControlConnection* component in switched VoATM and VoIP and for the *IpMediaStreamConnection* application the remote end is a router. It is required to be able to establish SVCs to different routers. Therefore, the *addressToCall* attribute is a list of remote addresses. The first SVC call is sent to the first address listed in the *addressToCall* attribute. If the setup fails or the call is established but fails at a later time, the system attempts to set up a connection to next address listed in the *addressToCall* attribute. If a failure occurs when using the last address in the list, the system attempts to setup a connection to the first address in the list and then continues as before.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
List of	String (1..44, AESANsapAddress)
List Size	3
Default	No default

GROUP Nsta Vgs Ctrl Aap Operational (Oper)

Properties	Operational
Description	This group contains operational status information for the *Aap* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl Aap svcStatus (status)

Access	Read only
Description	This attribute indicates the status of the SVC connection. When this attribute has the value ***initializing***, it indicates that the component is initializing when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed,*** it indicates that an error occurred while sending a release message to the network (as a consequence of a Delete request) while the component was in ***connecting*** state.
Mib	Vgs
Values	initializing connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Aap lastSetupFailureCause (failCause)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the cause code in the last call release message following an unsuccessful call setup attempt. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. If no call setup attempts have failed, this attribute has a value of 0.
Mib	Vgs
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Aap lastSetupFailureDiagnostic (failDiag)

Access	Read only
Description	This attribute indicates the diagnostic code in the last call release message following an unsuccessful call setup attempt. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If no call setup attempts have failed, this attribute is an empty string.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Aap retryTimeRemaining (timer)

Access	Read only
Description	This attribute indicates the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt is made. When the value reaches 0 an attempt will be made to establish the connection. When the timer is not running this attribute has a value of 0.
Mib	Vgs
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Nsta Vgs Ctrl Aap retryFailures (failures)

Access	Read only
Description	This attribute counts the number of consecutive failed connection attempts. This counter is reset to 0 whenever a connection is successfully established or the connection is restarted using the *Restart* verb. The counter wraps to zero when the maximum value is exceeded.

VERB Restart Nsta Vgs Ctrl SpvcAp

Impact	Service
Description	*Restart Nsta/n Vgs Control/n SpvcAccessPoint* *Restart Nsta/n Vgs IpMConn SpvcAccessPoint* *Restart Nsta/n Conn/n SpvcAccessPoint* This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection is released first. This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP Nsta Vgs Ctrl SpvcAp **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains provisioning data for the *SpvcAp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl SpvcAp **atmServiceCategory (service)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable

Copyright © 2006, Nortel Nortel Confidential

bit rate service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a *peakCellRate*, *sustainedCellRate*, and *maximumBurstSize*. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. The non real-time variable bit rate service may support statistical multiplexing of connections.

If the parent of the *SpvcAp* is a *Ctrl* component then the default value of *atmServiceCategory* attribute is ***nrtVariableBitRate***; it may not take the value ***rtVariableBitRate***. If the parent of the *SpvcAp* is an *IpMConn* component then the default value of *atmServiceCategory* attribute is ***rtVariableBitRate***; it may not take the value ***nrtVariableBitRate***.

Criticality	Component
Description	This attribute specifies the list of remote NSAP addresses which this component can call. At least one address must be provisioned. For the *ControlConnection* application in switched VoATM and VoIP and for the *IpMediaStreamConnection* application the remote end is a router. It is required to be able to establish SVCs to different routers. Therefore, the *addressToCall* attribute is a list of remote addresses. The first SVC call is sent to the first address listed in the *addressToCall* attribute. If the setup fails or the call is established but fails at a later time, the system attempts to set up a connection to next address listed in the *addressToCall* attribute. If a failure occurs when using the last address in the list, the system attempts to set up a connection to the first address in the list and then continues as before.

GROUP Nsta Vgs Ctrl SpvcAp **Operational (Oper)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains operational status information for the *SpvcAp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl SpvcAp svcStatus (status)

Access	Read only
Description	This attribute specifies the status of the SVC connection. When this attribute has the value ***initializing***, it indicates that the component is initializing when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* for consecutive connection set up attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed,*** it indicates that an error occurred while sending a release message to the network (as a consequence of a *Delete* request) while the component was in ***connecting*** state.
Mib	Vgs
Values	initializing connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Nsta Vgs Ctrl SpvcAp lastSetupFailureCause (failCause)

Access	Read only
Description	This attribute contains the cause code in the last call release message following an unsuccessful call set up attempt. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	Vgs
Values	Decimal (0..255)

Default	No default

ATTRIBUTE Nsta Vgs Ctrl SpvcAp **lastSetupFailureDiagnostic (failDiag)**

Access	Read only
Description	This attribute contains the diagnostic code in the last call release message following an unsuccessful call set up attempt. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl SpvcAp **retryTimeRemaining (timer)**

Access	Read only
Description	This attribute indicates the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt is made. When the value reaches ***0*** an attempt will be made to establish the connection. When the timer is not running a value of ***0*** is returned.
Mib	Vgs
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Nsta Vgs Ctrl SpvcAp **retryFailures (failures)**

Access	Read only
Description	This attribute counts the number of consecutive failed connection attempts. This counter is reset to ***0*** whenever a connection is successfully established or the connection is restarted using the *Restart* verb. The counter wraps to ***0*** when the maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..2147483647)
Default	No default

GROUP Nsta Vgs Ctrl SpvcAp **AccessPointOper (ApOper)**

Properties	Operational

Properties	Provisioned
Description	This group contains the provisioning data for the *SctpPort* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ctrl SctpPort diffServiceCodepoint (diffServ)

Access	Read and write
Description	This attribute specifies the Differentiated Service Codepoint field in IP datagrams from this port. Refer to RFC 2474. On changing, subsequent datagrams will use the new value.
Mib	Vgs
Values	Decimal (0..63)
Default	40

ATTRIBUTE Nsta Vgs Ctrl SctpPort rtoInitial (init)

Access	Read and write
Description	This attribute specifies the initial time-out value for the retransmission timer (RTO). This value is used until a Round Trip Time (RTT) measurement has been made for the destination transport address. The provisioned value must be between *rtoMin* and *rtoMax*.
Mib	Vgs
Values	Decimal (1..255)
Units	seconds
Default	3

ATTRIBUTE Nsta Vgs Ctrl SctpPort rtoMin (min)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the minimum permissible value for the recalculated retransmission timer (RTO). If the computed RTO value is less than *rtoMin*, the RTO value is set to the value of *rtoMin*.
Mib	Vgs
Values	Decimal (1..255)
Units	seconds
Default	1

ATTRIBUTE Nsta Vgs Ctrl SctpPort rtoAlpha (alpha)

Access	Read and write
Description	This attribute specifies the smoothing factor used in the computation and management of the retransmission timer (RTO) in steps of 0.125 (the entered value is rounded to the nearest multiple of 0.125). These values have been selected in the SCTP specification as being optimal for this application where Round Trip Time (RTT) measurements are made not more than once per round-trip.
Mib	Vgs
Values	Decimal (0.000..255.000)
Default	0.125

ATTRIBUTE Nsta Vgs Ctrl SctpPort rtoBeta (beta)

Access	Read and write
Description	This attribute specifies the delay variance factor used in the computation and management of the retransmission timer (RTO) in steps of 0.125 (the entered value is rounded to the nearest multiple of 0.125).
Mib	Vgs
Values	Decimal (0.000..255.000)
Default	0.250

ATTRIBUTE Nsta Vgs Ctrl SctpPort validCookieLife (life)

Access	Read and write
Description	This attribute specifies the message parameter indicating to the receiver how much increment the sender wishes the receiver to add to its default cookie life-span.
Mib	Vgs
Values	Decimal (1..255)
Units	seconds
Default	60

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Ctrl SctpPort **associationMaxRetries (assocRetries)**

Access	Read and write
Description	This attribute specifies the maximum number of retransmission attempts before the sender of data indicates the destination endpoint as unreachable.
Mib	Vgs
Values	Decimal (0..255)
Default	10

ATTRIBUTE Nsta Vgs Ctrl SctpPort **rtoMax (max)**

Access	Read and write
Description	This attribute specifies the maximum permissible value for the recalculated retransmission timer time-out (RTO). If the computed RTO value is more than *rtoMax*, the RTO value is set to the value of *rtoMax*.
Mib	Vgs
Values	Decimal (1..255)
Units	seconds
Default	60

ATTRIBUTE Nsta Vgs Ctrl SctpPort **linkToApplication (link)**

Access	Read and write
Description	This attribute specifies a link to the *Nsta/n Vgs Iua*, *Nsta/n Vgs M2ua* or *Nsta/n Vgs V5ua* component that is making use of this port.
Mib	Vgs
Values	Link (Service, sctpPortConnection)
Default	No default

ATTRIBUTE Nsta Vgs Ctrl SctpPort **heartbeatInterval (interval)**

Access	Read and write
Description	An SCTP endpoint monitors the reachability of the idle destination transport addresses of its peer by sending a heartbeat chunk every *heartbeatInterval* to the destination transport address defined for the association.
Mib	Vgs
Values	Decimal (1..65535)
Units	seconds
Default	30

Description	This group contains provisioning data for the *AtmTrunkConnection* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs AtmTConn remoteAddress (rAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM address of the node that may be reached via this trunk. The *remoteAddress* attribute must be set to a valid ATM address. This address must not be the same as the value of the *gatewayAtmAddress* attribute of the *Nsta Vgs* component.
Mib	Vgs
Values	String (1..44, AESANsapAddress)
Default	No default

ATTRIBUTE Nsta Vgs AtmTConn vcci (vcci)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the VCCI for this trunk. The *vcci* attribute must be set to a value to uniquely identify an ATM trunk between two nodes. Consequently all ATM trunks between any two nodes must have distinct *vcci* attribute values. The connection on the remote node must be configured with the same *vcci* attribute value. ATM trunks terminating on different remote nodes may share the same *vcci* attribute value. A *Check Prov* command will fail if the user tries to provision a value greater than 4095 for the *vcci* attribute of a *AtmTConn* component, when its subcomponent is an *Aap*, a *Pap* or an *SpvcAp*.
Mib	Vgs
Values	Decimal (0..32767)
Default	No default

ATTRIBUTE Nsta Vgs AtmTConn packetLogLaw (muALaw)

Access	Read and write
Description	This attribute specifies whether the digitizing scheme is mu-law or A-law. This attribute defines the default that is used by individual *AtmTConn* components at call setup unless an alternative value is provided by the controller. The default value ***sameAsGateway*** specifies that the *packetLogLaw* attribute will take the same value as the *defaultLogLaw* attribute of the *Vgs*. This attribute may be changed without impacting existing calls. The remote end of this connection should be provisioned with the same *packetLogLaw* attribute value.
Mib	Vgs
Values	muLaw aLaw sameAsGateway
Default	sameAsGateway

ATTRIBUTE Nsta Vgs AtmTConn holdOverTime (hoTime)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum period of time before a partially filled AAL2 packet is scheduled for transmission. It is also referred to as the combined use timer period (Timer_CU).
Mib	Vgs
Values	Decimal (0.500..15.875)
Units	msec
Default	2.000

ATTRIBUTE Nsta Vgs AtmTConn maxNumberAal2Trunks (trunks)

Access	Read and write
Description	This attribute specifies the maximum number of AAL2 trunks that may be allocated on this ATM trunk. The local node may allocate no more than this number of trunks.
Mib	Vgs
Values	Decimal (0..247)
Default	240

GROUP Nsta Vgs AtmTConn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs AtmTConn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Vgs

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Nsta Vgs AtmTConn operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Vgs

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Nsta Vgs AtmTConn usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: Vgs

Values:
idle
active (activ)
busy

Default: idle

Description	This group contains provisioning data for the *ActiveAccessPoint* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs AtmTConn Aap atmServiceCategory (service)

Access	Read and write
Criticality	Process
Description	This attribute specified the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable bit rate service may support statistical multiplexing of real time sources.
Mib	Vgs
Values	constantBitRate (cbr) rtVariableBitRate (rtVbr)
Default	rtVariableBitRate

ATTRIBUTE Nsta Vgs AtmTConn Aap peakCellRate (pcr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the peak cell rate of the ATM connection.
Mib	Vgs
Values	Decimal (1..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Nsta Vgs AtmTConn Aap sustainedCellRate (scr)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the sustained cell rate of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cell/s
Default	0

ATTRIBUTE Nsta Vgs AtmTConn Aap **maximumBurstSize (mbs)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum burst size, at the peak cell rate, of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cell/s
Default	0

ATTRIBUTE Nsta Vgs AtmTConn Aap **retryLimit (limit)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of consecutive unsuccessful setup attempts before further attempts are abandoned. If this limit is reached, management action is required (restart the connection attempts with the *Restart* verb). A value of zero indicates no limit; attempts will continue indefinitely until a successful connection is established.
Mib	Vgs
Values	Decimal (0..65535)
Default	0

GROUP Nsta Vgs AtmTConn Aap **Operational (Oper)**

Properties	Operational
Description	This group contains operational status information for the *Aap* component.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs AtmTConn Aap **svcStatus (status)**

Access	Read only
Description	This attribute indicates the status of the SVC connection. When this attribute has the value ***initializing***, it indicates that the component is initializing when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed,*** it indicates that an error occurred while sending a release message to the network (as a consequence of a Delete request) while the component was in ***connecting*** state.
Mib	Vgs
Values	initializing connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Nsta Vgs AtmTConn Aap **lastSetupFailureCause (failCause)**

Access	Read only
Description	This attribute indicates the cause code in the last call release message following an unsuccessful call setup attempt.The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. If no call setup attempts have failed, this attribute has a value of 0.
Mib	Vgs
Values	Decimal (0..255)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs AtmTConn Aap **lastSetupFailureDiagnostic (failDiag)**

Access	Read only
Description	This attribute contains the diagnostic code in the last call release message following an unsuccessful call setup attempt. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If no call setup attempts have failed, this attribute is an empty string.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs AtmTConn Aap **retryTimeRemaining (timer)**

Access	Read only
Description	This attribute indicates the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt is made. When the value reaches 0 an attempt will be made to establish the connection. When the timer is not running this attribute has a value of 0.
Mib	Vgs
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Nsta Vgs AtmTConn Aap **retryFailures (failures)**

Access	Read only
Description	This attribute counts consecutive failed connection attempts. This counter is reset to 0 whenever a connection is successfully established or the connection is restarted using the *Restart* verb. The counter wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..2147483647)
Default	No default

GROUP Nsta Vgs AtmTConn Aap **AccessPointOper (ApOper)**

Properties	Operational
Description	This group contains operational information regarding the end point of the connection. This group is common to all types of access points.

VERB Restart Nsta Vgs AtmTConn SpvcAp

Impact	Service
Description	*Restart Nsta/n Vgs AtmTConn/n SpvcAccessPoint* This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection is released first. This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP Nsta Vgs AtmTConn SpvcAp Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioning data for the *SpvcAp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs AtmTConn SpvcAp atmServiceCategory (service)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable bit rate service may support statistical multiplexing of real time sources.
Mib	Vgs
Values	constantBitRate (cbr) rtVariableBitRate (rtVbr)
Default	rtVariableBitRate

ATTRIBUTE Nsta Vgs AtmTConn SpvcAp **peakCellRate (pcr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the peak cell rate of the ATM connection.
Mib	Vgs
Values	Decimal (1..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Nsta Vgs AtmTConn SpvcAp **sustainedCellRate (scr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the sustained cell rate of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs

VERB Ping Nsta Vgs IpMConn

Impact	Passive
Description	*Ping -ipAddr(IP Address) Nsta/n Vgs IpMediaStreamConnection* This command causes an ICMP echo request to be sent to the host specified by the *ipAddr* option. If a response is received for the request, a second request is sent; if no response is received for the first request, no further request is sent. The remote IP host must respond to an ICMP ping request within 5 seconds of the request being generated. This is intended for testing network connections at the IP level. Only one *Ping* command per component is allowed to be in progress at any one time.

GROUP Nsta Vgs IpMConn Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *IpMConn* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn ipAddress (ipAddr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the IP address of this IP connection and must be unique to the IP network.

Copyright © 2006, Nortel Nortel Confidential

When the *IpMConn* component is copied using the *Copy* command, this attribute is set to ***0.0.0.0*** to prevent a duplication of IP addresses.

Mib	Vgs
Values	IP address
Default	No default

ATTRIBUTE Nsta Vgs IpMConn udpPortBase (udpBase)

Access	Read and write
Criticality	Process
Description	This attribute specifies the low end of the range of UDP port numbers which will be assigned to media stream connections using this *IpMConn* component.The high end of the range is equal to *udpPortBase* + ((2 * 24) - 1). The value provisioned is allocated by the network operating company according to the numbering plan. If the *cardType* is ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3***, ***2pVS*** or ***2pOC3ChSmIrVsp4e***, this attribute may only take the value ***16384***, ***32768*** or ***49152***. In addition, if IP access is via a Gigabit Ethernet port on the ***2pGeMmSrVsp3*** card, the value may only be ***49152***.
Mib	Vgs
Values	Decimal (8192; 16384; 24576; 32768; 40960; 49152; 57344)
Default	49152

GROUP Nsta Vgs IpMConn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value

Copyright © 2006, Nortel Nortel Confidential

is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Vgs

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Nsta Vgs IpMConn operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Vgs

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Nsta Vgs IpMConn usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Vgs

Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs IpMConn Statistics (Stats)

Properties	Operational
Description	This group contains the statistics for the *IpMConn* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn txPackets (txPkt)

Access	Read only
Description	This attribute counts the packets transmitted since the component was activated. The value wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Long Integer
Default	No default

ATTRIBUTE Nsta Vgs IpMConn rxPackets (rxPkt)

Access	Read only
Description	This attribute counts all packets received (including errored packets) since the component was activated. The value wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Long Integer
Default	No default

ATTRIBUTE Nsta Vgs IpMConn erroredRxPackets (errRxPkt)

Access	Read only
Description	This attribute counts the errored packets since the component was activated. Errors may occur due to: - packets discarded on buffer full, - destination voice processing hardware is not functioning, - no IP address yet available, If the IP packets are transferred using AAL5 cells, this count will also

Copyright © 2006, Nortel Nortel Confidential

	contain any AAL5 CRC errors. The value wraps to zero when the maximum value is exceeded. This attribute is filtered when the ***vspIpGigE*** or the ***vgpIpG729GigE*** feature is provisioned.
Mib	Vgs
Values	Long Integer
Default	No default

ATTRIBUTE Nsta Vgs IpMConn **pingRequestsReceived (rxPing)**

Access	Read only
Description	This attribute counts the ICMP Echo request (ping) packets received since the component was activated. The value wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Long Integer
Default	No default

ATTRIBUTE Nsta Vgs IpMConn **atmarpPacketsReceived (rxAtmArp)**

Access	Read only
Description	This attribute counts the ATMARP (request or response) packets received since the component was activated. The value wraps to zero when the maximum value is exceeded. This attribute is filtered when the ***vspIpGigE*** or the ***vgpIpG729GigE*** feature is provisioned, or the *VrAp* subcomponent is provisioned under this component.
Mib	Vgs
Values	Long Integer
Default	No default

ATTRIBUTE Nsta Vgs IpMConn **receivedPacketsDiscarded (rxDiscPkt)**

Access	Read only
Description	This attribute counts the packets received but discarded due to lack of internal buffer space. The value wraps to zero when the maximum value is exceeded. This attribute is filtered when the card type is ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3***, ***2pVS*** or ***2pOC3ChSmIrVsp4e***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	Long Integer
Default	No default

ATTRIBUTE Nsta Vgs IpMConn unsupportedPacketsReceived (rxUnsupPkt)

Access	Read only
Description	This attribute counts the packets received that are not IP or ICMP datagrams attributable to particular voice channels. This attribute does not include packets that are counted in *pingRequestsReceived*, *atmarpPacketsReceived* or *receivedPacketsDiscarded* attributes. The value wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Long Integer
Default	No default

GROUP Nsta Vgs IpMConn NstaVgsConnectionStatus (ConnStat)

Properties	Operational
Description	This group contains an attribute which provides information on the status of the VGS connections.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn currentStatus (cStat)

Access	Read only
Description	This attribute specifies the current status of a *Vgs AtmTConn*, *IpMConn* or *Ctrl* connection. ***enabled*** indicates that the component is enabled and available to transport traffic. ***activating*** indicates that the component is progressing through its expected sequence of activation and enabling actions, and that no errors having been reported. ***atmConnectionNotReady*** indicates that a problem has been reported with the ATM VCC linked to the component's *Nap, Aap* or *Pap* subcomponent, resulting in the component being in a disabled state. ***vspNotReady*** indicates that the *Vsp* component linked to the parent *Nsta* component is either disabled or locked. ***outOfResource*** indicates that no hardware resource is available on the VSP card to support the component. This means that the VSP card is inadequately equipped or has suffered some level of hardware failure.

Copyright © 2006, Nortel Nortel Confidential

ipNetworkInaccessible indicates that a connection into the IP network cannot be created. This may be due to physical ports being disabled, or the inability of routing software to establish an appropriate connection.

COMPONENT Nsta Vgs IpMConn NailedUpAdaptionPoint (Nap)

Groups: GROUP Nsta Vgs IpMConn Nap Provisioned (Prov)

Scope: Device

Description:
Nsta/n Conn/n NailedUpAdaptionPoint
Nsta/n Conn/n Brag/n Ccst NailedUpAdaptionPoint
Nsta/n Vgs AtmTConn/n NailedUpAdaptionPoint
Nsta/n Vgs Control/n NailedUpAdaptionPoint
Nsta/n Vgs IpMConn NailedUpAdaptionPoint

This component is used to provide access to a nailed-up ATM connection (an *Atmif Vcc Nep*).

Components in the *Nsta* component hierarchy which require access to such connections will have a *NailedUpAdaptionPoint* subcomponent.

VERB Restart Nsta Vgs IpMConn Aap

Impact	Service
Description	*Restart Nsta/n Vgs Control/n ActiveAccessPoint* *Restart Nsta/n Vgs IpMConn ActiveAccessPoint* *Restart Nsta/n Conn/n ActiveAccessPoint* This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection is released first. This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP Nsta Vgs IpMConn Aap **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains provisioning data for the *Aap* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn Aap **atmServiceCategory (service)**

Access	Read and write
Criticality	Component
Description	This attribute specified the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable bit rate service may support statistical multiplexing of real time sources.

Copyright © 2006, Nortel Nortel Confidential

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a *peakCellRate*, *sustainedCellRate*, and *maximumBurstSize*. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. The non real-time variable bit rate service may support statistical multiplexing of connections.

If the parent of the *Aap* is a *Ctrl* component then the default value of *atmServiceCategory* attribute is ***nrtVariableBitRate***; it may not take the value ***rtVariableBitRate***. If the parent of the *Aap* is an *IpMConn* or *Conn* component then the default value of *atmServiceCategory* attribute is ***rtVariableBitRate***; it may not take the value ***nrtVariableBitRate***.

Mib	Vgs
Values	constantBitRate (cbr) rtVariableBitRate (rtVbr) nrtVariableBitRate (nrtVbr)
Default	No default

ATTRIBUTE Nsta Vgs IpMConn Aap **peakCellRate (pcr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the peak cell rate of the ATM connection.
Mib	Vgs
Values	Decimal (1..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Nsta Vgs IpMConn Aap **sustainedCellRate (scr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the sustained cell rate of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cell/s

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Nsta Vgs IpMConn Aap maximumBurstSize (mbs)

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum burst size, at the peak cell rate, of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cells
Default	0

ATTRIBUTE Nsta Vgs IpMConn Aap retryLimit (limit)

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of consecutive unsuccessful setup attempts before further attempts are abandoned. If this limit is reached, management action is required (restart the connection attempts with the *Restart* verb). A value of zero indicates no limit; attempts will continue indefinitely until a successful connection is established.
Mib	Vgs
Values	Decimal (0..65535)
Default	0

GROUP Nsta Vgs IpMConn Aap AapAddressessProv (AapAddrProv)

Properties	Provisioned
Description	This group contains NSAP address provisioning data.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn Aap expectedRemoteAddress (expectedAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the expected remote address information for an incoming setup request. If *expectedRemoteAddress* is not empty, only matching addresses in incoming setup are considered for acceptance.

Copyright © 2006, Nortel Nortel Confidential

If *expectedRemoteAddress* is less than 40 characters long, the remote address must match the value in *expectedRemoteAddress* to be accepted.

If *expectedRemoteAddress* is empty, connection requests are accepted from any remote address.

Mib	Vgs
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Nsta Vgs IpMConn Aap localAddress (localAddr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the access point's ATM address. If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) is provisioned, a default value for *localAddress* based on the *nodePrefix* is provided. If a default cannot be generated the operator is forced to set a value for this attribute. Alternatively, the *ModuleData nodePrefix* attribute may be provisioned, and this access point component then deleted and re-added.
Mib	Vgs
Values	String (1..44, AESANsapAddress)
Default	No default

ATTRIBUTE Nsta Vgs IpMConn Aap addressToCall (addrToCall)

Access	Read and write
Criticality	Component
Description	This attribute specifies the list of remote NSAP addresses which this component can call. At least one address must be provisioned. For the *ControlConnection* component in switched VoATM and VoIP and for the *IpMediaStreamConnection* application the remote end is a router. It is required to be able to establish SVCs to different routers. Therefore, the *addressToCall* attribute is a list of remote addresses. The first SVC call is sent to the first address listed in the *addressToCall* attribute. If the setup fails or the call is established but fails at a later time, the system attempts to set up a connection to next address listed in the *addressToCall* attribute. If a failure occurs when using the last address in the list, the system attempts to setup a connection to the first address in the list and then continues as before.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
List of	String (1..44, AESANsapAddress)
List Size	3
Default	No default

GROUP Nsta Vgs IpMConn Aap Operational (Oper)

Properties	Operational
Description	This group contains operational status information for the *Aap* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn Aap svcStatus (status)

Access	Read only
Description	This attribute indicates the status of the SVC connection. When this attribute has the value ***initializing***, it indicates that the component is initializing when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed,*** it indicates that an error occurred while sending a release message to the network (as a consequence of a Delete request) while the component was in ***connecting*** state.
Mib	Vgs
Values	initializing connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Nsta Vgs IpMConn Aap lastSetupFailureCause (failCause)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the cause code in the last call release message following an unsuccessful call setup attempt. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification. If no call setup attempts have failed, this attribute has a value of 0.
Mib	Vgs
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Vgs IpMConn Aap **lastSetupFailureDiagnostic (failDiag)**

Access	Read only
Description	This attribute indicates the diagnostic code in the last call release message following an unsuccessful call setup attempt. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If no call setup attempts have failed, this attribute is an empty string.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs IpMConn Aap **retryTimeRemaining (timer)**

Access	Read only
Description	This attribute indicates the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt is made. When the value reaches 0 an attempt will be made to establish the connection. When the timer is not running this attribute has a value of 0.
Mib	Vgs
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Nsta Vgs IpMConn Aap **retryFailures (failures)**

Access	Read only
Description	This attribute counts the number of consecutive failed connection attempts. This counter is reset to 0 whenever a connection is successfully established or the connection is restarted using the *Restart* verb. The counter wraps to zero when the maximum value is exceeded.

Copyright © 2006, Nortel Nortel Confidential

VERB Restart Nsta Vgs IpMConn SpvcAp

Impact	Service
Description	*Restart Nsta/n Vgs Control/n SpvcAccessPoint* *Restart Nsta/n Vgs IpMConn SpvcAccessPoint* *Restart Nsta/n Conn/n SpvcAccessPoint* This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection is released first. This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP Nsta Vgs IpMConn SpvcAp **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains provisioning data for the *SpvcAp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn SpvcAp **atmServiceCategory (service)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable

Copyright © 2006, Nortel Nortel Confidential

bit rate service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a *peakCellRate*, *sustainedCellRate*, and *maximumBurstSize*. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. The non real-time variable bit rate service may support statistical multiplexing of connections.

If the parent of the *SpvcAp* is a *Ctrl* component then the default value of *atmServiceCategory* attribute is ***nrtVariableBitRate***; it may not take the value ***rtVariableBitRate***. If the parent of the *SpvcAp* is an *IpMConn* component then the default value of *atmServiceCategory* attribute is ***rtVariableBitRate***; it may not take the value ***nrtVariableBitRate***.

Access	Read only
Criticality	Component
Description	This attribute indicates the address of the remote end point. If a connection is currently established, it will contain the NSAP address of the remote end point. If a connection is not established, the *remoteAddress* attribute has the value ***unknown***.
Mib	Vgs
Values	String (7..40, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs IpMConn SpvcAp **lastTearDownCause (cause)**

Access	Read only
Description	This attribute indicates the cause code in the last call release message that contained the CAUSE information element. Note that the call must have been successfully established before being torn down. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	Vgs
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Vgs IpMConn SpvcAp **lastTearDownDiagnostic (diag)**

Access	Read only
Description	This attribute indicates the diagnostic code in the last call release message. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

COMPONENT Nsta Vgs IpMConn **AtmConnection (AtmCon)**

Groups	GROUP Nsta Vgs IpMConn AtmCon Operational (Oper)
Scope	Device

Copyright © 2006, Nortel Nortel Confidential

Description	An AtmConnection component is created for each ATM connection established by an application. It shows where the data traffic for this connection is directed.
Mib	Vgs

GROUP Nsta Vgs IpMConn AtmCon Operational (Oper)

Properties	Operational
Description	This attribute group contains the operational attributes for the *NapAtmConnection* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpMConn AtmCon nextHop

Access	Read only
Description	This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established.
Mib	Vgs
Values	The name of the component
Default	No default

COMPONENT Nsta Vgs IpMConn VirtualRouterAccessPoint (VrAp)

Groups	GROUP Nsta Vgs IpMConn VrAp Provisioned (Prov)
Scope	Application
Description	*Nsta/n Vgs Ctrl/n VrAp* *Nsta/n Vgs IpMConn VrAp* *Nsta/n Vgs DbgAccess VrAp* This component represents a point of access to a *VirtualRouter* component, which provides an IP forwarding functionality to this *Nsta/n Vgs* component hierarchy. If at least one *VrAp* component is used within a *Nsta/n Vgs* component hierarchy, then all IP network access from within that hierarchy must be via *VrAp* components.

Copyright © 2006, Nortel Nortel Confidential

In addition, a *VCac* component cannot be provisioned within a *Nsta/n Vgs* component hierarchy which contains a *VrAp* component.

Mib: Vgs

Common Verbs: Help, List, Display, Add, DELete

GROUP Nsta Vgs IpMConn VrAp Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisioning data for the *VrAp* component.

Mib: Vgs

ATTRIBUTE Nsta Vgs IpMConn VrAp subnetAccessName (subnet)

Access: Read and write

Description: This attribute specifies the *Vr/n Pp/m IpPort LogicalIf/x.y.z.u* component instance to be used by this *VrAp*.

The value of the *ipAddr* attribute defined by the parent of this *VrAp* must belong to the subnet defined by the specified *Vr/n Pp/m IpPort LogicalIf/x.y.z.u* component instance.

Mib: Vgs

Values: The name of the component

Default: No default

COMPONENT Nsta Vgs SimpleGatewayCtrlProt (Sgcp)

Groups: GROUP Nsta Vgs Sgcp Provisioned (Prov)

Scope: Device

Description: *Nsta/n Vgs SimpleGatewayCtrlProt*

This component provides an interface to an SGCP based media gateway controller using the SGCP protocol.

Mib: Vgs

Common Verbs: Help, List, Display, Add, DELete

Copyright © 2006, Nortel Nortel Confidential

GROUP Nsta Vgs Sgcp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *Sgcp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Sgcp rsipMessages (rsipM)

Access	Read and write
Description	This attribute specifies if RSIP message generation is enabled or disabled. When a value of ***disabled*** is provisioned then no RSIP messages are generated. When a value of ***enabled*** is provisioned then RSIP messages are generated. The value to be provisioned is determined by the ability of the media gateway controller to receive RSIP messages. Incorrect provisioning of this value (to ***disabled***) could cause failure conditions to be wrongly diagnosed. Incorrect provisioning of this value (to ***enabled***) causes RSIP messages to be discarded by the media gateway controller.
Mib	Vgs
Values	disabled enabled
Default	disabled

ATTRIBUTE Nsta Vgs Sgcp defaultServiceMgrName (defSmn)

Access	Read and write
Description	This attribute specifies the default remote name for all SGCP messages when no other remote name can be determined (from the Notified Entity or the source address of the last message received). (Note: The Notified Entity is a host name or IP address). This attribute is also used for all RSIP messages. A remote name does not need to be provisioned, but if it is, it is used to look up an IP address on a DNS server.
Mib	Vgs
Values	String (0..255, ASCII)
Default	""

ATTRIBUTE Nsta Vgs Sgcp defaultServiceMgrPort (defSmp)

Access	Read and write
Description	This attribute specifies the default remote UDP port for all SGCP messages transmitted if no other remote port can be determined (from the notified entity or the source address of the last message received). This attribute is also used for all RSIP messages.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	Decimal (1..65535)
Default	2427

ATTRIBUTE Nsta Vgs Sgcp maxTxRetries (maxTxRetries)

Access	Read and write
Description	This attribute specifies the maximum number of retransmissions of an SGCP protocol message. If no reply is received following the transmission of an SGCP protocol message, it is retransmitted according to the number of times specified by this attribute, to the same IP address. If a reply is still not received, a different IP address may be attempted which is obtained from (and in the following order): - the Notified Entity - the source address of the last message received or - the *defaultServiceMgrName* attribute. A value of ***0*** indicates no retransmissions.
Mib	Vgs
Values	Decimal (0..5)
Default	2

ATTRIBUTE Nsta Vgs Sgcp initialTxRetryTime (initTxRetryTime)

Access	Read and write
Description	This attribute specifies the initial retry time for an SGCP protocol message. If no reply is received following the transmission of an SGCP protocol message, the first retransmission (subject to the number of retransmissions specified by the *maxTxRetries* attribute) occurs after the time-out specified by this attribute. Subsequent retransmission time-outs randomly increase, subject to the maximum value specified by the *maxTxRetryTime* attribute. The initial retry time is rounded down to the nearest multiple of 100 milliseconds. This value is ignored if the *maxTxRetries* attribute is set to ***0***.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	300

ATTRIBUTE Nsta Vgs Sgcp maxTxRetryTime (mTxRetryTime)

Access	Read and write
Description	This attribute specifies the maximum retransmission time for an SGCP protocol message.

Copyright © 2006, Nortel Nortel Confidential

	If no reply is received following the transmission of an SGCP protocol message, the time-outs between retransmissions randomly increase, subject to the maximum value specified by this attribute. This value is ignored if the value of the *maxTxRetries* attribute is ***0*** or ***1***. The maximum retransmission time is rounded down to the nearest multiple of 100 milliseconds. This value must be greater than, or equal to, the value of the *initialTxRetryTime* attribute.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	1000

ATTRIBUTE Nsta Vgs Sgcp mfInitialTxRetryTime (mfInitTxRetryTime)

Access	Read and write
Description	This attribute specifies the initial retry time for an MF SGCP protocol message. If no reply is received following the transmission of an MF SGCP protocol message, the first retransmission (subject to the number of retransmissions specified by the *maxTxRetries* attribute) occurs after the time-out specified by this attribute. Subsequent retransmission time-outs randomly increase, subject to the maximum value specified by the *mfMaxTxRetryTime* attribute. This value is ignored if the *maxTxRetries* attribute is set to ***0***.
Mib	Vgs
Values	Decimal (1..20)
Units	seconds
Default	3

ATTRIBUTE Nsta Vgs Sgcp mfMaxTxRetryTime (mfMaxTxRetryTime)

Access	Read and write
Description	This attribute specifies the maximum retransmission time for an MF SGCP protocol message. If no reply is received following the transmission of an MF SGCP protocol message, the time-outs between retransmissions randomly increase, subject to the maximum value specified by this attribute. This value is ignored if the value of the *maxTxRetries* attribute is ***0*** or ***1***. This value must be greater than, or equal to, the value of the *mfInitialTxRetryTime* attribute.
Mib	Vgs
Values	Decimal (1..20)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	5

ATTRIBUTE Nsta Vgs Sgcp udpPortConnection (udpConn)

Access	Read and write
Description	This attribute specifies the link to the *Nsta/n Vgs CtrlConn/n UdpPort/n* component that defines the UDP port access to the IP network for the SGCP protocol.
Mib	Vgs
Values	Link (Service, linkToApplication)
Default	No default

ATTRIBUTE Nsta Vgs Sgcp mfMaxTxRetries (mfMaxTxRetries)

Access	Read and write
Description	This attribute specifies the maximum number of retransmissions of an MF SGCP protocol message. If no reply is received following the transmission of an MF SGCP protocol message, it is retransmitted the number of times specified by this attribute, to the same IP address. If a reply is still not received, a different IP address may be attempted which is obtained from (and in the following order): - the Notified Entity - the source address of the last message received or - the *defaultServiceMgrName* attribute. A value of ***0*** indicates no retransmissions.
Mib	Vgs
Values	Decimal (0..5)
Default	2

COMPONENT Nsta Vgs VoiceCallAdmissionControl (VCac)

Groups	GROUP Nsta Vgs VCac Provisioned (Prov) GROUP Nsta Vgs VCac Operational (Oper)
Scope	Device
Description	*Nsta/n Vgs VoiceCallAdmissionControl* This component provides the voice Call Admission Control function for the media gateway. The voice call admission control function actively refuses and deletes calls requested by the controller based on the resources allocated to the media gateway. The resources allocated consist of the internal resources of the media gateway hardware, the quality of service provided by the ATM trunk

Copyright © 2006, Nortel Nortel Confidential

used for the call and the backplane bandwidth within the shelf allocated to the media gateway.

If this component is not present then the voice Call Admission Control function is not performed by the media gateway.

Mib	Vgs
Common Verbs	Help List Display Add DELete

GROUP Nsta Vgs VCac Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *Nsta Vgs VCac* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs VCac packetLossProbabilityIndex (plpIndex)

Access	Read and write
Description	This attribute specifies the target packet loss probability for the media gateway, and is an input to the Call Admission Control algorithm. 10 to the power of the *packetLossProbabilityIndex* is the packet loss probability used in the algorithm, for example if the attribute is provisioned to -3, then 10 to the power of -3 is 0.001, or 1 in 1000.
Mib	Vgs
Values	Signed (-6..-2)
Default	-3

ATTRIBUTE Nsta Vgs VCac averageActiveDuration (avActive)

Access	Read and write
Description	This attribute specifies the average duration of the active voice period (also known as talk-spurt) for the media gateway, and is an input to the Call Admission Control algorithm.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	400

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs VCac sourceActiveTime (srcActive)

Access	Read and write
Description	This attribute specifies the percentage of time that the source is active for the media gateway, and is an input to the Call Admission Control algorithm.
Mib	Vgs
Values	Decimal (20..100)
Units	%
Default	40

ATTRIBUTE Nsta Vgs VCac allocatedShelfBandwidth (shBw)

Access	Read and write
Description	This attribute specifies the percentage of shelf backplane bandwidth allocated to the media gateway, and is an input to the Call Admission Control algorithm. The attribute is used by the Call Admission Control algorithm as a limit for the anticipated use of shelf backplane bandwidth resources. The purpose of this attribute is to limit the amount of shelf backplane resources available to a media gateway, and is dependent on the number of VSP cards inserted into a shelf. Reducing this value will have no effect on existing calls, but it will prevent any further calls being made until existing calls clear and release their bandwidth. The total sum of all *VCac* component *allocatedShelfBandwidth* attributes within a shelf may not exceed 100%.
Mib	Vgs
Values	Decimal (10..100)
Units	%
Default	25

ATTRIBUTE Nsta Vgs VCac deleteCallsOnVbd (delOnVbd)

Access	Read and write
Description	This attribute specifies whether calls that autonomously transition from voice to voice band data (VBD) are deleted if the new bandwidth requirements of the call exceed the bandwidth available to the voice CAC function. A value of ***enabled*** will delete violating transitioning calls.

Copyright © 2006, Nortel Nortel Confidential

A value of ***disabled*** will not delete transitioning calls.

Mib	Vgs
Values	disabled enabled
Default	enabled

GROUP Nsta Vgs VCac Operational (Oper)

Properties	Operational
Description	This group contains operational data for the *Nsta Vgs VCac* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs VCac refusedNetworkBw (nbRef)

Access	Read only
Description	This attribute counts the connection requests that have been refused by the voice CAC function due to network bandwidth limitations since the component was activated. The attribute wraps to 0 when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs VCac refusedInternalResources (irRef)

Access	Read only
Description	This attribute counts the connection requests that have been refused by the voice CAC function due to internal resource limitations since the component was activated. Increases in this counter indicate that either the provisioned attribute *allocatedShelfBandwidth* is too low for the network engineering model applied, or that the network has been incorrectly engineered such that the maximum bandwidth required by on-net calls (that is AAL2-AAL2 switched calls) exceeds the voice gateway bandwidth available. The attribute wraps to 0 when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

Impact	Service
Description	*Zero Nsta/n Vgs LocalAnnouncements* This verb is used to re-initialize attributes which record peak values.

GROUP Nsta Vgs LocalAnnouncements Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the Local Announcement facility.
Mib	Vgs

ATTRIBUTE Nsta Vgs LocalAnnouncements fileName

Access	Read and write
Description	The attribute specifies the filename (without extension) of the announcement fileset which is used for the *LocalAnnouncements* component. The files are located in /user/pvg/announcements/. Changing the value will not affect announcements in progress. The specified fileset is automatically transferred from the CP to the FP before it is used and the file currently being used can be determined from the *currentFileName* attribute. This attribute must be supplied.
Mib	Vgs
Values	String (0..40, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	""

ATTRIBUTE Nsta Vgs LocalAnnouncements **defaultLanguage**

Access	Read and write
Description	This attribute specifies the language to be used on the announcement when no language is provided via the Media Gateway Controller. This value may be overridden on a per *Brag* component basis in the *Nsta/n Vgs Brag/n AnnouncementLanguage* component. Possible values: any 3 character ASCII string (lower case a-z) for example "eng", or an empty string. If the value is empty, no language is specified when looking up announcements. When the Media Gateway Controller specifies a language value, it overrides the provisioned values in the Media Gateway.
Mib	Vgs
Values	String (0..3, ASCII)
Default	""

GROUP Nsta Vgs LocalAnnouncements **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs LocalAnnouncements **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Vgs

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Nsta Vgs LocalAnnouncements operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Vgs

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Nsta Vgs LocalAnnouncements usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Nsta Vgs LocalAnnouncements availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The

Copyright © 2006, Nortel Nortel Confidential

operationalState is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Nsta Vgs LocalAnnouncements proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase.

Copyright © 2006, Nortel Nortel Confidential

If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Nsta Vgs LocalAnnouncements controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — Vgs

Set of
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Nsta Vgs LocalAnnouncements alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

major
minor
alarmOutstanding (outst)

Default: No default

ATTRIBUTE Nsta Vgs LocalAnnouncements **standbyStatus (osiStby)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

	The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Vgs
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Nsta Vgs LocalAnnouncements unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Vgs
Values	false true
Default	false

GROUP Nsta Vgs LocalAnnouncements Operational (Oper)

Properties	Operational
Description	This group contains attributes which indicate the causes of any *LocalAnnouncements* component failure.
Mib	Vgs

ATTRIBUTE Nsta Vgs LocalAnnouncements currentFileName

Access	Read only
Description	This attribute indicates the name (without path or extension) of the current announcement file which *LocalAnnouncements* is using for new announcements. The value may be different from that specified by the *fileName* attribute if the value of *fileTransferStatus* attribute is not ***complete***. If no file has been transferred, then this attribute is an empty string.
Mib	Vgs
Values	String (0..40, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs LocalAnnouncements **fileTransferStatus**

Access	Read only
Description	This attribute indicates the status of the transfer of the announcement file from the CP to the FP. Possible values are: ***inProgress***: The file as specified in *fileName* is being transferred. Any announcement request are serviced using the file specified in *currentFileName*. ***complete***: The file transfer is complete. The file as specified in *fileName* is the same as the file specified in *currentFileName.* ***missing***: The system cannot find the complete fileset specified in *fileName* on the CP. The current file is left as is. An alarm is raised in this state. The FP will poll for files until transfer can commence. ***fileTooLong***: The current fileset as defined in *fileName* on the CP is too long to be loaded successfully. The current file is left as is. An alarm is raised in this state. The FP will poll to look for changes in file length or timestamp. Reduction of file length to within the acceptable limit, causes automatic download to occur once it is deemed that the file is stable. ***fileError***: The current fileset as defined in *fileName* on the CP has failed sanity checks after download, and is not to be used as an active load. The current file is left as is. An alarm is raised in this state. The FP will poll to look for changes in file length or timestamp. This causes automatic download to occur once it is deemed that the file is stable. ***cpNotResponding***: The CP is not responding. The CP may be busy or the disk may be locked. The FP will poll to check for CP availability.
Mib	Vgs
Values	inProgress complete missing fileTooLong fileError cpNotResponding
Default	No default

ATTRIBUTE Nsta Vgs LocalAnnouncements **unknownNameRequests**

Access	Read only
Description	This attribute counts the announcement requests rejected due to unknown name or unsupported name or language combination. The value is reset

Access	Read only
Description	This attribute indicates the instantaneous percentage of the local announcement resource in use.
Mib	Vgs
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Nsta Vgs LocalAnnouncements peakAnnouncementResourceUsed

Access	Read only
Description	This attribute indicates the peak announcement resource used since this attribute was last reset. The value of this attribute can be reset to 0 by the *Zero* command.
Mib	Vgs
Values	Decimal (0..100)
Units	%
Default	No default

COMPONENT Nsta Vgs DigitCollection

Groups	GROUP Nsta Vgs DigitCollection Provisioned (Prov) GROUP Nsta Vgs DigitCollection Operational (Oper)

Copyright © 2006, Nortel Nortel Confidential

Scope	Device
Description	*Nsta/n Vgs DigitCollection* This component represents the digit collection capabilities of the PVG switched voice application. These capabilities include detection of digits on the TDM circuit side, to collate such digits in accordance with digit maps provided by the Call Server, and to report such digit strings to the Call Server when the digit maps completion criteria are met. If no DigitCollection component is provisioned for a given Vgs, digit collection is disabled for that Vgs. The DigitCollection component must not be provisioned for a Vgs which has an Sgcp subcomponent.
Mib	Vgs
Common Verbs	Help List Display Add DELete

VERB Zero **Nsta Vgs DigitCollection**

Impact	Service
Description	*Zero Nsta/n Vgs DigitCollection* This verb is used to re-initialize attributes which record peak values.

Properties	Provisioned
Description	This group contains the provisioning data for the *Vgs DigitCollection* component.
Mib	Vgs

ATTRIBUTE **Nsta Vgs DigitCollection** **initialDigitTimer**

Access	Read and write
Description	This attribute specifies the value of the Initial Digit Time-out to be used in digit collection. This is the time-out value between request and entering the first number. On expiring of this time a notification is sent to the Media Gateway Controller. The value of this attribute is used when no value is supplied by the controller.
Mib	Vgs
Values	Decimal (1..99)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	16

ATTRIBUTE Nsta Vgs DigitCollection **shortInterDigitTimer**

Access	Read and write
Description	This attribute specifies the value of the short Inter-Digit Time-out to be used in digit collection. This timer is reset after each digit key depressed is received. On expiring of this time a notification is sent to the Media Gateway Controller. The value of this attribute is used when no value is supplied by the controller.
Mib	Vgs
Values	Decimal (1..99)
Units	seconds
Default	4

ATTRIBUTE Nsta Vgs DigitCollection **longInterDigitTimer**

Access	Read and write
Description	This attribute specifies the value of the long Inter-Digit Time-out to be used in digit collection. This timer is reset after each digit key depressed is received. On expiring of this time a notification is sent to the Media Gateway Controller. The value of this attribute is used when no value is supplied by the controller.
Mib	Vgs
Values	Decimal (1..99)
Units	seconds
Default	16

ATTRIBUTE Nsta Vgs DigitCollection **longDigitTimerDuration**

Access	Read and write
Description	This attribute specifies the duration after which a digit (* or #) will be recognized as ‘long’. The value used is dependent on the Media Gateway Controller. This attribute defines a default value to be used when a value is not supplied by the controller.
Mib	Vgs
Values	Decimal (0.1..9.9)
Units	seconds
Default	2.0

GROUP Nsta Vgs DigitCollection **Operational (Oper)**

Properties	Operational

Description	This group contains provisioning data for the *Aal2SvcService* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Aal2Svc svcSetupTimeout (timeout)

Access	Read and write
Description	This attribute specifies the length of time allowed for an SVC setup before calls waiting for that SVC are cleared. This attribute is used when trunks are created and does not affect existing trunks.
Mib	Vgs
Values	Decimal (50..50000)
Units	msec
Default	1000

ATTRIBUTE Nsta Vgs Aal2Svc svcPreCreation (preCreation)

Access	Read and write
Description	This attribute specifies whether pre-creation of SVCs is enabled. If *svcPreCreation* is ***enabled*** then an SVC setup is initiated when the bandwidth available in existing VCCs between two NSAP addresses is down to a level such that a new SVC would be required for the next call.
Mib	Vgs
Values	enabled disabled

Copyright © 2006, Nortel Nortel Confidential

Default	enabled

ATTRIBUTE Nsta Vgs Aal2Svc **autocalcTrafficPrms (autocalc)**

Access	Read and write
Description	This attribute specifies whether the ATM traffic parameters are automatically calculated based on the value of the *maxNumberOfAal2Trunks* attribute of the *Aal2SvcProfile* component. When the *autocalcTrafficPrms* is set to ***enabled*** any provisioned values of the ATM traffic parameters of the *Aal2SvcProfile* subcomponent are ignored and the values are calculated automatically based on an assumption of G.711 CODECs and no silence suppression. When the *autocalcTrafficPrms* is set to ***disabled*** the values specified in the attributes of the *Aal2SvcProfile* component are used. This attribute is used when trunks are created and does not affect existing trunks.
Mib	Vgs
Values	enabled disabled
Default	enabled

ATTRIBUTE Nsta Vgs Aal2Svc **activeOriginatedSvcs (activeOrig)**

Access	Read only
Description	This attribute indicates the number of currently active SVCs originated by this gateway.
Mib	Vgs
Values	Decimal (0..500)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc **activeTerminatedSvcs (activeTerm)**

Access	Read only
Description	This attribute indicates the number of currently active SVCs terminated by this gateway.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..500)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc originatedSvcs (origin)

Access	Read only
Description	This attribute counts the number of SVCs originated by the gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc terminatedSvcs (term)

Access	Read only
Description	This attribute counts the number of SVCs terminated by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc activeSvcsDeleted (activeDel)

Access	Read only
Description	This attribute counts the number of SVCs deleted while in the active state carrying traffic. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc svcsPending (pending)

Access	Read only
Description	This attribute indicates the number of SVC creation requests currently requested but not yet established.
Mib	Vgs
Values	Decimal (0..500)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Aal2Svc emptySvcCount (empty)

Access	Read only
Description	This attribute indicates the number of SVCs that are enabled but not carrying narrowband calls.
Mib	Vgs
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc networkReleaseCount (releaseCount)

Access	Read only
Description	This attribute counts the number of ATM network releases received by the *Aal2SvcService* component. This provides an indication of the total number of SVCs or SVC attempts that failed due to ATM network conditions. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc neverUsedSvcsDeleted (neverUsedDel)

Access	Read only
Description	This attribute counts the number of SVCs that were created by this gateway and deleted without carrying any traffic. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc unavailableSvcCount (unavail)

Access	Read only
Description	This attribute indicates the number of SVCs currently unavailable to trunk selection.
Mib	Vgs
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc narrowbandConnectionsRefused (connsRefused)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the narrowband connections rejected due to failure of the SVC creation process. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc svcSetupTimeoutCount (timeoutCount)

Access	Read only
Description	This attribute counts the number of times the SVC setup timeout expired. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc overloadedSvcCount (overloaded)

Access	Read only
Description	This attribute counts the number of times an SVC was overloaded. An SVC is overloaded when narrowband calls are simultaneously placed on the SVC at both its originating and terminating ends, causing the *activeConnections* attribute of the *TConn* component to exceed the *maxNumberAal2Trunks* specified in the *Profile* component. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc lastSvcSetupTimeoutNsap (lastTimeoutNsap)

Access	Read only
Description	This attribute indicates the NSAP address of the last SVC attempt for which the SVC setup timeout attribute expired. If the string is empty, then such a timeout has never occurred.
Mib	Vgs
Values	String (0..40, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Aal2Svc lastSvcSetupFailureNsap (supFailNsap)

Access	Read only
Description	This attribute indicates the remote NSAP address of the last SVC attempt for which the setup request failed. If the string is empty, SVC setup failures have occurred.
Mib	Vgs
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc lastSvcSetupFailureCause (supCause)

Access	Read only
Description	This attribute indicates the cause of the the last SVC setup failure, as defined in the ATM Forum ATM User-Network Interface Specification. This attribute is only meaningful if the *lastSvcSetupFailureNsap* attribute is not empty.
Mib	Vgs
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc lastSvcSetupFailureDiagnostic (supDiag)

Access	Read only
Description	This attribute indicates the diagnostic code associated with the last SVC setup failure, as defined in the ATM Forum ATM User-Network Interface Specification. This attribute is only meaningful if the *lastSvcSetupFailureNsap* attribute is not empty.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc lastSvcAbnormalTearDownNsap (tdNsap)

Access	Read only
Description	This attribute indicates the remote NSAP address of the last SVC which did not experience a normal tear down. If the string is empty, an abnormal SVC tear down has not occurred.
Mib	Vgs
Values	String (0..40, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc lastSvcAbnormalTearDownCause (tdCause)

Access	Read only
Description	This attribute indicates the tear down cause for the last SVC that did not experience a normal tear down, as defined in the ATM Forum ATM User-Network Interface Specification. This attribute is only meaningful if the *lastSvcAbnormalTearDownNsap* attribute is not empty.
Mib	Vgs
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Vgs Aal2Svc lastSvcAbnormalTearDownDiagnostic (tdDiag)

Access	Read only
Description	This attribute indicates the tear down diagnostic code associated with the last SVC which did not experience a normal tear down, as defined in the ATM Forum ATM User-Network Interface Specification. This attribute is only meaningful if the *lastSvcAbnormalTearDownNsap* attribute is not empty.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

COMPONENT Nsta Vgs Aal2Svc Profile (Prof)

Instance	Decimal (1..1)
Groups	GROUP Nsta Vgs Aal2Svc Prof Provisioned (Prov)
Scope	Device
Description	*Nsta/n Vgs Aal2Svc Aal2SvcProfile/n* This component provides the parameters for automatically created SVCs.

Copyright © 2006, Nortel Nortel Confidential

The attributes of this component are only used when SVCs are created and do not affect values used by an existing trunk.

Mib	Vgs
Common Verbs	Help List Display Add DELete

GROUP Nsta Vgs Aal2Svc Prof Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioning data for the *Aal2SvcProfile* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Aal2Svc Prof holdOverTime (hoTime)

Access	Read and write
Description	This attribute specifies the maximum period of time before a partially filled AAL2 packet is scheduled for transmission. It is also referred to as "combined use timer" (Timer_CU), in the ITU-T I.363.2. A value of ***0*** specifies that an ATM cell is transmitted as soon as an AAL2 packet is placed in the cell. Each ATM cell therefore contains one AAL2 packet. The *holdOverTime* affects the packet delay and the bandwidth used by the connection. The longer the delay the higher the bandwidth efficiency of the ATM connection and vice versa. The *holdOverTime* is rounded to the nearest multiple of 0.125 milliseconds.
Mib	Vgs
Values	Decimal (0.000..15.875)
Units	msec
Default	2.000

ATTRIBUTE Nsta Vgs Aal2Svc Prof maxNumberAal2Trunks (maxTrunks)

Access	Read and write
Description	This attribute specifies the maximum number of AAL2 trunks that may be allocated on this ATM trunk. The local node may allocate no more than this number of trunks. The number of currently active trunks is indicated by the *activeConnections* attribute of the *Aal2SvcConnection* component.
Mib	Vgs
Values	Decimal (1..247)

Copyright © 2006, Nortel Nortel Confidential

Default	4

ATTRIBUTE Nsta Vgs Aal2Svc Prof **svcPersistence (persistence)**

Access	Read and write
Description	This attribute specifies the length of time that an AAL2 SVC is kept up after the last narrowband call to use it has been deleted. This attribute is used to modify the SVC caching system. Longer values result in larger caches of SVCs.
Mib	Vgs
Values	Decimal (0..600)
Units	seconds
Default	180

ATTRIBUTE Nsta Vgs Aal2Svc Prof **atmServiceCategory (service)**

Access	Read and write
Description	This attribute specifies the ATM Service Category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". The real-time variable bit rate service may support statistical multiplexing of real time sources.
Mib	Vgs
Values	constantBitRate (cbr) rtVariableBitRate (rtVbr)
Default	rtVariableBitRate

ATTRIBUTE Nsta Vgs Aal2Svc Prof **peakCellRate (pcr)**

Access	Read and write
Description	This attribute specifies the peak cell rate of the ATM connection. The value is ignored if the *autoCalcTrafficPrms* attribute has the value ***enabled***. Otherwise, the value must be non-zero.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..2147483647)
Units	cell/s
Default	800

ATTRIBUTE Nsta Vgs Aal2Svc Prof **sustainedCellRate (scr)**

Access	Read and write
Description	This attribute specifies the sustained cell rate of the ATM connection. The value is ignored if the *autoCalcTrafficPrms* attribute has the value ***enabled***. Otherwise, the value must be non-zero if the *atmServiceCategory* attribute is ***rtVariableBitRate***, and zero if the atmServiceCategory is ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cell/s
Default	800

ATTRIBUTE Nsta Vgs Aal2Svc Prof **maximumBurstSize (mbs)**

Access	Read and write
Description	This attribute specifies the maximum burst size, at the peak cell rate, of the ATM connection. The value is ignored if the *autoCalcTrafficPrms* attribute has the value ***enabled***. Otherwise, the value must be non-zero if the *atmServiceCategory* attribute is ***rtVariableBitRate***, and zero if the atmServiceCategory is ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cells
Default	1

COMPONENT Nsta Vgs Aal2Svc **TrunkConnection (TConn)**

Instance	Decimal (0..4095)
Groups	GROUP Nsta Vgs Aal2Svc TConn Operational (Oper)
Scope	Device
Description	*Nsta/n Vgs Aal2Svc Aal2SvcTrunkConnectionl/n* This dynamic component provides visibility for all automatically created SVCs.

Copyright © 2006, Nortel Nortel Confidential

This component is present if and only if the corresponding ATM trunk is available for use by narrowband calls. It is thus present immediately after the SVC is established. It is also present after the SVC has been released from the network for as long as the hold-off timer is running, as indicated by the *holdOverTime* attribute. On expiry of the hold-off timer, the VCC is deleted in the SPM, and this component instance is removed.

ATTRIBUTE Nsta Vgs Aal2Svc TConn AtmCon nextHop

Access	Read only
Description	This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established.
Mib	Vgs
Values	The name of the component
Default	No default

COMPONENT Nsta Vgs AmrBasicRateGroup (AmrBrag)

Instance	Decimal (0..127)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Nsta Vgs AmrBrag Provisioned (Prov) GROUP Nsta Vgs AmrBrag OsiState (State) GROUP Nsta Vgs AmrBrag Operational (Oper)
Scope	Device
Description	*Nsta/n Vgs AmrBasicRateGroup/n* This component represents a number of TDM connections from the Voice Services Processor (VSP) to the TDM network. The TDM connections are all associated with the same TDM interface. A particular *AmrBrag* is associated with a single E1 channel. Connections on this channel are used to transport AMR-encoded speech. This component defines default processing for all TDM connections on this channel. For each connection, this default processing may be overridden by the controller.

GROUP Nsta Vgs AmrBrag Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *AmrBrag* component.
Mib	AmrBrag

ATTRIBUTE Nsta Vgs AmrBrag interfaceName (intName)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies a link to a *Chan* component, which in turn specifies the timeslots for the *AmrBrag.* The attribute must specify an *Lp/n E1/n Chan/n* component. *Lp/n DS1/n Chan/n* components are not supported.
Mib	AmrBrag
Values	Link (Service, applicationFramerName)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Vgs AmrBrag defaultRate (defRate)

Access	Read: All Write: All
Description	This attribute specifies the AMR encoding rate to be used for a voice call when no rate is defined during call setup via the call setup protocol.
Mib	AmrBrag
Values	Decimal (12.20)
Units	kbit/s
Default	12.20

ATTRIBUTE Nsta Vgs AmrBrag tdmLogLaw (muALaw)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the G.711 *tdmLogLaw* to use on the TDM side of an NSTA trunk. If set to ***autoConfigured***, then the value used is derived from the facility, namely ***muLaw*** is used for *DS1* trunks, while ***aLawEbi*** would be used by *E1* trunks. For *E1* trunks, ***muLaw*** is not permitted. ***muLaw*** - use muLaw companding, not supported on E1 trunks ***aLawEbi*** - use aLawEbi companding ***aLawAbi*** - use aLawAbi companding ***autoConfigured*** - use companding law appropriate for facility
Mib	AmrBrag
Values	muLaw aLawEbi autoConfigured aLawAbi
Default	autoConfigured

ATTRIBUTE Nsta Vgs AmrBrag lossIntegrationPeriod (intPeriod)

Access	Read: All Write: All
Description	This attribute specifies the interval of time for which a loss of packet condition must persist before the corresponding call is dropped. A value of ***disabled*** specifies that packet loss integration is disabled and therefore call connections will not be dropped due to packet loss.

Default	enabled

ATTRIBUTE Nsta Vgs AmrBrag minimumEchoReturnLoss (minEchoRetLoss)

Access	Read: All Write: All
Description	This attribute specifies the minimum echo return loss that can be expected on the line. This attribute has no effect if *echoCancellation* is ***disabled.***
Mib	AmrBrag
Values	Decimal (3; 6)
Units	dB
Default	3

ATTRIBUTE Nsta Vgs AmrBrag echoCancelComfortNoiseGeneration (eCanComNoiseGen)

Access	Read: All Write: All
Description	This attribute enables or disables comfort noise generation for the echo cancellation feature. This attribute has no effect if *echoCancellation* is ***disabled***.
Mib	AmrBrag
Values	disabled enabled
Default	enabled

ATTRIBUTE Nsta Vgs AmrBrag echoCancellationTailLength (eCanTail)

Access	Read: All Write: All
Description	This attribute specifies the echo cancellation tail length applied to all timeslots. This attribute has no effect if *echoCancellation* is ***disabled***.
Mib	AmrBrag
Values	Decimal (64)
Units	msec
Default	64

ATTRIBUTE Nsta Vgs AmrBrag backgroundNoiseConditioning (bnc)

Access	Read: All Write: All
Description	This attribute enables or disables background noise conditioning and low-pass filtering.

Copyright © 2006, Nortel Nortel Confidential

disabled - background noise conditioning is disabled
enabled - background noise conditioning is enabled.
enabledLowPass - background noise conditioning and low-pass filtering are enabled.

The background noise conditioning algorithm has an optional post-processing feature that performs low-pass filtering on the noise conditioned signal. Depending on the presence of any other third-part voice quality devices within the network, the operator may desire to disable low-pass filtering to prevent any voice quality degradation due to feature interaction.

Mib: AmrBrag

ATTRIBUTE Nsta Vgs AmrBrag disContinuousTransmission (dtx)

Access	Read: All Write: All
Description	This attribute enables or disables the DTX feature of the AMR speech encoder in the downlink direction. In the uplink direction, the AMR speech decoder is capable of handling DTX SID and No Data frames. DTX should be enabled only if it is supported by the RNC. When enabled, two modes are supported. These modes specify how to handle the scenario that occurs when no data is being transmitted. ***disabled*** - disable DTX ***enabledSilent*** - enable DTX and transmit nothing when no data is being transmitted. ***enabledIuNoData*** - enable DTX and transmit empty IuUP frames when no data is being transmitted.
Mib	AmrBrag
Values	disabled enabledSilent enabledIuNoData
Default	disabled

ATTRIBUTE Nsta Vgs AmrBrag backgroundNoiseReduction (bnr)

Access	Read: All Write: All
Description	This attribute enables or disables background noise reduction. The operator may desire to disable this feature if external third-party voice quality equipment that performs a a similar function is used in the network. Performing background noise reduction more than once may degrade voice quality.
Mib	AmrBrag
Values	disabled enabled
Default	disabled

ATTRIBUTE Nsta Vgs AmrBrag mobileEchoControl (mec)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute enables or disables mobile echo control. The operator may desire to disable this feature if external third-party voice quality equipment that performs a a similar function is used in the network. Performing mobile echo control more than once may degrade voice quality.
Mib	AmrBrag
Values	disabled enabled
Default	disabled

ATTRIBUTE Nsta Vgs AmrBrag echoCancellationFixedDelay (eCanFixDel)

Access	Read: All Write: All
Description	This attribute specifies the fixed delay offset for the echo cancellation tail length applied to all timeslots. This attribute has no effect if *echoCancellation* is ***disabled***.
Mib	AmrBrag
Values	Decimal (0..16)
Units	msec
Default	0

ATTRIBUTE Nsta Vgs AmrBrag mobileEchoControlFixedDelay (mecFixDel)

Access	Read: All Write: All
Description	This attribute specifies the fixed delay offset for the mobile echo control tail length applied to all timeslots. The value specified must be a multiple of 20 msec. This attribute has no effect if *mobileEchoControl* is ***disabled***.
Mib	AmrBrag
Values	Decimal (100; 120; 140; 160; 180; 200; 220; 240; 260; 280; 300; 320)
Units	msec
Default	220

ATTRIBUTE Nsta Vgs AmrBrag tandemFreeOperation (tfo)

Access	Read: All Write: All
Description	This attribute enables or disables the Tandem Free Operation (TFO) feature of the Transcoding and Rate Adaptation Unit (TRAU). The operator may desire to enable this feature if he wants to avoid a voice quality degradation introduced by the speech encoding and decoding

Copyright © 2006, Nortel Nortel Confidential

processes in the Core Networks and improve the end-to-end voice quality. When TFO is enabled, the TRAU operates in TFO mode when the terminating network supports it.

The operator may desire to disable this feature if the originating or terminating Core Networks does not support Tandem Free Operation.

Mib: AmrBrag

Values:
disabled
enabled

Default: disabled

ATTRIBUTE Nsta Vgs AmrBrag downlinkAutomaticGainControlTfo (dnAgcTfo)

Access:
Read: All
Write: All

Description: This attribute enables or disables Automatic Gain Control (AGC) in the downlink direction for Tandem Free Operation (TFO) mode. AGC in the downlink may be turned off for TFO mode and still on for the normal operations.

This voice quality feature should be enabled if the operator desires to control variations in call volume in the downlink direction for TFO mode. This attribute has no effect if *tandemFreeOperation* is ***disabled***.

disabled - downlink AGC is disabled for TFO mode
enabled - downlink AGC is enabled for TFO mode
sameAsNormalMode - downlink AGC is enabled for TFO mode if it is enabled for normal mode; otherwise, it is disabled.

Mib: AmrBrag

Values:
disabled
enabled
sameAsNormalMode

Default: sameAsNormalMode

Values:
disabled
enabled
sameAsNormalMode

Default: sameAsNormalMode

ATTRIBUTE Nsta Vgs AmrBrag iuTimeAlignment (iuTimeAlig)

Access:
Read: All
Write: All

Description: This attribute enables or disables the time alignment algorithm for the Iu-User Plane (Iu-UP) feature of the Transcoding and Rate Adaptation Unit (TRAU).

The operator may desire to enable this feature to minimize the buffer delay in the Radio Network Controller (RNC) by controlling the downlink transmission timing in the peer Iu-UP protocol layer entity.

Copyright © 2006, Nortel
Nortel Confidential

The proper operation of this feature may be hindered by the standards interpretation of the RNC vendor. The operator may desire to leave this feature disabled if Iu Time Alignment standards interpretation differences are discovered with the RNC vendor.

Mib: AmrBrag

Values: disabled
enabled

Default: disabled

ATTRIBUTE Nsta Vgs AmrBrag bufferSize (bufSize)

Access: Read: All
Write: All

Criticality: Process

Description: This attribute specifies the capacity of the packet delay variation (PDV) buffer. The PDV buffer is sized to store the amount of data that can be transmitted to the TDM network in the specified period of time.

To ensure end-to-end voice quality, a PDV buffer is provided at the output of the uplink RNC-TRAU network to filter out ATM AAL2 packet jitter and maintain the isochronous nature of the voice traffic. To ensure that PDV can be tolerated, it is necessary to initialize this buffer with a reserve of transmitted data. The size of this reserve is defined by the *pdvt* attribute, and the size of the buffer that holds this reserve is specified by the *bufSize* attribute.

The size of the initialization reserve is set to the amount of data that can be transmitted to the TDM network in the time specified by the *pdvt* attribute. There should be enough data in the PDV buffer to allow transmission for the period of time specified by the *pdvt* attribute before buffer underflow due to packet delay occurs. When packets experience excessive delay, the buffer underflows, causing idle or comfort noise to be transmitted. When packets arrive more quickly, the buffer capacity above the initialization reserve determines the amount of data that can be stored before buffer overflow occurs.

This attribute must be at least 20 msec greater than the value specified by the *pdvt* attribute. Typically the *bufSize* is twice that of the *pdvt* value.

Mib: AmrBrag

Values: Decimal (40..80)

Units: msec

Default: 80

ATTRIBUTE Nsta Vgs AmrBrag packetDelayVariationTolerance (pdvt)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the packet delay variation tolerance. Packet delay variation tolerance specifies the maximum packet arrival jitter that the reassembly process tolerates in the packet stream without producing errors on the TDM interface. This attribute, together with the *bufSize* attribute, can be configured to optimize the jitter against absolute delay trade-off in various network configurations. Increasing the value of this attribute will increase the delay while optimizing the jitter.
Mib	AmrBrag
Values	Decimal (10..60)
Units	msec
Default	25

ATTRIBUTE Nsta Vgs AmrBrag echoCancelHybridDetector (eCanHybDet)

Access	Read: All Write: All
Description	This attribute enables or disables the hybrid detector for the echo cancellation feature. The hybrid detector will temporarily disable the echo canceller when a digital call is detected. This attribute normally specifies enabled and should be changed only on the advice of Nortel support personnel.
Mib	AmrBrag
Values	disabled enabled
Default	enabled

ATTRIBUTE Nsta Vgs AmrBrag backgroundNoiseConditioningTfo (bncTfo)

Access	Read: All Write: All
Description	This attribute enables or disables background noise conditioning and low-pass filtering for Tandem Free Operation (TFO) mode. The background noise conditioning algorithm has an optional post-processing feature that performs low-pass filtering on the noise conditioned signal. Depending on the presence of any other third-party voice quality devices within the network, the operator may desire to disable low-pass filtering to prevent any voice quality degradation due to feature

GROUP Nsta Vgs AmrBrag OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib AmrBrag

ATTRIBUTE Nsta Vgs AmrBrag adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib AmrBrag

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Nsta Vgs AmrBrag operationalState (osiOper)

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AmrBrag
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs AmrBrag usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AmrBrag
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs AmrBrag Operational (Oper)

Properties	Operational
Description	This group contains attributes which indicate the causes of *AmrBrag* or *CsdBrag* component failure.
Mib	AmrBrag

ATTRIBUTE Nsta Vgs AmrBrag failureCause (failCause)

Access	Read: All Write: Illegal
Description	This attribute indicates the cause for failure. The failure cause values are:

Copyright © 2006, Nortel Nortel Confidential

serviceChanNotReady - the TDM LP is down, or waiting for the CHAN to establish communication.
atmConnectionNotReady - the ATM LP is down, or has not established communication.
operatorLock - a component on which this *Brag* depends is locked by the operator.
internalError - an internal error, which can not be determined has occurred.
outOfResource - the current demand has exceeded the capacity of the hardware resources.
vspNotReady - the VSP card is down, or has not established communication.
activating - component creation is currently in progress.
none - no failure.

Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 udpPortConnection (udpConn)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the link to the *Nsta Vgs CtrlConn UdpPort* component that defines the UDP port access to the IP network for connection to the layer 3 user. It should match the UDP port provisioned in the corresponding *Mtp3 Linkset Link* component specified by its *remoteUdpPort* attribute. A port must be specified for *Check Prov* to succeed. Within a single *Nsta Vgs* hierarchy, at most three *Mtp2* components can link to *UdpPort* components under the *Ctrl/mg* component, and at most three *Mtp2* components can link to *UdpPort* components under the *Ctrl/sg* component. Changing this attribute will cause the link to be restarted.
Mib	AmrBrag
Values	Link (Service, linkToApplication)
Default	No default

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 alignmentReadyTimer (t1)

Access	Read: All Write: All
Description	This attribute specifies the value of the Alignment Ready timer defined in ITU-T recommendation Q.703. This timer is started when the link reaches the “Alignment Ready” state. This timer stops upon entering the “In Service” state. Reception of a FISU or MSU while in the “Alignment Ready” state causes the state transition to the “In Service” state. A timer expiry causes the state to transition to the “Idle” state. The number of expiries of this timer is counted by the attribute *alignmentReadyTimeouts.*
Mib	AmrBrag
Values	Decimal (40..50)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	45

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 notAlignedTimer (t2)

Access	Read: All Write: All
Description	This attribute specifies the value of the “Not Aligned “timer defined in ITU-T recommendation Q.703. It is used during initial alignment. This timer is started when the link enters the “Not Aligned” state which begins sending status indication “O”. If the timer expires before receiving a status indication “O”, “N” or “E”, alignment is stopped and the “Idle” state is entered. Otherwise the link proceeds to the “Aligned” state. The number of expiries of this timer is counted by the attribute *notAlignedTimeouts.*
Mib	AmrBrag
Values	Decimal (5..150)
Units	seconds
Default	60

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 alignedTimer (t3)

Access	Read: All Write: All
Description	This attribute specifies the value of the Timer “aligned” defined in ITU-T recommendation Q.703. It is used during initial alignment. This timer is started when the link enters the “Aligned” state which begins sending status indication “N” or “E”, depending on whether the link is in normal or emergency alignment mode respectively. If the timer expires before a status indication “N” or “E” is received, alignment is stopped and the “Idle” state is entered. Otherwise the link proceeds to the “Proving” state. The number of expiries of this timer is counted by the attribute *alignedTimeouts.*
Mib	AmrBrag
Values	Decimal (1000..2000)
Units	msec
Default	1500

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 normalProvingTimer (t4n)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the value of the proving period timer for normal alignment as defined in ITU-T recommendation Q.703. It is used during initial alignment. It is started when the link enters the “Proving” state. In normal alignment mode, proving must last for a period specified by this timer before the link can enter the “Aligned Ready” state. Expiry of this timer indicates a successful proving period unless the proving period has been previously aborted up to four times. A higher value for this timer ensures a more stable link, but increases the time taken to bring the link in service.
Mib	AmrBrag
Values	Decimal (7500..9500)
Units	msec
Default	8500

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 emergencyProvingTimer (t4e)

Access	Read: All Write: All
Description	This attribute specifies the value of the proving period timer for emergency alignment as defined in ITU-T recommendation Q.703. It is used during initial alignment. It is started when the link enters the “Proving” state. In emergency alignment mode, proving must last for a period specified by this timer before the link can enter the “Aligned Ready” state. Expiry of this timer indicates a successful proving period unless the proving period has been previously aborted up to four times. A higher value for this timer ensures a more stable link, but increases the time taken to bring the link in service.
Mib	AmrBrag
Values	Decimal (1000..2000)
Units	msec
Default	1500

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 sendingSibTimer (t5)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the value of the “Sending SIB” timer defined in ITU-T recommendation Q.703. It is used for congestion control. The value of this timer determines the interval at which the receiving end of a signalling link, which detects a congestion situation returns a status indication “B” to the remote transmitting end of the link. This causes the remote end of the link to stop sending messages until the congestion condition goes away. The number of times a status indication “B”, that is, a congestion indication is sent is counted by the attribute *congestionIndicationTx*. The number of times a congestion situation is detected is counted by the attribute *congestionDetects*.
Mib	AmrBrag
Values	Decimal (80..120)
Units	msec
Default	100

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 **remoteCongestionTimer (t6)**

Access	Read: All Write: All
Description	This attribute specifies the value of the remote congestion timer defined in ITU-T recommendation Q.703. This timer begins when a status indication “B” is received, indicating congestion at the remote end. This timer is stopped when the congestion abates at the signalling point, as indicated by a message in the retransmit buffer being acknowledged. Upon timer expiration, a link failure indication is generated. The number of times a status indication “B” is received, indicating congestion at the remote end, is counted by the attribute *remoteCongestionIndicationsRx.*
Mib	AmrBrag
Values	Decimal (3000..6000)
Units	msec
Default	4500

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 **ackTimer (t7)**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the value of the “Excessive delay of acknowledgment” timer defined in ITU-T recommendation Q.703. It is used during normal sending and receiving of MSUs. This timer starts when the first MSU is placed in the retransmit buffer and is pending acknowledgment. This timer is stopped after the last MSU in the retransmit buffer is acknowledged. This timer is restarted after each acknowledgment when the retransmit buffer is non-empty. It is also restarted each time a link status indication unit “B” is received. If the timer expires, a link failure indication is generated. The number of expiries of this timer is counted by the attribute *ackTimeouts.*
Mib	AmrBrag
Values	Decimal (500..2000)
Units	msec
Default	1250

GROUP **Nsta Vgs AmrBrag Mtp2** **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AmrBrag

ATTRIBUTE **Nsta Vgs AmrBrag Mtp2** **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — AmrBrag

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — AmrBrag

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — AmrBrag

Values — idle
active (activ)
busy

Default — idle

GROUP Nsta Vgs CsdBrag Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *NstaVgsWgCsdBasicRateGroup* component.
Mib	CsdBrag

ATTRIBUTE Nsta Vgs CsdBrag interfaceName (intName)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies a link to a *Chan* component, which in turn specifies the timeslots for the *CsdBrag.* This attribute must specify an *Lp/n E1/n Chan/n* component. *Lp/n DS1/n Chan/n* components are not supported.
Mib	CsdBrag
Values	Link (Service, applicationFramerName)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag defaultMode (defMode)

Access	Read: All Write: All
Description	This attribute specifies the operational mode to be used for a CSD call when no mode is defined during call setup via the call setup protocol. ***transparent*** - operate in transparent CSD mode when no mode is defined. ***nonTransparent*** - operate in non-transparent CSD mode when no mode is defined.

Copyright © 2006, Nortel Nortel Confidential

Mib	CsdBrag
Values	transparent nonTransparent
Default	transparent

ATTRIBUTE Nsta Vgs CsdBrag defaultRate (defRate)

Access	Read: All Write: All
Description	This attribute specifies the encoding rate to be used for a CSD call when no rate is defined during call setup via the call setup protocol. Transparent mode only supports a rate of ***64.0*** kbit/s, and nontransparent mode only supports ***14.4*** kbit/s.
Mib	CsdBrag
Values	Decimal (14.40; 64.00)
Units	kbit/s
Default	64.00

ATTRIBUTE Nsta Vgs CsdBrag lossIntegrationPeriod (intPeriod)

Access	Read: All Write: All
Description	This attribute specifies the interval of time for which a loss of packet condition must persist before the corresponding call is dropped. A value of ***disabled*** specifies that packet loss integration is disabled, and therefore call connections will not be dropped due to packet loss.
Mib	CsdBrag
Values	Decimal (1..50) disabled
Units	seconds
Default	5

ATTRIBUTE Nsta Vgs CsdBrag bufferSize (bufSize)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the capacity of the packet delay variation (PDV) buffer. The PDV buffer will be sized to store the amount of data that can be transmitted to the TDM network in the specified period of time.

Copyright © 2006, Nortel Nortel Confidential

To ensure end-to-end voice quality, a PDV buffer is provided at the output of the uplink RNC-TRAU network to filter out ATM AAL2 packet jitter. To ensure that PDV can be tolerated, it is necessary to initialize this buffer with a reserve of transmitted data. The size of this reserve is defined by the *pdvt* attribute, and the size of the buffer that holds this reserve is specified by the *bufSize* attribute.

The size of the initialization reserve is set to the amount of data that can be transmitted to the TDM network in the time specified by the *pdvt* attribute. There should be enough data in the PDV buffer to allow transmission for the period of time specified by the *pdvt* attribute before buffer underflow due to packet delay occurs. When packets experience excessive delay, the buffer underflows, causing fill sequences to be transmitted. When packets arrive more quickly, the buffer capacity above the initialization reserve determines the amount of data that can be stored before buffer overflow occurs.

This attribute must be at least 40 msec greater than the value of the *pdvt* attribute. Typically the *bufSize* is twice that of the *pdvt* value.

Mib	CsdBrag
Values	Decimal (40..160)
Units	msec
Default	100

ATTRIBUTE Nsta Vgs CsdBrag **packetDelayVariationTolerance (pdvt)**

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the packet delay variation tolerance. Packet delay variation tolerance specifies the maximum packet arrival jitter that the reassembly process tolerates in the packet stream without producing errors on the TDM interface. This attribute, together with the *bufSize* attribute, can be configured to optimize the jitter against absolute delay trade-off in various network configurations.
Mib	CsdBrag
Values	Decimal (10..120)
Units	msec
Default	50

GROUP Nsta Vgs CsdBrag Mtp2 Provisioned (Prov)

Properties Provisioned

Description This group contains the provisioning attributes for the *Mtp2* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	CsdBrag

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 layer3IpAddress (l3IpAddr)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the remote IP address of the layer 3 entity that owns this link. This address must match the IP address provisioned in the corresponding *Mtp3* component specified by its *linkToPort* attribute. Changing this attribute will cause the link to be restarted.
Mib	CsdBrag
Values	IP address
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 layer3Port (l3Port)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the remote UDP port of the layer 3 entity that owns this link. This port must match the UDP port provisioned in the corresponding *Mtp3* component specified by its *linkToPort* attribute. Changing this attribute will cause the link to be restarted.
Mib	CsdBrag
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 udpPortConnection (udpConn)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the link to the *Nsta Vgs CtrlConn UdpPort* component that defines the UDP port access to the IP network for connection to the layer 3 user. It should match the UDP port provisioned in the corresponding *Mtp3 Linkset Link* component specified by its *remoteUdpPort* attribute.

Copyright © 2006, Nortel Nortel Confidential

A port must be specified for *Check Prov* to succeed.

Within a single *Nsta Vgs* hierarchy, at most three *Mtp2* components can link to *UdpPort* components under the *Ctrl/mg* component, and at most three *Mtp2* components can link to *UdpPort* components under the *Ctrl/sg* component.

Changing this attribute will cause the link to be restarted.

Mib	CsdBrag
Values	Link (Service, linkToApplication)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 alignmentReadyTimer (t1)

Access	Read: All Write: All
Description	This attribute specifies the value of the Alignment Ready timer defined in ITU-T recommendation Q.703. This timer is started when the link reaches the “Alignment Ready” state. This timer stops upon entering the “In Service” state. Reception of a FISU or MSU while in the “Alignment Ready” state causes the state transition to the “In Service” state. A timer expiry causes the state to transition to the “Idle” state. The number of expiries of this timer is counted by the attribute *alignmentReadyTimeouts.*
Mib	CsdBrag
Values	Decimal (40..50)
Units	seconds
Default	45

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 notAlignedTimer (t2)

Access	Read: All Write: All
Description	This attribute specifies the value of the “Not Aligned “timer defined in ITU-T recommendation Q.703. It is used during initial alignment. This timer is started when the link enters the “Not Aligned” state which begins sending status indication “O”. If the timer expires before receiving a status indication “O”, “N” or “E”, alignment is stopped and the “Idle” state is entered. Otherwise the link

Copyright © 2006, Nortel Nortel Confidential

proceeds to the “Aligned” state.

The number of expiries of this timer is counted by the attribute *notAlignedTimeouts.*

Mib	CsdBrag
Values	Decimal (5..150)
Units	seconds
Default	60

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 alignedTimer (t3)

Access	Read: All Write: All
Description	This attribute specifies the value of the Timer “aligned” defined in ITU-T recommendation Q.703. It is used during initial alignment. This timer is started when the link enters the “Aligned” state which begins sending status indication “N” or “E”, depending on whether the link is in normal or emergency alignment mode respectively. If the timer expires before a status indication “N” or “E” is received, alignment is stopped and the “Idle” state is entered. Otherwise the link proceeds to the “Proving” state. The number of expiries of this timer is counted by the attribute *alignedTimeouts.*
Mib	CsdBrag
Values	Decimal (1000..2000)
Units	msec
Default	1500

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 normalProvingTimer (t4n)

Access	Read: All Write: All
Description	This attribute specifies the value of the proving period timer for normal alignment as defined in ITU-T recommendation Q.703. It is used during initial alignment. It is started when the link enters the “Proving” state. In normal alignment mode, proving must last for a period specified by this timer before the link can enter the “Aligned Ready” state. Expiry of this timer indicates a successful proving period unless the proving period has been previously aborted up to four times.

Copyright © 2006, Nortel Nortel Confidential

	A higher value for this timer ensures a more stable link, but increases the time taken to bring the link in service.
Mib	CsdBrag
Values	Decimal (7500..9500)
Units	msec
Default	8500

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 emergencyProvingTimer (t4e)

Access	Read: All Write: All
Description	This attribute specifies the value of the proving period timer for emergency alignment as defined in ITU-T recommendation Q.703. It is used during initial alignment. It is started when the link enters the “Proving” state. In emergency alignment mode, proving must last for a period specified by this timer before the link can enter the “Aligned Ready” state. Expiry of this timer indicates a successful proving period unless the proving period has been previously aborted up to four times. A higher value for this timer ensures a more stable link, but increases the time taken to bring the link in service.
Mib	CsdBrag
Values	Decimal (1000..2000)
Units	msec
Default	1500

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 sendingSibTimer (t5)

Access	Read: All Write: All
Description	This attribute specifies the value of the “Sending SIB” timer defined in ITU-T recommendation Q.703. It is used for congestion control. The value of this timer determines the interval at which the receiving end of a signalling link, which detects a congestion situation returns a status indication “B” to the remote transmitting end of the link. This causes the remote end of the link to stop sending messages until the congestion condition goes away. The number of times a status indication “B”, that is, a congestion indication is sent is counted by the attribute *congestionIndicationTx*. The number of times a congestion situation is detected is counted by the attribute *congestionDetects*.

Copyright © 2006, Nortel Nortel Confidential

Mib	CsdBrag
Values	Decimal (80..120)
Units	msec
Default	100

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 remoteCongestionTimer (t6)

Access	Read: All Write: All
Description	This attribute specifies the value of the remote congestion timer defined in ITU-T recommendation Q.703. This timer begins when a status indication “B” is received, indicating congestion at the remote end. This timer is stopped when the congestion abates at the signalling point, as indicated by a message in the retransmit buffer being acknowledged. Upon timer expiration, a link failure indication is generated. The number of times a status indication “B” is received, indicating congestion at the remote end, is counted by the attribute *remoteCongestionIndicationsRx.*
Mib	CsdBrag
Values	Decimal (3000..6000)
Units	msec
Default	4500

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 ackTimer (t7)

Access	Read: All Write: All
Description	This attribute specifies the value of the “Excessive delay of acknowledgment” timer defined in ITU-T recommendation Q.703. It is used during normal sending and receiving of MSUs. This timer starts when the first MSU is placed in the retransmit buffer and is pending acknowledgment. This timer is stopped after the last MSU in the retransmit buffer is acknowledged. This timer is restarted after each acknowledgment when the retransmit buffer is non-empty. It is also restarted each time a link status indication unit “B” is received.

Copyright © 2006, Nortel Nortel Confidential

If the timer expires, a link failure indication is generated.

The number of expiries of this timer is counted by the attribute *ackTimeouts.*

Mib	CsdBrag
Values	Decimal (500..2000)
Units	msec
Default	1250

GROUP Nsta Vgs CsdBrag Mtp2 **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	CsdBrag

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	CsdBrag
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 **operationalState (osiOper)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	CsdBrag
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	CsdBrag
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs CsdBrag Mtp2 Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Mtp2* component.
Mib	CsdBrag

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 alignmentReadyTimeouts (t1Tmouts)

Access	Read: All Write: Illegal
Description	This attribute counts the timeouts of the Alignment Ready timer (T1) represented by the attribute *alignmentReadyTimer.*

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 notAlignedTimeouts (t2Tmouts)

Access	Read: All Write: Illegal
Description	This attribute counts the timeouts of the “Not Aligned “timer (T2) represented by the attribute *notAlignedTimer.* The counter wraps to zero when it exceeds the maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 alignedTimeouts (t3Tmouts)

Access	Read: All Write: Illegal
Description	This attribute counts the timeouts of the Aligned Timer (T3) represented by the attribute *alignedTimer.* The counter wraps to zero when it exceeds the maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 congestionDetects (congDet)

Access	Read: All Write: Illegal
Description	This attribute counts the number of times congestion was detected at the local end of the signalling link. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 congestionIndicationsTx (congIndTx)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute counts the number of congestion indications transmitted. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 remoteCongestionIndicationsRx (remCongIndRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of congestion indications received from the remote end. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 ackTimeouts (t7Tmouts)

Access	Read: All Write: Illegal
Description	This attribute counts the timeouts of the T7 Timer represented by the attribute *ackTimer.* The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 insvFailures (insvFail)

Access	Read: All Write: Illegal
Description	This attribute counts the number of in-service link outages. It does not include failures which occur during the alignment process. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msuTx

Access	Read: All Write: Illegal
Description	This attribute counts the number of message signal units transmitted. This includes the number of message signal units retransmitted, indicated by the attribute *msuRetransmits*. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msuRetransmits (msuReTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of message signal units retransmitted because of negative acknowledgments. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msuRx

Access	Read: All Write: Illegal
Description	This attribute counts the number of message signal units received. This includes the MSUs with errors, indicated by the attribute *msuErrors.* The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msuErrors (msuErrs)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of ingress signal units discarded because of sequence number, length or CRC errors. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msuOctetsTx (octTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of layer 3 payload octets transmitted. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msuOctetsRx (octRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of layer 3 payload octets received. The counter wraps to 0 when it exceeds its maximum value.
Mib	CsdBrag

Values	Decimal (1..5)
Units	seconds
Default	3

GROUP Nsta Vgs V5ua OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs V5ua adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Vgs

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Nsta Vgs V5ua operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Vgs

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Nsta Vgs V5ua usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs V5ua Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Nsta/n Vgs V5ua* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs V5ua applicationServerStatus

Access	Read only
Description	This attribute indicates the status of the Application Server. The possible values are: ***active*** - The Application Server (AS) is available and application traffic is active. This state implies that at least one Application Server Process (ASP) is in active state. ***up*** - The AS is available but no application traffic is active (one or more related ASPs are in the inactive state, but none in the active state). The recovery timer is not running or has expired. ***down*** - The AS is unavailable. This state implies that all related ASPs are in the down state for this AS. The recovery timer is not running or has expired. ***pending*** - The ASP has transitioned from active to inactive or down and it was the last remaining active ASP in the AS. A recovery timer starts, and any incoming SCN messages after that will be queued by the SG. If an ASP becomes active before a recovery timer expires, the AS will move to active state and all the queued messages will be sent to the active ASP.
Mib	Vgs
Values	up down active pending
Default	down

COMPONENT Nsta Vgs V5ua ApplicationServerProcess (Asp)

Instance	address [IP address] port [Decimal (1..65535)]
Groups	GROUP Nsta Vgs V5ua Asp Operational (Oper)

GROUP Nsta Vgs BragS Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioning data for the *BasicRateGroupServer* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs BragS localAddress

Access	Read and write
Criticality	Process
Description	This attribute specifies the NSAP address of the *BragS*. If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) has been provisioned, a default value for *localAddress* based on the *nodePrefix* is provided. If a default value can not be generated the operator is forced to set a value for this attribute. Alternatively, the *ModuleData nodePrefix* attribute may be provisioned, and this *BragS* component then deleted and readded.
Mib	Vgs
Values	String (1..44, AESANsapAddress)
Default	No default

ATTRIBUTE Nsta Vgs BragS tdmLogLaw (muALaw)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the G.711 companding law to use on the TDM service stream. If set to ***aLaw***, Alaw companding is used. If set to ***muLaw***, Mulaw companding is used. If set to ***autoConfigured***, then the actual value used is derived from the facility, namely ***muLaw*** would be used for *DS1* stream, while ***aLaw*** would be used by *E1* stream.
Mib	Vgs
Values	muLaw aLaw autoConfigured
Default	autoConfigured

ATTRIBUTE Nsta Vgs BragS bufferSize (bufSize)

Access	Read and write
Criticality	Process
Description	This attribute specifies the capacity of the packet delay variation (PDV) buffer in milliseconds of data. To ensure that PDV can be tolerated it is necessary to initialize the system with a reserve of information in the buffer used to reassemble data for transmission across the TDM network. The size of this reserve is defined by the *pdvt* and *bufferSize* attributes. The amount of data played out to the TDM network (in time equal to the value of the *pdvt* attribute) is equal to the size of the initialization reserve. There should be enough data in the reassembly buffer to allow transmission for a period of time defined by the *pdvt* attribute before buffer underflow due to the next delayed packet occurs. If the ***vgsIp, vsIpG729, vgsIpGe***, or ***vgsIpG729Ge*** feature have been provisioned the default *bufferSize* will be ***60ms*** otherwise the *bufferSize* will be ***50ms***. The value should always be greater than two times the value of the *pdvt* attribute plus the maximum packet size, except on a ***2pGeMmSrVsp3*** card where it need only be greater than or equal to two times the *pdvt*. The maximum packet size is 20ms for ***vgsIp***, ***vgsIpG729, vgsIpGe*** and ***vgsIpG729Ge*** features and 10ms for all other features. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to

Copyright © 2006, Nortel Nortel Confidential

sameAsProfile.

This attribute has no effect if the *packetDelayVariationTolerance* attribute is set to ***adaptive***.

Mib	Vgs
Values	Decimal (5..100) sameAsProfile
Units	msec
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS **packetDelayVariationTolerance (pdvt)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum packet arrival jitter in milliseconds that the reassembly process will tolerate in the packet stream without producing errors on the TDM interface. This attribute together with the *bufferSize* attribute, can be configured to optimize the jitter versus absolute delay tradeoff in various network configurations. The value should always be less than the value of the *bufferSize* attribute minus the maximum packet size divided by two, except on a ***2pGeMmSrVsp3*** card where it need only be less than or equal to the *bufferSize* divided by two. The maximum packet size is 20ms for ***vgsIp, vgsIpG729, vgsIpGe*** and ***vgsIpG729Ge*** features and 10ms for all other features. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***. If set to ***adaptive***, the hardware attempts to minimise the absolute delay while allowing for the maximum packet arrival jitter encountered. This value is only supported on the following cards: ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3***, ***2pVS.***
Mib	Vgs
Values	Decimal (5..50) sameAsProfile adaptive

Copyright © 2006, Nortel Nortel Confidential

Units	msec
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS lossIntegrationPeriod (intPeriod)

Access	Read and write
Description	This attribute specifies the interval of time in seconds for which a loss of packet condition must persist before the corresponding call is dropped. A value of ***0*** specifies that packet loss integration is disabled and therefore call connections are not suspended after packet loss. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	Decimal (0..50) sameAsProfile
Units	seconds
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS ingressGain (iGain)

Access	Read and write
Description	This attribute specifies the gain applied on the TDM ingress side to balance the network loss plan.
Mib	Vgs
Values	Signed (-12..12)
Units	dB
Default	0

ATTRIBUTE Nsta Vgs BragS egressGain (eGain)

Access	Read and write
Description	This attribute specifies the gain applied on the TDM egress side to balance the network loss plan.
Mib	Vgs
Values	Signed (-12..12)
Units	dB
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs BragS echoCancellation (eCan)

Access	Read and write
Description	This attribute specifies whether echo cancellation is enabled or disabled. The value of this attribute will determine whether echo cancellation will be on or off when a 2100Hz tone is detected. Note that the controller may override this attribute on a call by call basis to activate or deactivate echo cancellation. ***g165Mode*** - Enables echo cancellation except when a 2100Hz tone with phase reversal is detected. ***alwaysOn*** - Enables echo cancellation regardless of whether a 2100Hz tone is detected. ***g164Mode*** - Disables echo cancellation only when a 2100Hz tone is detected, regardless of phase reversal. ***disabled*** - Disables echo cancellation. The values ***alwaysOn*** and ***g164Mode*** are not permitted on a ***2pGeMmSrVsp3*** card.
Mib	Vgs
Values	g165Mode disabled alwaysOn g164Mode
Default	g165Mode

ATTRIBUTE Nsta Vgs BragS minimumEchoReturnLoss (minEchoRetLoss)

Access	Read and write
Description	This attribute specifies the minimum echo return loss that can be expected on the line.
Mib	Vgs
Values	Decimal (0; 3; 6)
Units	dB
Default	6

ATTRIBUTE Nsta Vgs BragS echoCancelComfortNoiseGeneration (eCanComNoiseGen)

Access	Read and write
Description	The attribute specifies whether comfort noise generation for the echo cancellation feature is enabled or disabled. This attribute has no effect if

Copyright © 2006, Nortel Nortel Confidential

echoCancellation is ***disabled*** through provisioning or through 2100 Hz tone detection.

Mib	Vgs
Values	enabled disabled
Default	enabled

ATTRIBUTE Nsta Vgs BragS defaultVoiceRate (defVRate)

Access	Read and write
Description	This attribute specifies the default coding algorithm to be used under normal conditions (when no 2100 Hz tone is detected). For each connection, this default coding algorithm can be overridden by the controller. When the VSP card type is ***2pGeMmSrVsp3*** or ***2pOC3ChSmIrVsp3***, and the ***vgsAtm*** or ***vgsAtmG729*** feature is provisioned, the value must be ***64kG711, 24kG726*** or ***32kG726*** If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	64kG711 32kG726 24kG726 8kG729 sameAsProfile
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS tone2100Rate (toneRate)

Access	Read and write
Description	This attribute specifies the coding algorithm to be used for timeslots within all the *DBrag* subcomponents of this *BragS* component on which 2100 Hz tone is detected (phase reversal may or may not be detected). This attribute takes precedence over the *defaultVoiceRate* attribute. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	64kG711 32kG726 sameAsProfile
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS silenceDetectionHangOverTime (silDetTime)

Access	Read and write
Description	This attribute specifies the time in milliseconds for which the speech path is left on before being suppressed when a timeslot is silent. This helps to prevent clipping at the end of words. This attribute specifies the silence detection hang over time for all voice packets transmitted on IP and is ignored by AAL2 transmission. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	Decimal (30..500) sameAsProfile
Units	msec
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS silenceSuppression (silSup)

Access	Read and write
Description	This attribute specifies whether silence suppression is performed. A value of ***enabled*** indicates that silence suppression is performed as default. For each connection this default can be overridden by the controller. A value of ***disabled*** indicates that silence suppression is not performed under any circumstances. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	enabled disabled sameAsProfile
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS silenceSuppressionThreshold (silSupThresh)

Access	Read and write
Description	This attribute specifies the level above which silence suppression is not performed. A value in the range -39 to -36 dBm0 is only permitted on a ***2pGeMmSrVsp3*** card. If ***sameAsProfile***, the equivalent value from the *PktProf* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	Signed (-60..-36) sameAsProfile
Units	dBm0
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS signalingType (sigType)

Access	Read and write
Criticality	Process
Description	This attribute specifies the signaling type of the trunks within all the *DBrag* components of this *BragS*. ***unsignaled*** performs no additional signaling. ***mfRemote*** performs MF signaling to a remote call server. This attribute must be set to ***unsignaled*** when using ATM transport.
Mib	Vgs
Values	unsignaled mfRemote
Default	unsignaled

ATTRIBUTE Nsta Vgs BragS echoCancellationTailLength (eCanTail)

Access	Read and write
Description	This attribute specifies the Echo Cancellation tail length applied to all timeslots within all the *DBrag* components of this *BragS*.

Copyright © 2006, Nortel Nortel Confidential

A value of 32ms should be used for networks with a round trip delay of 0 to 28 ms, and a value of 48 ms should be used for networks with a round trip delay of 28 to 44 ms. The use of 48 ms for round trip delays of less than 32 ms is not advised. The use of 64 ms is reserved for the ***2pGeMmSrVsp3*** card.

If set to ***autoConfigure*** the actual value used depends on card type. If the card type is ***12mVspAal*** or ***Vsp2***, the echo cancellation tail length is set to 32 ms. If the card type is ***2pGeMmSrVsp3***, the echo cancellation tail length is set to 64 ms.

This attribute must be set to ***32,*** or ***autoConfigure*** for the non switched voice over ATM service and when running on a ***12mVspAal*** card.

This attribute must be set to ***32***, ***48*** or ***autoConfigure*** when using a ***Vsp2*** card.

This attribute must be set to ***128*** or ***autoConfigure*** when using a ***2pGeMmSrVsp3*** card.

Default sameAsVgs

ATTRIBUTE Nsta Vgs BragS minimumDtmfPowerLevel (minDtmfPwr)

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the value of the minimum power level at which DTMF digits must be detected. This value is used to allow for different specification for different administrations. This attribute is ignored if the *DigitCollection* component is not present under the parent *Vgs*. This attribute must be a multiple of 3 on a ***2pGeMmSrVsp3*** card.
Mib	Vgs
Values	Signed (-30..-22)
Units	dBm0
Default	-27

ATTRIBUTE Nsta Vgs BragS **digitTransport**

Access	Read and write
Description	This attribute specifies the method by which digit tones are transported. If ***64kG711***, then G.729 voice channels will upspeed to send ***64kG711*** packets when DTMF is detected. If ***sendAsVoice***, DTMF is encoded using currently selected codec. If ***squelch,*** during the playback of a digit, silence is sent over the voice path, encoded at the current encoding rate. If ***relay***, this value enables negotiation of mutual support for the relay of DTMF tones as RFC2833 VoIP packets. Should this negotiation fail then behavior is the same as for ***64kG711***. A value of ***relay*** is only valid on a ***2pGeMmSrVsp3*** card. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	sendAsVoice 64kG711 squelch relay sameAsProfile
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS **vbdTransport**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the method by which voiceband data tones are transported. If ***useTone2100Rate***, then G.729 voice channels will upspeed to send ***64kG711*** packets when VBD is detected regardless of whether or not the remote gateway has indicated support for this codec. If ***useTone2100RateIfNegotiated***, then G.729 voice channels will upspeed to send ***64kG711*** packets when VBD is detected only when the remote gateway has indicated support for this codec. If ***sameAsProfile***, the equivalent value from the *PktProf* subcomponent of the parent *Vgs* component is used. If an *H248* component is provisioned, then this attribute must be set to ***sameAsProfile***.
Mib	Vgs
Values	useTone2100RateIfNegotiated useTone2100Rate sameAsProfile
Default	sameAsProfile

ATTRIBUTE Nsta Vgs BragS continuityTestType (cotType)

Access	Read and write
Description	This attribute specifies the type of continuity test. The possible values are: ***4Wire*** - Use 4 Wire continuity test ***2WireAnnex B2*** - Use 2 Wire COT as specified in document ANSI T1.113.4 B2 ***2WireAnnex B3 TLRH*** - Use 2 Wire COT as specified in document ANSI T1.113.4 B3, PVG acting as a 4-wire exchange. ***2WireAnnex B3 THRL*** - Use 2 Wire COT as specified in document ANSI T1.113.4 B3, PVG acting as a 2-wire exchange. The only accepted value for ***Vsp2*** cards is ***4Wire.***
Mib	Vgs
Values	4Wire 2WireAnnexB2 2WireAnnexB3TLRH 2WireAnnexB3THRL
Default	4Wire

GROUP Nsta Vgs FaxR Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the IP Fax Relay facility.
Mib	Vgs

ATTRIBUTE Nsta Vgs FaxR v34OverVbd (v34)

Access	Read and write
Description	This attribute specifies how the system transports V.8/V.34 fax data. If ***enabled***, V.8/V.34 fax data will be transported using Voice Band Data modes through upspeed to G.711 rather than directly transitioning to T.38 mode. If ***disabled***, transition to T.38 will occur on detection of V.8/V.34 fax data. This attribute should be set to ***enabled*** only if the underlying packet loss rate of the network is less than 0.05%. For a loss rate greater than this it is recommended that V.8/V.34 fax data be transported using T.38.
Mib	Vgs
Values	enabled disabled
Default	disabled

ATTRIBUTE Nsta Vgs FaxR t38FaxUdpRedundancyDepth (redundancy)

Access	Read and write
Description	This attribute specifies the depth of redundancy used in T.38 over UDP/IP. Note that this attribute will increase the bandwidth of a T.38 transmission by a factor equal to the redundancy depth specified.
Mib	Vgs
Values	Decimal (0..3)
Default	1

ATTRIBUTE Nsta Vgs FaxR t38PacketReorderDelay (delay)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies how long T.38 packets are held on the receive buffer for reordering before passing to playout. This in turn determines how long out of order or late packets may be. A lower value will decrease the system's ability to reorder and playout contiguous fax data.
Mib	Vgs
Values	Decimal (0..400)
Units	msec
Default	200

GROUP Nsta Vgs FaxR OperationalT38 (OperT38)

Properties	Operational
Description	This group contains attributes which indicate attempted and actual fax relay connections.
Mib	Vgs

ATTRIBUTE Nsta Vgs FaxR t38AutonomousConnections (auto)

Access	Read only
Description	This attribute counts the connections which have negotiated autonomous transition into T38 mode. This attribute wraps to zero when it reaches its maximum value. It will also reset to zero when the *Vsp* component is locked.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs FaxR t38SuccessfulCalls (successful)

Access	Read only
Description	This attribute counts the connections that entered T.38 mode and completed successfully. This attribute wraps to zero when it reaches its maximum value. It will also reset to zero when the *Vsp* component is locked.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs FaxR t38MgcConnections (mgc)

Access	Read only
Description	This attribute counts the connections that were explicitly transitioned into T38 mode by the media gateway controller.

Copyright © 2006, Nortel Nortel Confidential

This attribute wraps to zero when it reaches its maximum value. It will also reset to zero when the *Vsp* component is locked.

VERB Ping Nsta Vgs DbgAccess

Impact	Passive
Description	*Ping -ipAddr(IP Address) Nsta/n Vgs DebugIpAccess* This command causes an ICMP echo request to be sent to the host specified by the *ipAddr* option. If a response is received for the request, a second request is sent; if no response is received for the first request, no further request is sent. The remote IP host must respond to an ICMP ping request within 5 seconds of the request being generated. This is intended for testing network connections at the IP level. Only one *Ping* command per component is allowed to be in progress at any one time.

GROUP Nsta Vgs DbgAccess **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisioning data for the *DebugIpAccess* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs DbgAccess **ipAddress (ipAddr)**

Access	Read and write
Description	This attribute specifies the IP address of the debug capability on the Api Conversion Module (ACM) of the ***2pGeMmSrVsp3*** card. Control messages from the controller will be sent to this IP address to debug connections within this device. This address is used to advertise the gateway to the external hosts and to filter incoming IP packets (only packets destined for this *ipAddress* attribute value are accepted; all other packets are silently dropped). This attribute may be changed without affecting existing calls. This attribute may accept values in the range ***0.0.0.0*** to ***255.255.255.255*** though these limiting values themselves will be prevented by semantic check. A default value of ***0.0.0.0*** is set to ensure a legal address is provisioned. When the *DbgIpAccess* component is copied using the *Copy* command, this attribute is set to ***0.0.0.0*** to prevent a duplication of IP addresses.
Mib	Vgs
Values	IP address
Default	0.0.0.0

GROUP Nsta Vgs DbgAccess **OsiState (State)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs DbgAccess adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Vgs
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Vgs DbgAccess operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Vgs
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Nsta Vgs DbgAccess **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs DbgAccess **NstaVgsConnectionStatus (ConnStat)**

Properties	Operational
Description	This group contains an attribute which provides information on the status of the VGS connections.
Mib	Vgs

ATTRIBUTE Nsta Vgs DbgAccess **currentStatus (cStat)**

Access	Read only
Description	This attribute specifies the current status of a *Vgs AtmTConn*, *IpMConn* or *Ctrl* connection. ***enabled*** indicates that the component is enabled and available to transport traffic. ***activating*** indicates that the component is progressing through its expected sequence of activation and enabling actions, and that no errors having been reported. ***atmConnectionNotReady*** indicates that a problem has been reported with the ATM VCC linked to the component's *Nap, Aap* or *Pap* subcomponent, resulting in the component being in a disabled state. ***vspNotReady*** indicates that the *Vsp* component linked to the parent *Nsta* component is either disabled or locked. ***outOfResource*** indicates that no hardware resource is available on the

Copyright © 2006, Nortel Nortel Confidential

VSP card to support the component. This means that the VSP card is inadequately equipped or has suffered some level of hardware failure.

ipNetworkInaccessible indicates that a connection into the IP network cannot be created. This may be due to physical ports being disabled, or the inability of routing software to establish an appropriate connection.

Mib	Vgs
Values	enabled activating atmConnectionNotReady vspNotReady outOfResource ipNetworkInaccessible
Default	No default

GROUP Nsta Vgs DbgAccess **Statistics (Stats)**

Properties	Operational
Description	This group contains attributes which indicate traffic load and error statistics.
Mib	Vgs

ATTRIBUTE Nsta Vgs DbgAccess **txMessages (txMsgs)**

Access	Read only
Description	This attribute counts the messages transmitted since the component was activated. The value wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess **rxMessages (rxMsgs)**

Access	Read only
Description	This attribute counts messages received without errors since the component was activated. The value wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess **aal5Failures (errs)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts AAL5 errors over this control connection, where AAL5 errors represents the combined total of CRC, Length Field, and max_SDU_deliver_length errors. This attribute is filtered when the ***vgsIpGigE*** or the ***vgsIpG729GigE*** feature is provisioned, or the *VrAp* subcomponent is provisioned under this component. The value wraps to zero when the maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)

VERB Restart Nsta Vgs DbgAccess SpvcAp

Impact	Service
Description	*Restart Nsta/n Vgs Control/n SpvcAccessPoint* *Restart Nsta/n Vgs IpMConn SpvcAccessPoint* *Restart Nsta/n Conn/n SpvcAccessPoint* This command is used to restart the automatic connection procedure. The operational attributes *retryTimeRemaining* and *retryFailures* are also reset. The *Restart* verb restarts the connection procedure with the current active address as specified in the *addressToCall* attribute. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection is released first. This command fails if the *svcStatus* attribute has the value ***initializing*** or the value ***failed***.

GROUP Nsta Vgs DbgAccess SpvcAp **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains provisioning data for the *SpvcAp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **atmServiceCategory (service)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM service category for SVCs. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for constant bit rate service. Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as "bursty". Cells which are delayed beyond the value specified by *cellTransferDelay* are assumed to be of significantly reduced value to the application. The real-time variable

Copyright © 2006, Nortel Nortel Confidential

bit rate service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a *peakCellRate*, *sustainedCellRate*, and *maximumBurstSize*. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. The non real-time variable bit rate service may support statistical multiplexing of connections.

If the parent of the *SpvcAp* is a *Ctrl* component then the default value of *atmServiceCategory* attribute is ***nrtVariableBitRate***; it may not take the value ***rtVariableBitRate***. If the parent of the *SpvcAp* is an *IpMConn* component then the default value of *atmServiceCategory* attribute is ***rtVariableBitRate***; it may not take the value ***nrtVariableBitRate***.

Mib	Vgs
Values	constantBitRate (cbr) rtVariableBitRate (rtVbr) nrtVariableBitRate (nrtVbr)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **peakCellRate (pcr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the peak cell rate of the ATM connection.
Mib	Vgs
Values	Decimal (1..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **sustainedCellRate (scr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the sustained cell rate of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cell/s

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **maximumBurstSize (mbs)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum burst size, at the peak cell rate, of the ATM connection. It must be provisioned with a non-zero value when the *atmServiceCategory* attribute has the value ***rtVariableBitRate*** or ***nrtVariableBitRate***, and it must be provisioned with zero value when it has the value ***constantBitRate***.
Mib	Vgs
Values	Decimal (0..2147483647)
Units	cells
Default	0

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **retryLimit (limit)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of consecutive unsuccessful setup attempts before further attempts are abandoned. If this limit is reached, management action is required (restart the connection attempts with the *Restart* verb). A value of zero indicates no limit; attempts will continue indefinitely until a successful connection is established.
Mib	Vgs
Values	Decimal (0..65535)
Default	0

GROUP Nsta Vgs DbgAccess SpvcAp **SpvcApAddressessProv (SpvcApAddrProv)**

Properties	Provisioned
Description	This group contains NSAP address provisioning data for the *SpvcAp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **localAddress (localAddr)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the access point's ATM address. If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) is provisioned, a default value for *localAddress* based on the *nodePrefix* is

Copyright © 2006, Nortel Nortel Confidential

provided.

If a default cannot be generated the operator is forced to set a value for this attribute. Alternatively, the *ModuleData nodePrefix* attribute may be provisioned, and this access point component then deleted and re-added.

Mib	Vgs
Values	String (1..44, AESANsapAddress)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **remoteVpiVci (rVpiVci)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the remote VPI and VCI for an *SpvcAp* component.
Mib	Vgs
Values	Integer Sequence (0..255; 1..65535)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **addressToCall (addrToCall)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the list of remote NSAP addresses which this component can call. At least one address must be provisioned. For the *ControlConnection* application in switched VoATM and VoIP and for the *IpMediaStreamConnection* application the remote end is a router. It is required to be able to establish SVCs to different routers. Therefore, the *addressToCall* attribute is a list of remote addresses. The first SVC call is sent to the first address listed in the *addressToCall* attribute. If the setup fails or the call is established but fails at a later time, the system attempts to set up a connection to next address listed in the *addressToCall* attribute. If a failure occurs when using the last address in the list, the system attempts to set up a connection to the first address in the list and then continues as before.
Mib	Vgs
List of	String (1..44, AESANsapAddress)
List Size	3
Default	No default

GROUP Nsta Vgs DbgAccess SpvcAp **Operational (Oper)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains operational status information for the *SpvcAp* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp svcStatus (status)

Access	Read only
Description	This attribute specifies the status of the SVC connection. When this attribute has the value ***initializing***, it indicates that the component is initializing when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests are processed. A connection has been requested but not yet established. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that the connection has just been torn down and an attempt to re-establish the connection has not yet occurred. This is a transient state of the component. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* for consecutive connection set up attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed,*** it indicates that an error occurred while sending a release message to the network (as a consequence of a *Delete* request) while the component was in ***connecting*** state.
Mib	Vgs
Values	initializing connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp lastSetupFailureCause (failCause)

Access	Read only
Description	This attribute contains the cause code in the last call release message following an unsuccessful call set up attempt. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	Vgs
Values	Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **lastSetupFailureDiagnostic (failDiag)**

Access	Read only
Description	This attribute contains the diagnostic code in the last call release message following an unsuccessful call set up attempt. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code.
Mib	Vgs
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **retryTimeRemaining (timer)**

Access	Read only
Description	This attribute indicates the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt is made. When the value reaches ***0*** an attempt will be made to establish the connection. When the timer is not running a value of ***0*** is returned.
Mib	Vgs
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **retryFailures (failures)**

Access	Read only
Description	This attribute counts the number of consecutive failed connection attempts. This counter is reset to ***0*** whenever a connection is successfully established or the connection is restarted using the *Restart* verb. The counter wraps to ***0*** when the maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..2147483647)
Default	No default

GROUP Nsta Vgs DbgAccess SpvcAp **AccessPointOper (ApOper)**

Properties	Operational
Description	This group contains operational information regarding the end point of the connection. This group is common to all types of access points.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **remoteAddress (rAddr)**

Access	Read only
Criticality	Component
Description	This attribute indicates the address of the remote end point. If a connection is currently established, it will contain the NSAP address of the remote end point. If a connection is not established, the *remoteAddress* attribute has the value ***unknown***.
Mib	Vgs
Values	String (7..40, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **lastTearDownCause (cause)**

Access	Read only
Description	This attribute indicates the cause code in the last call release message that contained the CAUSE information element. Note that the call must have been successfully established before being torn down. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	Vgs
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Nsta Vgs DbgAccess SpvcAp **lastTearDownDiagnostic (diag)**

Access	Read only
Description	This attribute indicates the diagnostic code in the last call release message. The diagnostic code is contained in the CAUSE information element and is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code.
Mib	Vgs
Values	String (0..8, ASCII)

GROUP Nsta Vgs Ipif IpIfProv (IpPr)

Properties	Provisioned
Description	This group contains the provisionable data for the *NstaVgsIpInterface* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Ipif defaultRouterAddress (defRtr)

Access	Read and write
Description	This attribute specifies the IP address of the default router in the local subnet for *VspEth1000BaseSX* ports. IP packets destined for a device outside the local subnet are forwarded to this router by default.
Mib	Vgs
Values	IP address
Default	0.0.0.0

ATTRIBUTE Nsta Vgs Ipif subnetMask (netMask)

Access	Read and write
Description	This attribute specifies the subnet mask of the network connected to the *VspEth1000BaseSX* ports. Any destination outside the subnet must be forwarded to a router.
Mib	Vgs
Values	IP address
Default	255.255.252.0

ATTRIBUTE Nsta Vgs Ipif switchoverOnFailure (swOver)

Access	Read and write
Description	This attribute specifies if a card switchover should occur if a steady state link failure is observed on all *VspEth1000BaseSX* ports on this card. A switchover to the standby card occurs only when all of the following apply: 1) The *switchoverOnFailure* attribute is enabled.

Copyright © 2006, Nortel Nortel Confidential

2) The *IpIf* component is without an active port for a continuous period specified in the *switchoverHoldoffTime* attribute
3) At least one of the *VspEth1000BaseSX* ports has been active since the card started up following a reboot or a switchover.
4) The standby card is available.

Possible values are:

enabled - a switchover will occur, subject to the conditions specified above.

disabled - a switchover will not take place if a link failure is detected.

Mib	Vgs
Values	enabled disabled
Default	disabled

ATTRIBUTE Nsta Vgs IpIf switchoverHoldoffTime (holdoffTime)

Access	Read and write
Description	This attribute specifies how long a steady state link failure on all provisioned *VspEth1000BaseSX* ports can occur before a card switchover is triggered. This attribute only has meaning when the *switchoverOnFailure* attribute is ***enabled***.
Mib	Vgs
Values	Decimal (1..180)
Units	seconds
Default	30

GROUP Nsta Vgs IpIf IpIfOp (IpOp)

Properties	Operational
Description	This group contains the operational data for *Nsta Vgs IpInterface* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs IpIf unsupportedFramesReceived (rxUnsupFrm)

Access	Read only
Description	This attribute indicates the number of frames received with a protocol type which is neither IP nor ARP. This count does not include MAC control frames. This counter wraps to zero after it reaches its maximum value.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

COMPONENT Nsta Vgs MediaGatewayController (Mgc)

Instance	String (1..20, ASCII)
Groups	GROUP Nsta Vgs Mgc Provisioned (Prov)
Scope	Device
Description	*Nsta/n Vgs MediaGatewayController/n* This component contains the H.248 attributes that are specific to a particular controller.
Mib	Vgs
Common Verbs	Help List Display Add DELete

GROUP Nsta Vgs Mgc Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *Mgc* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Mgc initialMgcAddress (addr)

Access	Read and write
Description	This attribute specifies the controller IP address to which the gateway sends the initial H.248 registration message. The controller IP address to which the gateway sends subsequent H.248 transaction requests may be different from this attribute, depending on whether H.248 registration redirection, handoff, or failover procedures have been performed. The controller IP address currently in use is given by the *H248 mgcAddress* operational attribute. The values ***0.0.0.0*** and ***255.255.255.255*** are not permitted.
Mib	Vgs
Values	IP address
Default	No default

ATTRIBUTE Nsta Vgs Mgc initialMgcPort (port)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the controller UDP port to which the gateway sends the initial H.248 registration message. The controller UDP port to which the gateway sends subsequent H.248 transaction requests may be different from this attribute, depending on whether H.248 registration redirection, handoff, or failover procedures have been performed. The controller UDP port currently in use is given by the *H248 mgcPort* operational attribute.
Mib	Vgs
Values	Decimal (1..65535)
Default	2944

ATTRIBUTE Nsta Vgs Mgc encodingFormat (encFmt)

Access	Read and write
Description	This attribute specifies the encoding format used by the gateway to send H.248 messages to this controller. The format may be one of the following: - ***longText*** - a readable format, but longer to transfer. ***shortText*** - a short, space efficient format, suitable for machine transfer, but less readable.
Mib	Vgs
Values	shorttext longtext
Default	shorttext

ATTRIBUTE Nsta Vgs Mgc ds3Format

Access	Read and write
Criticality	Component
Description	This attribute specifies the DS3 physical termination identifier format used in the H.248 messages. DS3 physical termination identifier format is described in NTP NN10600-780.
Mib	Vgs
Values	String (1..64, ASCII)
Default	DS3/#2/#1/#2/#1

ATTRIBUTE Nsta Vgs Mgc e1Format

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute represents the E1 physical termination identifier format used by the controller. E1 physical termination identifier format is described in NTP NN10600-780.
Mib	Vgs
Values	String (1..64, ASCII)
Default	E1/#2/#2/#1

ATTRIBUTE Nsta Vgs Mgc **stmnVc4Vc12Format**

Access	Read and write
Criticality	Component
Description	This attribute specifies the STM-n with VC4/VC12 physical termination identifier format used by the controller. STM-n with VC4/VC12 physical termination identifier format is described in NTP NN10600-780.
Mib	Vgs
Values	String (1..64, ASCII)
Default	STM/#1/#1/#1/VC4VC12/#1/#1/#1/#1/#1

ATTRIBUTE Nsta Vgs Mgc **stsnOcnVt15Format**

Access	Read and write
Criticality	Component
Description	This attribute specifies the STS-n/OC-n with VT15 physical termination identifier format used by the controller. STS-n/OC-n with VT15 physical termination identifier format is described in NTP NN10600-780.
Mib	Vgs
Values	String (1..64, ASCII)
Default	STS/#1/#1/#1/VT15/#1/#1/#1/#1

ATTRIBUTE Nsta Vgs Mgc **ipFormat**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the IP ephemeral termination identifier format being used by the controller. IP ephemeral termination identifier format is described in NTP NN10600-780.
Mib	Vgs
Values	String (1..64, ASCII)
Default	rtp/#1

ATTRIBUTE Nsta Vgs Mgc aal2Format

Access	Read and write
Criticality	Component
Description	This attribute specifies the AAL2 ephemeral termination identifier format used by the controller. AAL2 ephemeral termination identifier format is described in NTP NN10600-780.
Mib	Vgs
Values	String (1..64, ASCII)
Default	aal2/#1

ATTRIBUTE Nsta Vgs Mgc initialNormalMgExecutionTime (time)

Access	Read and write
Description	This attribute specifies the value of the H.248 MG property root/ normalMGExecutionTime on H.248 cold boot. This is the initial value of the interval within which the controller expects a response, exclusive of network delay. The value is rounded to the nearest 100 milliseconds.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	500

ATTRIBUTE Nsta Vgs Mgc initialNormalMgcExecutionTime (cTime)

Access	Read and write
Description	This attribute specifies the value of the H.248 MG property root/ normalMGCExecutionTime on H.248 cold boot. This is the initial value of the interval within which the gateway expects a response from the controller, exclusive of network delay.

Copyright © 2006, Nortel Nortel Confidential

	The value is rounded to the nearest 100 milliseconds.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	500

ATTRIBUTE Nsta Vgs Mgc initMgProvnlRespTimerValue

Access	Read and write
Description	This attribute specifies the value of the H.248 MG property root/ MGProvisionalResponseTimerValue on H.248 cold boot. This is the initial value of the time within which the controller expects a Pending Response from the gateway if a Transaction cannot be completed. The value is rounded to the nearest 100 milliseconds.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	2000

ATTRIBUTE Nsta Vgs Mgc initMgcProvnlRespTimerValue

Access	Read and write
Description	This attribute specifies the value of the H.248 MG property root/ MGCProvisionalResponseTimerValue on H.248 cold boot. This is the initial value of the time within which the gateway expects a Pending Response from the controller if a Transaction cannot be completed. The value is rounded to the nearest 100 milliseconds.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	500

ATTRIBUTE Nsta Vgs Mgc maximumTxRetries (ret)

Access	Read and write
Description	This attribute specifies the maximum number of retransmissions for an unacknowledged H.248 transaction request. If the gateway has not received a message from the controller after the maximum number of retries, then the gateway will perform the H.248 failover procedure.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	Decimal (0..10)
Default	2

ATTRIBUTE Nsta Vgs Mgc maximumTxRetryTime (tRet)

Access	Read and write
Description	This attribute specifies the maximum time between retransmissions of an unacknowledged H.248 transaction request by the controller. The value is rounded to the nearest 100 milliseconds.
Mib	Vgs
Values	Decimal (100..10000)
Units	msec
Default	1000

ATTRIBUTE Nsta Vgs Mgc transactionQuarantineTimer (quar)

Access	Read and write
Description	This attribute is the H.248 long timer value (LONG-TIMER) used for quarantining H.248 responses sent to the controller. The gateway will keep H.248 response copies for at least this time.
Mib	Vgs
Values	Decimal (1..24)
Units	seconds
Default	24

ATTRIBUTE Nsta Vgs Mgc egressCotDuration

Access	Read and write
Description	This attribute specifies the default duration of the egress continuity test tone generated by the gateway. The value is rounded to the nearest 100 milliseconds.
Mib	Vgs
Values	Decimal (1..180000)
Units	msec
Default	20000

ATTRIBUTE Nsta Vgs Mgc highestVersion (hiVer)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the highest protocol version to be negotiated with the controller upon H.248 registration.
Mib	Vgs
Values	Decimal (1..1)
Default	1

ATTRIBUTE Nsta Vgs Mgc mgList

Access	Read only
Description	This attribute specifies a list of links to *H248* components that use this component.
Mib	Vgs
List of	Link (Service, mgcList)
List Size	1
Default	No default

COMPONENT Nsta Vgs H248

Instance	Decimal (0)
Groups	GROUP Nsta Vgs H248 Provisioned (Prov) GROUP Nsta Vgs H248 Operational (Oper) GROUP Nsta Vgs H248 Statistics (Stats)
Scope	Device
Description	*Nsta/n Vgs H248/n* This component represents an interface between a gateway and a controller using the H.248 (Megaco) Protocol.
Mib	Vgs
Common Verbs	Help List Display Add DELete

GROUP Nsta Vgs H248 Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *H248* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs H248 mgMid

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies the Message Identifier that the gateway includes as part of every message sent to the controller. The format of this string is described in NTP NN10600-780.
Mib	Vgs
Values	String (1..64, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs H248 udpPortConnection (port)

Access	Read and write
Description	This attribute is a link to the *Nsta/n Vgs Ctrl/n UdpPort/n* component that defines the MG local UDP port for the H.248 protocol. The default UDP port for H.248 text format is 2944.
Mib	Vgs
Values	Link (Service, linkToApplication)
Default	No default

ATTRIBUTE Nsta Vgs H248 sdpFormat

Access	Read and write
Description	This attribute specifies the Session Description Protocol (SDP) media line compliance for SDPs sent and received by the gateway. ***strictH248*** - force strict H.248 SDP media line compliance for both receiving and transmitting SDPs. ***h248*** - flexible when receiving SDP media lines. Complies with H.248 when sending SDP media lines. ***nonH248*** - flexible when receiving SDP media lines and may send multiple SDP media lines per SDP group when appropriate.
Mib	Vgs
Values	h248 strictH248 nonH248
Default	nonH248

ATTRIBUTE Nsta Vgs H248 atmSdpTransmitFormat

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Session Description Protocol (SDP) format that the gateway sends when establishing an AAL2 connection. ***vgcp*** - Comply with the VGCP SDP format. ***rfc3108*** - Comply with the RFC-3108 SDP format.
Mib	Vgs
Values	vgcp rfc3108
Default	rfc3108

ATTRIBUTE Nsta Vgs H248 mgcList

Access	Read and write
Description	This attribute specifies an ordered list of links to associated *Mgc* components, which specify the provisioned attributes for use with the primary and (multiple) secondary controllers. The controller preference used by the gateway when registering is determined by the order of adding links (that is, the first is preferred). The list must contain at least one entry.
Mib	Vgs
List of	Link (Service, mgList)
List Size	3
Default	No default

GROUP Nsta Vgs H248 Operational (Oper)

Properties	Operational
Description	This group contains operational data for the *H248* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs H248 negotiatedVersion (vers)

Access	Read only
Description	This attribute is the current H.248 protocol version which the gateway sends in H.248 transaction requests and is therefore the negotiated version between the controller and the gateway. The attribute equals ***0*** when the gateway is registering.
Mib	Vgs
Values	Decimal (0..99)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs H248 maximumContexts (ctxts)

Access	Read only
Description	This attribute indicates the maximum number of H.248 contexts supported by the gateway.
Mib	Vgs
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Nsta Vgs H248 normalMgExecutionTime (time)

Access	Read only
Description	This attribute indicates the current value of the interval within which the controller expects a response from the gateway, exclusive of network delay.
Mib	Vgs
Values	Decimal (0..10000)
Units	msec
Default	No default

ATTRIBUTE Nsta Vgs H248 normalMgcExecutionTime (cTime)

Access	Read only
Description	This attribute indicates the current value of the interval within which the gateway expects a response from the controller, exclusive of network delay.
Mib	Vgs
Values	Decimal (0..10000)
Units	msec
Default	No default

ATTRIBUTE Nsta Vgs H248 mgcProvisionalRespTimerValue

Access	Read only
Description	This attribute indicates the current value of the time within which the gateway expects a Pending Response from the controller if a Transaction cannot be completed.
Mib	Vgs
Values	Decimal (0..10000)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Vgs H248 maximumInactivityTime (mit)

Access	Read only
Description	This attribute indicates the time the gateway will wait for an H.248 message from the controller before the gateway attempts to contact the controller to determine if it is still active. The value ***off*** indicates that the maximum inactivity timer is not enabled.
Mib	Vgs
Values	Decimal (0..655350) off
Units	msec
Default	No default

ATTRIBUTE Nsta Vgs H248 failovers

Access	Read only
Description	This attribute counts the number of times the gateway has performed failover procedures and attempted contact with another controller since the *H248* component was activated.
Mib	Vgs
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Nsta Vgs H248 mgcMid

Access	Read only
Description	This attribute indicates the Message Identifier of the current controller being used. This value is obtained from the controller response to the gateway registration message. The attribute has zero length when the gateway is registering.
Mib	Vgs
Values	String (0..64, ASCII)
Default	No default

ATTRIBUTE Nsta Vgs H248 mgcAddress (addr)

Access	Read only
Description	This attribute indicates the current controller IP address to which the gateway sends H.248 transaction requests.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	IP address
Default	No default

ATTRIBUTE Nsta Vgs H248 mgcPort

Access	Read only
Description	This attribute indicates the current controller UDP port to which the gateway sends H.248 transaction requests.
Mib	Vgs
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Nsta Vgs H248 mgcInUse

Access	Read only
Description	This attribute indicates the instance name of the *Mgc* component currently in use.
Mib	Vgs
Values	The name of the component
Default	No default

ATTRIBUTE Nsta Vgs H248 mgProvisionalRespTimerValue

Access	Read only
Description	This attribute indicates the current value of the time within which the controller expects a Pending Response from the gateway if a Transaction cannot be completed.
Mib	Vgs
Values	Decimal (0..10000)
Units	msec
Default	No default

GROUP Nsta Vgs H248 Statistics (Stats)

Properties	Operational
Description	This group contains statistics for the *H248* component. These are filtered on ***12mVspAal*** and ***Vsp2*** cards.
Mib	Vgs

ATTRIBUTE Nsta Vgs H248 txRetransmissions

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of media gateway control protocol retransmissions sent by the Gateway. Each retransmission of a given message will be individually counted.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs H248 rxRetransmissions

Access	Read only
Description	This attribute counts the number of media gateway control protocol retransmissions sent by the Gateway. Each retransmission of a given message will be individually counted.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Nsta Vgs PacketNetworkProfile (PktProf)

Instance	Decimal (0)
Groups	GROUP Nsta Vgs PktProf Provisioned (Prov)
Scope	Device
Description	*Nsta/n Vgs PacketNetworkProfile/n* The *PacketNetworkProfile* component represents a profile of the PVG packet side characteristics of narrowband calls.
Mib	Vgs
Common Verbs	Help List Display Add

GROUP Nsta Vgs PktProf Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *PacketNetworkProfile* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs PktProf bufferSize (bufSize)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute represents the capacity of the packet delay variation (PDV) buffer in milliseconds of data. To ensure that PDV can be tolerated it is necessary to initialize the system with a reserve of information in the buffer used to reassemble data for transmission across the TDM network. The size of this reserve is defined by the *pdvt* and *bufferSize* attributes. The amount of data played out to the TDM network (a period of time defined by the *packetDelayVariationTolerance* attribute) is equal to the size of the initialization reserve. There should be enough data in the reassembly buffer to allow transmission for a period of time defined by the *pdvt* attribute before buffer underflow due to the next delayed packet occurs. If the ***VgsIp, VgsIpG729, VgsIpGe,*** or ***VgsIpG729Ge*** feature has been provisioned the default *bufferSize* will be ***60ms***; otherwise the *bufferSize* will be ***50ms***. The value should always be greater than the maximum packet size plus two times the value of the *pdvt* attribute, except on ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3*** and ***2pOC3ChSmIrVsp4e*** cards where it need only be greater than or equal to two times the value of the *pdvt* attribute. The maximum packet size is 20ms for ***VgsIp***, ***VgsIpG729, VgsIpGe*** and ***VgsIpG729Ge*** features and 10ms for all other features. This attribute has no effect if the *packetDelayVariationTolerance* attribute is set to ***adaptive***.
Mib	Vgs
Values	Decimal (5..100)
Units	msec
Default	No default

ATTRIBUTE Nsta Vgs PktProf **packetDelayVariationTolerance (pdvt)**

Access	Read and write
Criticality	Component
Description	This attribute represents the maximum packet arrival jitter in milliseconds that the reassembly process will tolerate in the packet stream without producing errors on the TDM interface. This attribute together with the *bufferSize* attribute, can be configured to optimize the jitter versus absolute delay trade off in various network configurations. The value should always be less than the value of the *bufferSize* attribute

Copyright © 2006, Nortel Nortel Confidential

	minus the maximum packet size divided by two, except on ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3*** and ***2pOC3ChSmIrVsp4e*** cards, where it need only be less than or equal to the value of the *bufferSize* attribute divided by two. The maximum packet size is 20ms for ***VgsIp***, ***VgsIpG729, VgsIpGe,*** and ***VgsIpG729Ge*** features and 10ms for all other features. If set to ***adaptive***, the hardware attempts to minimise the absolute delay while allowing for the maximum packet arrival jitter encountered. This value is only supported on the following cards: ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3,*** ***2pOC3ChSmIrVsp4e***.
Mib	Vgs
Values	Decimal (5..50) adaptive
Units	msec
Default	20

ATTRIBUTE Nsta Vgs PktProf lossIntegrationPeriod (intPeriod)

Access	Read and write
Description	This attribute represents the interval of time in seconds for which a loss of packet condition must persist before the corresponding call is dropped. A value of zero specifies that packet loss integration is disabled and therefore call connections are not suspended after packet loss.
Mib	Vgs
Values	Decimal (0..50)
Units	seconds
Default	5

ATTRIBUTE Nsta Vgs PktProf silenceDetectionHangOverTime (silDetTime)

Access	Read and write
Description	This attribute represents the time in milliseconds for which the speech path is left on, before being suppressed when a timeslot is silent. This helps to prevent clipping at the end of words.
Mib	Vgs
Values	Decimal (30..500)
Units	msec
Default	200

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs PktProf silenceSuppression (silSup)

Access	Read and write
Description	This attribute represents whether silence suppression is performed. A value of ***enabled*** indicates that silence suppression is performed as default. For each connection this default can be overridden by the controller. A value of ***disabled*** indicates that silence suppression is not performed under any circumstances.
Mib	Vgs
Values	enabled disabled
Default	disabled

ATTRIBUTE Nsta Vgs PktProf silenceSuppressionThreshold (silSupThresh)

Access	Read and write
Description	This attribute represents the level above which silence suppression is not performed. A value in the range -39 to -36 dBm0 is only permitted on ***2pGeMmSrVsp3***, ***2pOC3ChSmIrVsp3*** and ***2pOC3ChSmIrVsp4e*** cards.
Mib	Vgs
Values	Signed (-60..-36)
Units	dBm0
Default	-40

ATTRIBUTE Nsta Vgs PktProf digitTransport

Access	Read and write
Description	This attribute represents the method by which digit tones are transported. If set to ***64kG711***, then G.729 voice channels will upspeed to send ***64kG711*** packets when DTMF is detected. If set to ***sendAsVoice***, DTMF is encoded using currently selected codec. If set to ***squelch,*** during the playback of a digit, silence is sent over the voice path, encoded at the current encoding rate. If set to ***relay***, this value enables negotiation of mutual support for the relay of DTMF tones as RFC2833 VoIP packets. Should this negotiation fail then behavior is the same as for ***64kG711***. A value of ***relay*** is only valid on ***2pGeMmSrVsp3*** and ***2pOC3ChSmIrVsp3*** and ***2pOC3ChSmIrVsp4e*** cards.

Copyright © 2006, Nortel Nortel Confidential

If the *Sw Lpt featureList* attribute contains ***vgsAtm***, ***vgsAtmDc*** or ***vgsIp*** and the card type is ***12mVspAal*** or ***Vsp2***, this attribute is ignored and the value of ***sendAsVoice*** will be the digit tone transport method.

Mib — Vgs

Values — sendAsVoice
64kG711
squelch
relay

Default — No default

ATTRIBUTE Nsta Vgs PktProf vbdTransport

Access — Read and write

Description — This attribute represents the method by which voiceband data tones are transported.

If set to ***useTone2100Rate***, then G.729 voice channels will upspeed to send ***64kG711*** packets when VBD is detected regardless of whether or not the remote gateway has indicated support for this codec.

If set to ***useTone2100RateIfNegotiated***, then G.729 voice channels will upspeed to send ***64kG711*** packets when VBD is detected only when the remote gateway has indicated support for this codec.

Mib — Vgs

Values — useTone2100RateIfNegotiated
useTone2100Rate

Default — useTone2100RateIfNegotiated

ATTRIBUTE Nsta Vgs PktProf stateChangeSignalingMode (scsMode)

Access — Read and write

Description — This attribute specifies the mechanism that the gateway uses to signal inband changes in call state to the gateway on the far side of the packet network. This attribute only applies to the following features:

vgsAtm
vgsAtmG729

The possible values for this attribute are:

proprietary - Proprietary PVG tone indication packets are sent.

itu - Standard User State Control (USC) packets are sent, in compliance with ITU-T Recommendation 1.366.2 Annex O.

A value of ***proprietary*** is only permitted on the following cards:

Copyright © 2006, Nortel Nortel Confidential

12mVspAal,
Vsp2,
Vsp2W,
2pGeMmSrVsp3.

A value of ***itu*** is only permitted on the following cards:

2pGeMmSrVsp3,
2pOC3ChSmIrVsp3,
2pOC3ChSmIrVsp4e.

For the ***2pOC3ChSmIrVsp3*** and ***2pOC3ChSmIrVsp4e***card, the default for this attribute is ***itu***. For all other cards the defult for this attribute is ***proprietary***.

Mib — Vgs

Values — proprietary
itu

Default — No default

ATTRIBUTE Nsta Vgs PktProf overrideCodecNegotiation (ocn)

Access — Read and write

Description — This attribute provides a mechanism to override the normal codec negotiation procedures to allow optimization between RTO connected Gateways..

When the ***vgsIpRtoCdma*** feature is provisioned, any of the following values may be provisioned:

disabled
wirelineRto
wirelessRto

For all other features, this attribute must be set to ***disabled***.

Mib — Vgs

Values — disabled
wireline
wireless
wirelineRto
wirelessRto
wirelineTrfo
wirelessTrfo

Default — disabled

ATTRIBUTE Nsta Vgs PktProf tone2100Rate (toneRate)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute represents the coding algorithm to be used when a 2100 Hz tone is detected (phase reversal may or may not be detected). This attribute takes precedence over the *defaultCodecList* attribute. For all card types, this attribute must be set to ***64kG711A or 64kG711U*** when using IP transport. When the ***vgsAtm*** feature is provisioned on a ***2pOC3ChSmIrVsp3*** card, then this attribute must be set to ***64kG711A or 64kG711U*** if the attribute *defaultCodecList* has been set to ***8kG729***.
Mib	Vgs
Values	64kG711U 64kG711A 32kG726ITU
Default	64kG711A

ATTRIBUTE Nsta Vgs PktProf **defaultCodecList (defCList)**

Access	Read and write
Description	This attribute represents the ordered list of coding algorithms to be used under normal conditions (when no 2100 Hz tone is detected). For each connection, this default coding algorithm can be overridden by the controller. The first value in the list is the ***defaultVoiceRate*** codec. The values in the list are differentiated by the ***featureList*** provisioned for various ***cardTypes***. The list will be able to handle up to 16 codecs for ***VoIP*** features. The list will be able to handle up to 1 codec for ***VoATM*** features. The first instance of ***64kG711U*** or ***64kG711A*** in this list implicitly defines the default packet log law. While using ***VoIp*** features, ***all*** the supported codecs must be provisioned in the defaultCodecList. Only the order can be changed. Following is the list of supported codecs for ***VoIP*** features: When the feature ***vgsIp*** or ***vgsIpGe*** is provisioned for cardType ***Vsp2,*** the supported codecs are - ***64kG711A and 64kG711U*** When the feature ***vgsIpG729*** is provisioned for cardType ***Vsp2,*** the supported codecs are - ***64kG711A, 64kG711U and 8kG729*** When the feature ***vgsIp*** is provisioned for cardTypes ***2pOC3ChSmIrVsp3, 2pVS or 2pOC3ChSmIrVsp4e,*** the supported codecs are - ***64kG711A, 64kG711U, 32kG726ITU and 8kG729*** When the feature ***vgsIpTrFo*** is provisioned for cardTypes

Copyright © 2006, Nortel Nortel Confidential

2pOC3ChSmIrVsp3 or 2pOC3ChSmIrVsp4e, the supported codecs are - ***64kG711A, 64kG711U and EVRC0***

When the feature ***vgsIpRtoCdma*** is provisioned for cardTypes ***2pOC3ChSmIrVsp3, 2pVS or 2pOC3ChSmIrVsp4e***, the supported codecs are - ***64kG711A, 64kG711U, 8kG729 and EVRC0***

When the features ***vgsIp or vgsIpGe*** is provisioned for the cardType ***2pGeMmSrVsp3***, the supported codecs are - ***64kG711A, 64kG711U and 32kG726ITU***

When the features ***vgsIpG729 or vgsIpG729Ge*** is provisioned for the cardType ***2pGeMmSrVsp3***, the supported codecs are - ***64kG711A, 64kG711U, 32kG726ITU and 8kG729***

While using ***VoATM*** features, only ***one*** of the supported codecs can be provisioned for the defaultCodecList. Following is the list of supported codecs for ***VoATM*** features.

When feature ***vgsAtm*** is provisioned for cardTypes ***2pGeMmSrVsp3, 2pOC3ChSmIrVsp3 or 2pVS,*** the supported codecs are ***- 64kG711A, 64kG711U, 32kG726ITU and 24kG726ITU***

When feature ***vgsAtmG729*** is provisioned for cardTypes ***2pGeMmSrVsp3, 2pOC3ChSmIrVsp3 or 2pVS,*** the supported codecs are - ***64kG711A, 64kG711U, 32kG726ITU, 24kG726ITU and 8kG729***

When the feature ***vgsAtm*** is provisioned for cardType ***Vsp2,*** the supported codecs are ***- 64kG711A, 64kG711U and 32kG726ITU***

When the feature ***vgsAtmG729*** is provisioned for cardType ***Vsp2,*** the supported codecs are ***- 64kG711A, 64kG711U, 32kG726ITU and 8kG729***

Following codecs are not supported in the current release: ***40kG726ITU 16kG726ITU 40kG726IETF 32kG726IETF 24kG726IETF 16kG716IETF rtAudio***

Opt. Subcomp.	COMPONENT Nsta Vgs Tag ChannelAssociatedSignaling (Cas)
Common Verbs	Help List Display Add DELete

GROUP Nsta Vgs Tag Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the provisioning data for the *TdmAccessGroup* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Tag interfaceName (ifName)

Access	Read and write
Criticality	Process
Description	This attribute specifies the link to a *Chan* component. This *Chan* component must exist on the same Functional Processor.
Mib	Vgs
Values	Link (Service, applicationFramerName)
Default	No default

ATTRIBUTE Nsta Vgs Tag profile (prof)

Access	Read and write
Description	This attribute specifies the *TdmNetworkProfile* component to use on the TDM trunks of the *Tag* component when a call is setup.
Mib	Vgs
Values	Link (Service, applicationList)
Default	No default

GROUP Nsta Vgs Tag OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs Tag adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Vgs

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Nsta Vgs Tag operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Vgs

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Nsta Vgs Tag usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Vgs

This attribute must be supplied.

Mib Vgs

Values Link (Service, applicationList)

Default No default

GROUP Nsta Vgs Tag Cas Operational (Oper)

Properties Operational

Description This group contains attributes that indicate the status of a *Cas* component.

Mib Vgs

ATTRIBUTE Nsta Vgs Tag Cas txSignals

Access Read only

Description This attribute counts CAS line signals transmitted towards the TDM interface since the component was activated.

The counter wraps to ***0*** when it exceeds its maximum value.

Mib Vgs

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE Nsta Vgs Tag Cas rxSignals

Access Read only

Description This attribute counts CAS line signals received from the TDM interface since the component was activated.

The counter wraps to ***0*** when it exceeds its maximum value.

Mib Vgs

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE Nsta Vgs Tag Cas busyChannels

Access Read only

Description This attribute indicates the number of endpoints in answer or setup state for the *Chan* component specified in the *interfaceName* attribute of the parent component. This includes only the endpoints that are not in idle or blocked state.

Mib Vgs

Values Decimal (0..30)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nsta Vgs Tag Cas blockedChannels

Access	Read only
Description	This attribute indicates the number of endpoints in blocked state for the *Chan* component specified in the *interfaceName* attribute of the parent component.
Mib	Vgs
Values	Decimal (0..30)
Default	No default

ATTRIBUTE Nsta Vgs Tag Cas signalFailureIndications

Access	Read only
Description	This attribute counts the number of incoming line state changes that are not recognized as valid candidates for that stage in a call, and that are reported as a Signal Failure to the call server. The counter wraps to ***0*** when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Nsta Vgs TdmNetworkProfile (TProf)

Instance	Decimal (0..15)
Groups	GROUP Nsta Vgs TProf Provisioned (Prov)
Scope	Device
Description	*Nsta/n Vgs TdmNetworkProfile/n* This component represents a profile defining TDM network behaviour that can be referenced by *Tag* components.
Mib	Vgs
Common Verbs	Help List Display Add DELete

GROUP Nsta Vgs TProf Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the provisioning data for the *TdmNetworkProfile* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs TProf tdmLogLaw (loglaw)

Access	Read and write
Description	This attribute specifies the G.711 companding law to use. The possible values are: ***aLaw:*** Alaw companding is used. ***muLaw:*** Mulaw companding is used. ***autoConfigured:*** Mulaw companding is used by *DS1* trunks, while Alaw companding is used by *E1* trunks.
Mib	Vgs
Values	muLaw aLaw autoConfigured
Default	autoConfigured

ATTRIBUTE Nsta Vgs TProf ingressGain (iGain)

Access	Read and write
Description	This attribute specifies the gain applied on the TDM ingress side to balance the network loss plan.
Mib	Vgs
Values	Signed (-15..15)
Units	dB
Default	0

ATTRIBUTE Nsta Vgs TProf egressGain (eGain)

Access	Read and write
Description	This attribute specifies the gain applied on the TDM egress side to balance the network loss plan.
Mib	Vgs
Values	Signed (-15..15)
Units	dB
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs TProf minimumEchoReturnLoss (minEchoRetLoss)

Access	Read and write
Description	This attribute specifies the minimum echo return loss that can be expected on the line. For the following features, the default for this attribute is ***3***: ***gsmBicnMg***, ***umtsBicnMg***, ***cdmaCodec***. For all other features, the default for this attribute is ***6***.
Mib	Vgs
Values	Decimal (0; 3; 6)
Units	dB
Default	No default

ATTRIBUTE Nsta Vgs TProf echoCancellation (eCan)

Access	Read and write
Description	This attribute specifies whether echo cancellation is enabled or disabled. Note that echo cancellation is always disabled when a 2100 Hz tone is detected. The operator may decide to disable this functionality if a third-party echo canceller is present in the network, because having more than one echo canceller will adversely affect voice quality. Note that the gateway controller may override this attribute on a call by call basis to activate or deactivate echo cancellation. This attribute does not have any effect on Wireless digital data services. ***disabled*** - Disables echo cancellation. ***g165Mode*** - Enables echo cancellation except when a 2100Hz tone with phase reversal is detected.
Mib	Vgs
Values	disabled g165Mode
Default	g165Mode

ATTRIBUTE Nsta Vgs TProf echoCancelComfortNoiseGeneration (eCanComNoiseGen)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	The attribute specifies whether comfort noise generation for the echo cancellation feature is enabled or disabled. The possible values are: ***disabled*** - Comfort noise generation is disabled. ***enabled*** - Comfort noise generation is enabled. This attribute has no effect if the echo canceller is disabled.
Mib	Vgs
Values	disabled enabled
Default	enabled

ATTRIBUTE Nsta Vgs TProf echoCancelTailLength (eCanTailLength)

Access	Read and write
Description	This attribute specifies the echo cancellation tail length. This attribute has no effect if the echo canceller is disabled. For the following features, the default for this attribute is ***64***: ***gsmBicnMg***, ***umtsBicnMg***, ***cdmaCodec***. For all other features, the default for this attribute is ***128***.
Mib	Vgs
Values	64 128
Units	msec
Default	No default

ATTRIBUTE Nsta Vgs TProf echoCancelTailOffset (eCanTailOffset)

Access	Read and write
Description	This attribute specifies the fixed delay offset for the echo cancellation tail length applied to all timeslots. This attribute has no effect if the echo canceller is disabled. This attribute is only applicable for the following features: ***gsmBicnMg***,

Copyright © 2006, Nortel Nortel Confidential

umtsBicnMg,
cdmaCodec.

Mib	Vgs
Values	Decimal (0..16)
Units	msec
Default	0

ATTRIBUTE Nsta Vgs TProf toneset (toneset)

Access	Read and write
Description	This attribute specifies the tone set available to the controller. The possible values are: ***sameAsVgs*** - Use the *defaultToneset* attribute from the *Vgs* component ***argentina*** - Use the tone set for Argentina. ***australia -*** Use the tone set for Australia. ***austria*** - Use the tone set for Austria. ***belgium*** - Use the tone set for Belgium. ***bolivia*** - Use the tone set for Bolivia. ***brazil -*** Use the tone set for Brazil. ***brazilCustom1 -*** Use the tone set for BrazilCustom1. ***canadaUsa*** - Use the tone set for Canada and the USA. ***chile*** - Use the tone set for Chile. ***china*** - Use the tone set for China. ***custom1*** - Use the tone set patched for Custom1. ***custom2*** - Use the tone set patched for Custom2. ***custom3*** - Use the tone set patched for Custom3. ***custom4*** - Use the tone set patched for Custom4. ***custom5*** - Use the tone set patched for Custom5. ***czech*** - Use the tone set for the Czech Republic. ***denmark*** - Use the tone set for Denmark. ***finland*** - Use the tone set for Finland. ***france -*** Use the tone set for France. ***germany*** - Use the tone set for Germany. ***greece*** - Use the tone set for Greece. ***hongKong*** - Use the tone set for Hong Kong. ***hungary*** - Use the tone set for Hungary. ***india*** - Use the tone set for India. ***ireland*** - Use the tone set for Ireland. ***israel*** - Use the tone set for Israel. ***italy -*** Use the tone set for Italy. ***japan*** - Use the tone set for Japan. ***jfpt*** - Use the tone set for Japanese Fire and Police trunks. ***korea*** - Use the tone set for Korea. ***malaysia*** - Use the tone set for Malaysia. ***mexico*** - Use the tone set for Mexico. ***mexicoCustom1*** - Use the tone set for MexicoCustom1.

ATTRIBUTE Nsta Vgs Q921Prof **applicationList (appList)**

Access	Read only
Description	This attribute contains a list of *Q921* components linked to this profile.
Mib	Vgs
List of	Link (Service, profile)
Default	No default

GROUP Nsta Vgs Q921Prof **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisioning data for the *Q921* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Q921Prof **t200**

Access	Read and write
Description	This attribute specifies the maximum time between the transmission of a layer 2 frame and the receipt of an acknowledgement from the user. This is the acknowledgement timer (T200). The value is rounded to the nearest 0.5 second.
Mib	Vgs
Values	Decimal (0.5..5.0)
Units	seconds
Default	1.0

ATTRIBUTE Nsta Vgs Q921Prof **t203**

Access	Read and write
Description	This attribute specifies the maximum time without frame exchange during multiple frame operations.
Mib	Vgs
Values	Decimal (10..300)
Units	seconds
Default	10

ATTRIBUTE Nsta Vgs Q921Prof **n200**

Access	Read and write
Description	This attribute specifies the maximum number of retransmissions of a layer 2 frame.
Mib	Vgs

Values	Decimal (1..8)
Default	3

ATTRIBUTE Nsta Vgs Q921Prof n201

Access	Read and write
Description	This attribute specifies the maximum length of an information field.
Mib	Vgs
Values	Decimal (4..260)
Units	octets
Default	260

ATTRIBUTE Nsta Vgs Q921Prof outstandingFrames

Access	Read and write
Description	This attribute specifies the maximum number of sequentially numbered I frames (k) that may be unacknowledged at any given time after which no new frames are transmitted unless as part of an error recovery procedure.
Mib	Vgs
Values	Decimal (1..127)
Default	7

ATTRIBUTE Nsta Vgs Q921Prof side

Access	Read and write
Criticality	Process
Description	This attribute specifies if this end of the PRI trunk is to be considered the network end or the user end. The possible values are: ***user***, ***network***.
Mib	Vgs
Values	user network
Default	network

Description: This group contains the provisioning data for the *CasDefn* component.

Mib: Vgs

ATTRIBUTE Nsta Vgs CasDefn fileName

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the name (without path or extension) of the file that contains the specific CAS variant. The file will be delivered with the software load. Changing the value of this attribute triggers the transfer of the file from the CP to the VSP FP, and clears down any existing CAS trunks associated with this *CasDefn* component. This attribute must be supplied.
Mib	Vgs
Values	String (0..16, ASCII)
Default	""

ATTRIBUTE Nsta Vgs CasDefn primaryRateType

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of standard framing used at the TDM interface. All *CasDefn* components, under the same *Vgs* hierarchy, must have the same value provisioned for this attribute. The possible values are: ***ds1*** - TDM interfaces associated with this *CasDefn* component are compliant to the DS1 standard. CAS signaling transport using DS1 Robbed-Bit Signaling is used. ***e1*** - TDM interfaces associated with this *CasDefn* component are compliant to the E1 standard. CAS signaling transport using timeslot 16 is used.
Mib	Vgs
Values	ds1 e1
Default	ds1

ATTRIBUTE Nsta Vgs CasDefn applicationList (appList)

Access	Read only
Description	This attribute lists all of the *Cas* components associated with this *CasDefn* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
List of	Link (Service, channelAssocSignalingDefinition)

GROUP Nsta Vgs CasDefn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs CasDefn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Vgs
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Vgs CasDefn operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	Vgs
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs CasDefn usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs CasDefn Operational (Oper)

Properties	Operational
Description	This group contains attributes that indicate the status of the *CasDefn* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs CasDefn fileTransferStatus

Access	Read only
Description	This attribute indicates the status of the transfer of the CAS profile file from the CP to the VSP FP. The possible values are: ***inProgress***: The file as specified in *fileName* attribute is being transferred. CAS signaling requests against trunks associated to this *CasDefn* component are not accepted.

Copyright © 2006, Nortel Nortel Confidential

complete: The file transfer is complete. CAS signaling requests against trunks associated to this *CasDefn* component are accepted.

missing: The system can not find the file, specified in the *fileName* attribute, on the CP. An alarm is raised in this state. The VSP FP polls for the file until the transfer can commence.

fileTooLong: The file set in the *fileName* attribute is too long to be loaded successfully. An alarm is raised in this state. The VSP FP polls to look for changes in file length or timestamp.

fileError: The file set in the *fileName* attribute has failed sanity checks after the transfer, and can not be used. An alarm is raised in this state. The VSP FP polls to look for changes in file length or timestamp.

cpNotResponding: The CP is not responding. The CP may be busy or the disk may be locked. The VSP FP polls to check for the CP availability.

Mib	Vgs
Values	inProgress complete missing fileTooLong fileError cpNotResponding
Default	missing

COMPONENT Nsta Vgs Mtp2Profile

Instance	Decimal (1..10)
Groups	GROUP Nsta Vgs Mtp2Profile Mtp2ProfileProv
Scope	Device
Description	Nsta/n Vgs Mtp2Profile/n This component represents the configurable parameters for the Message Transfer Part Layer 2 (MTP2) transport.

GROUP Nsta Vgs Mtp2Profile Mtp2ProfileProv

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the provisionable attributes for the *Mtp2Profile* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Mtp2Profile **protocolVariant (pV)**

Access	Read: All Write: All
Description	This attribute specifies the variant of the Message Transfer Part Layer 2 (MTP2) protocol that applies to the component. The values of the protocol timer attributes must be provisioned within the range applicable to the protocol variant specified by this attribute. The various values for this attribute are: ***itu*** - The component represents the ITU variant of the protocol (ITU-T Q.703). ***ansi*** - The component represents the ANSI variant of the protocol (ANSI T1.111.3).
Mib	Vgs
Values	itu ansi
Default	itu

ATTRIBUTE Nsta Vgs Mtp2Profile **alignmentReadyTimer (t1)**

Access	Read: All Write: All
Description	This attribute specifies the value of the “Alignment Ready” timer defined in ITU-T recommendation Q.703. This timer is started when the link reaches the “Alignment Ready” state. This timer stops upon entering the “In Service” state. Reception of a Fill-In Signal Unit (FISU) or a Message Signal Unit (MISU) while in the “Alignment Ready” state causes the state transition to the “In Service” state. A timer expiry causes the state to transition to the “Idle” state. The number of expiries of this timer is counted by the attribute *alignmentReadyTimeouts* (defined in the *Nsta/n Vgs Mtp2/n* component). The value of this timer must be between ***40*** and ***50*** seconds for the ITU variant of the protocol and between ***12*** and ***16*** seconds for the ANSI variant.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (12..50)
Units	seconds
Default	45

ATTRIBUTE Nsta Vgs Mtp2Profile notAlignedTimer (t2)

Access	Read: All Write: All
Description	This attribute specifies the value of the “Not Aligned” timer defined in ITU-T recommendation Q.703. It is used during initial alignment. This timer is started when the link enters the “Not Aligned” state which begins sending status indication “O”. If the timer expires before receiving a status indication “O”, “N” or “E”, alignment is stopped and the “Idle” state is entered. Otherwise the link proceeds to the “Aligned” state. The number of expiries of this timer is counted by the attribute *notAlignedTimeouts* (defined in the *Nsta/n Vgs Mtp2/n* component). The value of this timer must be between ***5*** and ***150*** seconds for the ITU variant of the protocol and between ***5*** and ***30*** seconds for the ANSI variant.
Mib	Vgs
Values	Decimal (5..150)
Units	seconds
Default	60

ATTRIBUTE Nsta Vgs Mtp2Profile alignedTimer (t3)

Access	Read: All Write: Illegal
Description	This attribute specifies the value of the “Aligned” timer defined in ITU-T recommendation Q.703. It is used during initial alignment. This timer is started when the link enters the “Aligned” state which begins sending status indication “N” or “E”, depending on whether the link is in normal or emergency alignment mode respectively. If the timer expires before a status indication “N” or “E” is received, alignment is stopped and the “Idle” state is entered. Otherwise the link proceeds to the “Proving” state. The number of expiries of this timer is counted by the attribute *alignedTimeouts* (defined in the *Nsta/n Vgs Mtp2/n* component). The value of this timer must be between ***1000*** and ***2000*** milliseconds for

Copyright © 2006, Nortel Nortel Confidential

	the ITU variant of the protocol and between ***5000*** and ***14000*** milliseconds for the ANSI variant.
Mib	Vgs
Values	Decimal (1000..14000)
Units	msec
Default	1500

ATTRIBUTE Nsta Vgs Mtp2Profile normalProvingTimer (t4n)

Access	Read: All Write: Illegal
Description	This attribute specifies the value of the “Proving Period” timer for normal alignment as defined in ITU-T recommendation Q.703. It is used during initial alignment. It is started when the link enters the “Proving” state. In normal alignment mode, proving must last for a period specified by this timer before the link can enter the “Aligned Ready” state. Expiry of this timer indicates a successful proving period unless the proving period has been previously aborted up to four times. A higher value for this timer ensures a more stable link, but increases the time taken to bring the link in service. The value of this timer must be between ***7500*** and ***9500*** milliseconds for the ITU variant of the protocol and between ***2000*** and ***2550*** milliseconds for the ANSI variant.
Mib	Vgs
Values	Decimal (2000..9500)
Units	msec
Default	8500

ATTRIBUTE Nsta Vgs Mtp2Profile emergencyProvingTimer (t4e)

Access	Read: All Write: Illegal
Description	This attribute specifies the value of the “Proving Period” timer for emergency alignment as defined in ITU-T recommendation Q.703. It is used during initial alignment. It is started when the link enters the “Proving” state. In emergency alignment mode, proving must last for a period specified by this timer before the link can enter the “Aligned Ready” state.

Copyright © 2006, Nortel Nortel Confidential

Expiry of this timer indicates a successful proving period unless the proving period has been previously aborted up to four times.

A higher value for this timer ensures a more stable link, but increases the time taken to bring the link in service.

The value of this timer must be between ***400*** and ***600*** milliseconds for the ITU variant of the protocol and between ***500*** and ***700*** milliseconds for the ANSI variant.

Mib	Vgs
Values	Decimal (400..700)
Units	msec
Default	500

ATTRIBUTE Nsta Vgs Mtp2Profile sendingSibTimer (t5)

Access	Read: All Write: Illegal
Description	This attribute specifies the value of the “Sending SIB” timer defined in ITU-T recommendation Q.703. It is used for congestion control. The value of this timer determines the interval at which the receiving end of a signalling link, which detects a congestion situation returns a status indication “B” to the remote transmitting end of the link. This causes the remote end of the link to stop sending messages until the congestion condition goes away. The number of times a status indication “B”, that is, a congestion indication is sent is counted by the attribute *congestionIndicationsSent* (defined in the *Nsta/n Vgs Mtp2/n* component). The number of times a congestion situation is detected is counted by the attribute *congestionDetects* (defined in the *Nsta/n Vgs Mtp2/n* component). This attribute has the same value ranges for both ANSI and ITU variants of the protocol.
Mib	Vgs
Values	Decimal (80..120)
Units	msec
Default	100

ATTRIBUTE Nsta Vgs Mtp2Profile remoteCongestionTimer (t6)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the value of the “Remote Congestion” timer defined in ITU-T recommendation Q.703. This timer begins when a status indication “B” is received, indicating congestion at the remote end. This timer is stopped when the congestion abates at the signalling point, as indicated by a message in the retransmit buffer being acknowledged. Upon timer expiration, a link failure indication is generated. The number of times a status indication “B” is received, indicating congestion at the remote end, is counted by the attribute *congestionIndicationsReceived* (defined in the *Nsta/n Vgs Mtp2/n* component). The value of this timer must be between ***3000*** and ***6000*** milliseconds for the ITU variant of the protocol and between ***1000*** and ***6000*** milliseconds for the ANSI variant.
Mib	Vgs
Values	Decimal (1000..6000)
Units	msec
Default	4500

ATTRIBUTE Nsta Vgs Mtp2Profile ackTimer (t7)

Access	Read: All Write: All
Description	This attribute specifies the value of the “Excessive delay of acknowledgment” timer defined in ITU-T recommendation Q.703. It is used during normal sending and receiving of Message Signal Units (MSU). This timer starts when the first MSU is placed in the retransmit buffer and is pending acknowledgment. This timer is stopped after the last MSU in the retransmit buffer is acknowledged. This timer is restarted after each acknowledgment when the retransmit buffer is non-empty. It is also restarted each time a link status indication unit “B” is received. If the timer expires, a link failure indication is generated. The number of expiries of this timer is counted by the attribute *ackTimeouts* (defined in the *Nsta/n Vgs Mtp2/n* component).

Copyright © 2006, Nortel Nortel Confidential

This attribute has the same value ranges for both ANSI and ITU variants of the protocol.

Mib	Vgs
Values	Decimal (500..2000)
Units	msec
Default	1250

ATTRIBUTE Nsta Vgs Mtp2Profile applicationList (appList)

Access	Read: All Write: Illegal
Description	This attribute specifies a list of *Nsta/n Vgs Mtp2/n* components linked to this profile.
Mib	Vgs

ATTRIBUTE Nsta Vgs Mtp2 msuErrors (msuErrs)

Access	Read: All Write: Illegal
Description	This attribute counts the number of ingress signal units discarded because of sequence number, length or Cyclic Redundancy Check (CRC) errors. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Mtp2 msuOctetsSent (octetTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of layer 3 payload octets transmitted within the Message Signal Units (MSU). The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs Mtp2 msuOctetsReceived (octetRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of layer 3 payload octets received within the Message Signal Units (MSU). The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway Mtp2

Description	The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway Mtp2 component.

ATTRIBUTE Nsta Vgs Mtp2 alignmentReadyTimeouts

Description	This attribute counts the number of timeouts of the “Alignment Ready” timer (T1) represented by the attribute *alignmentReadyTimer* (defined in the *Nsta/n Vgs Mtp2Profile/n* component).

Copyright © 2006, Nortel Nortel Confidential

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 notAlignedTimeouts

Description This attribute counts the number of timeouts of the “Not Aligned” timer (T2) represented by the attribute *notAlignedTimer* (defined in the *Nsta/n Vgs Mtp2Profile/n* component).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 alignedTimeouts

Description This attribute counts the number of timeouts of the “Aligned” timer (T3) represented by the attribute *alignedTimer* (defined in the *Nsta/n Vgs Mtp2Profile* component).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 congestionDetects

Description This attribute counts the number of times congestion was detected by the *MonitoredCommunicationsProtocol* dynamic subcomponent at the local end of the signalling link.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 congestionIndicationsSent

Description This attribute counts the number of congestion indications transmitted to the remote end of the signalling link. The congestion is detected locally by the *MonitoredCommunicationsProtocol* dynamic subcomponent and is transmitted to the remote end if it does not abate within the time interval specified by the *sendingSibTimer* (T5) attribute of the linked *Nsta/n Vgs Mtp2Profile/n* component.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 congestionIndicationsReceived

Description This attribute counts the number of congestion indications received from the remote end of the signalling link.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Mtp2 ackTimeouts

Description — This attribute counts the number of timeouts of the T7 Timer represented by the attribute *ackTimer* (defined in the *Nsta/n Vgs Mtp2Profile/n* component).

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 inServiceFailures

Description — This attribute counts the number of failures the *Mtp2* link has experienced while it was “In service”.

It does not include failures which occur during the alignment process.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuSent

Description — This attribute counts the number of Message Signal Units (MSU) transmitted. This includes the number of MSUs retransmitted, indicated by the attribute *msuRetransmits*.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuRetransmits

Description — This attribute counts the number of Message Signal Units (MSU) retransmitted because of negative acknowledgments.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuReceived

Description — This attribute counts the number of Message Signal Units (MSU) received. This includes the MSUs with errors, indicated by the attribute *msuErrors.*

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuErrors

Description — This attribute counts the number of ingress signal units discarded because of sequence number, length or Cyclic Redundancy Check (CRC) errors.

The counter counts the number of events in the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuOctetsSent

Description This attribute counts the number of layer 3 payload octets transmitted within the Message Signal Units (MSU).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuOctetsReceived

Description This attribute counts the number of layer 3 payload octets received within the Message Signal Units (MSU).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

COMPONENT Nsta Vgs Mtp2 MonitoredCommunicationProtocol (MCP)

Groups GROUP Nsta Vgs Mtp2 MCP OsiState (State)
GROUP Nsta Vgs Mtp2 MCP Operational (Oper)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway Mtp2 MonitoredCommunicationProtocol

Scope Application

Description ... *MonitoredCommunicationProtocol*

This component represents the functionality that monitors the status of communication between the parent component and the neighboring component with which the parent component is communicating. This component does the following:
- detects the loss of communication between the neighbors being monitored.
- counts messages lost between the monitored neighbors.
- ensures that the neighbor does not overflow with messages from this component.

GROUP Nsta Vgs Mtp2 MCP OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Copyright © 2006, Nortel Nortel Confidential

here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Vgs

ATTRIBUTE Nsta Vgs Mtp2 MCP **adminState (osiAdmin)**

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib Vgs

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Nsta Vgs Mtp2 MCP **operationalState (osiOper)**

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib Vgs

Values enabled (ena)
disabled (dis)

Default disabled

ATTRIBUTE Nsta Vgs Mtp2 MCP **usageState (osiUsage)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs Mtp2 MCP **Operational (Oper)**

Properties	Operational
Description	This group contains the operational data for the *MonitoredCommunicationProtocol* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs Mtp2 MCP **communicationFailures (commFailures)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of communication failures between the neighbors being monitored. The communication failure is detected in two ways: - if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively. - if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented. The counter wraps to zero when it exceeds the maximum value.

ATTRIBUTE Nsta Vgs Mtp2 MCP **communicationFailures (commFailures)**

Description	This attribute counts the number of communication failures between the neighbors being monitored. The communication failure is detected in two ways: - if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively. - if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **messageTxFailures (msgTxFailures)**

Description	This attribute counts the number of payload messages sent to the neighbor but were not received by the neighbor.

Copyright © 2006, Nortel Nortel Confidential

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **messageRxFailures (msgRxFailures)**

Description This attribute counts the number of payload messages that were sent by the neighbor but were not received by this component. This is detected by a gap in the Message Numbers received in payload messages from the neighbor.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableRequestsTx (enableReqsTx)**

Description This attribute counts the number of Monitor Enable Request messages sent by this component to the neighbor.

The value of this attribute is incremented when a Monitor Enable Request message is sent in an attempt to establish monitoring communication between the neighbors to be monitored.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableRequestsRx (enableReqsRx)**

Description This attribute counts the number of Monitor Enable Request messages received by this component.

The value of this attribute is incremented when a Monitor Enable Request message is received from the neighbor in an attempt to establish monitoring communication.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableResponsesTx (enableRspsTx)**

Description This attribute counts the number of Monitor Enable Response messages sent by this component.

The value of this attribute is incremented when a Monitor Enable Response message is sent to the neighbor in response to a Monitor Enable Request message.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableResponsesRx (enableRspsRx)**

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of Monitor Enable Response messages received by this component in response to the Monitor Enable Request message. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **heartbeatsTx (hbsTx)**

Description	This attribute counts the number of Heartbeat messages sent by this component to the neighbor. If no messages are sent by this component for the duration of the Heartbeat timer, then a Heartbeat message is sent to the neighbor and the value of this attribute is incremented. The Heartbeat timer is not provisionable and is set by the neighbors being monitored. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **heartbeatRx (hbsRx)**

Description	This attribute counts the number of Heartbeat messages received by this component. The value of this attribute is incremented when the Heartbeat message is received. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **messagesTx (msgsTx)**

Description	This attribute counts the number of payload messages sent by this component to the neighbor. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **messagesRx (msgsRx)**

Description	This attribute counts the number of payload messages received by this component. The counter counts the number of events in the collection interval.

Copyright © 2006, Nortel
Nortel Confidential

Description	This attribute specifies the frequency for sending Message Transfer Part Layer 2 User Adaptation (M2UA) heartbeat messages to peer nodes. The heartbeat timer, T(beat), has two purposes. It is used to determine how often to send out heartbeat messages. It is also used to determine how long to wait for heartbeat acknowledgement (2 *T(beat)) before considering the peer to be unavailable. A value of ***0*** disables sending of heartbeat messages.
Mib	Vgs
Values	Decimal (0..60)
Units	seconds

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default	No default

ATTRIBUTE Nsta Vgs M2ua proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default	No default

ATTRIBUTE Nsta Vgs M2ua controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	Vgs
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Nsta Vgs M2ua alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	Vgs
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Nsta Vgs M2ua **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE Nsta Vgs M2ua As recoveryTimer (recoveryT)

Access	Read: All Write: All
Description	This attribute specifies the amount of time to buffer outgoing messages when the Application Server Process (ASP) becomes inaccessible. If this timer expires before the ASP returns to service, the messages are dropped and the Application Server (AS) transitions into the ***down*** state. A value of ***0*** indicates that buffering should not occur, and the AS should immediately transition into the ***down*** state when the ASP becomes inaccessible. Note that higher values for this attribute will require more memory to be reserved for message buffering.
Mib	Vgs
Values	Decimal (0..5)
Units	seconds
Default	2

GROUP Nsta Vgs M2ua As OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs M2ua As adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Vgs

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Nsta Vgs M2ua As operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Vgs

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Nsta Vgs M2ua As usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: Vgs

Values:
idle
active (activ)
busy

Default: idle

Mib	Vgs

ATTRIBUTE Nsta Vgs M2ua As state

Access	Read: All Write: Illegal
Description	This attribute indicates the peer Application Server (AS) state as determined by the local User Adaptation application. The state is defined in RFC 3331 and is one of the following: ***down*** - The AS is unavailable. This state implies that all related Application Server Processes (ASPs) are in the ASP-DOWN state for this AS. This is the initial AS state. ***active*** - The AS is available and application traffic is active. This state implies that at least one ASP is in the ASP-ACTIVE state. ***inactive*** - The AS is available but no application traffic is active (that is, one or more related ASPs are in the ASP-INACTIVE state, but none are in the ASP-ACTIVE state). ***pending*** - An active ASP has transitioned to ASP-INACTIVE or ASP-DOWN state and it was the last remaining active ASP.
Mib	Vgs
Values	inactive active pending down
Default	No default

ATTRIBUTE Nsta Vgs M2ua As interfacesActive (ifActive)

Access	Read: All Write: Illegal
Description	This attribute indicates the number of Interface Identifiers (IID) currently in an active state. This value is initially zero and increases up to a maximum of the number of *lid* components provisioned under this component.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs M2ua As Iid MCP Operational (Oper)

Properties	Operational
Description	This group contains the operational data for the *MonitoredCommunicationProtocol* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs M2ua As Iid MCP communicationFailures (commFailures)

Access	Read: All Write: Illegal
Description	This attribute counts the number of communication failures between the neighbors being monitored. The communication failure is detected in two ways:

Copyright © 2006, Nortel Nortel Confidential

- if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively.
- if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented.

The counter wraps to zero when it exceeds the maximum value.

Mib: Vgs

Values: Decimal (0..4294967295)

Default: No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messageTxFailures (msgTxFailures)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of payload messages sent to the neighbor but were not received by the neighbor.

The counter wraps to zero when it exceeds the maximum value.

Mib: Vgs

Values: Decimal (0..4294967295)

Default: No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messageRxFailures (msgRxFailures)

Access: Read: All
Write: Illegal

Description: This attribute counts the number of payload messages that were sent by the neighbor but were not received by this component. This is detected by a gap in the Message Numbers received in payload messages from the neighbor.

The counter wraps to zero when it exceeds the maximum value.

Mib: Vgs

Values: Decimal (0..4294967295)

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messagesTx (msgsTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of payload messages sent by this component to the neighbor. The counter wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messagesRx (msgsRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of payload messages received by this component. The counter wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP sequenceGapsTx (seqGapsTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of Sequencing Gap messages sent by this component. When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent and the value of this attribute is incremented. The Sequence Gap message shows the start and end of the gap in the Messages Numbers. The counter wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **sequenceGapsRx (seqGapsRx)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of Sequencing Gap messages received by this component. When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent. The value of this attribute is incremented when this message is received. The Sequence Gap message shows the start and end of the gap in the Messages Numbers. The counter wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **unknownMessagesRx (unknownMsgsRx)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of messages received by this component that are not recognized by the MonitoredCommunicationProtocol (MCP). The counter wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **messagesDiscarded (msgsDiscarded)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of messages that were discarded to avoid overflowing of the neighbor. The number of messages that the neighbor can handle without overflowing is identified from the Available Capacity field in the messages received from the neighbor. If the value of the Available Capacity field is zero, payload messages to be sent to the neighbor are discarded and the value of this counter is incremented. The counter wraps to zero when it exceeds the maximum value.

ATTRIBUTE Nsta Vgs M2ua As Iid MCP heartbeatTimer (hbTimer)

Access	Read: All Write: Illegal
Description	This attribute indicates the duration of the Heartbeat timer. The value of the Heartbeat timer is negotiated between the monitored parent components.
Mib	Vgs
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Iid MCP heartbeatRetries

Access	Read: All Write: Illegal
Description	This attribute indicates the number of expiries of the Heartbeat timer allowed before marking the communication with the neighbor as down. The value of the Heartbeat retries is negotiated between the monitored parent components.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default
Default	COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol
Description	The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol component.

ATTRIBUTE Nsta Vgs M2ua As Iid MCP communicationFailures (commFailures)

Description	This attribute counts the number of communication failures between the neighbors being monitored. The communication failure is detected in two ways: - if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute

Copyright © 2006, Nortel Nortel Confidential

is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively.
- if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messageTxFailures (msgTxFailures)

Description — This attribute counts the number of payload messages sent to the neighbor but were not received by the neighbor.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messageRxFailures (msgRxFailures)

Description — This attribute counts the number of payload messages that were sent by the neighbor but were not received by this component. This is detected by a gap in the Message Numbers received in payload messages from the neighbor.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP enableRequestsTx (enableReqsTx)

Description — This attribute counts the number of Monitor Enable Request messages sent by this component to the neighbor.

The value of this attribute is incremented when a Monitor Enable Request message is sent in an attempt to establish monitoring communication between the neighbors to be monitored.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP enableRequestsRx (enableReqsRx)

Description — This attribute counts the number of Monitor Enable Request messages received by this component.

Copyright © 2006, Nortel Nortel Confidential

The value of this attribute is incremented when a Monitor Enable Request message is received from the neighbor in an attempt to establish monitoring communication.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP enableResponsesTx (enableRspsTx)

Description This attribute counts the number of Monitor Enable Response messages sent by this component.

The value of this attribute is incremented when a Monitor Enable Response message is sent to the neighbor in response to a Monitor Enable Request message.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP enableResponsesRx (enableRspsRx)

Mib	Vgs

ATTRIBUTE Nsta Vgs M2ua As Asp ipAddress (ip)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the Internet Protocol (IP) address of the remote Application Server Process (ASP). If the value of the *localRole* attribute is set to ***client***, this is the destination towards which a Stream Control Transmission Protocol (SCTP) association is established. If the value of the *localRole* attribute is ***server***, this is the address from which a connection is expected.
Mib	Vgs
Values	IP address
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp port

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the Stream Control Transmission Protocol (SCTP) port of the remote Application Server Process (ASP).
Mib	Vgs
Values	Decimal (1..65535)
Default	2904

ATTRIBUTE Nsta Vgs M2ua As Asp localRole (role)

Access	Read: All Write: All
Description	This attribute specifies whether this node should behave as a ***server***, receiving connections from the remote Application Server Process (ASP), or as a ***client***, initiating connections towards the remote ASP.
Mib	Vgs
Values	server client
Default	server

ATTRIBUTE Nsta Vgs M2ua As Asp sctpAckDelay (ackDelay)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the delayed acknowledgement timer for the Stream Control Transmission Protocol (SCTP) association used by this Application Server Process (ASP). This controls the maximum interval between the sending of SCTP Selective Acknowledgement (SACK) chunks during idle communication periods.
Mib	Vgs
Values	Decimal (50..500)
Units	msec
Default	200

GROUP Nsta Vgs M2ua As Asp **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs M2ua As Asp **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Vgs
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Asp **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Vgs
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs M2ua As Asp **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs M2ua As Asp **AspSctpOper**

Properties	Operational
Description	This group contains the operational data for the *ApplicationServerProcess* component pertaining to Stream Control Transmission Protocol (SCTP) messages.
Mib	Vgs

ATTRIBUTE Nsta Vgs M2ua As Asp **sctpEstablishIndications (sctpEstInds)**

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of M-SCTP Establish Indications received for this Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***server***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp sctpEstablishRequests (sctpEstReqs)

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Establish Requests sent for this Application Server Process (ASP). This attribute counts the number of the attempts to establish a Stream Control Transmission Protocol (SCTP) association with the remote ASP. This counter is incremented only when the value of the *localRole* attribute is set to ***client***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp sctpEstablishFailures (sctpEstFails)

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Establish Requests that failed to successfully establish a Stream Control Transmission Protocol (SCTP) association with the remote Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***client***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp sctpReleaseIndications (sctpRelInds)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Release Indications received for this Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***server***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp sctpRestartIndications (sctpRestartInds)

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Restart Indications received for this Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***server***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

GROUP Nsta Vgs M2ua As Asp AspSmTmOper

Properties	Operational
Description	This group contains the operational data for the *ApplicationServerProcess* component that pertains to the Application Server Process (ASP) state machine and traffic management.
Mib	Vgs

ATTRIBUTE Nsta Vgs M2ua As Asp aspUpMsgsReceived (aspUpRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of Application Server Process (ASP) Up (UP) messages received. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp aspDownMsgsReceived (aspDnRx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of Application Server Process (ASP) Down (DOWN) messages received. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp aspUpAcksSent (aspUpAcksTx)

Access	Read: All Write: Illegal
Description	This attribute counts the number of Application Server Process (ASP) Up Acknowledgement (UP ACK) messages sent. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs M2ua As Asp aspDownAcksSent (aspDnAcksTx)

Common Verbs	Help List Display Add DELete

GROUP Nsta Vgs V5Link Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes for the *Nsta/n Vgs V5Link* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs V5Link interfaceName

Access	Read and write
Criticality	Process
Description	This is the value for the link identifier for SgV5 signalling. The link identifier provides the capability to use a specific identifier provisioned at both the MGC and the SG. This attribute specifies the link to the E1 Chan component that in turn specifies the timeslot for the Message V5Link transports.
Mib	Vgs
Values	Link (Service, applicationFramerName)
Default	No default

ATTRIBUTE Nsta Vgs V5Link linkTolid

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the instance of the V5UAIID component to which the instance of the V5Link is linked. This is used only if integer format interfaceId is supported.
Mib	Vgs
Values	Link (Service, linkToLayer2)
Default	No default

ATTRIBUTE Nsta Vgs V5Link profile

Access	Read and write
Description	This attribute specifies a link to the Nsta/n Vgs V5Profile/n component, which in turn specifies the configurable parameters for this V5Link.
Mib	Vgs
Values	Link (Service, applicationList)
Default	No default

COMPONENT Nsta Vgs V5Link LapV5 (LapV5)

Instance	Decimal (15; 16; 31)
Groups	GROUP Nsta Vgs V5Link LapV5 OsiState (State) GROUP Nsta Vgs V5Link LapV5 Operational (Oper)
Scope	Device
Description	*Nsta/n Vgs Brag/n V5Link LapV5/<timeslot number>* *Nsta/n Vgs MgV5Link/n LapV5/n* This component represents a Link Access Protocol (LAP) entity for the V5.2 C-channel. The instance value is the specific timeslot used by the C-channel on the associated E1. The *LapV5* is provisioned whenever the indicated timeslot is to be used either for carrying V5.2 messaging (as an active C-channel) or when it is to be in a “stand-by” mode to provide an alternate C-channel, used if the active C-channel fails. A *V5Link* does not need to have any C-channels, so it is legitimate to have a *V5Link* component with no *LapV5* subcomponents. However, there can be no more that three *LapV5* subcomponents, since the standards explicitly state that only timeslots 15, 16, and 31 may be used for C-channels.
Mib	Vgs
Common Verbs	Help List Display Add DELete

Copyright © 2006, Nortel Nortel Confidential

GROUP Nsta Vgs V5Link LapV5 **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs V5Link LapV5 **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Vgs
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Vgs V5Link LapV5 **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Vgs
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs V5Link LapV5 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs V5Link LapV5 Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Nsta/n Vgs Brag/n V5Link LapV5/<timeslot>* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs V5Link LapV5 interfaceId

Access	Read only
Criticality	Component
Description	This attribute indicates the V5UA protocol link identifier for this *LapV5*. The value displayed here is the expected value of the V5UA interface identifier for this particular C-channel. Any V5UA messages received by the *V5ua* with this specific interface identifier are processed by this *LapV5*. If the interface identifier received in a V5UA message does not match the interface identifier of any *LapV5* associated with this *Vgs*, the message is discarded. The format of the *LapV5* interface identifier and that of the *V5Link* interface identifier are closely related. The *LapV5* interface identifier is equal to the interface identifier of its parent *V5Link*, plus the timeslot number.

Copyright © 2006, Nortel Nortel Confidential

	Therefore, the lowest 5 bits of the interface identifier are either 0 (for the *V5Link*), 15, 16, or 31 (for the C-channels).
Mib	Vgs
Values	Hex (H.0..H.ffffffff)
Default	No default

ATTRIBUTE Nsta Vgs V5Link LapV5 **txFrames**

Access	Read only
Description	This attribute counts the frames transmitted towards the TDM interface since the component was activated. This includes retransmitted frames. The counter wraps to 0 when its maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs V5Link LapV5 **rxFrames**

Access	Read only
Description	This attribute counts the frames received from the TDM interface since the component was activated. This includes errored frames. The counter wraps to 0 when its maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs V5Link LapV5 **erroredFrames**

Access	Read only
Description	This attribute counts the frames received from the TDM interface with errors since the component was activated. Note that the errored frames counted here do not include all errors. According to V5.2 standards, short frames (under the minimum required length) and some other errors are discarded without reporting them to upper levels of the V5.2 stack. The counter wraps to 0 when its maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs V5Link LapV5 **retransmittedFrames**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts retransmission attempts. The peer layer 2 must respond to an I frame within the protocol timer interval provisioned as *t200* seconds. If the peer layer 2 fails to acknowledge a frame prior to the expiry of the timer and there have not been *n200* retransmissions yet, the *LapV5* retransmits the unacknowledged frame and increments *retransmittedFrames*. If there have been sufficient retransmission attempts to reach the provisioned *n200* limit, the C-channel attempts to re-establish, and the *n200Exhausted* increments. The counter wraps to 0 when its maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs V5Link LapV5 **n200Exhausted**

Access	Read only
Description	This attribute counts the number of times that the retransmission limit specified by the *n200* attribute was exceeded on this C-channel (*LapV5*). Each time the limit is reached, the counter is incremented and the *LapV5* re-establishes the C-channel. The counter wraps to 0 when its maximum value is exceeded.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs V5Link LapV5 **activeDataLinkProtocols**

Access	Read only
Description	This attribute indicates the set of V5.2 protocols currently established on C-channel. The following protocols ate supported: ***protection*** (***prot***) - This protocol provides the capability to enable stand-by C-channels when the active C-channels fail ***link*** - This protocol provides the capability to enable and disable E1 links, as well as provide Link Identification procedure messaging. ***control*** (***ctrl***) - This protocol provides the capability to enable and disable user terminals (sets). ***bcc*** - This protocol provides the capability to allocate specific B channels on indicated E1 links t a call.

Copyright © 2006, Nortel Nortel Confidential

pstn - This protocol provides the capability to signla user terminal events from the terminal to the network and responses back to the terminal.

ATTRIBUTE Nsta Vgs V5Prof **t200**

Access	Read and write
Description	This attribute specifies the maximum time allowed between the transmission of a layer 2 frame and the receipt of an acknowledgement from the user. This is the acknowledgement timer (T200). The value is rounded to the nearest 0.5 second.
Mib	Vgs
Values	Decimal (0.5..5.0)
Units	seconds
Default	1.0

ATTRIBUTE Nsta Vgs V5Prof **t203**

Access	Read and write
Description	This attribute specifies the maximum time without frame exchange during multiple frame operations. Expiry of this timer leads to a "keep-alive" polling RR or RNR frame being transmitted to ensure that the remote layer 2 entity is still active.
Mib	Vgs
Values	Decimal (10..300)
Units	seconds
Default	10

ATTRIBUTE Nsta Vgs V5Prof **n200**

Access	Read and write
Description	This attribute specifies the maximum number of retransmissions of a layer 2 frame.
Mib	Vgs
Values	Decimal (1..8)
Default	3

ATTRIBUTE Nsta Vgs V5Prof **n201**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the maximum length of an information field.
Mib	Vgs
Values	Decimal (4..260)
Units	octets
Default	260

ATTRIBUTE Nsta Vgs V5Prof maxOutstandingFrames

Access	Read and write
Description	This attribute specifies the maximum number of sequentially numbered I frames (k) that may be unacknowledged at any given time after which no new frames are transmitted unless as part of an error recovery procedure.
Mib	Vgs
Values	Decimal (1..127)
Default	7

COMPONENT Nsta Vgs SgV5UserAdaptation (SgV5)

Groups	GROUP Nsta Vgs SgV5 Provisioned (Prov) GROUP Nsta Vgs SgV5 OsiState (State) GROUP Nsta Vgs SgV5 Operational (Oper)
Scope	Device
Description	*Nsta/n Vgs SgV5* The V5 signalling gateway communicates with the MGC by SgV5 (V5.2 User Adaptation Layer) over SCTP. This component provides the signalling linkage between the SG and the MGC.
Mib	Vgs
Opt. Subcomp.	COMPONENT Nsta Vgs SgV5 ApplicationServer (As)

ATTRIBUTE Nsta Vgs SgV5 sctpPortConnection

Access	Read and write
Description	This is the component nmae of the Nsta/x Vgs Control/SG SctpPort/n linked to the SgV5 component.
Mib	Vgs
Values	Link (Service, linkToApplication)
Default	No default

GROUP Nsta Vgs SgV5 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Vgs
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Nsta Vgs SgV5 operationalState (osiOper)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Vgs
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs SgV5 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs SgV5 Operational (Oper)

Properties	Operational
Description	This group contains operational attributes of the *Vgs SgV5* component. *Nsta/n*
Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 connectionRefused

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The attribute counts the number of SCTP connection requests refused by SgV5. The most likely cause for a connection to be refused is that the requestors IP address and /or port is not configured on this voice gateway.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

Description	This group contains the provisionable data for the *ApplicationServer* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 As recoveryTimer (recoveryT)

Access	Read: All Write: All
Description	This attribute specifies the amount of time to buffer outgoing messages when the Application Server Process (ASP) becomes inaccessible.

Copyright © 2006, Nortel Nortel Confidential

If this timer expires before the ASP returns to service, the messages are dropped and the Application Server (AS) transitions into the ***down*** state.

A value of ***0*** indicates that buffering should not occur, and the AS should immediately transition into the ***down*** state when the ASP becomes inaccessible.

Note that higher values for this attribute will require more memory to be reserved for message buffering.

Mib	Vgs
Values	Decimal (0..5)
Units	seconds
Default	2

ATTRIBUTE Nsta Vgs SgV5 As **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the peer Application Server (AS) state as determined by the local User Adaptation application. The state is defined in RFC 3331 and is one of the following: ***down*** - The AS is unavailable. This state implies that all related Application Server Processes (ASPs) are in the ASP-DOWN state for this AS. This is the initial AS state. ***active*** - The AS is available and application traffic is active. This state implies that at least one ASP is in the ASP-ACTIVE state. ***inactive*** - The AS is available but no application traffic is active (that is, one or more related ASPs are in the ASP-INACTIVE state, but none are in the ASP-ACTIVE state). ***pending*** - An active ASP has transitioned to ASP-INACTIVE or ASP-DOWN state and it was the last remaining active ASP.
Mib	Vgs
Values	inactive active pending down
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As **interfacesActive (ifActive)**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of Interface Identifiers (IID) currently in an active state. This value is initially zero and increases up to a maximum of the number of *Iid* components provisioned under this component.
Mib	Vgs
Values	Decimal (0..4294967295)

Scope Application

Description ... *MonitoredCommunicationProtocol*

This component represents the functionality that monitors the status of communication between the parent component and the neighboring component with which the parent component is communicating. This component does the following:
- detects the loss of communication between the neighbors being monitored.
- counts messages lost between the monitored neighbors.

Copyright © 2006, Nortel Nortel Confidential

- ensures that the neighbor does not overflow with messages from this component.

Properties	Operational
Description	This group contains the operational data for the *MonitoredCommunicationProtocol* component.
Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 As Iid MCP **communicationFailures (commFailures)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of communication failures between the neighbors being monitored. The communication failure is detected in two ways:

Copyright © 2006, Nortel Nortel Confidential

- if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively.
- if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented.

The counter wraps to zero when it exceeds the maximum value.

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **sequenceGapsRx (seqGapsRx)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of Sequencing Gap messages received by this component. When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent. The value of this attribute is incremented when this message is received. The Sequence Gap message shows the start and end of the gap in the Messages Numbers. The counter wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **unknownMessagesRx (unknownMsgsRx)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of messages received by this component that are not recognized by the MonitoredCommunicationProtocol (MCP). The counter wraps to zero when it exceeds the maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **messagesDiscarded (msgsDiscarded)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of messages that were discarded to avoid overflowing of the neighbor. The number of messages that the neighbor can handle without overflowing is identified from the Available Capacity field in the messages received from the neighbor. If the value of the Available Capacity field is zero, payload messages to be sent to the neighbor are discarded and the value of this counter is incremented. The counter wraps to zero when it exceeds the maximum value.

ATTRIBUTE Nsta Vgs SgV5 As Iid MCP heartbeatTimer (hbTimer)

Access	Read: All Write: Illegal
Description	This attribute indicates the duration of the Heartbeat timer. The value of the Heartbeat timer is negotiated between the monitored parent components.
Mib	Vgs
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As Iid MCP heartbeatRetries

Access	Read: All Write: Illegal
Description	This attribute indicates the number of expiries of the Heartbeat timer allowed before marking the communication with the neighbor as down. The value of the Heartbeat retries is negotiated between the monitored parent components.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default
Default	COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway SgV5UserAdaptation ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol
Description	The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway SgV5UserAdaptation ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol component.

ATTRIBUTE Nsta Vgs SgV5 As Iid MCP communicationFailures (commFailures)

Description	This attribute counts the number of communication failures between the neighbors being monitored. The communication failure is detected in two ways: - if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute

Copyright © 2006, Nortel Nortel Confidential

is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively.
- if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP messageTxFailures (msgTxFailures)

Description — This attribute counts the number of payload messages sent to the neighbor but were not received by the neighbor.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP messageRxFailures (msgRxFailures)

Description — This attribute counts the number of payload messages that were sent by the neighbor but were not received by this component. This is detected by a gap in the Message Numbers received in payload messages from the neighbor.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP enableRequestsTx (enableReqsTx)

Description — This attribute counts the number of Monitor Enable Request messages sent by this component to the neighbor.

The value of this attribute is incremented when a Monitor Enable Request message is sent in an attempt to establish monitoring communication between the neighbors to be monitored.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP enableRequestsRx (enableReqsRx)

Description — This attribute counts the number of Monitor Enable Request messages received by this component.

Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 As Asp ipAddress (ip)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the Internet Protocol (IP) address of the remote Application Server Process (ASP). If the value of the *localRole* attribute is set to ***client***, this is the destination towards which a Stream Control Transmission Protocol (SCTP) association is established. If the value of the *localRole* attribute is ***server***, this is the address from which a connection is expected.
Mib	Vgs
Values	IP address
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As Asp port

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the Stream Control Transmission Protocol (SCTP) port of the remote Application Server Process (ASP).
Mib	Vgs
Values	Decimal (1..65535)
Default	2904

ATTRIBUTE Nsta Vgs SgV5 As Asp localRole (role)

Access	Read: All Write: All
Description	This attribute specifies whether this node should behave as a ***server***, receiving connections from the remote Application Server Process (ASP), or as a ***client***, initiating connections towards the remote ASP.
Mib	Vgs
Values	server client
Default	server

ATTRIBUTE Nsta Vgs SgV5 As Asp sctpAckDelay (ackDelay)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the delayed acknowledgement timer for the Stream Control Transmission Protocol (SCTP) association used by this Application Server Process (ASP). This controls the maximum interval between the sending of SCTP Selective Acknowledgement (SACK) chunks during idle communication periods.
Mib	Vgs
Values	Decimal (50..500)
Units	msec
Default	200

GROUP Nsta Vgs SgV5 As Asp **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 As Asp **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Vgs
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Vgs
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nsta Vgs SgV5 As Asp **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Vgs
Values	idle active (activ) busy
Default	idle

GROUP Nsta Vgs SgV5 As Asp **AspSctpOper**

Properties	Operational
Description	This group contains the operational data for the *ApplicationServerProcess* component pertaining to Stream Control Transmission Protocol (SCTP) messages.
Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 As Asp **sctpEstablishIndications (sctpEstInds)**

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of M-SCTP Establish Indications received for this Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***server***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As Asp sctpEstablishRequests (sctpEstReqs)

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Establish Requests sent for this Application Server Process (ASP). This attribute counts the number of the attempts to establish a Stream Control Transmission Protocol (SCTP) association with the remote ASP. This counter is incremented only when the value of the *localRole* attribute is set to ***client***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As Asp sctpEstablishFailures (sctpEstFails)

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Establish Requests that failed to successfully establish a Stream Control Transmission Protocol (SCTP) association with the remote Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***client***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As Asp sctpReleaseIndications (sctpRelInds)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Release Indications received for this Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***server***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Nsta Vgs SgV5 As Asp **sctpRestartIndications (sctpRestartInds)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of M-SCTP Restart Indications received for this Application Server Process (ASP). This counter is incremented only when the value of the *localRole* attribute is set to ***server***. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs
Values	Decimal (0..4294967295)
Default	No default

GROUP Nsta Vgs SgV5 As Asp **AspSmTmOper**

Properties	Operational
Description	This group contains the operational data for the *ApplicationServerProcess* component that pertains to the Application Server Process (ASP) state machine and traffic management.
Mib	Vgs

ATTRIBUTE Nsta Vgs SgV5 As Asp **aspUpMsgsReceived (aspUpRx)**

Access	Read: All Write: Illegal
Description	This attribute counts the number of Application Server Process (ASP) Up (UP) messages received. The counter wraps to zero when it exceeds its maximum value.
Mib	Vgs

Copyright © 2006, Nortel Nortel Confidential

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **packetsReceived**

Description — This attribute counts the number of IP packets received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **bytesSent**

Description — This attribute counts the number of bytes sent.

This count includes the Stream Control Transmission Protocol (SCTP) message headers and chunk headers but does not include the IP header.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **bytesReceived**

Description — This attribute counts the number of bytes received.

This count includes the Stream Control Transmission Protocol (SCTP) message headers and chunk headers but does not include the IP header.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **dataChunksSent**

Description — This attribute counts the number of Payload Data (DATA) chunks sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **dataChunksReceived**

Description — This attribute counts the number of Payload Data (DATA) chunks received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **sackChunksSent**

Description — This attribute counts the number of Selective Acknowledgement (SACK) chunks sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **sackChunksReceived**

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **outOfResourceErrorsSent**

Description This attribute counts the number of "Out of Resource" errors sent.

This corresponds to error code 4 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **outOfResourceErrorsReceived**

Description This attribute counts the number of "Out of Resource" errors received.

This corresponds to error code 4 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **invalidAssocRestartErrorsSent**

Description This attribute counts the number of "Restart of an association with new addresses" errors sent.

This corresponds to error code 11 defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **invalidAssocRestartErrorsReceived**

Description This attribute counts the number of "Restart of an association with new addresses" errors received.

This corresponds to error code 11 defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **userInitiatedAbortsSent**

Description This attribute counts the number of "User Initiated Abort" indications sent by the local Stream Control Transmission Protocol (SCTP) user.

This corresponds to error code 12 defined in the SCTP Implementer's Guide.

Copyright © 2006, Nortel Nortel Confidential

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **userInitiatedAbortsReceived**

Description This attribute counts the number of "User Initiated Abort" indications received from the peer Stream Control Transmission Protocol (SCTP) user.

This corresponds to error code 12 defined in the SCTP Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **checksumErrors**

Description This attribute counts the number of incoming packets that were discarded due to checksum verification failure.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **retransmittedChunks**

Description This attribute counts the number of Payload Data (DATA) chunks retransmitted.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **gapAcknowledgementsSent**

Description This attribute counts the number of chunks reported to the far end in "Gap Ack" reports. This provides an indication of the number of chunks that were locally received out of order.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **gapAcknowledgementsReceived**

Description This attribute counts the number of chunks reported by the far end in "Gap Ack" reports. This provides an indication of the number of chunks that were received out of order by the far end.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

COMPONENT NetworkSynchronization (NS)

Groups	GROUP NS Provisioned (Prov) GROUP NS OsiState (State) GROUP NS Operational (Oper)
Scope	Network
Description	The *NetworkSynchronization* component administers the network clock synchronization.
Mib	Time
Common Verbs	Help List Display Add DELete

VERB Revert NS

Impact	Service
Description	This command moves all clock sources in the reversion delay list to the current clock source list, if the reversion condition applies, to be available for clock synchronization. When entered with no option, this command is applicable only when reversionDelay is manual.

GROUP NS Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisioning data for the *NetworkSynchronization* component.
Mib	Time

ATTRIBUTE NS primaryReference (priRef)

Access	Read and write

Copyright © 2006, Nortel

Nortel Confidential

Description	This attribute specifies the port that is the preferred choice as the reference for the network clock.
Mib	Time
Values	The name of the component
Default	No default

ATTRIBUTE NS secondaryReference (secRef)

Access	Read and write
Description	This attribute specifies the port that is the second choice for the reference for the network clock.
Mib	Time
Values	The name of the component
Default	No default

ATTRIBUTE NS tertiaryReference (tertRef)

Access	Read and write
Description	This attribute specifies the port that is the third choice for the reference for the network clock.
Mib	Time
Values	The name of the component
Default	No default

ATTRIBUTE NS useableReferences (useRef)

Access	Read and write
Description	This attribute specifies the criteria that a reference must meet for the *NetworkSynchronization* component to consider it a usable clocking source. A value of ***enabled*** indicates that all enabled clocking sources are usable. A value of ***notDegraded*** indicates that clocking sources must be enabled and not degraded to be usable.
Mib	Time
Values	enabled notDegraded
Default	enabled

ATTRIBUTE NS reversionDelay (revDel)

Access	Read and write
Description	This attribute specifies how long the *NetworkSynchronization* component waits before using a port as a reference after it has been cleared of its degraded/disabled status.

Copyright © 2006, Nortel Nortel Confidential

Note:
In non-revertive (manual) mode, if all provisioned references have failed, the NS stays in holdover mode (NS *clockSyncState* = *freeRun*). When one of the provisioned references becomes available, the NS remains in holdover mode and will not automatically switch to the available reference (exiting holdover requires that an operator issue the command "revert ns"). In revertive mode, the NS automatically exits holdover mode and switches to the available reference, either immediately or with a delay if provisioned.

Mib	Time
Values	Decimal (0..120) manual (man)
Units	minutes
Default	0

ATTRIBUTE NS ssmProtocol (ssm)

Access	Read and write
Description	This attribute specifies if the clock reference selection based on Synchronization Status Message (SSM) is enabled on the node. If this attribute has a value of ***enabledRevertive***, then the activeReference and standbyReference are revertive to the provisioned priority of primary, secondary or tertiary provided the reference has the same quality level. If the attribute value is ***enabledNonRevertive***, then the activeReference clock reference selection is not dependent on the provisioned priority of primary, secondary or tertiary (the standbyReference clock will always be revertive). If the attribute value is ***enabledMigration***, then the SSM messages are stored and broadcasted as in other enabled states but no switching decisions are made based on the SSM messages (this is a useful state during network migration when not all node in the network are distributing the proper SSM values). If the attribute value is ***disabled***, then the SSM messages are only stored but no broadcasting or switching decision is made.
Mib	Time
Values	disabled enabledRevertive enabledNonRevertive enabledMigration
Default	disabled

ATTRIBUTE NS termPanel (termPanel)

Access	Read and write
Description	This attribute specifies whether a termination panel is used in the external timing configuration. A value of ***yes*** indicates the termination panel is used. A value of ***no*** indicates the termination panel is not used.

Copyright © 2006, Nortel Nortel Confidential

Mib	Time
Values	no yes
Default	No default

ATTRIBUTE NS setsPrimaryReference (setsPriRef)

Access	Read and write
Description	This attribute specifies the source that is the preferred choice as the reference for the SETS port.
Mib	Time
Values	nsSelect bitsA bitsB nsProcessed none
Default	none

ATTRIBUTE NS setsSecondaryReference (setsSecRef)

Access	Read and write
Description	This attribute specifies the source that is the second choice for the reference for the SETS port.
Mib	Time
Values	nsSelect bitsA bitsB nsProcessed none
Default	none

ATTRIBUTE NS setsTertiaryReference (setsTertRef)

Access	Read and write
Description	This attribute specifies the source that is the third choice for the reference for the SETS port.
Mib	Time
Values	nsSelect bitsA bitsB nsProcessed none
Default	none

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE NS setsSSMProtocol (setsSSM)

Access	Read and write
Description	This attribute specifies if the SETS clock reference selection based on Synchronization Status Message (SSM) is enabled. If this attribute has a value of ***enabledRevertive***, then the setsActiveReference and setsStandbyReference are revertive to the provisioned priority of SETS primary, secondary or tertiary provided the reference has the same quality level. If the attribute value is ***enabledNonRevertive***, then the setsActiveReference clock reference selection is not dependent on the provisioned priority of SETS primary, secondary or tertiary (the setsStandbyReference clock will always be revertive). If the attribute value is ***disabled***, then the SSM messages are only stored but no broadcasting or switching decision is made.
Mib	Time
Values	disabled enabledRevertive enabledNonRevertive
Default	disabled

ATTRIBUTE NS setsSquelchTimer (setsSquelch)

Access	Read and write
Description	This attribute specifies how long the *NetworkSynchronization* component waits before starting the SETS clock source selection. This is to allow the stability of the reference sources. This timer is applicable after a node reset or CP switchover.
Mib	Time
Values	Decimal (0..12)
Units	minutes
Default	0

GROUP NS OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Time

ATTRIBUTE NS adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Time
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE NS operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Time
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE NS usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Time

Values
idle
active (activ)
busy

Default — idle

GROUP NS Operational (Oper)

Properties — Operational

Description

This group contains the operational attributes for the *NetworkSynchronization* component.

Mib — Time

ATTRIBUTE NS clockSyncState (clkSyncState)

Access — Read only

Description

When the *clockSyncState* attribute has a value of ***freeRun***, either no reference have been provisioned or none of the provisioned references have been found to be valid. The Stratum-3 clock is allowed to run freely at its last adjusted frequency. When the *clockSyncState* attribute has a value of ***synchronizing***, the Stratum-3 is trying to synchronize in frequency to a valid provisioned reference. This state should last approximately 1-2 minutes, provided the reference is stable. Once frequency synchronization is achieved, a null phase is acquired and the value of the *clockSyncState* attribute becomes ***synchronized***. In this state, both phase and frequency are tracked and compensated for. This node is now ready to support transparent data services.

Mib — Time

Values
freeRun
synchronizing
synchronized

Default — No default

ATTRIBUTE NS activeReference (actRef)

Access — Read only

Description

This attribute indicates the active 8Khz clock reference source

Mib — Time

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE NS standbyReference (standyRef)

Access	Read only
Description	This attribute indicates the standby 8Khz clock reference source that will be selected if a failure is detected on the active source.
Mib	Time
Values	The name of the component
Default	No default

ATTRIBUTE NS activeRefSSMValue (actSsm)

Access	Read only
Description	This attribute indicates the Synchronization Status Messages (SSM) value received from the active reference port. This attribute is filtered out when no active reference port is available or ssmProtocol is disabled.
Mib	Time
Values	Decimal (0..15)
Default	No default

ATTRIBUTE NS standbyRefSSMValue (stdSsm)

Access	Read only
Description	This attribute indicates the Synchronization Status Message (SSM) value received from the standby reference port. This attribute is filtered out when no standby reference port is available or ssmProtocol is disabled.
Mib	Time
Values	Decimal (0..15)
Default	No default

ATTRIBUTE NS setsActiveReference (setsActRef)

Access	Read only
Description	This attribute indicates the active 8Khz clock reference source for the SETS port.
Mib	Time
Values	nsSelect bitsA bitsB

Copyright © 2006, Nortel Nortel Confidential

	nsProcessed none
Default	none

ATTRIBUTE NS setsStandbyReference (setsStandyRef)

Access	Read only
Description	This attribute indicates the standby 8Khz clock reference source for the SETS port that will be selected if a failure is detected on the active source.
Mib	Time
Values	nsSelect bitsA bitsB nsProcessed none
Default	none

ATTRIBUTE NS setsActiveRefSSMValue (setsActSsm)

Access	Read only
Description	This attribute indicates the Synchronization Status Messages (SSM) value received from the active reference source for the SETS port. This attribute is filtered out when no active reference port is available or ssmProtocol is disabled.
Mib	Time
Values	Decimal (0..15)
Default	No default

ATTRIBUTE NS setsStandbyRefSSMValue (setsStdSsm)

Access	Read only
Description	This attribute indicates the Synchronization Status Message (SSM) value received from the standby reference source for the SETS port. This attribute is filtered out when no standby reference port is available or ssmProtocol is disabled.
Mib	Time
Values	Decimal (0..15)
Default	No default

ATTRIBUTE NS setsSquelchTimerStatus (setsSquelchStat)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the time remaining (in minutes) before the setsSquelchTimer expires.
Mib	Time
Values	Decimal (0..12)
Units	minutes
Default	0

ATTRIBUTE NS setsPllAlarm (setsPllAlarm)

Access	Read only
Description	This attribute indicates whether the Pll Alarm has been raised, indicating the SETS PLL cannot detect the active 8 Khz clock reference source.
Mib	Time
Values	on off
Default	off

About this document

The guide contains detailed reference material pertaining to Multiservice Switch components.

Who should read this guide

This is a detailed reference guide intended to be used for installing, configuring, provisioning or operating a Multiservice Switch node.

How this guide is organized

The introductory chapters:

- give a detailed description of components and attributes
- help you to find your way through this document. Field descriptions and examples ensure a complete understanding of the reference chapters that follow

The remaining chapters contain all component and attribute information for all subsystems. They explain the fields and information required to provision, monitor, operate, and maintain a Multiservice Switch node.

What you need to know

You should understand Multiservice Switch network architecture.

Copyright © 2006, Nortel

Nortel Confidential

Component and attribute overview

After reading this chapter, you will have a good understanding of what components are and how they work to provide Nortel Multiservice Switch functionality. You will understand that components are defined by their elements, and that a hierarchy tree dictates their functionality.

An analogy that relates components to an automobile has been included as an aid to help you appreciate relationships between components.

For Multiservice Switch-specific examples of components and how they are presented in this document, see Interpreting information in this document (page 21).

What are components?

A large part of Nortel Multiservice Switch system flexibility resides in the extensive use of components in both its design and deployment. A component represents some part of the system which could be a service, a piece of software or a physical hardware component. Virtually every Multiservice Switch subsystem has components. Components are manageable entities, which control Multiservice Switch software, hardware capabilities and access services.

Components provide the infrastructure through which network operators and administrators interact with network elements. Standardized and organized in a highly structured environment, components provide the model for operator interaction with Multiservice Switch.

Copyright © 2006, Nortel

Nortel Confidential

All operator commands are addressed to components for:

- provisioning
- monitoring
- maintenance

Provisioning
Provisioning defines, or re-defines, the operating parameters and performance characteristics of Nortel Multiservice Switch nodes. To initialize a Multiservice Switch service or capability, components specific to that service or capability must be provisioned. Components can also be added automatically when a parent component is added. Frequently, when a component is added, default values are added automatically.

Monitoring
Monitoring components means to observe the operating parameters and performance characteristics of Nortel Multiservice Switch nodes.

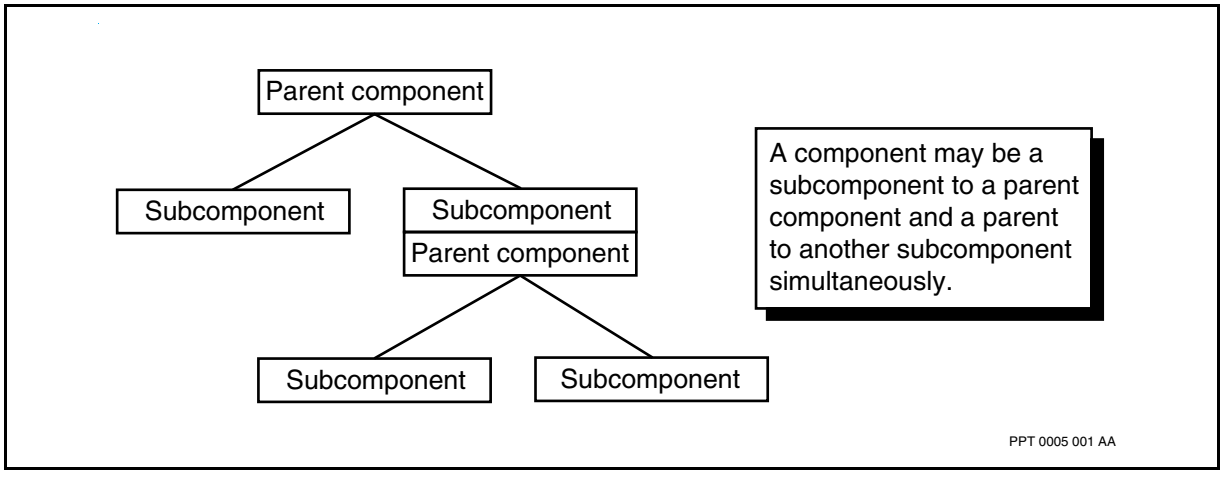
Maintenance
Maintenance means taking components out of service or re-defining their operating characteristics to perform troubleshooting or corrective procedures.

Component hierarchy tree

Components are arranged into hierarchies. A hierarchy is a tree-like structure that defines relationships between the individual components. Through this structure, a functional relationship is developed between each of the components that combine to form Nortel Multiservice Switch systems.

By their relative positions in the hierarchy, components have their parent components and subcomponents defined. A component can have another component below it in the hierarchy. They are called subcomponents. Subcomponents have all the normal characteristics of components and they have a parent component.

How components form into parent and subcomponents by their relative positions



Copyright © 2006, Nortel
Nortel Confidential

Components form the building blocks of network functionality. Everything that makes up a component has a responsibility to perform a task. Components combine to form components.

Component terms and concepts

Before continuing, you should be familiar with the following terms and concepts:

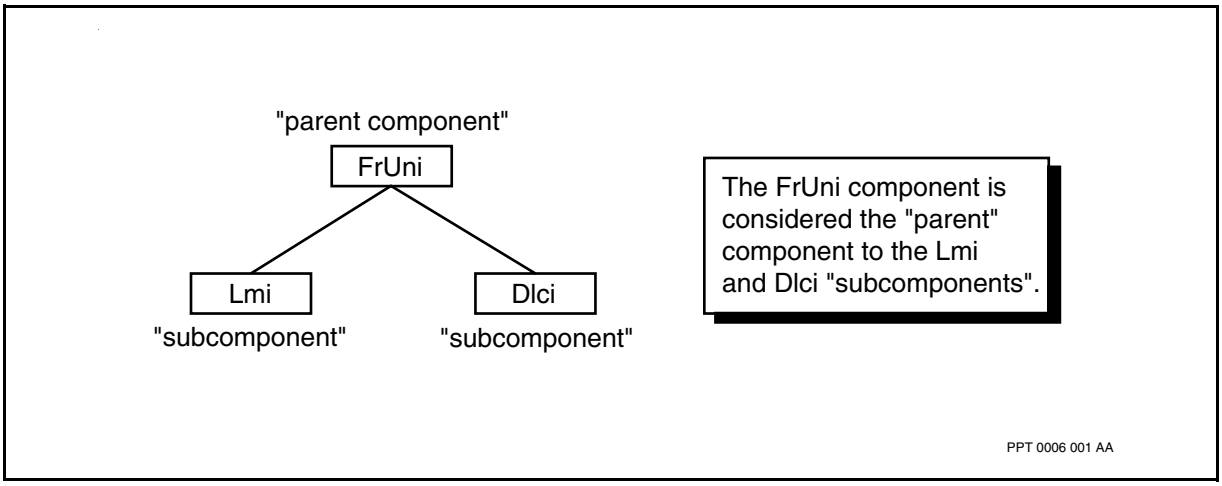
- components and subcomponents
- type
- instance
- name
- verbs
- attributes
- group

Components and subcomponents

Throughout this documentation set, you may have noticed the terms components and subcomponents. Subcomponents and components have the same properties, “sub” indicates the component’s relative position within the hierarchy. In some cases, components may have operational influence over their respective parent and subcomponents. They are the method for indicating the behavior of some functionality in Nortel Multiservice Switch systems.

An example is the Frame Relay User to network interface (FrUni) component, the LocalManagementInterface (LMI) component and the DataLinkConnectionIdentifier (Dlci) component. All three are components but the LMI component and the DLCI component are considered subcomponents of the FrUni component.

The FrUni is the “parent component” to the Lmi and Dlci “subcomponents”



Copyright © 2006, Nortel
Nortel Confidential

Type

A component type refers to a specific type of component such as the Frame Relay user-to-network interface (FrUni) component.

An example of a component type is simply, FrameRelayUni. Note the component type does not specify a value or instance of a particular instance of FrameRelayUni running on the node.

Instance

When more than one of a component type exists, they are differentiated by an instance value. The instance value is information (such as a decimal or a string) appended to the component type. The component instance is separated from the type by a slash. When only one instance of a component exists on the node, the component is identified by its type, that is, without a slash (/) and instance value.

Example 1
The component FrUni/4 Dlci/7 refers to Dlci instance 7 under FrUni instance 4.

Example 2
There can be only one instance of the Lmi subcomponent for each instance of the FrUni component and as such, Lmi instance values are not required (for example FrUni/3 Lmi).

Name

The component name combines the component type with the instance. Every component has a name. A component name is constructed by the concatenation of several component/instance pairs.

Example 1
By adding the component instance 4 to the component type FrameRelayUni (FrUni), we get:

FrUni/4

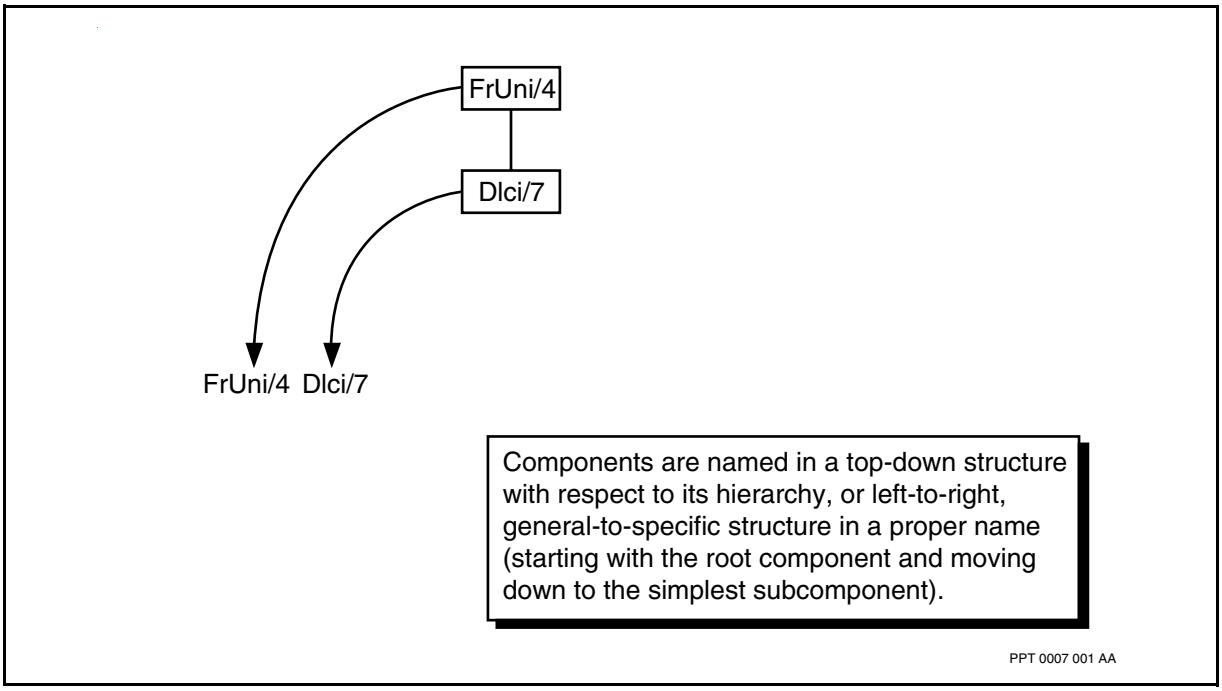
Example 2
A sequence of more than one component type and instance pairs is also a component name, such as:

FrUni/4 Dlci/7

Each type-instance part in the sequence is a subcomponent of its predecessor. In the above example, the Dlci component is a subcomponent of FrUni parent component.

Copyright © 2006, Nortel Nortel Confidential

How the naming methodology mirrors the component hierarchy tree



Note that in some cases where there can be only one instance of a component (for example, Shelf), the component appears without an instance value.

Verbs

Verbs are commands issued to Nortel Multiservice Switch components. Commands carry out tasks necessary to provision, maintain and operate your node. Verbs are the action portion of the command.

Within Multiservice Switch systems are a number of verbs that can be issued to all components. These are called common verbs and are described in NN10600-050 *Nortel Multiservice Switch 7400/15000/20000 Command Reference*.

In addition to common commands, there exist a number of commands which are specific to particular subsystems and their components.

Attributes

Components have attributes that define the behavior or informational aspects associated with a specific component. Attributes are either:

- operational
- provisionable

  Note: Components with operational attributes may also have provisionable attributes.

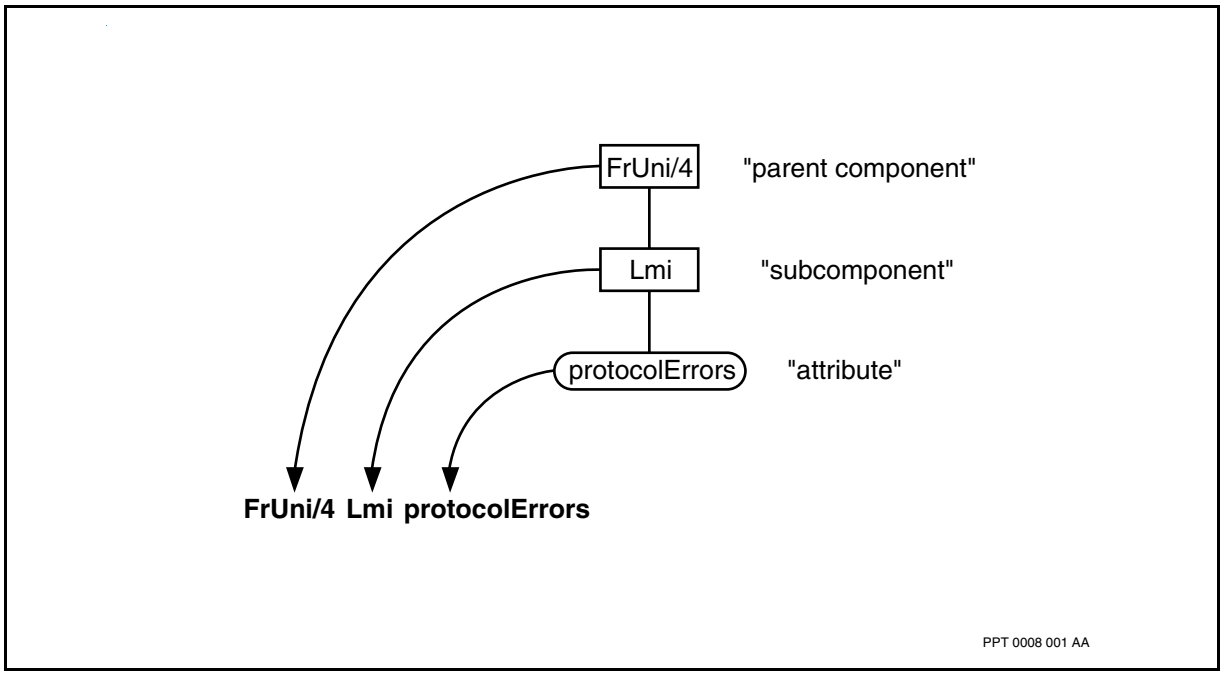
Copyright © 2006, Nortel
Nortel Confidential

Operational
Operational attributes provide information or data used for monitoring the operation of Nortel Multiservice Switch networks and services. The values of operational attributes are not retained across system restarts. These values can not be provisioned, but some of them can be set. These attributes include information such as:

- component OSI management state
- statistical data

For example, the Frame Relay LocalManagementInterface (Lmi) component with protocolErrors attribute is used to determine if, and how many, Lmi protocol errors have taken place within a given time frame. The Lmi component with this attribute is shown in the figure,The Lmi component with protocolErrors attribute (page 11).

The Lmi component with protocolErrors attribute

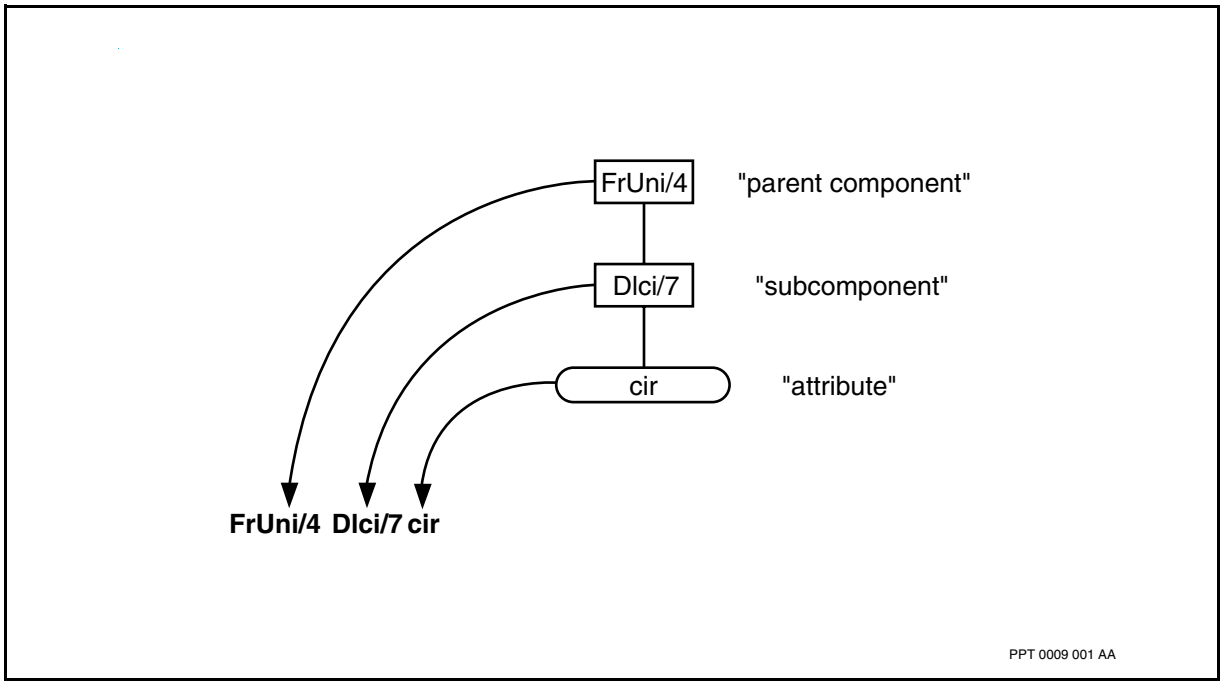


Provisionable
Provisionable attribute values can be configured by the network operator or administrator so that Multiservice Switch subsystems or services perform or behave in a certain manner. All components which are provisioned are saved across system restarts. Some components with provisionable attributes are mandatory and are created automatically by their parent. Components with provisionable attributes can also have operational attributes.

For example, the Frame Relay DataLinkConnectionIdentifier (Dlci) component with committedInformationRate (cir) attribute is used by the operator to specify the committed information rate (the rate at which the system will perform data transfer under normal conditions) in bits per second.

Copyright © 2006, Nortel
Nortel Confidential

The Dlci component with the cir attribute set



Groups

The attributes of a component are divided into one or more groups whose members share similar characteristics. The characteristics that may be shared could include operating characteristics, or will define whether the attribute was operational or provisionable.

An example of a group is all the provisionable attributes of the Frame Relay DataLinkConnectionIdentifier (Dlci) component. The name of this group is FrsDataLinkConnectionIdentifierProv.

Copyright © 2006, Nortel
Nortel Confidential

The attributes in this group include:

- maximumFrameSize
- committedInformationRate
- committedBurstSize
- excessBurstSize
- measurementInterval
- rateEnforcementAdaptation

Each of the above attributes relates specifically to the configuring of the DataLinkConnectionIdentifier. You set these attributes when you provision the Frame Relay service.

Component hierarchy - An everyday analogy

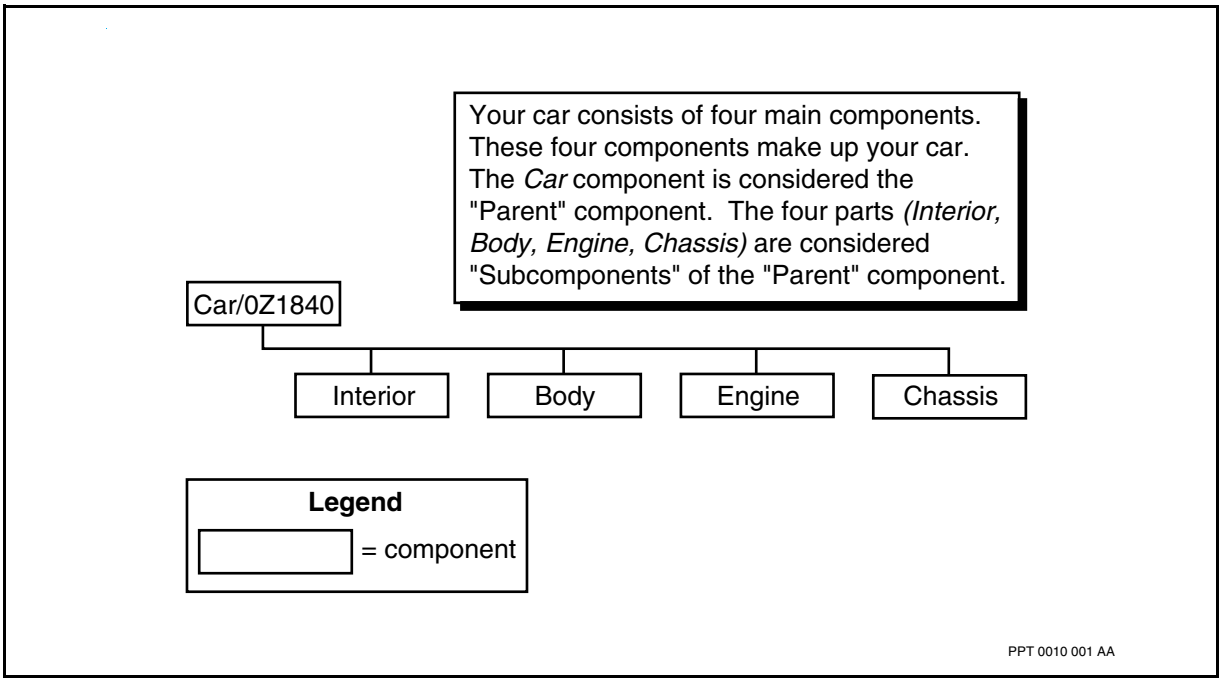
To help define components in everyday terms, think of the parts, or components if you will, that make up your automobile. For the sake of explanation, think of your car as being made up of the following main pieces, or components:

- interior
- body
- engine
- chassis

These four components are the subcomponents that make up the parent component, that being your car as a whole. This two level hierarchy can be represented by the hierarchy diagram. The car, like every car on the road, was assigned a license plate (or in component terms, an instance value) of 0Z1840. The license plate sets your car apart from all of the other cars which are virtually identical to it.

Copyright © 2006, Nortel Nortel Confidential

The first level breakdown of the component hierarchy that is your car



Note that the use of the terms parent component and subcomponent will alternate as each level of the hierarchy is described. This is because these terms describe the relative position of the components as they relate to the hierarchy. What was considered a subcomponent at a higher level in the hierarchy would now be considered a parent component of the subcomponent.

At this point the car's components can be properly named. The names are:

- Car/0Z1840
- Car/0Z1840 Interior
- Car/0Z1840 Body
- Car/0Z1840 Engine
- Car/0Z1840 Chassis

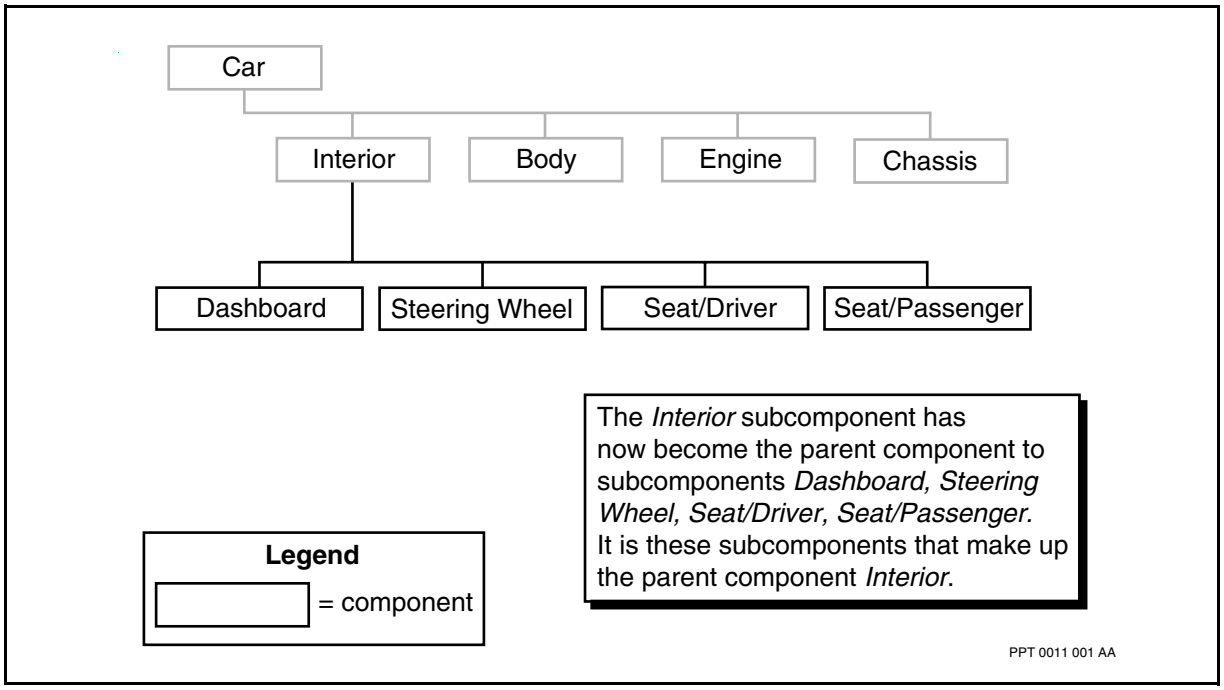
Now let's examine the subcomponents that make up the "Interior" parent component. What was the subcomponent "Interior" is now the parent to these subcomponents:

- dashboard
- steeringwheel
- seat/driver
- seat/passenger

Notice that the Seat components were assigned instance values. This is because both seats are identical and the instance value differentiates them.

Copyright © 2006, Nortel
Nortel Confidential

The second level breakdown of the Interior component



The components that make up the car's interior (as properly named) include:

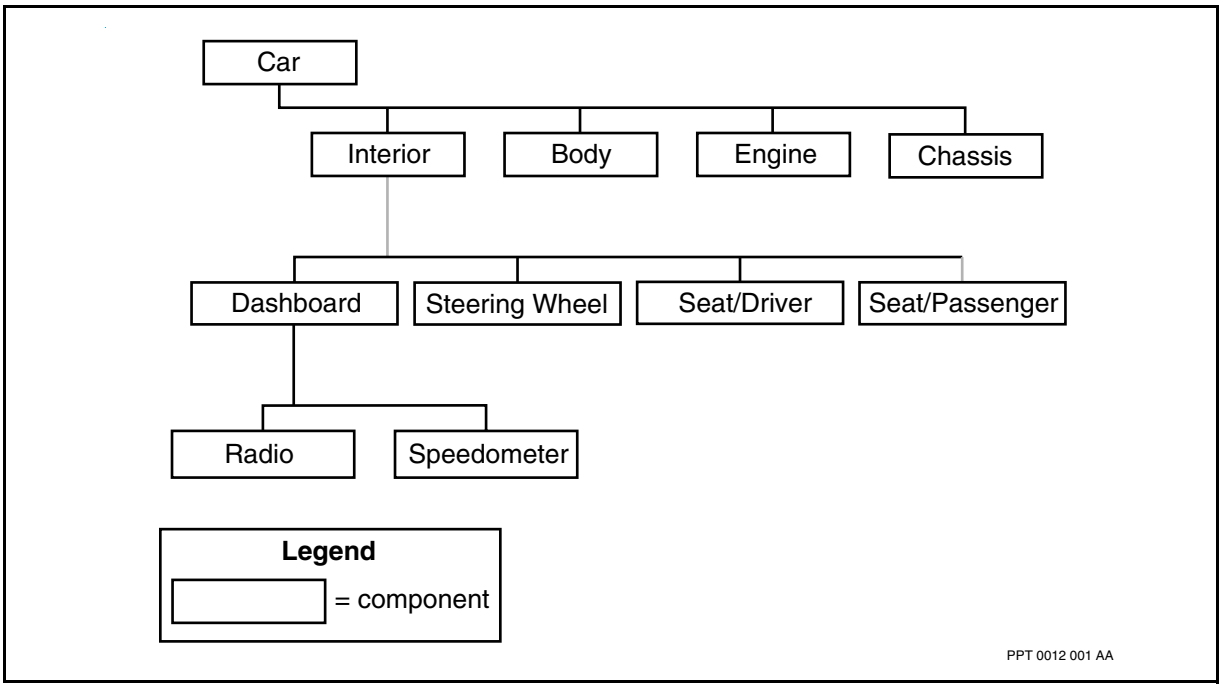
- Car/0Z1840
- Car/0Z1840 Interior
- Car/0Z1840 Interior Dashboard
- Car/0Z1840 Interior SteeringWheel
- Car/0Z1840 Interior Seat/driver
- Car/0Z1840 Interior Seat/passenger

If we examine the subcomponent dashboard, we notice that it has two subcomponents. These subcomponents include:

- radio
- speedometer

Copyright © 2006, Nortel
Nortel Confidential

The third level breakdown of the dashboard component



Assigning attributes

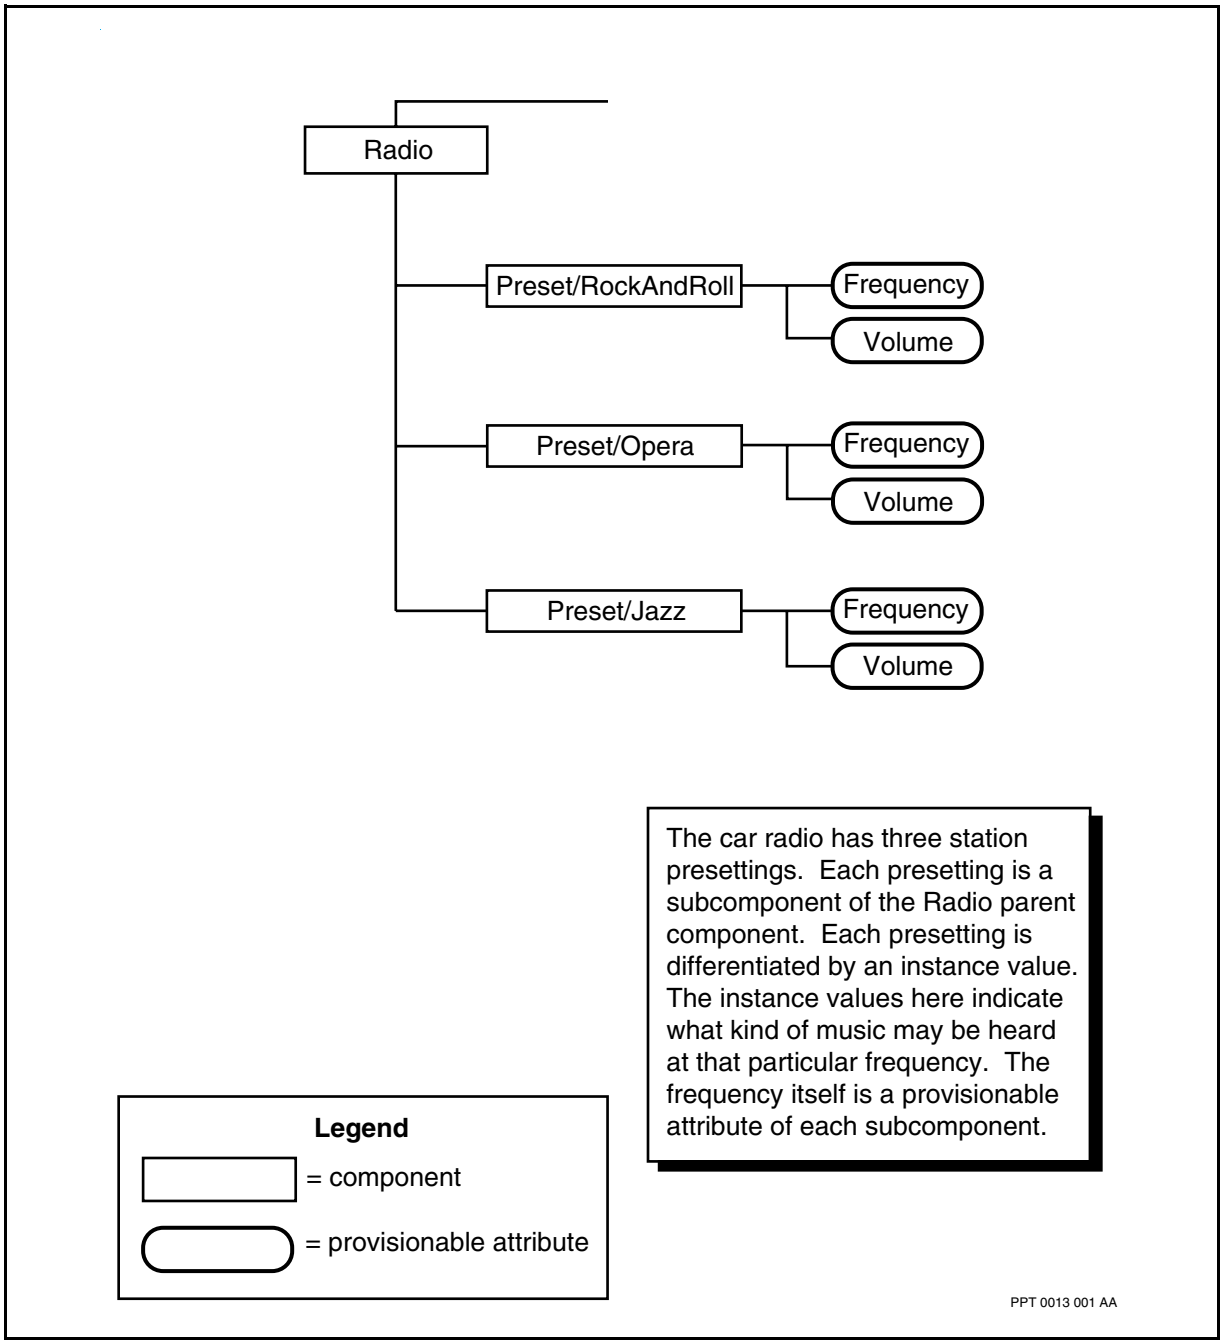
At this stage of our analogy we will assign attributes to those subcomponents that make up the Dashboard parent component.

Radio

To change the station on a car radio you must manually adjust it to obtain the preferred frequency. Many car radios have radio station presettings so you do not have to adjust the receiver's settings to a different frequency when you would like to listen to a different station, you just push a button. These preset stations must be previously provisioned. In our example, we have provisioned three preset receiver frequencies on our radio. These presettings are subcomponents of the Radio parent component. The frequencies are the provisionable attributes of the subcomponents. The three settings are given instance values which define what kind of music each station plays.

Copyright © 2006, Nortel
Nortel Confidential

The radio has three station presettings whose frequency must be provisioned



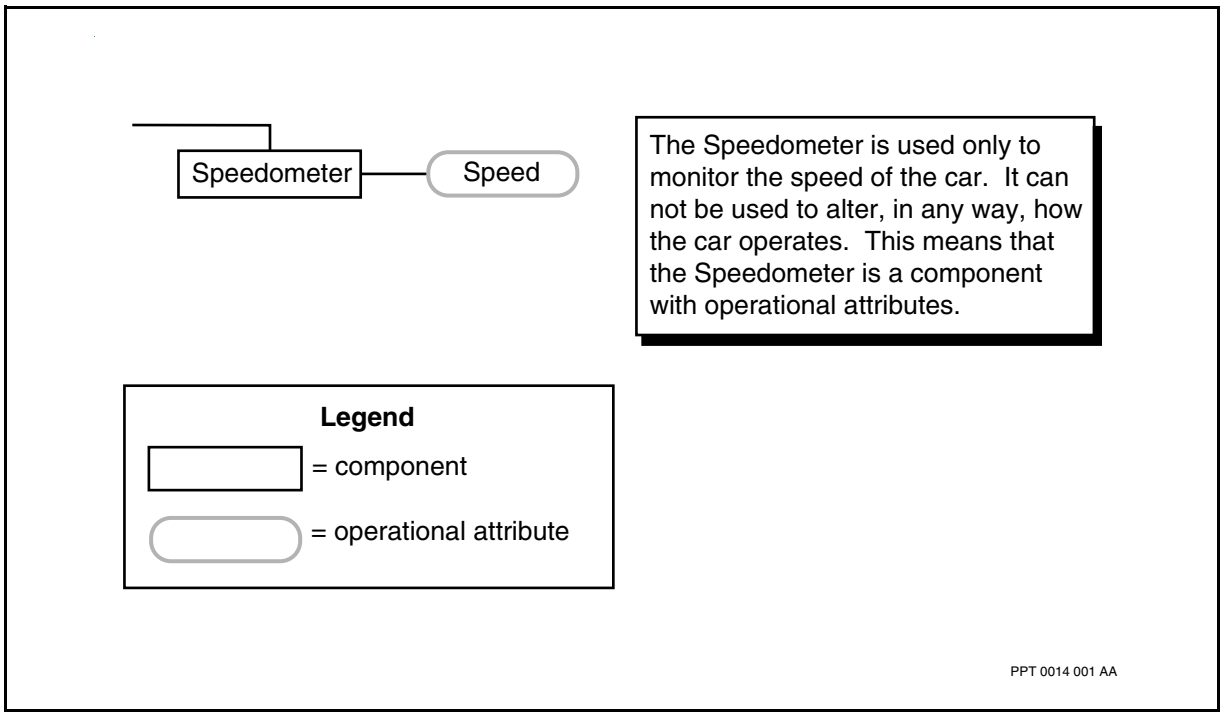
Speedometer

The speedometer tells you how fast the car is travelling. The speed can not be set using the speedometer. When the car is not operating the speed is reset to zero. You may only utilize the speedometer when the car is operating and you can not influence

Copyright © 2006, Nortel
Nortel Confidential

the car's speed through the speedometer component. It is because of these points, that makes the speedometer a component with *operational* attributes. The attribute tells you the car's speed only and nothing else.

As you can only use the Speedometer to monitor your car's speed, it is a component with operational attributes



Applying naming conventions to the analogy

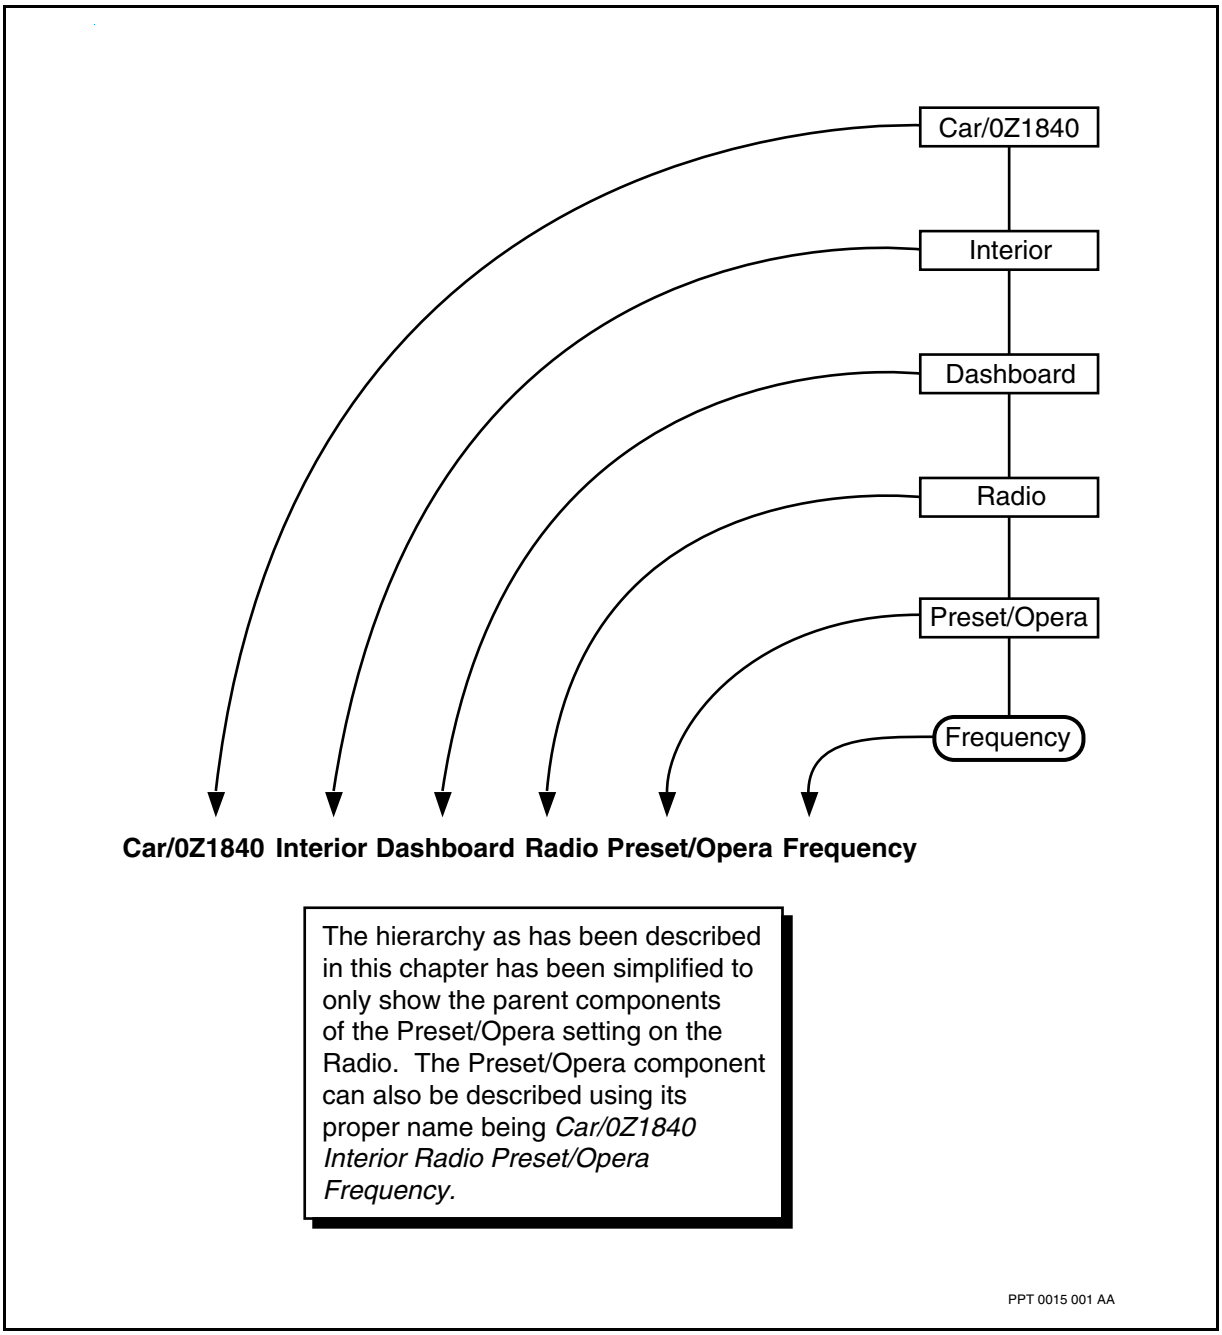
Component names consist of all components and subcomponents, each with an instance value. To apply this rule see the examples.

Example 1

The Radio parent component's station setting can be described visually.

Copyright © 2006, Nortel
Nortel Confidential

How the frequency attribute for the Opera radio station is named



Example 2
The proper name for the Jazz radio station frequency component would be:

Car/0Z1840 Interior Dashboard Radio Preset/ jazz

Copyright © 2006, Nortel
Nortel Confidential

The point to understand here is that there can be many variations of a similar theme. The instance values distinguish one variation from the next, even though they may appear to be virtually identical.

Example 3
The name of the Speedometer component would be:

Car/0Z1840 Interior Dashboard Speedometer

As this component is operational, the component shows the speed our car is travelling at.

Chapter summary

This chapter described components and the hierarchical nature that structures their existence. The way in which Nortel Multiservice Switch systems are made up of component building blocks, and the way that each component block contributes to the system functionality, was also described. An analogy relating Multiservice Switch hierarchy to that of an automobile was included to help you better understand the component hierarchy. This chapter forms the basis of component understanding so that you may use the remaining chapters of this document confidently.

Interpreting information in this document

How this document is organized

Each Nortel Multiservice Switch product subsystem has its own chapter in this document and each is described by means of:

- a hierarchical table of contents which provides an abbreviated component description
- a formal component description

This chapter contains a description of both.

Abbreviated component description

The abbreviated component description lists components, groups, verbs (including options and responses) and attributes. These are designed to make it easy to locate the operational and provisionable parameters of the component you require.

The abbreviated component description levels which reflect the hierarchical structure of the components. This list explains each type of level and provides an example.

- root component

  This is the top level element in the component hierarchy, for example, the enterprise module (EM).

- component

  A component, for example, Collector (Col), can be subcomponent of the root component or of another component. Nortel Multiservice Switch systems accepted abbreviation is displayed in brackets.

- group

  This level divides the attributes into groups that share similar characteristics. An example, Provisioned (Prov) is a group containing all the provisionable attributes of the Collector component.The abbreviation for the group name is displayed in the brackets.

- attribute

Copyright © 2006, Nortel

Nortel Confidential

This level names the attribute, for example, agentQueueSize (agentQ). The abbreviation of the attribute's name is shown in brackets.

- verb

  In addition to the common verbs that may be applied to a component, there may component specific commands that only apply to certain components, for example, newfile. The abbreviation of the verb is found in brackets.

Formal component description

The formal component description is similar to the abbreviated component description but contains more information. The formal component description defines components in terms of:

- a description of the specific component
- the specific component's attributes
- the specific component's verbs

This document covers all of these aspects for component as a section before describing another component. This description can be visualized using the diagram.

Copyright © 2006, Nortel Nortel Confidential

The detailed information is contained in information modules. These modules include:

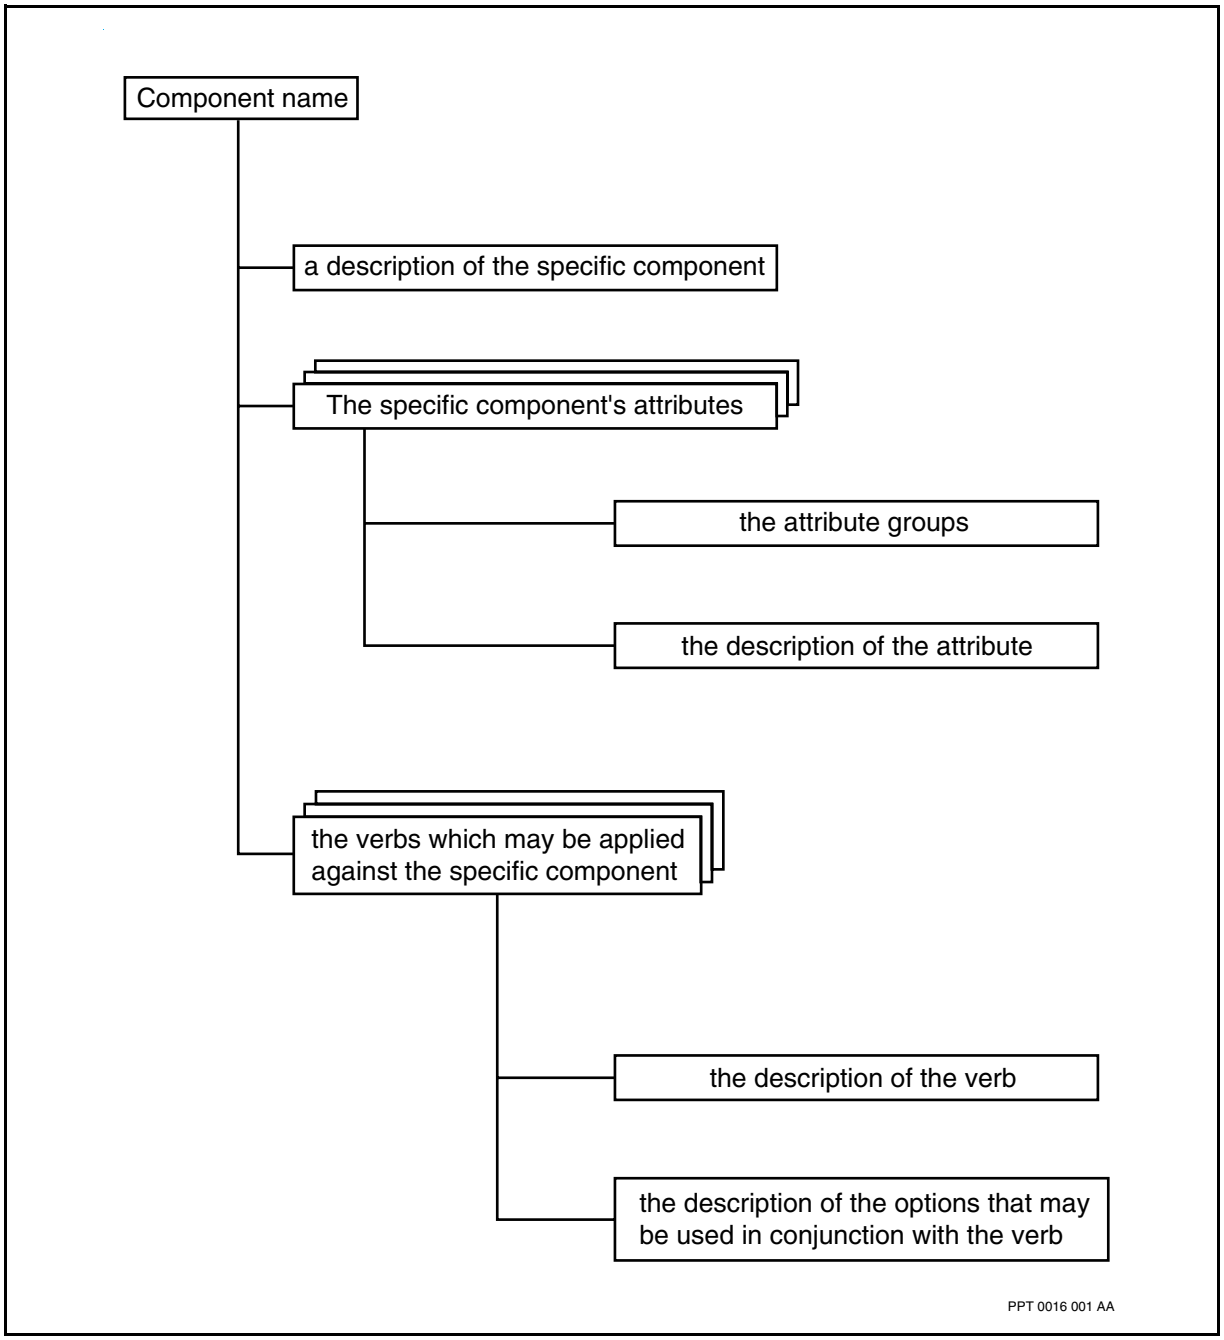
- components
- attributes
- verbs

The component section presents the component from a high level similar to the abbreviated component description. The attribute section describes the attributes that apply to the component. The verb section describes each verb that may be used on the component.

It should be noted that not every component includes all the fields of information as described in this chapter. If the component you are researching is missing one or more fields, then those missing fields do not apply to that particular component.

Copyright © 2006, Nortel Nortel Confidential

How this document modularizes the details of each Multiservice Switch component



Components

The component description section provides a high-level description of the component.

Copyright © 2006, Nortel
Nortel Confidential

This field...	Contains...
COMPONENT	This names the component being detailed
Groups	This lists the attribute groups defining the data for a component type.
Scope	This states the level of operator capability required to access or change components of this type.
Opt. Subcomp.	This states the optional components which must be added or provisioned by the user.
Subcomponents	This states the subcomponents that are created automatically when the parent component is created.
Dyn. Subcomp.	These are the non-provisionable (operational) subcomponents.
Dyn. Opt. Subcomp.	These are the subcomponents which may have optional or dynamic instances.

Attributes

Attributes in this document are covered in terms of two levels:

- attribute groups
- attribute descriptions

Attribute groups

Attributes are organized into attribute groups. Attributes in a particular attribute group share similar characteristics.

This field...	Contains...
GROUP	Identifies the group to which the following attributes belong.
Properties	This specifies whether the attribute is provisionable or operational.

Attribute descriptions

At this level the attributes are described in detail.

This field...	Contains...
ATTRIBUTE	This is the attribute being described.

Copyright © 2006, Nortel Nortel Confidential

This field...	Contains...
Criticality	This defines the disruption to the service that will occur if the attribute's value is changed. NONE - The attribute's value can be changed without causing any disruption to the service. PROCESS - One of the attribute's parent components, and all of that component's subcomponents will be taken out of service. To determine the specific component you must run checkprov. COMPONENT - The attribute's parent component and all of the component's subcomponents will be taken out of service. MODULE - The module will reload once a change is made.
Access	This states whether the component is write only, read only, read and write, or none.
Default	This states the attributes assigned default value.
Values	This specifies the attribute's data type, that is, the set of values it can assume.

Verbs

Many of Nortel Multiservice Switch components include unique verbs which may be applied against the component. In this document, these component-specific verbs are detailed in their own series of subsections that follow the description of the component's attributes. The verbs are detailed in the following sections:

- verb description
- options
- responses

Each verb is defined. Verb options define operational parameters that may be applied to that verb. Every system response (a message from the system displayed on the network management tool) from the use of that verb follows.

Verb description

The verb description states the verb and the impact.

This field...	Contains...
VERB	This is the verb being described.
Impact	This states the level of operator capability required to use this command.

Options

Verb options are conditions applied to verbs to limit their scope of influence.

Copyright © 2006, Nortel Nortel Confidential

This field...	Contains...
OPTION	This is the verb option being described.

Responses

Responses are messages from Nortel Multiservice Switch indicating that there is a process under execution, or an error was made during provisioning. Responses will also warn you if you attempt something before completing any prerequisites.

This field...	Contains...
RESPONSE	This states the system response resulting from the use of a verb.

Chapter summary

This chapter described how this document presents all the information about Nortel Multiservice Switch components. Described is how each chapter details a specific component using a hierarchy diagram, an abbreviated component description, and a formal component description. How each of these mechanisms is used is included with appropriate examples and diagrams. This chapter instructs you how to use the remainder of this document with confidence.

Copyright © 2006, Nortel Nortel Confidential

Common Verbs

VERB Add (A) **Common**

Impact	Configuration
Description	*Add [-superiors] <component name>* This verb creates a new component (with default attribute values) in the edit view. The operator's session must be in provisioning mode to use this command. Components which are created automatically (for example, when their parent component is added) cannot be "manually" created with the *Add* command. **Options:** *-superiors* If this option is specified and one or more ancestors of the component to be added do not exist, the *Add* command will automatically add the missing ancestor component(s), with default attribute values. If this option is not specified, the *Add* command fails when any of the ancestors of the component to be added do not exist.

Copyright © 2006, Nortel

Nortel Confidential

VERB DELete **Common**

Impact	Configuration
Description	*Delete <component name>* This verb removes a component (and all its subcomponents) from the edit view. The operator's session must be in provisioning mode to use this command. When asked to delete any component which is a "required" subcomponent of its parent, either *Delete* will refuse if only a single such subcomponent is possible, or semantic checks will fail if all such subcomponents have been deleted. Components which are created automatically (for example, when their parent component is added) cannot be removed with the *Delete* command. To remove all components (including required ones) whose associated feature has already been removed, use command *Clear -rf Prov* To undo the effect of *Delete*, the *Copy Prov* command may be used.

VERB Display (D) **Common**

Impact	Passive
Description	*Display [-current] [-provisionedData] [-operationalData] [-noTabular] <component name> [<attribute specification>]* This verb obtains the values of (a subset of) the attributes of one or more components. The attribute specification is a list of one or more attribute or group names, separated by commas. If this specification is present, *Display* will show only the requested attributes and/or groups of attributes. If there is no attribute specification, the default behavior of *Display* depends on whether the operator session is in provisioning mode or not. A session in provisioning mode will see the values (in the edit view) of all provisionable attributes. A session not in provisioning mode will see the values (in the current view) of all operational attributes. See below for options to override this behavior. The component name may be "wild-carded" by entering it in the form <component name> <component type>/<pattern> in which case the *Display* command shows attribute values for all subcomponents of the given component name that are of the specified type and that match the pattern. A pattern may contain one or more wildcard (*) characters. An example: display prov view/*.full.* Similarly, the form <component name> * may be used to display attribute values for all subcomponents of the given

Copyright © 2006, Nortel Nortel Confidential

component name. If this form is used, no attribute specification is allowed.

The wild-carded form will produce tabular output (unless the *-noTabular* option was specified). However, if the component has too many attributes, not all will fit in the table. An indication of the attributes not shown will be made. Two possible solutions are to specify fewer attributes explicitly, or to indicate that your screen width is larger than the default of 79. This can be done as shown in this example:

```
1> me
Nmis Telnet Session/5; userid = x
Impact = service; Scope = device;    CustomerId = 0

2> set nmis tel ses/5 screenWidth 131
Nmis Telnet Session/5
ok 1995-09-11 12:40:22.35
```

Options:

-current

If this option is specified, the attribute values displayed are those for the current view, even if the operator's session is in provisioning mode. Without this option, the information is retrieved from the edit view if the session is in provisioning mode and the data is provisioned. If the session is in provisioning mode but the data is not provisioned, or the session is not in provisioning mode, the information is retrieved from the current view.

-provisionedData

This option is significant only if no specific attributes or groups have been requested in the *Display* command. If this option is present, all provisioned data of the component will be displayed. Without this option, the provisioned data will be displayed only if the operator session is in provisioning mode.

-operationalData

This option is significant only if no specific attributes or groups have been requested in the *Display* command. If this option is present, all operational data of the component will be displayed. Without this option, the operational data will be displayed only if the operator session is not in provisioning mode.

-noTabular

A wild-carded display (for example, d lp/*) will format information in a tabular style. Long rows may wrap onto several lines and some information may be truncated. In these cases, this option will format information one attribute per line, without loss of information.

Copyright © 2006, Nortel Nortel Confidential

VERB Help (H) **Common**

Impact	Passive
Description	*Help [-verb(<verb>)] [-subcomponents] [<component class> [<attribute specification>]]* This verb provides information about components, attributes, and verbs. A component class is a sequence of component type names. If no component class is entered, *Help* displays the syntax of the *Help* command, a list of top-level component types, and a list of verbs which can be entered without specifying any component name. If a component class is entered, *Help* displays information about the class, including allowed subcomponent types and verbs. The component class may be followed by an attribute specification, which is either an attribute name or an attribute group name. In this case *Help* displays information about the requested attribute or attribute group. **Options:** *-verb(<verb>)* This option specifies the name of a verb for which the user wants to have a detailed description. This verb must be valid for the specified component class. *-subcomponents* This option requests a display of the hierarchy of all subcomponent types under the specified component class.

VERB List (L) **Common**

Impact	Passive
Description	*List [-current] [-provisionedComponents] [-operationalComponents] [<component specification>]* This verb lists the subcomponents of a specified component instance. The component specification can either be a component name, in which case the subcomponents of the named component are listed, or it can have the form <component name> <component type>/<pattern> in which case only the subcomponents of the named component that are of the specified type and whose instances match the pattern are listed. A pattern can consist of one or more wildcard (*) characters. An example: list prov view/*.full.* If the operator session is in provisioning mode, the component instances displayed are those in the edit view, and only provisioned subcomponents are displayed. If the operator session is not in provisioning mode, the component instances displayed are those in the current view, and both provisioned and operational subcomponents are displayed.

Copyright © 2006, Nortel Nortel Confidential

Options:
-current
If this option is specified, the subcomponents listed will be those in the current view. Without this option, the subcomponents listed will be those in the edit view if the operator's session is in provisioning mode and the specified component is provisioned. If the operator is in provisioning mode and the specified component is operational, or the operator is not in provisioning mode, the subcomponents listed will be those in the current view.

-provisionedComponents
If this option is specified, provisioned subcomponents will be listed. Otherwise, provisioned subcomponents will be listed only if the operator session is in provisioning mode and the *-operationalComponents* option has not been specified.

-operationalComponents
If this option is specified, operational subcomponents will be listed. Otherwise, operational subcomponents will be listed only if the operator session is not in provisioning mode and the *-provisionedComponents* option has not been specified.

VERB LOCK **Common**

Impact: Service

Description:

Lock [-force] <component name>
This verb will cause the specified component to enter the OSI ***shuttingDown*** administrative state. While shutting down, the component continues to provide service to existing clients but rejects any new requests for service. In some cases, locking a component also causes all its subcomponents to shut down.

When the component is no longer providing service, it enters the OSI ***locked*** administrative state.

Options:
-force
If this option is present, service to current clients is terminated and the ***locked*** state is entered immediately (that is, without first going through the ***shuttingDown*** state). Without this option, *Lock* behaves as described above.

Copyright © 2006, Nortel Nortel Confidential

VERB Set (S) **Common**

Impact	Service
Description	*Set <component name> <attribute name> <value> [, <attribute name> <value> ...]* This verb changes one or more of a component's attribute values. The syntax for the values depends on the data type of the attribute being set. For multi-valued attributes, such as lists, several values may follow the attribute name. Provisionable attributes can be changed only in the edit view, and only by an operator whose session is in provisioning mode.

VERB Unlock **Common**

Impact	Service
Description	*Unlock <component name>* This verb causes the specified component to enter the OSI ***unlocked*** state.

VERB Find (F) **Common**

Impact	Passive
Description	Find -freelinks(<component class>) [-attribute(<attribute>) [-nonrecursive] [-c] [-p] [-o] [<component name>] This verb returns all provisioned components that are available to be linked to the specified component class. The user can specify a target component name, which will limit the components that are searched. The target component name supports any wildcarding, pattern matching, and value-based filtering that are supported by the list and display commands. Example: Find -freelinks(atmif) lp/* ds3/* **Options**: -*freelinks*(<component class>) This option is mandatory. The *Find* command will return components to which this class can be linked. -*attribute*(<attribute>) This option is required when the component class specified by the -*freelinks* option has more than one settable link attribute. This option designates which attribute will be used by the find command. -*nonrecursive* By default, the find command searches the subtree(s) routed at the target component name. This option indicates that the subcomponents should not be recursively searched.

Copyright © 2006, Nortel Nortel Confidential

-current
If this option is specified, the components returned will be those in the current view. Without this option, the components returned will be those in the edit view if the operator's session is in provisioning mode. If the operator is not in provisioning mode, the components returned will be those in the current view.

-provisionedComponents
If this option is specified, provisioned components will be returned. Otherwise, provisioned components will be returned only if the *-operationalComponents* option has not been specified.

-operationalComponents
If this option is specified, operational components will be returned. Otherwise, operational components will be returned only if the operator session is not in provisioning mode and the *-provisionedComponents* option has not been specified.

Copyright © 2006, Nortel Nortel Confidential

Responses

RESPONSE ..... and ... should not be less than 1 hour apart.

Description

This response is issued when a semantic check is done on a Collector, indicating that this pair of times are too close together. It appears once for each invalid pair of times.

ATTRIBUTE invalidTimeFirstOfPair

Description

This is the first of a pair of times that are too close together.

Values Time (HM)

ATTRIBUTE invalidTimeSecOfPair

Description

This is the second of a pair of times that are too close together.

Values Time (HM)

RESPONSE Error:

Description

This response is issued to show the attribute which is in error on a DCS intra-component semantic error or warning.

ATTRIBUTE attribute

Description This attribute identifies the attribute containing the error.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel

Nortel Confidential

RESPONSE Attribute Problem

Description

This response is generated when the node detects a problem with the way the MDM uses an attribute. This can occur for the get, set or help services and action. The actual problem is indicated via related alarms and responses. Some problems are ignored and so multiple such responses are possible for each attribute with a problem.

System action: the command is ignored for this attribute. The command may or may not be executed for other attributes.

Operator action: avoid using this attribute. Update the software on the MDM.

ATTRIBUTE attribute

Description

This parameter identifies, by name, the attribute for which a problem has been detected.

Values

Decimal (0..65535)

RESPONSE Component problem

Description

This error response is generated when the node detects a problem with the way the MDM uses the component name target of a command. The actual problem is indicated via related alarms and responses.

System action: the command fails.

Operator action: avoid using this component. Update the software on the MDM.

ATTRIBUTE component

Description

This parameter contains the valid portion of the component name.

Values

The name of the component

RESPONSE Group problem

Description

This response is generated when the node detects a problem with the way the MDM uses a group. This can occur for the get or help service and action. The actual problem is indicated via related alarms and responses. Some problems are ignored and so multiple such responses are possible for each group with a problem.

System action: the command is ignored for this group. The command may or may not be executed for other groups.

Operator action: avoid using this group. Update the software on the MDM.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE group

Description — This parameter identifies the group, by name, for which a problem has been detected.

Values — Decimal (0..65535)

RESPONSE Option problem

Description — This response is generated when the node detects a problem with the way the MDM uses an option. The actual problem is indicated via related alarms and responses.

System action: the option may be ignored. The other options may be or may not be accessed. If not, the command fails.

Operator action: avoid using this option unless it is mandatory. Update the software on the MDM.

ATTRIBUTE option

Description — This parameter identifies the option, by name, for which a problem has been detected.

Values — Decimal (0..65535)

RESPONSE Fmip command identifier invalid

Description — This error response is generated when an invalid service or action is requested.

System action: the command is not executed.
Operator action: avoid using this command. Update the software on the MDM. The help command can be used to get a list of all verbs (services or actions).

ATTRIBUTE action

Description — This parameter identifies the unrecognized action type. The MDM may or may not be able to convert it to an ASCII name.

Values — Decimal (0..65535)

ATTRIBUTE service

Description — This parameter identifies the unrecognized service. The MDM may or may not be able to convert it to an ascii name.

Values — Decimal (0..65535)

RESPONSE ....

Description

This response describes the attributes specific to an Alarm Event.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE activeListStatus

Description — This mandatory attribute is the active alarm list status. This is equivalent to the DPN-100 Alarm Type field and is used by the NMS to add (on receiving a **set**) and delete (on receiving a **clear**) alarms from the alarm displays.

Values
message (MSG)
set (SET)
clear (CLR)

ATTRIBUTE severity

Description — This mandatory attribute is the severity of the alarm which should indicate what priority that fixing this problem should be given. All values are OSI-defined; refer to CCITT X.733 for a more complete description.

Values
indeterminate
critical
major
minor
warning
cleared

ATTRIBUTE alarmType

Description — This mandatory attribute is the Alarm Type field as defined by OSI which is used to indicate a broad category of what is wrong. The first six values are OSI-defined; refer to CCITT X.733 (for the first 5) and CCITT X.736 (for the last) for a more complete description.

The value ***operator*** is used when an alarm is issued due to an operator command. The values ***debug*** and ***unknown*** are for compatibility with DPN-100 and are used for debugging alarms and for those which do not fit any of the above, respectively.

Values
communications
qualityOfService
processing
equipment
environmental
security
operator
debug
unknown

ATTRIBUTE probableCause

Description — This mandatory attribute is the probable cause for the alarm which usually qualifies the Alarm Type field. Most values are OSI-defined; refer to CCITT X.733 and X.736 for a more complete description. Some Nortel Networks-specific causes are added to be more descriptive in cases where no OSI-defined cause is appropriate.

ATTRIBUTE ntpIndex

Description	This mandatory attribute is an 8-digit code that is an index into NTP NN10600-230 which provides a more detailed description of the alarm and possible actions to take. The first four digits indicate a “grouping” of alarms (a set of alarms common to a particular subsystem or component, etc.). The last four digits are a subindex arbitrarily assigned by the application which is responsible for the “group”.
Values	BCD (8)

RESPONSE

Description	This response describes the attributes specific to a Log Event.

ATTRIBUTE userId

Description	This mandatory attribute is the user id of the user who issued the command (see **command**).
Values	String (0..8, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE sessionSequenceNumber

Description	This mandatory attribute is a numeric session sequence number. A “login” Log and all commands issued during that particular session would have the same sequence number. The next time a user (the same one or a different one) logs in, a new sequence number is used.
Values	Decimal (0..4294967295)

ATTRIBUTE command

Description	This mandatory attribute is the command which was entered by the user.
Values	String (1..255, ASCII)

ATTRIBUTE response

Description	This mandatory attribute is the success/failure indicator of the command which was entered. Note that this is not the full textual response actually received by the user.
Values	String (1..255, ASCII)

RESPONSE

Description	This response describes the attributes specific to a Debug Event.

ATTRIBUTE debugData

Description	This mandatory attribute is the debugging information.
Values	String (0..1024, ASCII)

RESPONSE Accounting Information

Description	This response describes the attributes specific to a Vintage 4 format Accounting Event.

ATTRIBUTE vintage4Data

Description	This mandatory attribute is hexadecimal data which is in the same format as the DPN-100 Vintage 4 accounting record.
Values	String (0..255, Hex)

RESPONSE You have insufficient impact capability to access ....

Description	This error response is generated whenever an operator is prevented from accessing a group or attribute due to insufficient impact capability. **System action**: the command is not applied to the named group or attribute; it may have been applied to other groups or attributes specified in the command. **Operator action**: you must log in using a userid with a higher impact capability in order to access this group or attribute.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE attribute

Description — This attribute contains the name of an attribute which the operator is not permitted to access with this command.

Values — Decimal (0..65535)

ATTRIBUTE group

Description — This attribute contains the name of a group which the operator is not permitted to *Display*.

Values — Decimal (0..65535)

RESPONSE Invalid Software Distribution Site or file access error on the Software Distribution Site.

Description — The *Start Sw Dld* command issues this response when an Application name version, as specified by the *avListToDownload* attribute, could not be found at the site specified by the *-h* option of the command.
This could be caused by one of the following:
- The host IP address specified in the *-h* option of the command does not correspond to a site which contains software compatible with this type of Nortel Networks Multiservice Switch.
- There is a directory or file access error on the Software Distribution Site (SDS).

ATTRIBUTE fileBeingAccessed

Description — This attribute is the name of the file or directory which is being accessed at the time of the error.

Values — String (1..128, ASCII)

RESPONSE File access error on Filesystem.

Description — This response is issued when the download is stopped due to some directory or file access error on the file system of the module attempting the download.

ATTRIBUTE fileBeingAccessed

Description — This attribute is the name of the file or directory which is being accessed at the time of the error.

Values — String (1..128, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Cannot ....

Description

This response may indicate a file system failure.

System action: If the file system error occurred during processing of an operator command, the command terminates (it may have been partly executed).
Operator action: Check that the file system is enabled. If the error occurred during a write or delete operation, check that the named file is not protected. Retry the operator command which produced the error (if applicable). If the problem persists, follow the fault clearing procedures for the file system.

ATTRIBUTE failedOperation

Description

This attribute identifies the operation which failed.

Values

open
read
write
close
delete
swap
protect
unprotect

ATTRIBUTE fileOrDirectory

Description

This attribute indicates whether the file involved was a directory or an ordinary file.

Values

directory
file

ATTRIBUTE fileName

Description

This attribute contains the file or directory name.

Values

String (0..128, ASCII)

RESPONSE Unrecognized attribute identifier: component description mismatch

Description

This warning response is generated when the MDM uses an unrecognized attribute identifier. This can only occur for the get, help or set commands. This response may be repeated for every attribute with this problem. Other attributes are still processed.

System action: the command is ignored for this attribute. Other attributes are still processed.

Operator action: Update the software on the MDM. The help command can be used to list the names of the recognized attributes. Avoid using attributes not in this list.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE attribute

Description — This parameter identifies an attribute, by numeric id, that is not recognized by the node. The MDM may or may not be able to convert it to an ASCII name.

Values — Decimal (0..65535)

RESPONSE Attribute value/index out of range: component description mismatch

Description — This response is generated when the MDM attempts to set an attribute to contain a value or index that is out of range.

System action: the command is ignored for this attribute. Other attributes are still processed.
Operator action: Update the software on the MDM. The help command can be used to list the appropriate value/index ranges.

ATTRIBUTE attribute

Description — This parameter identifies, by name, the attribute for which a problem has been detected. This response may be repeated for every attribute with this problem. Other attributes are still processed

Values — Decimal (0..65535)

RESPONSE .....

Description

This response describes the attributes specific to an Alarm Event.

ATTRIBUTE notificationId

Description — This mandatory attribute is the notification Id of the alarm. The high-order byte is the slot number of the card from which this alarm originated. The low-order 24 bits contain a sequence number which increases each time an alarm is generated. Thus, this Id provides a simple way of uniquely identifying an alarm as well as the order in which alarms are generated on a card. For cross-card ordering, one would have to look at the time stamp (see *dateAndTime*).

Values — Hex (H.0..H.ffffff)

ATTRIBUTE commentData

Description — This optional attribute is additional textual information for the network operator to use. Other than for software alarms, if it is not self-explanatory, it should be described in NTP NN10600-230.

Note: The total number of bytes in comment, operator, and internal data may not exceed 750 bytes.

Values — String (0..750, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE operatorData

Description	This optional attribute is additional hexadecimal information for the network operator to use. Other than for software alarms, it should be described in NTP NN10600-230. Note: The total number of bytes in comment, operator, and internal data may not exceed 750 bytes.
Values	String (0..750, Hex)

ATTRIBUTE pid

Description	This optional attribute is a string representation of the internal process id (Pid) of the process which generated the alarm (for internal use only).
Values	String (0..25, ASCII)

ATTRIBUTE fileName

Description	This optional attribute is an internal file name (for internal use only).
Values	String (0..255, ASCII)

ATTRIBUTE relatedComponentNames

Description	This mandatory attribute is a list of the names of any components related to the component (that is, the one in the header FIELD) against which this alarm is raised. It typically contains at least the LP and possibly the card on which the originating component resides.
List of	The name of the component

ATTRIBUTE fileLineNumber

Description	This optional attribute is an internal line number in the file (see *fileName*) referred to above (for internal use only).
Values	Decimal (0..4294967295)

ATTRIBUTE fileVersion

Description	This optional attribute is a version indicator of the file (*fileName*) referred to above (for internal use only).
Values	String (0..255, ASCII)

ATTRIBUTE correlatedNotificatns

Description	This optional attribute is additional internal hexadecimal information for internal use only. It does not have to be described in NTP NN10600-230. It is a list of *notificationId*s which would indicate other alarms which are related to this one. Note that if this is not a MSG alarm, the MDM clears any SET alarms whose *notificationId*s are listed here.
List of	Hex (H.0..H.ffffff)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE internalData

Description — This optional attribute is additional internal hexadecimal information for internal use only. It does not have to be described in NTP NN10600-230 .

Note: The total number of bytes in comment, operator, and internal data may not exceed 750 bytes.

Values — String (0..750, Hex)

RESPONSE The following components have been created:

Description — This is the normal response to an *Add* command. It lists all the components added, including the component specified in the *Add* command, any missing ancestors which were added, and any automatically added subcomponents.

ATTRIBUTE component

Description — This attribute contains the name of a component which has been added. It is repeated for every added component.

Values — The name of the component

RESPONSE Syntax Error

Description — This error response group is generated when an operator inputs a syntactically invalid command. This response is specially formatted to indicate where in the original command, the error occurred.

System action: the command is completely ignored.
Operator action: re-issue the command as appropriate.

ATTRIBUTE term

Description — This attribute contains the symbolic name of the syntactic term in error (for example, “verb”, “option”, “component”, “attribute”, “group”).

The portion of the original input corresponding to this term is indicated via braces.

Values — String (1..255, ASCII)

ATTRIBUTE termStart

Description — This attribute contains the character offset from the start of the command where the symbolic term starts. Given “ABCD”, then “BC” starts at offset of 1.

Values — Decimal (0..1023)

ATTRIBUTE termEnd

Description — This attribute contains the character offset from the start of the command where the symbolic term ends. Given “ABCD”, then “BC” ends at offset 3. This is one character beyond the ending character position.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..1023)

ATTRIBUTE problem

Description	This attribute contains a description of the problem associated with the term (for example, “missing”, “unrecognized”).
Values	String (1..255, ASCII)

ATTRIBUTE relatedTerm

Description	This optional attribute contains the symbolic name of another syntactic term that is related to the first one. The portion of the original input corresponding to this term is indicated via braces.
Values	String (1..255, ASCII)

ATTRIBUTE term2Start

Description	This optional attribute contains the character offset from the start of the command where the symbolic term starts. Given “ABCD”, then “BC” starts at offset of 1.
Values	Decimal (0..1023)

ATTRIBUTE term2End1

Description	This optional attribute contains the character offset from the start of the command where the symbolic term ends. Given “ABCD”, then “BC” ends at offset 3. This is one character beyond the ending character position.
Values	Decimal (0..1023)

ATTRIBUTE reason

Description	This optional attribute contains the reason the parsing problem occurred.
Values	String (1..255, ASCII)

RESPONSE Component ... already exists.

Description	This error response is generated by an *Add* or *Copy Prov* command if execution of the command would create a component that already exists in the edit view. **System action**: the command is not executed. **Operator action**: in the case of an *Add* command, no action is needed, since the desired component is already in the edit view. In the case of a *Copy Prov* command, retry the command using a different -*destination* option.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE component

Description — This attribute is the name of the component that already exists. It is present only if the component name is different from the component name specified in the command.

Values — The name of the component

RESPONSE Component... does not exist....

Description — This error response is generated whenever the component to which a command applies does not exist.

System action: the command is not executed.
Operator action: for commands which can be applied to either current or edit views of provisioning data, ensure first that the correct view is the view being examined, then retry the command with a valid component name.

ATTRIBUTE component

Description — This attribute contains the name of the missing component. It is present only if the component name is different from the component name specified in the command.

Values — The name of the component

ATTRIBUTE view

Description — The view from which a component does not exists. This attribute is only present for commands that operate on more than one view; for example, the *Display* and *Set* command can specify both operational and provisional attributes.

Values — current
edit

RESPONSE A total of ... components have been deleted.

Description — This is the normal response to a *Delete* command. It contains a count of deleted components.

ATTRIBUTE count

Description — This attribute counts the number of deleted components.

Values — Decimal (0..65535)

RESPONSE The filename specified is invalid.The correct format for activate, apply or load is:...name[.type[.number]]The correct format for a save or commit command is only:...nameThe name...may contain only alphanumeric ...

Description — An *Activate*, *Apply, Commit*, *Load* or *Save* command produces this response when the specified file name has an invalid form.

System action: the command is ignored.
Operator action: retry the command with a valid file name.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE reason

Description — The text describes the format of a provisioning file.

Values — Decimal (0..0)

RESPONSE The above response was generated during loading, when the following command failed:.....

Description — During loading, this response is issued whenever a command from the provisioning data file fails to execute successfully. This should only happen if the *-force* option was used on the *Load* command, or if loading a partial view.

System action: loading is terminated at the point where the error was detected, unless the *-force* option is in effect (in which case loading continues).
Operator action: this response includes the response to the failed command, which can be interpreted in the same way as if the command had been entered manually. If the *-force* option is in effect, the most probable cause of this error is that the file being loaded requires a different software configuration than what is currently running on the Control Processor. Previous output from the *Load* command will have indicated what changes should be made to the software configuration.

ATTRIBUTE command

Description — This attribute contains the command that failed during loading.

Values — String (1..2048, ASCII)

RESPONSE Too many errors loading file ....

Description — This error response is generated when the number of failed commands read from the provisioning file being loaded, exceeds a predefined limit. Note that this limit on the number of failed commands is not enforced if the *-force* option is used in the *Load* command.

System action: the edit view is updated to match the parts of the provisioning data file which were loaded without errors. Loading stops at the point where the error limit was reached.
Operator action: to attempt loading of the entire file, ignoring the error limit, re-issue the *Load* command, specifying the *-force* option.

ATTRIBUTE file

Description — This attribute identifies the provisioning file being read.

Values — String (1..40, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Session..... is in provisioning mode.

Description

This error response is generated when the operator attempts to enter a provisioning command which is allowed outside provisioning mode only when no other session is in that mode.

This includes the following commands: *Activate*, *Commit*, *Confirm*, *Restore*, *Start*, and *Stop*.

System action: the command is ignored.
Operator action: wait until the current provisioning operator is finished. To terminate the other operator's provisioning session, retry the *Start Prov* command using the *-force* option. (Note: if you terminate the other operator's session, the edit view may contain changes made by that operator which have not been saved on disk.)

ATTRIBUTE provisioningSession

Description

This attribute identifies the session which is currently in provisioning mode.

Values

The name of the component

ATTRIBUTE userId

Description

This attribute identifies the user whose session is in provisioning mode.

Values

String (0..8, ASCII)

RESPONSE .....

Description

This error response is generated when a provisioning command is entered and the provisioning system is currently executing a provisioning command.

System action: the new command is ignored.
Operator action: wait for the previous command to complete.

ATTRIBUTE reason

Description

This attribute gives the type of provisioning command that is being executed.

Values

Initial loading is in progress
Activation is in progress
Initial activation is in progress
Roll back sequence is in progress
Save prov command is in progress
Load or Apply prov command is in progress
Check prov command is in progress
You must confirm the edit view changes first, then proceed with the provisioning command
Clear prov command is in progress
Copy prov command is in progress
Commit prov command is in progress
Delete command is in progress

Copyright © 2006, Nortel Nortel Confidential

Confirm prov command is in progress
Add command is in progress
Restore command is in progress

ATTRIBUTE commandPhase

Description — This attribute gives the phase of the command that is currently being executed.

Values — Decimal (0..100)

ATTRIBUTE additionReason

Description — This is an optional attribute which gives the percentage of work that has been finished.

Values — Decimal (0..100)

ATTRIBUTE file

Description — This is an optional attribute. This attribute only shows up when an *apply*, *load* or *save* command is in progress, it gives the name of the file currently being accessed.

Values — String (0..40, ASCII)

RESPONSE Component has no... subcomponents of the requested type....

Description — This message will be generated by a *List* command, or by a *Display* command using a “wild card” specification, if no subcomponents matching the component type specification were found.

ATTRIBUTE reason

Description — This attribute contains the reason explaining why no subcomponents are displayed

Values — provisioned or operational
provisioned
operational

requested

ATTRIBUTE filter

Description — This attribute indicates to the user that their userid does not have the correct scope or cid to list subcomponents.

Values — Decimal (0..0)

RESPONSE Fmip PDU problem

Description — This response is generated when a severe problem has been detected with the fmip pdu.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE notificationId

Description — This parameter contains the notification identifier of the alarm that contains related information as to why the pdu has a problem. It is optional.

Values — Hex (H.0..H.fffffff)

RESPONSE Displaying attribute ... is not allowed.

Description — This error response is generated when the operator attempts to display an attribute for which *Display* is not permitted. Note that this message does not signify that the operator has insufficient impact capability, but rather that no operator is allowed to *Display* this attribute.

System action: none. Any other requested attributes which the operator is allowed to *Display* will have been displayed by the command that produced this message.
Operator action: none.

ATTRIBUTE attribute

Description — This attribute identifies the attribute that cannot be displayed.

Values — Decimal (0..65535)

RESPONSE Setting attribute ... is not allowed.

Description — This error response is generated when the user attempts to set an attribute for which *Set* is not permitted.

System action: the named attribute's value is unchanged. Any other attributes specified in the same command will have been set if the operator is allowed to do so. Note that this message does not signify that the operator has insufficient impact capability, but rather that no operator is allowed to *Set* this attribute.
Operator action: none.

ATTRIBUTE attribute

Description — This attribute identifies the attribute that cannot be set.

Values — Decimal (0..65535)

RESPONSE You must be in provisioning mode to set attribute ....

Description — This error response is generated when the operator attempts to set a provisioning attribute while their session is not in provisioning mode.

System action: the attribute value is unchanged; other attributes, if any, in the *Set* command may have been set.
Operator action: issue a *Start Prov* command before attempting to set any provisionable attribute.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE attribute

Description	This attribute identifies the attribute that cannot be set.
Values	Decimal (0..65535)

RESPONSE Fed problem

Description	A Fed related problem occurred.

ATTRIBUTE problem

Description	The problem with the given fed.
Values	unrecognized missing unexpected corrupt invalid value

ATTRIBUTE type

Description	The recognized Fed Type that has a problem.
Values	fedArray fedArrayItem fedArrayItemValue fedAttribute fedAttributeValue fedBits fedBitSet fedCondition fedComplexFilter fedComponentInstance fedComponentName fedContinuedLogical fedContinuedPhysical fedField fedFieldActionType fedFieldAsciiBuffer fedFieldAsciiLog fedFieldComponentName fedFieldEventType fedFieldGetRequest fedFieldGetResponse fedFieldHeader fedFieldOptions fedFieldResponseError fedFieldResponseErrorAscii fedFieldResponseNormal fedFieldSetRequest fedFieldTime fedFieldTransaction

ATTRIBUTE typeId

Description	An unrecognized Fed Type.
Values	Decimal (0..65535)

ATTRIBUTE length

Description	The length of the FedTlv. This attribute is optional.
Values	Decimal (0..65535)

ATTRIBUTE valueUnsigned

Description	The value of a Fed as a DECIMAL when possible.
Values	Decimal (0..65535)

ATTRIBUTE valueHex

Description	The value of a Fed as a hex string.
Values	String (0..255, Hex)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE valueAscii

Description	The value of a FEDas an ASCII string.
Values	String (0..255, ASCII)

RESPONSE The edit view differs from the current view....

Description	This response is generated when a user successfully starts the provisioning session. **System action**: none. **Operator action**: none. This message is for information only.

ATTRIBUTE provCommandInProgress

Description	The presence of this attribute indicates that a provisioning command is still in progress and the end result of this provisioning command will change the number of components added to or deleted from the edit view.
Values	An Activate Prov command is in progress. Initial activation is in progress. A roll back sequence is in progress. A Save Prov command is in progress. A Load or Apply Prov command is in progress. A Check Prov command is in progress. Changes in the edit view have not been confirmed. The Clear Prov command is in progress. The Copy Prov command is in progress. The Commit Prov command is in progress. The Delete command is in progress. The Confirm Prov command is in progress. An Add command is in progress. The Restore Prov command is in progress.

ATTRIBUTE componentAddedCount

Description	This attribute indicates the number of components that have been added to the edit view since the last activation.
Values	Decimal (0..2147483647)

ATTRIBUTE componentDeletedCount

Description	This attribute indicates the number of components that have been deleted from the edit view since the last activation.
Values	Decimal (0..2147483647)

ATTRIBUTE dataChangedCount

Description	This attribute indicates the number of attributes that have been changed in the edit view since the last activation.
Values	Decimal (0..2147483647)

RESPONSE Error: ...

Description — This response is issued when a semantic check error occurs requiring only a string response.

ATTRIBUTE errorString

Description — This attribute is a string issued as a semantic check error.

Values — String (1..255, ASCII)

RESPONSE The software supporting this component is not loaded.

Description — This response is generated when the MDM uses an unrecognized subcomponent type identifier.

System action: the command fails.

Operator action: Load the software onto the node. Update the software on the MDM. The help command can be used to list the names of the recognized subcomponents. Avoid using components not derived from this list.

ATTRIBUTE component

Description — This parameter contains the valid portion of the component name.

Values — The name of the component

ATTRIBUTE subcomponentType

Description — This parameter identifies the unrecognized subcomponent type. The MDM may or may not be able to convert it to an ascii name.

Values — Decimal (0..65535)

RESPONSE Component instance out of range or invalid syntax: component description mismatch

Description — This response is generated when the MDM uses a component instance value that is out of range or does not have the correct syntax.

System action: the command fails.

Operator action: Update the software on the MDM. The help command can be used to list the appropriate instance value ranges.

ATTRIBUTE component

Description — This parameter contains the valid portion of the component name. The last subcomponent instance which is in error is not shown.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Unrecognized group identifier: component description mismatch

Description

This warning response is generated when the MDM uses an unrecognized group identifier. This can only occur for the get or help commands. This response may be repeated for every group with this problem. Other groups are still processed.

System action: the command is ignored for this group. Other groups are still processed.

Operator action: Update the software on the MDM. The help command can be used to list the names of the recognized groups. Avoid using groups not in this list.

ATTRIBUTE group

Description

This parameter identifies a group, by numeric id, that is not recognized by the node. The MDM may or may not be able to convert it to an ASCII name.

Values

Decimal (0..65535)

RESPONSE Unrecognized option identifier: component description mismatch

Description

This warning response is generated when the MDM uses an unrecognized option identifier. This response may be repeated for every option with this problem. Other options are still processed.

System action: the option is ignored. Other options are still processed.

Operator action: Update the software on the MDM. The help command can be used to list the names of the recognized options. Avoid using options not in this list.

ATTRIBUTE option

Description

This parameter identifies an option, by numeric id, that is not recognized by the node. The MDM may or may not be able to convert it to an ASCII name.

Values

Decimal (0..65535)

RESPONSE Option value/index out of range: component description mismatch

Description

This response is generated when the MDM attempts to pass an options value or index that is out of range.

System action: the command is ignored for this option. Other options are still processed.

Operator action: Update the software on the MDM. The help command can be used to list the appropriate value/index ranges.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE option

Description — This parameter identifies the option, by name, for which a problem has been detected.

Values — Decimal (0..65535)

RESPONSE Component ... is not ready. Try again later.

Description — This error response occurs when an operator command has been sent to a component, but the component has indicated that it is still initializing and is not yet ready.

System action: the command terminates without having done anything.
Operator action: retry the command later.

ATTRIBUTE component

Description — The name of the component that is not ready. This attribute is present only if the component is different from the one specified in the command.

Values — The name of the component

RESPONSE The semantically checked file ... has an invalid file format.

Description — This response is generated when the specified view has a bad format, for example, the application list and feature set information is missing.

System action: the command is ignored.
Operator action: re-enter the command using a properly formatted file.

ATTRIBUTE file

Description — This attribute is the name of the file that has an invalid file format. A software alarm is also generated by the subsystem SCS.

Values — String (1..40, ASCII)

RESPONSE Help on attribute ... is not allowed.

Description — This error response is generated when the operator attempts to ask for help on an attribute for which *Help* is not permitted. Note that this message does not signify that the operator has insufficient impact capability, but rather that no operator is allowed to query *Help* on this attribute.

System action: none.
Operator action: none.

ATTRIBUTE attribute

Description — This attribute identifies the attribute that cannot be queried for help.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE ... .

Description

This response contains the three OSI State attributes and the six OSI Status attributes. It is used in Alarms and SCNs.

The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component that issues alarms or SCNs. For component-specific information and the valid state combinations, refer to the appropriate NTP.

ATTRIBUTE adminState

Description

This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is in administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

locked
unlocked
shuttingDown

ATTRIBUTE operationalState

Description

This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

enabled
disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE usageState

Description

This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Values

idle
active
busy

ATTRIBUTE availabilityStatus

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***degraded*** indicates the service provided by the component is degraded in some way such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of

inTest
failed
dependency
powerOff
offLine
offDuty
degraded
notInstalled
logFull
migrating

ATTRIBUTE proceduralStatus

Description

If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is

Copyright © 2006, Nortel Nortel Confidential

enabled.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of

initializationRequired (initRequired)
notInitialized (notInit)
initializing
reporting
terminating

ATTRIBUTE controlStatus

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of

subjectToTest
partOfServicesLocked (partOfSrvLckd)
reservedForTest (rsrvdForTest)
suspended

ATTRIBUTE alarmStatus

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding

Copyright © 2006, Nortel Nortel Confidential

against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Set of

underRepair
critical
major
minor
alarmOutstanding (alrmOutstdng)

ATTRIBUTE standbyStatus

Description

If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Values

hotStandby
coldStandby
providingService (providingServ)
notSet

ATTRIBUTE unknownStatus

Description

This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status

Copyright © 2006, Nortel Nortel Confidential

attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure. This could be used, for example, when a “proxy” alarm is issued on the component’s behalf.

Values
false
true

RESPONSE The value of ...

Description
This error response is generated by the *Copy Prov* command when a DNA attribute cannot be copied from the source component to the destination component. Usually this is because doing so would create a duplicate DNA.

System action: the value of the DNA attribute is set to empty (zero length).
Operator action: use the *Set* command to give the DNA attribute another value.

ATTRIBUTE attribute

Description
The name of the attribute that was not copied.

Values
Decimal (0..65536)

Replication
The name of the component

ATTRIBUTE component

Description
This attribute contains the name of the (destination) component whose DNA was set to empty.

Values
The name of the component

RESPONSE The specified verb is ambiguous with ....

Description
The *Help* command generates this error response if the named verb is ambiguous for the given component class.

System action: the command is not executed.
Operator action: re-enter the command, supplying an appropriate verb name.

ATTRIBUTE listOfAmbiguities

Description
This attribute contains the list of verbs which are ambiguous matches with the specified verb.

Values
String (0..255, ASCII)

Copyright © 2006, Nortel
Nortel Confidential

RESPONSE The ... verb is not applicable to this component.The component has no readable attributes.

Description — The *Help* command generates this error response if the named verb is the common verb display, and the component definition does not contain any readable attributes.

System action: the command is not executed.
Operator action: use help on the component to display the allowable verbs.

ATTRIBUTE matchedVerbName

Description — This attribute contains the fullname of the verb specified in the command. This lets the user know exactly what the system's interpretation is of any abbreviation or unambiguous string that is specified in the command.

Values — String (0..255, ASCII)

RESPONSE The ... verb is not applicable to this component.The component has no writable attributes.

Description — The *Help* command generates this error response if the named verb is the common verb set, and the component definition does not contain any writable attributes.

System action: the command is not executed.
Operator action: use help on the component to display the allowable verbs.

ATTRIBUTE matchedVerbName

Description — This attribute contains the fullname of the verb specified in the command. This lets the user know exactly what the system's interpretation is of any abbreviation or unambiguous string that is specified in the command.

Values — String (0..255, ASCII)

RESPONSE Loading file ... is aborted.

Description — This response is generated when loading is aborted due to failure in checking the version and feature set information.

System action: View is not loaded.
Operator action: Upgrade the switch's software and retry the command.

ATTRIBUTE file

Description — The name of the view to be loaded.

Values — String (1..40, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE No more sequence numbers available for view ... - specify a different name.

Description — This response occurs when the system attempts to generate the next view sequence number (during an *Activate*, *Commit* or *Save*), and the highest possible value (999) is already in use.

System action: the command is not executed.
Operator action: retry the command using a different file name.

ATTRIBUTE file

Description — This attribute identifies the provisioning file which already exists.

Values — String (1..40, ASCII)

RESPONSE Permission denied: you have insufficient scope capability....

Description — This error response is generated whenever an operator cannot access a component due to insufficient scope capability.

System action: the command is not executed.
Operator action: you must log in using a userid with a higher scope capability in order to access this component.

ATTRIBUTE component

Description — This attribute contains the name of the component for which the operator has invalid scope access. It is present only if different from the target component.

Values — The name of the component

RESPONSE Component ...is owned by another customer.

Description — This error response is generated when an operator attempts to access a component owned by another customer.

System action: the command is not executed for this component.
Operator action: none.

ATTRIBUTE component

Description — This attribute contains the name of the component owned by another customer. It is present only if the component name is different from the component name specified in the command.

Values — The name of the component

RESPONSE ... file(s) deleted.

Description — This response is generated when the *Tidy* command is done. It indicates to the user the number of files that have been removed from the provisioning directory.

System action: none. This is an information message only.
Operator action: none.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE count

Description — This attribute is the number of files deleted from the provisioning directory.

Values — Decimal (1..65535)

RESPONSE ... will be kept.

Description — This response is generated when the committed view, current view, last used view, a protected view, or a base view is within the list of views the *Tidy* command is attempting to remove. These views are never removed by the *Tidy* command.

System action: the named view is not deleted.
Operator action: none. This message is for information only.

ATTRIBUTE reason

Description — Describe the type of view not removed

Values —
Committed file
Last used file
Current view file
Protected file
Non-provisioning file
Open file
Base file

ATTRIBUTE fileName

Description — The committed or the last used view name.

Values — String (1..40, ASCII)

RESPONSE ... is not a provisionable component.

Description — The *Save* command generates this response if the operator specifies a component to be saved (via the *-component* option) which is not provisionable. Since *Save* saves only provisioned components, the command is rejected.

System action: the command is not executed.
Operator action: if desired, retry the command, specifying a provisionable component.

ATTRIBUTE component

Description — This attribute contains the name of the component.

Values — The name of the component

Copyright © 2006, Nortel
Nortel Confidential

RESPONSE Operational ..... not exist in the edit view. Include the -current option.

Description

The *List* or *Display* commands generate this error response when the user is in provisioning mode and requests information about operational data in the edit view. The response attribute indicates the type of data requested by the operator. Only one type of data will be present.

System action: the command is not executed.
Operator action: issue the list command again with the -current option.

ATTRIBUTE components

Description

The response attribute indicates that the operator attempted to show information about many operational components while in provisioning mode. The operator could have entered one of:
PROV 1> list -o [-p] component
PROV 2> list [-o] [-p] operComponent
PROV 3> display [-o] [-p] operComponent *

Values

Decimal (0..0)

ATTRIBUTE component

Description

This response attribute indicates that the operator attempted to display information about an operational component while in provisioning mode. The operator could have entered one of:
PROV 1> display [-o] [-p] operComponent

Values

Decimal (0..0)

ATTRIBUTE group

Description

This response attribute indicates that the operator attempted to display information about an operational group within provisioning mode. The operator could have entered one of:
PROV> display [-o] [-p] component operGroup

Values

Decimal (0..65535)

ATTRIBUTE attribute

Description

This response attribute indicates that the operator attempted to display information about an operational attribute within provisioning mode. The operator could have entered one of:
PROV> display [-o] [-p] component operationalAttribute

Values

Decimal (0..65535)

ATTRIBUTE data

Description

This response attribute indicates that the operator attempted to display information about an operational data within provisioning mode. The operator could have entered one of:
PROV> display -o [-p] component

Values

Decimal (0..0)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Help on Group ... is not allowed.

Description — This error response is generated when the operator attempts to ask for help on a group for which *Help* is not permitted. Note that this message does not signify that the operator has insufficient impact capability, but rather that no operator is allowed to query *Help* on this group.

System action: none.
Operator action: none.

ATTRIBUTE group

Description — This attribute identifies the group that cannot be queried for help.

Values — Decimal (0..65535)

RESPONSE The value of ... was not copied to ....

Description — *Copy* can generate this warning when copying part of the current view to the edit view. If a link attribute of a “source” component names a component which does not exist in the edit view, or if the destination component is already linked to something else and it does not support multiple links, the attribute in the copied component is not set.

System action: the link attribute is set to empty.
Operator action: determine the appropriate component to link to. Add this component if necessary, or remove the existing link, then enter a *Set* command to set the link attribute.

ATTRIBUTE attribute

Description — This attribute names the link attribute that cannot be set.

Values — Decimal (1..65535)

Replication — The name of the component

ATTRIBUTE component

Description — This attribute identifies the component containing the named attribute.

Values — The name of the component

RESPONSE Component has no ... data.

Description — This warning message is issued when a *Display* command does not find any data to display for components that have no data. If data is not displayed due to insufficient impact, the invalid impact error response is generated instead.

ATTRIBUTE reason

Description — This response attribute indicates the type of the requested data that could not be found.

Copyright © 2006, Nortel Nortel Confidential

Values	provisioned or operational provisioned operational

RESPONSE Error:

Description	A *Check* command produces this response when two attributes within the same component have incompatible values. **System action**: no *Activate* command will be accepted until a subsequent *Check* completes without errors. **Operator action**: correct the incompatibility between the values of the attributes specified by “attribute” and “conflictingAttribute”, then retry the *Check* command.

RESPONSE Warning: Activation will disrupt service for the following component(s):

Description	A *Check* command generates this response to identify the component(s) which will go out of service temporarily if this view is activated. **System action**: None - information message only. **Operator action**: Follow appropriate procedures before activating the view (these could include notification, *Lock*ing of components, etc.)

ATTRIBUTE component

Description	This attribute is used to identify each component which will be taken out of service by an activation (up to a maximum of 200 components).
List of	The name of the component

ATTRIBUTE additional

Description	This attribute states the number of components which will be taken out of service, by an activation, but were not listed by name.
Values	Decimal (0..4000000000)

RESPONSE The committed file is ....

Description	The *Commit* command uses this response to display the name of the committed file. **System action**: none. **Operator action**: none. This message is for information only.

ATTRIBUTE file

Description	This attribute is the name of the committed file.
Values	String (1..40, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE The provisioning data is saved in file ....

Description — The *Save* command uses this response to display the name of the file used to save the provisioning data.

System action: none.
Operator action: none. This message is for information only.

ATTRIBUTE file

Description — This attribute is the name of the file created by the *Save* command.

Values — String (1..40, ASCII)

RESPONSE Loaded or applied file ....

Description — The *Apply* or *Load* command generates this message when loading is complete, to display the name of the file loaded.

System action: none.
Operator action: none. This message is for information only.

ATTRIBUTE file

Description — This attribute is the name of the accessed file.

Values — String (1..40, ASCII)

RESPONSE usage: Help [-verb(\...)] [-subcomponents] [\.....[\...[, \...]]]...

Description — This is the normal response to a *Help* command which specifies neither options nor a component class. It consists of a usage description followed by a list of top level components and a list of verbs for which a component name is not mandatory.

ATTRIBUTE subcomponentTypes

Description — This attribute contains a list of all top level component types.

List of — String (0..255, ASCII)

ATTRIBUTE verbs

Description — This attribute contains the names of all verbs for which a component name is not mandatory.

List of — String (0..255, ASCII)

RESPONSE

Description — This is the normal response to a *Help* command which requests information about a specific attribute group.

ATTRIBUTE groupName

Description — This attribute contains the name of the given group.

Values — String (0..255, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE groupType

Description	This attribute indicates whether the group being described by this response is provisionable or not.
Values	Operational Provisionable

ATTRIBUTE attributeList

Description	This attribute contains the names of the attributes in the group.
List of	String (0..255, ASCII)

RESPONSE

Description	This is the normal response to a *Help* command which requests information about a specific attribute.

ATTRIBUTE attributePrompt

Description	This attribute contains the name (and abbreviation) of the specified attribute.
Values	String (0..255, ASCII)

ATTRIBUTE readAccess

Description	This attribute specifies the level of operator impact capability required to *Display* the attribute. A value of “not allowed” means that no operator is allowed to *Display* it.
Values	not allowed debug systemAdministration configuration service passive all

ATTRIBUTE writeAccess

Description	This attribute indicates the level of operator impact capability required to *Set* the attribute. A value of “not allowed” indicates that the attribute is read-only, that is, no operator is allowed to *Set* it.
Values	not allowed debug systemAdministration configuration service passive all

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE criticality

Description

This attribute displays the criticality of the attribute.

Changing the value of a provisionable attribute with criticality ***none*** does not cause any disruption of service when the change is made effective (by a subsequent *Activate* command).

Changing the value of an attribute with criticality ***component*** will cause the component containing the attribute to temporarily go out of service on an *Activate*.

Changing the value of an attribute with criticality ***parent*** will cause the component containing the attribute, and possibly some of its ancestor components, to temporarily go out of service on an *Activate*.

Changing the value of an attribute with criticality ***parent (set only)*** will cause the component containing the attribute, and possibly some of its ancestor components, to temporarily go out of service on an *Activate.* Adding a new instance of a component containing such an attribute does not cause any component to go out of service.

Values

none
component
parent
module
parent (set only)

ATTRIBUTE type

Description

This attribute contains the type specification for the attribute.

Values

String (0..255, ASCII)

ATTRIBUTE index

Description

This attribute describes the index or indices of the attribute. For a VECTOR or replicated attribute, there will be one index; for an ARRAY there will be two indices; for all other types there will be no indices and this attribute will be omitted from the response.

The description of an index identifies both its type and its permitted values. In the case of an ARRAY index, the name of the index and its abbreviation are included.

Values

String (0..255, ASCII)

ATTRIBUTE values

Description

This attribute identifies the permitted values of the attribute.

Values

String (0..255, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE defaultValue

Description	This attribute contains the default value of the attribute.
Values	String (0..255, ASCII)

ATTRIBUTE units

Description	This attribute identifies the units for the values of the attribute.
Values	String (0..255, ASCII)

ATTRIBUTE flags

Description	This attribute lists the flags of an attribute.
Values	String (0..255, ASCII)

RESPONSE

Description	This is the normal response to a *Help* command when the *-subcomponents* option is specified.

ATTRIBUTE hierarchyEntry

Description	This attribute contains the name (and abbreviation) of a subcomponent type, appropriately indented. It will be repeated if there are multiple subcomponents.
Values	String (0..255, ASCII)

RESPONSE

Description	This is the normal response to a *Help* command that requests information about a specific verb.

ATTRIBUTE verb

Description	This attribute contains the name of the given verb.
Values	String (0..255, ASCII)

ATTRIBUTE impact

Description	This attribute indicates the level of operator impact capability required to use the given verb.
Values	debug administration configuration service passive Refer to ReadAccess'ofattribute.' Refer to WriteAccess'ofattribute.'

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE mandatoryOptions

Description — This attribute displays the mandatory options of the verb.

List of — String (0..255, ASCII)

ATTRIBUTE options

Description — This attribute displays the options of the verb.

List of — String (0..255, ASCII)

RESPONSE The ... verb is not allowed for this component.

Description — The *Help* command generates this error response if the named verb is a recognizable verb, but is illegal for the given component class.

System action: the command is not executed.
Operator action: re-enter the command, supplying an appropriate verb name.

ATTRIBUTE matchedVerbName

Description — This attribute contains the fullname of the verb specified in the command. This lets the user know exactly what the system's interpretation is of any abbreviation or unambiguous string that is specified in the command.

Values — String (0..255, ASCII)

RESPONSE .....

Description

This response is the List command output.

ATTRIBUTE type

Description

This attribute describes whether the entry found in the directory was a file or a directory.

Values

dir (directory)
file

ATTRIBUTE status

Description

The value of this attribute tells if the file or directory is write protected.

Values

yes (protected)
no (unprotected)

ATTRIBUTE size

Description — This attribute describes the size, in bytes, of the file.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE timeStamp

Description
This attribute describes the file's last modification time.

Values Time (DHMS)

ATTRIBUTE name

Description
This attribute describes the file's name.

Values String (1..128, ASCII)

RESPONSE ..... is not ... one.

Description The List command generates this error response when the options used in the command conflict with the component type.

System action: the command is not executed.
Operator action: issue the list command again with the correct options.

ATTRIBUTE component

Description This attribute identifies the component. This would happen if the operator entered:
PROV 1>list -o -c provisionedComponent
2>list -o provisionedComponent
PROV 3>list -p operationalComponent
4>list -p operationalComponent

Values Decimal (0..0)

ATTRIBUTE subComponent

Description This attribute identifies the component. This would happen if the operator entered:
PROV 1>list -o -c provisionedComponent/*
2>list -o provisionedComponent/*
PROV 3>list -p operationalComponent/*
4>list -p operationalComponent/*

Values Decimal (0..65535)

ATTRIBUTE group

Description This attribute identified the group whose type conflicts with the options. It could happen if the operator entered:
PROV 1>display -o -c provisionedGroup
2>display -o provisionedGroup
PROV 3>display -p -c operationalGroup
4>display -p operationalGroup

Values Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE attribute

Description — This attribute identified the attribute whose type conflicts with the options. It could happen if the operator entered:
PROV 1>display -o -c provisionedAttribute
2>display -o provisionedAttribute
PROV 3>display -p -c operationalAttribute
4>display -p operationalAttribute

Values — Decimal (0..65535)

ATTRIBUTE dataType

Description — This attribute identifies the type of the component, whether it is provisioned or operational.

Values — an operational
a provisioned

RESPONSE .....

Description — This is the first part of the normal response to a *Help* command which requests information about a specific component.

ATTRIBUTE subcomponentTypes

Description — This attribute contains the types of the top level subcomponents of the chosen component.

List of — String (0..255, ASCII)

ATTRIBUTE componentPrompt

Description — This attribute contains the name (and the abbreviation, if there is one) of the chosen component.

Values — String (0..255, ASCII)

ATTRIBUTE instanceType

Description — This attribute identifies the permitted instance values for the component class. If only one instance of the component is permitted, this attribute is omitted from the response.

Values — String (0..255, ASCII)

ATTRIBUTE existance

Description — This attribute specifies the rules for adding and deleting the component.

A value of ***required*** means that an instance of this component type is added at the same time as its parent is, and there must always be at least one instance of this type present thereafter. This means that where multiple instances of a component type (under the same parent) are permitted, the operator may be allowed to add and delete instances of this component type, provided at least one instance remains when provisioning is complete.

Copyright © 2006, Nortel Nortel Confidential

A value of ***optional*** means that instances of this component type may be added and deleted explicitly by operator commands; there need not be any instance of this component.

A value of ***dynamic*** means that the application software associated with the parent component can add and delete instances of this component type; however the operator is not allowed to do so.

A value of ***dynamic or optional*** means that this component type may have provisioned or dynamic instances. The provisioned instances are any that the operator adds, and they replace any existing dynamic instance with the same instance value. Dynamic instances cannot be deleted by the operator.

Values

required
optional
dynamic
dynamic or optional

ATTRIBUTE scope

Description — This attribute indicates the level of operator scope capability required to access the chosen component.

Values

network
device
application

RESPONSE

Description — This is the second part of the normal response to a *Help* command which requests information about a specific component. It describes one attribute group of the component. If the component has multiple groups, one of these responses will appear for each group.

ATTRIBUTE attributeList

Description — This attribute contains the names of the attributes in the group.

List of — String (0..255, ASCII)

ATTRIBUTE groupType

Description — This attribute indicates whether the group being described by this response is provisionable or not.

Values

Operational
Provisionable

ATTRIBUTE groupName

Description — This attribute contains the name of an attribute group that belongs to the chosen component.

Values — String (0..255, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE

Description — This is the third and final part of the normal response to a *Help* command which requests information about a specific component.

ATTRIBUTE verbs

Description — This attribute contains a list of verbs that can be applied to the chosen component.

List of — String (0..255, ASCII)

RESPONSE List ... is full.

Description — This error response is generated when the operator attempts to add a value to a list attribute that already contains the maximum permitted number of elements.

System action: the attribute value is unchanged; other attributes, if any, in the *Set* command may have been set.
Operator action: if desired, remove an element from the named attribute, then retry the original *Set* command.

ATTRIBUTE attribute

Description — This attribute identifies the attribute that cannot be set.

Values — Decimal (0..65535)

RESPONSE

Description — This response is the WorkingDir command output.

ATTRIBUTE pathName

Description — This attribute describes the working directory pathname.

Values — String (1..128, ASCII)

RESPONSE ... ...

Description — This response indicates the RID, MID and PID of an intermediate node in the network visited as the ping query packet was travelling to its destination.

ATTRIBUTE rid

Description — This attribute indicates the RID of the intermediate node that was visited as the ping query packet was travelling to its destination.

Values — Decimal (1..127)

ATTRIBUTE mid

Description — This attribute indicates the MID of the intermediate node that was visited as the ping query packet was travelling to its destination.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (1..2046)

ATTRIBUTE pid

Description This attribute indicates the process identifier of the intermediate node that was visited as the ping query packet was travelling to its destination. Note that for a Nortel Networks Multiservice Switch, this value is 0.

Values Decimal (0..4294967295)

RESPONSE The specified verb is not recognized....

Description The *Help* command generates this error response if the named verb is not defined for the given component class.

System action: the command is not executed.
Operator action: re-enter the command, supplying an appropriate verb name.

ATTRIBUTE matchedComponent

Description This attribute indicates whether a component was specified or not.

Values by this component

RESPONSE The ... verb requires a component to be specified.

Description The *Help* command generates this error response if the named verb is a recognizable verb, but this verb requires a component.

System action: the command is not executed.
Operator action: re-enter the command, supplying an appropriate verb name.

ATTRIBUTE matchedVerbName

Description This attribute contains the fullname of the verb specified in the command. This lets the user know exactly what the system's interpretation is of any abbreviation or unambiguous string that is specified in the command.

Values String (0..255, ASCII)

RESPONSE Cannot set the ... on another users Session.

Description This error response appears if a user tries to issue a *Set* command on the *dataStreams* attribute of a session other than his own.
The user is prevented from changing someone else's attribute.

ATTRIBUTE attribute

Description This attribute specifies the name of the attribute that cannot be set.

Values Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Command aborted due to internal error....

Description	This error response is returned when a command has failed due to some internal error such as a software error or engineering error (for example, out of memory). There should be an alarm generated that would indicate the remedial action to perform. **System action**: the command is aborted. It may have been partially executed. **Operator action**: examine the alarm output to determine the nature of the problem and the appropriate action.

ATTRIBUTE notificationId

Description	This attribute is the unique alarm identifier associated with the error. If the alarm ID is unknown, this attribute is omitted.
Values	Hex (H.0..H.fffffff)

RESPONSE The following AV(s) have been removed:

Description	This response is issued to indicate to the user which *AVs* have been removed as a result of a *Tidy* or *Remove c*ommand.

ATTRIBUTE listOfRemovedAvs

Description	This attribute is a list of the names of *AVs* which have been removed.
List of	String (1..30, ASCII)

RESPONSE AV(s) already exist(s):

Description	This response is issued when the user specifies, in the *avListToDownload*, one or more *AVs* which already exist on disk. These *AVs* are not added to the *avListToDownload*.

ATTRIBUTE existingAvList

Description	This attribute is a list of *AVs*, which the user attempted to add to the *avListToDownload*, but which exist already on disk.
List of	String (1..30, ASCII)

RESPONSE

Description	The following describes the attributes of the Test process to be displayed for an automatic test statistics display.

ATTRIBUTE bitsTx

Description	This attribute indicates the number of bits sent during the test period.
Values	Long Integer

ATTRIBUTE bytesTx

Description	This attribute indicates the number of bytes sent during the test period.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE frmTx

Description This attribute indicates the number of frames sent during the test period.

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values Long Integer

ATTRIBUTE bitsRx

Description This attribute indicates the number of bits received during the test period.

Values Long Integer

ATTRIBUTE bytesRx

Description This attribute indicates the number of bytes received during the test period.

Values Long Integer

ATTRIBUTE frmRx

Description This attribute indicates the number of frames received during the test period.

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Values Long Integer

ATTRIBUTE erroredFrmRx

Description This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.

For all other card types, this attribute indicates the number of errored frames received during the test period.

Values Long Integer

ATTRIBUTE bitErrorRate

Description This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface.

For all other card types, this attribute indicates the calculated bit error rate on the link derived from the received errored frames and transmitted frames ratio.

Values String (0..5, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE elapsedTime

Description

This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Values — Decimal (0.00..30240.00)

Units — minutes

ATTRIBUTE timeRemaining

Description

This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.

Values — Decimal (0.00..30240.00)

Units — minutes

RESPONSE Other end already linked to component ....

Description — This error response is generated when the user attempts to *Set* a LINK type attribute, when the remote end is already linked to something, and does not support multiple links.

System action: the LINK attribute is unchanged.
Operator action: if desired, remove the link from the component named in the error response, then retry the original *Set* command.

ATTRIBUTE currentRemoteValue

Description — This attribute contains the name of the component to which the remote end is currently linked.

Values — The name of the component

RESPONSE Loading provisioning data on the standby CP: ...% done.

Description — A *Switchover, Restart,* or *Reset (active cp or lp/0)* command generates this response if the standby CP is still in the process of preloading the provisioning data.

System Action: the *Switchover* or *Reset* command is ignored.

Operator Action: retry the command later. If an immediate switchover is necessary, you may use the *Restart -force Lp/0* or *Reset -force Lp/0* command; however doing so may cause FPs to restart.

ATTRIBUTE percentageDone

Description — This attribute indicates the percentage of the provisioning data loaded onto the standby CP.

Values — Decimal (0..100)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE The software upgrade failed due to a failure in upgrading the standby CP. Failure reason: .....

Description — The Control Processor software upgrade failed because the standby CP failed while being upgraded. Software upgrade is aborted.

ATTRIBUTE pcsString

Description — This attribute may be used to provide further information.

Values — String (0..512, ASCII)

ATTRIBUTE pcsAbortReason

Description — This attribute indicates why the software migration is being aborted.

Values —
Abort reason undetermined
Inserted card type does not match provisioned card type
Card has been inserted into an unconfigured slot
A software error occured
Card failed self tests
Card is not responding
Card has backplane connectivity problems
Card with unsupported PEC code is inserted
Standby Cp crashed
Active Cp crashed
Software downgrade is detected but not supported
Active spared FP crashed
Disk synchronization failed
Migration stopped via stopprov'command'
Standby CP failed to load software with in alloted time

RESPONSE Feature ... must be present in the feature list of at least one Lpt component linked to an Lp in the current view before this provisioning file can be loaded.

Description — A *Load* command produces this response when one or more of the features that appear in the load file are not present in any feature list in the current view. This implies that the software necessary to load some parts of the file is not currently loaded.

System action: the file is not loaded. The edit view is unchanged.
Operator action: Correct the *featureList* attributes of one or more *LogicalProcessorType* components (found under the *Software* component) as indicated by this response. Check, activate and confirm these changes (this will involve a CP reload). Then retry the original *Load* command.
Note: if necessary, the *-force* option can be used to attempt loading of the file. However, syntax errors will likely result, and some components which are present in the file may not appear in the edit view after loading.
A reload -f(<filename>) lp/0 command is another option to load and activate this file.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE feature

Description — This attribute gives the name of a missing feature that must be added, checked and activated before retrying the *Load* command.

Values — String (1..30, ASCII)

RESPONSE Av ... must be present in the avList of the Sw component in the current view before this provisioning file can be loaded.

Description — A *Load* command produces this response when one or more of the Application versions that appear in the load file are not present in the AVL of the current view. This implies that the software necessary to load some parts of the file is not currently loaded.

System action: the file is not loaded. The edit view is unchanged.
Operator action: Correct the *AVL* attribute of the *Software* component by adding the *AV* component as indicated by the response. Check, activate and confirm these changes (this will involve a CP reload). Then retry the original *Load* command.
Note: if necessary, the *-force* option can be used to attempt loading of the file. However, syntax errors will likely result, and some components which are present in the file may not appear in the edit view after loading.
A reload -f(<filename>) lp/0 command is another option to load and activate this file.

ATTRIBUTE applicationVersion

Description — This attribute gives the name of a missing Av that must be added, checked and activated before retrying the *Load* command.

Values — String (1..30, ASCII)

RESPONSE Application ... in the current views avList should be version ... before this provisioning file can be loaded. Versions other than this one may also be acceptable.

Description — A *Load* command produces one of these responses for each application version (AV) in the load file which is incompatible with a currently selected AV.

System action: the file is not loaded. The edit view is unchanged.
Operator action: Correct the *avList* attribute of component *Software* as indicated by this response. Check, activate and confirm these changes (this will involve a CP reload). Then retry the original *Load* command.
Note: if necessary, the *-force* option can be used to attempt loading of the file. However, syntax errors will likely result, and some components which are present in the file may not appear in the edit view after loading.
A reload -f(<filename>) lp/0 command is another option to load and activate this file.

ATTRIBUTE applicationName

Description — This attribute names an application whose *avList* entry must be changed.

Values — String (1..30, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE versionName

Description — This attribute indicates the required version of the named application.

Values — String (1..30, ASCII)

RESPONSE Application ... in the current views avList must be at least version ... before this provisioning file can be loaded.

Description — A *Load* command produces one of these responses for each application version (AV) in the load file which is incompatible with a currently selected AV.

System action: the file is not loaded. The edit view is unchanged.
Operator action: Correct the *avList* attribute of component *Software* as indicated by this response. Check, activate and confirm these changes (this will involve a CP reload). Then retry the original *Load* command.
Note: if necessary, the *-force* option can be used to attempt loading of the file. However, syntax errors will likely result, and some components which are present in the file may not appear in the edit view after loading.
A reload -f(<filename>) lp/0 command is another option to load and activate this file.

ATTRIBUTE applicationName

Description — This attribute names an application whose *avList* entry must be changed.

Values — String (1..30, ASCII)

ATTRIBUTE versionName

Description — This attribute indicates the minimum required version of the named application.

Values — String (1..30, ASCII)

RESPONSE The following views or files reference this Av or are corrupted and therefore the Av cannot be removed as requested:

Description — This response is issued to indicate to the user the views (current and/or edit) and/or provisioning files which reference the *A*v that the operator wanted removed. This response can also indicate provisioning files which are corrupted. The result in all cases is that the Av cannot be removed.

ATTRIBUTE listOfFileNames

Description — This attribute is a list of view and/or file names which reference the associated Av (or possibly are corrupted).

List of — String (1..40, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE These AV names are invalid and cannot be downloaded:

Description — This response is issued when the user specifies, an Av name in the *avListToDownload*, that has either a missing Application name or a missing Version as part of its name. A valid Av name must consist of both an application name and a version separated by an underscore. These invalid *AVs* are not added to the *avListToDownload*.

ATTRIBUTE invalidAvNameList

Description — This attribute is a list of *AVs*, which the user attempted to add to the *avListToDownload*, but which are invalid names.

List of — String (1..30, ASCII)

RESPONSE ..... and ... should not be more than 12 hours apart.

Description

This response is issued when a semantic check is done on a Collector, indicating that this pair of times are too far apart. It appears once for each invalid pair of times.

ATTRIBUTE invalidTimeFirstOfPair

Description

This is the first of a pair of times that are too far apart.

Values — Time (HM)

ATTRIBUTE invalidTimeSecOfPair

Description

This is the second of a pair of times that are too far apart.

Values — Time (HM)

RESPONSE ... component(s) reported errors.

Description — Cas generates this error response when it encounters errors due to incompatible options while processing a wild-carded command.

System action: the command is partially executed.
Operator action: issue the command again on those components that failed using the correct options.

ATTRIBUTE count

Description — This attribute identifies the number of errors encountered.

Values — Decimal (0..65535)

RESPONSE The Filesystem is full.

Description — This response is issued when the download is stopped due to the local disk of the file system becoming full.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE fileBeingAccessed

Description	This attribute is the name of the file or directory which is being accessed at the time of the error.
Values	String (1..128, ASCII)

RESPONSE There is insufficient disk space for download to continue.

Description	This response is issued when the download is stopped because of lack of disk space that the file system has detected.

ATTRIBUTE fileBeingAccessed

Description	This attribute is the name of the file or directory which is being accessed at the time of the error.
Values	String (1..128, ASCII)

RESPONSE Cannot download data from SDS; possible link failure.

Description	This response is issued when the download is stopped due to a bad read from the data socket. One possible reason for this is that the download connection path has failed.

ATTRIBUTE fileBeingAccessed

Description	This attribute is the name of the file or directory which is being accessed at the time of the error.
Values	String (1..128, ASCII)

RESPONSE The Copy command is not allowed for the ... component.

Description	The *Copy* command produces this response if the *Add* command cannot be applied to the component types specified in the *-source* option. **System action**: the *Copy* command is not executed. **Operator action**: none.

ATTRIBUTE component

Description	This attribute contains the name of the component that cannot be copied.
Values	The name of the component

RESPONSE The following AV(s) would be removed if the Tidy command was issued without the query option:

Description	This response is returned to the user to indicate which *AVs* would be removed if a *Tidy* command (without the *Query* option) was issued.

ATTRIBUTE listOfRemovedAvs

Description	This attribute is a list of the names of *AVs* which would be removed if *the Tidy* command is issued without the query option
List of	String (1..30, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE ....

Description

This response is generated when a provisioning command, other than the one entered by the operator, is invoked automatically by the system. For example, if *Activate Prov* is entered by the user, and the Edit View has not been semantically checked, the system will automatically invoke the semantic checker before proceeding with the activate.

System action: another command will be automatically executed as part of the specified one.
Operator action: none. This message is for information only.

ATTRIBUTE command

Description

This attribute gives the type of provisioning command that is being invoked.

Values

Invoking Activate prov command
Invoking Save prov command
Invoking Load prov command
Invoking Check prov command
Invoking Clear prov command
Invoking Copy prov command
Invoking Commit prov command
Invoking Delete command
Invoking Confirm prov command
Invoking Add command

RESPONSE View ... has not been saved in a delta format.

Description

This error response is generated when a user attempts to *apply* a view that has not been saved in a ***delta*** format, that is, the difference between the current and edit views at the time of the *Save Prov.*

System action: the command is ignored.
Operator action: Enter a correct view name.

ATTRIBUTE file

Description

This attribute is the name of the view saved without the ***delta*** format.

Values

String (1..40, ASCII)

RESPONSE The base file ... does not exist. The delta file ... cannot be loaded.

Description

A *Load* or an *Activate* command produces this response when the specified file is a delta file and the base for the delta file cannot be found. The base file for the delta file has been deleted, most likely by a manual operator command entered in error.

System action: the command is not executed.
Operator action: if possible, restore the base file and reissue the *Load* or *Activate* command. Otherwise, use the *Tidy* command to remove the delta file and retry the *Load* or *Activate* using a different view.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE file

Description — This attribute indicates the name of the missing base file.

Values — String (1..40, ASCII)

ATTRIBUTE fileName

Description — This attribute indicates the name of the delta file which could not be loaded.

Values — String (1..40, ASCII)

RESPONSE Saving the ... into ... (with ... formats) ...

Description — This response is generated at the start of saving a view to disk. This can occur with *activate*, *commit* or *save*. Saving can be aborted via *stop*. In certain cases, a single *save prov* command can result in both the current and edit views to be saved.

System action: none.
Operator action: none. This message is for information only.

ATTRIBUTE view

Description — The view from which components are saved onto disk.

Values — current
edit

ATTRIBUTE file

Description — This attribute is the name of the view being saved.

Values — String (1..40, ASCII)

ATTRIBUTE formats

Description — This attribute contains the formats of the provisioning data that are being saved. Refer to the *formats* attribute of the *View* subcomponent for more information.

Set of — ascii
commit
delta
part
portable

RESPONSE In the voiceRates attribute:...

Description — This response is used when the user attempts to set the *voiceRates* attribute to an illegal value. The only rate allowed for ***g711Only*** encoding is 64 kbit/s. The only rate allowed for ***g728Only*** encoding is 16 kbit/s. The only rate allowed for ***g729Only*** encoding is 8 kbit/s. The minimum ***g711G726*** rate must be 32, 24 or 16 kbit/s. The maximum ***g711G726*** rate must be 64, 32, 24 or 16 kbit/s. The min ***g711G726*** rate cannot be greater than the max ***g711G726*** rate.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE errorType

Description — See the description in the response.

Values —
g711Only rates must be 64.0 kbit/s
g728Only rates must be 16.0 kbit/s
g729Only rates must be 8.0 kbit/s
The minimum g711G726 rate must be 16.0, 24.0 or 32.0 kbit/s
The maximum g711G726 rate must be 16.0, 24.0, 32.0 or 64.0 kbit/s.
The minimum g711G726 rate cannot exceed the maximum g711G726 rate

RESPONSE In the modemFaxRates attribute:...

Description — This response is used when the user attempts to set the *modemFaxRates* attribute to an illegal value. The only rate allowed for ***g711Only*** encoding is 64 kbit/s. The minimum ***g711G726*** rate must be 32, 24 or 16 kbit/s. The maximum ***g711G726*** rate must be 64, 32, 24 or 16 kbit/s.The minimum ***g711G726*** rate cannot be greater than the max ***g711G726*** rate. The minimum ***relay*** rate must be 0.0 kbit/s. The maximum ***relay*** rate must be 14.4, 12.0, 9.6, 7.2, 4.8 or 2.4 kbit/s.

ATTRIBUTE errorType

Description — See the description in the response.

Values —
g711Only rates must be 64.0 kbit/s
The minimum g711G726 rate must be 16.0, 24.0 or 32.0 kbit/s
The maximum g711G726 rate must be 16.0, 24.0, 32.0 or 64.0 kbit/s
The minimum g711G726 rate cannot exceed the maximum g711G726 rate
The minimum relay rate must be 0.0 kbit/s
The maximum relay rate must be 14.4, 12.0, 9.6, 7.2, 4.8 or 2.4 kbit/s
The minimum relay rate cannot exceed the maximum relay rate

RESPONSE Error: Command not executed.Component ... does not exist.

Description — The *Start* command produces this response when attempted for a *ServiceTrace* component which has not been provisioned or its receiver specified by *rcvr* attribute has not been provisioned.

System action: The *Start* command has no effect.

Operator action: Check existence of the specified *ServiceTrace* component or *Rcvr* component, enter command again.

ATTRIBUTE componentMissing

Description — This attribute is the component name which has not been provisioned.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The trace call to the receiver has failed with ..., ...

Description — The *Start* command produces this response when the trace call fails to connect to the receiver.

System action: The service trace session stopped.

Operator action: Check the failure reason according to the values of *clearCause* and *diagnostic*, correct it, enter command again.

ATTRIBUTE clearCause (cause)

Description — This attribute is the trace VC clear cause.

Values — Hex (H.0..H.ff)

ATTRIBUTE diagnostic (diag)

Description — This attribute is the trace VC diagnostic code.

Values — String (1..8, Hex)

RESPONSE You cannot set both operational and provisioned attributes at the same time.

Description — This error response is generated when the operator attempts to set operational and provisioned attributes at the same time, eg,
set component oper 5, prov 7
This is an error because operational attributes only exist in the current view, while provisioned attributes can only be set in the edit view. This would cause two views to be accessed simultaneously.

System action: the entire *Set* command is ignored.
Operator action: issue at least two separate *Set* commands, one for the provisioned attributes, and another for the operational ones.

ATTRIBUTE operationalAttribute

Description — This attribute identifies the operational attribute that conflicts with the provisioned one.

Values — Decimal (0..65535)

ATTRIBUTE provisionedAttribute

Description — This attribute identifies the provisioned attribute that conflicts with the operational one.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:This application is incompatible with the value specified by attribute ... of the component ....

Description — This error message appears in response to a *Check Prov* command if the value specified in the identified attribute is incompatible with an application.

System action: The edit view cannot be activated.
Operator action: Choose a different value for the indicated attribute.

ATTRIBUTE valueId

Description — This attribute contains the numeric ID of the attribute whose specified value is incompatible with the application.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE valueComponentName

Description — This attribute contains the name of the component containing the attribute whose specified value is incompatible with the application.

Values — The name of the component

RESPONSE The ... is congested.

Description — This response is returned when either the CP or the first hop of the path to reach the destination is congested.

ATTRIBUTE congestedComponent

Description — This attribute indicates whether the CP or the path is congested.

Values — CP
path

RESPONSE ... packets were sent, ... packets were returned.

Description — This response indicates how many query packets were sent and how many of them were returned. It is used in response to the *-all* ping option. The paths found and their usage follow the response.

ATTRIBUTE numAllPktSent

Description — This attribute indicates how many query packets were sent.

Values — Decimal (1..16)

ATTRIBUTE numAllPktReceived

Description — This attribute indicates how many query packets were returned.

Values — Decimal (1..16)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Path ... used ... time(s):

Description — This response contains the header line for a particular path used by one or more ping query packets. It is used in response to the *-all* ping option. The path mentioned in the header line follows the response.

ATTRIBUTE pathId

Description — This attribute indicates the identifier of the path which follows.

Values — Decimal (1..16)

ATTRIBUTE pathCount

Description — This attribute indicates how many times the path which follows was used.

Values — Decimal (1..16)

RESPONSE Destination ..., ... VC path taken is:

Description — This response indicates the destination RID and MID of the Frame Relay DLCI connection. It is used for the *ping* command with no option. The path taken by the VC of the Frame Relay DLCI follows the response.

ATTRIBUTE vcsDestRid

Description — This attribute indicates the destination RID of Frame Relay DLCI connection.

Values — Decimal (1..127)

ATTRIBUTE vcsDestMid

Description — This attribute indicates the destination MID of Frame Relay DLCI connection.

Values — Decimal (1..2046)

RESPONSE and another ... component(s).

Description — This is the normal response to an *Add* command. It displays the number of extra subcomponents which have been added if there were more than 6 in total.

ATTRIBUTE count

Description — This attribute indicates the number of added components that have not been displayed.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The following applications have reserved IP addresses. (At most 20 applications are shown.)

Description — A *Check Prov* command generates this response if one or more linked components have a reserved IP address. A reserved IP address is one of:
1) The interface address defined at the *ProtocolPort*.
2) The subnet address - the host portion of the address is all zeros.
3) The broadcast address - the host portion of the address is all ones.

ATTRIBUTE illegalFriReserved

Description — This attribute contains a list of the offending Frame Relay interfaces.

List of — The name of the component

List Size — 20

RESPONSE Selected reference is not capable of providing a reference.

Description — The Set command generates this response whenever an operator adds an invalid component name to the list.

ATTRIBUTE erroredReferenceEntry

Description — This parameter contains a copy of the offending value.

Values — The name of the component

RESPONSE A ... command is already in progress.

Description — The *Tidy* command produces this response if another *Tidy Prov*, *Tidy Software*, or *Remove Software Av* command is in progress.

System action: the *Tidy* command is not executed.
Operator action: re-enter the command after the running one has finished.

ATTRIBUTE tidyAction

Description — This attribute indicates the actual *Tidy* or *Remove* command that is in progress.

Values — tidy prov
tidy software
remove software

RESPONSE

Description — This response is used to display collected round trip delay information. It contains the sent and returned packets data size in bytes, the emission priority order of the packet, and the average, minimum and maximum round trip delays to the destination in milliseconds. Five samples are sent to the destination. Results are calculated based on returned packets.

ATTRIBUTE averageRtd

Description — This attribute indicates the average round trip delay to the destination.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..20000)
Units	msec

ATTRIBUTE minimumRtd

Description	This attribute indicates the minimum round trip delay to the destination.
Values	Decimal (0..20000)
Units	msec

ATTRIBUTE maximumRtd

Description	This attribute indicates the maximum round trip delay to the destination.
Values	Decimal (0..20000)
Units	msec

ATTRIBUTE sentPktDataSize

Description	This attribute indicates the round trip delay query packet data size, excluding the Nortel Networks proprietary common header and the subnet header, sent to the destination.
Values	Decimal (0..4095)
Units	bytes

ATTRIBUTE returnedPktDataSize

Description	This attribute indicates the round trip delay acknowledge packet data size, excluding the Nortel Networks proprietary common header and the subnet header, received from the destination.
Values	Decimal (0..4095)
Units	bytes

ATTRIBUTE pktEmissionPriority

Description	This attribute indicates the emission priority order used for the round trip delay query.
Values	normal high interrupting

ATTRIBUTE numRtdPktSent

Description	This attribute indicates how many round trip delay query packets were sent to the destination.
Values	Decimal (0..5)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE numRtdPktReceived

Description	This attribute indicates how many round trip delay query packets were returned.
Values	Decimal (0..5)

RESPONSE Outgoing Telnet access ....

Description	The *Telnet* command produces this error when the attempt to set up a Telnet client connection fails for some reason. The *reason* attribute contains more information as to why it failed.

ATTRIBUTE reason

Description	This attribute contains text which should help the user to know why the *Telnet* command failed.
Values	String (0..255, ASCII)

RESPONSE Outgoing Telnet access ....

Description	The *Telnet* command produces this error when the attempt to set up a Telnet client connection fails for some reason. The *reason* attribute contains more information as to why it failed.

ATTRIBUTE reason

Description	This attribute contains text which should help the user to know why the *Telnet* command failed.
Values	String (0..255, ASCII)

RESPONSE Invalid Data Length for Facility

Description	Facility Classes A,B and C require one, two or three octets of Data, respectively. Facility code D has the length of data encoded in the first byte. The code is determined from the upper two bits of the Facility Code.

ATTRIBUTE escapeFaxAttributeCode

Description	This will just echo back the Facility that was input.
Values	String (1..128, Hex)
Replication	Hex (H.0..H.ff)

RESPONSE Error: Component ... does not exist.

Description	A *Check Prov* command produces this response when the index of an *IpxSapApplyEntry* does not specify an existing *ProtocolPort*.

ATTRIBUTE missingPpName

Description	This attribute contains the name of the *ProtocolPort* which does not exist.
Values	The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: There is no IpxPort component under ....

Description — A *Check Prov* command produces this response when the index of an *IpxSapApplyEntry* specifies a *ProtocolPort* which does not have an *IpxPort* subcomponent.

ATTRIBUTE missingPpName

Description — This attribute contains the name of the *ProtocolPort* which does not have an *IpxPort* subcomponent.

Values — The name of the component

RESPONSE Error:The value of ripNeighbor, ..., is not a valid IP address for a RIP neighbor.

Description — A *Check Prov* command produces this response when the attribute *ripNeighbor* is set to an address that does not belong to any Class A, B or C network.

ATTRIBUTE invalidRipNbrAddress

Description — This attribute contains value of the invalid *ripNeighbor* address.

Values — IP address

RESPONSE Error:Duplicate sourceAddress found. The sourceAddress must be unique for all StaticEndPoint and MultipointStaticEndPoint components within the same sharedDomainVirtualRouter. Please verify against

Description — A *Check Prov* command produces this response when it detects that at least two *StaticEndPoint* or *MultipointStaticEndPoint* components have the identical *sourceAddress* and *sharedDomainVirtualRouter* attributes. The *sourceAddress* of *StaticEndPoint* or *MultipointStaticEndPoint* components within the same *sharedDomainVirtualRouter* must be unique.

System action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Change the value of *sourceAddress* or *sharedDomainVirtualRouter* attributes of the related *StaticEndPoint* or *MultipointStaticEndPoint* components to ensure that, the *sourceAddress* of *StaticEndPoint* or *MultipointStaticEndPoint* components within the same *sharedDomainVirtualRouter* is unique.

ATTRIBUTE otherDupTunnelEndpt

Description — This attribute indicates the other *StaticEndPoints* or *MultipointStaticEndPoints* component which has the identical *sourceAddress* within same *sharedDomainVirtualRouter*.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE File ... compile failed:.....

Description — This returns an informational error string describing why the filter file failed to compile.

ATTRIBUTE fileName

Description — This attribute holds the fully qualified name of the file we're trying to compile.

Values — String (1..255, ASCII)

ATTRIBUTE compilerErrorMsg

Description — This attribute contains a single string holding the compiler error which caused the compile to fail.

Values — String (1..80, ASCII)

RESPONSE Error: The bfrIndex value ... is already being used by other Bfr component. The suggested value is ....

Description — The *Check* command produces this response if two or more *Bfr* components on the same *Lp* have the same *bfrIndex* value.
To correct this problem, change the *bfrIndex* to the suggested value.

ATTRIBUTE currentValue

Description — This attribute specifies the current value of the attribute *bfrIndex*.

Values — Decimal (0..511)

ATTRIBUTE suggestedValue

Description — This attribute specifies the suggested value of the attribute *bfrIndex*.

Values — Decimal (0..511)

RESPONSE Error: ... is an invalid value for attribute ... .

Description — This group contains responses for invalid string values entered by the user. This response will be displayed when the user tries to set to value for a network number / node number string.

ATTRIBUTE invalidString

Description — This attribute contains the actual string value entered by the user.

Values — String (1..18, ASCII)

ATTRIBUTE invalidAttribute

Description — This attribute contains the attribute name of the attribute containing the error.

Values — Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: Attribute ... cannot be ... if attribute ... is ... .

Description — This response group informs the user if the *networkNumberProv* and the *defaultType* are incorrectly provisioned. This response will be invoked on a set command.

ATTRIBUTE netNoName

Description — This attribute contains the name of the *networkNumberProv* attribute to be displayed at response time

Values — Decimal (1..65535)

ATTRIBUTE netNoValue

Description — This attribute contains the value of the *networkNumberProv* attribute to be displayed at response time.

Values — String (0..4, Dashed Hex)

ATTRIBUTE defTypeName

Description — This attribute contains the name of the *defaultType* attribute to be displayed at response time.

Values — Decimal (1..65535)

ATTRIBUTE defTypeValue

Description — This attribute contains the value of the *defaultType* attribute to be displayed at response time.

Values —
other
broadcast
ppp
wanRip
unnumberedRip

RESPONSE Error : ... cannot be ... for the media provisioned .

Description — This response group informs the user if the if the *defaultType* is incorrectly set based on the encapsulation on the *ipxPort*. This response will be invoked while setting the defaultType value.

ATTRIBUTE defTypeName

Description — This attribute contains the name of the *defaultType* attribute to be displayed at response time.

Values — Decimal (1..65535)

ATTRIBUTE defTypeValue

Description — This attribute contains the value of the *defaultType* attribute to be displayed at response time.

Values —
other
broadcast

ppp
wanRip
unnumberedRip

RESPONSE Host ... responded in ... milliSecs.

Description — This response contains the node address of the host which responded back.

ATTRIBUTE node

Description — This attribute node address of the host which actually responded to the ping.

Values — String (1..6, Dashed Hex)

ATTRIBUTE time

Description — This attribute describes the time in which the node responds to the ping request.

Values — Decimal (1..2000)

RESPONSE Error : ... encapsulation is invalid for provisioned media type.

Description — This response group informs the user if the IpxPort instance Id is incorrectly set for a given media application. This response will be invoked when a Ipx Port is added under the protocol port.

ATTRIBUTE encapVal

Description — This attribute contains the instance (encapsulation) of the *ipxPort* attribute to be displayed at response time.

Values —
link
ethernet
novell
sap
snap
vns
tunnel

RESPONSE Error : No Net Sentry component installed under ... .

Description — This response group checks for the presence or absence of the *netSentry* component under the *vr*. This response will be invoked when the user tries to add a NetSentry component under Ipx or A NetSentry Port component under an IpxPort.

ATTRIBUTE vrName

Description — This attribute contains the name of the *vr* component to be displayed at response time.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: ... cannot exist without ... .

Description — This response group informs the user that an ipx port cannot be provisioned without ipx being provisioned. This response will be invoked while adding an Ipx port under the protocol port.

ATTRIBUTE ipxPortCompName

Description — This attribute contains the name of the *IpxPort* instance to be displayed at response time

Values — The name of the component

ATTRIBUTE ipxCompName

Description — This attribute contains the value of the *Ipx* instance to be displayed at response time.

Values — The name of the component

RESPONSE Error: IPX component ... does not exist.

Description — This group contains responses for invalid protocol port names or SAP Filter ids by the user. This response will be displayed when the user tries add a *IpxSapApplyEntry* filter with a protocol port name or a SAP filter id which has not been provisioned.

ATTRIBUTE invalidPort

Description — This attribute contains the protocol port component or SAP Filter Component which must be provisioned.

Values — The name of the component

RESPONSE Error: ... is an invalid value for attribute ... .

Description — This group contains a response which will be displayed when the user tries to set a value of 0 or ff-ff-ff-ff for the internal network number.

ATTRIBUTE invalidValue

Description — This attribute contains the actual dashed hex value for the internal network number entered by the user.

Values — String (1..4, Dashed Hex)

ATTRIBUTE invalidAttribute

Description — This attribute contains the internal network number attribute which is in error.

Values — Decimal (1..65535)

RESPONSE Error: ... ... is assigned to ... .

Description — This response group informs the user if the *networkNumberProv* has already been assigned to an existing *ipxPort*. This check would be invoked on a add command.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE netNoName

Description — This attribute contains the name of the *networkNumberProv* attribute to be displayed at response time

Values — Decimal (1..65535)

ATTRIBUTE netNoValue

Description — This attribute contains the value of the *networkNumberProv* attribute to be displayed at response time.

Values — String (0..4, Dashed Hex)

ATTRIBUTE ipxPortComp

Description — This attribute contains the *ipxPort* Component to be displayed at response time.

Values — The name of the component

RESPONSE Error: At least one of the attributes ..., ..., ... or ... should be specified.

Description — A *Check* command will produce this response if the user does not specify the *type*, *name*, *networkNumber* or the *node* for a given SAP filter instance.

ATTRIBUTE invalidType

Description — This attribute contains the attribute name of the attribute *type*.

Values — Decimal (1..65535)

ATTRIBUTE invalidName

Description — This attribute contains the attribute name of the attribute *name*.

Values — Decimal (1..65535)

ATTRIBUTE invalidNetNo

Description — This attribute contains the attribute name of the attribute *networkNumber*.

Values — Decimal (1..65535)

ATTRIBUTE invalidNode

Description — This attribute contains the attribute name of the attribute *node*.

Values — Decimal (1..65535)

RESPONSE Error: ... encapType must be llcEncap or ipxVcEncap.

Description — A *check prov* command produces this error message when the attribute *encapType* under the linked *AtmMpe* component is neither ***llcEncap*** nor ***ipxVcEncap***.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE atmMpeName

Description — This attribute contains the name of the *AtmMpe* component.

Values — The name of the component

RESPONSE ERROR: The attribute ... is not a valid Token Ring group address.

Description

The first two bytes of a valid group address, in canonical form, must be 03-00, and the least significant bit of the next byte must be 1.

ATTRIBUTE groupMacAdrId

Description

This attribute contains the numeric ID of the MAC address attribute involved in the error.

Values — Decimal (1..65535)

RESPONSE ERROR: The attribute ... must set its U/L bit to 1.

Description

A provisioned MAC address must have its locally administrative bit set to 1. This response is generated as a result of a semantic failure.

ATTRIBUTE localAdminMacAdrId

Description

This attribute contains the numeric ID of the MAC address attribute involved in the error.

Values — Decimal (1..65535)

RESPONSE ERROR: The attribute ... can not be provisioned as broadcast address (FF-FF-FF-FF-FF-FF).

Description

The broadcast MAC address is not a valid value for this attribute. This response is generated as a result of a semantic failure.

ATTRIBUTE bcastMacAdrId

Description

This attribute contains the numeric ID of the MAC address attribute involved in the error.

Values — Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: Bridge priority provisioned for this spanning tree is out of range for the following operational protocol specification - ....

Description

This response group is used to encode an error message that will be displayed to the user when the bridge priority semantic check fails. The bridge priority semantic check verifies if the provisioned bridge priority is valid according to the provisioned protocol specification. Priorities supplied by the user must meet the following conditions:
1) 0-255 for protocol specification DEC and
2) 0-65535 for protocol specification IEEE.
System Action: The provisioning session will fail
Operator Action: Provision the correct value for the attribute *priority* as per the rules mentioned above based upon the *protocolSpec* provisioned for the indicated spanning tree instance.

ATTRIBUTE opStp

Description

This attribute will carry the operational value of the protocol specification assigned to the spanning tree instance.

Values

both
dec
ieee8021

RESPONSE Error: Number of ... bridge ports provisioned,... exceeds allowed maximum of ....

Description

This response group is provided to encode the response to be set back to the user in case of a semantic check failure. This semantic check checks if the number of bridge ports provisioned under the same VirtualRouter does not exceed the allowed maximum of 255.
System Action: The provisioning session will fail
Operator Action: Reduce the number of bridge ports provisioned to be under the allowed maximum of 255.

ATTRIBUTE brPortType

Description

This attribute contains the bridge type which was exceeded.

Values

String (1..9, ASCII)

ATTRIBUTE numBrpsProvd

Description

This attribute will actually carry the number of bridge ports provisioned.

Values

Decimal (1..65535)

ATTRIBUTE numBrpsAllowed

Description

This attribute will actually carry the allowed maximum number of bridge ports.

Values

Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The following bridge port was provisioned when no port numbers were available: ... This port must be deleted before this session can be activated.

Description — This response group is provided to encode the response to be sent back to the user in case a bridge port was provisioned after the maximum allowed bridge ports were allocated. When this occurs, a port number cannot be assigned to the bridge port and the port is considered to be invalid.
System Action: The provisioning session will fail
Operator Action: Delete the specified bridge port. If the maximum number of bridge ports is not provisioned, it can be re-added into the system.

ATTRIBUTE invBrCompName

Description — This attribute will actually carry the component name of the invalid bridge port.

Values — The name of the component

RESPONSE Error: ... must be the same for all source route bridge ports in the same domain.

Description — The error message is returned when the user has provisioned an invalid *internalLanId, or bridgeNum* value.
System Action: The provisioning session will fail
Operator Action: Correct the *internalLanId* or bridgeNum value, then initiate a *check prov* or an *act prov* command.

ATTRIBUTE attributeName

Description — This attribute will carry the name of the *bridgeNum* or *internalLanId* attribute.

Values — Decimal (0..65535)

RESPONSE Error: Invalid LanId value specfied. ... must be in range (1 - 4095).

Description — The error message is returned when the user has provisioned an invalid *lanId* or *internalLanId* value.
System Action: The provisioning session will fail
Operator Action: Correct the *lanId* or *internalLanId* value, then initiate a *check prov* or an *act prov* command.

ATTRIBUTE attributeName

Description — This attribute will carry the name of the *lanid* or *internalLanId* attribute.

Values — Decimal (0..65535)

RESPONSE ...

Description — Display LanTest specific information, this may be in the form of multiple responses.

ATTRIBUTE testData

Description — This attribute contains the test information requested.

Copyright © 2006, Nortel Nortel Confidential

Values String (0..255, ASCII)

RESPONSE ERROR: The attribute ... is not a valid Token Ring functional address.

Description
The provisioned functional address must contain the bit mask of 03-00-fe-8f-84-01.

ATTRIBUTE funcAdrId

Description
This attribute contains the numeric ID of the functional address attribute involved in the error.

Values Decimal (1..65535)

RESPONSE Warning: (00-00-00-00-00-00) is provisioned for attribute ....

Description
A MAC address consisting of all zeros is not a valid value for this attribute. This response is generated as a result of a semantic failure.

ATTRIBUTE zeroMacAdrId

Description
This attribute contains the numeric ID of the MAC address attribute involved in the error.

Values Decimal (1..65535)

RESPONSE Error: Attribute ... has an illegal value of ... for this bridge port and medium combination.

Description
A *check prov* command produces this response if the attribute *preserveDomain* cannot have the value ***on*** for the given bridge port and medium combination.
The Ethernet media cannot handle a value of ***on*** for the attribute *preserveDomain*.
System Action: A error message is generated and provisioning session fails.
Operator Action: Set the value of *preserveDomain* attribute to ***off***.

ATTRIBUTE pd

Description This attribute carries the name of the *preserveDomain* attribute.

Values Decimal (1..65535)

ATTRIBUTE pdVall

Description This attribute will carries the value of the *preserveDomain* attribute.

Values
off
on

RESPONSE Error: Attribute ... has an illegal value of ... for this bridge port and medium combination.

Description	This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the attribute *serviceClass* can have the value ***ordered*** for the given bridge port and medium combination. This response is not supported as the attribute *serviceClass* was obsoleted. **System Action**: A error message is generated and provisioning session fails. **Operator Action**: Set the value of *serviceClass* attribute to ***notOrdered***. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE svc

Description	This attribute will actually carry the name of the *serviceClass* attribute.
Values	Decimal (1..65535)

ATTRIBUTE svcVal

Description	This attribute will actually carry the value of the *serviceClass* attribute.
Values	ordered notOrdered

RESPONSE No name

Description	This is an EGP Neighbor Loss Trap derived from RFC 1450, RFC 1213, and RFC 1157. An egpNeighborLoss trap signifies that an *EgpNeighbor* has been marked down and the EGP peer relationship no longer obtains.

ATTRIBUTE egpNeighAddrOid

Description	This is the object identifier of the EgpNeighAddr variable binding in the trap The object identifier is “root.iso.org.dod.internet.mgmt.mib-2.egp.egpNeighTable.egpNeighEntry.egpNeighAddr”
Values	Integer Sequence

ATTRIBUTE egpNeighAddrValue

Description	This is the value of the egpNeighAddr that has been lost.
Values	IP address

RESPONSE IpPing: Rx reply of ... bytes from ...: icmpSeq=..., time=...ms

Description	This response indicates that the ping to the specified IP address was successful.

ATTRIBUTE bytes

Description	This attribute indicates the number of bytes contained in the IP echo reply packet.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (30..20000)

ATTRIBUTE ipAddr

Description	This attribute indicates the IP address of the remote host.
Values	IP address

ATTRIBUTE sequence

Description	This attribute indicates the sequence number contained in the echo reply.
Values	Decimal (0..4294967295)

ATTRIBUTE time

Description	This attribute indicates the time the echo request/reply takes to make a round trip.
Values	Decimal (0..65535)

RESPONSE Destination ... is not responding after ... attempt(s).

Description	This response indicates that the ping to the specified IP address was unsuccessful.

ATTRIBUTE ipAddr

Description	This attribute indicates the *ipAddr* of the remote host.
Values	IP address

ATTRIBUTE attempts

Description	This attribute indicates the number of attempts made before the *Ping* command declared that the destination was not responding.
Values	Decimal (1..4095)

RESPONSE IP Trace Route for ...:Path taken:

Description	This response contains the header line used when the *-traceRoute* ping option was specified. It is used when the trace was successful. The path taken follows this response.

ATTRIBUTE ipAddr

Description	This attribute indicates the IP address of the remote host.
Values	IP address

RESPONSE No name

Description	This is the DLCI Status Change Trap derived from the draft Frame Relay DTE MIB (draft-ietf-iplpdn-frmib-dte-02.txt). This trap event is generated when a virtual circuit changes state. It has either been created or invalidated, or has toggled between the active and inactive states. The object identifier for this trap is “root.iso.org.dod.internet.mgmt.mib-2.transmission.frameRelay.frameRelayTraps.frDLCIStatusChange”

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE frCircuitStateObjectId

Description — This is the object identifier of the frCircuitState variable binding in the trap. The object identifier is “root.iso.org.dod.internet.mgmt.mib-2.transmission.frameRelay.frCircuitTable.frCircuitEntry.frCircuitState” plus an instance specific portion.

Values — Integer Sequence

ATTRIBUTE frCircuitStateValue

Description — This is the value of the frCircuitState variable binding in the trap. The value of frCircuitState indicates whether the particular virtual circuit is operational. The object identifier of this variable binding is “root.iso.org.dod.internet.mgmt.mib-2.transmission.frameRelay.frCircuitTable.frCircuitEntry.frCircuitState” plus an instance specific portion.

Values — invalid
active
inactive

RESPONSE Error: Number of ... stp instances exceeds allowedmaximum of 16.

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the total number of stp instances does not exceed 16.
This response will contain a message that corresponds to the finding that the number of stp instances provisioned exceeds 16.
System Action: The provisioning session will fail
Operator Action: Verify that the number of instances of the component *SpanningTreeProtocol* provisioned are less than 16. This includes the *SpanningTreeProtocol* component with the value of its attribute *stpMode* set to ***backbone***. If there are more instances of the component *SpanningTreeProtocol* provisioned than allowed then delete the unwanted instances of the same. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE mode

Description — This attribute will actually carry the mode of stp found in violation.

Values — tb
sr

RESPONSE Error: Interdependency criterion between ..., and ... not satisfied.

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the following criteria are satisfied:
bridgeMaxAge >= 2 * *bridgeHelloTime* + 1.0 seconds.
System Action: The provisioning session will fail
Operator Action: Check the values of the indicated attributes and ensure that the criterion mentioned below is satisfied. After this type in the *check prov* or the *act prov* command.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE bma

Description — This attribute will actually carry the name of one of the attributes that is used to verify the criteria. The attribute's name is *bridgeMaxAge.*

Values — Decimal (1..65535)

ATTRIBUTE bht

Description — This attribute will actually carry the name of one of the attributes that is used to verify the criteria. The attribute's name is *bridgeHelloTime*.

Values — Decimal (1..65535)

RESPONSE Error: Interdependency criterion between ... and ... is not satisfied.

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the following criteria are satisfied:
2 *(*bridgeForwardDelay* -1.0sconds) >= *bridgeMaxAge***.**
System Action: The provisioning session will fail
Operator Action: Check the values of the indicated attributes and ensure that the criterion mentioned below is satisfied**.** After this type in the *check prov* or the *act prov* command.

ATTRIBUTE bma

Description — This attribute will actually carry the name of one of the attributes that is used to verify the criteria. The attribute's name is *bridgeMaxAge.*

Values — Decimal (1..65535)

ATTRIBUTE bfd

Description — This attribute will actually carry the name of one of the attributes that is used to verify the criteria.The attribute's name is *bridgeForwardDelay.*

Values — Decimal (1..65535)

RESPONSE Error: The following component ..... does not exist.

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the bridge port mentioned as the value of the *receivePort* attribute has already been provisioned.
This response contains a message that corresponds to the finding that the bridge port used as *receivePort* has not been provisioned yet. A bridge port must be provisioned in the same provisioning session as the *StaticTableEntry* component.
System Action: The provisioning session will fail
Operator Action: Provision the indicated bridge port or change the value of the attribute *receivePort* so that it does not refer to a bridge port that has not been provisioned yet. Also ensure that the provisioned bridge port name is a valid bridge port name. After this type in the *check prov* or the *act prov* command.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE ppName

Description — This attribute will actually carry the component name of the protocol port that was used as a part of the value of the *receivePort* attribute. Protocol port(s) and bridge port(s) that are going to be used in the attribute *receivePort* must be provisioned before they are referred to.

Values — The name of the component

ATTRIBUTE brPortName

Description — This attribute will actually carry the name of the bridge port that was used as the value of the *receivePort* attribute but was not found to be provisioned yet. This could also be due to the fact that an invalid bridge port name was provisioned. Bridge port(s) that are going to be used as *receivePort* must be provisioned before they are referred to.

Values — String (1..29, ASCII)

RESPONSE Error: The following bridge port, part of attribute ..., does not exist.- ... .

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if all the bridge ports mentioned in the *allowedToGoTo* attribute are already provisioned.
This attribute contains a message that corresponds to the finding that some bridge port(s) specified in the attribute *allowedToGoTo* has / have not been provisioned yet. All bridge ports mentioned in this attribute are expected to be provisioned before they are referred to.
System Action: The provisioning session will fail
Operator Action: Provision the indicated bridge ports or change the value of the attribute *allowedToGoTo* so that it does not refer to bridge port(s) that has/have not been provisioned yet. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE atgt

Description — This attribute will actually carry the name of the attribute *allowedToGoTo* under the component *StaticTableEntry*.

Values — Decimal (1..65535)

ATTRIBUTE brPortName

Description — This attribute will actually carry the component name of the bridge ports that were mentioned in the attribute *allowedToGoTo* under the component *StaticTableEntry* and was not found to be provisioned yet.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: No Net Sentry component installed under ....

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check, checks for the following:
1. If the global component *NetSentry* is provisioned yet.
This attribute houses a message that corresponds to the finding that the component *Vr/<string> Bridge NetSentry* was provisioned before the *Vr/<string> NetSentry* component.
System Action: The provisioning session will fail.
Operator Action: Provision the global *Vr/<string> NetSentry* component or delete the component *Vr/<string> Bridge NetSentry.* After this type in the *check prov* or the *act prov* command.

ATTRIBUTE noGlobalNsComp

Description — This attribute will actually carry the component name of the *Vr/<string>* component to be displayed at response time.

Values — The name of the component

RESPONSE Error: Following domain number must be provisioned before being referred to- ....

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check, checks for the following:
If the referenced domain number is actually provisioned.
This attribute houses a message that corresponds to the finding that the domain number referred to in the component *ApplyTableEntry* has not been provisioned yet.
System Action: The provisioning session will fail
Operator Action: Provision the indicated domain number, setting it as the value of the attribute *domainNum* of a bridge port or change the value of the attribute *domainNum* in the *NsAte* component so that it refers to a domain that has already been provisioned. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE domNum

Description — This attribute will actually carry the domain number which was expected to be provisioned but was not found to be so.

Values — Decimal (0..4294967293)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: This bridge port cannot exist without the following component- ....

Description

This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the *TransparentBridge* component is provisioned when a bridge port exists.
This response contains a message that corresponds to the finding that one of the above mentioned components, required for the operation of this bridge port, has not been provisioned yet.
System Action: The provisioning session will fail
Operator Action: Provision the indicated component. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE compName

Description

This attribute will actually carry the component name that is required for the operation of the bridge port.

Values

The name of the component

RESPONSE Error: It is illegal to provision this bridge port and the following bridge port under the same protocol port- ....

Description

This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the combination of bridge ports provisioned under the protocol port is legal, given the bridge port types and the associated medium. This response is obsoleted as only the transparent bridge port is supported.
System Action: The provisioning session will fail
Operator Action: Delete one of the bridge ports provisioned under the indicated protocol port. This bridge port can be provisioned under a different protocol port as per the rules mentioned below.

ATTRIBUTE brpName

Description

This attribute carries the component name of the bridge port which is found to be an illegal combination when provisioned together with the bridge port being checked, under the same protocol port.

Values

The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: Either A) the domain number assigned to this bridge port is wrong, since it is being used as an instanceidentifier of the backbone stp- ...; or B) the preserveDomainattribute of this bridge port is wrong and it should be set ON.

Description

A *check prov* command produces this response if the domain number provisioned for the access bridge port is the same as the instance identifier of the man *stp*.
This response contains a message which corresponds to the finding that the domain number assigned to the access bridge port is the same as the instance identifier of the backbone *stp* instance. A *stp* component's instance identifier usually represents the domain it is associated with, except when the attribute *stpMode* in the *stp* component has a value of ***backbone***. This instance cannot be used as a domain number for a access bridge port.
System Action: The provisioning session will fail.
Operator Action: Verify that the domain number assigned to any access bridge port is not equal to the instance identifier of the *SpanningTreeProtocol* component whose attribute *stpMode* is set to ***backbone***. If such a condition is found, change the domain number assigned to concerned bridge port(s).

ATTRIBUTE domNum

Description

This attribute will carries the domain number found in violation.

Values

Decimal (0..4294967295)

RESPONSE Error: Bridge port priority provisioned out of range for the following operational stp type- ....

Description

This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the bridge port priority range is correct as according to the operational stp type.
This response contains a message that corresponds to the finding that the bridge port priority is found to be other than the following range for the corresponding stp type:
1) 0-255 for stp type DEC and
2) 0-65535 for stp type IEEE.
System Action: The provisioning session will fail
Operator Action: Provision the correct value for the attribute *portPriority* as per the rules mentioned above. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE opStp

Description

This attribute will carry the operational value of the stp type the bridge port will participate in.

Values

dec
ieee8021

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: There should exist at least one instance of the following stp component for this bridge port to be operational- ....

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if there exists at least one instance of the *SpanningTreeProtocol* component provisioned while there exist bridge ports provisioned.
This response contains a message that corresponds to the finding that there does not exist a single instance of the *SpanningTreeProtocol* component provisioned while there exist bridge ports provisioned. In other words it is not allowed to provision bridge ports that are out of stp's reach.
System Action: The provisioning session will fail
Operator Action: Provision an instance of the component *SpanningTreeProtocol*. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE stpComp

Description — This attribute will carry the name of the stp component needed for the operation of the bridge port.

Values — The name of the component

RESPONSE Error: It is illegal for the following bridge port ... to be the value of the attribute receivePort, and part of attribute ... .

Description — This response group is provided to encode the response to be sent back to the user in case of a semantic check failure. This semantic check checks if the bridge port mentioned in the *receivePort* attribute appears in the *allowedToGoTo* attribute.
System Action: The provisioning session will fail
Operator Action: Provision the value of the attribute *allowedToGoTo* so that the bridge port provisioned as the *receivePort* does not appear in it. After this type in the *check prov* or the *act prov* command.

ATTRIBUTE brPortName

Description — This attribute will actually carry the name of the bridge port that was used as the value of the *receivePort* attribute but was found to be a part of the attribute *allowedToGoTo*. Bridge port(s) that are going to be used as *receivePort* cannot appear in the *allowedtoGoTo* attribute.

Values — String (1..29, ASCII)

ATTRIBUTE atgt

Description — This attribute will actually carry the name of the attribute *allowedToGoTo* under the component *StaticTableEntry*.

Values — Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE ERROR: The attribute ... can not be provisioned as a multicasting address.

Description

A multicasting address is not a valid value for this attribute. This response is generated as a result of a semantic failure.

ATTRIBUTE mcastMacAdrId

Description

This attribute contains the numeric ID of the MAC address attribute involved in the error.

Values Decimal (1..65535)

RESPONSE WARNING: The attribute ... is provisioned.

Description

This Warning message is generated when a MAC address is provisioned.

ATTRIBUTE provMacAdrScId

Description

This attribute contains the numeric ID of the provisioned MAC address.

Values Decimal (1..65535)

RESPONSE Error:The ... feature must be provisioned on ....

Description The *Start* command produces this response when attempted against a service trace receiver without the corresponding trace receiver feature having been provisioned.

System action: The *Start* command has no effect.

Operator action: Add the required feature to the list of features specified by the *featureList* for this LP, issues *Start* command again.

ATTRIBUTE rcvrFeature

Description This attribute is the trace receiver feature which must be provisioned.

Values String (0..20, ASCII)

ATTRIBUTE lp

Description This attribute is the component name of the LP which has requested a trace.

Values The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Cannot Unlock - attribute ... is not set to up.

Description — This error response is generated when an operator attempts to *Unlock* a component whose currently provisioned administrative status is ***down*** or ***testing***.

System action: the *Unlock* command is ignored.
Operator action: if desired, change the value provisioned for the indicated attribute to ***up***, then retry the original *Unlock* command. Note that doing this will cause the component to attempt to go into service whenever a CP reload occurs.

ATTRIBUTE attribute

Description — This attribute identifies the provisioned administrative status attribute.

Values — Decimal (0..65535)

RESPONSE Destination reachable. Measured round trip delay ....

Description — This response contains the measured round trip delay taken to reach the destination node.

ATTRIBUTE roundTripDelay

Description — This attribute contains the round trip delay encountered to reach the destination node.

Values — Decimal (0..10000)

RESPONSE .....

Description — This response contains the *nodeName and nodeId* of an intermediate node in the network that was visited as the ping query packet travelled to its destination. The order of nodes listed (through multiple occurances of this response) is the order the nodes were traversed.

ATTRIBUTE nodeName

Description — This attribute contains the *nodeName* of each intermediate node that was visited as the ping query packet travelled to its destination.

Values — String (1..12, ASCII)

ATTRIBUTE nodeId

Description — This attribute contains the *nodeId* of each intermediate node that was visited as the ping query packet travelled to its destination.

Values — Decimal (1..4095)

RESPONSE Path ... used ... times:

Description — This response contains the header line for a particular path used by one or more ping query packets. It is used in response to the *-all* ping option. The path taken follows this response.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE pathInstance

Description	This attribute contains the instance number of the path which follows.
Values	Decimal (1..16)

ATTRIBUTE pathCount

Description	This attribute contains the count of the number of times the path which follows was used.
Values	Decimal (1..16)

RESPONSE Measured maximum round trip delay was ....

Description	This response contains the maximum measured round trip delay taken to reach a destination node in the logical network.

ATTRIBUTE maxRoundTripDelay

Description	This attribute contains the round trip delay encountered to reach the destination node.
Values	Decimal (0..10000)

RESPONSE Cannot Unlock - attribute ..... is not set to active.

Description	This error response is generated when an operator attempts to *Unlock* a component corresponding to a provisioned SNMP table row whose *rowStatus* is not ***active***. Note that if the table can have dynamic as well as provisioned rows, the component containing the provisioned data is not the same as the one representing the SNMP table. **System action**: the *Unlock* command is ignored. **Operator action**: if desired, change the value provisioned for the indicated attribute to ***active***, then retry the original *Unlock* command.

ATTRIBUTE provisionedComponent

Description	This attribute identifies the component which contains the provisioned *rowStatus* attribute. It is present only if the component is different from that specified in the *Unlock* command.
Values	The name of the component

ATTRIBUTE rowStatusAttribute

Description	This attribute identifies the provisioned *rowStatus* attribute.
Values	Decimal (0..65535)
Replication	The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:...The value specified for ... is invalid. It must be in SnmpUdpAddress Format: IPaddress-UDPport, where UDPport is 162.

Description — A *Set Vr/x Snmp Community/n Manager/n transportAddress* command produces this response when the specified *transportAddress* has an invalid format.

System action: the command is ignored.

Operator action: retry the command with a valid *transportAddress*.

ATTRIBUTE snmpUdpAddressFormat

Description — This attribute contains the numeric ID of the attribute whose value was *Set* incorrectly.

Values — Decimal (1..65535)

RESPONSE Error:...The ... attribute does not match any ... instance.

Description — This error message appears in response to a *Check Prov* command if the value of an *Vr/x Snmp Community/n viewIndex* attribute does not match the replication *index* for a *Vr/x Snmp View/x, n.n* component.

System action: The provisioning view cannot be activated.

Operator action: Set the *viewIndex* attribute to match the replication *index* of an existing *View* component, or add a *View* component with the replication *index* corresponding to *viewIndex*.

ATTRIBUTE attrInError

Description — This attribute contains the numeric ID of the *viewIndex* attribute whose value was not properly set.

Values — Decimal (1..65535)

ATTRIBUTE viewComponent

Description — This attribute indicates a pattern for a *View* component name which is meant to be referenced by the *viewIndex* attribute.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:...The ... attribute is set incorrectly. The set bit should be consistent with the access mode specified by ... . The v1Trap and v2Trap may not be set simultaneously.

Description — This error message appears in response to a *Check Prov* command if the value of the *Vr/x Snmp Community/n Manager/n* component's *privileges* attribute is inconsistent with the parent *Community* component's *accessMode* attribute. Note that ***set*** operations are only allowed if the *Community accessMode* is ***readWrite***.

System action: The provisioning view cannot be activated.

Operator action: Change the *Manager privileges* to be consistent with the *Community accessMode*, or change the *Community accessMode* to allow the *Manager privileges*.

ATTRIBUTE privilegesAttribute

Description — This attribute contains the numeric ID of the *privileges* attribute involved in the conflict.

Values — Decimal (1..65535)

ATTRIBUTE relatedComponent

Description — This attribute contains the component name of the parent *Community* component, whose *accessMode* attribute is involved in the conflict.

Values — The name of the component

ATTRIBUTE accessModeAttribute

Description — This attribute contains the numeric ID of the parent *Community* component's *accessMode* attribute involved in the conflict.

Values — Decimal (1..65535)

Replication — The name of the component

RESPONSE Error:...There are ... instances of the ... component. The maximum number of allowed instances is ....

Description — This error message is generated in response to a *Check Prov* command when the maximum number of *Party, Context or Acl* components has been exceeded.

System action: The provisioning view cannot be activated.

Operator action: Delete enough *Party, Context or Acl* components so that the maximum number of components is not exceeded.

ATTRIBUTE numberOfSubcomponents

Description — This attribute contains the number of subcomponents. This value exceeds the maximum number allowed.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE nameOfSubcomponent

Description — This attribute contains the name of the subcomponent which has too many instances. It can be *Party*, *Context*, or *Acl*.

Values — The name of the component

ATTRIBUTE maximumNumberOfSubcomponents

Description — This attribute contains a value indicating the maximum number of allowed subcomponents.

Values — Decimal (0..4294967295)

RESPONSE Error:...The ... and ... components have the same value for the ... attribute.

Description — This error message is generated in response to a *Check Prov* command when duplicate *Vr/x Snmp Community/n Manager/n* components are found. The *Manager* components are the same if the value of their *transportAddress* attributes are the same.

System action: The provisioning view cannot be activated.

Operator action: Delete one of the *Manager* components or ensure that their *transportAddress* attributes are different.

ATTRIBUTE managerComponent1

Description — This attribute contains the component name of the first instance of duplicate *Manager* components.

Values — The name of the component

ATTRIBUTE managerComponent2

Description — This attribute contains the component name of the second instance of duplicate *Manager* components.

Values — The name of the component

ATTRIBUTE duplicatedAttribute

Description — This attribute contains the numeric ID of the *transportAddress* attribute which must be unique among *Manager* components.

Values — Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:...The ... and ... components have the same value for the ..., and ... attributes.

Description — This error message is generated in response to a *Check Prov* command when duplicate *Vr/x Snmp Community/n* components are found. The *Community* components are the same if they have the same values for their *communityString* and *tDomain* attributes.

System action: The provisioning view cannot be activated.

Operator action: Delete one of the *Community* components or change the value of at least one of the *communityString* or *tDomain* attributes so that the *Community* components are no longer the same.

ATTRIBUTE communityComponent1

Description — This attribute contains the component name of the first duplicate *Community* component.

Values — The name of the component

ATTRIBUTE communityComponent2

Description — This attribute contains the component name of the second duplicate *Community* component.

Values — The name of the component

ATTRIBUTE duplicatedAttribute1

Description — This attribute contains the numeric ID of the *communityString* attribute which is involved in the conflict.

Values — Decimal (1..65535)

ATTRIBUTE duplicatedAttribute2

Description — This attribute contains the numeric ID of the *tDomain* attribute which is involved in the conflict.

Values — Decimal (1..65535)

RESPONSE Warning:The value of the ... ... attribute has been changed from ... to ... on the copy.

Description — This warning message appears in response to a *Copy* command when a component containing an attribute whose value must be unique is copied. A new value for the named attribute in the destination component is automatically assigned when the *Copy* is done.

System action: the named attribute has been assigned a unique value.
Operator action: none.

ATTRIBUTE nameOfChangedComponent

Description — This attribute contains the name of the destination component whose attribute value was changed.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE changedAttribute

Description	This attribute contains the numeric ID of the attribute whose value was changed.
Values	Decimal (1..65535)
Replication	The name of the component

ATTRIBUTE oldValueOfAttribute

Description	This attribute contains the original value of the attribute in the source component of the *Copy* operation.
Values	Decimal (0..4294967295)

ATTRIBUTE newValueOfAttribute

Description	This attribute contains the newly assigned value of the attribute in the destination component of the *Copy* operation.
Values	Decimal (0..4294967295)

RESPONSE Error:...SNMP requires the VirtualRouter Ip component to be provisioned when the ... attribute has the value ....

Description	This error message is generated in response to a *Check Prov* command when a *Vr/x Snmp ipStack* attribute has a provisioned value of ***vrIp*** and the *Vr/x Ip* component has not been provisioned. **System action**: The provisioning view cannot be activated. **Operator action**: Provision the *Vr/x Ip* component or change the value of the *Vr/x Snmp ipStack* attribute, or delete the *Vr/x Snmp* component.

ATTRIBUTE attributeInError

Description	This attribute contains the numeric ID for the *ipStack* attribute involved in the conflict.
Values	Decimal (1..65535)

ATTRIBUTE attributeValue

Description	This attribute contains the value of the *ipStack* attribute involved in the conflict.
Values	vrIp ipiFrIpiVc

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: ... SNMP requires the IpiFr or IpiVc component to be provisioned when the ... attribute has the value ....

Description — This error message is generated in response to a *Check Prov* command when a *Vr/x Snmp ipStack* attribute has a provisioned value of ***ipiFrIpiVc*** and neither *IpiFr* nor *IpiVc* component have been provisioned.

System action: The provisioning view cannot be activated.

Operator action: Provision the *IpiFr* or *IpiVc* component or change the value of the *Vr/x Snmp ipStack* attribute, or delete the *Vr/x Snmp* component.

ATTRIBUTE attributeInError

Description — This attribute contains the numeric ID for the *ipStack* attribute involved in the conflict.

Values — Decimal (1..65535)

ATTRIBUTE attributeValue

Description — This attribute contains the value of the *ipStack* attribute involved in the conflict.

Values — vrIp
ipiFrIpiVc

RESPONSE Warning:...A unique value could not be assigned to the ..... attribute.

Description — This warning message appears in response to an *Add* or *Copy* command when it is not possible to assign a unique value to an attribute whose value must be assigned when the *Add* or *Copy* is done. All possible values are currently in use by other components of the same type.

System action: the attribute specified in the response could not be assigned a valid value and the component is left with invalid provisioning data.
Operator action: the component specified in the response should be *deleted*. If you wish to add this component again, then you should *delete* other components of the same type and *activate* the provisioning view in order to free up attribute values.

ATTRIBUTE nameOfAffectedComponent

Description — This attribute contains the name of the component whose attribute was not assigned a valid value. This attribute will not appear if the component which generates the response contains the attribute whose value was not properly assigned.

Values — The name of the component

RESPONSE Error:...The Vr managementAccess attribute must be enabled when the ... attribute has the value ....

Description

This error message is generated in response to a *Check Prov* command when a *Vr/x Snmp alarmsAsTraps* attribute has a provisioned value of ***enabled*** and the *Vr/x managementAccess* attribute is set to ***disabled***.

System action: The provisioning view cannot be activated.

Operator action: Change the value of the *Vr/x Snmp alarmsAsTraps* attribute to ***disabled*** or change the *Vr/x managementAccess* attribute value or remove the *Vr/x Snmp* component.

ATTRIBUTE attributeInError

Description

This attribute contains the numeric ID for the *alarmsAsTraps* attribute involved in the conflict.

Values

Decimal (1..65535)

ATTRIBUTE attributeValue

Description

This attribute contains the value of the *alarmsAsTraps* attribute involved in the conflict.

Values

enabled
disabled

RESPONSE Error: ... Snmp requires the Man component to be provisioned when the ... attribute has the value ....

Description

This error message is generated in response to a *Check Prov* command when a *Vr/x Snmp alarmsAsTraps* attribute has a provisioned value of ***enabled*** and no *Man* component has been provisioned.

System action: The provisioning view cannot be activated.

Operator action: Provision the *Man* component or change the value of the *Vr/x Snmp alarmsAsTraps* attribute, or delete the *Vr/x Snmp* component.

ATTRIBUTE attributeInError

Description

This attribute contains the numeric ID for the alarmsAsTraps attribute involved in the conflict.

Values

Decimal (1..65535)

ATTRIBUTE attributeValue

Description

This attribute contains the value of the alarmsAsTraps attribute involved in the conflict.

RESPONSE Error:...The mib subtree specified in the view instance... is not allowed on a non management virtual router.

Description

This error message appears in response to a *Check Prov* command if the MIB subtree value specified in the subscriber V*r/x Snmp View* is starting with 1.3.6.1.4.1.562

System action: The provisioning view cannot be activated.

Operator action: Change the MIB subtree value specified in the subscriber V*r/x Snmp View* to indicate a branch which is not associated with Nortel Enterprise MIB branches, or delete this *view*.

ATTRIBUTE actualValProved

Description

This attribute contains the actual value of the MIB subtree specified in a subscriber *Vr/x snmp view* component, which causes the conflict.

Values

The name of the component

RESPONSE Error: The Stp component must ...exist for ... connections.

Description

This response is generated by the *Check Prov* command when *SrcPvc* or *DstPvc* exists, but *Stp* does not exist, or *Stp* exists, but *SrcPvc* or *DstPvc* does not exist.

ATTRIBUTE invalid

Description

Either “” or “not ”.

Values

String (0..4, ASCII)

ATTRIBUTE connection

Description

Either “SPVC” or “PVC”.

Values

String (3..4, ASCII)

RESPONSE Error: This is a backbone brige port (preserveDomain = on), but its domainNum matches the STP instance of the access STP - .... Change either the preserveDomain attribute or the domainNum attribute.

Description

A *Check Prov* command produces this response when the user has provisioned the bridge port as a backbone port (*preserveDomain* = ***on***) but *domainNum* of that bridge port matches the STP instance of an access STP (*stpMode* = ***access***).

ATTRIBUTE domNum

Description

This attribute carries the domain number found in violation.

RESPONSE

Description — This RtStats collected event record is generated by an ATM Signalling Interface at the end of each RtStats collection interval. It contains statistics related to call setup attempts and failures. ATM User-Network Interface Specification Version 3.1.(af-sig-0010.002) is referred for Failure Cause Values.

ATTRIBUTE txSetupPdus

Description — This attribute indicates the total number of outgoing call setup attempts in the last collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE txFailureCause3

Description — This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 3.

Values — Decimal (0..4294967295)

ATTRIBUTE txFailureCause17

Description — This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 17.

Values — Decimal (0..4294967295)

ATTRIBUTE txFailureCause18

Description — This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 18.

Values — Decimal (0..4294967295)

ATTRIBUTE txFailureCause21

Description — This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 21.

Values — Decimal (0..4294967295)

ATTRIBUTE txFailureCause27

Description — This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 27.

Values — Decimal (0..4294967295)

ATTRIBUTE txFailureCause28

Description — This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 28.

Values — Decimal (0..4294967295)

ATTRIBUTE txFailureCause35

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 35.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause36

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 36.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause37

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 37.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause41

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 41.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause45

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 45.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause47

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 47.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause49

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 49.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause57

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 57.

ATTRIBUTE txFailureCause58

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 58.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause63

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 63.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause65

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 65.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause73

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 73.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause78

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 78.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause88

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 88.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause96

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 96.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause99

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 99.

ATTRIBUTE txFailureCause100

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 100.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause104

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 104.
Values	Decimal (0..4294967295)

ATTRIBUTE txFailureCause111

Description	This attribute indicates the total number of outgoing call setup attempts in the last collection interval rejected with cause value 111.
Values	Decimal (0..4294967295)

ATTRIBUTE rxSetupPdus

Description	This attribute indicates the total number of incoming call setup attempts in the last collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE rxFailureCause3

Description	This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 3.
Values	Decimal (0..4294967295)

ATTRIBUTE rxFailureCause17

Description	This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 17.
Values	Decimal (0..4294967295)

ATTRIBUTE rxFailureCause18

Description	This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 18.
Values	Decimal (0..4294967295)

ATTRIBUTE rxFailureCause21

Description	This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 21.

ATTRIBUTE rxFailureCause96

Description — This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 96.

Values — Decimal (0..4294967295)

ATTRIBUTE rxFailureCause99

Description — This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 99.

Values — Decimal (0..4294967295)

ATTRIBUTE rxFailureCause100

Description — This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 100.

Values — Decimal (0..4294967295)

ATTRIBUTE rxFailureCause104

Description — This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 104.

Values — Decimal (0..4294967295)

ATTRIBUTE rxFailureCause111

Description — This attribute indicates the total number of incoming call setup attempts in the last collection interval rejected by the switch with cause value 111.

Values — Decimal (0..4294967295)

ATTRIBUTE signallingChannelStatus

Description — This attribute indicates if the signalling interface is capable of processing or originating call setup requests.

If the value is ***up*** then the signalling channel was capable of processing or originating call setup requests at the end of the last collection interval.

If the value is ***down*** then the signalling channel was not capable of processing or originating call setup requests at the end of the last collection interval.

Values — down
up

ATTRIBUTE rxCbrSetup

Description — This attribute indicates the total number of incoming CBR call setup attempts received by this ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE rxRtVbrSetup

Description — This attribute indicates the total number of incoming RtVBR call setup attempts received by this ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

ATTRIBUTE rxNrtVbrSetup

Description — This attribute indicates the total number of incoming NrtVBR call setup attempts received by this ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

ATTRIBUTE rxUbrSetup

Description — This attribute indicates the total number of incoming UBR call setup attempts received by this ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

ATTRIBUTE txCbrSetup

Description — This attribute indicates the total number of outgoing CBR call setup attempts transmitted by this ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

ATTRIBUTE txRtVbrSetup

Description — This attribute indicates the total number of outgoing RtVBR call setup attempts transmitted by the ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

ATTRIBUTE txNrtVbrSetup

Description — This attribute indicates the total number of outgoing NrtVBR call setup attempts transmitted by this ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

ATTRIBUTE txUbrSetup

Description — This attribute indicates the total number of outgoing UBR call setup attempts transmitted by this ATM interface during the last collection interval. This total includes successful and unsuccessful setup attempts.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE rxCbrSetupFail

Description	This attribute indicates the total number of failed incoming CBR call setup attempts received by this ATM interface during the last collection interval.
Values	Decimal (0..65535)

ATTRIBUTE rxRtVbrSetupFail

Description	This attribute indicates the total number of failed incoming RtVBR call setup attempts received by this ATM interface during the last collection interval.
Values	Decimal (0..65535)

ATTRIBUTE rxNrtVbrSetupFail

Description	This attribute indicates the total number of failed incoming NrtVBR call setup attempts received by this ATM interface during the last collection interval.
Values	Decimal (0..65535)

ATTRIBUTE rxUbrSetupFail

Description	This attribute indicates the total number of failed incoming UBR call setup attempts received by this ATM interface during the last collection interval.
Values	Decimal (0..65535)

ATTRIBUTE txCbrSetupFail

Description	This attribute indicates the total number of failed outgoing CBR call setup attempts transmitted by this ATM interface during the last collection interval.
Values	Decimal (0..65535)

ATTRIBUTE txRtVbrSetupFail

Description	This attribute indicates the total number of failed outgoing RtVBR call setup attempts transmitted by this ATM interface during the last collection interval.
Values	Decimal (0..65535)

ATTRIBUTE txNrtVbrSetupFail

Description	This attribute indicates the total number of failed outgoing NrtVBR call setup attempts transmitted by this ATM interface during the last collection interval.
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE txUbrSetupFail

Description — This attribute indicates the total number of failed outgoing UBR call setup attempts transmitted by this ATM interface during the last collection interval.

Values — Decimal (0..65535)

RESPONSE Error:The value of ripInterface, ..., does not match any RIP interface address provisioned on this virtual router.

Description — A *Check Prov* command produces this response when the attribute *ripInterface* is set to an address that does not match any *LogicalIf* address on this virtual router that has a *RipIf*.

ATTRIBUTE invalidRipInterfaceAddress

Description — This attribute contains the invalid *ripInterface* address.

Values — IP address

RESPONSE Error: The Autonomous System Identifier asId ...of this neighbor can not be equal to the asId of this Egp entity.

Description — This error message appears when the value of Autonomous System Identifier *asId* of the *EgpNeighbor* is equal to the value of Autonomous System Identifier *asId* of the *Egp* entity.

ATTRIBUTE invalidNeighborAsId

Description — This attribute contains the asId of the invalid neighbor.

Values — Decimal (1..65535)

RESPONSE Error: The effective address of NetworkList ... is not a valid IP network address.

Description — This response group generates an error in case the effective address of the *NetworkList* component is not a valid IP network address. i.e., either all 0's (0.0.0.0) or all 1's (255.255.255.255).

ATTRIBUTE invalidExportAddress

Description — This attribute contains the value of invalid *NetworkList* address.

Values — IP address

RESPONSE Error: The neighbor address, ..., does not correspond to any networks provisioned on this virtual router.

Description — A *Check Prov* command produces this response when an EGP neighbor is provisioned with an address that does not correspond to any network as defined by the *LogicalIf*s.

ATTRIBUTE invalidNeighborAddress

Description — This attribute contains value of the invalid *neighbor* address.

Values — IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The specified mask ... is not a valid contiguous mask.

Description — This error message appears in response to a Check Prov command when the value of a specified mask is provisioned with an invalid discontiguous mask.
1. The semantic check function will check for the contiguity of the mask by checking if there are contiguous 1's.

ATTRIBUTE invalidMask

Description — This attribute contains the value of the invalid mask.

Values — IP address

RESPONSE Error: The NextHop Address ... does not belong to any of the subnets provisioned under an IpPort.

Description — This error message appears when the value of a *NextHops* provisioned for a static *RouteEntry* does not belong to one of the subnets provisioned under an *IpPort*. Each provisioned *NextHop* should belong to a valid subnet. This can be accomplished either by adding a *logicalIf* entry under *IpPort* component or changing the *NextHop* address to reflect to one of the subnets provisioned by *logicalIf* entry.

ATTRIBUTE invalidNextHopAddress

Description — This attribute contains the value of invalid *NextHop* address.

Values — IP address

RESPONSE Error: The combination of IP Address ... and Mask ... does not provide a valid entry.

Description — This error message appears when the logical-AND of address and mask do not make a valid entry.

ATTRIBUTE invalidDestAddress

Description — This attribute contains the index value of the invalid destination address.

Values — IP address

ATTRIBUTE invalidDestMask

Description — This attribute contains the index value of the invalid destination mask.

Values — IP address

RESPONSE Error: The ripinterface value can not be set to ....

Description — This error message is invoked when the *ripInterface* address is set to 0xffffffff..

ATTRIBUTE invalidRipInterfaceAddress

Description — This attribute contains value of invalid rip Interface Address.

Values — IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The attribute metricType for StubAreaEntry ... should be set to ospfMetric if and only if the attribute importAsExtern for the AreaEntry is set to importNoExternal.

Description — This Error message appears when there is inconsistency between the attribute *importAsExtern* and the *metricType.*

ATTRIBUTE ospfStubAreaId

Description — This attribute contains the value of invalid *areaId*.

Values — IP address

RESPONSE Error: The value of routerId should not be ....

Description — This error message is produced when the *routerId* is set to either 0.0.0.0 or 255.255.255.255

ATTRIBUTE invalidAddress

Description — This attribute contains value of invalid Router Id.

Values — IP address

RESPONSE Error: The value of stub area ID ... is not equal to any of the StubAreaEntries provisioned under OSPF component.

Description — This Error message appears when this areaId does not match to any of the stub areas provisioned.

ATTRIBUTE ospfStubAreaId

Description — This attribute contains the value of invalid *areaId*.

Values — IP address

RESPONSE Error: The value of areaId ... is not equal to any of the AreaEntries provisioned under the Ospf component.

Description — This Error message will appear for different components under *Ospf* that used areaId. When this areaId does not match to any of the areas provisioned.

ATTRIBUTE ospfAreaId

Description — This attribute contains the value of invalid *areaId*.

Values — IP address

RESPONSE Error: The attribute importAsExtern for AreaEntry ... should be set either to importNoExternal or to importNssa.

Description — This Error message appears when there is a valid *AreaEntry* provisioned for *StubAreaEntry* component, but the value of *importAsExtern* attribute for that *AreaEntry* is not set either to ***importNoExternal*** or ***importNssa***.

ATTRIBUTE ospfStubAreaId

Description — This attribute contains the value of invalid *areaId*.

Copyright © 2006, Nortel Nortel Confidential

Values IP address

RESPONSE Error: When the value of advertiseDefault is set to yes then the value of importAsExtern for this area ... should be set to importNssa.

Description This error message is produced when the *StubArea* belongs to a valid provisioned Areas but if the value of *advertiseDafult* is set to ***yes***, then the attribute *importAsExtern*'s value for that particular *AreaEntry* should be ***importNssa***.

ATTRIBUTE ospfStubAreaEntryAreaId

Description This attribute will contain the value of invalid *areaId*.

Values IP address

RESPONSE Error: When the index lsdbType is set to nssaExternalLink then the attribute importAsExtern for this Area ... should be set to importNssa.

Description This Error message will appear when the index *lsdbType* is set to ***nssaExternalLink*** then the attribute *importAsExtern* for that *Area* should have the value of ***importNssa***.

ATTRIBUTE ospfAggregateEntryAreaId

Description This attribute contains the value of invalid *areaId*.

Values IP address

RESPONSE Error: The index value nbrRouterId can not be all ....

Description This Error message is produced when the provisioned index value *nbrRouterId* is equal to 0.0.0.0 or 255.255.255.255.

ATTRIBUTE invalidAddress

Description This attribute contains value of invalid Interface Address.

Values IP address

RESPONSE Error:The value of outInterface, ..., does not match any RIP interface address provisioned on this routing component.

Description A *Check Prov* command produces this response when the attribute *outInterface* is set to an address that does not match any *logicalIf* or *Interface* address on this routing component (*Vr*, *Rtr* or *Vrf*) that has a *RipIf*.

ATTRIBUTE invalidOutInterface

Description This attribute contains value of the invalid *outInterface* address.

Values IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The value of interface, ..., does not match any RIP interface address provisioned on this routing component.

Description — A *Check Prov* command produces this response when the attribute *interface* is set to an address that does not match any *LogicalIf* or *Interface* address on this routing component (*Vr*, *Rtr* or *Vrf*) that has a *RipIf*.

ATTRIBUTE invalidInterfaceAddress

Description — This attribute contains value of the invalid *interface* address.

Values — IP address

RESPONSE Error:The value of ripInterface, ..., does not match any RIP interface address provisioned on this routing component.

Description — A *Check Prov* command produces this response when the attribute *ripInterface* is set to an address that does not match any *LogicalIf* or *Interface* address on this routing component (*Vr*, *Rtr* or *Vrf*) that has a *RipIf*.

ATTRIBUTE invalidRipInterface

Description — This attribute contains the invalid *ripInterface* address.

Values — IP address

RESPONSE Error: The address ... and mask ... should be in classA, classB or classC.

Description — This error message appears when the specified address and mask are not in classA or in classB or in classC for *ApplyEntry* component.

ATTRIBUTE netSentryAddress

Description — This attribute contains the value of invalid mask.

Values — IP address

ATTRIBUTE netSentryMask

Description — This attribute contains the value of invalid mask.

Values — IP address

RESPONSE Error: The HostEntry Address ... does not belong to any of the subnets provisioned as Interface or as logicalIfEntry under IpPort.

Description — This error will be generated if the hostAddress provisioned does not correlate with any of the subnets provisioned for an *interface* or *ipPort.*

ATTRIBUTE arpHostEntry

Description — This attribute will contain the address of Host Entry.

Values — IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The PhysAddress can not be ....

Description	This error message is displayed when attribute *PhysAddress* is set to all zeroes or all ones.

ATTRIBUTE invalidPhysAddress

Description	This attribute contains the value of invalid physical Address.
Values	String (0..6, Dashed Hex)

RESPONSE Error: The netMask ... is not one of classA, classB, or classC.

Description	This error message appears when *netMask* under *IpLogicalInterface* or *Interface* is not one of classA, classB or classC. *netMask* must be contiguous starting from the left-most bit.

ATTRIBUTE invalidNetMask

Description	This attribute contains the value of invalid *netMask*.
Values	IP address

RESPONSE Error: The specified Address ... is not one of classA, classB or classC.

Description	This error message appears when the specified IP Address is not of classA, classB or classC.

ATTRIBUTE invalidAddress

Description	This attribute contains the value of invalid IP address.
Values	IP address

RESPONSE Error: The Ip Address ... is a network address given provisioned NetMask.

Description	This error message appears when IP Address under *IpLogicalInterface* or *Interface* happens to be a broadcastAddress.

ATTRIBUTE invalidAddress

Description	This attribute contains the value of invalid IP address.
Values	IP address

RESPONSE Error: There are duplicate LogicalIf ... found.

Description	This error message appears when there are duplicate *IpLogicalInterface* Addresses found under two different *IpPorts*.

ATTRIBUTE invalidAddress

Description	This attribute contains the value of invalid *IP address.*
Values	IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The NextHop Address can not be set to ....

Description — This error message appears when the value of *NextHops* provisioned for a static *RouteEntry* is set to 0.0.0.0 or 255.255.255.255.

ATTRIBUTE invalidAddress

Description — This attribute contains the value of the invalid *NextHop* address.

Values — IP address

RESPONSE Error: There are duplicate linkDestinationAddress ... found.

Description — This error message appears when there are duplicate *linkDestinationAddresses* found.

ATTRIBUTE invalidAddress

Description — This attribute contains the value of invalid IP address.

Values — IP address

RESPONSE Error: Mtu of ... exceeds the maximum defined range of the media.

Description — This error message appears when *maxTxUnit* is not within the defined range of the media.
The possible media ranges are Ethernet=1500, FDDI=4470, X25=9188, PPP=18000, TokenRing=18944.

ATTRIBUTE invalidMtuRange

Description — This attribute contains the value of an out of range MTU.

Values — Decimal (0..65535)

RESPONSE Error: The linkDestinationAddress can not be set to ....

Description — This error message appears when:
1) The attribute *linkModel* under *IpPort* or *Interface* component is set to ***pointToPoint*** and the attribute *linkDestinationAddress* under *IpLogicalInterface* or *Interface* component is set either to 0.0.0.0 or 255.255.255.255;

2) The media linked to the *ProtocolPort* is not *Ppp* and the attribute *linkDesintationAddress* is set to a non-zero value.

ATTRIBUTE invalidAddress

Description — This attribute contains value of invalid linkDestination Address.

Values — IP address

RESPONSE Error: The value of index rangeNet can not be set to ....

Description — This error message appears when index value of *rangeNet* of Ospf AreaRange Entry is set to either 0x00000000 or 0xffffffff.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE invalidAddress

Description — This attribute contains the value of invalid rangeNet address.

Values — IP address

RESPONSE Error:The NextHop Address ... can not be equal to any logicalIf If it belongs to any subnets provisioned under an IpPort.

Description — This error message appears when the value of *NextHops* provisioned for a static *RouteEntry* belongs to one of the subnets provisioned under an IpPort; however, the *NextHop* address is equal to the index value of some *LogicalIfEntry* component.

ATTRIBUTE invalidNextHopAddress

Description — This attribute contains the value of an invalid *NextHop* address.

Values — IP address

RESPONSE Error:The combination of destAddress and destMask is ambiguous, Please add destAddress as ....

Description — This error message appears when the logical-AND of destAddress and not of destMask provides and ambiguous entry.

ATTRIBUTE invalidDestAddress

Description — This attribute contains the value of the index *destAddress*.

Values — IP address

RESPONSE Error:The feature ... is not provisioned in the feature list of ....

Description — The *Check Prov* command produces this response when an IP, IPX, or bridge port is configured under *ProtocolPort* component, but the corresponding feature is not present in the *featureList* of the *Sw Lpt/<string>* component associated with the port's inbound card.

ATTRIBUTE featName

Description — This attribute indicates the feature that is required in the *featureList* of *Sw Lpt/<string>* for an IP/IPX/bridge port. The feature can be ip, ipx, or bridge depending on the protocol port.

Values — String (1..30, ASCII)

ATTRIBUTE lpt

Description — This attribute indicates the *Sw Lpt* component associated with the inbound card of a particular protocol port. This component should have an IP/IPX/bridge feature in its *featureList* if the IP/IPX/bridge port is provisioned under *ProtocolPort*.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The effective address of NetworkList ... is not a valid IP network address.

Description — This response group generates an error in case the effective address of the *NetworkList* component is not a valid IP network address, i.e., either all 0's (0.0.0.0) or all 1's (255.255.255.255).

ATTRIBUTE invalidExportAddress

Description — This attribute contains the value of invalid *NetworkList* address.

Values — IP address

RESPONSE Error: The value of localAddressConfigured, ..., does not match any IP interface address provisioned on this routing component.

Description — A *Check Prov* command produces this response when the attribute *localAddressConfigured* is set to an address that does not match any *logicalIf* or *Interface* address on this routing component (*Vr*, *Rtr* or *Vrf*).

ATTRIBUTE invalidIPInterfaceAddress

Description — This attribute contains value of the invalid *localAddressConfigured* address.

Values — IP address

RESPONSE Error: The attribute peerAs, ..., must be set to a BGP peerAs on this routing component.

Description — A *Check Prov* command produces this response when the value of attribute *peerAs* does not match the *peerAs* of any BGP peer on the routing component (*Vr*, *Rtr* or *Vrf*).

ATTRIBUTE invalidPeerAs

Description — This attribute contains value of the invalid *peerAs* value.

Values — Decimal (0..65535)

RESPONSE Error: The value of peerIpAddress, ..., does not match any peers address on this routing component.

Description — A *Check Prov* command produces this response when the value of attribute *peerIpAddress* does not match the address of any BGP peer on the routing component (*Vr*, *Rtr* or *Vrf*).

ATTRIBUTE invalidPeerAddress

Description — This attribute contains value of the invalid *peerIpAddress* value.

Values — IP address

RESPONSE Error: The value of the attribute bgpIdentifier should not be ....

Description — This error message appears when the *bgpIdentifier* attribute is set to either 0.0.0.0 or 255.255.255.255.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE invalidBgpId

Description — This attribute contains value of invalid *Bgp* Identifier.

Values — IP address

RESPONSE Error:Exceeded maximum number of Vr, Rtr and Vrf components.

Description — The *Check Prov* command produces this response when the maximum number of total allowable *Vr*, *Router* and *Vrf* components has been exceeded.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: Delete *Vr*, *Rtr* and *Vrf* components which are in excess of the maximum allowed

ATTRIBUTE maxAllowedVrs

Description — The maximum number of provisionable *Vr*, *Router* and *Vrf c*omponents.

Values — Decimal (0..65535)

ATTRIBUTE currentProvisionedVrs

Description — The current number of provisioned *Vr*, *Router* and *Vrf* components.

Values — Decimal (0..65535)

RESPONSE Error:Exceeded maximum allowable Protocol Ports and Interfaces.

Description — The *Check Prov* command produces this response when the maximum number of allowable Protocol Ports and Interfaces has been exceeded. Delete all Protocol Ports and Interfaces which are in excess of the maximum allowed.

ATTRIBUTE maxAllowedProtocolPorts

Description — The maximum number of provisionable Protocol Ports and Interfaces.

Values — Decimal (0..65535)

ATTRIBUTE currentProvisionedProtocolPorts

Description — The current number of provisioned Protocol Ports and Interfaces.

Values — Decimal (0..65535)

RESPONSE ... dynamic ARP entries removed.

Description — This response indicates the number of dynamic ARP entries removed. If no entries were removed, it may be due to specifying an incorrect IP address for the *-logicalIf* option.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE numDeleted

Description	This is the number of dynamic ARP entries removed.
Values	Decimal (0..65535)

RESPONSE Error: ... is an invalid value for attribute ... .

Description	This group contains a response which will be displayed when the user tries to set a value of ff-ff-ff-ff for the port network number.

ATTRIBUTE invalidValue

Description	This attribute contains the actual dashed hex value for the port network number entered by the user.
Values	String (0..4, Dashed Hex)

ATTRIBUTE invalidAttribute

Description	This attribute contains the port network number attribute which is in error.
Values	Decimal (1..65535)

RESPONSE Download stopped. The following AV does not support the processor target specified:

Description	This response is issued when the user have specified an option of the *processorTargets* attribute which is not applicable to the given AV. This is the case when the requested files (for example, ***ppc*** type) are not present in the corresponding AD file.

ATTRIBUTE scsAvName

Description	This attribute contains the name of the AV which does not support the file type specified in the hardwareType attribute.
Values	String (1..30, ASCII)

RESPONSE Error:The following TosMap components contain conflicting tos values:

Description	A *Check Prov* command produces this response if any value in the *tos* attribute appears in two different *TosMap* components under the same *CosPolicyGroup*, and the *assignedCos* attribute of the two parent *Policy* components are not equal.

ATTRIBUTE tosMap1

Description	This attribute specifies the first of two conflicting *TosMap* components.
Values	The name of the component

ATTRIBUTE tosMap2

Description	This attribute specifies the second of two conflicting *TosMap* components.
Values	The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The following IpAddrLayer4Flow components conflict with each other because they both specify all addresses, some of the same port numbers, and the same protocol:

Description

A *Check Prov* command produces this response if the following conditions are all true for two *IpAddrLayer4Flow* subcomponents of the *CosPolicyGroup*:

1. The values of the *assignedCos* attribute of the parent *Policy* components are not equal.
2. The values of the *protocol* attributes are equal.
3. The values of the *prefixLength* attributes are zero.
4. The values of the *portNumberRange* attributes specify overlapping, but not equal port ranges.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that at least one of the following conditions is true for the two *IpAddrLayer4Flow* components:

1. The *protocol* attributes have different values.
2. The *prefix* and *prefixLength* attributes specify different IP address ranges.
3. The *portNumberRange* attributes specify non-overlapping port ranges.

ATTRIBUTE flow1

Description

This attribute specifies the first of two conflicting *IpAddrLayer4Flow* components.

Values

The name of the component

ATTRIBUTE flow2

Description

This attribute specifies the second of two conflicting *IpAddrLayer4Flow* components.

Values

The name of the component

RESPONSE

Description

This response displays the result of the OAM Ethernet port test.

ATTRIBUTE testResult

Description

This attribute records the result of last port test executed on the OAM Ethernet port. The result can be one of the following values.
pass: the test passed
fail: the test failed
neverRun: the test has not been run
running: the test is running

Copyright © 2006, Nortel Nortel Confidential

Values	running pass fail neverRun

RESPONSE Frame Relay Accounting Information

Description	This response describes the attributes specific to a Frame Relay accounting record. All items which belong to a Frame Relay accounting record are defined here. This definition is translated into Service Data Description files - sdd file. The Accounting Data Server (ADS) uses the sdd file to decode accounting records.

ATTRIBUTE recordType

Description	*recordType* attribute indicates the type of the record. For the first record in the accounting period, only *first* is set to 1. For the last record, only *last* is set to 1. For intermediate records, both *first* and *last* are set to 0. If there is only one record in the accounting period, then both *first* and *last* are set to 1. first, ~last - first record ~first, ~last - intermediate record. ~first, last - final record. first, last - first and last record (one only).
Set of	first last

ATTRIBUTE callType

Description	This attribute defines the type of the call for which this accounting record is issued. ~gateway, ~localNetwork - non gateway call. ~gateway, localNetwork - gateway call to another network gateway, ~localNetwork - gateway call from another network gateway, localNetwork - gateway transit call.
Set of	gateway localNetwork

ATTRIBUTE callReferenceNumber

Description	This attribute contains the value of the call reference number assigned to each new call. Accounting records are uniquely defined by a call reference number on each function processor. In double ended accounting the *callReferenceNumber* is the same for both accounting records. Call reference number is unique only on function processor
Values	Decimal (0..16777215)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE callingNodeIdentifier

Description — This attribute identifies the calling (originating) node by a unique number assigned to each node in the *ModuleData* component. (In DPN it is called a NamsId.)

Values — Decimal (256..49151)

ATTRIBUTE callingCustomerIdentifier

Description — This attribute contains the number assigned in each service to a customer and it identifies the customer at the calling end of the call in the Customer Network Management.

Values — Decimal (0; 1..8191)

ATTRIBUTE callingPortIdentifier

Description — This attribute contains the function processor number used by the service issuing the accounting record for the calling (originating) part of the call. If the port information is from DPN, then the pe, port and pi numbers are encoded as 5, 5, 6 bits.

Values — Decimal (0..65535)

ATTRIBUTE callingNpi

Description — This attribute contains the calling numbering plan indicator of the calling address.

Values — x121
e164

ATTRIBUTE callingAddress

Description — This attribute contains the calling DataNetworkAddress of the interface. *callingAddress* includes DNIC (first 4 digits) for X.121, and CC (Country Code) for the E.164 address of the calling end. The maximum length is 15 digits.

Values — BCD (1..15)

ATTRIBUTE callingDlci

Description — This attribute contains the calling DLCI number of the interface. (DLCI is sometimes called LCN - logical channel number). This number is assigned to the call request at the calling end.

Values — Decimal (16..1007)

ATTRIBUTE calledNodeIdentifier

Description

This attribute identifies the called (terminating) node by a unique number assigned to each node in the *ModuleData* component. (In DPN it is called a NamsId.)

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (256..49151)

ATTRIBUTE calledCustomerIdentifier

Description
This attribute contains the number assigned in each service to a customer and it identifies the customer at the called end of the call in the Customer Network Management.

Values Decimal (0; 1..8191)

ATTRIBUTE calledPortIdentifier

Description This attribute contains the function processor number used by the service issuing an accounting record for the called (terminating) side of the call. If the port information is from DPN, then the pe, port and pi numbers are encoded as 5, 5, 6 bits.

Values Decimal (0..65535)

ATTRIBUTE calledNpi

Description This attribute contains the called numbering plan indicator of the called address.

Values x121
e164

ATTRIBUTE calledAddress

Description
This attribute contains the called DataNetworkAddress of the interface. *calledAddress* includes DNIC (first 4 digits) for X.121, and CC (Country Code) for the E.164 address of the called end. The maximum length is 15 digits.

Values BCD (1..15)

ATTRIBUTE calledDlci

Description
This attribute contains the called DLCI number of the interface. (DLCI is sometimes called LCN - logical channel number). This number is assigned to the call request at the called end.

Values Decimal (16..1007)

ATTRIBUTE segmentSizeIndex

Description This attribute is the segment size index provisioned on the module.
It is used to calculate the number of segments sent and received in the accounting record. Two to the power of *segmentSizeIndex* is equal to the segment size (in bytes) provisioned in the *VirtualCircuitSytem* component. For example, if the segment size is 128, then *segmentSizeIndex* is 7.

Values Decimal (0..16)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE clearCause

Description — This attribute is the clear cause signalled at the end of a connection. It is set to H.b0 for intermediate records.

Values — Decimal (0..255)

ATTRIBUTE diagnosticCode

Description — This attribute is the diagnostic code signalled at the end of a connection. It is set to 0 for intermediate records.

Values — Decimal (0..255)

ATTRIBUTE callingCir

Description — This attribute contains the calling end provisioned CIR (Committed Information Rate).

Values — Decimal (0..65535)

ATTRIBUTE callingEir

Description — This attribute contains the calling end provisioned EIR (Excess Information Rate).

Values — Decimal (0..65535)

ATTRIBUTE callingServiceType

Description — This attribute indicates the service supported by the port used by the calling end. This number is provisioned on each interface Dna as *accountClass*.

Values — Decimal (0..50)

ATTRIBUTE callingCollectReason

Description — This attribute indicates the reason for the accounting collection of the calling end (It can be any combination of Audit, Study, Test, Billing, Force).

Set of
bill
test
study
audit
force

ATTRIBUTE callingDse

Description — This attribute defines the calling end Data Service Exchange provisioned in Dna as an arbitrary number in the *serviceExchange* attribute.

Values — Decimal (0..255)

ATTRIBUTE callingRateAdaptation

Description

provisioned - rate adaptation provisioned on the calling end of the call.

Copyright © 2006, Nortel Nortel Confidential

occurred - rate adaptation occurred on the calling end of the call.
enforced - rate enforcement provisioned on the calling end of the call.

Set of
provisioned
occured
enforced

ATTRIBUTE callingClassOfService

Description
emissionPriority - emission priority provisioned.

Set of
emissionPriority

ATTRIBUTE calledCir

Description
This attribute contains the called end provisioned CIR (Committed Information Rate).

Values
Decimal (0..65535)

ATTRIBUTE calledEir

Description
This attribute contains the called end provisioned EIR.

Values
Decimal (0..65535)

ATTRIBUTE calledServiceType

Description
This attribute indicates the service supported by the port used by the called end-user. This number is provisioned on each interface Dna as *accountClass*.

Values
Decimal (0..255)

ATTRIBUTE calledCollectReason

Description
This attribute indicates the reason for the accounting collection of the called end (It can be any combination of Audit, Study, Test, Billing, Force).

Set of
bill
test
study
audit
force

ATTRIBUTE calledDse

Description
One byte field defines the called end Data Service Exchange provisioned in Dna as an arbitrary number in the *serviceExchange* attribute.

Values
Decimal (0..255)

ATTRIBUTE calledRateAdaptation

Description
provisioned - rate adaptation provisioned on the called end of the call

Copyright © 2006, Nortel
Nortel Confidential

occurred - rate adaptation occurred on the called end of the call.
enforced - rate enforcement provisioned on the called end of the call.

Set of
provisioned
occured
enforced

ATTRIBUTE calledClassOfService

Description

emissionPriority - emission priority provisioned.

Set of
emissionPriority

ATTRIBUTE flags

Description

This attribute contains values for the call characteristics.
calledEndCharging - called end is charging.
~calledEndCharging - calling end is charging
highPriority - call is high priority.
pvcType - call is pvc.
~pvcType - call is svc.
hunted - call was hunted.
redirected - call was redirected.
calledGenerated - called end generated accounting record.
~calledGenerated - calling end generated accounting record.
calledCleared - call was cleared by called end.
~calledCleared - call was cleared by calling end.
unique - accounting record is unique.
reachedDataTransfer - call reached data transfer.
collReasonValid - collection reasons are valid.
callingUni - interface is callingUni.
~callingUni - interface is callingNni.
calledUni - interface is calledUni.
~calledUni - interface is calledNni.
spareOne - not used
spareTwo - not used
callingAbit - called Abit set

hunted
redirected
calledGenerated
calledCleared
unique
reachedDataTransfer
collReasonValid
userDataInCallReq
callingUni
calledUni
spareOne
spareTwo
callingAbit
calledAbit

ATTRIBUTE startTime

Description

This attribute represents the start time in the accounting record. For SVC it is the time when the call request packet was created. For PVC it is set by the Master VC when the master call is formatted. On the subsequent accounting record, the start time corresponds to the end time of the previous record. If Time of Day Accounting (TODA) is used, start time (and end time) correspond to times set in the schedule (set in *Col/accounting collectionTimes* attribute).

Values

Time (DHMS)

ATTRIBUTE endTime

Description

This attribute represents the end time in the accounting record. If TODA is used, the end time in non-final records is the time of the TODA period. For 12-hour accounting, the time on non-final records is the time when the 12-hour timer expires at the charged end. On final accounting records, the end time is the time when the disconnect packet is first received. If Time of Day Accounting (TODA) is used, end time (and start time) correspond to times set in the schedule (set in *Col/accounting collectionTimes* attribute).

Values

Time (DHMS)

ATTRIBUTE elapsedTime

Description

This attribute represents the duration of the call in 0.1 second increments. This time interval is started when call request is processed. If call does not reach data transfer, then elapsed time is set to 0. Elapsed time represents the true measure of the accounting period. It is measured independently of start time and end time. Since start time and end time can be changed

Copyright © 2006, Nortel Nortel Confidential

externally by adjusting the clock, elapsed time can be shorter or longer than the difference between start time and end time. This difference can show as much as 60 seconds on accounting records for the virtual circuits which are idle (carry no traffic) and when TODA is used (in which case it is caused by the internal TODA detection mechanism). When a 12 hour accounting period is used, elapsed time is exact or differs by a few seconds from a 12 hour duration.

Values — Decimal (0..16777215)

ATTRIBUTE callingEgressBytes

Description — This attribute contains the total number of bytes received at the calling end.

Values — Long Integer

ATTRIBUTE callingIngressBytes

Description — This attribute contains the total number of bytes sent at the calling end.

Values — Long Integer

ATTRIBUTE callingEgressFrames

Description — This attribute contains the total number of frames received at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE callingIngressFrames

Description — This attribute contains the total number of frames sent at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE callingEgressSegments

Description — This attribute contains the total number of segments received at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE callingIngressSegments

Description — This attribute contains the total number of segments sent at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE callingEirEgressBytes

Description — This attribute contains the number of EIR bytes received from the subnet at the calling end.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE callingEirIngressBytes

Description — This attribute contains the number of EIR bytes sent to the subnet at the calling end.

Values — Long Integer

ATTRIBUTE callingEirEgressFrames

Description — This attribute contains the number of EIR Frames received from the subnet at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE callingEirIngressFrames

Description — This attribute contains the number of EIR Frames sent to the subnet at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE callingEirEgressSegments

Description — This attribute contains the number of EIR segments received from the subnet at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE callingEirIngressSegments

Description — This attribute contains the number of EIR segments sent to the subnet at the calling end

Values — Decimal (0..4294967295)

ATTRIBUTE callingDiscardedBytes

Description — This attribute contains the number of bytes discarded at the calling end due to rate enforcement when no rate adaptation occurred.

Values — Long Integer

ATTRIBUTE callingDiscardedFrames

Description — This attribute contains the number of frames discarded at the calling end due to rate enforcement when no rate adaptation occurred.

Values — Decimal (0..4294967295)

ATTRIBUTE callingDiscardedSegments

Description — This attribute contains the number of segments discarded at the calling end due to rate enforcement when no rate adaptation occurred.

Values — Decimal (0..4294967295)

ATTRIBUTE calledEgressBytes

Description — This attribute contains the total number of bytes received at the called end.

Copyright © 2006, Nortel Nortel Confidential

frsShortLocalCounts
frsShortLocalAndRemoteCounts
frsInterworkingPvcRecord
frsInterworkingSvcRecord
frsIpOptPvcRecord

ATTRIBUTE callingTotalPwmIntervalNumber

Description

This attribute contains the number of the pwm (peak water mark) interval in which the pwm occurred and is not part of accounting record if Time of Day is not running. (Attribute *collectionTimes* in *Collector* component for accounting is not set.)
The value is relative to *collectionTimes* attribute together with *peakWaterMarkInterval* attribute in *Collector* component. For example if *collectionTimes* is set to 16:00 and value of *callingTotalPwmIntervalNumber* is reported 3 and attribute *peakWaterMarkInterval* in *Collector* component is set to 5 minutes, then peak traffic happened between 16:15 and 16:20.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..1000)

ATTRIBUTE callingEirPwmIntervalNumber

Description

This attribute contains the number of the pwm (peak water mark) interval in which the pwm occurred and is not part of accounting record if Time of Day is not running. (Attribute *collectionTimes* in *Collector* component for accounting is not set.)

Values Decimal (0..1000)

ATTRIBUTE callingCirPwmIntervalNumber

Description

This attribute contains the number of the pwm (peak water mark) interval in which the pwm occurred and is not part of accounting record if Time of Day is not running. (Attribute *collectionTimes* in *Collector* component for accounting is not set.)

Values Decimal (0..1000)

ATTRIBUTE calledTotalPwmIntervalNumber

Description

This attribute contains the number of the pwm (peak water mark) interval in which the pwm occurred and is not part of accounting record if Time of Day is not running. (Attribute *collectionTimes* in *Collector* component for accounting is not set.)

Values Decimal (0..1000)

ATTRIBUTE calledEirPwmIntervalNumber

Description

This attribute contains the number of the pwm (peak water mark) interval in which the pwm occurred and is not part of accounting record if Time of Day is not running. (Attribute *collectionTimes* in *Collector* component for accounting is not set.)

Values Decimal (0..1000)

ATTRIBUTE calledCirPwmIntervalNumber

Description

This attribute contains the number of the pwm (peak water mark) interval in which the pwm occurred and is not part of accounting record if Time of Day is not running. (Attribute *collectionTimes* in *Collector* component for accounting is not set.)

Values Decimal (0..1000)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE originalNpi

Description

This attribute contains numbering plan indicator for originally called address.

Values

x121
e164

ATTRIBUTE originalAddress

Description

This attribute contains originally called DataNetworkAddress of the interface if call was redirected.

Values

BCD (1..15)

ATTRIBUTE originalServiceType

Description

This attribute indicates the service supported by the port used by the calling end. This number is provisioned on each interface Dna as accountClass.

Values

Decimal (0..255)

ATTRIBUTE callingTransferPriority

Description

This attribute indicates the transfer priority used in the direction towards the network.

The transfer priority is a preference configured for an application according to its time-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n is the transfer priority index, contains a default setting for routing class of service (***multimedia, delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned under the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a network operator if required.

Values

Decimal (0..255)

ATTRIBUTE calledTransferPriority

Description

This attribute indicates the transfer priority used in the direction from the network.

The transfer priority is a preference configured for an application according to its time-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n is the transfer priority index, contains a default setting for routing class of service (***multimedia, delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned under the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a network operator if required.

Values — Decimal (0..255)

ATTRIBUTE circuitId

Description — This attribute indicates a unique string, set by the operator as the "*correlationTag*" provisioned attribute, which identifies the call for accounting purposes. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network.

Typically, the attribute is provisioned, as the *correlationTag*, with the same value at both ends of the connection, but this is not mandatory. As a default, there is no *correlationTag* provisioned against the DLCI.

For single-sided accounting with the Egress Protocol on, the circuit identifier specifies the *correlationTag* value provisioned at the local interface only. There is no circuit identifier for the remote DLCI in the record. For double-sided accounting, the accounting records generated at each end contains the local *correlationTag* value.

Values — String (32, ASCII)

ATTRIBUTE callingIpAddress

Description — This attribute contains the calling IP address of the Frame Relay interface for the connection. It is only applicable when using BNX. Its value is taken from the *ipAddress* attribute in the *BnxProtocol* subcomponent of the FrUni. The *ipAddress* attribute must have been set to an IP address which is associated with the Frame Relay port. This address must be in the same subnet as the associated protocol port.

Values — IP address

ATTRIBUTE calledIpAddress

Description — This attribute contains the called IP address for the connection. It is only applicable when using BNX. Its value is taken from the *calledIpAddress* attribute in the *BnxIwf* subcomponent of the DLCI for the connection. The *calledIpAddress* attribute must have been set to the destination IP address which receives the datagrams.

Values — IP address

RESPONSE

Description — This response displays the port test statistics.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE elapsedTime

Description	This attribute is the number of minutes elaspsed since the test started.
Values	Decimal (0..4294967295)

ATTRIBUTE timeRemaining

Description	This attribute is the number of minutes remaining before the test terminates itself.
Values	Decimal (0..4294967295)

ATTRIBUTE frmTx

Description	This attribute is the number of frames sent during the test period.
Values	Long Integer

ATTRIBUTE bitsTx

Description	This attribute is the number of bits sent during the test period.
Values	Long Integer

ATTRIBUTE frmRx

Description	This attribute is the total number of frames received during the test period.
Values	Long Integer

ATTRIBUTE bitsRx

Description	This attribute is the total number of bits received during the test period.
Values	Long Integer

ATTRIBUTE erroredFrmRx

Description	This attribute is the total number of errored frame received during the test period.
Values	Long Integer

RESPONSE IP Account Record Information

Description	This record describes the attributes specific to the IP accounting. All items which belong to an IP accounting record are defined here.Ip Accounting records are generated for individual *ProtocolPorts*.

ATTRIBUTE recordIdentifier

Description	This attribute distinguishes the IP accounting record from other types of accounting records.
Values	ipAcctRecord

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE vpnId

Description — This attribute indicates the virtual Private Intranet Identifier to which the *ProtocolPort* component instance belongs.
Note that this attribute will be obsoleted in the near future. It's functionality is replaced by the *virtualPrivateNetworkIdentifier* attribute. Any affected tools that use this attribute should be converted to use the *vpnId* attribute instead.

Values — Decimal (1..255)

ATTRIBUTE collectReason

Description — This attribute indicates the reason(s) for accounting collection which are the same as the ***accountCollection*** attribute in *Vr Ip*. It can be any combination of the following reasons: ***bill, test, study, audit,*** or ***force***.

Set of
bill
test
study
audit
force

ATTRIBUTE protocolPortIfIndex

Description — This attribute indicates the interface index of the Protocol Port that generated this accounting record

Values — Decimal (1..1024)

ATTRIBUTE protocolPortInstance

Description — This attribute indicates the instance name of the protocol port that generated this accounting record.

Values — String (1..20, ASCII)

ATTRIBUTE mediaType

Description — This attribute indicates the type of media over which IP traffic is being carried. It is one of the following values:
pointToPointTunnel
pointToMultipointTunnel
frameRelay
atmMpe
ppp
A value of ***frameRelay*** is used by the *ProtocolPort* components that are linked to either the *IpDlciGroup* or *FrDte* component.

Values
pointToPointTunnel
pointToMultipointTunnel
frameRelay
atmMpe
ppp

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE localNodeIdentifier

Description	This attribute identifies the node by a unique number assigned to each node. This value is provisioned in the attribute *namsId* of the component *ModuleData*.
Values	Decimal (256..49151)

ATTRIBUTE vrInstance

Description	This attribute indicates which VR generated the accounting record.
Values	String (1..16, ASCII)

ATTRIBUTE startTime

Description	This attribute represents the starting time of the accounting interval for the *ProtocolPort.* In subsequent records, this attribute represents the starting time of the current accounting collection interval. When TODA (time of day accounting) is enabled, the collection intervals are delimited by the entries in the TODA schedule (the *Col/accounting collectionTimes* attribute). When TODA is disabled, they are delimited by a timer that expires every 12-hours.
Values	Time (DHMS)

ATTRIBUTE endTime

Description	This attribute indicates the time when the current accounting collection interval ended. In the last accounting record this attribute represents the time when accounting was disabled. When TODA (time of day accounting) is enabled, the collection intervals are delimited by the entries in the TODA schedule (the *Col/accounting collectionTimes* attribute). When TODA is disabled, they are delimited by a timer that expires every 12-hours.
Values	Time (DHMS)

ATTRIBUTE elapsedTime

Description	This attribute indicates the length of time, in 0.1 second increments, the protocol port was enabled during the reported accounting interval. It is the true duration of the accounting interval, measured independently of the start and end time (since start time and end time can be affected by the adjustment of the clock, elapsed time can be shorter or longer than the difference between them).
Values	Decimal (0..16777215)

ATTRIBUTE ipTunnelSrcAddr

Description	This attribute indicates the source IP Tunnel address in the shared domain.This attribute appears in the accounting record only if the *mediaType* is:

Copyright © 2006, Nortel Nortel Confidential

pointToPointTunnel
pointToMultipointTunnel

Values IP address

ATTRIBUTE ipTunnelDestAddr

Description This attribute indicates the destination IP Tunnel address in the shared doamin.This attribute appears in the accounting record only if the *mediaType* is:
pointToPointTunnel
pointToMultipointTunnel

Values IP address

ATTRIBUTE InOctets

Description This attribute contains the aggregate number of octets received by the *ProtocolPort* during the accounting interval.

Values Long Integer

ATTRIBUTE OutOctets

Description This attribute contains the aggregate number of octets transmitted by the *ProtocolPort* during the accounting interval.

Values Long Integer

ATTRIBUTE InPkts

Description This attribute contains the aggregate number of packets received by the *ProtocolPort* during the accounting interval.

Values Long Integer

ATTRIBUTE OutPkts

Description This attribute contains the aggregate number of packets transmitted by a *ProtocolPort* during the accounting interval.

Values Long Integer

ATTRIBUTE InDiscards

Description This attribute indicates the aggregate number of packets received by the *ProtocolPort* that were discarded, during the accounting interval.

Values Long Integer

ATTRIBUTE OutDiscards

Description This attribute indicates the aggregate number of packets transmitted by the *ProtocolPort* that were discarded, during the accounting interval.

Values Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Cos0InOctets

Description — This attribute contains the total number of Cos0 octets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos0OutOctet

Description — This attribute contains the total number of Cos0 octets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos0InPkts

Description — This attribute contains the number of Cos0 packets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos0OutPkts

Description — This attribute contains the total number of Cos0 packets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos0InDiscards

Description — This attribute indicates the number of Cos0 packets received by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos0OutDiscards

Description — This attribute indicates the number of Cos0 packets transmitted by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos1InOctets

Description — This attribute contains the total number of Cos1 octets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos1OutOctet

Description — This attribute contains the total number of Cos1 octets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Cos1InPkts

Description — This attribute contains the number of Cos1 packets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos1OutPkts

Description — This attribute contains the total number of Cos1 packets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos1InDiscards

Description — This attribute indicates the number of Cos1 packets received by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos1OutDiscards

Description — This attribute indicates the number of Cos1 packets transmitted by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos2InOctets

Description — This attribute contains the total number of Cos2 octets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos2OutOctet

Description — This attribute contains the total number of Cos2 octets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos2InPkts

Description — This attribute contains the number of Cos2 packets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos2OutPkts

Description — This attribute contains the total number of Cos2 packets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Cos2InDiscards

Description — This attribute indicates the number of Cos2 packets received by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos2OutDiscards

Description — This attribute indicates the number of Cos2 packets transmitted by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos3InOctets

Description — This attribute contains the total number of Cos3 octets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos3OutOctet

Description — This attribute contains the total number of Cos3 octets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos3InPkts

Description — This attribute contains the number of Cos3 packets received by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos3OutPkts

Description — This attribute contains the total number of Cos3 packets transmitted by the *ProtocolPort* during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos3InDiscards

Description — This attribute indicates the number of Cos3 packets received by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

ATTRIBUTE Cos3OutDiscards

Description — This attribute indicates the number of Cos3 packets transmitted by the *ProtocolPort* that were discarded, during the accounting interval.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE virtualPrivateNetworkIdentifier

Description — This attribute indicates the Virtual Private Network (VPN) associated with the Virtual Router that relates to this accounting record. This is a globally unique identifier composed of a three-octet long Organizationally Unique Identifier (OUI) followed by a four-octet long VPN index as described in RFC 2685.The value "***000000:00000000***" identifies an unspecified VPN.

Values — String (7, Hex)

ATTRIBUTE ipTunnelVcgVr

Description — This attribute indicates the IP tunnel Carrier VR (VCG) and it is used by the RTD feature only. This attribute appears in the accounting record only if the *mediaType* is:
pointToPointTunnel
pointToMultipointTunnel

Values — String (1..16, ASCII)

ATTRIBUTE ipTunnelVcgIpAddr

Description — This attribute indicates the BGP loopback IP address of the VCG VR used by RTD feature. This attribute appears in the accounting record only if the *mediaType* is:
pointToPointTunnel
pointToMultipointTunnel

Values — IP address

RESPONSE Full Vc Accounting Information

Description

This response describes the attributes specific to a full Vc accounting record. All items which belong to a full Vc accounting record are defined here. This definition is translated into Service Data Description files - sdd file. Accounting Data Server (ADS) uses the sdd file to decode accounting records.

ATTRIBUTE recordType

Description

recordType attribute indicates the type of the record. For the first record in the accounting period, only *first* is set to 1. For the last record, only *last* is set to 1. For intermediate records, both *first* and *last* are set to 0. If there is only one record in the accounting period, then both *first* and *last* are set to 1.
first, ~last - first record
~first, ~last - intermediate record.
~first, last - final record.
first, last - first and last record (one only).

Set of — first
last

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE callType

Description

This attribute defines the type of call for which this accounting record is issued.
~gateway, ~localNetwork - non gateway call.
~gateway, localNetwork - gateway call to another network
gateway, ~localNetwork - gateway call from another network
gateway, localNetwork - gateway transit call.

Set of

gateway
localNetwork

ATTRIBUTE callReferenceNumber

Description

This attribute contains the value of the call reference number assigned to each new call. Accounting records are uniquely defined by a call reference number on each function processor. In double ended accounting the *callReferenceNumber* is the same for both accounting records. Call reference number is unique only on function processor.

Values

Decimal (0..16777215)

ATTRIBUTE callingNodeIdentifier

Description

This attribute identifies the calling (originating) node by a unique number assigned to each node in the ModuleData component. (In DPN it is called a NamsId.)

Values

Decimal (256..49151)

ATTRIBUTE callingCustomerIdentifier

Description

This attribute contains the number assigned in each service to a customer and it identifies the customer at the calling end of the call in the Customer Network Management.

Values

Decimal (0; 1..8191)

ATTRIBUTE callingPortIdentifier

Description

This attribute contains the function processor number used by the service issuing the accounting record for the calling (originating) part of the call. If the port information is from DPN, then the pe, port, and pi numbers are respectively encoded as 5, 5, 6 bits.

Values

Decimal (0..65535)

ATTRIBUTE callingNpi

Description

This attribute contains calling numbering plan indicator of the calling address.

Copyright © 2006, Nortel Nortel Confidential

Values x121
e164

ATTRIBUTE callingAddress

Description
This attribute contains the calling DataNetworkAddress of the interface. *callingAddress* includes DNIC (first 4 digits) for X.121, and CC (Country Code) for the E.164 address of the calling end. The maximum length is 15 digits.

Values BCD (1..15)

ATTRIBUTE callingDlci

Description
This attribute contains the calling DLCI number of the interface. (DLCI is sometimes called LCN - logical channel number). This number is assigned to the call request at the calling end.

Values Decimal (16..1007)

ATTRIBUTE calledNodeIdentifier

Description
This attribute identifies the called (terminating) node by a unique number assigned to each node in the ModuleData component. (In DPN it is called a NamsId.)

Values Decimal (256..49151)

ATTRIBUTE calledCustomerIdentifier

Description
This attribute contains the number assigned in each service to a customer and it identifies the customer at the called end of the call in the Customer Network Management.

Values Decimal (0; 1..8191)

ATTRIBUTE calledPortIdentifier

Description
This attribute contains the function processor number used by the service issuing accounting record for the called (terminating) side of the call. If the port information is from DPN, then the pe, port, and pi numbers are respectively encoded as 5, 5, 6 bits.

Values Decimal (0..65535)

ATTRIBUTE calledNpi

Description This attribute contains the called numbering plan indicator of the called address.

Values x121
e164

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE calledAddress

Description

This attribute contains the called DataNetworkAddress of the interface. *calledAddress* includes DNIC (first 4 digits) for X.121, and CC (Country Code) for the E.164 address of the called end. The maximum length is 15 digits.

Values BCD (1..15)

ATTRIBUTE calledDlci

Description

This attribute contains the called DLCI number of the interface. (DLCI is sometimes called LCN - logical channel number). This number is assigned to the call request at the called end.

Values Decimal (16..1007)

ATTRIBUTE segmentSizeIndex

Description

This attribute is the segment size index provisioned on the module.
It is used to calculate the number of segments sent and received in the accounting record. Two to the power of *segmentSizeIndex* is equal to the segment size (in bytes) provisioned in the *VirtualCircuitSytem* component. For example, if the segment size is 128, then *segmentSizeIndex* is 7.

Values Decimal (0..16)

ATTRIBUTE clearCause

Description This attribute is the clear cause signalled at the end of connection. It is set to H.b0 for intermediate records.

Values Decimal (0..255)

ATTRIBUTE diagnosticCode

Description This attribute is the diagnostic code signalled at the end of connection. It is set to 0 for intermediate records

Values Decimal (0..255)

ATTRIBUTE callingServiceType

Description

This attribute indicates the service supported by the port used by the calling end. This number is provisioned on each interface Dna as *accountClass*.

Values Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE callingCollectReason

Description
This attribute indicates the reason for accounting collection of the calling end (can be any combination of Audit, Study, Test, Billing, Force).

Set of
bill
test
study
audit
force

ATTRIBUTE callingDse

Description
This attribute defines the calling end Data Service Exchange provisioned in Dna as arbitrary number in *serviceExchange* attribute.

Values
Decimal (0..255)

ATTRIBUTE calledServiceType

Description
This attribute indicates the service supported by the port used by the called end-user. This number is provisioned on each interface Dna as *accountClass*.

Values
Decimal (0..255)

ATTRIBUTE calledCollectReason

Description
This attribute indicates the reason for accounting collection of the called end (can be any combination of Audit, Study, Test, Billing, Force).

Set of
bill
test
study
audit
force

ATTRIBUTE calledDse

Description
One byte field defines the called end Data Service Exchange provisioned in Dna as arbitrary number in *serviceExchange* attribute.

Values
Decimal (0..255)

ATTRIBUTE flags

Description
This attribute contains values for call characteristics.
calledEndCharging - called end is charging.
~calledEndCharging - calling end is charging
highPriority - call is high priority.
pvcType - call is Pvc.
~pvcType - call is svc.

Copyright © 2006, Nortel
Nortel Confidential

	hunted - call was hunted. redirected - call was redirected. calledGenerated - called end generated accounting record. ~calledGenerated - calling end generated accounting record. calledCleared - call was cleared by called end. ~calledCleared - call was cleared by calling end. unique - accounting record is unique. reachedDataTransfer - call reached data transfer. collReasonValid - collection reasons are valid. userDataInCallReq - user data present in call request. fastSelect - fast select call restrictedResponse - fast select call with restricted response
Set of	calledEndCharging highPriority pvcType hunted redirected calledGenerated calledCleared unique reachedDataTransfer collReasonValid userDataInCallReq fastSelect restrictedResponse

ATTRIBUTE startTime

Description	This attribute represents start time in the accounting record. For SVC it is the time when the call request packet was created. For PVC it is set by the Master VC when the master call is formatted. On subsequent accounting record, the start time corresponds to the end time of the previous record. If Time of Day Accounting (TODA) is used, start time (and end time) correspond to times set in the schedule (set in *Col/accounting collectionTimes* attribute).
Values	Time (DHMS)

ATTRIBUTE endTime

Description	This attribute represents end time in the accounting record. If TODA is used, the end time in non-final records is the time of the TODA period. For 12-hour accounting, the time on non-final records is the time when the 12-hour timer expires at the charged end. On final accounting records, the end time is the time when the disconnect packet is first received. If Time of Day Accounting (TODA) is used, end time (and start time) correspond to times set in the schedule (set in *Col/accounting collectionTimes* attribute).
Values	Time (DHMS)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE elapsedTime

Description

Duration of the call in 0.1 second increments. This time interval is started when call request is processed. If call does not reach data transfer elapsed time is set to 0. Elapsed time represents true measure of the accounting period. It is measured independent of start time and end time. Since start time and end time can be changed externally by adjusting the clock, elapsed time can be shorter or longer than difference between start time and end time. This difference can show as much as 60 seconds on accounting records for the virtual circuits which are idle (carry no traffic) and when TODA is used and is caused in this case by internal TODA detection mechanism. When 12 hour accounting period is used elapsed time is exact or differs by a few seconds from 12 hour duration.

Values Decimal (0..16777215)

ATTRIBUTE localEgressSegments

Description This attribute contains the total number of segments received at the local end.

Values Decimal (0..4294967295)

ATTRIBUTE localIngressSegments

Description This attribute contains the total number of segments sent at the local end.

Values Decimal (0..4294967295)

ATTRIBUTE originalNpi

Description This attribute contains numbering plan indicator for originally called address.

Values x121
e164

ATTRIBUTE originalAddress

Description This attribute contains originally called DataNetworkAddress of the interface if call was redirected.

Values BCD (1..15)

ATTRIBUTE originalServiceType

Description This attribute indicates the service supported by the port used by the calling end. This number is provisioned on each interface Dna as accountClass.

Values Decimal (0..255)

ATTRIBUTE callingReceiveWindow

Description

This attribute contains the value for the local calling end receive window

Copyright © 2006, Nortel Nortel Confidential

size. For SVC/PVC this field is populated by X.25 and X.75 services, all other services set it to 0.

Values Decimal (0..16)

ATTRIBUTE calledReceiveWindow

Description

This attribute contains the value for the local called end receive window size. For SVC/PVC this field is populated by X.25 and X.75 services, all other services set it to 0.

Values Decimal (0..16)

ATTRIBUTE callingSendWindow

Description

This attribute contains the value for the local calling end send window size. For SVC/PVC this field is populated by X.25 and X.75 services, all other services set it to 0.

Values Decimal (0..16)

ATTRIBUTE calledSendWindow

Description

This attribute contains the value for the local called end send window size. For SVC/PVC this field is populated by X.25 and X.75 services, all other services set it to 0.

Values Decimal (0..16)

ATTRIBUTE callingCalledThruput

Description

This attribute contains throughput class of packets sent from the calling DTE to the called end.

Values Decimal (0..16)

ATTRIBUTE calledCallingThruput

Description

This attribute contains throughput class of packets sent from the called DTE to the calling end.

Values Decimal (0..16)

ATTRIBUTE callingCalledPktSize

Description

This attribute contains the value of the packet size sent from the calling DTE to the called end. The value is base 2 of actual packet size.

Values Decimal (0..16)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE calledCallingPktSize

Description

This attribute contains the value of the packet size sent from the called DTE to the calling end. The value is base 2 of actual packet size.

Values

Decimal (0..16)

ATTRIBUTE recordIdentifier

Description

recordIdentifier attribute indicates the contents of the accounting record.

Values

gvcVintage4
frsVintage4
frsLocalCounts
frsLocalAndRemoteCounts
frsShortLocalCounts
frsShortLocalAndRemoteCounts

ATTRIBUTE localUserResets

Description

This attribute contains the total number of user resets at the local end.

Values

Decimal (0..4294967295)

ATTRIBUTE callingTransferPriority

Description

This attribute indicates the transfer priority used in the direction towards the network.

The transfer priority is a preference configured for an application according to its time-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n is the transfer priority index, contains a default setting for routing class of service (***multimedia, delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned under the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a network operator if required.

Values

Decimal (0..255)

ATTRIBUTE calledTransferPriority

Description

This attribute indicates the transfer priority used in the direction from the network.

The transfer priority is a preference configured for an application according to its time-sensitivity requirement. Frames with high transfer priority are served by the network before the frames with normal priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Values — Decimal (0..255)

RESPONSE Time Change Information

Description

This response describes the attributes specific to an event caused by change of time on the switch. When time is adjusted by more than 20 seconds, time change record is issued and sent to be part of accounting stream. It is then used to keep track of changed of clock for each switch and to explain potential inconsistencies in the accounting records related to start time and end time.

ATTRIBUTE recordType

Description

Always set to first and last.

Set of

first
last

ATTRIBUTE oldDate

Description

This attribute represents old time on the switch before time was adjusted.

Values — Time (DHMS)

ATTRIBUTE newDate

Description

This attribute represents new time on the switch after time was adjusted. Change of time may cause TODA trigger to generate accounting records if time which was adjusted spans TODA expiry. TODA expiry is defined in *Collector/Accounting* component *collectionTimes* attribute.

Values — Time (DHMS)

ATTRIBUTE namsId

Description

This attribute contains *namsId* of the switch which issued time change accounting record. Value of *namsId* is provisioned in *ModuleData* component.

Values — Decimal (256..49151)

Copyright © 2006, Nortel Nortel Confidential

gvcVintage4
frsVintage4
frsLocalCounts
frsLocalAndRemoteCounts
frsShortLocalCounts
frsShortLocalAndRemoteCounts
timeChangeRecord

RESPONSE Mpa Voice Accounting Information

Description

This response describes the attributes specific to an MPA voice accounting record. All items which belong to an MPA voice accounting record are defined here. This definition is translated into Service Data Description files - sdd file. Multiservice Data Provider (MDP) uses the sdd file to decode accounting records.

ATTRIBUTE recordIdentifier

Description

This attribute distinguishes the Voice accounting record from other types of accounting records.

Values

mpaVoAccRecord

ATTRIBUTE recordType

Description

This attribute indicates the type of the record. For the first record in the accounting period, only ***first*** is set. For the last record, only ***last*** is set. For intermediate records, neither ***first*** nor ***last*** is set. If there is only one record in the accounting period, then both ***first*** and ***last*** are set.
first, ***~last*** (recordType_first 1, recordType_last 0) - first record
~first, ***~last*** (recordType_first 0, recordType_last 0) - intermediate record.
~first, ***last*** (recordType_first 0, recordType_last 1) - final record.
first, ***last*** (recordType_first 1, recordType_last 1) - first and last record (one only).

Set of

first
last

ATTRIBUTE callCorrelationIdentifier

Description

This attribute indicates a unique value assigned to all accounting records generated by calling and called nodes for this call. The *callCorrelationId* is used during post processing of accounting records to correlate records generated by different nodes. The *callCorrelationId* is always unique in the network with respect to *callCorrelationIds* generated by other function processors. The value of *callCorrelationId* repeats after 2^{24} calls on the same, continually active function processor.

Values

String (13, Hex)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE startTime

Description	This attribute indicates the start time of the accounting record. For the first record, this is the time when the setup message was received. On subsequent accounting records, the *startTime* will be equal to the *endTime* of the previous record. If Time of Day Accounting (TODA) is used, *startTime* is the time of the TODA (set in *Col/accounting collectionTimes* attribute).
Values	Time (DHMS)

ATTRIBUTE endTime

Description	This attribute indicates end time of the accounting record. In the final accounting record for a call, *endTime* is the time when the disconnect packet was received. If TODA is used, *endTime* in non-final records is the time of the TODA. For 12-hour accounting, *endTime* in non-final records is the time when the 12-hour timer expires.
Values	Time (DHMS)

ATTRIBUTE elapsedTime

Description	This attribute indicates the duration of the call in 0.1 second increments. This time interval is started when the call request is processed. *elapsedTime* indicates the true measure of the accounting period. It is measured independent of *startTime* and *endTime*. Since *startTime* and *endTime* can be changed externally by adjusting the clock, *elapsedTime* can be shorter or longer than the difference between *startTime* and *endTime*. When 12 hour accounting is used, *elapsedTime* is exact or differs by a few seconds from a 12 hour duration.
Values	Decimal (0..16777215)

ATTRIBUTE localNodeIdentifier

Description	This attribute identifies the *nodeId* of the node that generated the accounting record. *nodeId* is assigned to each node in the *ModuleData* component.
Values	Decimal (1..4095)

ATTRIBUTE localLogicalProcessor

Description	This attribute indicates the logical processor used by the service issuing the accounting record.
Values	Decimal (0..15)

ATTRIBUTE localPort

Description	This attribute indicates the port used by the service issuing the accounting record.
Values	Decimal (0..1024)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE localMpanlInstanceNo

Description	This attribute indicates the MPANL instance number issuing the accounting record.
Values	Decimal (1..65535)

ATTRIBUTE callingNumber

Description	This attribute indicates the calling number signalled to the node. This may have a length of 0 if the calling number was not provided.
Values	String (0..16, ASCII)

ATTRIBUTE localDlci

Description	This attribute indicates the local dlci number of the interface. This number is assigned to the call request by the node generating this accounting record.
Values	Decimal (0; 16..1007)

ATTRIBUTE calledNumber

Description	This attribute indicates the called number signalled to the node. If *Mpanl/n Voice Acct digitsSuppressed* was provisioned with a non-zero value, that number of trailing digits in *calledNumber* are replaced with “X”s.
Values	String (1..32, ASCII)

ATTRIBUTE connectedNumber

Description	This attribute indicates the connected number signalled to the node. This may have a length of zero if the connected number was not provided.
Values	String (0..16, ASCII)

ATTRIBUTE sourceNpi

Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *sourceDna*. This is the value sent by the source accounting node to the destination accounting node during call setup. The *sourceDna* may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Values	x121 e164

ATTRIBUTE sourceDna

Description	This attribute indicates the data network address (the unique identifier) of the calling addressable switched voice application. This is the value sent by the source accounting node to the destination accounting node during call setup. It is valid in accounting records generated by both ends of the call.
Values	BCD (0..15)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE destinationNpi

Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *destinationDna*. This is the value sent by the destination accounting node to the source accounting node during call setup. The *destinationDna* may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Values	x121 e164

ATTRIBUTE destinationDna

Description	This attribute indicates the data network address (the unique identifier) of the called addressable switched voice application. This is the value sent by the destination accounting node to the source accounting node during call setup. It is valid in accounting records generated by both ends of the call.
Values	BCD (0..15)

ATTRIBUTE clearCause

Description	This attribute indicates the reason the call was cleared. If the call was cleared in the subnet, this attribute contains a Q931 value regardless of the source protocol. If the call was cleared by the MPA, this attribute may contain other information conforming to the specifications of the used protocol. It is set to 0 for intermediate records.
Values	Decimal (0..127)

ATTRIBUTE diagnosticCode

Description	This attribute indicates the diagnostic code signalled at the end of connection. It is set to 0 for intermediate records.
Values	Hex (H.0..H.ffffff)

ATTRIBUTE localServiceType

Description	This attribute indicates the service supported by the port used by the local interface. This number is provisioned on each interface as *accountClass*.
Values	Decimal (0..255)

ATTRIBUTE localCollectReason

Description	This attribute indicates the reason the accounting record was generated (The reason can be any combination of ***audit***, ***study***, ***test***, ***bill***).
Set of	bill test study audit

ATTRIBUTE localDse

Description — This attribute defines the local end Data Service Exchange provisioned as an arbitrary number in *serviceExchange* attribute.

Values — Decimal (0..255)

ATTRIBUTE localCustomerIdentifier

Description — This attribute indicates the number assigned in each service to a customer. It identifies the customer in the Customer Network Management on the end which generated the accounting record.

Values — Decimal (0; 1..8191)

ATTRIBUTE mpaVoiceFlags

Description — This attribute indicates values for call characteristics.
answered (mpaVoFlags_answered 1) - The call was answered
originating (mpaVoFlags_originating 1) - The local end originated the call.
~originating (mpaVoFlags_originating 0) - The far end originated the call.
unique (mpaVoFlags_unique 1) - If this is set to 1, it guarantees that only the local end generated one or more accounting records for this call.
clearedInSubnet (mpaVoFlags_clearedInSubnet 1) - This flag is only valid in the final accounting record. The value 1 indicates the call was cleared from within the subnet side of this MPANL instance.
~clearedInSubnet (mpaVoFlags_clearedInSubnet 0) - This flag is only valid in the final accounting record. The value 0 indicates the call was cleared from outside the subnet side of this MPANL instance.

Set of — answered
originating
unique
clearedInSubnet

ATTRIBUTE callAnswerTime

Description — This attribute indicates the time in seconds between the setup indication and the call answered indication for answered calls. For unanswered calls, this attribute indicates the time between the setup indication and the call release indication. For values greater than 255 seconds it reports 255 seconds.

Values — Decimal (0..255)

RESPONSE ATM Accounting Record Information

Description — This response describes the attributes specific to the ATM accounting record. All items that belong to an ATM accounting record are defined here.

ATTRIBUTE recordIdentifier

Description — This attribute distinguishes the ATM accounting record from other types of accounting records.

Copyright © 2006, Nortel Nortel Confidential

Values atmAccRecord

ATTRIBUTE recordType

Description The *recordType* attribute indicates the position of the accounting record in a sequence of records generated by a given interface for a given call.

The attribute is a set that contains the value ***first*** for the first record of the call and the value ***last*** for the last record of a call; for calls that generate only one accounting record, both ***first*** and ***last*** are present.; for intermediate records, neither ***first*** nor ***last*** are present.

Set of
first
last

ATTRIBUTE callConnId

Description This attribute may be used by downstream processing systems to correlate the accounting records issued for the same call at different interfaces (nodes) in the network. For SVCs (switched virtual connections) and S-PVCs (soft permanent virtual connections), the *callConnId* is generated by the switch and is unique for every call in the network. For PVCs (permanent virtual connections), the *callConnId* is provisioned in the *correlationTag* attribute of the *AtmIf Vcc Vcd* or *AtmIf Vpc Vpd* component.

Values String (64, Hex)

ATTRIBUTE callingCollectReason

Description This attribute indicates the reason(s) for accounting collection at the ATM interface. It can be any combination of the following reasons: ***Billing, Test, Study, Audit,*** or ***Force***. For SVCs and SPVCs, it indicates the value provisioned in attribute *accountCollection* of component *AtmIf Uni* or *Atmif Iisp*. For PVCs, it indicates the value provisioned in attribute *accountCollection* of *NAcct*.

For SVCs and SPVCs, this attribute is present only for incoming calls.

For PVCs, only *calledCollectReason* is present for both incoming and outgoing calls.

Set of
bill
test
study
audit
force

ATTRIBUTE calledCollectReason

Description This attribute indicates the reason(s) for accounting collection at the ATM interface. It can be any combination of the following reasons: ***Billing, Test, Study, Audit,*** or ***Force***. For SVCs and SPVCs, it indicates the value provisioned in attribute *accountCollection* of component *AtmIf Uni* or *AtmIf Iisp*. For PVCs, it indicates the value provisioned in attribute

accountCollection of component *AtmIf NAcct*.

For SVCs and SPVCs, this attribute is present only for outgoing calls.

For PVCs, only *calledCollectReason* is present for both incoming and outgoing calls.

Set of
bill
test
study
audit
force

ATTRIBUTE callingServiceType

Description

This attribute indicates the service type of the interface that generated the accounting record. For SVCs and SPVCs, the value is provisioned in attribute *accountClass* for each ATM interface (under the *AtmIf Uni* or *AtmIf Iisp* component). For PVCs, it indicates the value provisioned in attribute *accountClass* of component *AtmIf NAcct*.

For SVCs and SPVCs, this attribute is present only for incoming calls.

For PVCs, only *calledServiceType* is present for both incoming and outgoing calls.

Values

Decimal (0..255)

ATTRIBUTE calledServiceType

Description

This attribute indicates the service type of the interface that generated the accounting record. For SVCs and SPVCs, the value is provisioned in attribute *accountClass* for each ATM interface (under the *AtmIf Uni* or *AtmIf Iisp* component). For PVCs, the value is provisioned in attribute *accountClass* for each ATM interface (under the *AtmIf NAcct* component).

For SVCs and SPVCs, this attribute is present only for outgoing calls.

For PVCs, only *calledServiceType* is present for both incoming and outgoing calls.

Values

Decimal (0..255)

ATTRIBUTE callingDse

Description

This attribute indicates the Data Service Exchange associated with the ATM interface. For SVCs and SPVCs, it indicates the value provisioned in attribute *serviceExchange* of component *AtmIf Uni* or *AtmIf Iisp*. For PVCs, it indicates the value provisioned in attribute *serviceExchange* of component *AtmIf NAcct*.

For SVCs and SPVCs, this attribute is present only for incoming calls.

For PVCs, only *calledDse* is present for both incoming and outgoing calls.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..255)

ATTRIBUTE calledDse

Description	This attribute indicates the Data Service Exchange associated with the ATM interface. For SVCs and SPVCs, it indicates the value provisioned in attribute *serviceExchange* of component *AtmIf Uni* or *AtmIf Iisp*. For PVCs, it indicates the value provisioned in attribute *serviceExchange* of component *AtmIf NAcct*. For SVCs and SPVCs, this attribute is present only for outgoing calls. For PVCs, only *calledDse* is present for both incoming and outgoing calls.
Values	Decimal (0..255)

ATTRIBUTE callOrigMethod

Description	This attribute indicates whether the call is point-to-point, point-to-multipoint, multipoint-to-multipoint, or multipoint-to-point.
Values	pointToPoint pointToMultipt multiptToPoint multiptToMultipt

ATTRIBUTE callType

Description	This attribute indicates the type of call. It is one of the following values: ***pvcChannel*** (switched virtual connection) ***spvcChannel*** (soft permanent virtual connection) ***pvcChannel*** (permanent virtual channel transporting a nailed up connection) ***pvcPath*** (permanent virtual path transporting a nailed up connection)
Values	pvcChannel pvcPath svcChannel spvcChannel

ATTRIBUTE connPointType

Description	This attribute indicates what type of connection point generated the call record: ***originating***, ***intermediate***, or ***terminating***. It can be used by downstream processing systems when correlating two or more records for the same call.
Values	originating intermediate terminating

ATTRIBUTE atmInterfaceNumber

Description	This attribute indicates the number of the ATM interface that generates the accounting record.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..4095)

ATTRIBUTE callVpi

Description	This attribute indicates the VPI of the connection point at the interface where the accounting record is generated.
Values	Decimal (0..4095)

ATTRIBUTE callVci

Description	This attribute indicates the VCI of the connection point at the interface where the accounting record is generated.
Values	Decimal (0..65535)

ATTRIBUTE atmCallTermCauseValue

Description	This attribute indicates the call termination cause value as defined by the ATM Forum AtmIf UNI 3.1 specification. It is set to 0 for non-final records.
Values	Decimal (0..255)

ATTRIBUTE callTermInSetup

Description	This attribute indicates whether or not the call was terminated in setup (unsuccessful call attempt).
Values	false true

ATTRIBUTE cellCountValidityFlag

Description	This attribute indicates whether or not the cell counts in this accounting record are valid.
Values	invalid valid

ATTRIBUTE startTime

Description	In the first accounting record for a call, this attribute indicates the time the call was set up. In subsequent records, this attribute represents the time the current accounting collection interval started. When TODA (time of day accounting) is enabled, the collection intervals are delimited by the entries in the TODA schedule (the *Col/accounting collectionTimes* attribute). When TODA is disabled, they are delimited by a timer that expires every 12-hours (per call).
Values	Time (DHMS)

ATTRIBUTE endTime

Description	In non-final accounting records, this attribute indicates the time the current accounting collection interval ended. In the final record for a call, this attribute represents the time the call was cleared.

Copyright © 2006, Nortel Nortel Confidential

When TODA is enabled, the collection intervals are delimited by the entries in the TODA schedule (the *Col/accounting collectionTimes* attribute). When TODA is disabled, they are delimited by a timer that expires every 12-hours (per call).

Values — Time (DHMS)

ATTRIBUTE elapsedTime

Description — This attribute indicates the length of time, in 0.1 second increments, the connection was enabled during the reported accounting interval. It is the true duration of the accounting interval, measured independently of the start and end time (since start time and end time can be affected by the adjustment of the clock, elapsed time can be shorter or longer than the difference between them).

Values — Decimal (0..16777215)

ATTRIBUTE callingNsapAddr

Description — This attribute indicates the NSAP address of the calling party.

This attribute is not present in accounting records for PVCs.

Values — String (20, Hex)

ATTRIBUTE calledNsapAddr

Description — This attribute indicates the NSAP address of the called party.

This attribute is not present in accounting records for PVCs.

Values — String (20, Hex)

ATTRIBUTE callingNsapSubAddr

Description — This attribute indicates the saved NSAP address of the calling party (which is restored when leaving the public network).

This attribute is not present in accounting records for PVCs.

Values — String (20, Hex)

ATTRIBUTE calledNsapSubAddr

Description — This attribute indicates the saved NSAP address of the called party (which is restored when leaving the public network).

This attribute is not present in accounting records for PVCs.

Values — String (20, Hex)

ATTRIBUTE callForwPcrClp0

Description — This attribute indicates the Peak Cell Rate (PCR) for the connection in the forward direction, for high-priority cells (with CLP=0). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callForwPcrClp01

Description — This attribute indicates the Peak Cell Rate (PCR) for the connection in the forward direction, for all cells (with CLP=0 or CLP=1). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callForwScrClp0

Description — This attribute indicates the Sustained Cell Rate (SCR) for the connection in the forward direction, for high-priority cells (with CLP=0). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callForwScrClp01

Description — This attribute indicates the Sustained Cell Rate (SCR) for the connection in the forward direction, for all cells (with CLP=0 or CLP=1). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callForwMbsClp0

Description — This attribute indicates the Maximum Burst Size (MBS) for the connection in the forward direction, for high-priority cells (with CLP=0). The value is in cells.

Values — Decimal (0..4294967295)

ATTRIBUTE callForwMbsClp01

Description — This attribute indicates the Maximum Burst Size (MBS) for the connection in the forward direction, for all cells (with CLP=0 or CLP=1). The value is in cells.

Values — Decimal (0..4294967295)

ATTRIBUTE callForwQos

Description — This attribute indicates the quality of service (QoS) for the connection in the forward direction. The values of the QoS are conforming to the ATM Forum Atmif UNI 3.1 specification.

Values — Decimal (0..4)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE callBackPcrClp0

Description — This attribute indicates the Peak Cell Rate (PCR) for the connection in the backward direction, for high-priority cells (with CLP=0). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callBackPcrClp01

Description — This attribute indicates the Peak Cell Rate (PCR) for the connection in the backward direction, for all cells (with CLP=0 or CLP=1). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callBackScrClp0

Description — This attribute indicates the Sustained Cell Rate (SCR) for the connection in the backward direction, for high-priority cells (with CLP=0). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callBackScrClp01

Description — This attribute indicates the Sustained Cell Rate (SCR) for the connection in the backward direction, for all cells (with CLP=0 or CLP=1). The value is in cells per second.

Values — Decimal (0..4294967295)

ATTRIBUTE callBackMbsClp0

Description — This attribute indicates the Maximum Burst Size (MBS) for the connection in the backward direction, for high-priority cells (with CLP=0). The value is in cells.

Values — Decimal (0..4294967295)

ATTRIBUTE callBackMbsClp01

Description — This attribute indicates the Maximum Burst Size (MBS) for the connection in the backward direction, for all cells (with CLP=0 or CLP=1). The value is in cells.

Values — Decimal (0..4294967295)

ATTRIBUTE callBackQos

Description — This attribute indicates the quality of service (QoS) for the connection in the backward direction. The values of the QoS are conforming to the ATM Forum Uni 3.1 specification.

Values — Decimal (0..4)

ATTRIBUTE ingressCellCountClp0

Description — This attribute contains the number of high priority cells (with CLP=0) received from the link during the accounting interval.

Values — Long Integer

ATTRIBUTE ingressCellCountClp01

Description — This attribute indicates the total number of cells (with CLP=0 or CLP=1) received from the link during the accounting interval.

Values — Long Integer

ATTRIBUTE egressCellCountClp0

Description — This attribute contains the number of high priority cells (with CLP=0) transmitted on the link during the accounting interval.

Values — Long Integer

ATTRIBUTE egressCellCountClp01

Description — This attribute indicates the total number of cells (with CLP=0 or CLP=1) transmitted on the link during the accounting interval.

Values — Long Integer

ATTRIBUTE ingressDiscardedClp0

Description — This attribute indicates the number of high priority cells or frames (with CLP=0) received from the link and discarded (not transmitted to the switch) during the accounting interval.

For consistency with other operational measurements for various applications, the count is expressed either as number of cells or as number of frames.

For applications: Loop, CES, Wireless, PVG, and ABS, the count is expressed in cells.

For applications: FrAtm, PORS, ATMMPE, and control channels for SVCs, the count is expressed in frames.

For applications: Test, SVCs, SVPs, and MPLS, the count is expressed in cells unless AAL5 is used. When AAL5 is used, the count is expressed in frames.

Values — Long Integer

ATTRIBUTE ingressDiscardedClp01

Description — This attribute indicates the total number of cells or frames (with CLP=0 or CLP=1) received from the link and discarded (not transmitted to the switch) during the accounting interval.

Copyright © 2006, Nortel Nortel Confidential

Values — Long Integer

ATTRIBUTE callTrafficMgmt

Description — This attribute indicates the traffic management policy in effect for the call: tagging (setting CLP=1) or dropping cells.
If ***tagFwd*** is present, then tagging is enabled in the forward direction, otherwise cells are dropped; if ***tagBkwd*** is present, then tagging is enabled in the backward direction, otherwise cells are dropped.

Set of — tagFwd
tagBwd

ATTRIBUTE callBestEffort

Description — This attribute indicates whether the “best effort” request was specified in the call setup message.

Values — false
true

ATTRIBUTE callingCustomerIdentifier

Description — This attribute contains the number assigned in each service to a customer and it identifies the customer at the calling end of the call in the Customer Network Management.

For SVCs and SPVCs, this attribute is present only for incoming calls.

For PVCs, only *calledCustomerIdentifier* is present for both incoming and outgoing calls.

Values — Decimal (0..8191)

ATTRIBUTE calledCustomerIdentifier

Description — This attribute contains the number assigned in each service to a customer and it identifies the customer at the called end of the call in the Customer Network Management.

For SVCs and SPVCs, this attribute is present only for outgoing calls.

For PVCs, only *calledCustomerIdentifier* is present for both incoming and outgoing calls.

Values — Decimal (0..8191)

ATTRIBUTE callingNodeIdentifier

Description — This attribute identifies the calling node by a unique number assigned to each node. This value is provisioned in the attribute *namsId* of the

Copyright © 2006, Nortel Nortel Confidential

component *ModuleData*.

For SVCs and SPVCs, this attribute is present only for incoming calls.

For PVCs, only *calledNodeIdentifier* is present for both incoming and outgoing calls.

Values — Decimal (256..49151)

ATTRIBUTE calledNodeIdentifier

Description — This attribute identifies the called node by a unique number assigned to each node. This value is provisioned in the attribute *namsId* of the component *ModuleData*

For SVCs and SPVCs, this attribute is present only for outgoing calls.

For PVCs, only *calledNodeIdentifier* is present for both incoming and outgoing calls.

Values — Decimal (256..49151)

ATTRIBUTE minimumCtd

Description — This attribute indicates the minimum calculated cell transfer delay value in microseconds for this connection. Cell transfer delay is calculated as half of the measured segment round trip delay of a loopback cell.

This value is visible only for SPVC and SPVP connections when the *ctdCalculation* attribute of the *AtmIf* component is ***on*** and the *segSwitchSideLoopback* attribute value is ***on*** for the connection.

The value is 0 when the switch-side loopback is not working.

Values — Decimal (0..2147483647)

ATTRIBUTE maximumCtd

Description — This attribute indicates the maximum calculated cell transfer delay value in microseconds for this connection. Cell transfer delay is calculated as half of the measured segment round trip delay of a loopback cell.

This value is visible only for SPVC and SPVP connections when the *ctdCalculation* attribute of the *AtmIf* component is ***on*** and the *segSwitchSideLoopback* attribute value is ***on*** for the connection.

The value is 0 when the switch-side loopback is not working.

Values — Decimal (0..2147483647)

ATTRIBUTE averageCtd

Description — This attribute indicates the average of all calculated cell transfer delay in microseconds for this connection. Cell transfer delay is calculated as half of the measured segment round trip delay of a loopback cell.

Copyright © 2006, Nortel Nortel Confidential

This value is visible only for SPVC and SPVP connections when the *ctdCalculation* attribute of the *AtmIf* component is ***on*** and the *segSwitchSideLoopback* attribute value is ***on*** for the connection.

The value is 0 when the switch-side loopback is not working.

Values — Decimal (0..2147483647)

ATTRIBUTE sampleSizeCtd

Description — This attribute indicates the number of loopback cells sampled for cell transfer delay calculations.

This value is included only for SPVC and SPVP connections when the *ctdCalculation* attribute of the *AtmIf* component is ***on*** and the *segSwitchSideLoopback* attribute value is ***on*** for the connection.

Values — Decimal (0..16384)

ATTRIBUTE lFwdTotalUserCellTxClp0

Description — This attribute indicates the total number of user cells with CLP=0 transmitted from the local side in the forward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values — Long Integer

ATTRIBUTE lFwdTotalUserCellTxClp01

Description — This attribute indicates the total number of user cells with CLP=0+1 transmitted from the local side in the forward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values — Long Integer

ATTRIBUTE lFwdTotalUserCellRxClp0

Description — This attribute indicates the total number of user cells with CLP=0 received on the Remote Side in the forward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values — Long Integer

ATTRIBUTE lFwdTotalUserCellRxClp01

Description — This attribute indicates the total number of user cells with CLP=0+1 received on the Remote Side in the forward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values — Long Integer

ATTRIBUTE lFwdTotalPmCellDiscardCount

Description — This attribute indicates the total number of Performance Monitoring cells discarded in the forward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE IBwdTotalUserCellTxClp0

Description This attribute indicates the total number of user cells with CLP=0 transmitted from the Remote Side in the backward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values Long Integer

ATTRIBUTE IBwdTotalUserCellTxClp01

Description This attribute indicates the total number of user cells with CLP=0+1 transmitted from the Remote Side in the backward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values Long Integer

ATTRIBUTE IBwdTotalUserCellRxClp0

Description This attribute indicates the total number of user cells with CLP=0 received on the local side in the backward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values Long Integer

ATTRIBUTE IBwdTotalUserCellRxClp01

Description This attribute indicates the total number of user cells with CLP=0+1 received on the local side in the backward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values Long Integer

ATTRIBUTE IBwdTotalPmCellDiscardCount

Description This attribute indicates the total number of Performance Monitoring cells discarded in the backward direction. This value is included only when Performance Monitoring is provisioned on the link side.

Values Decimal (0..4294967295)

ATTRIBUTE IArTotalTime

Description This attribute indicates the total time in seconds that is used to calculate the Availability Ratio. This value is included only when Performance Monitoring is provisioned on the link side.

Values Decimal (0..4294967295)

ATTRIBUTE IArAvailableTime

Description This attribute indicates the total time in seconds that a connection was available. This value is included only when Performance Monitoring is provisioned on the link side.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE sFwdTotalUserCellTxClp0

Description — This attribute indicates the total number of user cells with CLP=0 transmitted from the local side in the forward direction. This value is included only when performance Monitoring is provisioned on the switch side.

Values — Long Integer

ATTRIBUTE sFwdTotalUserCellTxClp01

Description — This attribute indicates the total number of user cells with CLP=0+1 transmitted from the local side in the forward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values — Long Integer

ATTRIBUTE sFwdTotalUserCellRxClp0

Description — This attribute indicates the total number of user cells with CLP=0 received on the Remote Side in the forward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values — Long Integer

ATTRIBUTE sFwdTotalUserCellRxClp01

Description — This attribute indicates the total number of user cells with CLP=0+1 received on the Remote Side in the forward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values — Long Integer

ATTRIBUTE sFwdTotalPmCellDiscardCount

Description — This attribute indicates the total number of Performance Monitoring cells discarded in the forward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values — Decimal (0..4294967295)

ATTRIBUTE sBwdTotalUserCellTxClp0

Description — This attribute indicates the total number of user cells with CLP=0 transmitted from the Remote Side in the backward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values — Long Integer

ATTRIBUTE sBwdTotalUserCellTxClp01

Description — This attribute indicates the total number of user cells with CLP=0+1 transmitted from the Remote Side in the backward direction. This value is

included only when Performance Monitoring is provisioned on the switch side.

Values Long Integer

ATTRIBUTE sBwdTotalUserCellRxClp0

Description This attribute indicates the total number of user cells with CLP=0 received on the local side in the backward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values Long Integer

ATTRIBUTE sBwdTotalUserCellRxClp01

Description This attribute indicates the total number of user cells with CLP=0+1 received on the local side in the backward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values Long Integer

ATTRIBUTE sBwdTotalPmCellDiscardCount

Description This attribute indicates the total number of Performance Monitoring cells discarded in the backward direction. This value is included only when Performance Monitoring is provisioned on the switch side.

Values Decimal (0..4294967295)

ATTRIBUTE sArTotalTime

Description This attribute indicates the total time in seconds that is used to calculate the Availability Ratio. This value is included only when Performance Monitoring is provisioned on the switch side.

Values Decimal (0..4294967295)

ATTRIBUTE sArAvailableTime

Description This attribute indicates the total time in seconds that a connection was available. This value is included only when Performance Monitoring is provisioned on the switch side.

Values Decimal (0..4294967295)

ATTRIBUTE atmServiceCategory

Description This attribute indicates the ATM service category for both directions of the connection.

Values
UBR
CBR
rt-VBR
nrt-VBR
ABR

ATTRIBUTE circuitId

Description

This attribute indicates a unique string, set by the operator allowing the customer to assign a meaningful name to identify and manage the VCC/ VPC level components that make up a circuit. It is provisioned in the *correlationTag* attribute of the *AtmIf Vcc Vcd* or *AtmIf Vpc Vpd* component. Downstream processing may use this attribute to correlate accounting records issued at different nodes in the network.

Values

String (64, ASCII)

ATTRIBUTE rxUpcViolationOnEnforcer1

Description

This attribute counts the UPC violations observed by the Generic Cell Rate Algorithm (GCRA) Enforcer 1. This attribute is only applicable if UPC is enforced or monitored. This attribute is not applicable for standard *VPT VCC* components.

This attribute is not applicable on CQC-based, APC-based, and QRD-based ATM cards.

When the value of the *rxTrafficDescType* attribute for this connection. is 3, 4, 5, 6, 7 or 8, Enforcer 1 enforces conformance of traffic received from the interface to PCR CLP0+1.

If UPC is enforced, all non-conforming cells are discarded by this enforcer. These discarded cells are included in *rxCellDiscard* attribute value.

For basic *Vpt* components, this attribute indicates the aggregated total of all *rxUpcViolationOnEnforcer1* attribute values for the *Vcc* components associated with the *Vpt* component.

The counter wraps to zero when it exceeds its maximum value.

Values

Long Integer

ATTRIBUTE rxUpcViolationOnEnforcer2

Description

This attribute counts the UPC violations observed by the Generic Cell Rate Algorithm (GCRA) Enforcer 2. This attribute is only applicable if UPC is enforced or monitored. This attribute is not applicable for standard *VPT VCC* components.

This attribute is not applicable on CQC-based, APC-based, and QRD-based ATM cards.

Enforcer 2 is applicable only if the *rxTrafficDescType* attribute value for this connection is 4, 5, 6, 7 or 8.

When the value of *rxTrafficDescType* attribute is 4 or 5**,** Enforcer 2 enforces conformance of traffic received from the interface to PCR CLP0.

When the value of *rxTrafficDescType* attribute is 6**,** Enforcer 2 enforces

Copyright © 2006, Nortel Nortel Confidential

conformance of traffic received from the interface to SCR CLP0+1.

When the value of *rxTrafficDescType* attribute is 7 or 8, Enforcer 2 enforces conformance of traffic received from the interface to SCR CLP0.

If UPC is enforced, Enforcer 2 discards non-conforming cells for *rxTrafficDescType* attribute values of 4, 6 and 7. It tags non-conforming cells for *rxTrafficDescType* attribute values of 5 and 8. Discarded cells are counted in the *rxCellDiscard* attribute value.

For basic *Vpts* component, this attribute indicates the aggregated total of all *rxUpcViolationOnEnforcer2* attribute values for the *Vcc* components associated with the *Vpt* component.

The counter wraps to zero when it exceeds its maximum value.

Values — Long Integer

RESPONSE Voice Networking Accounting Information

Description — This response describes the attributes specific to a voice networking accounting record. All items that belong to a voice networking accounting record are defined here. This definition is translated into Service Data Description files - sdd file. The Multiservice Data Provider (MDP) uses the sdd file to decode accounting records.

ATTRIBUTE recordIdentifier

Description — This attribute distinguishes the Voice Networking accounting record from other types of accounting records.

Values — vnetAccRecord

ATTRIBUTE recordType

Description — This attribute indicates the type of the record. For the first record in the accounting period, only ***first*** is set. For the last record, only ***last*** is set. For intermediate records, neither ***first*** nor ***last*** is set. If there is only one record in the accounting period, then both ***first*** and ***last*** are set.
first, ***~last*** (recordType_first 1, recordType_last 0) - first record
~first, ***~last*** (recordType_first 0, recordType_last 0) - intermediate record.
~first, ***last*** (recordType_first 0, recordType_last 1) - final record.
first, ***last*** (recordType_first 1, recordType_last 1) - first and last record (one only).

Set of — first
last

ATTRIBUTE callCorrelationIdentifier

Description — This attribute indicates a unique value assigned to all accounting records generated by calling and called nodes for this call. The *callCorrelationId* is used during post processing of accounting records to correlate records generated by different nodes. The *callCorrelationId* is always unique in the

Copyright © 2006, Nortel Nortel Confidential

network with respect to *callCorrelationIds* generated by other function processors. The value of *callCorrelationId* repeats after 2 to the power of 24 calls on the same, continually active function processor.

Values — String (13, Hex)

ATTRIBUTE startTime

Description — This attribute indicates the start time of the accounting record.

For the first record, this is the time when the setup message was received. On subsequent accounting records, the *startTime* is equal to the *endTime* of the previous record. If Time of Day Accounting (TODA) is used, *startTime* is the time of the TODA (set in *Col/accounting collectionTimes* attribute).

Values — Time (DHMS)

ATTRIBUTE endTime

Description — This attribute indicates end time of the accounting record. In the final accounting record for a call, *endTime* is the time when the disconnect packet was received. If TODA is used, *endTime* in non-final records is the time of the TODA. For 12-hour accounting, *endTime* in non-final records is the time when the 12-hour timer expires.

Values — Time (DHMS)

ATTRIBUTE elapsedTime

Description — This attribute indicates the duration of the call in 0.1 second increments. This time interval is started when the call request is processed. *elapsedTime* indicates the true measure of the accounting period. It is measured independent of *startTime* and *endTime*. Since *startTime* and *endTime* can be changed externally by adjusting the clock, *elapsedTime* can be shorter or longer than the difference between *startTime* and *endTime*. When 12 hour accounting is used, *elapsedTime* is exact or differs by a few seconds from a 12 hour duration.

Values — Decimal (0..16777215)

ATTRIBUTE localNodeIdentifier

Description — This attribute identifies the *nodeId* of the node that generated the accounting record. *nodeId* is assigned to each node in the *ModuleData* component.

Values — Decimal (1..4095)

ATTRIBUTE localLogicalProcessor

Description — This attribute indicates the logical processor used by the service issuing the accounting record.

Values — Decimal (0..15)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE localPort

Description — This attribute indicates the port used by the service issuing the accounting record.

Values — Decimal (0..7)

ATTRIBUTE localTimeslots

Description — This attribute indicates the time slots used by the node issuing the accounting record. Note that in ISDN multiple time slots may be assigned to a single call. Accounting records are not generated for call attempts that fail to get a time slot.

Set of — Decimal (1..31)

ATTRIBUTE callingNumber

Description — This attribute indicates the calling number signalled to the node. This may have a length of 0 if the calling number was not provided. The maximum length is 16 digits.

Values — String (0..16, ASCII)

ATTRIBUTE localDlci

Description — This attribute indicates the local DLCI number of the interface. (DLCI is sometimes called LCN - logical channel number). This number is assigned to the call request by the node generating this accounting record.

Values — Decimal (0; 16..1007)

ATTRIBUTE calledNumber

Description — This attribute indicates the called number signalled to the node. If *Vroute/n Acct digitsSuppressed* was provisioned with a non-zero value, that number of trailing digits in *calledNumber* are replaced with “X”s.

Values — String (1..32, ASCII)

ATTRIBUTE connectedNumber

Description — This attribute indicates the connected number signalled to the node. This may have a length of zero if the connected number was not provided.

Values — String (0..16, ASCII)

ATTRIBUTE sourceNpi

Description — This attribute indicates the Numbering Plan Indicator (NPI) of the *sourceDna*. This is the value sent by the source accounting node to the destination accounting node during call setup. The *sourceDna* may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.

Values — x121
e164

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE sourceDna

Description	This attribute indicates the data network address (the unique identifier) of the calling addressable switched voice application. This is the value sent by the source accounting node to the destination accounting node during call setup. It is valid in accounting records generated by both ends of the call.
Values	BCD (0..15)

ATTRIBUTE destinationNpi

Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *destinationDna*. This is the value sent by the destination accounting node to the source accounting node during call setup. The *destinationDna* may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Values	x121 e164

ATTRIBUTE destinationDna

Description	This attribute indicates the data network address (the unique identifier) of the called addressable switched voice application. This is the value sent by the destination accounting node to the source accounting node during call setup. It is valid in accounting records generated by both ends of the call.
Values	BCD (0..15)

ATTRIBUTE callVncs

Description	This attribute identifies the *VoiceNetworkingCallServer* used locally for this call by its instance value. This will have a value of 0 in an accounting record generated by a terminating end node.
Values	Decimal (0; 1..16)

ATTRIBUTE callProfile

Description	This attribute identifies the *VoiceProfile* instance used locally for this call. *VoiceProfile* instance values are only unique with respect to a particular *Vncs* instance. This will have a value of 0 in an accounting record generated by a terminating end node.
Values	Decimal (0; 1..16)

ATTRIBUTE vnetCallType

Description	This attribute defines the type of call for which this accounting record is issued. ***data*** - ISDN data call ***modem*** - a 2100 Hz tone was detected during the call ***faxRelay*** - fax relay was applied to this call ***modemRelay*** - modem relay was applied to this call ***voice*** - all other calls

Copyright © 2006, Nortel Nortel Confidential

Values	voice data modem faxRelay modemRelay

ATTRIBUTE clearCause

Description	This attribute indicates the reason the call was cleared. If the call was cleared in the subnet, this attribute contains a Q931 value regardless of the source protocol. If the call was cleared by the PBX, this attribute may contain other information conforming to the specifications of the used protocol. It is set to 0 for intermediate records.
Values	Decimal (0..127)

ATTRIBUTE diagnosticCode

Description	This attribute indicates the diagnostic code signalled at the end of connection. It is set to 0 for intermediate records.
Values	Hex (H.0..H.ffffff)

ATTRIBUTE localServiceType

Description	This attribute indicates the service supported by the port used by the local interface. This number is provisioned on each interface as *accountClass*.
Values	Decimal (0..255)

ATTRIBUTE localCollectReason

Description	This attribute indicates the reason the accounting record was generated (The reason can be any combination of ***audit***, ***study***, ***test***, ***bill***, ***force***).
Set of	bill test study audit force

ATTRIBUTE localDse

Description	This attribute defines the local end Data Service Exchange provisioned as an arbitrary number in *serviceExchange* attribute.
Values	Decimal (0..255)

ATTRIBUTE localCustomerIdentifier

Description	This attribute indicates the number assigned in each service to a customer. It identifies the customer in the Customer Network Management on the end that generated the accounting record.
Values	Decimal (0; 1..8191)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE vnetFlags

Description	This attribute indicates values for call characteristics. ***bumped*** (vnetFlags_bumped 1) - The call was bumped to another path by a higher priority call in the accounting interval reported by this record. ***optimized*** (vnetFlags_optimized 1) - The path of the call was altered in the accounting interval reported by this record. ***answered*** (vnetFlags_answered 1) - The call was answered ***frameCountsValid*** (vnetFlags_frameCountsValid 1) - The frame counts in this accounting record are valid. ***originating*** (vnetFlags_originating 1) - The local end originated the call. ***~originating*** (vnetFlags_originating 0) - The far end originated the call. ***tandemPassThrough*** (vnetFlags_tandemPassThrough 1) - The node that generated this record used tandem pass through for this call. ***faxRelayDownspeed*** (vnetFlags_faxRelayDownspeed 1) - The fax relay call accounted by this record lowered the relay rate in the accounting interval reported by this record. ***unique*** (vnetFlags_unique 1) - If this is set to 1, it guarantees that only the local end generated one or more accounting records for this call. ***clearedInSubnet*** (vnetFlags_clearedInSubnet 1) - This flag is only valid in the final accounting record. The value 1 indicates the call was cleared from within the subnet. ***~clearedInSubnet*** (vnetFlags_clearedInSubnet 0) - This flag is only valid in the final accounting record. The value 0 indicates the call was cleared from outside the subnet.
Set of	bumped optimized answered frameCountsValid originating tandemPassThrough faxRelayDownspeed unique clearedInSubnet

ATTRIBUTE callRingTime

Description	This attribute indicates the time in seconds between the setup indication and the call answered indication for answered calls. For unanswered calls, this attribute indicates the time between the setup indication and the call release indication. For values greater than 255 seconds it reports 255 seconds.
Values	Decimal (0..255)

ATTRIBUTE framesAtRate1ToNetwork

Description	This attribute indicates the total number of rate 1 frames sent to the network.
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE framesAtRate2ToNetwork

Description	This attribute indicates the total number of rate 2 frames sent to the network.
Values	Decimal (0..4294967295)

ATTRIBUTE framesAtRate3ToNetwork

Description	This attribute indicates the total number of rate 3 frames sent to the network.
Values	Decimal (0..4294967295)

ATTRIBUTE framesAtRate1FromNetwork

Description	This attribute indicates the total number of rate 1 frames received from the network.
Values	Decimal (0..4294967295)

ATTRIBUTE framesAtRate2FromNetwork

Description	This attribute indicates the total number of rate 2 frames received from the network.
Values	Decimal (0..4294967295)

ATTRIBUTE framesAtRate3FromNetwork

Description	This attribute indicates the total number of rate 3 frames received from the network.
Values	Decimal (0..4294967295)

ATTRIBUTE rate1

Description	This attribute indicates the bit rate of the rate 1 statistics in bit/s.
Values	Decimal (0..1920000)

ATTRIBUTE rate2

Description	This attribute indicates the bit rate of the rate 2 statistics in bit/s.
Values	Decimal (0..1920000)

ATTRIBUTE rate3

Description	This attribute indicates the bit rate of the rate 3 statistics in bit/s.
Values	Decimal (0..1920000)

ATTRIBUTE rate1CompressionAlgorithm

Description	This attribute indicates the compression algorithm used for the rate 1 statistics. If no compression algorithm was used, the value is ***none***.

Copyright © 2006, Nortel Nortel Confidential

Values	none g711 g726 g728 g729 faxRelay modemRelay

ATTRIBUTE rate2CompressionAlgorithm

Description	This attribute indicates the compression algorithm used for the rate 2 statistics. If no compression algorithm was used, the value is ***none***.
Values	none g711 g726 g728 g729 faxRelay modemRelay

ATTRIBUTE rate3CompressionAlgorithm

Description	This attribute indicates the compression algorithm used for the rate 3 statistics. If no compression algorithm was used, the value is ***none***.
Values	none g711 g726 g728 g729 faxRelay modemRelay

ATTRIBUTE rate1FrameSize

Description	This attribute indicates the size of the rate 1 frames in bytes.
Values	Decimal (0..999)

ATTRIBUTE rate2FrameSize

Description	This attribute indicates the size of the rate 2 frames in bytes.
Values	Decimal (0..999)

ATTRIBUTE rate3FrameSize

Description	This attribute indicates the size of the rate 3 frames in bytes.
Values	Decimal (0..999)

ATTRIBUTE frmLostInNetwork

Description	This attribute indicates the number of frames lost in the network. If it is greater than 65535 then the value reported is 65535.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)

ATTRIBUTE frmDumped

Description	This attribute indicates the number of frames that were dumped to limit the size of the egress queue. *frmDumped* may be an indication of persistent network clock synchronization problems between the interfaces involved in the calls. If it is greater than 255 then the value reported is 255.
Values	Decimal (0..255)

ATTRIBUTE frmUnderRuns

Description	This attribute indicates the number of frames that arrived late to prevent the egress queue from becoming empty. *frmUnderRuns* are an indication of network clock synchronization problems between the interfaces involved in the calls. If it is greater than 255 then the value reported is 255.
Values	Decimal (0..255)

RESPONSE FR-ATM Accounting Information

Description	This response describes the attributes specific to a FR-ATM accounting record. All items which belong to a FR-ATM accounting record are defined here.

ATTRIBUTE recordType

Description	The *recordType* attribute indicates the type of the record. For the first record in the accounting period, only ***first*** is set to 1. For the last record, only ***last*** is set to 1. For intermediate records, both ***first*** and ***last*** are set to 0. If there is only one record in the accounting period, then both ***first*** and ***last*** are set to 1. first, ~last - first record. ~first, ~last - intermediate record. ~first, last - final record. first, last - first and last record (one only).
Set of	first last

ATTRIBUTE recordIdentifier

Description	The *recordIdentifier* attribute indicates the contents of the accounting record. A value ***frAtmAccRecord*** indicates that it is a FR-ATM accounting record.
Values	frAtmAccRecord

ATTRIBUTE callConnId

Description	This attribute may be used by downstream processing systems to correlate the accounting records issued for the same call at different interfaces (nodes) in the network. For SPVCs (soft permanent virtual connections), the *callConnId* is generated by the switch and is unique for every call in the network. For NPVCs (nailed-up permanent virtual

Copyright © 2006, Nortel Nortel Confidential

connections), the *callConnId* is provisioned in the *correlationTag* attribute of the *FrAtm Dlci Siwf Npvc* component.

Values — String (32, Hex)

ATTRIBUTE callType

Description — This attribute indicates the type of call. It is one of the following values:
spvcChannel (soft permanent virtual connection),
pvcChannel (permanent virtual channel transporting a nailed-up connection).

Values — pvcChannel
spvcChannel

ATTRIBUTE interworkingType

Description — This attribute indicates the type of FR-ATM interworking being accounted for.

Values — frf8
frf5

ATTRIBUTE callingNodeIdentifier

Description — This attribute identifies the calling (originating) node by a unique number assigned to each node in the *ModuleData* component.

Values — Decimal (256..49151)

ATTRIBUTE callingCustomerIdentifier

Description — This attribute contains the number assigned in each service to a customer and it identifies the customer of the FR-ATM at the calling end of the call.

Values — Decimal (0; 1..8191)

ATTRIBUTE callingNsapAddr

Description — This attribute indicates the NSAP address of the calling party.

This attribute may not be present in accounting records for FRF.8 NPVCs and FRF.5 DLCI configurations, because the provisioning of the FR-ATM address is optional. Furthermore, at the called end, if the calling address is present in the setup request, then it will be present in the accounting record.

Values — String (20, Hex)

ATTRIBUTE callingEndPointNsapAddr

Description — This attribute indicates the NSAP address of the calling End Point for FRF.5 configuration.

This attribute is only present for FRF.5. Furthermore, at the called end, if the calling address is present in the setup request, then it will be present in the accounting record.

Copyright © 2006, Nortel Nortel Confidential

Values	String (20, Hex)

ATTRIBUTE callingDlci

Description	This attribute contains the calling DLCI number of the interface. This attribute does not appear in accounting records for the called end of a FRF.8 SPVC.
Values	Decimal (16..1007)

ATTRIBUTE callingVpi

Description	This attribute indicates the VPI of the calling end. For a FRF.5 configuration, this attribute is the calling VPI of the End Point, that the *FrAtm* is associated with. At the called end, if the calling address is present in the setup request, then it will be present in the accounting record.
Values	Decimal (0..4095)

ATTRIBUTE callingVci

Description	This attribute indicates the VCI of the calling end. If the calling address is present in the setup request, then it will be present at the called end. Also, for a FRF.5 configuration, this attribute is the calling VCI of the End Point that the *FrAtm* is associated with.
Values	Decimal (0..65535)

ATTRIBUTE calledNodeIdentifier

Description	This attribute identifies the called (terminating) node by a unique number assigned to each node in the *ModuleData* component.
Values	Decimal (256..49151)

ATTRIBUTE calledCustomerIdentifier

Description	This attribute contains the number assigned in each service to a customer, and it identifies the customer at the called end of the call.
Values	Decimal (0; 1..8191)

ATTRIBUTE calledNsapAddr

Description	This attribute indicates the NSAP address of the called party. For FRF.8 NPVC, this attribute will not appear in the accounting record.
Values	String (20, Hex)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE calledEndPointNsapAddr

Description	This attribute indicates the NSAP address of the called End Point for FRF.5 configuration. This is only applicable for FRF.5.
Values	String (20, Hex)

ATTRIBUTE calledDlci

Description	This attribute contains the called DLCI of the interface. This attribute will not occur in records for FRF.8 NPVC configuration and the calling end of a FRF.8 SPVC configuration. In the case of FRF.5, this called DLCI is the DLCI in the FRF.5 End Point.
Values	Decimal (16..1007)

ATTRIBUTE calledVpi

Description	This attribute indicates the VPI of the called end. For FRF.8 NPVC, this attribute does not appear in the accounting record.
Values	Decimal (0..4095)

ATTRIBUTE calledVci

Description	This attribute indicates the VCI of the called end. This attribute will not occur in records only for FRF.8 NPVC configuration.
Values	Decimal (0..65535)

ATTRIBUTE atmCallTermCauseValue

Description	This attribute indicates the call termination cause value as defined by the ATM Forum AtmIf UNI 3.1 specification. It is set to 0 for non-final records.
Values	Decimal (0..255)

ATTRIBUTE callingCir

Description	This attribute indicates the calling end CIR (Committed Information Rate).
Values	Decimal (0..65535)

ATTRIBUTE callingEir

Description	This attribute indicates the calling end EIR (Excess Information Rate).
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE callingServiceType

Description — This attribute indicates the service supported by the port used by the calling end. This number is provisioned on each interface *FrAtm Ca* as *accountClass*.

Values — Decimal (0..50)

ATTRIBUTE callingCollectReason

Description — This attribute indicates the reason for the accounting collection of the calling end (It can be any combination of ***audit, study, test, billing, force***).

Set of
bill
test
study
audit
force

ATTRIBUTE callingDse

Description — This attribute indicates the calling end Data Service Exchange provisioned in *FrAtm Ca* as an arbitrary number in the *serviceExchange* attribute.

Values — Decimal (0..255)

ATTRIBUTE calledCir

Description — This attribute indicates the called end CIR (Committed Information Rate).

Values — Decimal (0..65535)

ATTRIBUTE calledEir

Description

This attribute contains the called end EIR (Excess Information Rate).

Values — Decimal (0..65535)

ATTRIBUTE calledServiceType

Description — This attribute indicates the service supported by the port used by the called end-user. This number is provisioned on each interface *FrAtm Ca* as *accountClass*.

Values — Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE calledCollectReason

Description — This attribute indicates the reason for the accounting collection of the called end (It can be any combination of ***audit, study, test, billing, force***).

Set of
bill
test
study
audit
force

ATTRIBUTE calledDse

Description — This attribute indicates the called end Data Service Exchange provisioned in *FrAtm Ca* as an arbitrary number in the *serviceExchange* attribute.

Values — Decimal (0..255)

ATTRIBUTE flags

Description — This attribute indicates values for the call characteristics.
calledGenerated - called end generated accounting record.
~calledGenerated - calling end generated accounting record.
calledCleared - call was cleared by called end.
~calledCleared - call was cleared by calling end.

Set of
calledGenerated
calledCleared

ATTRIBUTE startTime

Description — This attribute indicates the start time in the accounting interval.
On the subsequent accounting interval, the start time corresponds to the end time of the previous interval.

Values — Time (DHMS)

ATTRIBUTE endTime

Description — This attribute indicates the end time in the accounting interval.

On final accounting records, the end time is the time when the connection is disconnected.

Values — Time (DHMS)

ATTRIBUTE elapsedTime

Description — This attribute indicates the duration of the call in 0.1 second increments. This time interval is started when the call request is processed. If call does not reach data transfer, then elapsed time is set to 0. Elapsed time represents the true measure of the accounting period. It is measured independently of start time and end time. Since start time and end time can be changed externally by adjusting the clock, elapsed time can be shorter or longer than the difference between start time and end time.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..16777215)

ATTRIBUTE callingEgressBytes

Description	This attribute indicates the total number of bytes sent to the link at the calling end.
Values	Long Integer

ATTRIBUTE callingIngressBytes

Description	This attribute indicates the total number of bytes received from the link at the calling end.
Values	Long Integer

ATTRIBUTE callingEgressFrames

Description	This attribute indicates the total number of frames sent to the link at the calling end.
Values	Decimal (0..4294967295)

ATTRIBUTE callingIngressFrames

Description	This attribute indicates the total number of frames received from the link at the calling end.
Values	Decimal (0..4294967295)

ATTRIBUTE callingEirEgressBytes

Description	This attribute indicates the number of EIR bytes sent to the link at the calling end.
Values	Long Integer

ATTRIBUTE callingEirIngressBytes

Description	This attribute indicates the number of EIR bytes received from the link at the calling end.
Values	Long Integer

ATTRIBUTE callingEirEgressFrames

Description	This attribute indicates the number of EIR Frames sent to the link at the calling end.
Values	Decimal (0..4294967295)

ATTRIBUTE callingEirIngressFrames

Description	This attribute indicates the number of EIR Frames received from the link at the calling end.
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE callingDiscardedBytes

Description — This attribute indicates the number of bytes discarded at the calling end.

Values — Long Integer

ATTRIBUTE callingDiscardedFrames

Description — This attribute indicates the number of frames discarded at the calling end.

Values — Decimal (0..4294967295)

ATTRIBUTE calledEgressBytes

Description — This attribute indicates the total number of bytes sent to the link at the called end.

Values — Long Integer

ATTRIBUTE calledIngressBytes

Description — This attribute indicates the total number of bytes received from the link at the called end.

Values — Long Integer

ATTRIBUTE calledEgressFrames

Description — This attribute indicates the total number of frames sent to the link at the called end.

Values — Decimal (0..4294967295)

ATTRIBUTE calledIngressFrames

Description — This attribute indicates the total number of frames received from the link at the called end.

Values — Decimal (0..4294967295)

ATTRIBUTE calledEirEgressBytes

Description — This attribute contains the number of EIR bytes sent to the link at the called end.

Values — Long Integer

ATTRIBUTE calledEirIngressBytes

Description — This attribute indicates the number of EIR bytes received from the link at the called end.

Values — Long Integer

ATTRIBUTE calledEirEgressFrames

Description — This attribute indicates the number of EIR Frames send to the link at the called end.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)

ATTRIBUTE calledEirIngressFrames

Description	This attribute indicates the number of EIR Frames received from the link at the called end.
Values	Decimal (0..4294967295)

ATTRIBUTE calledDiscardedBytes

Description	This attribute indicates the number of bytes discarded at the called end.
Values	Long Integer

ATTRIBUTE calledDiscardedFrames

Description	This attribute indicates the number of frames discarded at the called end.
Values	Decimal (0..4294967295)

ATTRIBUTE callingTransferPriority

Description	This attribute indicates the transfer priority at the calling end.
Values	Decimal (0..255)

ATTRIBUTE calledTransferPriority

Description	This attribute indicates the transfer priority at the called end.
Values	Decimal (0..255)

ATTRIBUTE circuitId

Description	This attribute indicates a unique string, set by the operator as the “correlationTag” provisioned attribute, which identifies the call for accounting purposes. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. Typically, the attribute is provisioned, as the correlationTag, with the same value at both ends of the connection, but this is not mandatory. As a default, there is no correlationTag provisioned against the DLCI
Values	String (0..32, ASCII)

RESPONSE The following AVs will be removed if the Tidy command is issued without the query option. Some of these AVs are partial AVs.

Description	This response is issued only when the query option is used for the *Tidy* command. It lists the AVs which would be tidied if the *Tidy* command was issued without the query option. This list also includes some partial AVs.

ATTRIBUTE listOfRemovedAvs

Description	This attribute is a list of the names of AVs which would be removed if the *Tidy* command was issued without the query option.
List of	String (1..30, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Only partial AVs exist on the disk. They will be removed if the Tidy command was issued without the query option.

Description — This response is returned when partial AVs exist on the disk which would be removed if the *Tidy* command was issued without the query option.

ATTRIBUTE listOfRemovedAvs

Description — This attribute is a list of the names of AVs which would be removed if the *Tidy* command was issued without the query option.

List of — String (1..30, ASCII)

RESPONSE APS request of equal or higher priority already in effect.

Description — This response is issued when the APS request invoked by the command entered is of lower priority than the APS requests already present on the *Aps* component.

ATTRIBUTE apsResponseText

Description — This response text gives the specific reason why the command was ignored. For example, “Far end is transmitting signalFail on protection”, and a suggested alternative, such as “Use ‘switch -force’ to override the signalFail”.

Values — String (0..256, ASCII)

RESPONSE Error:The component name specified by attribute... does not exist or was not specified.

Description — This error message appears in response to a *Check Prov* command if the specified component name cannot be found in the edit view.

ATTRIBUTE atmAccMissingComponent

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the *atmConnection* to be used.

Values — Decimal (0..65535)

RESPONSE Error:The ATM connection specified by attribute ... is not supported.

Description — This error message appears in response to a *Check Prov* command if the *atmConnection* specified is not supported by this component.

ATTRIBUTE atmAccVCUnsupported

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the ATM connection which is unsupported.

Values — Decimal (0..65535)

RESPONSE Error:The component name specified by attribute ... does not exist or was not specified.

Description — This error message appears in response to a *Check Prov* command if the specified component name cannot be found in the edit view.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE paAtmAccMissingComponent

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the ATM connection to be used.

Values — Decimal (0..65535)

RESPONSE Error:The ATM connection specified by attribute ... is not supported.

Description — This error message appears in response to a *Check Prov* command if the ATM connection specified is not supported by this component.

ATTRIBUTE paAtmAccVCUnsupported

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the ATM connection which is unsupported.

Values — Decimal (0..65535)

RESPONSE Error: The ATM connection specified by attribute ... must have the same VPI value as its parent Trunk ATM connection.

Description — This error message appears in response to a *Check Prov* command if the ATM connection specified has a different VPI value from its parent Trunk ATM connection.

ATTRIBUTE paAtmAccVpMismatch

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the ATM connection which has a different VPI value from its parent Trunk ATM connection.

Values — Decimal (0..65535)

RESPONSE Error: The ATM connection specified by attribute ... must have the same AtmIf value as its parent Trunk ATM connection.

Description — This error message appears in response to a *Check Prov* command if the ATM connection specified has a different AtmIf value from its parent Trunk ATM connection.

ATTRIBUTE paAtmAccAtmifMismatch

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the ATM connection which has a different AtmIf instance value from its parent Trunk ATM connection.

Values — Decimal (0..65535)

RESPONSE Error: The parent Trunk ATM connection specified by its attribute ... is elastic. Pa Atm must be configured for mapped mode on inverse multiplexing Atm trunks.

Description — This error message appears in response to a *Check Prov* command if Pa Atm Mode is set to multiplexing and its parent Trunk Atm connection is elastic. Pa Atm does not support elastic Vcc. Mapped mode is recommended on inverse multiplexing Atm trunks.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE paAtmAccMuxNotAllowed

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the ATM connection which is elastic.

Values — Decimal (0..65535)

RESPONSE Warning: The ATM connection specified by attribute ... is not relevant in mapped mode and will be ignored.

Description — This warning message appears in response to a *Check Prov* command if a provisioned VCC component is associated with a Pa Atm which is in map mode.

ATTRIBUTE paAtmAccMapModeWarning

Description — This attribute contains the numeric ID of the attribute used to specify the component name of the ATM connection which is associated with a map-moded Pa ATM.

Values — Decimal (0..65535)

RESPONSE

Description — The following describes the attributes of loopback to be displayed when a stop loopback command is issued.

ATTRIBUTE localTotalFrm (ltf)

Description — This attribute records the number of frames looped back to the link since the loopback mode was started.

Values — Decimal (0..4294967295)

ATTRIBUTE localTotalBytes (ltb)

Description — This attribute records the number of bytes looped back to the link since the loopback mode was started.

Values — Decimal (0..4294967295)

ATTRIBUTE localFecnFrm (lff)

Description — This attribute records the number of frames with the Forward Explicit Congestion Notification (FECN) bit set, looped back to the link since the loopback mode was started.

Values — Decimal (0..4294967295)

ATTRIBUTE localBecnFrm (lbf)

Description — This attribute records the number of frames with the Backward Explicit Congestion Notification (BECN) bit set, looped back to the link since the loopback mode was started.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE localDeFrm (ldf)

Description	This attribute records the number of frames with the Discard Eligibility (DE) bit set, loopback to the link since the looped back mode was started.
Values	Decimal (0..4294967295)

ATTRIBUTE localDeBytes (ldb)

Description	This attribute records the number of bytes in frames with the Discard Eligibility (DE) bit set, looped back to the link since the loopback mode was started.
Values	Decimal (0..4294967295)

ATTRIBUTE remoteTotalFrm (rtf)

Description	This attribute records the number of frames looped back to the subnet since the loopback mode was started.
Values	Decimal (0..4294967295)

ATTRIBUTE remoteTotalBytes (rtb)

Description	This attribute records the number of bytes looped back to the subnet since the loopback mode was last started.
Values	Decimal (0..4294967295)

ATTRIBUTE remoteFecnFrm (rff)

Description	This attribute records the number of frames with the Forward Explicit Congestion Notification (FECN) bit set, looped back to the subnet since the loopback mode was started.
Values	Decimal (0..4294967295)

ATTRIBUTE remoteBecnFrm (rbf)

Description	This attribute records the number of frames with the Backward Explicit Congestion Notification (BECN) bit set, looped back to the subnet since the loopback mode was started.
Values	Decimal (0..4294967295)

ATTRIBUTE remoteDeFrm (rdf)

Description	This attribute records the number of frames with the Discard Eligibility (DE) bit set, looped back to the subnet since the loopback mode was started.
Values	Decimal (0..4294967295)

ATTRIBUTE remoteDeBytes (rdb)

Description	This attribute records the number of bytes in frames with the Discard Eligibility (DE) bit set, looped back to the subnet since the loopback mode was started.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

RESPONSE Error:The vcci attribute for the AtmTrunkConnection component must take values in the range 0-4095 when an Aal2Svc component is provisioned.

Description A *Check Prov* command produces this response if the user tries to provision a value in the range 0-4095 for the *vcci* attribute of a *AtmTConn* component, when an *Aal2SvcService* component is provisioned.

System action: no *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: provision a value between 0 and 4095 for the *vcci* attribute of the *VgsConn* component.

ATTRIBUTE relatedComponent

Description This attribute identifies the component in which the error was detected.

Values The name of the component

RESPONSE

Description This is the normal response for a *Trace* command issued against a connection. It lists the ATM components at each hop along the connection path up to the next segment OAM boundary.

An example of the complete response is:
Switch side trace result:
EM/NewYork AtmIf/10 Vcc/0.43
EM/Raleigh AtmIf/30 Vcc/0.43
EM/Raleigh AtmIf/51 Vcc/1.66
EM/Denver AtmIf/40 Vpt/1 Vcc/66
EM/Denver AtmIf/12 Vpt/4 Vcc/25
EM/Atlanta AtmIf/71 Vcc/4.25
EM/Atlanta AtmIf/70 Vcc/0.37

Note that the lines of response in the Trace command output are not necessarily in order. This is due to the fact that the Trace command requires a response from each node along the connection. The time taken to respond to the trace cell depends on the load on that processor. So in any node that has other activity, there are minor differences in the time to respond to the Trace command.

The Trace response for a *Vcc* does not show any hops of a VCC which are conveyed on a path connection (VPC). In this case the Trace command only shows the *Vcc* hop points, along with any *Virtual Path Terminators (VPTs)* that may be present.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE switchSideResponseList

Description — This attribute is used to create a response containing the switch-side trace results.

List of — The name of the component

ATTRIBUTE linkSideResponseList

Description — This attribute is used to create a response containing the link-side trace results.

List of — The name of the component

RESPONSE Warning:Traffic will not be forwarded to any ATM FP LPs with the following LPTs, since the ppplwf or mlppplwf feature is not provisioned in the featureList of those LPTs:

Description — This response is produced by the *Check Prov* command if the user has not provisioned the ***ppplwf*** feature on any card which can be used to route an SPVC configured through a *PppIwf AtmAdaptionPoint*.

ATTRIBUTE component

Description — This attribute specifies the identity of each *Lpt* which does not have the feature ***ppplwf*** provisioned on it.

List of — The name of the component

RESPONSE Error: The ... attribute must ...

Description — This error response is generated by the *Check Prov* command when the operator attempts to provision a PVC connection and the *atmConnection* attribute is not provisioned, or the operator attempts to provision an SPVC connection and the *atmConnection* attribute is provisioned.

ATTRIBUTE invalidType

Description — This attribute contains the numeric ID of the attribute which was left unprovisioned.

Values — Decimal (1..65535)

ATTRIBUTE invalidValue

Description — Either “be set.“ or “not be set.“.

Values — String (7..11, ASCII)

RESPONSE Error: The ... attribute must be set.

Description — This response is produced by the *Check* command if the user has not provisioned the *linkToProtocolPort* attribute.

ATTRIBUTE invalidType

Description — This attribute contains the numeric ID of the attribute which was left unprovisioned.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)

RESPONSE Error: The ... attribute must be set.

Description	This response is produced by the *Check* command if the user has not provisioned the *ilsForwarder* attribute.

ATTRIBUTE invalidType

Description	This attribute contains the numeric ID of the attribute which was left unprovisioned.
Values	Decimal (1..65535)

RESPONSE Error: ... encapType must be llcEncap or ipVcEncap.

Description	This error message appears when the attribute *encapType* under the linked *AtmMpe* component is neither ***llcEncap*** nor ***ipVcEncap***.

ATTRIBUTE atmMpeName

Description	This attribute contains the name of the *AtmMpe* component.
Values	The name of the component

RESPONSE Failed to reach destination within the maximum of ... hops.

Description	This response indicates the *Ping -traceRoute* command cannot reach the given destination IP address within the maximum number of hops supported by IP Trace Route.

ATTRIBUTE hopCount

Description	This attribute indicates the maximum number of hops the *Ping -traceRoute* command will try to reach its destination.
Values	Decimal (1..255)

RESPONSE IP Trace Route for ...:Path taken:

Description	This response contains the header line used when the *-traceRoute* ping option was specified. It is used when the trace was unsuccessful due to a timeout. The path taken before the 10 second timer expired follows this response.

ATTRIBUTE ipAddr

Description	This attribute indicates the IP address of the remote host.
Values	IP address

RESPONSE ...Hop ...:...(failed)

Description	This response is printed as the last line of the ping *-traceRoute* command when the command fails or times out. It indicates the number hops the command had traversed before it failed.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE hopCount

Description	This attribute indicates the number of hops the command had traversed when the command failed.
Values	Decimal (1..255)

RESPONSE .....

Description	This response contains the *hopCount*, *hopAddress* and *roundTripTime* of an intermediate node in the network to reach the IP address being traced.

ATTRIBUTE hopCount

Description	This attribute indicates the hop count of a node that was visited by the *Ping -traceRoute* command.
Values	Decimal (1..255)

ATTRIBUTE ipAddress

Description	This attribute indicates the IP address of a node that was visited by the *Ping -traceRoute* command. The value 0.0.0.0 is displayed if a transit router along the path did not respond. This might be the result of a node filtering incoming and/or outgoing ICMP messages, for example, a firewall router. In this case, the *roundTripTime* is displayed as 0 as well and should be ignored.
Values	IP address

ATTRIBUTE roundTripTime

Description	This attribute indicates the round trip time taken to reach this node. The value 0 is displayed if a transit router along the path did not respond. This might be the result of a node filtering incoming and/or outgoing ICMP messages, for example, a firewall router. In this case, the IP address is displayed as 0.0.0.0 as well and should be ignored.
Values	Decimal (0..65535)

RESPONSE Transport Connection to ... is up.

Description	This response indicates that the *Ping* issued against the enabled *Ep* has verified that the transport connection to the remote end is up. If the *Ping* issued against the Ep is disabled due to transport priority overlap, then this response indicates that the transport connection from this Ep's associated Ep to the remote end is up.

ATTRIBUTE remoteComponentName

Description	This attribute indicates the component name of the remote *Ep.*
Values	String (0..46, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: ... encapType must be llcEncap.

Description	This error message appears when the attribute *encapType* under the linked *AtmMpe* component is not ***llcEncap***.

ATTRIBUTE atmMpeName

Description	This attribute contains the name of the *AtmMpe* component.
Values	The name of the component

RESPONSE Warning:Traffic will not be forwarded to any AtmMpe protocol port on Lp(s) with the following Lpt(s), since the feature atmMpe is not provisioned in the featureList of those Lpt(s):

Description	This response is produced by the *Check Prov* command if the user has not provisioned the ***atmMpe*** feature on any card which has the ***ip*** feature provisioned.

ATTRIBUTE component

Description	This attribute specifies the identity of each *Lpt* which does not have the feature ***atmMpe*** provisioned on it.
List of	The name of the component

RESPONSE Error:The feature atmMpe must be provisioned in the featureList of ...

Description	This error response is generated when the feature ***atmMpe*** is not provisioned on the corresponding logical processor.

ATTRIBUTE lpt

Description	This attribute indicates the *Lpt* which should have the ***atmMpe*** feature on it.
Values	The name of the component

RESPONSE ...

Description	This response is generated as an error response to the start verb. The reasons for this response include: The FRUNI is incapable of generation traffic in its current state.

ATTRIBUTE ErrorMsg

Description	This attribute contains the error message to be displayed.
Values	String (1..81, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:An Lsp must have one of either a ...,or ... or ... subcomponent provisioned when a FEC MscMap is provisioned under the LspG.

Description — The *Check Prov* command produces this response when the specified component name cannot be found in the edit view.

System Action: The *Check Prov* fails.

Operator Action: Provision either an *LdpQos* or *CrLdpQos* or *RsvpQos* component under this *Lsp* component.

ATTRIBUTE mplsLspGLspMissingCrLdpQosError

Description — This attribute indicates the name of the *CrLdpQos* component to be used in the response.

Values — Decimal (0..65535)

ATTRIBUTE mplsLspGLspMissingLdpQosError

Description — This attribute indicates the name of the *LdpQos* component to be used in the response.

Values — Decimal (0..65535)

ATTRIBUTE mplsLspGLspMissingRsvpQosError

Description — This attribute indicates the name of the *RsvpQos* component to be used in the response.

Values — Decimal (0..65535)

RESPONSE Error:The total number of LSP components has exceeded the allowable limit of ... per Mpls component.

Description — The *Check Prov* command produces this response when the number of *Lsp* components provisioned has exceeded a defined constant

System Action: The *Check Prov* fails.

Operator Action: Reduce the number of *Lsp* components provisioned

ATTRIBUTE mplsLspGLspTooManyLspsError

Description — This attribute indicates the maximum number of *Lsp* components that can be provisioned on a switch under an *Mpls* component . This value is a constant set within the software.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:A Te component must have the ... attribute set when the Lsp component has a CrLdpQos subcomponent.

Description — The *Check Prov* command produces this response when the *TrafficEngineering* component does not have its *pathname* attribute set.

System Action: The *Check Prov* fails.

Operator Action: Provision the *pathname* attribute under the *TrafficEngineering* component to point to a valid MPLS *Path* component.

ATTRIBUTE mplsTePathnameSetError

Description — This attribute indicates the name of the *Pathname* attribute to be used in the response.

Values — Decimal (0..65535)

RESPONSE Warning:The ... attribute will be ignored when the Lsp component has an LdpQos subcomponent.

Description — The *Check Prov* command produces this response when the *Lsp* component has an *LdpQos sub*component provisioned and the *PathOnDemand* attribute is set to ***enabled*** or when an *LdpQos* component is provisioned and the *PathName* attribute is set.

System Action: The *Check Prov* command passes.

Operator Action: No operator action required.

ATTRIBUTE mplsTeLdpQosWarning

Description — This attribute indicates the name of the attribute to be used in the response.

Values — Decimal (0..65535)

RESPONSE Error:A Te ... attribute has to be set to an existing Path component.

Description — The *Check Prov* command produces this response when the *pathname* attribute of the *TrafficEngineering* component of an *Lsp* component has been set to a non-existent *Path.*

System Action: The *Check Prov* fails.

Operator Action: Provision the *pathname* attribute to point to a valid MPLS *Path* component.

ATTRIBUTE mplsTePathnameExistError

Description — This attribute indicates the name of the *Pathname* attribute to be used in the response.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: ... in the standby LSP attribute does not have Service Category as standby value.

Description — The *Check Prov* command produces this response when an *Lsp* has been added to a *standbyLsp* but has a non-standby value.

System Action: The *Check Prov* fails.

Operator Action: Either remove the *Lsp* component with a non-standby *serviceCategory* value from the *standbyLsp* attribute or change it's *serviceCategory* value to ***standby***.

ATTRIBUTE nonStandbyLsp

Description — This attribute specifies the component name of the *Lsp Msc* to be used in the response.

Values — The name of the component

RESPONSE Error:Each non-standby Lsp must have a unique serviceCategory. ... has duplicate serviceCategory.

Description — The *Check Prov* command produces this response when multiple *Lsp* components have been provisioned under the same *LspGroup* components using the same non-standby *serviceCategory.*

System Action: The *Check Prov* fails.

Operator Action: Ensure that each of the *Lsp* components provisioned under an *LspGroup* component has a unique non-standby *serviceCategory*.

ATTRIBUTE mplsMscUniqScError

Description — This attribute indicates the component name of the *Lsp Msc* to be used in the response.

Values — The name of the component

RESPONSE Error:... standby list cannot include a primary Lsp.

Description — The *Check Prov* command produces this response when a *standbyLsp* has been provisioned to include a non-standby LSP.

System Action: The *Check Prov* fails.

Operator Action: Either remove the *Lsp* instance with a non-standby *serviceCategory* value from the *standbyLsp* or change the *serviceCategory* value to ***standby***.

ATTRIBUTE mplsMscNonStandbyInListError

Description — This attribute indicates the component name of the standby list to be used in the response.

Copyright © 2006, Nortel Nortel Confidential

Values — The name of the component

RESPONSE Error:A standby Lsp cannot appear in more than one standby list. ... and ... include the same Lsp.

Description — The *Check Prov* command produces this response when a standby LSP has been included in more than one *standbyLsp*.

System Action: The *Check Prov* fails.

Operator Action: Remove the *Lsp* component instance value from one of the *standbyLsp*.

ATTRIBUTE firstStandbyInOnePlusListError

Description — This attribute indicates the component name of the *standbyLsp* to be used in the response.

Values — The name of the component

ATTRIBUTE secondStandbyInOnePlusListError

Description — This attribute indicates the component name of the *standbyLsp* to be used in the response.

Values — The name of the component

RESPONSE Error:Standby Lsp ... does not appear in any standby list.

Description — The *Check Prov* command produces this response when a standby LSP has not been added to any *standbyLsp*.

System Action: The *Check Prov* fails.

Operator Action: Either change the *Msc* component *serviceCategory* attribute value to a non-standby value or add it to a *standbyLsp*.

ATTRIBUTE mplsMscHangingStandbyError

Description — This attribute indicates the component name of the Lsp to be used in the response.

Values — The name of the component

RESPONSE Error:A Path component must have at least one ... subcomponent.

Description — The *Check Prov* command produces this response when no *Hop* components have been provisioned under the *Path* component.

System Action: The *Check Prov* fails.

Operator Action: Provision at least one *Hop* component under each *Path* component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE pathNoHopsError

Description — This attribute indicates the name of the *Hop* subcomponent used in the response.

Values — Decimal (0..65535)

RESPONSE Error:The total number of Path components has exceeded the allowable limit of ... per Mpls component.

Description — The *Check Prov* command produces this response when the number of *Path* components provisioned exceeds a preset value.

System Action: The *Check Prov* fails.

Operator Action: Reduce the number of *Path* components provisioned.

ATTRIBUTE mplsPathTooManyPathsError

Description — This attribute indicates the maximum number of *Path* components that can be provisioned on a switch under a *Mpls* component. This value is a constant set within the software.

Values — Decimal (0..65535)

RESPONSE Error:Hop ... attribute is inadmissible. Choose a valid Class A, B or C non-reserved address.

Description — The *Check Prov* command produces this response when the IpV4 address for this *Hop* component is not a valid Class A,B or C non-reserved address.

System Action: The *Check Prov* fails.

Operator Action: Provision the *IpV4address* attribute of this *Hop* component using a valid Class A,B or C non-reserved address.

ATTRIBUTE pathHopInvalidAddrError

Description — This attribute indicates the name of the *IpV4Address* attribute to be used in the response.

Values — Decimal (0..65535)

RESPONSE Error:The total number of Hop components has exceeded the allowable limit of ... per Mpls component.

Description — The *Check Prov* command produces this response when the number of *Hop* components provisioned exceeds a preset number.

System Action: The *Check Prov* fails.

Operator Action: Reduce the number of *Hop* components provisioned.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE mplsPathHopTooManyHopsError

Description — This attribute indicates the maximum number of *Hop* components that can be provisioned on a switch under a *Virtual Router*. This value is a constant set within the software.

Values — Decimal (0..65535)

RESPONSE Error:An LspGroup component must have one ... subcomponent.

Description — The *Check Prov* command produces this response when a *ForwardingEquivalenceClass* component has not been provisioned under the *LspGroup* component.

System Action: The *Check Prov* fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Provision a *ForwardingEquivalenceClass* component under the *LspGroup* component.

ATTRIBUTE lspGroupMissingIpFwdError

Description — This attribute indicates the name of the *ForwardingEquivalenceClass* component to be used in the response.

Values — Decimal (0..65535)

RESPONSE Error:The total number of LspGroup components has exceeded the allowable limit of ... per VirtualRouter.

Description — The *Check Prov* command produces this response when the number of *LspGroup* components provisioned exceeds a preset number.

System Action: The *Check Prov* fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Reduce the number of *LspGroup* components provisioned.

ATTRIBUTE mplsLspGTooManyLspGsError

Description — This attribute indicates the maximum number of *LspGroup* components that can be provisioned on a switch under a *VirtualRouter* component. This value is a constant set within the software.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:Duplicate ipv4Elem value or masked Ipv4 address with another LspGroup component. The duplicate address and length is ...,....

Description — The *Check Prov* command produces this response when the provisioned *ipv4Element* instance value of the *Ipv4Epa* subcomponent or the IP address defined by the combination of *ipv4Element* and *ipv4Pref* values (masked IP address) is duplicated under another *LspGroup* component.

System Action: The *Check Prov* command fails.

Operator Action: Ensure that the IP address represented by each *Ipv4Epa* component is unique under the *Mpls* component. This includes both uniqueness of the *ipv4Element* instance value along and the IP address defined by combining *ipv4Element* and *ipv4Pref* instance values.

ATTRIBUTE ipV4DuplicateAddrError

Description — This attribute indicates the *ipv4Element* to be used in the response.

Values — IP address

ATTRIBUTE ipV4DuplicateAddrLengthError

Description — This attribute indicates the *ipv4Pref* to be used in the response.

Values — Decimal (1..32)

RESPONSE Error:The timeslot provisioned for Ccst has not been provisioned in the Channel timeslot list.

Description — A *Check Prov* command produces this error response if the *Channel timeslot* attribute does not contain the timeslot provisioned for the *Ccst* component. Note that if the *Ccst timeslot* attribute is set to ***autoConfigure***, then the *Channel timeslot* attribute must contain ***16*** for E1 or ***24*** for DS1.

System action: No *Activate Prov* command will be accepted until a subsequent *Check Prov* completes without errors.
Operator action: Provision the *Channel timeslot* attribute to include the timeslot used by *Ccst*.

ATTRIBUTE conflictingComponent

Description — This attribute identifies the *Channel* component for which the incorrect *timeslot* provisioning has been detected.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:PModule subcomponent instance numbers must range contiguously from 1 to ... if the Shelf Card cardType attribute is ....

Description

A *Check Prov* command produces this error response when a *Vsp* component has an incorrect number of *PModule* subcomponent instances for the provisioned card type.

12 *PModule* instances are required on a ***12mVspAal*** or ***Vsp2*** card.

24 *PModule* instances are required on a ***2pGeMmSrVsp3*** card.

23 *PModule* instances are required on a ***2pOC3ChSmIrVsp3*** card.

53 *PModule* instances are required on a ***2pVS*** card.

45 *PModule* instances are required on a ***2pOC3ChSmIrVsp4e*** card.

System action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: Provision the number of *PModule* components appropriately for the card type.

ATTRIBUTE vspPModuleCount

Description

This attribute indicates the required number of *PModule* subcomponents.

Values

12
24
23
53
45

ATTRIBUTE vspCardType

Description

This attribute indicates the card type for the *Vsp* component.

Values

12mVspAal
Vsp2
2pGeMmSrVsp3
2pOC3ChSmIrVsp3
2pVS
2pOC3ChSmIrVsp4e

RESPONSE Error: The value specified for the ... attribute is invalid for this card type.

Description

A *Check Prov* command produces this response when a semantic check fails concerning an MSA card.

ATTRIBUTE attribute

Description

This is the attribute involved in the response.

Values

Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:.....Reason: on MSA cards, ...

Description	A Check Prov command produces this response when a semantic check escape fails on an MSA card

ATTRIBUTE attribute

Description	This is the main attribute involved in the response.
Values	Decimal (1..65535)

ATTRIBUTE attributeHexValueMustBe

Description	This is the hex value that must be applied to the attribute
Values	Hex (H.0..H.ffffffff)

RESPONSE Warning:Traffic using LANE service will not be forwarded to any Lp with the following Lpt(s), since the laneClient feature is not provisioned in the feature list of those Lpt(s):

Description	A *CHECK* command produces this response if the 'laneClient' feature is not provisioned on an ATM *Lpt* that has any of the features: atmUni, atmIisp, atmPnni; or an *Lpt* that has any of the features: ip, ipx, bridge.

ATTRIBUTE component

Description	This attribute specifies the identity of each *Lpt* that does not have the feature 'laneClient' provisioned on it.
List of	The name of the component

RESPONSE IpPing: Rx ... from ... for ...: icmpSeq=... ...

Description	This response indicates that the ping to the specified IP address was unsuccessful due to an ICMP error.

ATTRIBUTE type

Description	This attribute indicates the type of ICMP error received that correlates to an outstanding echo request. ICMP errors that are reported include all variations of unreachable errors, and the time exceeded error. Refer to RFC 792 for details on ICMP.
Values	String (0..20, ASCII)

ATTRIBUTE sourceIpAddr

Description	This attribute indicates the IP address of which the unreachable ICMP packet was originated.
Values	IP address

ATTRIBUTE destIpAddr

Description	This attribute indicates the IP address of the intended destination of the echo request.
Values	IP address

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE sequence

Description	This attribute indicates the sequence number of the failed echo request.
Values	Decimal (0..4294967295)

ATTRIBUTE data

Description	This attribute indicates any other relevant data in the ICMP error, such as the MTU in an 'unreachable - need fragment' ICMP error.
Values	String (0..20, ASCII)

RESPONSE Reconnect command successful, connection ....

Description	The *Reconnect* command produces this response to indicate that the connection was successfully established using the requested path.

ATTRIBUTE currentPath

Description	This attribute specifies the path in use after the *Reconnect* command.
Values	with primary path with alternate path using PNNI routing

RESPONSE Reconnect not successful, connection ....

Description	The *Reconnect* command produces this response to indicate that the connection could not be established using the requested path.

ATTRIBUTE currentPath

Description	This attribute specifies the path in use after the *Reconnect* command.
Values	with primary path with alternate path using PNNI routing not established

RESPONSE .....

Description	This indicates the number of components which generated warnings and the number of components which generated errors that could not be displayed due to volume limitations.

ATTRIBUTE warningCount

Description	This attribute indicates the number of components that have generated warnings that have not been displayed.
Values	Decimal (0..4294967295)

ATTRIBUTE errorCount

Description	This attribute indicates the number of components that have generated errors that have not been displayed.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

RESPONSE Error:An Lsp component must have a ... subcomponent provisioned.

Description The *Check Prov* command produces this response when the specified component name cannot be found in the edit view.

System Action: The *Check Prov* command fails.

Operator Action: Provision the component indicated as missing component under this *Lsp* component.

ATTRIBUTE mplsLspGLspMissingSubCompError

Description This attribute indicates the name of the missing subcomponent to be used in the response.

Values Decimal (0..65535)

RESPONSE Error:A ... subcomponent must be provisioned under the Fec component.

Description The *Check Prov* command produces this response when the specified component name cannot be found in the edit view.

System Action: The *Check Prov* fails.

Operator Action: Provision an *IpV4Epa* subcomponent under this *Fec* component.

ATTRIBUTE ipFwdPolMissingSubCompError

Description This attribute contains the name of the *IpV4Epa* subcomponent to be used in the response.

Values Decimal (0..65535)

RESPONSE Error:When the frequency attribute is set to veryFrequent, ... must equal ....

Description The *Check Prov* command produces this response when the *frequency* attribute has been set to ***veryFrequent*** and either the *peakDataRate* does not equal the *committedDataRate* or the *peakBurstSize* does not equal the *committedBurstSize*.

System Action: The *Check Prov* fails.

Operator Action: Alter the attributes to meet the required conditions.

ATTRIBUTE mplsCrLdpQosDataPeakError

Description This attribute indicates the name of one of the *CrLdpQos* attributes to be used in the response.

Values Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE mplsCrLdpQosDataCommittedError

Description	This attribute indicates the name of one of the *CrLdpQos* attributes to be used in the response.
Values	Decimal (0..65535)

RESPONSE Error: The following have duplicate IP addresses. (At most 20 components are shown.)

Description	A *Check Prov* command generates this response if two or more linked components have the same IP address. The first component has this Ip address will be recognized. But the second and more with same Ip address will be listed under this response.

ATTRIBUTE illegalFriDuplicated

Description	This attribute contains a list of the offending Frame Relay interfaces.
List of	The name of the component
List Size	20

RESPONSE Warning:This will disrupt all the BNX Dlcis under ....

Description	The *Check Prov* command generates this response when the attribute *linkToIpServer* and/or *ipAddress* have been changed.

ATTRIBUTE frUniName

Description	This attribute indicates the component name of its parent: *FrUni* or *FrNni*.
Values	The name of the component

RESPONSE Cannot Unlock - attribute ... is not set to unlocked.

Description	This error response is generated when an operator attempts to *Unlock* a component whose currently provisioned administrative status is ***permLocked***. **System action**: the *Unlock* command is ignored. **Operator action**: if desired, change the value provisioned for the indicated attribute to ***unlocked***, then retry the original *Unlock* command. Note that doing this will cause the component to attempt to go into service whenever a FP reload occurs.

ATTRIBUTE attribute

Description	This attribute identifies the provisioned administrative status attribute.
Values	Decimal (0..65535)

RESPONSE node id = ... port id = ...

Description	This response contains the information for one hop in a computed route returned as the result of issuing the *Run* command on the *RouteFinder* component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE nodeId

Description	This attribute specifies the node ID of a logical node at the near end of the hop.
Values	String (22, Hex)

ATTRIBUTE portId

Description	This attribute indicates the port ID of the PNNI interface leaving the node identified by the *nodeId* attribute.
Values	Decimal (0..4294967295)

RESPONSE node id = ...

Description	This response contains the information for one hop with an unknown port ID in a computed route returned as the result of issuing the Run verb on the RouteFinder component.

ATTRIBUTE nodeId

Description	This attribute specifies the node ID of a logical node at the near end of the hop.
Values	String (22, Hex)

RESPONSE Route ...: Optimal Path Metric Value : ...

Description	This response contains the header line for one computed route returned as the result of issuing the *Run* command on the *RouteFinder* component.

ATTRIBUTE route

Description	This attribute specifies the route number of one of the routes returned as the result of issuing the *Run* command on the *RouteFinder* component.
Values	Decimal (1..15)

ATTRIBUTE optMetricValue

Description	This attribute indicates the results of the optimization metric for the best routing path found.
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:Duplicated remote end is found in ....

Description — The *Check Prov* command generates this response when there are duplicated *calledIpAddress* and *calledDlci* pairs or *backupCalledIpAddress* and *backupCalledDlci* pairs in *BnxIwf* components under the same *FrUni* or *FrNni*.

System action: No *Activate* command is accepted until the provisioning information is corrected.

Operator action: Change one or more of the attributes of the duplicated *BnxIwf* components (*calledIpAddress*, *calledDlci*, *backupCalledIpAddress,* or *backupCalledIpAddress*) to make the remote ends unique.

ATTRIBUTE illegalFriDuplicated

Description — This attribute contains an offending *BnxIwf* component.

Values — The name of the component

RESPONSE Error: The aggregateNet ... is a host address. Use network address for the corresponding aggregateMask

Description — This response is generated when host address is used to aggregate routes

ATTRIBUTE ospfAggregateNetAddress

Description — This attribute contains the net address

Values — IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE DPRS MCS switched path associated with McsMgr ... ...

Description

This response is returned when the operator issued a *ping* command without the -rtd option and the data path currently being used for this FR VC is a pre-determined DPRS MCS switched path.

When data traffic of this FR VC is carried over a DPRS MCS switched path, the *ping* command should be issued with the -rtd option and meant to get the round-trip-delay information of this switched path.

However, if information about this switched path is needed, please refer to the component “McsMgr DprsMcsEpG/<x> Ep/<y> EpD” associated with this switched path. The steps are as follow (please note that <x> and <y> should be replaced using the actual values displayed in this response):
1) Display the attribute “transportConnectionPreference” under this component to see how this path is setup (using PORS or ATM).
2) If the value is “porsOnly”, the path information can be obtained using “display McsMgr DprsMcsEpG/<x> Ep/<y> LCo” and looking at the value of attribute “path”. Otherwise, the value for attribute “transportConnectionPreference” is “atmOnly”. In this case, you have to check the attribute “nextHop” under component: “McsMgr DprsMcsEpG/<x> Ep/<y> AtmCon” and trace the same attribute manually hop-by-hop to get the path information.

ATTRIBUTE vcsEpG

Description

This attribute indicates the group number of the DPRS MCS endpoint associated with the switched path.

Values

Decimal (1..8191)

ATTRIBUTE vcsEp

Description

This attribute indicates the Ep number of the DPRS MCS endpoint associated with the switched path.

Values

Decimal (1..256)

RESPONSE

Description

The *Trace* command produces this response when the command completes normally. This is only the initial part of the complete response. The complete response includes multiple instances of *AtmTracePartialResponse* as well.

The following is an example of the complete response:

Trace status = Trace Completed Normally
Src port Id=001e0001
Src port name =EM/PARIS Atmif/30

Node Id =60A0391111111111111111111111110090CF55E80060
Node name = PARIS
Port Id =0700001

Copyright © 2006, Nortel Nortel Confidential

Port name= EM/PARIS Atmif/112

...

Node Id =60A039111111111111111111111110090CF55E81163
Node name = ENGLAND
Port Id =0700001
Port name= EM/ENGLANG Atmif/112

...

Node Id = 60A039111111111111111111111110090CF55E81163
Node name = MOSCOW
Port Id =0700001
Port name= EM/MOSCOW Atmif/112

ATTRIBUTE status

Description — This attribute indicates the status of the trace. The string should be one of the following:

***Completed normally**:* The trace completed normally.

***Incomplete**:* Partial trace returned.

***Exceeded information element length limitations**:* The number of traced nodes exceeded the maximum number of hops.

***Exceeded message length limitations**:* The message length exceeded the maximum allowed size.

Values
Completed normally
Incomplete
Exceeded information element length limitations
Exceeded message length limitations

ATTRIBUTE srcPortId

Description — This attribute indicates the trace source port identifier used for this connection.

Values — Decimal (0..4294967295)

ATTRIBUTE srcPortName

Description — This attribute indicates the node name and the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.

Values — String (40, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The policy described by this component duplicates or conflicts with the policy described by ....

Description — A *Check Prov* command produces this response if the addition, deletion, or change of an *EgressPolicy* or *NetworkAddress* component results in an inconsistent set of egress policies.

ATTRIBUTE netAddrDupName

Description — This attribute contains the name of the conflicting *NetworkAddress* component.

Values — The name of the component

RESPONSE Error: ... encapType must be llcEncap.

Description — A *Check Prov* command produces this response when the *encapType* attribute of the linked *AtmMpe* is not ***llcEncap***.

ATTRIBUTE atmMpeName

Description — This attribute contains the name of the *AtmMpe* component.

Values — The name of the component

RESPONSE Error: The combination of attributes ... and ... is invalid because there are non-zero bits in the address which lie outside the mask.

Description — A *Check Prov* command produces this response when there are non-zero bits in the *sourceAddress* or *destinationAddress* which lie outside the corresponding mask.

ATTRIBUTE invalidAddress

Description — This attribute contains the numeric ID of the attribute with the invalid address.

Values — Decimal (1..65535)

ATTRIBUTE invalidMask

Description — This attribute contains the numeric ID of the attribute with the invalid mask.

Values — Decimal (1..65535)

RESPONSE Error: More than one Virtual Media Interface component linked to Vr/....

Description — The *Check* command produces this response if more than one *Interface* of the given *VirtualMedia* is linked to a given *VirtualRouter*. Delete any additional *VirtualMedia Interfaces*, or link them to another *VirtualRouter*

ATTRIBUTE vrId

Description — This attribute indicates the name of the *VirtualRouter*.

Values — String (1..8, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE The install version ... does not exist.

Description

The *Install* command generates this response when the install file version specified for the fabric application does not exist.
System action: The command was not accepted.
Operator action: Specify another fabric application version to install, or download the version first from the SDS site.

ATTRIBUTE file

Description

This attribute is the name of the install file to be loaded.

Values

String (1..50, ASCII)

RESPONSE Switch side trace result:

Description

The *Trace* command produces this response when the command completes normally. This is only the initial part of the complete response. The complete response includes multiple instances of *AtmTracePartialResponse* as well.

An example of the complete response is:
Switch side trace result:

Trace status = Trace Completed Normally.
Src port Id=001e0001
Src port name = EM/PARIS Atmif/30

Node Id=60A03911111111111111111111111110090CF55E80060
Node name = PARIS
Port Id =0700001
Port name = EM/PARIS Atmif/112

...

Node Id=60A03911111111111111111111111110090CF55E81163

Node Id=60A03911111111111111111111111110090CF55E81163
Node name = MOSCOW
Port Id =0700001
Port name= EM/MOSCOW Atmif/112

ATTRIBUTE status

Description

This attribute indicates the status of the trace. The string is one of the following:

Completed normally*:* The trace completed normally.

Copyright © 2006, Nortel Nortel Confidential

***Incomplete**:* Partial trace returned.

***Exceeded information element length limitations**:* The number of traced nodes exceeded the maximum number of hops.

***Exceeded message length limitations**:* The message length exceeded the maximum allowed size.

Values

Completed normally
Incomplete
Exceeded information element length limitations
Exceeded message length limitations

ATTRIBUTE srcPortId

Description

This attribute indicates the port identifier value used for this connection.

Values

Decimal (0..4294967295)

ATTRIBUTE srcPortName

Description

This attribute indicates the node name and the name of the source port used for this connection on the ingress side. This attribute only appears in the trace results for the trace source hop.

Values

String (40, ASCII)

RESPONSE Linkside trace result:

Description

The *Trace* command produces this response when the command completes normally. This is only the initial part of the complete response. The complete response includes multiple instances of *AtmTracePartialResponse* as well.

The following is an example of the complete response:
Linkside trace result:

Trace status = Trace Completed Normally.
Src port Id=001e0001
Src port name =EM/PARIS Atmif/30

Node Id =60A039111111111111111111111110090CF55E80060

RESPONSE

Description

The *Trace* command produces this response, or multiple instances of this response, when the path trace test connection completes normally. This partial response is also used by the connection trace to produce the complete response.

Multiple instances of this response are part of the complete response as show below:

Node Id=60A039111111111111111111111110090CF55E80060
Node name = PARIS
Port Id =0700001
Port name= EM/PARIS Atmif/112
...

Node Id=60A039111111111111111111111110090CF55E81163
Node name = ENGLAND
Port Id =0700001
Port name= EM/ENGLANG Atmif/112
...

Node Id=60A039111111111111111111111110090CF55E81163
Node name = MOSCOW
Port Id =0700001
Port name= EM/MOSCOW Atmif/112

ATTRIBUTE vpiVci

Description

This attribute indicates the VPI.VCI values are used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. This attribute is displayed for ATM interfaces only.

For the connection trace, the VPI.VCI values are included in the trace when the *-s* option is specified.

For the test connection, as defined by the specification, the VPI.VCI values are never included when the connection is released at the destination.

Values

Integer Sequence (0..4095; 0..65535)

ATTRIBUTE dlci

Description

This attribute indicates the DLCI value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. This attribute is displayed for FrAtm interfaces only.

For the connection trace, the VPI.VCI values are included in the trace when the *-s* option is specified.

For the test connection, as defined by the specification, the VPI.VCI values are never included when the connection is released at the destination.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..1023)

ATTRIBUTE callReference (callref)

Description This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages.

For the connection trace, the call reference value is included in the trace when the *-a* option is specified.

For the test connection, as defined by the specification, the call reference value is never included when the connection is released at the destination.

Values Hex (H.0..H.ffffff)

ATTRIBUTE endPointReference

Description This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages.

For the connection trace, the end point reference value is included in the trace when the *-a* option is specified.

For the test connection, as defined by the specification, the end point reference value is never included when the connection is released at the destination.

Values Hex (H.0..H.ffff)

ATTRIBUTE nodeId

Description This attribute indicates the lowest level node Id traversed for this hop.

Values String (22, Hex)

ATTRIBUTE nodeName

Description This attribute indicates the *nodeName* under the *ModuleData* component for this hop. Only Nortel Networks Multiservice Switches provide this information by including it in the Vendor Specific group.

Values String (15, ASCII)

ATTRIBUTE portId

Description This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages.

Values Decimal (0..4294967295)

ATTRIBUTE portName

Description This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. Only Nortel

Copyright © 2006, Nortel Nortel Confidential

Networks Multiservice Switches provide this information by including it in the Vendor Specific group.

Values — String (55, ASCII)

ATTRIBUTE pnniTraceContRefusalIndPresent (refusal)

Description — This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.

This is not applicable for a connection trace because this connection has already been established.

Values — absent
present

ATTRIBUTE crankbackDestNodeIndPresent (dest)

Description — This attribute indicates whether the “PNNI Crankback Received at Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node and has received a crankback for this call from a non-PNNI interface.

This is not applicable for a connection trace because this connection has already been established.

Values — absent
present

ATTRIBUTE pnniCrankbackGapIndPresent (gap)

Description — This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call has been subjected to a crankback, however, no Trace Transit List IE was returned by the node initiating the crankback.

This is not applicable for a connection trace because this connection has already been established.

Values — absent
present

ATTRIBUTE crankBackCause (cause)

Description — This attribute indicates the crankback cause. Please refer to the Private-Network-to-Network-Interface Specification Version 1.0 for more information.

This is not applicable for a connection trace because this connection has already been established.

For the test connection, this attribute is present when the *traceCrankback* is set to ***Yes.***

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..1000)

ATTRIBUTE blockedTransitType (type)

Description This attribute indicates the blocked transit type.

This is not applicable for a connection trace because this connection has already been established.

For the test connection, this attribute is present when the *traceCrankback* is set to ***Yes***.

Values Succeeding end block
Blocked node
Blocked link

ATTRIBUTE blockedNodeId (bNodeId)

Description This attribute indicates the blocked node Id during the call setup request. The blocked node Id identifies the logical node where the connection or party has been blocked.

This attribute is present when the *blockedTransitType* attribute is the ***Blocked node.***

Values String (22, Hex)

ATTRIBUTE blockedLinkPrecedingNodeId (pNodeId)

Description This attribute indicates the blocked link's preceding node Id during the call setup request. The blocked link's preceding node Id identifies the logical node preceding a link where the connection or party has been blocked.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link***.

Values String (22, Hex)

ATTRIBUTE blockedLinkPortId (bPortId)

Description This attribute indicates the blocked link's port identifier value used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's preceding node identifier.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values Decimal (0..4294967295)

ATTRIBUTE blockedLinkSucceedingNodeId (sNodeId)

Description This attribute indicates the blocked link's succeeding node Id during the call setup request. The blocked link's succeeding node Id identifies the logical node succeeding a link where the connection or party has been

Copyright © 2006, Nortel Nortel Confidential

blocked.

This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***

Values — String (22, Hex)

ATTRIBUTE dstVpiVci

Description — This attribute indicates the VPI.VCI values on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is displayed for ATM interfaces only.

For the connection trace, the VPI.VCI values are included in the trace when the *-s* option is specified.

For the test connection, as defined by the specification, the VPI.VCI values are never included when the connection is released at the destination.

Values — Integer Sequence (0..4095; 0..65535)

ATTRIBUTE dstDlci

Description — This attribute indicates the DLCI value on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for FrAtm interfaces.

For the connection trace, the VPI.VCI values are included in the trace when the *-s* option is specified.

For the test connection, as defined by the specification, the VPI.VCI values are never included when the connection is released at the destination.

Values — Decimal (0..1023)

ATTRIBUTE dstCallReference

Description — This attribute indicates the call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.

For the connection trace, the call reference value is included in the trace when the *-a* option is specified.

For the test connection, as defined by the specification, the call reference value is never included when the connection is released at the destination.

Values — Hex (H.0..H.ffffff)

ATTRIBUTE dstEndPointReference

Description — This attribute indicates the end point call reference value on the destination side. This attribute only appears in the trace result for the trace destination node.

Copyright © 2006, Nortel Nortel Confidential

For the connection trace, the end point reference value is included in the trace when the *-a* option is specified.

For the test connection, as defined by the specification, the end point reference value is never included when the connection is released at the destination.

Values — Hex (H.0..H.ffff)

ATTRIBUTE specifiedPath

Description — This attribute indicates whether this hop is the originator of this manually configured path. Only Nortel Networks Multiservice Switches provide this information by including it in the Vendor Specific group.

Values — no
yes

RESPONSE Syntax Error(s):

Description — A *Set* command produces this response when a syntax error is detected in an attribute whose value is a regular expression.

ATTRIBUTE errorString3

Description — This attribute contains the syntax error when an invalid character is detected in the expression.

Values — String (1..255, ASCII)

ATTRIBUTE errorString30

Description — This attribute contains the syntax error when duplicate special characters are found.

Values — String (1..255, ASCII)

RESPONSE Connection failed or not enough resources.

Description — The *Trace* command produces this response to indicate that there are not enough resources and displays the cause identifier for the operator to look at.

System action: None.

Operator action: Look at the cause identifier, change the proper parameters, and try this command again.

ATTRIBUTE causeId

Description — This attribute indicates the cause code value to identify the failure.

Values — Decimal (0..1000)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE

Description — The *Trace* command produces this response when the vendor specific information exists for one hop in the trace record. This is part of the complete response. The complete response may include multiple instances of this response.

ATTRIBUTE length

Description — This attribute indicates the length of a vendor specific information group.

Values — Decimal (0..11)

ATTRIBUTE organizationUniqueId (oui)

Description — This attribute indicates the Organization Unique Identifier (OUI) of a node that is not a Nortel Networks Multiservice Switch.

Values — String (3, Dashed Hex)

ATTRIBUTE data

Description — This attribute indicates the contents of a vendor specific information group.

Values — String (1..8, Hex)

RESPONSE Error: The value of ripInterface, ..., does not match any RIP interface address provisioned on this routing component.

Description — A *Check Prov* command produces this response when the attribute *ripInterface* is set to an address that does not match any *logicalIf* address on this routing component (*Vr*, *Rtr* or *Vrf*) that has a *RipIf*.

ATTRIBUTE invalidRipInterfaceAddress

Description — This attribute contains value of the invalid *ripInterface* address.

Values — IP address

RESPONSE Error: The value of ripNeighbor, ..., is not a valid IP address for a RIP neighbor.

Description — A *Check Prov* command produces this response when the attribute *ripNeighbor* is set to an address that does not belong to any Class A, B or C network.

ATTRIBUTE invalidRipNbrAddress

Description — This attribute contains value of the invalid *ripNeighbor* address.

Values — IP address

RESPONSE Error: The value of routeReflectorCluster should not be ....

Description — The *Check Prov* command produces this response when attribute *routeReflector* of *Bgp* component is ***true*** and the *routeReflectorCluster* attribute is ***0.0.0.0*** or ***255.255.255.255***.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE invalidBgpRouteReflectorClusterId

Description — This attribute contains the invalid route reflector cluster identifier.

Values — IP address

RESPONSE Error: Peer ... cannot be a client if the routeReflector attribute of BGP is false.

Description — A *Check Prov* command produces this response when the peer is specified as a client but the attribute *routeReflector* of *Bgp* component is not ***true***

ATTRIBUTE inwIpBgpRouteReflectorClient

Description — This attribute contains the IP address of the peer that is provisioned as a client

Values — IP address

RESPONSE Extenal peer ... cannot be a client of a routeReflector.

Description — A *Check Prov* command produces this response when an external peer is provisioned as a client of a Route Reflector.

ATTRIBUTE inwIpBgpRrExternalClientAddress

Description — This attribute contains the IP address of the external peer that is provisioned as a client

Values — IP address

RESPONSE There are ... records available for storage.

Description — The *Start* command produces this response indicating the number of records available to be stored.

System action: None.

Operator action: If the number of records available is zero, the operator should stop and clear some of the existing filters on this *Lp* or increase the value of *Lp/n Eng PTrace Ov maxTraceRecords*.

ATTRIBUTE recordsAvailable

Description — This attribute indicates the number of available records stored on this *Lp.*

Values — Decimal (0..200)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The encryption key length must be ... hex digits.

Description

A *Check Prov* command produces this response when *encAlgorithm* attribute is set to ***des***, ***3des*** or ***aes*** but the length of *encKey* attribute is not correct.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: Ensure the length of *encKey* attribute is correct for the *encAlg* attribute.

ATTRIBUTE encKeySize

Description

The attribute indicates the correct length for the encryption key.

Values

Decimal (0; 16; 48)

RESPONSE Error:The authentication key length must be ... hex digits.

Description

A *Check Prov* command produces this response when *authAlgorithm* attribute is set to ***md5*** or ***sha1***, but the length of *authKey* attribute is not correct (32 or 40).

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: Ensure the length of *authKey* attribute is valid for the *authAlg* attribute.

ATTRIBUTE authKeySize

Description

The attribute indicates the correct length for the authentication key.

Values

Decimal (0; 32; 40)

RESPONSE Warning:You must now set the key(s) for the new component:...

Description

A *Copy Prov* command produces this warning when a new *Vr/<string> Ip Spd/<string> Policy/<string> Sa/<secDestination, secProtocol, spi> ManualEspSa* component is created from an existing one. All attribute values are copied to the new component, except for the *authKey* and/or *encKey* attributes. For security reasons, those attribute values are not copied from one component to another.

System action: The *authKey* and/or *encKey* attributes for the new *ManEspSa* component are set to empty strings. Any subsequent *Check Prov* command involving the new component will fail unless the keys have been set to new values by the operator.

Operator action: *Set* the *authKey* and/or *encKey* attributes for the new *ManEspSa* component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE componentName

Description — The attribute indicates the component whose keys must be set.

Values — The name of the component

RESPONSE Error:The Ip Address ... must be a subnet address given provisioned netMask.

Description — A *Check Prov* command produces this response when it detects that the IP address of this *IpLogicalInterface* or *Interface* is not a subnet address given the provisioned *netMask*, and this *ProtocolPort* or *Interface* is linked to a *VirtualMedia Interface* or *Loopback Interface* component whose *mode* is set to ***alwaysUpSummaryInterface***.

System action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Change the value of IP address to a subnet address given the provisioned *netMask*.

ATTRIBUTE invalidAddress

Description — This attribute contains the value of invalid IP address.

Values — IP address

RESPONSE Released with :

Description — The Trace command produces this response to indicate the cause and diagnostic code for why the connection was relaesed.

System action: None.

Operator action: To debug why the connection failed.

ATTRIBUTE causeCode

Description — This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.

Values — Decimal (0..255)

ATTRIBUTE diagCode

Description — This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.

Values — String (0..8, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:echoCancellationTailLength on a ... card must be set to one of the following values:...

Description

A *Check Prov* command produces this response if the user sets the *echoCancellationTailLength* attribute to an inappropriate value for the card in use.

A value of ***32*** or ***autoConfigure*** is allowed on a ***12mVspAal*** card.

A value of ***32***, ***48*** or ***autoConfigure*** is allowed on a ***Vsp2*** card.

A value of ***64***, ***128*** or ***autoConfigure*** is allowed on a ***2pGeMmSrVsp3*** card.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the *echoCancellationTailLength* attribute is set to the appropriate value for the card being used

ATTRIBUTE vgsCardType

Description — This attribute indicates the card type being used.

Values
12mVspAal
Vsp2
2pGeMmSrVsp3

ATTRIBUTE vgsBragEcanTailLength

Description — This attribute indicates the allowed values for the *echoCancellationTailLength* attribute.

List of
autoConfigure
32
48
64
128

List Size — 4

RESPONSE

Description — This collected event represents the security logs for an SNMP set request. Several such logs may be required for a single set PDU.

ATTRIBUTE managerIpAddress

Description — This attribute is the IP address and port of the SNMP Management station (Manager) that issued the set request. It is in the format of IPaddress-162.

Values — String (1..255, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE snmpCommand

Description	This attribute is the command that was received by the SNMP Agent (for example, Set mscLpDS1ChanTimeslotDataRate.8.0.0 1).
Values	String (1..255, ASCII)

ATTRIBUTE cliCommand

Description	This attribute is the command line interface (CLI) equivalent of the command that was received by the SNMP Agent (for example, set lp/8 ds1/0 chan/0 timeslotDataRate doNotOverride). There is no equivalent CLI command for a Standard MIB variable set request.
Values	String (1..255, ASCII)

ATTRIBUTE response

Description	This attribute is the success/failure indicator of the command that was entered. In the case of a failure, a meaningful response message will be provided when possible. In most cases, this is the same message received if the command is entered via the CLI interface. Otherwise the message may be one of these responses defined under the *SNMP* component: SnmpAgentResourceUnavailable, SnmpAgentForcedOutProvMode, SnmpAgentReqFullSemantic, SnmpAgentUnknownCommunity, SnmpAgentReadonlyCommunity, SnmpAgentReadonlyManager, SnmpAgentUnknownManager, SnmpAgentRespPDUTooBig, SnmpAgentViewInvalidOid, SnmpAgentViewExcluded, SnmpAgentViewNotLeafNode, SnmpAgentViewNotWritable, SnmpAgentViewWrongType, SnmpAgentAddCompError, SnmpAgentSetAttrError, SnmpAgentGeneralErrors, SnmpAgentCpResetErr
Values	String (1..275, ASCII)

RESPONSE Error:...An invalid object identifier found in VarBind ....

Description	An SNMP set request produces this response when the SNMP set request has an invalid object identifier. **System action**: the command terminates without having done anything. **Operator action**: Validate the object identifier.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE attributeInError

Description — This attribute contains the index of the SNMP VarBind that caused this error.

Values — Decimal (1..1000)

RESPONSE Error:...The object identifier specified in VarBind ... is excluded by the view.

Description — An SNMP set request produces this response when the SNMP set request has an object identifier that is excluded by the SNMP view.

This can represent a security breach.

System action: the command terminates without having done anything.

Operator action: Use an appropriate view or reconfigure the current one.

ATTRIBUTE attributeInError

Description — This attribute contains the index of the SNMP VarBind that caused this error.

Values — Decimal (1..1000)

RESPONSE Error:...The object identifier specified in VarBind ... is not a leaf node.

Description — An SNMP set request produces this response when the SNMP set request has an object identifier that is not a leaf node.

System action: the command terminates without having done anything.

Operator action: none.

ATTRIBUTE attributeInError

Description — This attribute contains the index of the SNMP VarBind that caused this error.

Values — Decimal (1..1000)

RESPONSE Error:...The object identifier spcified in VarBind ... is not writable.

Description — An SNMP set request produces this response when the SNMP set request has an object identifier that is not writable.

System action: the command terminates without having done anything.

Operator action: Validate the object identifier.

ATTRIBUTE attributeInError

Description — This attribute contains the index of the SNMP VarBind that caused this error.

Values — Decimal (1..1000)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:...The value specified in VarBind ... has the wrong type.

Description

An SNMP set request produces this response when the SNMP set request has an object identifier with a wrong type.

System action: the command terminates without having done anything.

Operator action: Validate the type of the object identifier.

ATTRIBUTE attributeInError

Description

This attribute contains the index of the SNMP VarBind that caused this error.

Values

Decimal (1..1000)

RESPONSE Error:...Set failed on VarBind ... with the error status: ....

Description

An SNMP set request produces this response when the SNMP set request failed on a Standard MIB variable.

System action: the command terminates without having done anything.

Operator action: Check the logs for the SNMP error status.

ATTRIBUTE snmpVarBindIndex

Description

This attribute contains the index of the SNMP VarBind that caused this error.

Values

Decimal (1..1000)

ATTRIBUTE snmpErrorCode

RESPONSE Error:The dscpToMatch attribute must contain at least one value.

Description

A *Check Prov* command produces this response if the *dscpToMatch* attribute of the *BehaviorAggregate* component does not contain at least one value.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that the *dscpToMatch* attribute contains at least one value.

ATTRIBUTE ba1

Description

This attribute specifies the *BehaviorAggregate* component where the *dscpToMatch* attribute is empty.

Values

The name of the component

RESPONSE Error:The following BehaviorAggregate components contain conflicting dscpToMark values:

Description

A *Check Prov* command produces this response if the *dscpToMark* attribute of any two *BehaviorAggregate* subcomponents of the same *IngressServices* or the same *EgressServices* specify the same DSCP value.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Remove one of the two conflicting *BehaviorAggregate* components, or ensure that the two *dscpToMark* attributes specify different DSCP values.

ATTRIBUTE ba1

Description

This attribute specifies the first of two conflicting *BehaviorAggregate* components.

Values

The name of the component

ATTRIBUTE ba2

Description

This attribute specifies the second of two conflicting *BehaviorAggregate* components.

RESPONSE Error:The following BehaviorAggregate components contain conflicting dscpToMatch values:

Description

A *Check Prov* command produces this response if any value specified by the *dscpToMatch* attribute appears in two different *BehaviorAggregate* subcomponents of the same *IngressServices* or of the same *EgressServices*.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Remove one of the two conflicting *BehaviorAggregate* components, or ensure that the two *dscpToMatch* attributes specify disjoint sets of DSCP values.

ATTRIBUTE ba1

Description

This attribute specifies the first of two conflicting *BehaviorAggregate* components.

Values

The name of the component

ATTRIBUTE ba2

Description

This attribute specifies the second of two conflicting *BehaviorAggregate* components.

Values

The name of the component

RESPONSE Error:One of the following two PerHopBehavior subcomponent instances must be removed:

Description

A *Check Prov* command produces this response if two *PerHopBehavior* subcomponents instance values are equal.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Remove one of the two conflicting *PerHopBehavior* components.

ATTRIBUTE phb1

Description

This attribute specifies the first of two conflicting *PerHopBehavior* components.

Values

The name of the component

ATTRIBUTE phb2

Description

This attribute specifies the second of two conflicting *PerHopBehavior* components.

RESPONSE Error:The media ... is not supported for a Virtual Router that is linked to a VpnXc card.

Description

The *Check Prov* command produces this response when a *VirtualRouter* is linked to a ***VpnXc*** card, and it has a *ProtocolPort* that is linked to a media which is not supported for a ***VpnXc*** based Virtual Router.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: One of the following actions should be taken:
- delete the *ProtocolPort* that is linked to the unsupported media, or
- set the value of the *virtualRouterProcessor* attribute for the *VirtualRouter* to ***Lp/0***, or
- move the *ProtocolPort* to a *VirtualRouter* whose *virtualRouterProcessor* attribute value is ***Lp/0***.

ATTRIBUTE media

Description

This attribute indicates the component name of the unsupported media.

Values

The name of the component

RESPONSE Error:The ... feature does not support ... trace receiver.

Description

The *Start* command produces this response when attempted against a service trace receiver that is not supported by the targeted trace service.

System action: The *Start* command has no effect.

Operator action: Check the specified receiver type against the type of service trace as following, correct the receiver name in service *SrvTrace rcvr* attribute, then enter *Start* command again.

Currently, Frame Relay Trace features support ***X25***, ***FrameRelay*** and ***ATM*** receivers, and ATM Trace features support ***FrAtm*** and ***ATM*** receivers.

ATTRIBUTE serviceTraceFeature

Description

This attribute indicates the name of service trace feature.

Values

String (0..20, ASCII)

ATTRIBUTE rcvrFeature

Description

This attribute indicates the name of trace receiver feature.

Values

String (0..20, ASCII)

RESPONSE Error:The dscpToMark attribute is not equal to the instance value of a PerHopBehavior subcomponent of the Vr DifferentiatedServicesDomain

Description

A *Check Prov* command produces this response if the *dscpToMark* attribute value of the *BehaviorAggregate* subcomponent of the *IngressServices* is not equal to the instance value of a *PerHopBehavior* subcomponent under the *VirtualRouter DifferentiatedServicesDomain.*

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that the *dscpToMark* attribute of the *BehaviorAggregate* subcomponent of the *IngressServices* is equal to the instance value of a *PerHopBehavior* subcomponent under the *VirtualRouter DifferentiatedServicesDomain*.

ATTRIBUTE ba1

Description

This attribute specifies the *BehaviorAggregate* component where the *dscpToMark* attribute is out of range.

Values

The name of the component

RESPONSE Error:The following component,..., is incompatible with the use of a VrAp component in this Nsta/n Vgs hierarchy.

Description

A *Check Prov* command produces this response if a user tries to provision one of the following components under the same *Nsta/n Vgs* component tree where the *VrAp* component is provisioned: *Nap, Aap, Pap, SpvcAp, IpIf* and *VCac*.

System action: The *Check Prov* command fails. No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that no such component is provisioned within a *Nsta/n Vgs* component hierarchy which contains a *VrAp* component.

ATTRIBUTE disallowedCompName

Description

This attribute contains the name of the disallowed component.

Values

The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:Duplicate IP addresses are assigned to the following components:...

Description

A *Check Prov* command generates this response if the same IP address is assigned to two or more components which have *VrAp* subcomponents associated with the same *Vr/n* component instance.

System action: The *Check Prov* command fails. No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the IP addresses are unique for all components with *VrAp* subcomponents associated with the same *Vr/n* component instance.

ATTRIBUTE vgsCheckDuplicateErrCmpnt

Description

This attribute contains the names of the components for which this check fails.

List of

The name of the component

RESPONSE Error:The ... component must have its mode attribute set to alwaysUpInterface.

Description

A *Check Prov* command generates this response if the *Vm/n If/m* instance has a *Mode* attribute value other than ***alwaysUpInterface***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the *Vm/n If/m* instance associated with this *VrAp* component has the *mode* attribute set to ***alwaysUpInterface***.

ATTRIBUTE vrapCheckVmIfMode

Description

This attribute contains the name of the *Vm/n If/m* component for which this check fails.

Values

The name of the component

RESPONSE Error:The udpPortBase attribute must equal 16384, 32768 or 49152 when provisioned on a ... card.

Description

A *Check Prov* command produces this response if the user tries to provision a *udpPortBase* value other than ***16384***, ***32768*** or ***49152*** when the *Shelf Card cardType* attribute is of the specified type.

System action: no *Activate* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Provision the *udpPortBase* attribute with a value of ***16384***, ***32768*** or ***49152***.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE vgsCardType

Description — This attribute indicates the card type being used.

Values
2pGeMmSrVsp3
2pOC3ChSmIrVsp3
2pVS
2pOC3ChSmIrVsp4e

RESPONSE Error:The tosMask attribute of the following components are not equal:

Description — A *Check Prov* command produces this response if the *tosMask* attribute of all *EgressCosTreatment* subcomponents of the *CosPolicyGroup* are not equal.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that the *tosMask* attribute of all *EgressCosTreatment* subcomponents of the *CosPolicyGroup* are equal.

ATTRIBUTE inwIpPolEgressCosTmtTosMask1

Description — This attribute specifies the first of two *EgressCosTreatment* components where the *tosMask* attributes are not equal.

Values — The name of the component

ATTRIBUTE inwIpPolEgressCosTmtTosMask2

Description — This attribute specifies the second of two *EgressCosTreatment* components where the *tosMask* attributes are not equal.

Values — The name of the component

RESPONSE Error:The provisioned IP address must not be a broadcast address within the provisioned subnetMask.

Description — A *Check Prov* command produces this response if the IP Address is a broadcast address with in the *subnetMask*.

System Action: no *Activate Prov* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator Action: Provision a non-broadcast IP address.

ATTRIBUTE broadcastIpAddress

Description — This attribute contains the value of the broadcast IP address.

Values — IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE The following patched AVs reference the AV that you are attempting to remove. To remove the AV in question,first remove the patched AVs.

Description — The *Remove* command produces this response when the *AV* cannot be removed because there is a dependent patched *AV* present on the disk. Because of the relationship between a patched *AV* and its parent *AV*, the parent *AV* cannot be removed while it has patched *AV*s present on the disk, regardless of whether the patched *AV*s are currently in use.

System action: The *AV* is not removed.

Operator action: If the patched *AV*s are no longer in use, remove these *AV*s, and then remove the original *AV*. If the patched *AV*s are still in use, this *AV* cannot be removed.

ATTRIBUTE listOfFileNames

Description — This attribute is a list of patched *AV*s that are based on the AV that the user is attempting to remove.

List of — String (1..30, ASCII)

RESPONSE Warning:The discardPriority attribute of the following components specify different drop precedence selection methods:

Description — A *Check Prov* command produces this response if the *discardPriority* attribute of one or more, but not all, of the *IngressCosTreatment* subcomponents of the *CosPolicyGroup* is set to ***unchanged***.

System Action: The *Check Prov* will complete if there are no errors, however if the *CosPolicyGroup* component is used and the view is activated, then the Class of Service (CoS) to drop precedence mapping will not always apply.

Operator Action: Ensure that the *discardPriority* attribute of all *IngressCosTreatment* subcomponents of the *CosPolicyGroup* are either all set to ***unchanged*** or each set individually to ***high***, ***medium***, or ***low***.

ATTRIBUTE inwIpIngressCosTmtPortDp1

Description — This attribute specifies the first of two *IngressCosTreatment* components where the *discardPriority* attributes conflict.

Values — The name of the component

ATTRIBUTE inwIpIngressCosTmtPortDp2

Description — This attribute specifies the second of two *IngressCosTreatment* components where the *discardPriority* attributes conflict.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Warning:The ... attribute will be ignored when the ClsDef component is provisioned.

Description — The *Check Prov* command produces this response when the *ClsDef* component is provisioned.

System Action: The *Check Prov* passes.

Operator Action: No operator action required.

ATTRIBUTE mplsRsvpQosClsBwWarning

Description — This attribute indicates the name of the *Bandwidth* attribute to be used in the response.

Values — Decimal (0..65535)

RESPONSE The following patches are mutually exclusive and cannot beprovisioned together:

Description — The check Prov command produces this response when two or more Reset patches provisioned in the *Sw patchList* are found to be patching the same object file. Such patches cannot be activated together and are mutually exclusive.

System action: Semantic check is failed. No patches are loaded. The current view is unchanged.

Operator action: If a patch is required that reflects all the solutions found in the patches in question, contact your customer support representative in order to obtain a composite patch. If only one of the patches is required, remove all of the other flagged patches from the *Sw Patchlist*.

ATTRIBUTE duplicatePatchObjList

Description — This attribute indicates a list of Reset patches that cannot be provisioned together because they patch the same object file.

List of — String (1..30, ASCII)

RESPONSE The following Reset patches in the Sw patchList are incompatible with the patched AVs in the Sw Avl:

Description — The check prov command produces this response when a conflict is detected between a patched *AV* (new application version based on an existing, released *AV*) and a Reset patch provisioned in the *Sw patchList*. Such conflicts arise when both patches are patching the same object file.

System action: Semantic check is failed. No patches are loaded. The current view is unchanged.

Operator action: If a patch is required that reflects all the solutions found in the patches in question, contact your customer support representative in order to obtain a composite patch. If only the patched *AV* is required, remove all of the flagged patches from the Sw *Patchlist*.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE patchPdAvConflictList

Description	This attribute indicates a list of patches (patched *AV*s and Reset patches from the *Sw patchList*) that cannot be provisioned together because they patch the same object file.
List of	String (1..30, ASCII)

RESPONSE Warning:The cpEquipmentProtection attribute has been changed.Standby CP (card ...) will restart when this view is activated.

Description	This response is issued when the standby CP will be restarted due to a change in the *cpEquipmentProtection* attribute.

ATTRIBUTE cpepCardNumberReset

Description	The card number of the standby CP card which will be reset when the provisioning view is activated.
Values	Decimal (0..15)

RESPONSE Error:An Lsp component must have a ... or a ... subcomponent provisioned when an AtmSap component is provisioned under the LspG component.

Description	The *Check Prov* command produces this response when one of the specified components cannot be found in the edit view. **System Action**: The *Check Prov* fails. **Operator Action**: Provision the component indicated as missing component under this *Lsp* component.

ATTRIBUTE mplsLspGLspOneOfTwoSubCompError

Description	This attribute indicates the name of the missing subcomponent to be used in the response.
Values	Decimal (0..65535)

ATTRIBUTE mplsLspGLspOneOfTwoRsvpQosError

Description	This attribute indicates the name of the other component to be used in the response.
Values	Decimal (0..65535)

RESPONSE Error: The value of peerIpAddress, ..., does not match the address of any peer of the associated VCG virtual router.

Description

A *Check Prov* command produces this response when the value of attribute *peerIpAddress* does not match the address of any BGP peer of the associated VCG virtual router.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that the value of the *peerIpAddress* attribute of the *MBgp ImportPolicy/n* subcomponent under this *VirtualRouter* matches the instance value of one of the *Bgp Peer/<peerIpAddress>* subcomponents under the associated VCG *VirtualRouter*.

ATTRIBUTE invalidPeerAddress

Description

This attribute contains the invalid *peerIpAddress* value.

Values

IP address

RESPONSE Error: The address ... is not a valid IP network address prefix.

Description

A *Check Prov* command produces this response when the address prefix defined by the *Network* component is not a valid IP network address prefix. Examples include all 0's (***0.0.0.0***) or all 1's (***255.255.255.255***).

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Provision the *prefix* and *length* attributes of the specified *Network* component to be a valid non-reserved address prefix.

ATTRIBUTE invalidAddress

Description

This attribute contains the value of the invalid address prefix.

Values

IP address

RESPONSE Warning:The ... attribute will be ignored when the Lsp component has an RsvpQos subcomponent.

Description

The *Check Prov* command produces this response when the *Lsp* component has an *RsvpQos* component provisioned and the *PathOnDemand* attribute has been set to ***enabled***.

System Action: The *Check Prov* command passes.

Operator Action: No operator action required.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE mplsTeRsvpQosWarning

Description	This attribute indicates the name of the attribute to be used in the response.
Values	Decimal (0..65535)

RESPONSE Error:An Lsp component must not have a ... subcomponent provisioned when a StaticRoute subcomponent is provisioned.

Description	The *Check Prov* command produces this response when the specified component name is found in the edit view. **System Action**: The *Check Prov* fails. **Operator Action**: Remove the component indicated under this *Lsp* component.

ATTRIBUTE mplsLspGLspNotAllowedCompError

Description	This attribute indicates the name of the component to be used in the response.
Values	Decimal (0..65535)

RESPONSE Warning:Duplicate IP addresses are assigned to the following components:...

Description	A *Check Prov* command generates this response if the same IP address is assigned to two or more components within any *Nsta/n Vgs* components hierarchy. **System action:** None. **Operator action:** Ensure that the duplication of IP addresses do not cause a problem.

ATTRIBUTE vgsCheckDuplicateWngCmpnt

Description	This attribute contains the names of the components for which duplicate IP addresses are identified by this check.
List of	The name of the component

RESPONSE Warning:tdmLogLaw is recommended to take one of the following values:...

Description

A *Check Prov* command produces this response if the user sets the *tdmLogLaw* attribute to an inappropriate value for the card in use.

A value of ***aLaw*** or ***autoConfigure*** is recommended for an ***E1*** port.

A value of ***muLaw*** or ***autoConfigure*** is recommended for an ***DS1*** port.

System action: An *Activate Prov* command will be accepted with a warning being generated.

Operator action: Ensure that the *tdmLogLaw* attribute is set to the appropriate value for the TDM interface being used.

ATTRIBUTE vgsBragTdmLogLaw

Description — This attribute indicates the allowed values for the *tdmLogLaw* attribute.

List of
muLaw
aLaw
autoConfigure

List Size — 2

RESPONSE Warning:The provisioned ATM Sustained Cell Rate may be too small if all timeslots are active.

Description — A *Check Prov* command produces this response if the user tries to provision a sustained cell rate which is less than the minimum value that would be required for a given connection. This value is altered when fax idle suppression or silence suppression is enabled.

System action: None.
Operator action: Ensure that the Sustained Cell Rate is acceptable.

ATTRIBUTE subComponent

Description — The name of the related component which contains the Sustained Cell Rate. It may be one of the following:

AtmIf/n Vcc/m Vcd Tm.
Nsta/n Conn/m Aap
Nsta/n Conn/m SpvcAp"

Values — The name of the component

ATTRIBUTE nstaSustainedCellRate

Description — The calculated value of the sustained cell rate.

Values — Decimal (0..2147483647)

RESPONSE Error: FrUni DirectConnection and Dlci ... are mutually exclusive.

Description

The *Check Prov* command generates this response when a *DirectConnection* component is provisioned under the *FrUni* component, and a *BnxIwf* or *IpConnection* subcomponent is provisioned under a *Dlci* subcomponent of the same *FrUni*.

System Action: The *Check Prov* command fails. An *Activate Prov* command will not be accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Delete the *DirectConnection* component under the *FrUni*.
or
Delete the *Dlci* with the *BnxIwf* or *IpConnection* subcomponent provisioned under it.
or
Replace the *BnxIwf* or *IpConnection* component under the indicated *Dlci* with a *DirectCall* component.

ATTRIBUTE frUniDlciMutualExclusiveNetCmpnt

Description

This attribute indicates the *Dlci* subcomponent that is mutually exclusive to the *DirectConnection* subcomponent.

Values

Decimal (1..65535)

RESPONSE Error:The following IpAddrLayer4Flow components conflict with each other because they both specify all addresses, the same port numbers, and the same protocol:

Description

A *Check Prov* command produces this response if the following conditions are all true for two *IpAddrLayer4Flow* subcomponents of the *CosPolicyGroup*:

1. The values of the *assignedCos* attribute of the parent *Policy* components are not equal.
2. The values of the *protocol* attributes are equal.
3. The values of the *prefixLength* attributes are zero.
4. The values of the *portNumberRange* attributes are equal.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that at least one of the following conditions is true for the two *IpAddrLayer4Flow* components:

1. The *protocol* attributes have different values.
2. The *prefix* and *prefixLength* attributes specify different IP address ranges.
3. The *portNumberRange* attributes specify non-overlapping port ranges.

RESPONSE Error:The ... attribute does not conform to required syntax.

Description

A *Check Prov* command produces this response if the value of one of the termination identifier format attributes does not comply with the relevant termination identifier syntax.

The termination identifier syntax is described in NTP NN10600-780.

System action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Provision the attribute to comply with the termination identifier syntax.

RESPONSE Error:The Rd or Rt instance value ... specified is not valid.

Description — A *Check Prov* command produces this response when the *Rd* or *Rt* value specified for this VRF is not valid. Valid syntax values can be one of two types, type 0 or type 1.

Type 0 syntax is represented as AS:index, where AS is a valid 2 byte autonomous system number and index is a valid 4 byte integer.

Type 1 syntax is represented as IPAddr:index, where IPADDR is a valid non-zero IP Address and index is a valid 2 byte integer.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Delete the *RouteDistinguisher* or *RouteTarget* component which is causing the semantic check to fail. Add the *RouteDistinguisher* or *RouteTarget* value to be a valid value as specified above.

ATTRIBUTE invalidRdRtValue

Description — This attribute contains the instance value of the invalid *RouteDistinguisher* or *RouteTarget*.

Values — String (3..21, ASCII)

RESPONSE Error:The Rd instance value ... specified must be unique across all Vrfs.

Description — A *Check Prov* command produces this response when the *Rd* instance value specified for this *VpnRouteForwarder* already exists for another *Vrf*.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that the *RouteDistinguisher* instance value specified is unique across all *Vrfs*.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE nonUniqueRdValue

Description — This attribute contains the instance value of the duplicate *RouteDistinguisher*.

Values — String (3..21, ASCII)

RESPONSE Provisioned file is saved under a new version .... Use -force to attempt loading.

Description — A *Load* command generates this response when the application version in the provisioning file is newer than the current running software version on the shelf. The saved data of some components may be lost while loading this file.

System action: The *Load* command is not executed.
Operator action: Use *-force* to attempt loading.

ATTRIBUTE versionName

Description — This attribute indicates the application version in the provisioning file being loaded.

Values — String (1..30, ASCII)

RESPONSE Warning:The type of component ... has changed.The provisioned data for this component will be lost.

Description — The *Load* command generates this response when the component type in the current running software is different from the component type in the software being loaded. The saved provisioned data for the component will be lost upon activation.

System action: Display partial warning message and continue loading.
Operator action: Note that the component has changed its type; therefore, its attributes will have default values.

ATTRIBUTE component

Description — This attribute contains the name of the component which has changed its type.

Values — The name of the component

RESPONSE Error:...

Description — This error response is generated during the *CheckProv* command. It is generated if the framingType of the framer for the *TdmaIwfBearerChannel* does not match the card type to which the *TdmaIwfBearerChannel* is being provisioned or the *TdmaIwfBearerChannel* is being placed on an unknown
card type.

ATTRIBUTE tdmaIwfBcUnknownCardType

Description — This attribute indicates the *TdmaIwfBearerChannel* has an unknown card type.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0)

ATTRIBUTE tdmaIwfMvpFramingTypeError

Description This attribute indicates that the *TdmaIwfBearerChannel*'s framing type does not match its DS1Mvp or E1Mvp card type.

Values Decimal (0)

ATTRIBUTE tdmaIwfMtxFramingTypeError

Description This attribute indicates that the *TdmaIwfBearerChannel*'s framing type does not match its DS1C or E1C card type.

Values Decimal (0)

RESPONSE Error:...

Description This error response is generated when an IP address is not set for this *TdmaIwfCallServer* or the IP address is already being used by another *TdmaIwfCallServer*.

ATTRIBUTE tdmaIwfCsIpAddressUnset

Description This attribute indicates the *TdmaIwfCallServer* added a *TdmaIwfLogicalProcessor* that is being used by another *TdmaIwfCallServer*.

Values Decimal (0)

ATTRIBUTE tdmaIwfCsIpAddressInUse

Description This attribute indicates the *TdmaIwfCallServer* added a *TdmaIwfLogicalProcessor* that is being used by another *TdmaIwfCallServer*.

Values Decimal (0)

RESPONSE Error:...

Description This error response is generated when a *virtualRouterName* set for this *TdmaIwfCallServer* is not set or is set to a non-provisioned *virtualRouterName*.

ATTRIBUTE tdmaIwfVrAttrUnset

Description A *CheckProv* command produces this response if the *virtualRouterName* attribute of this *TdmaIwfCallServer* is not set or references a nonexistent *virtualRouterName*.

Values Decimal (0)

ATTRIBUTE tdmaIwfInvalidVrSet

Description This attribute indicates the *virtualRouterName* set for this *TdmaIwfCallServer* has not been provisioned.

Values Decimal (0)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:...

Description — This error response is generated when the *TdmaIwfCallServer TdmaIwfLogicalProcessor* instance is not added , another *TdmaIwfCallServer* already has that *TdmaIwfLogicalProcessor*, or the user is attempting to provision a service other than TDMA asynchronous data call.

ATTRIBUTE tdmaIwfLpInUse

Description — This attribute indicates the *TdmaIwfCallServer* added a *TdmaIwfLogicalProcessor* that is being used by another *TdmaIwfCallServer*.

Values — Decimal (0)

ATTRIBUTE tdmaIwfAsyncDataOnlySupported

Description — This attribute indicates the supported service provisioned for the *TdmaIwfCallServer* includes another service or services other than asynchronous data only.

Values — Decimal (0)

ATTRIBUTE tdmaIwfTdmaOnlySupported

Description — This attribute indicates the supported technology provisioned for the *TdmaIwfCallServer* includes something other than TDMA only.

Values — Decimal (0)

RESPONSE Error:...

Description — This error response is generated during the *CheckProv* command. It is generated if the following occurs:
1) the *TdmaIwfBearerChannel* has no corresponding *TdmaIwfCallServer*.
2) the *TdmaIwfLogicalProcessor* between corresponding *TdmaIwfBearerChannel* and *TdmaIwfCallServer* does not match.
3) the *LogicalProcessor* and its main card do not match.
The correspondence between the two components is established by way of the first index of the *TdmaIwfBearerChannel* and the index of the *TdmaIwfCallServer*.

ATTRIBUTE tdmaIwfCallServerNotProvisioned

Description — This attribute indicates the corresponding *TdmaIwfCallServer* is not provisioned.

Values — Decimal (0)

ATTRIBUTE tdmaIwfLpConflict

Description — This attribute indicates the *TdmaIwfLogicalProcessor* linked by the corresponding *TdmaIwfCallServer* and *TdmaIwfBearerChannel* is not the same.

Values — Decimal (0)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE tdmaIwfLpError

Description — This attribute indicates that the *LogicalProcessor*'s instance number does not match the card number to which it is provisioned. The user must reprovision the LogicalProcessor so that it matches the card number.

Values — Decimal (0)

RESPONSE Error: ...

Description — The *CheckProv* command produces this response if the *timeslots* attribute of the *Channel* component associated with this bearer channel contains more than one timeslot." This error message is used to specify an *applicationFramerName* for the *TdmaIwfFramer* subcomponent of the *TdmaIwfBearerChannel* that specifies a *Channel,* which has its timeslots set to more than one timeslot. An error is also generated when the *TdmaIwfFramer* subcomponent of the *TdmaIwfBearerChannel* that specifies a *Channel* which has its timeslot set to 16 on an E1 MVP card. Since *timeslot* 16 is reserved for signalling on an E1 MVP card, the *TdmaIwfBearerChannel* cannot be provisioned against this channel.

ATTRIBUTE tdmaIwfMoreThanOneChannel

Description — This attribute indicates the more than one timeslot is attempting to be provisioned against a channel.

Values — Decimal (0)

ATTRIBUTE tdmaIwfChan16

Description — This attribute indicates timeslot 16 is attempting to be provisioned on the E1 MVP or the E1C card.

Values — Decimal (0)

ATTRIBUTE tdmaIwfTimeslotNotOneGreater

Description — This attribute indicates the timeslot selected is not one greater than the channel provisioned in the Framer interfaceName.

Values — Decimal (0)

RESPONSE Error:...

Description — This error response is generated when a *Virtual Router* set for *this GsmIwfCallServer* is not set or is set to a non-provisioned *Virtual Router*.

ATTRIBUTE gsmIwfVrAttrUnset

Description — This attribute indicates the Virtual Router attribute for GsmIwfCallServer is not set.

Values — Decimal (0)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE gsmIwfInvalidVrSet

Description — This attribute indicates the *Virtual Router* set for this *GsmIwfCallServer* has not been provisioned or is inconsistent across other *GsmIwfCallServers*. *GsmIwfCallServers* on a centralized IWF (Interworking Function) must all share the same *Virtual Router*.

Values — Decimal (0)

RESPONSE Error:...

Description — This error response is generated when the *GsmIwfCallServer* Logical Processor subcomponent is not added or another *GsmIwfCallServer* already has that Logical Processor.

ATTRIBUTE gsmIwfNoCallServerLp

Description — This attribute indicates the *GsmIwfCallServer* has no Logical Processor subcomponent.

Values — Decimal (0)

ATTRIBUTE gsmIwfLpInUse

Description — This attribute indicates the *GsmIwfCallServer* added a Logical Processor that is being used by another *GsmIwfCallServer*.

Values — Decimal (0)

RESPONSE Error:...

Description — This error response is generated when
1) the *GsmIwfBearerChannel* has no corresponding *GsmIwfCallServer*.
2) the logical processor between corresponding *GsmIwfBearerChannel* and *GsmIwfCallServer* does not match.
The correspondence between the two components is established by way of the first index of the *GsmIwfBearerChannel* and the index of the *GsmIwfCallServer*.

ATTRIBUTE gsmIwfCallServerNotProvisioned

Description — This attribute indicates the corresponding *GsmIwfCallServer* is not provisioned. The corresponding *GsmIwfCallServer* must have the same trunk group number as *GsmIwfBearerChannel*.

Values — Decimal (0)

ATTRIBUTE gsmIwfLpConflict

Description — This attribute indicates the logical processor linked by the corresponding *GsmIwfCallServer* and *GsmIwfBearerChannel* is not the same.

Values — Decimal (0)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE ERROR:...

Description — The IP address cannot be 0.0.0.0 because devices that wants to communicate with IPI system requires the IP address.

ATTRIBUTE ipiInvalidIpAddrAttr

Description — The Ip Address must have a valid IP value.

Values — Decimal (0..2147483647)

ATTRIBUTE ipiInvalidSubnetMaskAttr

Description — There cannot be 1's after 0's in IPIFR subnet mask value because this is what distinguish a subnet mask from a host address. For example, 255.255.0.0 is a valid subnet mask, while 255.255.0.1 is a host address and therefore invalid as a subnet mask.

Values — Decimal (0..2147483647)

RESPONSE LAPS request of equal or higher priority already in effect.

Description — This response is issued when the APS request invoked by this command entered is of lower priority than the APS requests already present on the *Laps*.
System Action: None
Operation Action: The *clear Laps/n* command clears the current outstanding value of the *nearEndRequest* attribute. The command can be re-issued with a higher *nearEndRequest* attribute value.

ATTRIBUTE lapsResponseText

Description — This response text gives the specific reason why the command was ignored. For example, "Far end is transmitting ***signalFail*** on protection", and a suggested alternative, such as "Use '*switch -force*' to override the ***signalFail***'.

Values — String (0..256, ASCII)

RESPONSE Error: All AtmTConn subcomponents must have a unique combination of remoteAddress and vcci attributes.

Description

A *Check Prov* command produces this response if the user has added at least two *AtmTConn* subcomponents under a *Vgs* component which have the same value for their *remoteAddress* attribute and also have the same value for their *vcci* attribute.

System action: no *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Use unique *remoteAddress* and *vcci* attribute pairing under this *Vgs* component.

ATTRIBUTE relatedComponent

Description — This attribute identifies the component in which the error was detected.

Values — The name of the component

RESPONSE .....

Description

This response describes the attributes specific to an Alarm Event.

ATTRIBUTE activeListStatus

Description — This mandatory attribute is the active alarm list status. This is equivalent to the DPN-100 Alarm Type field and is used by the MDM to add (upon receiving a SET alarm) and delete (on receiving a CLEAR alarm) alarms from the alarm displays.

Values
message (MSG)
set (SET)
clear (CLR)

ATTRIBUTE severity

Description — This mandatory attribute is the severity of the alarm which should indicate what priority that fixing this problem should be given. All values are OSI-defined; refer to CCITT X.733 for a more complete description.

Values
indeterminate
critical
major
minor
warning
cleared

ATTRIBUTE alarmType

Description — This mandatory attribute is the alarm type field as defined by OSI which is used to indicate a broad category of what is wrong. The first 6 values are OSI-defined; refer to CCITT X.733 (for the first 5) and CCITT X.736 (for the last) for a more complete description.

The value *operator* is used when an alarm is issued due to an operator command. The values *debug* and *unknown* are for compatibility with DPN-100 and are used for debugging alarms and for those which do not fit any of the above, respectively.

Values
communications
qualityOfService
processing
equipment
environmental
security
operator

debug
unknown

ATTRIBUTE probableCause

Description

This mandatory attribute is the probable cause for the alarm which usually qualifies the Alarm Type field. Most values are OSI-defined; refer to CCITT X.733 and X.736 for a more complete description. Some Nortel Networks proprietary causes are added to be more descriptive in cases where no OSI-defined cause is appropriate.

ATTRIBUTE ntpIndex

Description	This mandatory attribute is an 8-digit code that is an index into NTP NN10600-230 which provides a more detailed description of the alarm and possible actions to take. The first 4 digits indicate a “grouping” of alarms (a set of alarms common to a particular subsystem or component, etc.). The last 4 digits are a subindex arbitrarily assigned by the application which is responsible for the “group”.
Values	BCD (8)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE notificationId

Description	This mandatory attribute is the notification Id of the alarm. The high-order byte is the slot number of the *Card* from which this alarm originated. The low-order 24 bits contain a sequence number which increases each time an alarm is generated. Thus, this id provides a simple way of uniquely identifying an alarm as well as the order in which alarms are generated on a card. For cross-card ordering, one would have to look at the time stamp (see ***dateAndTime***).
Values	Hex (H.0..H.ffffff)

ATTRIBUTE relatedComponentNames

Description	This mandatory attribute is a list of the names of any components related to the component (that is, the one in the header FIELD) against which this alarm is raised. It typically contains at least the *LP* and possibly the *Card* on which the originating component resides.
List of	The name of the component

ATTRIBUTE operatorData

Description	This optional attribute is additional hexadecimal information for the network operator to use. Other than for software alarms, it should be described in NTP NN10600-230.Note: The total number of bytes in comment, operator, and internal data may not exceed 750 bytes.
Values	String (0..750, Hex)

ATTRIBUTE pid

Description	This optional attribute is a string representation of the internal process id (PID) of the process that generated the alarm (for internal use only).
Values	String (0..25, ASCII)

ATTRIBUTE fileName

Description	This optional attribute is an internal file name (for internal use only).
Values	String (0..255, ASCII)

ATTRIBUTE fileLineNumber

Description	This optional attribute is an internal line number in the file (see **fileName**) referred to above (for internal use only).
Values	Decimal (0..4294967295)

ATTRIBUTE fileVersion

Description	This optional attribute is a version indicator of the file (**filename**) referred to above (for internal use only).
Values	String (0..255, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE internalData

Description — This optional attribute is additional internal hexadecimal information for internal use only. It does not have to be described in NTP NN10600-230.
Note: The total number of bytes in comment, operator, and internal data may not exceed 750 bytes.

Values — String (0..750, Hex)

ATTRIBUTE commentData

Description — This optional attribute is additional textual information for the network operator to use. Other than for software alarms, if it is not self-explanatory, it should be described in NTP NN10600-230.
Note: The total number of bytes in comment, operator, and internal data may not exceed 750 bytes.

Values — String (0..750, ASCII)

RESPONSE The software migration is paused, pause reason:...To resume, type Continue Prov. To stop, type Stop Prov.

Description — The *Activate Prov* command generates this message during a Hitless Software Migration when issued without the -noPause option and when certain software errors are generated or when the list of LPs participating in the Hitless Software Migration is changed before the migration shelf is ready.
Activate Prov command always generates this message during a Hitless Software Migration when issued with *-pause* option.
This response indicates that the software migration is paused. The operator can decide to resume by typing *Continue Prov* or to roll back to the existent software version by typing *Stop Prov.* The migration will pause as long as no action is taken by the operator.

ATTRIBUTE pcsString

Description — This attribute indicates the different reasons for a pause in Hitless Software Migration. Listed are different pause reasons for the corresponding LPs listed in the *PcsProvisioningActivateSwMigWillPause* response.

If the *Activate Prov* command is issued with the *-pause* option, a pause reason is displayed indicating that the migration is paused due to an operator request.

Values — String (0..968, ASCII)

RESPONSE Error: The specified mask ... is not a valid contiguous mask.

Description — This error message appears in response to a Check Prov command when the value of a specified mask is provisioned with an invalid discontiguous mask.
1. The semantic check function will check for the contiguity of the mask by checking if there are contiguous 1's.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE invalidMask

Description — This attribute contains the value of the invalid mask.

Values — IP address

RESPONSE RpHash: RP address of group ... is ..., where the first attribute is the group address, and the second one is the RP address.

Description — This response indicates the Rp for the given multicast group.

ATTRIBUTE gAddr

Description — This attribute represents the multicast group address for which RP is sought.

Values — IP address

ATTRIBUTE rpAddr

Description — This attribute indicates the IP address of the RP.

Values — IP address

RESPONSE RpHash: no RP address was found for group ...

Description — This response indicates that *RpHash* to the given multicast group (IP) address was unsuccessful.

ATTRIBUTE gAddr

Description — This attribute specifies the group IP address for which no RP was found.

Values — IP address

RESPONSE Error: There is no Domain component of instance ... provisioned under Mcast.

Description — A *Check* Prov command produces this response when an attempt is made to add a Domain under PimSm component without provisioning a Domain component of the same instance under *Mcast*.

ATTRIBUTE domainInstance

Description — This attribute indicates the domain instance.

Values — Decimal (0..3)

RESPONSE Error:The ... attribute must be set.

Description — A *Check* Prov command produces this response if the user has not provisioned the *candidateBsrAddrAssignment* attribute.

ATTRIBUTE invalidType

Description — This attribute contains the numeric ID of the attribute which was left unprovisioned.

Values — Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The ... attribute must be set.

Description — A *Check* Prov command produces this response if the user has not provisioned the *candidateRpAddrAssignment* attribute.

ATTRIBUTE invalidType

Description — This attribute contains the numeric ID of the attribute which was left unprovisioned.

Values — Decimal (1..65535)

RESPONSE Error: The address attribute must be linked to a LogicalIf under Vr instance ... .

Description — A *Check* Prov command produces this response when an attempt is made to link the *address* attribute to a LogicalIf under different Vr instance.

ATTRIBUTE vrInstance

Description — This attribute indicates the Vr instance.

Values — String (1..8, ASCII)

RESPONSE Error: The address attribute must be linked to the LogicalIf under Vr instance ... .

Description — A *Check* Prov command produces this response when an attempt is made to link the *address* attribute to a LogicalIf under different Vr instance.

ATTRIBUTE vrInstance

Description — This attribute indicates the Vr instance.

Values — String (1..8, ASCII)

RESPONSE Error: There is no Domain component of instance ... provisioned under PimSm.

Description — A *Check* Prov command produces this response when an attempt is made to change the mcastDomain attribute under IpPort without provisioning a Domain component of the same instance under *PimSm*.

ATTRIBUTE domainInstance

Description — This attribute indicates the domain instance.

Values — Decimal (0..3)

RESPONSE Error: The specified mask ... is not a valid contiguous mask.

Description — A *Check* Prov command produces this response when an attempt is made to provision a Group component with an invalid (discontiguous) mask.

ATTRIBUTE invalidMask

Description — This attribute contains the index value of the invalid mask.

Values — IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The combination of address ... and mask ... is invalid because there are non-zero bits in the address which lie outside the mask.

Description — A *Check* Prov command produces this response when an attempt is made to provision a Group component with non-zero bits in the IP Address which lie outside the corresponding mask.

ATTRIBUTE invalidAddress

Description — This attribute contains the index value of the invalid IP address.

Values — IP address

ATTRIBUTE invalidMask

Description — This attribute contains the index value of the invalid mask

Values — IP address

RESPONSE Error: The combination of Group Address ... and Mask... for this component is not valid. The trailing zerosin the GroupAddress should match those for the Mask.

Description — A *Check* Prov command produces this response when a Group component is added with an invalid GroupAddress and Mask pair. The “anded’ value of the Group Address and Mask pair should be the same as the Group Address.

ATTRIBUTE invalidAddrInPair

Description — This attribute contains the value of the invalid group addr.

Values — IP address

ATTRIBUTE invalidMaskInPair

Description — This attribute contains the value of the invalid mask.

Values — IP address

RESPONSE The following LPs will be reset when the shelf switches over to the new software, because mate cards are unavailable: ....The software migration will be paused. The migration can be stopped by issuing the Stop Prov command.

Description — The *Activate Prov* command generates this message during a Hitless Software Migration when issued without the *-noPause* option and when the list of LPs participating in the Hitless Software Migration is changed before the migration shelf is ready. Such a change occurs when the configured mate card of an LP becomes unavailable during migration. The response indicates that the software migration will be paused. The operator can stop the migration at this point by issuing the *Stop Prov* command.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE pcsLp

Description	This attribute lists the LPs that were participating in the Hitless Software Migration in the beginning, but they are no longer participating, because their configured mate cards are unavailable.
List of	The name of the component
List Size	8

RESPONSE Error: ... in the linkToMulStaticGp list of the LogicalIf under the IpPort must belong to the same domain as provisioned under the mcastDomain attribute of the IpPort component.

Description	his error message appears when a static route linked to the Logical If belongs to a domain other than that provisioned under the mcastDomain attribute of the IpPort.

ATTRIBUTE mulStaticRouteEntry

Description	This attribute contains the name of the *Mcast Static RouteEntry* component.
Values	The name of the component

RESPONSE Warning:IP multicast traffic will not be forwarded to any protocol port on Lp(s) with the following Lpt(s), since the feature ipMcast is not provisioned in the featureList of those Lpt(s):

Description	This response is produced by the *Check Prov* command if the user has not provisioned the ***ipMcast*** feature on any FP when the multicast component is provisioned.

ATTRIBUTE component

Description	The list of *Lpt* which does not have the feature ***ipMcast*** provisioned on it.
List of	The name of the component

RESPONSE This Ep is disabled due to transport priority overlap, pinging its associated Ep ... instead.

Description	This response indicates that a ping query packet could not be sent to the remote *Ep* because the *Ep* has been disabled due to Transport Priority overlap. **System action**: The associated Ep is pinged instead. **Operation action**: Non - wait for reply from ping.

ATTRIBUTE ComponentName

Description	This attribute indicates the component name of the associated *Ep.*
Values	String (0..46, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE When the shelf switches over to the new software load, ... will experience a service outage due to provisioning reasons.

Description	The *Activate Prov* command generates this message on the service active shelf at the beginning of a hitless software migration to provide a list of Logical Processors that will be reset for provisioning reasons. The response to indicate that the software migration can be stopped at this point would follow later.

ATTRIBUTE pcsLpProv

Description	This attribute lists the LPs that are not participating in the Hitless Software Migration for configuration reasons. This includes LPs that are provisioned without a spare card and LPs in 1forN configuration.
List of	The name of the component
List Size	16

RESPONSE When the shelf switches over to the new software load, ... will experience a service outage due to operational reasons.

Description	The *Activate Prov* command generates this message on the service active shelf at the beginning of a hitless software migration to provide a list of Logical Processors that will be reset for operational reasons. This message is generated only if the list of LPs is not empty. At this point the operator can stop the migration.

ATTRIBUTE pcsLpOper

Description	This attribute lists the LPs that are not participating in the Hitless Software Migration for operational reasons. This includes LPs that have cards with standby services unavailable.
List of	The name of the component
List Size	16

RESPONSE Error:The number of instances of the AtmTConn component must not exceed ... on a ... card.

Description	A *Check Prov* command produces this response if the user tries to provision more than the maximum number of *AtmTrunkConnection* components under a *Vgs*. The limit is ***1022***. **System action:** No *Activate Prov* command will be accepted until a subsequent *Check Prov* command completes without errors. **Operator action:** Ensure that the number of instances of the *AtmTConn* component under a specific *Vgs* does not exceed the maximum.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE vgsMaxNumberOfAtmTConns

Description	This attribute indicates the maximum allowed number of *AtmTConns* components
Values	1022

ATTRIBUTE vgsCardType

Description	This attribute indicates the card type being used.
Values	Vsp2 2pGeMmSrVsp3 2pOC3ChSmIrVsp3 Vsp2W 2pVS 2pOC3ChSmIrVsp4e

RESPONSE Error: The IpPort subcomponent of ... must have only a single logical interface.

Description	A *Check Prov* command generates this response if more than one *LogicalInterface*, and therefore more than one subnet, is provisioned under the *IpPort*.

ATTRIBUTE protocolPortName

Description	This attribute indicates the component name of the linked *ProtocolPort*.
Values	The name of the component

RESPONSE Error: The following are not on the same subnet as the linked ProtocolPort. (At most 20 components are shown.)

Description	A *Check Prov* command generates this response if one or more linked components are on a different subnet than the *ProtocolPort* to which the *FrIpServer* is linked. Each *FrIpServer* supports only a single subnet. This error could be caused by an incorrect *ipAddress* attribute under the linked *BnxProtocol* or by an incorrect subnet specification (*LogicalInterface* subcomponent) for the *IpPort* subcomponet of the linked *ProtocolPort*.

ATTRIBUTE illegalFri

Description	This attribute contains a list of the offending Frame Relay interfaces.
List of	The name of the component
List Size	20

RESPONSE Error: The following are not located on the same LogicalProcessor as the FrIpServer. (At most 20 applications are shown)

Description	A *Check Prov* command generates this response if one or more of the linked Frame Relay interfaces are on a different *LogicalProcessor* than the *FrIpServer*.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE illegalFriWrongLP

Description	This attribute contains a list of the offending Frame Relay interfaces.
List of	The name of the component

RESPONSE

Description	This real-time statistics event contains the attributes for the PCS performance measurement (real-time statistics) record.

ATTRIBUTE cpuUtilAvg

Description	This attribute indicates an average processor utilization level over the specified collection interval. The CPU utilization is averaged over a set of one-minute integration intervals.
Values	Decimal (0..100)
Units	%

ATTRIBUTE localMemUsageAvg

Description	This attribute indicates the average percentage of PEV local message blocks in use over the PM time interval
Values	Decimal (0..100)
Units	%

RESPONSE

Description	This collected performance measuring component describes the attributes contained in an ATM RtStats record. These measurements are generated by the ATM interface.

ATTRIBUTE linkCapacity

Description	This attribute indicates the physical capacity of this ATM interface.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE rxTotalCell

Description	This attribute indicates the number of cells with CLP=0+1 received during the collection interval.
Values	Long Integer

ATTRIBUTE txTotalCell

Description	This attribute indicates the number of cells with CLP=0+1 transmitted during the collection interval.
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE txCellDiscards

Description — This attribute indicates the number of cells with CLP=0+1 which are discarded before being transmitted during the collection interval.

Values — Long Integer

ATTRIBUTE rxCellDiscards

Description — This attribute indicates the number of cells CLP=0+1 which are discarded after being received during the collection interval.

Values — Long Integer

ATTRIBUTE txCbrDiscards

Description — This attribute indicates the number of cells with CLP=0+1 which are discarded before being transmitted during the collection interval by ATM CBR service category.

Values — Long Integer

ATTRIBUTE txRtVbrDiscards

Description — This attribute indicates the number of cells with CLP=0+1 which are discarded before being transmitted during the collection interval by ATM RtVBR service category.

Values — Long Integer

ATTRIBUTE txNrtVbrDiscards

Description — This attribute indicates the number of cells with CLP=0+1 which are discarded before being transmitted during the collection interval by ATM NrtVBR service category.

Values — Long Integer

ATTRIBUTE txUbrDiscards

Description — This attribute indicates the number of cells with CLP=0+1 which are discarded before being transmitted during the collection interval by ATM UBR service category.

Values — Long Integer

ATTRIBUTE remoteAtmIfLabel

Description — This attribute indicates the remote ATM interface, as provisioned in the *remoteAtmInterfaceLabel* attribute.

Values — String (0..60, ASCII)

ATTRIBUTE rxCbrTotalCell

Description — This attribute indicates the total number of ATM cells in the CBR service category, with CLP=0+1, received by the ATM interface during the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE rxRtVbrTotalCell

Description This attribute indicates the total number of ATM cells in the RtVBR service category, with CLP=0+1, received by the ATM interface during the collection interval.

Values Long Integer

ATTRIBUTE rxNrtVbrTotalCell

Description This attribute indicates the total number of ATM cells in the NrtVBR service category, with CLP=0+1, received by the ATM interface during the collection interval.

Values Long Integer

ATTRIBUTE rxUbrTotalCell

Description This attribute indicates the total number of ATM cells in the UBR service category, with CLP=0+1, received by the ATM interface during the collection interval.

Values Long Integer

ATTRIBUTE txCbrTotalCell

Description This attribute indicates the total number of ATM cells in the CBR service category, with CLP=0+1, transmitted by the ATM interface during the collection interval. This total includes conforming cells and cells that violated their traffic contract at all points in the network.

Values Long Integer

ATTRIBUTE txRtVbrTotalCell

Description This attribute indicates the total number of ATM cells in the RtVBR service category, with CLP=0+1, transmitted by the ATM interface during the collection interval. This total includes conforming cells and cells that violated their traffic contract at all points in the network.

Values Long Integer

ATTRIBUTE txNrtVbrTotalCell

Description This attribute indicates the total number of ATM cells in the NrtVBR service category, with CLP=0+1, transmitted by the ATM interface during the collection interval. This total includes conforming cells and cells that violated their traffic contract at all points in the network.

Values Long Integer

ATTRIBUTE txUbrTotalCell

Description This attribute indicates the total number of ATM cells in the UBR service category, with CLP=0+1, transmitted by the ATM interface during the

collection interval. This total includes conforming cells and cells that violated their traffic contract at all points in the network.

Values — Long Integer

RESPONSE Continue Prov failed due to a pausable event, pause reason: ...Use -force option to continue the migration. To abort migration type Stop Prov.

Description — The *Continue Prov* command generates this error message when the Hitless Software Migration is paused and there are pausable events.
The *Continue Prov* command will succeed only if the pausable events are all cleared.
The operator can decide to force the migration switchover to resume by typing *Continue -force Prov* or to abort the software migration by typing *Stop Prov*.
The migration will pause as long as no action is taken by the operator.

ATTRIBUTE pcsString

Description — This attribute indicates the reason why the *Continue Prov* command failed. The failure is caused by some pausable events that have occurred. These events include pausable alarms, software alarms generated on the migration shelf, applications nacking the provisioning data, and applications not ready for switchover.

Values — String (0..968, ASCII)

RESPONSE Error:The interfaceName attribute must be provisioned to link to an instance of ... component local to this card.

Description — A *Check Prov* command produces this response if the *interfaceName* attribute on components existing under this *Vgs* component has not been set to link to a *Chan, DS1 or E1* component on this card.
The following Components support this response:

Tag: *interfaceName* must link to a local *Chan* Component.
Q921: *interfaceName* must link to a local *Chan* Component.
LapV5: *interfaceName* must link to a local *Chan* Component.
V5Link: *interfaceName* must link to a local *DS1* or *E1* Component.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Set the *interfaceName* attribute to link to an instance of the suggested component on this card.

ATTRIBUTE interfaceNameLinkedComponent

Description — The name of the component to link to.

Values — String (0..15, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The ... attribute must be provisioned to link to an instance of the ... component under this Vgs.

Description

A *Check Prov* command produces this response if the specified attribute has not been set to an instance of the specified component type existing under this *Vgs* component.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Set the specified attribute to link to an instance of the specified component type existing under this *Vgs* component.

ATTRIBUTE profileLinkAttribute

Description

The name of the attribute to link.

Values

profile
casDefinition

ATTRIBUTE profileLinkComponent

Description

The name of the component to link to.

Values

TdmNetworkProfile
Q921Profile
CasDefn

RESPONSE Error:Each DS1 or E1 component cannot have more than one Chan subcomponent associated with an instance of the ... component.

Description

A *Check Prov* command produces this response if a *DS1* or *E1* componenent has more that one *Chan* subcomponents linked to the specified component type.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that each *DS1* or *E1* componenent has no more than one *Chan* subcomponents linked to the specified component type.

ATTRIBUTE maxCompLinkedComponent

Description

The name of the linked component.

Values

Tag
Q921

RESPONSE Error:The ... component may only have one of the following signaling type subcomponents provisioned:....

Description

A *Check Prov* command produces this response if the user tries to provision multiple signaling type subcomponents under the same parent component.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the parent component has only one signaling type subcomponent provisioned.

ATTRIBUTE parentComponent

Description

This attribute indicates the name of the parent component.

Values

Brag
BragS

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE vgsSignalingSubcomponent

Description	This attribute lists all the signaling type subcomponents currently provisioned under the parent component.
List of	Q921 V5Link Cas
List Size	3

RESPONSE Error:The ... component specified in the interfaceName attribute must have a Tc subcomponent.

Description	A *Check Prov* command produces this response if the indicated component specified in the *interfaceName* attribute does not have a *Tc* subcomponent. **System action**: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors. **Operator action**: Ensure the indicated component has a *Tc* subcomponent.

ATTRIBUTE chanComponentName

Description	This attribute indicates the component for which this check fails.
Values	The name of the component

RESPONSE Error: The address ... is not a valid IP network address prefix.

Description	A *Check Prov* command produces this response when the address prefix defined by the *Network* component is not a valid IP network address prefix. Examples include all 0's (***0.0.0.0***) or all 1's (***255.255.255.255***). **System action**: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors. **Operator Action**: Provision the *prefix* and *length* attributes of the specified *Network* component to be a valid non-reserved address prefix.

ATTRIBUTE invalidAddress

Description	This attribute contains the value of the invalid address prefix.
Values	IP address

RESPONSE node id = ...node name@level = ...port id = ...interface name = ...

Description	This response contains the information for one hop in a computed route returned as the result of issuing the *Run* command on the *RouteFinder* component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE nodeId

Description — This attribute specifies the node ID of a logical node at the near end of the hop.

Values — String (22, Hex)

ATTRIBUTE nodeName

Description — This attribute specifies the node name of a logical node at the near end of the hop. This attribute is NULL, if the node name is not provisioned under the *ModuleData* component.

Values — String (0..19, ASCII)

ATTRIBUTE portId

Description — This attribute indicates the port ID of the PNNI interface leaving the node identified by the *nodeId* attribute.

Values — Decimal (0..4294967295)

ATTRIBUTE interfaceName

Description — This attribute indicates the name of the PNNI interface attached to the node identified by the *nodeId* attribute.

This attribute's value can take one of the following forms:
(a) ***AtmIf/<1-4095>*** - If the interface is an ATM interface.
(b) ***AtmIf/<1-4095> Vpt/<1-4095>*** - If the interface is a VPT interface.
(c) Values ***<0-4294967295>*** - If the link is a logical link.

This attribute is left blank for a node that is not a Nortel Networks Multiservice Switch.

Values — String (0..19, ASCII)

RESPONSE node id = ...node name@level = ...

Description — This response contains the information for one hop with an unknown port ID in a computed route returned as the result of issuing the *Run* command on the *RouteFinder* component.

ATTRIBUTE nodeId

Description — This attribute specifies the node ID of a logical node at the near end of the hop.

Values — String (22, Hex)

ATTRIBUTE nodeName

Description — This attribute specifies the node name of a logical node at the near end of the hop. This attribute is NULL, if the node name is not provisioned under the *ModuleData* component.

Values — String (0..19, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The total number of ... components must not exceed ... on a ... card.

Description

A *Check Prov* command produces this response if the user tries to provision more than the maximum allowed number of *Q921*, *LapV5* or *Cas* components in the same *Vgs hierarchy*.

A maximum of 40 *Q921* or *LapV5* component instances is allowed on a ***Vsp2*** or ***12mVspAal*** card.

A maximum of 84 *Q921* or *Cas* component instances is allowed on a ***2pGeMmSrVsp3*** card.

A maximum of 64 *LapV5* component instances is allowed on a ***2pGeMmSrVsp3*** card.

A maximum of 84 *Q921* component instances is allowed on a ***2pOC3ChSmIrVsp3*** card.

A maximum of 84 *Q921* component instances is allowed on a ***2pVS*** card.

A maximum of 168 *Q921* or *Cas* component instances is allowed on a ***2pOC3ChSmIrVsp4e*** card.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the number of *Q921, LapV5* and *Cas* component instances under a given *Vgs* component is appropriate for the card being used.

ATTRIBUTE vgsNumberOfSignalingComponents

Description

This attribute indicates the maximum allowed number of signaling components.

Values

40
64
84
168

ATTRIBUTE vgsCardType

Description

This attribute indicates the card type being used.

Values

12mVspAal
Vsp2
2pGeMmSrVsp3
2pOC3ChSmIrVsp3
Vsp2W
2pVS
2pOC3ChSmIrVsp4e

ATTRIBUTE vgsSignalingComponent

Description	This attribute lists the names of the inappropriately provisioned signaling components.
List of	Q921 LapV5 Cas
List Size	3

RESPONSE Invalid Instance

Description	The *Add* command generates this response when the component instance has invalid characters. All printable ascii characters are valid except '<' '>' '/' ':' '*' '"' and whitespaces. **System action:** The *Add* command fails. **Operator action:** Update the software on the MDM. The *Help* command can be used to list the appropriate instance values.

ATTRIBUTE value

Description	The attribute indicates the value of a Fed as an ascii string for error details.
Values	String (0..255, ASCII)

RESPONSE Error:The noServiceResponse attribute must be set to noResponse when the lineType of the primary rate port is ....

Description	A *Check Prov* command produces this response if the *noServiceResponse* attribute is set to anything other than ***noResponse***, and the *lineType* of the primary rate port is set to ***cas***, ***d4Cas***, or ***esfCas***. This applies to the following card types: ***2pDS3cAal***, ***32pE1Aal***, ***2pOC3ChSmIrVsp3*** and *2pVS*. System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors. Operator action: Set the value of the *noServiceResponse* attribute (under the *Tc* component) to ***noResponse***.

ATTRIBUTE priLineType

Description	This attribute indicates the current value of the primary rate port's *lineType* attribute.
Values	cas d4Cas esfCas

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The total number of Isis components provisioned (...) exceeds the allowable maximum of ... instance(s).

Description — The *Check Prov* command produces this response when the maximum supported number of *Isis* components is exceeded.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator Action: Delete sufficient *Isis* subcomponents until the provisioned number is within the specified allowable limits.

ATTRIBUTE inwIpIsisIsisCount

Description — This attribute indicates the number of provisioned *Isis* components.

Values — Decimal (0..65535)

ATTRIBUTE inwIpIsisCountLimit

Description — This attribute indicates the maximum number of *Isis* components.

Values — Decimal (1..65535)

RESPONSE Error:The total number of Net components provisioned (...) exceeds the allowable maximum of ... instances per Isis component.

Description — The *Check Prov* command produces this response when the maximum supported number of *Net* components per *Isis* instance is exceeded.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator Action: Delete sufficient *Net* subcomponents until the provisioned number is within the specified allowable limits.

ATTRIBUTE inwIpIsisNetCount

Description — This attribute indicates the number of provisioned *Net* components found for this *Isis* instance.

Values — Decimal (0..65535)

ATTRIBUTE inwIpIsisNetCountLimit

Description — This attribute indicates the maximum number of *Net* subcomponents per *Isis* instance.

Values — Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The total number of IsisIf components provisioned (...) exceeds the allowable maximum of ... instances per ProtocolPort component.

Description — The *Check Prov* command produces this response when too many *IsisIf* components are provisioned under the same *ProtocolPort* component.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator Action: Delete *IsisIf* component instances until the number provisioned, under the same *ProtocolPort* component, equals or is less than the specified limit.

ATTRIBUTE inwIpIsisIfInstanceCount

Description — This attribute indicates the number of provisioned *IsisIf* components found under the associated *ProtocolPort*.

Values — Decimal (0..65535)

ATTRIBUTE inwIpIsisIfInstanceCountLimit

Description — This attribute indicates the maximum number of *IsisIf* subcomponents per *ProtocolPort* instance.

Values — Decimal (1..65535)

RESPONSE The ... component has more than one settable link attribute. The -attribute option is required.

Description — The *find* command generates this response when the component specified by the *-freelinks* option has more than one link attribute. The user must specify one of the attributes via the *-attribute* option.

System action: The *Find* command is not executed
Operator action: Reissue the command with the *-attribute* option

ATTRIBUTE component

Description — This attribute contains the name of the component that was specified in the command.

Values — The name of the component

RESPONSE The attribute ... is not a settable link.

Description — This error response is generated when the operator specifies a non-settable link attribute for the -attribute option of the *Find* command.

System action: The *Find* command is not executed
Operator action: None

ATTRIBUTE attribute

Description — This attribute identifies the invalid attribute.

Copyright © 2006, Nortel Nortel Confidential

Values String (0..255, ASCII)

RESPONSE The specified attribute is ambiguous with ....

Description The *Find* command generates this error response if the attribute specified in the *-attribute* option is ambiguous for the given component class.

System action: The *Find* command is not executed
Operator action:Reenter the command, supplying an appropriate attribute name

ATTRIBUTE listOfAmbiguities

Description This attribute contains the list of attributes that are ambiguous matches with the specified attribute.

Values String (0..255, ASCII)

RESPONSE The ... component has no settable link attributes.

Description The *Find* command generates this response when the component specified in the -freelinks option has no link attributes which can be set.

System action: The *Find* command is not executed
Operator action: None

ATTRIBUTE component

Description This attribute contains the name of the component which was specified in the command.

Values The name of the component

RESPONSE Warning:When calls are in progress, changing the ... attribute may result in some loss of traffic.

Description A *Check Prov* command produces this response if the user changes the value of the *lossIntegrationPeriod* or *egressGain* attribute.

The following components support this response:
Brag
BragS
PktProf

System action: None.

Operator action: If calls are present, ensure that traffic disruption is acceptable before activating the provisioning.

ATTRIBUTE vgsPossibleTrafficLossAttribute

Description The name of the attribute.

Values lossIntegrationPeriod
egressGain

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The ... attribute must not be provisioned with an empty value.

Description

A *Check Prov* command produces this response if the user tries to provision the specified attribute with an empty value.

The following components support this response:
CasDefn and *LocalAnnouncements. fileName* attribute may not have an empty value.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operation action: Provision the specified attribute with a non-empty value.

ATTRIBUTE vgsEmptyAttributeName

Description

The name of the attribute.

Values

Decimal (0..65535)

RESPONSE Error:The value provisioned for the ... attribute must only consist of the following characters:....

Description

A *Set* command produces this response if the user tries to provision a specified attribute with a value that does not consist entirely of the allowed characters.

The following components support this response:
CasDefn and *LocalAnnouncements*: *fileName* attribute may only contain the following characters: [a..z, A..Z, 0..9, ., _].
LocalAnnouncements and *AnnouncementLanguage*: *defaultLanguage* attribute may only contain the following characters: [a..z].

System action: The *Set* command is rejected.

Operation action: Set the specified attribute to a value that only consists of the allowed characters.

ATTRIBUTE vgsAttributeContainingChars

Description

The name of the attribute which has failed the check.

Values

Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE vgsCharsAllowed

Description	The list of the allowed characters.
List of	a..z A..Z 0..9 . _
List Size	4

RESPONSE Error:Standby Lsp ... must be provisioned with RsvpQ subcomponent when its primary Lsp sets serviceCategory attribute value to be diffServDomainElsp.

Description

The *Check Prov* command produces this response when a standby LSP having no *RsvpQos* subcomponent is added to the list of LSPs specified in the *StandbyLsp* attribute of a primary LSP whose value of *sc* attribute in *Msc* set to *diffServDomainElsp*.

System Action: The *Check Prov* fails.

Operator Action: Provision a *RsvpQos* subcomponent under the standby *Lsp* component.

ATTRIBUTE mplsMscDiffServStandbyLspError

Description	This attribute indicates the component name of the Lsp to be used in the response.
Values	The name of the component

RESPONSE Error:The netMask provisioned in ... forces the ipAddress value to be a broadcast address.

Description

A *Check Prov* command generates this response if the IP address provisioned in the parent component is a broadcast address.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the IP address of the parent component is not set to a broadcast address within the subnet.

ATTRIBUTE vrapBcIpAddrLogIf

Description	This attribute contains the name of the *Vr/n Pp/n Ip LogicalIf/n.n.n.n* component in which the *netMask* is provisioned.
Values	The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:..., as specified by the subnetAccessName attribute, must have a CustSpec subcomponent.

Description

A *Check Prov* command generates this response if the *Vr/n* component specified by the *subnetAccessName* attribute does not have a *CustSpec* subcomponent provisioned.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Provision a *CustSpec* component under the specified *Vr/n* component instance.

ATTRIBUTE vrapCustSpecVr

Description

This attribute contains the name of the *Vr/n* component for which this check fails.

Values

The name of the component

RESPONSE Error:The featureList attribute of ... must contain ip when a VrAp component is used within this Vgs hierarchy.

Description

A *Check Prov* command generates this response if a user provisions a *VrAp* component on an *Lp* which has not been provisioned to support the ***ip*** feature.

System action: The *Check Prov* command fails. No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that ***ip*** is provisioned in the *featureList* of the *Sw Lpt* referenced from this *Vgs* hierarchy, or replace the *VrAp* with another access point type.

ATTRIBUTE vrapSwLpt

Description

This attribute contains the name of the *Sw Lpt* component.

Values

The name of the component

RESPONSE Warning:The Bgp component provisioned under ... is not supported because at least one other instance of a Vr with a CustSpec component exists. There is also an instance of a Vr with a Vr Pp linked to a 4pGe card.

Description

A *Check Prov* command generates this response if the *Vr Ip Bgp* component is provisioned on a node that has one other instance of *Vr* with *CustSpec* component. In addition, there is an instance of a *Vr Pp* linked to a **4pGe** card.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE invalidCustSpecVrWithBgp

Description — This attribute indicates the name of the *VirtualRouter* component instance to which the *Bgp* component is added.

Values — The name of the component

RESPONSE Error: The ... attribute must be set.

Description — This response is produced by the *Check Prov* command if the user has not provisioned the *linkToEnetIf* attribute.

System action: The *Check Prov* command is failed.

Operator action: The remedial action is to *set* the *linkToEnetIf* attribute to a *La* component

ATTRIBUTE unprovisionedAttribute

Description — This attribute contains the numeric ID of the attribute which was left unprovisioned.

Values — Decimal (1..65535)

RESPONSE Error:One of the following two PerHopBehaviorMap subcomponent instances must be removed:

Description — A *Check Prov* command produces this response if produces this response if two *PerHopBehaviorMap* subcomponents instance values are equal.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Remove one of the two conflicting *PerHopBehaviorMap* components.

ATTRIBUTE phb1

Description — This attribute specifies the first of two conflicting *PerHopBehaviorMap* components.

Values — The name of the component

ATTRIBUTE phb2

Description — This attribute specifies the second of two conflicting *PerHopBehaviorMap* components.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The following two attributes must reference DifferentiatedServicesDomain PerHopBehavior component instances that are assigned equal TrafficClass values.

Description

A *Check Prov* command produces this response if for any of the following pairs of attributes:
ubrClp0ToPhb, *ubrClp1ToPhb*
nrtVbrClp0ToPhb, *nrtVbrClp1ToPhb*
rtVbrClp0ToPhb, *rtVbrClp1ToPhb*
cbrClp0ToPhb, *cbrClp1ToPhb*
if the *TrafficClass* component assigned to the *PerHopBehavior* component instance that matches the first attribute value is not equal to the *TrafficClass* component assigned to the *PerHopBehavior* component instance that matches the second attribute value.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Set the conflicting attributes to *PerHopBehavior* component instance values that satisfy the *TrafficClass* constraint.

ATTRIBUTE clp0

Description

This specifies the first of the two conflicting attributes.

Values

String (0..16, ASCII)

ATTRIBUTE clp1

Description

This specifies the second of the two conflicting attributes.

Values

String (0..16, ASCII)

RESPONSE Error:The following two attributes must reference DifferentiatedServicesDomain PerHopBehavior component instances that are assigned drop precedence values such that the drop precedence for Clp0 is not higher than that for Clp1.

Description

A *Check Prov* command produces this response if for any of the following pairs of attributes:
ubrClp0ToPhb, *ubrClp1ToPhb*
nrtVbrClp0ToPhb, *nrtVbrClp1ToPhb*
rtVbrClp0ToPhb, *rtVbrClp1ToPhb*
cbrClp0ToPhb, *cbrClp1ToPhb*
if the *dropPrecedence* assigned to the *PerHopBehavior* component instance that matches the first attribute value is higher than the *dropPrecedence* assigned to the *PerHopBehavior* component instance that matches the second attribute value.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Set the conflicting attributes to *PerHopBehavior* component instance values that satisfy the *dropPrecedence* constraint.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE clp0

Description — This specifies the first of the two conflicting attributes.

Values — String (0..16, ASCII)

ATTRIBUTE clp1

Description — This specifies the second of the two conflicting attributes.

Values — String (0..16, ASCII)

RESPONSE Error:The media ... is not supported for Interface under Vrf.

Description — A *Check Prov* command produces this response if the *Interface* is a subcomponent of a *Vrf* and an invalid media type is added as a subcomponent of the *Interface.*

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Remove the invalid media provisioned under the *Interface* subcomponent.

ATTRIBUTE invalidMedia

Description — Indicates the invalid media.

Values — String (1..20, ASCII)

RESPONSE Error:The media ... is not supported for Interface under Rtr.

Description — A *Check Prov* command produces this response if the *Interface* is a subcomponent of a *Router* and an invalid media type is added as a subcomponent of the *Interface.*

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Remove the invalid media provisioned under the *Interface* subcomponent.

ATTRIBUTE invalidMedia

Description — Indicates the invalid media.

Values — String (1..20, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The total number of MplsCon components has exceeded the allowable limit of ... per shelf.

Description

The *Check Prov* command generates this response when the number of *MplsCon* components provisioned exceeds a preset number.

System Action: The *Check Prov* command fails.

Operator Action: Reduce the number of *MplsCon* components provisioned.

ATTRIBUTE atmMplsConTooManyMplsConsErr

Description

This attribute indicates the maximum number of *MplsCon* components that can be provisioned on a switch. This value is a constant, set within the software.

Values

Decimal (0..2048)

RESPONSE Error:The ... attribute must take a value within the range -12 to 12 dB.

Description

A *Check Prov* command produces this response if the specified attribute has been provisioned to take a value outside the range -12 to 12 dB and the *featureList* attribute (under the *Lpt* component) is set to ***vgsAtm*** or ***vgsIp***.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the value provisioned for the specified attribute lies within the range -12 to 12 dB.

ATTRIBUTE vgsTdmNetworkProfileRange

Description

The name of the attribute requiring modification.

Values

ingressGain
egressGain

RESPONSE Error:The echoCancelTailLength attribute must be set to ....

Description

A *Check Prov* command produces this response if the *echoCancellationTailLength* attribute has been set to a value other than that specified in the response.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the *echoCancellationTailLength* attribute is set to the recommended value.

ATTRIBUTE vgsTdmNetworkProfileEcanTail

Description

The value to set the *echoCancellationTailLength* attribute to.

Copyright © 2006, Nortel Nortel Confidential

Values	64 128

RESPONSE Error:The moduleType attribute must take one of the following values:...

Description	A *Check Prov* command produces this response if the *moduleType* attribute is not assigned a recommended value. **System action**: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors. **Operator action**: Change the *moduleType* attribute to one of the recommended values.

ATTRIBUTE vspPModModuleType

Description	This attribute indicates the allowed values for the *moduleType* attribute.
List of	none vpm spm
List Size	2

RESPONSE Error:The NextHop Address ... can not be equal to any Interface address if it belongs to any subnets provisioned under a Vrf.

Description	This error message appears when the value of *NextHop* provisioned for a static *RouteEntry* belongs to one of the subnets provisioned under a Vrf; however, the *NextHop* address is equal to the index value of some *Interface* component. **System Action**: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors. **Operator Action**: Change the *NextHop* address not equal to the index value of any *Interface* component.

ATTRIBUTE invalidNextHopAddress

Description	This attribute contains the value of an invalid *NextHop* address.
Values	IP address

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The NextHop Address ... does not belong to any of the subnets provisioned under the Rtr.

Description — This error message appears when the value of a *NextHop* provisioned for a static *RouteEntry* does not belong to one of the subnets provisioned under the *Rtr*. Each provisioned *NextHop* should belong to a valid subnet.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Add an *Interface* entry under *Rtr* component or change the *NextHop* address to reflect to one of the subnets provisioned by *Interface* entry.

ATTRIBUTE invalidNextHopAddress

Description — This attribute contains the value of invalid *NextHop* address.

Values — IP address

RESPONSE Error:The NextHop Address ... can not be equal to any Interface address if it belongs to any subnets provisioned under a Rtr.

Description — This error message appears when the value of *NextHop* provisioned for a static *RouteEntry* belongs to one of the subnets provisioned under a *Rtr*; however, the *NextHop* address is equal to the index value of some *Interface* component.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Change the *Nexthop* address not equal to the index value of any *Interface* component.

ATTRIBUTE invalidNextHopAddress

Description — This attribute contains the value of an invalid *NextHop* address.

Values — IP address

RESPONSE Error: The NextHop Address ... does not belong to any of the subnets provisioned under a Vrf.

Description — This error message appears when the value of a *NextHop* provisioned for a static *RouteEntry* does not belong to one of the subnets provisioned under a *Vrf*. Each provisioned *NextHop* should belong to a valid subnet.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Add an *Interface* entry under *Vrf* component or change the *NextHop* address to reflect to one of the subnets provisioned by *Interface* entry.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE invalidNextHopAddress

Description — This attribute contains the value of invalid *NextHop* address.

Values — IP address

RESPONSE Error:Exceeded maximum number of Vrf components per Rtr.

Description — The *Check Prov* command produces this response when the maximum number of allowable *Vrfs* per *Rtr* has been exceeded.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: Delete *Vrf* components which are in excess of the maximum allowed.

ATTRIBUTE maxAllowedVrfs

Description — The maximum number of provisionable *Vrf* omponents.

Values — Decimal (0..65535)

ATTRIBUTE currentProvisionedVrfs

Description — The current number of provisioned *Vrf* components.

Values — Decimal (0..65535)

RESPONSE Error:The total number of IsisIf components provisioned (...) exceeds the allowable maximum of ... instances.

Description — The *Check Prov* command produces this response when the maximum supported number of *IsisIf* components is exceeded.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* command completes without errors.

Operator Action: Delete sufficient *IsisIf* components until the provisioned number is within the specified allowable limits.

ATTRIBUTE inwIpIsisIsisIfCount

Description — This attribute indicates the number of *IsisIf* components.

Values — Decimal (0..65535)

ATTRIBUTE inwIpIsisIsisIfCountLimit

Description — This attribute indicates the maximum number of *IsisIf* components.

Values — Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The packetDelayVariationTolerance attribute can not be set to adaptive on a ... card.

Description

A *Check Prov* command produces this response if the user sets the *packetDelayVariationTolerance* attribute to ***adaptive*** on one of the following cards:

12mVspAal,
Vsp2,
Vsp2W.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the *packetDelayVariationTolerance* attribute is set to a value other than ***adaptive***.

ATTRIBUTE vgsCardType

Description

This attribute indicates the card type being used.

Values

12mVspAal
Vsp2
Vsp2W

RESPONSE Error: The specified Address ... is not a valid IP interface address.

Description

This error message appears when the specified IP interface address is an address of class A, B or C. but it is not valid for the interface.

ATTRIBUTE invalidAddress

Description

This attribute contains the value of invalid IP address.

Values

IP address

RESPONSE For security reasons, ... files cannot be deleted.

Description

This response is generated when the operator tries to remove files which should not be deleted for security reasons.

ATTRIBUTE secureFileType

Description

This attribute gives the type of file that is being removed.

Values

log
commit

RESPONSE Setting the ... attribute is not allowed for this data type.

Description

This response is issued whenever a user tries to modify an attribute for a particular type of data due to security reasons.

ATTRIBUTE dataType

Description

This attribute identifies the attribute that cannot be modified by a user.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)

RESPONSE For security reasons, ... files cannot be touched.

Description	This response is generated when the operator tries to touch a file which should not be touched for security reasons.

ATTRIBUTE secureFileType

Description	This attribute gives the type of file that is being touched.
Values	log

RESPONSE The following patches are superseded by the released patches listed next to them. These superseded patches need to be replaced with the newer patches in the SW patchList:

Description	This response is issued when there are new released patches that supersede patches already present in the *Sw patchList.* The patches in the *Sw patchList* need to be removed from the patch list and replaced with the patches that supersede them. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

ATTRIBUTE listOfReleasedSuper

Description	This attribute contains the list of released patch pairs. The first patch of the pair is the patch which is to be superseded, the other patch is the one that has superseded the previous patch.
List of	String (1..30, ASCII)

RESPONSE The following patches are released and can be applied, however, the prerequisite patch listed beside each patch is either not eligible for auto-application or is missing from the CP disk:

Description	This response is issued when a prerequisite patch is either missing or ineligible for automatic application, thus preventing the automatic application of the patch in question. The ineligible patch may still be in verification status, or may be in a category that is not eligible for automatic application, or may not be set to Auto-Apply, or may even have conflicting relationships that prohibit the patch from application status. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

ATTRIBUTE listOfReleasedPrereq

Description	This attribute is a list of prerequisite patch pairs that cannot be applied.
List of	String (1..30, ASCII)

RESPONSE The following patches are released and can be added to the Sw patchList:

Description	The *Check Sw AutoPatch* command produces this response when released patches are applicable to the current provisioning and need to be added in the *Sw patchList* attribute.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE listOfReleasedPatches

Description	This attribute contains the list of released patches that can be added to the *Sw patchList*.
List of	String (1..30, ASCII)

RESPONSE The following Reset patches are released and should be added to the Sw patchList:

Description	The response is issued when Reset patches are available in released status. Reset patches are not eligible for automatic application, however, such patches that have been declared released should be strongly considered for manual application. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

ATTRIBUTE listOfReleasedResets

Description	This attribute contains the list of released Reset patches that should be added to the *Sw patchList.*
List of	String (1..30, ASCII)

RESPONSE Mutually exclusive released patches exist. Only one patch from each pair can be added to the provisioned patch list:

Description	The *Check Sw AutoPatch* command produces this response when mutually exclusive released patches exist. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command. **Operator Action:** Select one patch from each pair when updating the *SW patchList* attribute. **System Action**: Command *Check Sw AutoPatch* fails

ATTRIBUTE listOfReleasedMutex

Description	This attribute is a list of mutually exclusive released patch pairs.
List of	String (1..62, ASCII)

RESPONSE The following patches have been declared obsolete, with an emergency removal notice. These patches should be removed from the Sw patchList at the earliest opportunity:

Description	This response is issued when there are obsolete patches present in the *Sw patchList*. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

ATTRIBUTE listOfObePatches_c

Description	This attribute contains the list of Obsolete patches that should be removed from the Sw patchList.
List of	String (1..30, ASCII)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE The following patches are in verification status and may be manually applied if required (please see patch documentation to determine if you require any of these patches):

Description — This response is issued when there are verification patches relevant to the switch which are not in the *Sw patchList.* These patches may be either TAP or Reset. These patches may be required based on the documentation for each patch. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

ATTRIBUTE listOfVerificationPatches

Description — This attribute contains the list of verification patches relevant to the provisioned software configuration.

List of — String (1..30, ASCII)

RESPONSE The following Reset patches have been superseded by the patches listed next to them. It may be advantageous to replace these patches with the superseding ones:

Description — This response is issued when there are Reset patches in the *Sw patchList* that have been superseded. Refer to each patches' documentation to determine if it is advantageous to supersede the referred patch with the superseded one. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

ATTRIBUTE listOfResetSuper

Description — This attribute contains the list of pairs of Reset patches and the patches of which they are superseded.

List of — String (1..30, ASCII)

RESPONSE The following patches have been declared obsolete due to a defect. These patches should be removed from the Sw patchList:

Description — This response is issued when there are obsolete patches present in the *Sw patchList*. Refer to each patches' documentation to determine if it is advantageous to obsolete the referred patch. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

ATTRIBUTE listOfObsPatches

Description — This attribute contains the list of Obsolete patches that should be removed from the *Sw patchList*.

List of — String (1..30, ASCII)

RESPONSE The following released patches have been superseded by the verification patches listed next to them. It may be advantageous to replace these patches with the superseding ones:

Description — This response is issued when there are verification patches that supersede released patches. Refer to each patches' documentation to determine if it is advantageous to supersede the referred patch with the superseded one. This response is issued when the *all* option is used for the *Check Sw AutoPatch* command.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE listOfVerifSuperReleased

Description — This attribute contains the list of released patches and the verification patches by which they are superseded.

List of — String (1..30, ASCII)

RESPONSE The Sw patchList should contain the following patches:

Description — This response is issued every time the *Check Sw AutoPatch* command is run to summarize for the operator what the *Sw patchList* should contain.

ATTRIBUTE listOfFinalPatches

Description — This attribute contains the list of patches generated from the *Check Sw AutoPatch* command that should be in the *Sw patchList* attribute.

List of — String (1..30, ASCII)

RESPONSE

Description — This group contains the real-time collected statistics of the *Vgs* component.
These statistics are not collected on ***Vsp2*** or ***12mVspAal cards.***

ATTRIBUTE congestedSeconds (congSec)

Description — This attribute counts how many seconds that new media connection requests have been rejected because the Gateway was busy.

Values — Decimal (0..4294967295)

ATTRIBUTE overloadRejectedCommands (olRejCom)

Description — This attribute counts the control protocol commands that were rejected due to input message buffer overload.

Values — Decimal (0..4294967295)

ATTRIBUTE connectionsSetup (connSetup)

Description — This attribute counts the media connections successfully established by this gateway *Vgs* component and acknowledged to the Controller.

The value wraps to ***0*** when the maximum value is exceeded.

Values — Decimal (0..4294967295)

ATTRIBUTE connectionsLostToPacketNwLoss

Description — This attribute counts the connections lost to Gateway detectable network failures. This includes:
- individual connection media integrity time-outs.
-bulk connection loss due to *ATM VCC* failure or release or associated component deprovisioning.
-bulk connection loss due to local IP media link failure or associated component deprovisioning.

Copyright © 2006, Nortel Nortel Confidential

The counter wraps to ***0*** when it exceeds the maximum value.

Values Decimal (0..4294967295)

ATTRIBUTE connectionsLostToTdmPortLoss

Description This attribute counts the connections lost to Gateway detectable TDM unavailability since the last DCS real-time statistics request. This includes deprovisioning of a link with active connections.

The counter wraps to ***0*** when it exceeds the maximum value.

Values Decimal (0..4294967295)

ATTRIBUTE activeConnectionsAvg

Description This attribute indicates the average number of connections since the last request.The values are sampled every 1 second and averaged over the period.

Values Decimal (0..4294967295)

ATTRIBUTE activeConnectionsMax

Description This attribute indicates the maximum number of connections at any point since the last request.

Values Decimal (0..4294967295)

ATTRIBUTE activeConnectionsMin

Description This attribute indicates the minimum number of connections at any point since the last request.

Values Decimal (0..4294967295)

ATTRIBUTE evrcConnectionsSetup

Description This attribute counts the number of EVRC media connections successfully established by this gateway Vgs component.

The counter wraps to ***0*** when it exceeds the maximum value.

Values Decimal (0..4294967295)

ATTRIBUTE evrc0ConnectionsSetup

Description This attribute counts the number of EVRC0 (Header Free EVRC) media connections successfully stablished by this gateway Vgs component.

The counter wraps to ***0*** when it exceeds the maximum value.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE trfoConnectionsSetup

Description — This attribute counts the number of TrFO connections successfully established by this gateway Vgs component.

The counter wraps to ***0*** when it exceeds the maximum value.

Values — Decimal (0..4294967295)

ATTRIBUTE connectionsLostToTrfoFailure

Description — This attribute counts the number of connections lost due to TrFO failure since component creation.

The counter wraps to ***0*** when it exceeds the maximum value.

Values — Decimal (0..4294967295)

RESPONSE No name

Description — This group contains the collected statistics of the *DigitCollection* component.

ATTRIBUTE rejectedCollectionRequests

Description — This attribute counts the digit collection requests rejected due to lack of resources. A persistent increase indicates an engineered mismatch between demand for and capacity of the digit collection resources.

This counter wraps to zero if its maximum is reached.

Values — Decimal (0..4294967295)

RESPONSE No name

Description — This group contains the real-time collected statistics for the H248 component.
These statistics are not collected on ***Vsp2*** or ***12mVspAal*** cards***.***

ATTRIBUTE failovers

Description — This attribute counts the number of times the gateway has performed failover procedures and attempted contact with another controller since the last DCS real-time statistics poll.

Values — Decimal (0..65535)

ATTRIBUTE txRetransmissions (txRetran)

Description — This attribute counts the number of media gateway control protocol retransmissions sent by the Gateway. Each retransmission of a given transaction will be individually counted.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE rxRetransmissions (rxRetran)

Description	This attribute counts the number of media gateway control protocol retransmissions received by the Gateway. Each retransmission of a given transaction will be individually counted.
Values	Decimal (0..4294967295)

RESPONSE

Description	This collected statistics record contains the CPU resource utilization statistics collected at the real-time collection intervals for the *PBlock* component. These statistics will not be collected on ***12mVspAal*** and ***Vsp2*** cards.

ATTRIBUTE cpuUtilAvg

Description	This attribute indicates average processing utilization of this *PBlock* component. This value is calculated by taking the average of values sampled at 1 second intervals.
Values	Decimal (0..100)
Units	%

ATTRIBUTE cpuUtilAvgMin

Description	This attribute indicates the minimum average processing utilization of this *PBlock* component.
Values	Decimal (0..100)
Units	%

ATTRIBUTE cpuUtilAvgMax

Description	This attribute indicates the maximum average processing utilization of this *PBlock* component.
Values	Decimal (0..100)
Units	%

RESPONSE For security reasons, ... files cannot be unprotected.

Description	This response is generated when the operator tries to unprotect a file which should not be unprotected for security reasons.

ATTRIBUTE secureFileType

Description	This attribute gives the type of file that is being touched.
Values	log commit

Copyright © 2006, Nortel Nortel Confidential

RESPONSE

Description	This RtStats record is generated at the end of each 5-minute collection interval. It contains information related to the *FabricCard* component.

ATTRIBUTE maxFabricTemperature

Description	This attribute indicates the maximum temperature which the Fabric reached during the last collection interval.
Values	Decimal (0..100)
Units	degreeC

RESPONSE

Description	This RtStats collected event record contains statistics related to IP traffic passing through this interface.

ATTRIBUTE linkCapacity

Description	This attribute indicates the maximum bandwidth of the link available to layer 3 packet services.
Values	Long Integer
Units	octet/s

ATTRIBUTE inBytes

Description	This attribute indicates the total number of bytes incoming to this physical interface during the last collection interval. This excludes overhead from layer 2 frame headers.
Values	Long Integer

ATTRIBUTE outBytes

Description	This attribute indicates the total number of bytes outgoing from this physical interface during the last collection interval. This excludes overhead from layer 2 frame headers.
Values	Long Integer

ATTRIBUTE inPackets

Description	This attribute indicates the total number of IP and ARP packets incoming to this physical interface during the last collection interval.
Values	Long Integer

ATTRIBUTE outPackets

Description	This attribute indicates the total number of IP and ARP packets outgoing from this physical interface during the last collection interval.
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE inLocalTcpPackets

Description — This attribute indicates the total number of TCP packets incoming to this physical interface during the last collection interval and destined to this shelf, with the exception of packets destined to the VSP cards.

Values — Long Integer

ATTRIBUTE inLocalUdpPackets

Description — This attribute indicates the total number of UDP packets incoming to this physical interface during the last collection interval and destined to this shelf, with the exception of packets destined to the VSP cards.

Values — Long Integer

ATTRIBUTE inLocalIcmpPackets

Description — This attribute indicates the total number of ICMP packets incoming to this physical interface during the last collection interval and destined to this shelf, with the exception of packets destined to the VSP cards.

Values — Long Integer

ATTRIBUTE inLocalOspfPackets

Description — This attribute indicates the total number of OSPF packets incoming to this physical interface during the last collection interval and destined to this shelf, with the exception of packets destined to the VSP cards.

Values — Long Integer

ATTRIBUTE inLocalArpPackets

Description — This attribute indicates the total number of ARP packets incoming to this physical interface during the last collection interval and destined to this shelf, with the exception of packets destined to the VSP cards

Values — Long Integer

ATTRIBUTE inLocalPackets

Description — This attribute indicates the total number of packets incoming to this physical interface during the last collection interval and destined to this shelf that do not fit into the TCP, UDP, ICMP, ARP, or OSFP classification.

Values — Long Integer

ATTRIBUTE outLocalTcpPackets

Description — This attribute indicates the total number of TCP packets leaving this interface during the last collection interval, which originated on this shelf, with the exception of packets from the VSP cards.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE outLocalUdpPackets

Description — This attribute indicates the total number of UDP packets leaving this interface during the last collection interval, which originated on this shelf, with the exception of packets from the VSP cards.

Values — Long Integer

ATTRIBUTE outLocalIcmpPackets

Description — This attribute indicates the total number of ICMP packets leaving this interface during the last collection interval, which originated on this shelf, with the exception of packets from the VSP cards.

Values — Long Integer

ATTRIBUTE outLocalOspfPackets

Description — This attribute indicates the total number of OSPF packets leaving this interface during the last collection interval, which originated on this shelf, with the exception of packets from the VSP cards.

Values — Long Integer

ATTRIBUTE outLocalArpPackets

Description — This attribute indicates the total number of OSPF packets leaving this interface during the last collection interval, which originated on this shelf, with the exception of packets from the VSP cards.

Values — Long Integer

ATTRIBUTE outLocalPackets

Description — This attribute indicates the total number of packets leaving the interface during the last collection interval, which originated on this shelf, that do not fit into the TCP, UDP, ICMP, ARP, or OSPF classification.

Values — Long Integer

ATTRIBUTE inLocalDiscarded

Description — This attribute indicates the total number of malformed IP packets incoming to the interface during the last collection interval. These are packets which are corrupted.

Values — Long Integer

ATTRIBUTE outLocalDiscarded

Description — This attribute indicates the total number of packets attempting to exit the interface during the last collection interval which were rejected. These are packets which are corrupted or lost due to congestion.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE inLocalExceptions

Description — This attribute indicates the total number of packets received during the last collection interval on this interface and destined for this shelf that require exception handling, with the exception of packets destined to the VSP cards.

Values — Long Integer

ATTRIBUTE inFwdExceptions

Description — This attribute indicates the total number of packets received during the last collection interval on this interface, not destined for this shelf, that require exception handling.

Values — Long Integer

RESPONSE Invalid Logical Processor: Component Lp/... is not currently provisioned.

Description — This response is generated when the user issues a *Check Prov* command against an *LpG* that is provisioned with an *Lp* that does not exist in the *Shelf*.

ATTRIBUTE lpgInvalidLpError

Description — This attribute indicates the instance value of the *Lp* that does not exist in the Shelf.

Values — Decimal (1..15)

RESPONSE Lp/... can not be provisioned under both LpG/... and LpG/... at the same time.

Description — This response is generated when the user issues a *Check Prov* command against an *LpG* that is provisioned with an *Lp* already configured under another *LpG*. Any given Lp must be associated to a maximum of one *LpG*.

ATTRIBUTE lpgDuplicateLpInUseError

Description — This attribute indicates the instance value of the *Lp* that is duplicated under more than one *LpG*.

Values — Decimal (1..15)

ATTRIBUTE lpgFirstLpGNumberError

Description — This attribute indicates the instance value of the first *LpG* provisioned with a duplicated *Lp*.

Values — Decimal (1..7)

ATTRIBUTE lpgSecondLpGNumberError

Description — This attribute indicates the instance value of the second *LpG* provisioned with a duplicated *Lp*.

Values — Decimal (1..7)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Provisioning file ... has failed sanity andcannot be loaded.

Description — This response is generated by the *Load* or *Apply* commands when the specified file's sanity is failed.

System action: The command is ignored.
Operator action: Re-enter the command with properly saved provisioning file.

ATTRIBUTE file

Description — This attribute is the name of the file that has failed sanity.

Values — String (1..40, ASCII)

RESPONSE Error:When custType is pvg, and a protected route is provisioned under ... the preConfigFwdPath of ... must be set to enabled.

Description — A *Check Prov* command generates this response if the *preConfigFwdPath* attribute of the *Vr Ip* component is not set to ***enabled*** when a protected route is provisioned and the attribute *custType* of the *Vr CustSpec* component is ***pvg***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that *preConfigFwdPath* of the *Vr Ip* component is set to ***enabled***.

ATTRIBUTE vrComponentName

Description — This attribute indicates the name of the *Vr* component instance under which the protected route is provisioned.

Values — The name of the component

ATTRIBUTE vrIpComponentName

Description — This attribute indicates the name of the *Vr Ip* component.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:When custType is pvg, and a protected route is provisioned under ... the defaultProtectedFailureBehavior of ... must be set to discard.

Description

A *Check Prov* command generates this response if the *defaultProtectedFailureBehavior* attribute of the *Vr Ip Static* component is not set to ***discard*** when a protected route is provisioned and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that *defaultProtectedFailureBehavior* attribute of the *Vr Ip Static* component is set to ***discard*** when a protected route is provisioned and the attribute *custType* of the *Vr CustSpec* component is ***pvg***.

ATTRIBUTE vrComponentName

Description

This attribute indicates the name of the *Vr* component instance under which the protected route is provisioned.

Values

The name of the component

ATTRIBUTE vrIpStaticComponentName

Description

This attribute indicates the name of the *Vr Ip Static* component.

Values

The name of the component

RESPONSE Error:When custType is pvg, the heartbeat attribute of protected route...must be set to enabled.

Description

A *Check Prov* command generates this response if the *heartbeat* attribute of the *Vr Ip Static Route* component is not set to ***enabled*** when the route is a protected route and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that *heartbeat* of the *Vr Ip Static Route* component is set to ***enabled***.

ATTRIBUTE protectedRouteName

Description

This attribute indicates the name of the *Vr Ip Static Route* component instance which is a protected route.

Values

The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Warning:When custType is pvg, setting the defaultHeartbeatFailureBehavior of ... to hard may result in removal of a protected route if the heartbeat fails.

Description

A *Check Prov* command generates this response if the *defaultHeartbeatFailureBehavior* attribute of the *Vr Ip Static* component is set to ***hard*** when a protected route is provisioned and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

ATTRIBUTE vrIpStaticComponentName

Description

This attribute indicates the name of the *Vr Ip Static* component.

Values

The name of the component

RESPONSE Error:When custType is pvg, and a protected route is provisioned under ... the heartbeatDeadInterval attribute of ... must not be set to disabled.

Description

A *Check Prov* command generates this response if the *heartbeatDeadInterval* attribute of the *Vr Ip Static* component is not set to a value other than ***disabled*** when a protected route is provisioned.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that *heartbeatDeadInterval* attribute of *Vr Ip Static* component is not set to ***disabled*** when a protected route is provisioned.

ATTRIBUTE vrComponentName

Description

This attribute indicates the name of the *Vr* component instance under which the protected route is provisioned.

Values

The name of the component

ATTRIBUTE vrIpStaticComponentName

Description

This attribute indicates the name of the *Vr Ip Static* component.

Values

The name of the component

RESPONSE

Description

This real-time statistics event contains the attributes for the *Shelf* performance measurement (real-time statistics) record.

ATTRIBUTE criticalSetAlarms

Description

This attribute indicates the number of critical alarms that were set during the last collection interval.

Values

Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE majorSetAlarms

Description — This attribute indicates the number of major alarms that were set during the last collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE minorSetAlarms

Description — This attribute indicates the number of minor alarms that were set during the last collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE criticalClearAlarms

Description — This attribute indicates the number of critical alarms that were cleared during the last collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE majorClearAlarms

Description — This attribute indicates the number of major alarms that were cleared during the last collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE minorClearAlarms

Description — This attribute indicates the number of minor alarms that were cleared during the last collection interval.

Values — Decimal (0..4294967295)

RESPONSE Error:The following two PolicedPhb components conflict with each other because they have the same component instance value:

Description — Two *Meter* subcomponents of one *PolicerProfile* component must not have *PolicedPhb* subcomponents with equal component instance values.

System Action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Remove one of the conflicting *PolicedPhb* components.

ATTRIBUTE phb1

Description — This attribute specifies the first of two conflicting *PolicedPhb* components.

Values — The name of the component

ATTRIBUTE phb2

Description — This attribute specifies the second of two conflicting *PolicedPhb* components.

Copyright © 2006, Nortel Nortel Confidential

Values — The name of the component

RESPONSE Error:When custType is pvg and the mode of ... is interVrConnection the destination of the static route...must be the IP subnet defined for a Vsp card.

Description — A *Check Prov* command generates this response if the destination of the *Vr Ip Static Route* component is not an IP subnet defined for the *Nsta Vgs IpMConn* component on a VSP card when the *mode* attribute of the *Vm If* component is ***interVrConnection*** and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the destination of the *Vr Ip Static Route* component is an IP subnet defined for the *Nsta Vgs IpMConn* component on a VSP card when the *mode* attribute of the *Vm If* component is ***interVrConnection*** and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

ATTRIBUTE vmIfComponentName

Description — This attribute indicates the name of the *Vm If* component instance.

Values — The name of the component

ATTRIBUTE staticRouteComponentName

Description — This attribute indicates the name of the *Vr Ip Static Route* component instance.

Values — The name of the component

RESPONSE Error:When custType is pvg and the mode of ... is interVrConnection the static route...is not allowed.

Description — A *Check Prov* command generates this response if a default *RouteEntry/0.0.0.0* is provisioned when the *mode* attribute of the *Vm If* component is ***interVrConnection*** and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that no default *RouteEntry/0.0.0.0* is provisioned when the *mode* attribute of the *Vm If* component is ***interVrConnection*** and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

ATTRIBUTE vmIfComponentName

Description — This attribute indicates the name of the *Vm If* component instance.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE discardDefaultStaticRouteName

Description — This attribute indicates the name of the default *Vr Ip Static Route* component instance.

Values — The name of the component

RESPONSE Error:When the custType is pvg the lacpMode of ... must be passive.

Description — A *Check Prov* command generates this response if the *lacpMode* attribute of the *Lag* component is not set to ***passive*** when the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the *lacpMode* attribute of the *Lag* component is set to ***passive*** when the attribute *custType* of the *Vr CustSpec* component is ***pvg***.

ATTRIBUTE lagInstanceName

Description — This attribute indicates the name of the *Lag* component instance.

Values — The name of the component

RESPONSE Warning:When custType is pvg and there is at least one Vr Pp linked to a 4pGe card it is recommended that the phbRoutingSource of ... should be set to cs1.

Description — A *Check Prov* command generates this response if the *phbRoutingSource* attribute of the *Vr Dsd* component is not set to ***cs1*** when a *Vr Pp* component is linked to a ***4pGe*** card and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

ATTRIBUTE vrDiffServDomainName

Description — This attribute indicates the name of the *Vr Dsd* component instance.

Values — The name of the component

RESPONSE Warning:When custType is pvg and there is at least one Vr Pp linked to a 4pGe card it is recommended that the phbGeneralSource of ... should be set to df.

Description — A *Check Prov* command generates this response if the *phbGeneralSource* attribute of the *Vr Dsd* component is not set to ***df*** when a *Vr Pp* component is linked to a ***4pGe*** card and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE vrDiffServDomainName

Description — This attribute indicates the name of the *Vr Dsd* component instance.

Values — The name of the component

RESPONSE Warning:When custType is pvg it is recommended that the baMode of ... should be set to preserve.

Description — A *Check Prov* command generates this response if the *baMode* attribute of the *Vr Ip DiffServ Is* component is not set to ***preserve*** when the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

ATTRIBUTE vrIpDiffServIsName

Description — This attribute indicates the name of the *Vr Ip DiffServ Is* component.

Values — The name of the component

RESPONSE Warning:When custType is pvg the value of minimumLinks in all of the following Lag components is recommended to be the same as they are all linked to the same Vr....

Description — A *Check Prov* command generates this response if different *minimumLinks* values are assigned to *Lag* component instances which are linked to the same *Vr* component instance when the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

ATTRIBUTE lagInstanceList

Description — This attribute contains the list of the *Lag* component instances which are linked to the same *Vr* but have different values of *minimumLinks*.

List of — The name of the component

RESPONSE Warning:When custType is pvg and ... is used as a protected default route the minimumLinks of ... may be too low to provide flow protection during port failures if the flow rate exceeds the throughput of the ... active links.

Description — A *Check Prov* command generates this response when the *custType* attribute of the *Vr CustSpec* component is ***pvg*** and the *Lag* is used as a protected default route but has its *minmumLinks* set to a value which is too low.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE lagInstanceName

Description — This attribute indicates the name of the *Lag* component instance.

Values — The name of the component

ATTRIBUTE valueOfMinimumActiveLinks

Description — This attribute indicates the value of the *minimumLinks* of the *Lag* component instance.

Values — Decimal (1..31)

ATTRIBUTE numberOfActiveLinks

Description — This attribute indicates the number of the *Lag Link* component instances.

Values — Decimal (1..31)

RESPONSE Software patching failed due to the following reason:.....

Description — The *Activate Prov* command generates this error response when an event occurs preventing hitless software patching to proceed.

ATTRIBUTE pcsHspAbortReason

Description — This attribute indicates why Hitless Software Patching has been aborted.

Values — Abort reason undetermined.
A software error occured.
HSP stopped via StopProv'command.'
LP involved in patching went offline unexpectedly:
LP could not load software:

ATTRIBUTE pcsString

Description — This attribute may be used to provide further information.

Values — String (0..320, ASCII)

RESPONSE Continue Prov failed due to a pausable event, pause reason: .....The -force option will continue the software patching, but service outages may occur. To abort type Stop Prov.

Description — The *Continue Prov* command generates this response during Hitless Software Patching when issued without the *-force* option and when certain conditions are not met. The *Continue Prov* command will succeed only if the pausable events are all cleared. The operator can decide to force the Hitless Software Patching to resume by typing *Continue -force Prov* or to abort the Hitless Software Patching by typing *Stop Prov*.
System action: The *Continue Prov* command will resume software patching if the pausable conditions have been cleared. The *Continue -force Prov* command will ignore the pausable events and resume with the software patching. The *Stop Prov* command will cause a rollback to the current view software.
Operator action: Follow appropriate procedures for software patching.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE pcsHspTransferOfServices

Description — This attribute indicates which LPs failed to transfer their services to another processor card within the allotted time.

Values — String (0..320, ASCII)

ATTRIBUTE pcsHspCannotTransferServices

Description — This attribute indicates which LPs cannot transfer their services to another processor card.

Values — String (0..1120, ASCII)

ATTRIBUTE pcsHspProvidingServices

Description — This attribute indicates which LPs failed to indicate that they are providing service within the allotted time.

Values — String (0..320, ASCII)

ATTRIBUTE pcsHspPausibleAlarm

Description — This attribute indicates the LPs which have pausable alarms issued against it.

Values — String (0..320, ASCII)

ATTRIBUTE pcsHspAppsNotReady

Description — This attribute indicates which LPs have applications which are not ready.

Values — String (0..320, ASCII)

RESPONSE The software patching is paused because of the following reason:.....To resume, type Continue Prov. To stop, type Stop Prov.

Description — The *Activate Prov* command generates this response during Hitless Software Patching when issued without the *-noPause* option and when certain conditions are not met.
The *Activate Prov* command always generates this message during Hitless Software Patching when issued with the *-pause* option.
This response indicates that the software migration is paused. The Hitless Software Patching will pause as long as no action is taken by the operator.
System action: The *Continue Prov* command will resume software patching if the pausable conditions have been cleared. The *Stop Prov* command will cause a rollback to the current view software.
Operator action: Follow appropriate procedures for software patching.

ATTRIBUTE pcsHspTransferOfServices

Description — This attribute indicates which LPs failed to transfer their services to another processor card within the allotted time.

Values — String (0..320, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE pcsHspCannotTransferServices

Description	This attribute indicates which LPs cannot transfer their services to another processor card.
Values	String (0..1120, ASCII)

ATTRIBUTE pcsHspProvidingServices

Description	This attribute indicates which LPs failed to indicate that they are providing service within the allotted time.
Values	String (0..320, ASCII)

ATTRIBUTE pcsHspPausibleAlarm

Description	This attribute indicates the LPs which have pausable alarms issued against it.
Values	String (0..320, ASCII)

ATTRIBUTE pcsHspAppsNotReady

Description	This attribute indicates which LPs have applications which are not ready.
Values	String (0..320, ASCII)

ATTRIBUTE pcsHspPauseOptionIssued

Description	This attribute indicates that the *Activate Prov* command was issued with the *-pause* option.
Values	String (0..320, ASCII)

RESPONSE The following LPs will participate in software patching: ... The patching can be stopped by issuing the Stop Prov command.

Description	The *Activate Prov* command generates this response at the beginning of Hitless Software Patching, providing a list of Logical Processors that will be participating. At this point the operator can stop the Hitless Software Patching by issuing the *Stop Prov* command.

ATTRIBUTE pcsLpOper

Description	This attribute lists the LPs that are participating in the Hitless Software Patching.
List of	The name of the component
List Size	16

RESPONSE Error:The tunnelDestinationAddress ... must be one of the public tunnel addresses of the remote tunnel endpoints.

Description — The *Check Prov* command produces this response if an invalid IP address, specified for the tunnel endpoint, is not listed with the public tunnel addrsses of the remote tunnel endpoints. The *tunnelDestinationAddress* must be specified in the *destinationAddresses* attribute of the *InwIpTunnelMsep* component or the *destinationAddress* attribute of the *InwIpTunnelSep* component in the same shared domain.

ATTRIBUTE invalidTda

Description — This attribute specifies the invalid IP address of the *tunnelDestinationAddress* attribute.

Values — IP address

RESPONSE Error: The linkDestinationAddress can not be set to ....

Description — This error message appears when the provisioned media is not *Ppp* and the attribute *linkDestinationAddress* is provisioned with a non-zero value.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Change the provisioned *linkDestinationAddress* under the *Interface* component.

ATTRIBUTE invalidLinkDestAddress

Description — This attribute contains the value of the invalid *linkDestinationAddress*.

Values — IP address

RESPONSE Error: Some features in the Sw Lpt featureList attribute are not supported by the service bundle: ...

Description — This response group informs the user that not all features in the *Sw Lpt featureList* are supported by the service bundle. The features not supported by the service bundle are also listed.
System action: The *Check Prov* command has failed. No *Activate Prov* command will be accepted until a subsequent *Check Prov* command completes without errors.
Operator action: Set the ***serviceBundleName*** attribue to a valid service bundle name. The valid bundle names for a ***16pOC3PosAtm*** card are:
allServices
mplsAtmIp
porsAtmIp
Note that service bundle ***allServices*** cannot be used with a card whose product code starts with NTHW44.

ATTRIBUTE rspNpuListOfUnsupportedFeatures

Description — This attribute indicates the names of the features that are not supported by the provisionined service bundle.

Copyright © 2006, Nortel Nortel Confidential

Values String (0..255, ASCII)

RESPONSE Error:When the vgsIp feature is provisioned on a ... card, ... must be set to one of the following values:...

Description A *Check Prov* command produces this response if either of the attributes *defaultVoiceRate* or *tone2100Rate* has been set to ***32kG726*** and the feature ***vgsIp***, which is not capable of supporting G.726 on the current VSP card type, has been provisioned.

System action: No *Activate Prov* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Check to see if the feature ***vgsIp*** is required. If so, modify the attribute *tone2100Rate* to ***64kG711***, or modify the attribute *defaultVoiceRate* to either ***64kG711*** or ***8kG729***.

ATTRIBUTE vgsCardType

Description This attribute indicates the VSP card type currently being used by PVG.

Values 2pOC3ChSmIrVsp3
2pOC3ChSmIrVsp4e

ATTRIBUTE vgsPktProfAttributeName

Description This attribute indicates which *PktProf* component attribute is being checked against the ***vgsIp*** feature.

Values defaultVoiceRate
tone2100Rate

ATTRIBUTE vgsPktProfAttributeValues

Description This attribute indicates the allowed values for the *PktProf* component attribute that is being checked against the ***vgsIp*** feature.

List of 64kG711
8kG729

List Size 2

RESPONSE

Description The following describes the attributes of the hardware diagnostic test to be displayed automatically at the end of the test.

ATTRIBUTE status

Description This attribute records the current status of the hardware diagnostic test.
passed - indicates that the hardware diagnostic test passed.
failed - indicates that the hardware diagnostic test failed.
running - indicates that the hardware diagnostic test is currently running.
notYetRun - indicates that hardware diagnostic have not yet run on this card.

Copyright © 2006, Nortel Nortel Confidential

notSupported - indicates that the card does not support the running of the hardware diagnostic test.

Values
passed
failed
running
notYetRun
notSupported

ATTRIBUTE causeOfTermination

Description
This attribute records the reason the hardware diagnostic test ended. It contains one of the following values:
neverStarted: the card test has not been started.
testRunning: the card test is currently running.
testRanToCompletion: the hardware diagnostic test ran to completion.
stoppedByOperator: a *Stop* command was issued.
targetFailed: the target card became non-operational.

Values
neverStarted
testRunning
testRanToCompletion
stoppedByOperator
targetFailed

ATTRIBUTE startTime

Description
This attribute records the time at which the test was started.

Values
Time (DHMS)

ATTRIBUTE elapsedTime

Description
This attribute displays the number of minutes that the test has been running.

Values
Decimal (0..1440)

Units
minutes

RESPONSE Warning: Lp/... will be reset due to modifications to the Lp/... Npu component if this is an NTHW44 FP. All other FP types are not affected.

Description — The *Check Prov* command generates this response after the user has made a change to the *Lp Npu* component and the change is a critical change to the *Lp* component. Activation of the provisioning data will cause the card to be reset. Currently the only critical change is that of changing the ***serviceBundleName*** attribue on an NTHW44 FP. On a card whose product code does not start with NTHW44 the card will not be reset.
System action: The *Check Prov* command has just been executed. Continuing with an *Activate Prov* command will cause the card to be reset.
Operator action: The choices are:
1) Continue with the *Activate Prov* command and allow the card to be reset.
2) Use the *Copy Prov* command to undo all the provisioning changes.
3) Undo the change to the *Lp Npu* component and then issue the *Check Prov* command and the *Activate Prov* command.

ATTRIBUTE rspNpuLpCriticalChgAttrib1

Description — This attribute indicates the *Lp* component instance that is to be reset.

Values — Decimal (0..15)

ATTRIBUTE rspNpuLpCriticalChgAttrib2

Description — This attribute indicates the *Lp* component instance that is to be reset.

Values — Decimal (0..15)

RESPONSE Opened ... files cannot be protected.

Description — This response is generated when the operator tries to protect an opened file which should not be protected.

ATTRIBUTE secureFileType

Description — This attribute gives the type of file that is being protected.

Values — log

RESPONSE Error:An Mpls component must have an RsvpTe component provisioned under the ... component.

Description — The *Check Prov* command produces this response when the *Mpls* component has been provisioned under the *Router* component but no *RsvpTe* component has been provisioned under this *Router* component.

System Action: The *Check Prov* fails.

Operator Action: Provision an *RsvpTe* component under the *Router* component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE noRsvpTeCompErr

Description — This attribute indicates the name of the *Router* component used in the response.

Values — The name of the component

RESPONSE Error: The ... attribute value of ... for the component ... is invalid. Use a valid Class A, B or C non-reserved address.

Description — The *Check Prov* command produces this response when an invalid IP address has been provisioned for the specified component.

System Action: The *Check Prov* fails.

Operator Action: The specified attribute value for the component should be changed to a valid Class A, B or C non-reserved address.

ATTRIBUTE lspInvalidEpaErrorAttr

Description — This attribute indicates which attribute under the *Lsp* component is in error.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE lspInvalidEpaErrorVal

Description — This attribute indicates the invalid IP address that was provisioned.

Values — IP address

ATTRIBUTE lspInvalidEpaErrorComp

Description — This attribute indicates which component contains that invalid IP address.

Values — The name of the component

RESPONSE Error:The ... attribute under ... cannot be set to ... when this component is provisioned to be a primary LSP.

Description — The *Check Prov* command produces this response when the *addToIpRdb* attribute has been set to an invalid value for the specified *Lsp* component which has been provisioned to be a primary LSP.

System Action: The *Check Prov* fails.

Operator Action: The attribute value should either be changed to a valid value or the *Lsp* component should be provisioned to be a standby LSP.

ATTRIBUTE lspPlspAddToIpRdbErrorAttr

Description — This attribute indicates which attribute under the *Lsp* component is in error.

Values — Decimal (0..65535)

Replication — The name of the component

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE IspPIspAddToIpRdbErrorComp

Description — This attribute indicates which component is in error.

Values — The name of the component

ATTRIBUTE IspPIspAddToIpRdbErrorVal

Description — This attribute indicates which *Lsp* attribute value is invalid.

Values — false
true
sameAsPrimaryLsp (sameAsPLsp)

RESPONSE Error:The ... component has an invalid instance value. Use a valid class A, B or C non-reserved IP address.

Description — The *Check Prov* command produces this response when the specified component has been provisioned with an invalid IP address.

System Action: The *Check Prov* fails.

Operator Action: The component must be re-added using a valid class A, B or C non-reserved address.

ATTRIBUTE IspRaInvalidInstanceErrorComp

Description — This attribute indicates which component has been provisioned with an invalid instance.

Values — The name of the component

RESPONSE Error:The maximum number of ... Lsp components per Mpls component has been exceeded.

Description — The *Check Prov* command produces this response when the maximum number of allowable *Lsp* components have been exceeded for this *Mpls* component.

System Action: The *Check Prov* fails.

Operator Action: Delete some of the *Lsp* components to bring the total number below the maximum allowed value.

ATTRIBUTE IspMaxLspErrorVal

Description — This attribute indicates the maximum number of *Lsp* components allowed on the *Mpls* component.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The ... attribute for the component ... cannot have a value of ....

Description — The *Check Prov* command produces this response when *primaryLsp* attribute is set to a value of ***0***.

System Action: The *Check Prov* fails.

Operator Action: The *primaryLsp* attribute of this *Lsp* component must be provisioned with a valid *Lsp* instance value.

ATTRIBUTE IspZeroPLspErrorAttr

Description — This attribute indicates which attribute under the *Lsp* component is in error.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE IspZeroPLspErrorComp

Description — This attribute indicates which component is in error.

Values — The name of the component

ATTRIBUTE IspZeroPLspErrorValue

Description — This attribute indicates the value which is invalid for the specified attribute.

Values — Decimal (0..65535)

RESPONSE Error:An ... subcomponent cannot exist under ... when either the addToIpRdb attribute is set to false or the primaryLsp attribute is not the same as the instance value for this Lsp.

Description — The *Check Prov* command produces this response when either an *Lsp* component hase been provisioned to be a primary LSP with the *addToIpRdb* attribute set to ***false*** and provisioned with *IpV4ReachableAddress* subcomponents or the *Lsp* component has been provisioned to be a standby LSP and provisioned with *IpV4ReachableAddress* subcomponents.

System Action: The *Check Prov* fails.

Operator Action: If the *Lsp* component is a primary LSP, then the operator should either set the *addToIpRdb* attribute to ***true*** or delete the *IpV4ReachableAddress* subcomponents for this *Lsp* component.

If the *Lsp* component is a standby LSP, then the *IpV4ReachableAddress* subcomponents must be deleted for this LSP.

ATTRIBUTE IspNoRaAllowedErrorSubComp

Description — This attribute indicates which subcomponent type is not allowed to exist under this *Lsp* component.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)
Replication	The name of the component

ATTRIBUTE IspNoRaAllowedErrorComp

Description	This attribute indicates which *Lsp* component is in error.
Values	The name of the component

RESPONSE Error:The ... attribute under ... cannot be set to ... when this component is provisioned to be a primary LSP.

Description	The *Check Prov* command produces this response when the *alarmControl* attribute has been set to ***sameAsPrimaryLsp*** for an *Lsp* component that has been provisioned to be a primary LSP. **System Action**: The *Check Prov* fails. **Operator Action**: The *alarmControl* attribute for the specified *Lsp* component must be changed from ***sameAsPrimaryLsp*** to some other value or the *Lsp* component must be provisioned to be a standby LSP.

ATTRIBUTE IspPIspAlarmErrorAttr

Description	This attribute indicates which attribute under the *Lsp* component is in error.
Values	Decimal (0..65535)
Replication	The name of the component

ATTRIBUTE IspPIspAlarmErrorComp

Description	This attribute indicates which component is in error.
Values	The name of the component

ATTRIBUTE IspPIspAlarmErrorVal

Description	This attribute indicates which *Lsp* attribute value is invalid.
Values	none critical (crit) major (maj) sameAsPrimaryLsp (sameAsPLsp)

RESPONSE Error:The ... attribute under ... cannot be set to ... when this component is provisioned to be a primary LSP.

Description	The *Check Prov* command produces this response when the specified attribute has been provisioned to use an invalid value for the specified *Lsp* component which has been provisioned to be a primary LSP. **System Action**: The *Check Prov* fails. **Operator Action**: The attribute should be set to a valid value or the *Lsp* component should be provisioned to be a standby LSP.

RESPONSE Error:The ... attribute under ... cannot be set to ... when this component is provisioned to be a primary LSP.

Description — The *Check Prov* command produces this response when the specified attribute has been set to use an invalid value for the specified primary LSP component.

System Action: The *Check Prov* fails.

Operator Action: The attribute should be set to a valid value or the *Lsp* component should be provisioned to be a standby LSP.

ATTRIBUTE IspPIspSIspErrorAttr

Description — This attribute indicates which attribute under the *Lsp* component is in error.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE IspPIspSIspErrorComp

Description — This attribute indicates which *Lsp* component is in error.

Values — The name of the component

ATTRIBUTE IspPIspSIspErrorVal

Description — This attribute indicates which *Lsp* attribute value is invalid.

Values — Decimal (0..65535)

RESPONSE Error:The ... attribute under ... must be set to ... when this component is provisioned to be a standby LSP.

Description — The *Check Prov* command produces this response when the specified attribute has been set to an invalid value for the specified standby LSP component.

System Action: The *Check Prov* fails.

Operator Action: The attribute should be set to a valid value or the *Lsp* component should be provisioned to be a primary LSP.

ATTRIBUTE IspNonZeroEpaErrorAttr

Description — This attribute indicates which attribute under the *Lsp* component is in error.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE IspNonZeroEpaErrorComp

Description — This attribute indicates which *Lsp* component is in error.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE IspNonZeroEpaErrorVal

Description — This attribute indicates the invalid *Lsp* attribute value.

Values — IP address

RESPONSE Error:The maximum value of ... Hop components per Path component has been exceeded for this ... component.

Description — The *Check Prov* command produces this response when number of *Hop* components exceeds the maximum allowable number of *Hop* components for a *Path* component.

System Action: The *Check Prov* fails.

Operator Action: The operator will have to delete some of the *Hop* components for the specified *Path* component.

ATTRIBUTE pathMaxHopPerPathErrorVal

Description — This attribute indicates the maximum number of *Hops* components allowed for a *Path* component.

Values — Decimal (0..65535)

ATTRIBUTE pathMaxHopPerPathErrorComp

Description — This attribute indicates which *Path* component has too many *Hop* components provisioned.

Values — The name of the component

RESPONSE Error:The allowed maximum of ... Path components for an Mpls component has been exceeded.

Description — The *Check Prov* command produces this response when the number of provisioned *Path* components exceeds the maximum number of allowable *Path* components for an *Mpls* component.

System Action: The *Check Prov* fails.

Operator Action: The operator will have to delete some of the *Path* components to bring the total number of *Path* components below the maximum allowed value.

ATTRIBUTE pathMaxPathErrorAttr

Description — This attribute indicates the maximum value for the number of provisioned *Path* components.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Warning:The component ... has changed and is specified in the pathName attribute for .... This new path will not take effect until this Lsp is locked and then unlocked.

Description — The *Check Prov* command produces this response when a provisioning change has occurred to a *Path* component which is being used by an existing *Lsp* component.

System Action: The *Check Prov* issues a warning.

Operator Action: If the operator requires the affected *Lsp* components to use the updated *Path* component then the *Lsp* components will have to be locked and then unlocked.

ATTRIBUTE pathCompNameWarningPathComp

Description — This attribute indicates which Path component has been changed.

Values — The name of the component

ATTRIBUTE pathCompNameWarningLspComp

Description — This attribute indicates which *Lsp* component is affected by the changed *Path* component.

Values — The name of the component

RESPONSE Error:The component ... must have at least one Hop subcomponent provisioned.

Description — The *Check Prov* command produces this response when the specified *Path* component does not have at least one *Hop* subcomponent provisioned.

System Action: The *Check Prov* fails.

Operator Action: Provision at least one *Hop* subcomponent for this *Path* component.

ATTRIBUTE pathNoHopsErrorComp

Description — This attribute indicates which *Path* component requires a *Hop* subcomponent.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The ... component is provisioned to use ... as a ... LSP but ... is not provisioned.

Description

The *Check Prov* command produces this response when an *Lsp* component is provisioned to use another *Lsp* component as either a primary or standby LSP but the second *Lsp* component does not exist.

System Action: The *Check Prov* fails.

Operator Action: The second *Lsp* component should be provisioned to act as a primary or standby LSP for the first *Lsp* component or the first *Lsp* component should be provisioned to use another *Lsp* component as the primary or standby LSP.

ATTRIBUTE IspPIspSIspNotProvErrorComp

Description

This attribute indicates the first *Lsp* component that is in error.

Values

The name of the component

ATTRIBUTE IspPIspSIspNotProvErrorComp1

Description

This attribute indicates the second *Lsp* component that is specified in the attribute of the first *Lsp* component.

Values

The name of the component

ATTRIBUTE IspPIspSIspNotProvErrorType

Description

This attribute indicates whether the second *Lsp* component was to be used as a primary or standby LSP.

Values

primary
standby

ATTRIBUTE IspPIspSIspNotProvErrorComp2

Description

This attribute indicates the second *Lsp* component which does not exist.

Values

The name of the component

RESPONSE Error:When the ... ... attribute value is set to ..., the ... ... attribute value must be set to ....

Description

The *Check Prov* command produces this response when the *standbyLsp* attribute or the *primaryLsp* attribute has been set to a value for an *Lsp* component which does not correspond to the *primaryLsp* attribute or the *standbyLsp* attribute for another *Lsp* component.

System Action: The *Check Prov* fails.

Operator Action: The specified attribute value for the first component should match the specified attribute value for the second component.

RESPONSE Error:The ... attribute value of ... for the component ... is invalid. This value is linked to a component which either does not exist or it is not a Path component.

Description — The *Check Prov* command produces this response when the specified attribute has been set to link to a component which is either not a *path* component or has been set to link to a *path* component which does not exist.

System Action: The *Check Prov* fails.

Operator Action: The attribute value should be changed to link to a valid *path* component.

ATTRIBUTE IspPathNameInvalidAttr

Description — This attribute indicates which attribute under the *Lsp* component is in error.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE IspPathNameInvalidComp

Description — This attribute indicates the invalid component name used for the attribute in error.

Values — The name of the component

ATTRIBUTE IspPathNameInvalidComp1

Description — This attribute indicates the *Lsp* component that is in error.

Values — The name of the component

RESPONSE Error:The ... attribute under ... must not be set when this component is provisioned to be a standby LSP.

Description — The *Check Prov* command produces this response when the specified attribute has been set for the standby LSP component.

System Action: The *Check Prov* fails.

Operator Action: The specified attribute must be cleared of its provisioned value or the *Lsp* component must be provisioned to be a primary LSP.

ATTRIBUTE IspDoNotSetSIspErrorAttr

Description — This attribute indicates which attribute under the *Lsp* component is in error.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE IspDoNotSetSIspErrorComp

Description — This attribute indicates which *Lsp* component is in error.

Copyright © 2006, Nortel Nortel Confidential

Values The name of the component

RESPONSE Error:The duplicate address and prefix length of ...,... was detected for components:... and ....

Description The *Check Prov* command produces this response when a duplicate address and prefix length is detected between two components. This error could result from the duplication from any combination of *endPointAddress* attribute values under the *Lsp* component and the *IpV4ReachableAddress* instance value. The address that is duplicated may or may not be a masked address.

System Action: The *Check Prov* fails.

Operator Action: The two components in question should be re-provisioned such that the IP addresses are no longer duplicated.

ATTRIBUTE lspDupIpV4AddrErrorAddr

Description This attribute indicates which IP address has been duplicated.

Values IP address

ATTRIBUTE lspDupIpV4AddrErrorAddrLen

Description This attribute indicates which prefix length is being used for this IP address.

Values Decimal (0..65535)

ATTRIBUTE lspDupIpV4AddrErrorComp

Description This attribute indicates the first component that has the duplicated IP address.

Values The name of the component

ATTRIBUTE lspDupIpV4AddrErrorComp1

Description This attribute indicates the second component that has the duplicated IP address.

Values The name of the component

RESPONSE Error:The maximum value of ... Hop components has been exceeded for this component.

Description The *Check Prov* command produces this response when the total number of *Hop* components has exceeded the maximum value allowed for the *Mpls* component.

System Action: The *Check Prov* fails.

Operator Action: Delete some of the *Hop* components to bring the total number below the maximum allowed value.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE hopMaxHopPerMplsErrorVal

Description — This attribute indicates maximum allowed value for *Hop* components.

Values — Decimal (0..65535)

RESPONSE Error:No more than one instance of the ... component may be provisioned under the same Vgs component as this Spd component.

Description — A *Check Prov* command produces this response if more than one instance of each of the following components is provisioned under the same *Vgs* component as this *Spd*:

Mgc,
H248.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that no more than a single instance of each of the above components is provisioned under the same *Vgs* component as this *Spd*.

ATTRIBUTE pvgIpSecSpdComponentType

Description — This attribute indicates the component that is in error.

Values — Mgc
H248

RESPONSE Error:The value of the ikeResponseTimerValue attribute multiplied by the value of the ikeRetryAttempts attribute must be less than 70% of the value of the saTimeToLive attribute in the ... component.

Description — A *Check Prov* command produces this response if the value of the *ikeResponseTimerValue* attribute multiplied by the value of the *ikeRetryAttempts* attribute is greater than 70% of the value of the *saTimeToLive* attribute in the specified *IkeTransform* component.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the value of the *ikeResponseTimerValue* attribute multiplied by the value of the *ikeRetryAttempts* attribute is less than 70% of the value of the *saTimeToLive* attribute in the specified *IkeTransform* component.

ATTRIBUTE ikeTransformComponentName

Description — This attribute indicates the *ikeTransform* component that contains the attribute *saTimeToLive*.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:The ... attribute must reference an instance of the ... component under the same parent Spd as this Policy component.

Description — A *Check Prov* command produces this response if the specified attribute does not link to an instance of the specified component under the same parent *Spd* as this *Policy* component.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the specified attribute links to an instance of the specified component under the same parent *Spd* as this *Policy* component.

ATTRIBUTE linkAttribute

Description — This attribute indicates the attribute that is in error.

Values — ikePolicy
saProposal

ATTRIBUTE pvgIpSecSpdComponentType

Description — This attribute indicates the component that is in error.

Values — IkePolicy
SaProposal

RESPONSE Error:The value of the saTimeToLive attribute in each of the following components:...must be less than the minimum saTimeToLive attribute value of the following components:...

Description — A *Check Prov* command produces this response if any of the values of *saTimeToLive* in each of the indicated components is greater than the minimum *saTimeToLive* value of all the components listed.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: Ensure that the value of *saTimeToLive* in each of the indicated components is less than the minimum *saTimeToLive* value of all the components listed.

RESPONSE Error:When custType is pvg and the mode of ... is interVrConnection the routing protocol component...is not allowed.

Description

A *Check Prov* command generates this response if *OspfInterface RipInterface* or *IsisInterface* is provisioned when the *mode* attribute of the *Vm If* component is ***interVrConnection*** and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that no *OspfInterface RipInterface* or *IsisInterface* is provisioned under the *Vr Pp ipPort LogicalIf* when the *mode* attribute of the *Vm If* component is ***interVrConnection*** and the *custType* attribute of the *Vr CustSpec* component is ***pvg***.

ATTRIBUTE vmIfComponentName

Description

This attribute indicates the name of the *Vm If* component instance.

Values

The name of the component

ATTRIBUTE routingProtocolName

Description

This attribute indicates the routing protocol subcomponent name under the *Vr Pp ipPort LogicalIf* component.

Values

The name of the component

RESPONSE Error: The ... attribute cannot be set for SPVC type AtmMpe interfaces.

Description

This error response is generated by the *Check Prov* command when the *ilsForwarder* attribute of *AtmMpe* component is set for an SPVC type *AtmMpe* interface.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Ensure that the *ilsForwarder* attribute of the *AtmMpe* component is not set. Use of an IlsForwarder card when the *AtmMpe* component is configured for using SPVCs is not applicable.

ATTRIBUTE attribute

Description

This is the name of the attribute causing the error.

Values

Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error: The ... attribute cannot be set. Set ignored.

Description — This response is used when the operator attempts to set the *instance* attribute of the *Loopback* component.

System Action: The *Set* command is ignored.

Operator Action: None. This attribute cannot be set by the operator.

ATTRIBUTE attribute

Description — This is the name of the attribute that cannot be set.

Values — Decimal (1..65535)

RESPONSE Error: The ... attribute cannot be set. Set ignored.

Description — This response is used when the operator attempts to set the *instance* attribute of the *AtmMpe* component.

System Action: The *Set* command is ignored.

Operator Action: None. This attribute cannot be set by the operator.

ATTRIBUTE attribute

Description — This is the name of the attribute that cannot be set.

Values — Decimal (1..65535)

RESPONSE The following Av(s) do not exist in the provisioned list:

Description — This response is issued when the list of Avs specified for removal does not exist in the already provisioned list. This response is also issued when the list of Avs specified by the operator does not have the right case sensitivity.

ATTRIBUTE listOfAvsNotPresent

Description — This attribute is the list of Avs not present in the already provisioned list.

List of — String (1..30, ASCII)

RESPONSE Error:The ... attribute must not contain a value of 0.0.0.0.

Description — A *Check Prov* command produces this response if the user provisions the specified attribute to contain the value ***0.0.0.0***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the specified attribute does not contain the value ***0.0.0.0***.

ATTRIBUTE directionAttribute

Description — This attribute indicates the attribute that is in error.

Values	srcIpAddress dstIpAddress

RESPONSE Error:The ... component is not permitted under the same Vgs component as this Spd component.

Description	A *Check Prov* command produces this response if the user provisions the specified component in the same *Vgs* hierarchy as this *Spd* component. **System action:** No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors. **Operator action:** Delete the instance of the specified component.

ATTRIBUTE componentName

Description	This attribute indicates the component that must not be provisioned.
Values	The name of the component

RESPONSE Warning:This Voice Gateway as a whole is unsecured. The ... component does not have an Spd subcomponent.

Description	A *Check Prov* command produces this response if the specified *Ctrl* component does not have an *Spd* subcomponent. Note, this warning is only produced if a different *Ctrl* under this *Vgs* has been provisioned with an *Spd* subcomponent. **System action**: A warning is given. **Operator action**: It is recommended that an *Spd* subcomponent is provisioned under the specified *Ctrl* component.

ATTRIBUTE ctrlConnComponentName

Description	This attribute indicates the *Ctrl* component that does not have a *Spd* subcomponent.
Values	The name of the component

RESPONSE Error:The following Policy components must be provisioned in complementary pairs for inbound and outbound directions:...

Description	A *Check Prov* command produces this response if there are any *Policy* subcomponents under this *Spd* component that have not been provisioned with a complementary *Policy* component. **System action**: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors. **Operator action**: Ensure that all *Policy* components provisioned under this *Spd* component have been provisioned with a complementary *Policy* component.

ATTRIBUTE policyComponentList

Description — This attribute indicates the list of *Policy* components.

List of — The name of the component

RESPONSE Error:The value of the remoteIpAddress attribute must be equal to the value of the initialMgcAddress attribute in the ... component.

Description — A *Check Prov* command produces this response if the value of the *remoteIpAddress* attribute is not be equal to the value of the *initialMgcAddress* attribute in the specified *Mgc* component.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the value of the *remoteIpAddress* attribute is equal to the value of the *initialMgcAddress* attribute in the specified *Mgc* component.

ATTRIBUTE mgcComponentName

Description — This attribute indicates the *Mgc* component that contains the *initialMgcAddress* attribute.

Values — The name of the component

RESPONSE Error:When the value of the direction attribute is ... then the value of the ... attribute must not be equal to the value of the ipAddress attribute in the ... component.

Description — A *Check Prov* command produces this response if for a particular value of the *direction* attribute, the user provisions the value of the specified attribute to be equal to the value of attribute *ipAddress* in the specified *Ctrl* component.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the value of the specified attribute is not equal to the value of the *ipAddress* attribute in the specified *Ctrl* component.

ATTRIBUTE direction

Description — This attribute indicates the value of the *direction* attribute.

Values — inbound
outbound

ATTRIBUTE srcDstIpAddr

Description — This attribute indicates the attribute that is in error.

Values — srcIpAddress
dstIpAddress

Description — This attribute indicates the *Ctrl* component that holds the *ipAddress* attribute.

Values — The name of the component

RESPONSE Error: The value of ... under ... is different from the value under .... All the Ethernet components associated with the same Lag must have their TM EP attributes set to the same values.

Description — This response is issued as the result of a Check Prov or Act Prov command when any of the following attributes, *minimumBandwidthGuarantee, redMode* or *txQueueSize* are not set to the same value for the *Ethernet TM EP* subcomponents. All Ethernet components associated with LAG Links under the same LAG must have their TM EP attributes set to the same values

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE tmValueId

Description — This attribute contains the numeric identifier of the attribute that does not have the same value set for the other links in the same Lag.

Values — Decimal (0..65535)

Replication — The name of the component

ATTRIBUTE etherTm1ComponentName

Description — This attribute indicates the *Ethernet TM EP* subcomponent which is associated with the *Lag Link* component under checking.

Values — The name of the component

ATTRIBUTE etherTm2ComponentName

Description — This attribute indicates which *Ethernet TM EP* subcomponent has different value setting compared to the component under checking.

Values — The name of the component

RESPONSE Error:When the protocol attribute is set to icmp then the ... attribute must be set to any.

Description — A *Check Prov* command produces this response if the specified attribute is not set to ***any*** when the *protocol* attribute is set to ***icmp***.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the specified attribute is set to ***any***.

ATTRIBUTE portAttribute

Description — This attribute indicates the attribute that is in error.

Values — dstPort
srcPort

RESPONSE Error:When the action attribute is set to apply and the direction attribute is set to ... then the ... attribute must be set to equal the value of the initialMgcAddress attribute in the ... component.

Description — A *Check Prov* command produces this response if the value of the specified attribute is not equal to the value of the *initialMgcAddress* attribute in the specified *Mgc* component when the *action* attribute is set to ***apply*** and for the given value of the *direction* attribute.

System action: No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator action: Ensure that the value of the specified attribute is equal to the value of the *initialMgcAddress* attribute in the specified *Mgc* component.

ATTRIBUTE sequence

Description — This attribute indicates the sequence number contained in the ICMP echo reply packet.

Values — Decimal (0..4294967295)

ATTRIBUTE time

Description — This attribute indicates the time from the ICMP ping request being generated to the ICMP ping response being received.

Values — Decimal (0..4294967295)

RESPONSE ICMP echo request to ... failed.

Description — The *Ping* command generates this response to indicate that the ping to the specified IP address was unsuccessful because an ICMP error occurred.

ATTRIBUTE ipAddr

Description — This attribute indicates the IP address of the remote host.

Values — IP address

RESPONSE Error: The linkDestinationAddress can not be set to ... when the netmask is 255.255.255.255.

Description — This error message appears when
1) the provisioned media is *Ppp,* the value of the *netMask* attribute is ***255.255.255.255*** and the *linkDestinationAddress* is provisioned with a zero value;
2) the provisioned media is *Ppp,* the value of the *netMask* attribute is ***255.255.255.255*** and the *linkDestinationAddress* is provisioned as ***255.255.255.255***.

System Action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors.

Operator Action: Change the provisioned *linkDestinationAddress* under the *Interface* component.

ATTRIBUTE invalidLinkDestAddress

Description — This attribute contains the value of the invalid *linkDestinationAddress.*

Values — IP address

RESPONSE Error:Reason: Value of ... for EP 0 cannot be less than 32.

Description — This response is issued when a semantic check is done on a *bufferLimitPerEP* attribute for EP0 element.

ATTRIBUTE bufferLimitPerEp

Description — This attribute identifies the attribute containing the error.

Values	Decimal (0..4294967295)

RESPONSE Error:The Lmi pvcConfigParmsInFsr attribute can not be set to a value of vendorForumExtensions for a ... component.

Description	The *Check Prov* command generates this response when the value of the *Lmi pvcConfigParmsInFsr* attribute is set to ***vendorForumExtensions*** under a component that does not support Vendor Forum Extensions. System action: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* completes without errors. Operator action: Change the value of the *Lmi pvcConfigParmsInFsr* attribute to either ***yes*** or ***no***.

ATTRIBUTE frsLmiPvcConfigVndrFrmErrCmpnt

Description	This attribute indicates the component for which the *Lmi pvcConfigParmsInFsr* attribute can not be set to ***vendorForumExtensions.***
Values	Decimal (1..65535)
Replication	The name of the component

RESPONSE Error:...The combination of the ipAddress and port attributes must have a value that is unique under the Nsta/n Vgs ... component.

Description	The *Check Prov* command produces this response if the combination of the *ipAddress* and *port* attributes has a value that is not unique under the *Nsta/n Vgs M2ua/SgV5* component. **System action**: The *Check Prov* command fails. No *Activate* command is accepted until a subsequent *Check Prov* command completes without errors. **Operator action**: Ensure that the combination of the *ipAddress* and *port* attributes has a value that is unique under the *Nsta/n Vgs M2ua/SgV5* component.

ATTRIBUTE userAdaptationComponent

Description	This describes the User Adaptation component under which this Asp has been provisioned.
Values	The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:Only one of the following components can be provisioned under ...:FramerMlpppFramer.

Description

The *Check Prov* command generates this response if both of the following subcomponents are found under the same *Ppp* or *PppIwf* component:
Framer
MlpppFramer

The *Framer* and *MlpppFramer* are mutually exclusive.

System action: The *Check Prov* command fails. An *Activate Prov* command will not be accepted until a subsequent *Check Prov* completes without errors.

Operator action: Delete either the *Framer* or *MlpppFramer* subcomponent.

ATTRIBUTE pppBothFramersTypesComponent

Description

This attribute represents the root level component that has both a *Framer* and *MlpppFramer* subcomponent.

Values

The name of the component

RESPONSE Error:One of the following components must be provisioned under ...:FramerMlpppFramer.

Description

The *Check Prov* command generates this response if none of the following subcomponents are found under the same *Ppp* or *PppIWf* component:
Framer
MlpppFramer

One instance of *Framer* or *MlpppFramer* must exist under the *Ppp* or *PppIWf* component.

System action: The *Check Prov* command fails. An *Activate Prov* command will not be accepted until a subsequent *Check Prov* completes without errors.

Operator action: Add an instance of *Framer* or *MlpppFramer*.

ATTRIBUTE pppNoFramersTypesComponent

Description

This attribute represents the root level component that has no *Framer* or *MlpppFramer* subcomponent.

Values

The name of the component

RESPONSE The following LPs will participate in Hitless Critical Attribute Activation: ... The activation can be stopped by issuing the Stop Prov command.

Description

The *Activate Prov* command generates this response at the beginning of Hitless Critical Attribute activation, providing a list of Logical Processors that will be participating. At this point the operator can stop the Hitless Critical Attribute activation by issuing the *Stop Prov* command.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE pcsLpOper

Description	This attribute lists the LPs that are participating in the Hitless Critical Attribute activation.
List of	The name of the component
List Size	16

RESPONSE Continue Prov failed due to a pausable event, pause reason: ...The -force option will continue the activation, but service outages may occur. To abort type Stop Prov.

Description	The *Continue Prov* command generates this response during Hitless Critical Attribute activation when issued without the *-force* option and when certain conditions are not met. The *Continue Prov* command will succeed only if the pausable events are all cleared. The operator can decide to force the Hitless Critical Attribute activation to resume by typing *Continue -force Prov* or to abort the Hitless Critical Attribute activation by typing *Stop Prov*. **System action**: The *Continue Prov* command will resume activation if the pausable conditions have been cleared. The *Continue -force Prov* command will ignore the pausable events and resume with the Hitless Critical Attribute activation. The *Stop Prov* command will cause a rollback to the current view. **Operator action**: Follow appropriate procedures for Hitless Critical Attribute activation.

ATTRIBUTE pcsHcaPausibleAlarm

Description	This attribute indicates the LPs which have pausable alarms issued against it.
Values	String (0..320, ASCII)

ATTRIBUTE pcsHcaAppsNotReady

Description	This attribute indicates which LPs have applications which are not ready.
Values	String (0..320, ASCII)

RESPONSE Activation failed due to the following reason:...

Description	The *Activate Prov* command generates this error response when an event occurs preventing Hitless Critical Attribute activation to proceed.

ATTRIBUTE pcsHcaAbortReason

Description	This attribute indicates why Hitless Critical Attribute activation has been aborted.
Values	Abort reason undetermined. A software error occured. HCA stopped via StopProv'command.' LP involved in activation went offline unexpectedly: LP could not load software:

ATTRIBUTE pcsString

Description	This attribute may be used to provide further information.
Values	String (0..320, ASCII)

RESPONSE The activation is paused because of the following reason:...To resume, type Continue Prov. To stop, type Stop Prov.

Description	The *Activate Prov* command generates this response during Hitless Critical Attribute activation when issued without the *-noPause* option and when certain conditions are not met. The *Activate Prov* command always generates this message during Hitless Critical Attribute activation when issued with the *-pause* option. This response indicates that the activation is paused. The Hitless Critical Attribute activation will pause as long as no action is taken by the operator. **System action**: The *Continue Prov* command will resume activation if the pausable conditions have been cleared. The *Stop Prov* command will cause a rollback to the current view. **Operator action**: Follow appropriate procedures for Hitless Critical Attribute activation.

ATTRIBUTE pcsHcaPausibleAlarm

Description	This attribute indicates the LPs which have pausable alarms issued against it.
Values	String (0..320, ASCII)

ATTRIBUTE pcsHcaAppsNotReady

Description	This attribute indicates which LPs have applications which are not ready.
Values	String (0..320, ASCII)

ATTRIBUTE pcsHspPauseOptionIssued

Description	This attribute indicates that the *Activate Prov* command was issued with the *-pause* option.
Values	String (0..320, ASCII)

RESPONSE ...The hitlessActivation attribute under the ProvisioningSystem ActivationMode component must be set to disabled prior to performing service disruptive modifications.

Description	This response is issued during semantic check whenever conditions for a Hitless Critical Attribute activation or a Non-disruptive activation are not met.

ATTRIBUTE errorType

Description	This attribute indicates which type of activation is not permitted.
Values	Hitless Critical Attribute activation cannot occur. Reason(s): Non-disruptive Activation cannot occur. Reason(s):

ATTRIBUTE atmPnniLrbgLpName

Description — This attribute indicates the component name to which 'sw lpt/n' is linked.

Values — The name of the component

RESPONSE On this type of card, setting of ... is not allowed.

Description — This response is triggered when thresholds ***txCellDiscardThreshold***, ***rxCellDiscardThreshold***, ***txFrameDiscardThreshold***, and ***rxFrameDiscardThreshold*** under the ATM interface is set on ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pDS3Atm***, ***3pE3Atm***, ***3pDS1Atm***, ***3pE1Atm***, ***8pDS1Atm***, ***8pE1Atm***, and ***2pJ6MAtm*** cards.

ATTRIBUTE atmDiscardThreshold

Description — This attribute contains the name of threshold for ATM Discard Alarm. The name of thresholds are ***txCellDiscardThreshold***, ***rxCellDiscardThreshold***, ***txFrameDiscardThreshold***, and ***rxFrameDiscardThreshold***.

Values — String (0..49, ASCII)

RESPONSE On this type of card, setting of ... is not allowed.

Description — This response is triggered when thresholds ***txCellDiscardThreshold***, ***rxCellDiscardThreshold***, ***txFrameDiscardThreshold***, and ***rxFrameDiscardThreshold*** under the ATM service category is set on ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pDS3Atm***, ***3pE3Atm***, ***3pDS1Atm***, ***3pE1Atm***, ***8pDS1Atm***, ***8pE1Atm***, and ***2pJ6MAtm*** cards.

ATTRIBUTE atmCaDiscardThreshold

Description — This attribute contains the name of threshold for ATM Discard Alarm. The name of thresholds are ***txCellDiscardThreshold***, ***rxCellDiscardThreshold***, ***txFrameDiscardThreshold***, and ***rxFrameDiscardThreshold*** for different service category.

Values — String (0..49, ASCII)

RESPONSE Cannot test card pair ... which is not in a 1:1 or 1+1 sparing configuration running with full equipment protection.

Description — This response is generated when the user provisions a card pair that is not in a 1:1 or 1+1 spared configuration. Cards in 1:1 configuration are also checked for full Equipment Protection support. If the CP is specified, it is checked for hot CP equipment protection support. Card in 1+1 configuration are checked for LAPs sparing or LP group association. Unspared and 1:N spared cards are not supported for REX testing.

ATTRIBUTE invalidCardPair

Description — This is the invalid card pair specified for REX testing.

Values — Decimal (0..15)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE ...

Description — This response is issued during query REX.

ATTRIBUTE responseLastTestResult

Description — This attribute contains all the information about last run REX test.

Values — String (1..1024, ASCII)

ATTRIBUTE responseDowDetails

Description — This attribute contains provisioning details of DayOfWeek sub-components.

Values — String (1..2048, ASCII)

RESPONSE Warning:Packet loss may occur on ... if an Inter-Vr connection is enabled and this Vr is linked to a 2pGeMmSrVsp3 card or a 2pOC3ChSmIrVsp4e card.

Description — A *Check Prov* command generates this response when the *mode* attribute of the *Vm If* component is ***inter-VrConnection***, and this *Vr* is linked to a '***2pGeMmSrVsp3***' card or a '***2pOC3ChSmIrVsp4e***' card.

System action: No action is required from the system.

Operator action: No action is expected from the operator.

ATTRIBUTE lpComponent

Description — This attribute indicates the name of the Lp which linked to VSP3 card

Values — The name of the component

RESPONSE Error: On this card, the value of the attribute perVcQueueLimitReferenceRate must not exceed ....

Description — The check prov generaes this response if the ATM service category perVcQueueLimitReferenceRate is set to a value beyond the value supported on a card.

ATTRIBUTE perVcQLimitRefRate

Description — This contains the maximum value of the ATM service category perVcQueueLimitReferenceRate on a card.

Values — Decimal (0..5651320)

RESPONSE Error:... is not allowed on this Virtual Router

Description — The *Check Prov* command produces this response when a protocol which is permitted only on the Management Virtual Router has been added to a Virtual Router whose *managementAccess* attribute is ***disabled***.

ATTRIBUTE invalidProtocol

Description — Indicates the invalid protocol.

Copyright © 2006, Nortel Nortel Confidential

Values String (1..20, ASCII)

RESPONSE Error:Attribute ... under ... must be set.

Description A *check prov* will generate this response if the *attribute* under a link is not set.

System action: The *check prov* command is not accepted until a valid value is provied.

Operator action: Provide a valid value for the attribute under a link.

ATTRIBUTE atmPnniLrbgLinkAttr

Description This attribute contains the numeric identifier of the attribute that should be provisioned.

Values Decimal (0..65535)

ATTRIBUTE atmPnniLrbgLinkName

Description This attribute indicates the component name under which a certain attribute should be provisioned.

Values The name of the component

RESPONSE Error:Attribute ... under ... is different between ... and ....

Description A *check prov* will generate this response if the attribute is different between two links of one group.

System action: The *check prov* command is not accepted until the attribute of all links of one group is same.

Operator action: Make the attribute of all links of one group same.

ATTRIBUTE atmPnniLrbgLinkDiffAttr

Description This attribute contains the numeric identifier of the attribute that is different between two links

Values Decimal (0..65535)

Replication The name of the component

ATTRIBUTE atmPnniLrbgLinkDiffParent

Description This attribute indicates the component name under which a certain attribute should be same.

Values The name of the component

ATTRIBUTE atmPnniLrbgLink1Name

Description This attribute indicates the component name under which a certain attribute should be same.

Copyright © 2006, Nortel Nortel Confidential

Values — The name of the component

ATTRIBUTE atmPnniLrbgLink2Name

Description — This attribute indicates the component name under which a certain attribute should be same.

Values — The name of the component

RESPONSE Error:The attribute ... cannot be set to value .... This value is currently not available.

Description — A *Check Prov* command generates this response if the value specified for the *defaultToneset or toneset* attribute is set to any of the custom values.

System action: The *Check Prov* command fails. No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator Action: Ensure that the *defaultToneset or toneset* attribute is reprovisioned with another value.

ATTRIBUTE invalidAttribute

Description — This attribute contains the toneset attribute which is in error.

Values — Decimal (1..65535)

ATTRIBUTE invalidValue

Description — This attribute contains the actual toneset value entered by the user.

Values —
Custom1
Custom2
Custom3
Custom4
Custom5
Hungary
Norway
Finland
Denmark
Bolivia
SouthAfrica

RESPONSE Warning:Changes to attributes under this component require LCP to reconfigure. A Lock and Unlock of the associated Channel component or ... is required.

Description — The *Check Prov* command generates this response when an attribute is changed which requires LCP to reconfigure in order to use the new value.

System action: A *Check Prov* command passes and the warning is generated. The new value will only be used when LCP configuration occurs.

Operator Action: After the activation is complete perform a *Lock* and then an *Unlock* of the associated *Channel* component or *Ppp/Piwf* component to force LCP to reconfigure.

ATTRIBUTE pppRootLevelComponentType

Description — This attribute represents the root level component that must be locked and unlocked.

Values — The name of the component

RESPONSE Error:This Proposal is identical to ....

Description — A *Check Prov* command produces this response when this *Proposal* is identical to the specified *Proposal*.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: remove one of the identical *Proposal* components.

ATTRIBUTE identicalIpSecProposal

Description — The attribute indicates the identical IpSec *Proposal*.

Values — The name of the component

RESPONSE Error:This policy is identical to ....

Description — A *Check Prov* command produces this response when this *Policy* is identical to the specified *Policy*.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: remove one of the identical *Policy* components.

ATTRIBUTE identicalIkePolicy

Description — The attribute indicates the identical *Policy*.

Values — The name of the component

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:This Proposal is identical to ....

Description — A *Check Prov* command produces this response when this *Proposal* is identical to the specified *Proposal*.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: remove one of the identical *Proposal* components.

ATTRIBUTE identicalIkeProposal

Description — The attribute indicates the identical IKE *Proposal*.

Values — The name of the component

RESPONSE Error:Exceeded maximum number of Vr components.

Description — The *Check Prov* command produces this response when the maximum number of allowable *Vr* components has been exceeded. Delete all *Vr* components which are in excess of the maximum allowed.

System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until a subsequent *Check Prov* completes without errors.

Operator action: Delete *Vr* which are in excess of the maximum allowed

ATTRIBUTE maxAllowedVrs

Description — The maximum number of provisionable *Vr* components.

Values — Decimal (0..65535)

ATTRIBUTE currentProvisionedVrs

Description — The current number of provisioned *Vr* components.

Values — Decimal (0..65535)

RESPONSE Warning:A Delete of the Override subcomponent requires LCP to reconfigure. A Lock and Unlock of the associated Channel component or ... is required.

Description — The *Check Prov* command generates this response when the *Override* component is deleted.

This requires LCP to reconfigure in order to use the default values.

System action: The *Check Prov* command passes, but the default values will only be used when LCP configuration occurs.

Operator Action: After the activation is complete perform a *Lock* and then an *Unlock* of the associated *Channel* component or *Ppp/Piwf* component to force LCP to reconfigure.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE mlpppRootLevelComponentType

Description — This attribute represents the root level component that must be locked and unlocked.

Values — The name of the component

RESPONSE The current view file ... has been corrupted and cannot be committed. Use the -file option and commit a new file.

Description — The *Commit Prov* command generates this response when the current view file which is being committed has been corrupted.

System action: the command fails.
Operator action: retry the command,specifying the -file option.

ATTRIBUTE file

Description — This attribute is the name of the file being committed.

Values — String (1..40, ASCII)

RESPONSE Warning: Reason:Setting the ... attribute as non-blank for the standby CP may cause a card reset.

Description — The *check prov* command produces this response when the *Shelf Card/n configuredProductCode* attribute for the standby CP is provisioned to a non-blank value.

ATTRIBUTE pcsConfProductCodeAttribWarnResp

Description — This attribute specifies the attribute name that is set to a product code.

Values — Decimal (0..4294967295)

RESPONSE Error:Reason: The ... attribute cannot be provisioned to a non-default value which does not match with the inserted product engineering code for the active CP.

Description — The *check prov* command produces this response when the *Shelf Card/n configuredProductCode* attribute for the acive CP is provisioned with a value which does not match with inserted product engineering code.

ATTRIBUTE pcsConfProductCodeAttribErrResp

Description — This attribute specifies the attribute name that is set to an erroneous product code.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Error:Setting attribute ... is not allowed.

Description

A *set command* generates this response if any of the attributes *tone1CustomValue, tone2CustomValue, tone3CustomValue, tone4CustomValue* and *tone5CustomValue* is set to any value.

System action: The *set command* command fails. No *Activate* command will be accepted until a subsequent *Check Prov* command completes without errors.

Operator Action: Ensure that the attributes *tone1CustomValue, tone2CustomValue, tone3CustomValue, tone4CustomValue* and *tone5CustomValue* are not set to any value.

ATTRIBUTE customTonesetAttribute

Description — This attribute contains the custom tone value which cannot be set.

Values — Decimal (1..65535)

RESPONSE Hop ...: ... (time = ...)

Description — The ping command generates this response for each successful hop detected while performing a traceroute.

ATTRIBUTE ipAddr

Description — This attribute indicates the IP address of the remote host.

Values — IP address

ATTRIBUTE time

Description — This attribute indicates the round trip time of a ICMP ECHO request.

Values — Decimal (0..4294967295)

ATTRIBUTE hopno

Description — This attribute indicates the current hop number.

Values — Decimal (0..4294967295)

RESPONSE Hop ...: (failed)

Description — The ping command generates this response for each hop not responding while performing a traceroute.

ATTRIBUTE hopno

Description — This attribute indicates the current hop number.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

RESPONSE Ip Trace Route for ...:Path Taken:

Description — The *Ping* command generates this response to indicate that the traceroute to the specified IP address was successful and will be followed by the hop list.

ATTRIBUTE ipAddr

Description — This attribute indicates the IP address of the remote host.

Values — IP address

RESPONSE Destination ... is not responding after ... attempt(s).

Description — The *Ping* command generates this response to indicate that the ping to the specified IP address was unsuccessful because the host failed to reply with a valid ICMP response within 5 seconds.

ATTRIBUTE ipAddr

Description — This attribute indicates the IP address of the remote host.

Values — IP address

ATTRIBUTE retry

Description — This attribute indicates the number of attempts taken to ping a host.

Values — Decimal (0..4294967295)

RESPONSE Error:Attribute ... localHostDeviceTopology is set to a value other than layer3 and requires that attribute ... losDuringMigration be set to disabled.

Description

A *Check Porv* command generates this response when attribute ‘Vr custSpec localHostDeviceTopology’ is set to a value other than layer3 while its associated ‘Ip ethernet losDuringMigration’ is set to enabled.

System action: An *Activate Prov* command will not be accepted until a subsequent check completes without errors.

Operator Action: Set attributes ‘losDuringMigration’ and Vr CustSpeclosDuringMigration to the correct values or set attribute ‘losDuringMigration’ to disabled and delete attribute Vr CustSpec.

ATTRIBUTE vrComponentName

Description — This attribute represents Vr custSpec localHostDeviceTopology that is associated with this Ip ethernet.

Values — The name of the component

ATTRIBUTE IpEthernetComponentName

Description — This attribute represents the Ip ethernet component of the losDuringMigration attribute.

Copyright © 2006, Nortel Nortel Confidential

Values The name of the component

RESPONSE Error:Attribute ... localHostDeviceTopologyis set to layer3 and requires that the attribute ... losDuringMigration be set to enabled.

Description

A *Check Porv* command generates this response when attribute 'Vr custSpec localHostDeviceTopology' is set to layer3 while its associated 'Ip ethernet losDuringMigration' is set to disabled.

System action: An *Activate Prov* command will not be accepted until a subsequent check completes without errors.

Operator Action: Set attributes 'losDuringMigration' and 'Vr CustSpeclosDuringMigration' to the correct values or set attribute 'losDuringMigration' to disabled and delete attribute 'Vr CustSpec'.

ATTRIBUTE vrComponentName

Description This attribute represents Vr custSpec localHostDeviceTopology that is associated with this Ip ethernet.

Values The name of the component

ATTRIBUTE IpEthernetComponentName

Description This attribute represents the Ip ethernet component of the losDuringMigration attribute.

Values The name of the component

RESPONSE Error:Attribute ... losDuringMigration is set to a value of enabledand requires that the attribute ... customizationType be set topvg.

Description

A *Check Porv* command generates this response when attribute 'losDuringMigration' is set to enabled when its associated 'Vr custSpec customizationType' attribute is not provisioned to PVG.

System action: An *Activate Prov* command will not be accepted until a subsequent check completes without errors.

Operator Action: Set attributes 'losDuringMigration' and 'Vr CustSpec customizationType' to the correct values or set attribute 'losDuringMigration' to disabled and delete attribute 'Vr CustSpec'.

ATTRIBUTE vrComponentName

Description This attribute represents Vr custSpec localHostDeviceTopology that is associated with this Ip ethernet.

Values The name of the component

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE lpEthernetComponentName

Description	This attribute represents the lp ethernet component of the losDuringMigration attribute.
Values	The name of the component

RESPONSE Error: The value of the attribute cacheTableSize cannot be more than ... for Lp/0.

Description	The *Check Prov* command produces this response when the value of the attribute *cacheTableSize* for *Lp/0* under a *Router*/*Router Vrf* is greater than ***500***. System action: The *Check Prov* command fails. No *Activate Prov* command is accepted until the value of the attribute *cacheTableSize* for *Lp/0* under a *Router*/*Router Vrf* is set less than or equal to 500. Operator action: Ensure that the value of the attribute *cacheTableSize* for *Lp/0* under a *Router/Router Vrf* is set less than or equal to ***500***.

ATTRIBUTE maxIpCpCacheSize

Description	This attribute contains the maximum cache table size allowed on the Cp.
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

Collected Statistics

COLLECTED STATS Router VpnRouteForwarder Interface IngressServices MeterStatistics

Description	The statistics record generated by the Router VpnRouteForwarder Interface IngressServices MeterStatistics component.

ATTRIBUTE Rtr Vrf If IS Meter **committedInformationRate (cir)**

Description	This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions. The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..600000000)

ATTRIBUTE Rtr Vrf If IS Meter **excessInformationRate (eir)**

Description	This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information. The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.
Values	Decimal (0..50000000)

ATTRIBUTE Rtr Vrf If IS Meter **committedBurstSize (bc)**

Description	This attribute indicates the committed burst size (bc) in bits for the *Meter*. The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..600000000)

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE Rtr Vrf If IS Meter **excessBurstSize (be)**

Description	This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..50000000)

ATTRIBUTE Rtr Vrf If IS Meter **measurmentInterval (t)**

Description	This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*. The value of this attribute is derived from the provisioned *cir* and *bc* attributes values when both of those attributes are non-zero (t=*bc/cir*); otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.
Values	Decimal (0..4294967295)

ATTRIBUTE Rtr Vrf If IS Meter **packetsReceived**

Description	This attribute indicates the number of packets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess.
Values	Long Integer

ATTRIBUTE Rtr Vrf If IS Meter **octetsReceived**

Description	This attribute indicates the number of octets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess
Values	Long Integer

ATTRIBUTE Rtr Vrf If IS Meter **eirPacketsReceived (excessPackets)**

Description	This attribute indicates the number of packets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.
Values	Long Integer

ATTRIBUTE Rtr Vrf If IS Meter **eirOctetsReceived (excessOctets)**

Description	This attribute indicates the number of octets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.
Values	Long Integer

ATTRIBUTE Rtr Vrf If IS Meter **packetsRemarked**

Description	This attribute indicates the number of packets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE Rtr Vrf If IS Meter octetsRemarked

Description This attribute indicates the number of octets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr Vrf If IS Meter packetsDiscarded

Description This attribute indicates the number of packets discarded by the traffic meter during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr Vrf If IS Meter octetsDiscarded

Description This attribute indicates the number of octets discarded by the traffic meter during the prior statistics collection interval. .

Values Long Integer

COLLECTED STATS Router VpnRouteForwarder Interface EgressServices MeterStatistics

Description The statistics record generated by the Router VpnRouteForwarder Interface EgressServices MeterStatistics component.

ATTRIBUTE Rtr Vrf If ES Meter committedInformationRate (cir)

Description This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions.
The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values Decimal (0..600000000)

ATTRIBUTE Rtr Vrf If ES Meter excessInformationRate (eir)

Description This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information.

The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.

Values Decimal (0..50000000)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf If ES Meter **committedBurstSize (bc)**

Description — This attribute indicates the committed burst size (bc) in bits for the *Meter*. The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..600000000)

ATTRIBUTE Rtr Vrf If ES Meter **excessBurstSize (be)**

Description — This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..50000000)

ATTRIBUTE Rtr Vrf If ES Meter **measurmentInterval (t)**

Description — This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*.
The value of this attribute is derived from the provisioned *cir* and *bc* attributes values when both of those attributes are non-zero (t=*bc/cir*); otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.

Values — Decimal (0..4294967295)

ATTRIBUTE Rtr Vrf If ES Meter **packetsReceived**

Description — This attribute indicates the number of packets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess.

Values — Long Integer

ATTRIBUTE Rtr Vrf If ES Meter **octetsReceived**

Description — This attribute indicates the number of octets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess

Values — Long Integer

ATTRIBUTE Rtr Vrf If ES Meter **eirPacketsReceived (excessPackets)**

Description — This attribute indicates the number of packets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Rtr Vrf If ES Meter **eirOctetsReceived (excessOctets)**

Description — This attribute indicates the number of octets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE Rtr Vrf If ES Meter packetsRemarked

Description This attribute indicates the number of packets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr Vrf If ES Meter octetsRemarked

Description This attribute indicates the number of octets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr Vrf If ES Meter packetsDiscarded

Description This attribute indicates the number of packets discarded by the traffic meter during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr Vrf If ES Meter octetsDiscarded

Description This attribute indicates the number of octets discarded by the traffic meter during the prior statistics collection interval. .

Values Long Integer

COLLECTED STATS Router VpnRouteForwarder ControlPlaneProtection

Description The statistics record generated by the Router VpnRouteForwarder ControlPlaneProtection component.

ATTRIBUTE Rtr Vrf Cpp isolatedDa

Description This attribute indicates the ip address of the isolated locally destined DA.

Values IP address

ATTRIBUTE Rtr Vrf Cpp isolatedLp

Description This attribute indicates the LP number on which the locally destined address is being isolated.

Values Decimal (0..15)

ATTRIBUTE Rtr Vrf Cpp isolatedCounts

Description This attribute indicates the number of counts that the isolated DA encountered during the last 15 minutes.

Values Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Cpp **averageFlowRate**

Description — This attribute indicates the average flow rate of the isolated DA during the isolation period.

Values — Decimal (0..65535)

COLLECTED STATS Router Interface IngressServices MeterStatistics

Description — The statistics record generated by the Router Interface IngressServices MeterStatistics component.

ATTRIBUTE Rtr If IS Meter **committedInformationRate (cir)**

Description — This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions.
The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..600000000)

ATTRIBUTE Rtr If IS Meter **excessInformationRate (eir)**

Description — This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information.

The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.

Values — Decimal (0..50000000)

ATTRIBUTE Rtr If IS Meter **committedBurstSize (bc)**

Description — This attribute indicates the committed burst size (bc) in bits for the *Meter*. The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..600000000)

ATTRIBUTE Rtr If IS Meter **excessBurstSize (be)**

Description — This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..50000000)

ATTRIBUTE Rtr If IS Meter **measurmentInterval (t)**

Description — This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*.

Description	This attribute indicates an average processor utilization level over a the specified collection interval. This average is calculated based on one minute CPU utilization averages.
Values	Decimal (0..100)
Units	%

ATTRIBUTE Lp cpuUtilAvgMin

Description	This attribute indicates the minimum processor utilization level over a specified collection interval. This is calculated based on one minute CPU utilization averages.
Values	Decimal (0..100)
Units	%

ATTRIBUTE Lp cpuUtilAvgMax

Description	This attribute indicates the maximum processor utilization level over a specified collection interval. This is based on one minute CPU utilization averages.
Values	Decimal (0..100)
Units	%

ATTRIBUTE Lp memoryCapacity

Description	This attribute indicates the processor's memory capacity for each type of memory.
Vector of	Decimal (0..2147483647)
Units	kbyte
Index	fastRam normalRam sharedRam

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp memoryUsageAvg

Description	This attribute indicates the processor's average memory utilization for each type of memory in the specified collection interval. This is calculated using 15 second samples.
Vector of	Decimal (0..2147483647)
Units	kbyte
Index	fastRam normalRam sharedRam

ATTRIBUTE Lp memoryUsageAvgMin

Description	This attribute indicates the processor's minimum memory utilization for each type of memory in the specified collection interval. This is calculated using 15 second samples.
Vector of	Decimal (0..2147483647)
Units	kbyte
Index	fastRam normalRam sharedRam

ATTRIBUTE Lp memoryUsageAvgMax

Description	This attribute indicates the processor's maximum memory utilization for each type of memory in the specified collection interval. This is calculated using 15 second samples.
Vector of	Decimal (0..2147483647)
Units	kbyte
Index	fastRam normalRam sharedRam

ATTRIBUTE Lp sharedMsgBlockCapacity

Description	This attribute indicates the processor's shared message block memory capacity.
Values	Decimal (0..2147483647)
Units	kbyte

ATTRIBUTE Lp sharedMsgBlockUsageAvg

Description	This attribute indicates the processor's average shared message block memory utilization over a specified collection interval. This is calculated using 15 second samples.
Values	Decimal (0..2147483647)

Copyright © 2006, Nortel Nortel Confidential

Units	kbyte

ATTRIBUTE Lp sharedMsgBlockUsageAvgMin

Description	This attribute indicates the processor's minimum shared message block memory utilization over a specified collection interval. This is calculated using 15 second samples.
Values	Decimal (0..2147483647)
Units	kbyte

ATTRIBUTE Lp sharedMsgBlockUsageAvgMax

Description	This attribute indicates the processor's maximum shared message block memory utilization over a specified collection interval. This is calculated using 15 second samples.
Values	Decimal (0..2147483647)
Units	kbyte

ATTRIBUTE Lp localMsgBlockCapacity

Description	This attribute indicates the processor's local message block memory capacity. These message blocks are used for local messaging on the card.
Values	Decimal (0..2147483647)
Units	kbyte

ATTRIBUTE Lp localMsgBlockUsageAvg

Description	This attribute indicates the processor's average memory utilization of message blocks used for local messaging on the card, calculated over a specified collection interval. This is calculated using 15 second samples.
Values	Decimal (0..2147483647)
Units	kbyte

ATTRIBUTE Lp localMsgBlockUsageMin

Description	This attribute indicates the processor's minimum memory utilization of message blocks used for local messaging on the card, calculated over a specified collection interval.
Values	Decimal (0..2147483647)
Units	kbyte

ATTRIBUTE Lp localMsgBlockUsageMax

Description	This attribute indicates the processor's maximum memory utilization of message blocks used for local messaging on the card, calculated over a specified collection interval.
Values	Decimal (0..2147483647)

Units kbyte

COLLECTED STATS LogicalProcessor PCUServicesProcessor ProcessingModule ProcessingBlock

Description The statistics record generated by the LogicalProcessor PCUServicesProcessor ProcessingModule ProcessingBlock component.

ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilAvg (avg)

Description This attribute indicates the average PBlock CPU load during the statistics collection interval.

Values Decimal (0..100)

Units %

ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilMin (min)

Description This attribute indicates the minimum PBlock CPU load during the statistics collection interval.

Values Decimal (0..100)

Units %

ATTRIBUTE Lp Pcusp PModule PBlock cpuPBlockUtilMax (max)

Description This attribute indicates the maximum PBlock CPU load during the statistics collection interval.

Values Decimal (0..100)

Units %

COLLECTED STATS Collector

Description The statistics record generated by the Collector component.

ATTRIBUTE Col oldDateTime

Description This attribute shows the old date/time immediately prior to the time change.

Values Time (DHMS)

ATTRIBUTE Col newDateTime

Description This attribute shows the new date/time immediately after the time change.

Values Time (DHMS)

Copyright © 2006, Nortel Nortel Confidential

COLLECTED STATS VoiceNetworkingCallServer

Description	The statistics record generated by the VoiceNetworkingCallServer component.

ATTRIBUTE Vncs totalTranslations

Description	This spooled statistic counts the number of translation requests received by *Vncs* in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Vncs completeTranslations

Description	This spooled statistic counts the number of completed translations handled under each *DiallingPlan* component in the last statistics collection interval. The complete translations are the one that resulted in the return by VNCS server of the reply message with the routing information and *VoiceProfile* parameters associated with the directory number prefix supplied in the translation request message.
Vector of	Decimal (0..65535)
Index	Decimal (0..2)

ATTRIBUTE Vncs incompleteTranslations

Description	This spooled statistic counts the number of incomplete translations handled under each *DiallingPlan* component in the last statistics collection interval. The incomplete translations are the one that require more digits in the directory number prefix to uniquely identify routing attributes.
Vector of	Decimal (0..65535)
Index	Decimal (0..2)

ATTRIBUTE Vncs failedTranslations

Description	This spooled statistic counts the number of failed translations handled under this *DiallingPlan* component in the last statistics collection interval. The failed translations are the one for which the directory number prefix could not be found in the database.
Vector of	Decimal (0..65535)
Index	Decimal (0..2)

ATTRIBUTE Vncs usageCount

Description	This spooled statistic counts the number of times each *VoiceProfile* useage count is accessed to set up a connection in the last statistics collection interval.
Vector of	Decimal (0..65535)
Index	Decimal (1..64)

COLLECTED STATS Trunk

Description — The statistics record generated by the Trunk component.

ATTRIBUTE Trk remoteComponentName (remote)

Description — This attribute is the component name of the remote end which it has supplied through the *Trunk* staging protocol.

Values — String (1..26, ASCII)

ATTRIBUTE Trk measuredSpeedTolfMax

Description — This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown.

Values — Decimal (0..4294967295)

ATTRIBUTE Trk measuredSpeedTolfMin

Description — This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown.

Values — Decimal (0..4294967295)

ATTRIBUTE Trk measuredSpeedTolfCurrent

Description — This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown.

Values — Decimal (0..4294967295)

ATTRIBUTE Trk measuredRoundTripDelayMax

Description — This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown.

Values — Decimal (0..1500)

ATTRIBUTE Trk measuredRoundTripDelayMin

Description — This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown.

Values — Decimal (0..1500)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk measuredRoundTripDelayCurrent

Description — This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* staging protocols. A value of zero is provided when the link is disabled or the delay is unknown.

Values — Decimal (0..1500)

ATTRIBUTE Trk porsNormPktFromIf (normPkt)

Description — This attribute counts the number of normal priority packets received on the PORS *Trunk* normal priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsNormDiscUnforwardFromIf (normDisc)

Description — This attribute counts the number of normal priority packets discarded from the PORS *Trunk* normal priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsNormOctetFromIf (normOctet)

Description — This attribute counts the number of normal priority bytes received on the PORS *Trunk* normal priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsIntPktFromIf (intPkt)

Description — This attribute counts the number of interrupting priority packets received on the PORS *Trunk* interrupting priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsIntDiscUnforwardFromIf (intDisc)

Description — This attribute counts the number of interrupting priority packets discarded from the PORS *Trunk* interrupting priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk porsIntOctetFromIf (intOctets)

Description — This attribute counts the number of interrupting priority bytes received on the PORS *Trunk* interrupting priority queue in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE Trk remoteComponentName (remote)

Description — This attribute is the component name of the remote end which it has supplied through the *Trunk* or *DpnGateway* staging protocol.

Copyright © 2006, Nortel Nortel Confidential

Values String (1..26, ASCII)

ATTRIBUTE Trk measuredSpeedToIfMax

Description This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown.

Values Decimal (0..4294967295)

ATTRIBUTE Trk measuredSpeedToIfMin

Description This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown.

Values Decimal (0..4294967295)

ATTRIBUTE Trk measuredSpeedToIfCurrent

Description This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown.

Values Decimal (0..4294967295)

ATTRIBUTE Trk measuredRoundTripDelayMax

Description This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown.

Values Decimal (0..1500)

ATTRIBUTE Trk measuredRoundTripDelayMin

Description This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown.

Values Decimal (0..1500)

ATTRIBUTE Trk measuredRoundTripDelayCurrent

Description This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled or the delay is unknown.

Values Decimal (0..1500)

ATTRIBUTE Trk fwdPktFromIf (fwdPkt)

Description This attribute counts the number of forwarding packets received on the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk fwdDiscUnforwardFromIf (fwdDisc)

Description: This attribute counts the number of forwarding packets discarded by the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values: Long Integer

ATTRIBUTE Trk fwdOctetFromIf (fwdOctet)

Description: This attribute counts the number of forwarding bytes received on the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values: Long Integer

ATTRIBUTE Trk dprsPktFromIfByPrio (dprsPktBp)

Description: This attribute counts the number of DPRS packets received by the Trunk in the last statistics collection interval. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*.

Array of: Long Integer

Row: ep [ep0
ep1
ep2]

Column: dp [dp0
dp1
dp2
dp3]

ATTRIBUTE Trk dprsDiscPktFromIfByPrio (dprsDiscBp)

Description: This attribute counts the number of DPRS packets received and discarded by the Trunk in the last statistics collection interval. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*.

Array of: Long Integer

Row: ep [ep0
ep1
ep2]

Column: dp [dp0
dp1
dp2
dp3]

ATTRIBUTE Trk dprsOctetFromIfByPrio (dprsOctBp)

Description: This attribute counts the number of DPRS octets received by the Trunk in the last statistics collection interval. It is an array indexed by the emission

Copyright © 2006, Nortel Nortel Confidential

priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*.

Array of	Long Integer	
Row	ep ep1 ep2]	[ep0
Column	dp dp1 dp2 dp3]	[dp0

ATTRIBUTE Trk porsPktFromIfByPrio (porsPktBp)

Description: This attribute counts the number of PORS packets received by the Trunk in the last statistics collection interval. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*.

Array of	Long Integer	
Row	ep ep1 ep2]	[ep0
Column	dp dp1 dp2 dp3]	[dp0

ATTRIBUTE Trk porsDiscPktFromIfByPrio (porsDiscBp)

Description: This attribute counts the number of PORS packets received and discarded by the Trunk in the last statistics collection interval. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*.

Array of	Long Integer	
Row	ep ep1 ep2]	[ep0
Column	dp dp1 dp2 dp3]	[dp0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk porsOctetFromIfByPrio (porsOctBp)

Description	This attribute counts the number of PORS octets received by the Trunk in the last statistics collection interval. It is an array indexed by the emission priorities (*ep0*, *ep1* and *ep2*) and discard priorities (*dp0*, *dp1*, *dp2* and *dp3*) of the packets. The highest emission priority is *ep0* and the least discardable priority is *dp0*.
Array of	Long Integer
Row	ep [ep0 ep1 ep2]
Column	dp [dp0 dp1 dp2 dp3]

COLLECTED STATS Trunk UnAcked Framer

Description	The statistics record generated by the Trunk UnAcked Framer component.

ATTRIBUTE Trk UnAcked Framer rxBytes

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk UnAcked Framer rxFrames

Description	This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk UnAcked Framer txBytes

Description	This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE Trk UnAcked Framer txFrames

Description	This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk UnAcked Framer **rxTotalLinkUtil**

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS Trunk AtmAccess

Description — The statistics record generated by the Trunk AtmAccess component.

ATTRIBUTE Trk Atm **interfaceName (interface)**

Description — This attribute indicates the component name of the local ATM Layer 2 AAL5 interface that the *AtmAccess* component uses.

Values — String (1..45, ASCII)

ATTRIBUTE Trk Atm **txCell**

Description — This attribute counts the number of cells that have been transmitted to the interface on the *Vcc* in the last collection interval.

Values — Long Integer

Units — cells

ATTRIBUTE Trk Atm **txCellClp**

Description — This attribute counts the number of cells that have been transmitted to the interface on the *Vcc* with the CLP=1 in the last collection interval.

Values — Long Integer

Units — cells

ATTRIBUTE Trk Atm **txDiscard**

Description — This attribute counts the number of cells or frames received from the bus on the *Vcc* that have been discarded (due to congestion or when the *Vcc* interface is disabled) in the last collection interval.

Values — Long Integer

ATTRIBUTE Trk Atm **txDiscardClp**

Description — This attribute counts the number of cells or frames received from the bus on the *Vcc* with the CLP=1 that have been discarded (due to congestion or when the *Vcc* interface is disabled) in the last collection interval.

Values — Long Integer

ATTRIBUTE Trk Atm **rxCell**

Description — This attribute counts the number of cells that have been received from the interface on the *Vcc* in the last collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Units	cells

ATTRIBUTE Trk Atm rxCellClp

Description	This attribute counts the number of cells that have been received from the interface on the *Vcc* with the CLP=1 in the last collection interval.
Values	Long Integer
Units	cells

ATTRIBUTE Trk Atm rxDiscard

Description	This attribute counts the number of cells or frames received from the interface on the *Vcc* that have been discarded (due to congestion, non-conformance with UPC or AAL reassembly problems) in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk Atm rxDiscardClp

Description	This attribute counts the number of cells or frames received from the interface on the *Vcc* with the CLP=1 that have been discarded (due to congestion, non-conformance with UPC or AAL reassembly problems) in the last collection interval.
Values	Long Integer

ATTRIBUTE Trk Atm txCellRateMax

Description	This attribute indicates the maximum transmit cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txCellRateMin

Description	This attribute indicates the minimum transmit cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txCellRateAvg

Description	This attribute indicates the average transmit cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Trk Atm txClpCellRateMax

Description	This attribute indicates the maximum transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txClpCellRateMin

Description	This attribute indicates the minimum transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm txClpCellRateAvg

Description	This attribute indicates the average transmit cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxCellRateMax

Description	This attribute indicates the maximum receive cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxCellRateMin

Description	This attribute indicates the minimum receive cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxCellRateAvg

Description	This attribute indicates the average receive cell throughput rate of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxClpCellRateMax

Description	This attribute indicates the maximum receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxClpCellRateMin

Description	This attribute indicates the minimum receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxClpCellRateAvg

Description	This attribute indicates the average receive cell throughput rate with the CLP=1 of the *Vcc* in the last collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Trk Atm rxTotalVccUtil

Description	This attribute indicates the average total receive *Vcc* utilization computed based on comparing the total number of cells received on the *Vcc* with the estimated available bandwidth in the last collection interval.
Values	Decimal (0..200)
Units	%

ATTRIBUTE Trk Atm txTotalVccUtil

Description	This attribute indicates the average total transmitted *Vcc* utilization computed based on comparing the total number of cells transmitted on the *Vcc* with the estimated available bandwidth in the last collection interval.
Values	Decimal (0..200)
Units	%

COLLECTED STATS DpnGateway

Description	The statistics record generated by the DpnGateway component.

ATTRIBUTE DpnGate remoteComponentName (remote)

Description	This attribute is the component name of the remote end which it has supplied through the *Trunk* or *DpnGateway* staging protocol.
Values	String (1..26, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate measuredSpeedToIfMax

Description — This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown.

Values — Decimal (0..4294967295)

ATTRIBUTE DpnGate measuredSpeedToIfMin

Description — This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown.

Values — Decimal (0..4294967295)

ATTRIBUTE DpnGate measuredSpeedToIfCurrent

Description — This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown.

Values — Decimal (0..4294967295)

ATTRIBUTE DpnGate measuredRoundTripDelayMax

Description — This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown.

Values — Decimal (0..1500)

ATTRIBUTE DpnGate measuredRoundTripDelayMin

Description — This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown.

Values — Decimal (0..1500)

ATTRIBUTE DpnGate measuredRoundTripDelayCurrent

Description — This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled or the delay is unknown.

Values — Decimal (0..1500)

ATTRIBUTE DpnGate fwdPktFromIf (fwdPkt)

Description — This attribute counts the number of forwarding packets received on the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate fwdDiscUnforwardFromIf (fwdDisc)

Description — This attribute counts the number of forwarding packets discarded by the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values — Long Integer

ATTRIBUTE DpnGate fwdOctetFromIf (fwdOctet)

Description — This attribute counts the number of forwarding bytes received on the *Trunk* or *DpnGateway* in the last statistics collection interval.

Values — Long Integer

COLLECTED STATS DpnGateway Utp Framer

Description — The statistics record generated by the DpnGateway Utp Framer component.

ATTRIBUTE DpnGate Utp Framer rxBytes

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DpnGate Utp Framer rxFrames

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DpnGate Utp Framer txBytes

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DpnGate Utp Framer txFrames

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DpnGate Utp Framer rxTotalLinkUtil

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

Copyright © 2006, Nortel Nortel Confidential

COLLECTED STATS FrameRelayNni Framer

Description The statistics record generated by the FrameRelayNni Framer component.

ATTRIBUTE FrNni Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE FrNni Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE FrNni Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE FrNni Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE FrNni Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COLLECTED STATS FrameRelayUni Framer

Description The statistics record generated by the FrameRelayUni Framer component.

ATTRIBUTE FrUni Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE FrUni Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE FrUni Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE FrUni Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE FrUni Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COLLECTED STATS FrameRelayAtmInterface Framer

Description The statistics record generated by the FrameRelayAtmInterface Framer component.

ATTRIBUTE FrAtm Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE FrAtm Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE FrAtm Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE FrAtm Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE FrAtm Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COLLECTED STATS VoiceService Framer

Description The statistics record generated by the VoiceService Framer component.

ATTRIBUTE Vs Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE Vs Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE Vs Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE Vs Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE Vs Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COLLECTED STATS BitTransparentDataService Framer

Description The statistics record generated by the BitTransparentDataService Framer component.

ATTRIBUTE Btds Framer rxBytes

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Btds Framer rxFrames

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Btds Framer txBytes

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Btds Framer txFrames

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Btds Framer rxTotalLinkUtil

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS HdlcTransparentDataService Framer

Description — The statistics record generated by the HdlcTransparentDataService Framer component.

ATTRIBUTE Htds Framer rxBytes

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Htds Framer rxFrames

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Htds Framer **txBytes**

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Htds Framer **txFrames**

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Htds Framer **rxTotalLinkUtil**

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS X25Dte Lapb Framer

Description — The statistics record generated by the X25Dte Lapb Framer component.

ATTRIBUTE X25Dte Lapb Framer **rxBytes**

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE X25Dte Lapb Framer **rxFrames**

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE X25Dte Lapb Framer **txBytes**

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE X25Dte Lapb Framer **txFrames**

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE X25Dte Lapb Framer **rxTotalLinkUtil**

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS VirtualRouter ProtocolPort IpPort IngressServices MeterStatistics

Description — The statistics record generated by the VirtualRouter ProtocolPort IpPort IngressServices MeterStatistics component.

ATTRIBUTE Vr Pp IpPort IS Meter **committedInformationRate (cir)**

Description — This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions.
The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..600000000)

ATTRIBUTE Vr Pp IpPort IS Meter **excessInformationRate (eir)**

Description — This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information.

The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.

Values — Decimal (0..50000000)

ATTRIBUTE Vr Pp IpPort IS Meter **committedBurstSize (bc)**

Description — This attribute indicates the committed burst size (bc) in bits for the *Meter*.
The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..600000000)

ATTRIBUTE Vr Pp IpPort IS Meter **excessBurstSize (be)**

Description — This attribute indicates the excess burst size (be) in bits for the *Meter*.
The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values — Decimal (0..50000000)

ATTRIBUTE Vr Pp IpPort IS Meter **measurmentInterval (t)**

Description — This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*.
The value of this attribute is derived from the provisioned *cir* and *bc*

Copyright © 2006, Nortel Nortel Confidential

attributes values when both of those attributes are non-zero (t=*bc/cir*); otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.

Values — Decimal (0..4294967295)

ATTRIBUTE Vr Pp IpPort IS Meter **packetsReceived**

Description — This attribute indicates the number of packets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess.

Values — Long Integer

ATTRIBUTE Vr Pp IpPort IS Meter **octetsReceived**

Description — This attribute indicates the number of octets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess

Values — Long Integer

ATTRIBUTE Vr Pp IpPort IS Meter **eirPacketsReceived (excessPackets)**

Description — This attribute indicates the number of packets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Vr Pp IpPort IS Meter **eirOctetsReceived (excessOctets)**

Description — This attribute indicates the number of octets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Vr Pp IpPort IS Meter **packetsRemarked**

Description — This attribute indicates the number of packets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Vr Pp IpPort IS Meter **octetsRemarked**

Description — This attribute indicates the number of octets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Vr Pp IpPort IS Meter **packetsDiscarded**

Description — This attribute indicates the number of packets discarded by the traffic meter during the prior statistics collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE Vr Pp IpPort IS Meter **octetsDiscarded**

Description This attribute indicates the number of octets discarded by the traffic meter during the prior statistics collection interval. .

Values Long Integer

COLLECTED STATS VirtualRouter ProtocolPort IpPort EgressServices MeterStatistics

Description The statistics record generated by the VirtualRouter ProtocolPort IpPort EgressServices MeterStatistics component.

ATTRIBUTE Vr Pp IpPort ES Meter **committedInformationRate (cir)**

Description This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions.
The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values Decimal (0..600000000)

ATTRIBUTE Vr Pp IpPort ES Meter **excessInformationRate (eir)**

Description This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information.

The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.

Values Decimal (0..50000000)

ATTRIBUTE Vr Pp IpPort ES Meter **committedBurstSize (bc)**

Description This attribute indicates the committed burst size (bc) in bits for the *Meter*. The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values Decimal (0..600000000)

ATTRIBUTE Vr Pp IpPort ES Meter **excessBurstSize (be)**

Description This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Values Decimal (0..50000000)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Pp IpPort ES Meter **measurmentInterval (t)**

Description — This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*.
The value of this attribute is derived from the provisioned *cir* and *bc* attributes values when both of those attributes are non-zero (t=*bc/cir*); otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.

Values — Decimal (0..4294967295)

Values Long Integer

ATTRIBUTE Vr Pp IpPort ES Meter packetsDiscarded

Description This attribute indicates the number of packets discarded by the traffic meter during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Vr Pp IpPort ES Meter octetsDiscarded

Description This attribute indicates the number of octets discarded by the traffic meter during the prior statistics collection interval. .

Values Long Integer

COLLECTED STATS VirtualRouter Ip ControlPlaneProtection

Description The statistics record generated by the VirtualRouter Ip ControlPlaneProtection component.

ATTRIBUTE Vr Ip Cpp isolatedDa

Description This attribute indicates the ip address of the isolated locally destined DA.

Values IP address

ATTRIBUTE Vr Ip Cpp isolatedLp

Description This attribute indicates the LP number on which the locally destined address is being isolated.

Values Decimal (0..15)

ATTRIBUTE Vr Ip Cpp isolatedCounts

Description This attribute indicates the number of counts that the isolated DA encountered during the last 15 minutes.

Values Decimal (0..65535)

ATTRIBUTE Vr Ip Cpp averageFlowRate

Description This attribute indicates the average flow rate of the isolated DA during the isolation period.

Values Decimal (0..65535)

COLLECTED STATS VirtualRouter Ip Rtd

Description The statistics record generated by the VirtualRouter Ip Rtd component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Rtd localNodeIdentifier

Description	This attribute identifies the node by a unique number assigned to each node. This value is provisioned in the attribute *namsId* of the component *ModuleData*.
Values	Decimal (256..49151)

ATTRIBUTE Vr Ip Rtd ipVcgInstance

Description	This attribute indicates which VCG VR generated the statistics record
Values	String (1..16, ASCII)

ATTRIBUTE Vr Ip Rtd localVcgIpAddress

Description	This attribute indicates the VCG loopback IP address of the VCG VR that generated the statistics record.
Values	IP address

ATTRIBUTE Vr Ip Rtd remoteVcgIpAddress

Description	This attribute indicates the remote VCG destination address that will have the delays measured.
Values	IP address

ATTRIBUTE Vr Ip Rtd framesSent

Description	This attribute contains the number of frames transmitted by the *Virtual Carrier Gateway* during the latest interval.
Vector of	Decimal (1..5)
Index	Decimal (0..3)

ATTRIBUTE Vr Ip Rtd framesReceived

Description	This attribute contains the number of frames received by the *Virtual Carrier Gateway during* the collection interval.
Vector of	Decimal (1..5)
Index	Decimal (0..3)

ATTRIBUTE Vr Ip Rtd sample1StartTime

Description	This attribute represents the timestamp when the first sample was sent to this remote *Virtual Carrier Gateway.*
Values	Time (DHMS)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Rtd RoundTripDelays1

Description	This attribute indicates an array of round trip delays for the first sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3).
Vector of	Decimal (0..65535)
Index	Decimal (0..3)

ATTRIBUTE Vr Ip Rtd sample2StartTime

Description	This attribute represents the timestamp when the second sample of packets was sent to this remote *Virtual Carrier Gateway.*
Values	Time (DHMS)

ATTRIBUTE Vr Ip Rtd RoundTripDelay2

Description	This attribute indicates an array of round trip delays for the second sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3)
Vector of	Decimal (0..65535)
Index	Decimal (0..3)

ATTRIBUTE Vr Ip Rtd sample3StartTime

Description	This attribute represents the timestamp when the third sample of packets was sent to this remote *Virtual Carrier Gateway.*
Values	Time (DHMS)

ATTRIBUTE Vr Ip Rtd RoundTripDelay3

Description	This attribute indicates an array of round trip delays for the third sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3)
Vector of	Decimal (0..65535)
Index	Decimal (0..3)

ATTRIBUTE Vr Ip Rtd sample4StartTime

Description	This attribute represents the timestamp when the fourth sample of packets was sent to this remote *Virtual Carrier Gateway.*
Values	Time (DHMS)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vr Ip Rtd RoundTripDelay4

Description	This attribute indicates an array of round trip delays for the fourth sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3).
Vector of	Decimal (0..65535)
Index	Decimal (0..3)

ATTRIBUTE Vr Ip Rtd sample5StartTime

Description	This attribute represents the timestamp when the fifth sample of packets was sent to this remote *Virtual Carrier Gateway.*
Values	Time (DHMS)

ATTRIBUTE Vr Ip Rtd RoundTripDelay5

Description	This attribute indicates an array of round trip delays for the fifth sample of packets received by the *Virtual Carrier Gateway* during the last monitoring session, for each class of service (0 to 3).
Vector of	Decimal (0..65535)
Index	Decimal (0..3)

COLLECTED STATS PointToPointProtocol Framer

Description	The statistics record generated by the PointToPointProtocol Framer component.

ATTRIBUTE Ppp Framer rxBytes

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Ppp Framer rxFrames

Description	This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Ppp Framer txBytes

Description	This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

Values Decimal (0..100)

COLLECTED STATS FrMux Framer

Description The statistics record generated by the FrMux Framer component.

ATTRIBUTE FrMux Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE FrMux Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE FrMux Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE FrMux Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE FrMux Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COLLECTED STATS AtmInterface

Description The statistics record generated by the AtmInterface component.

ATTRIBUTE AtmIf remoteInstance

Description This attribute indicates the remote ATM interface, as provisioned in the *remoteAtmInterfaceLabel*.

Values String (0..60, ASCII)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf provRate

Description	This attribute indicates the provisioned bandwidth for this ATM interface.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Atmlf actualRate

Description	This attribute indicates the actual bandwidth for this ATM interface. When no errors occur it has a value equal to *provRate*. When the link (or IMA group) is down for the entire collection interval it has a value of zero. When the link goes down during the collection interval it has a value representing the average bandwidth during the collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Atmlf txUtilization

Description	This attribute indicates the average transmit traffic rate over the most recent collection interval expressed as a percentage of the ATM link bandwidth. On *AtmIf*s linked to MPLS POS interfaces, the ATM link is the *LSP*. Many *LSP*s could share the same POS link. If the POS link is underutilized it is possible for an *LSP* to carry more traffic than it has been assigned. This occurs as bandwidth on an *LSP* is allocated based on determining whether the requested bandwidth exceeds the available bandwidth on an *LSP*, not on whether the actual bandwidth exceeds the available bandwidth. When the actual bandwidth is higher than the requested bandwith it is possible that this extra traffic will be carried over the *LSP*. Since this is possible, the value of this attribute may exceed 100%. If the utilization exceeds 65535% then 65535 is displayed. If the *Lsp* has a bandwidth of 0, then 0 is displayed for the utilization.
Values	Decimal (0..65535)
Units	%

ATTRIBUTE Atmlf rxUtilization

Description	This attribute indicates the average receive traffic rate over the most recent collection interval expressed as a percentage of the ATM link bandwidth. On *AtmIf*s linked to MPLS POS interfaces, the ATM link is the *LSP*. Many *LSP*s could share the same POS link. If the POS link is underutilized it is possible for an *LSP* to carry more traffic than it has been assigned. This occurs as bandwidth on an *LSP* is allocated based on determining whether the requested bandwidth exceeds the available bandwidth on an *LSP*, not on whether the actual bandwidth exceeds the available

Copyright © 2006, Nortel Nortel Confidential

bandwidth. When the actual bandwidth is higher than the requested bandwith it is possible that this extra traffic will be carried over the *LSP*. Since this is possible, the value of this attribute may exceed 100%.

If the utilization exceeds 65535% then 65535 is displayed. If the *Lsp* has a bandwidth of 0, then 0 is displayed for the utilization.

Values	Decimal (0..65535)
Units	%

ATTRIBUTE Atmlf txMaxCellRate

Description	This attribute indicates the transmitted cell rate (CLP=0+1) during the busiest minute of the collection interval.

COLLECTED STATS AtmInterface

Copyright © 2006, Nortel Nortel Confidential

VirtualPathTerminator

Description — The statistics record generated by the AtmInterface VirtualPathTerminator component.

ATTRIBUTE Atmlf Vpt remoteInstance

Description — This attribute indicates the remote ATM interface, as provisioned in the *remoteAtmInterfaceLabel*.

Values — String (0..60, ASCII)

ATTRIBUTE Atmlf Vpt provRate

Description — This attribute indicates the provisioned bandwidth for this ATM interface.

Values — Decimal (0..4294967295)

Units — cell/s

ATTRIBUTE Atmlf Vpt actualRate

Description — This attribute indicates the actual bandwidth for this ATM interface. When no errors occur it has a value equal to *provRate*. When the link (or IMA group) is down for the entire collection interval it has a value of zero. When the link goes down during the collection interval it has a value representing the average bandwidth during the collection interval.

Values — Decimal (0..4294967295)

Units — cell/s

ATTRIBUTE Atmlf Vpt txUtilization

Description — This attribute indicates the average transmit traffic rate over the most recent collection interval expressed as a percentage of the ATM link bandwidth.

On *AtmIf*s linked to MPLS POS interfaces, the ATM link is the *LSP*. Many *LSP*s could share the same POS link. If the POS link is underutilized it is possible for an *LSP* to carry more traffic than it has been assigned. This occurs as bandwidth on an *LSP* is allocated based on determining whether the requested bandwidth exceeds the available bandwidth on an *LSP*, not on whether the actual bandwidth exceeds the available bandwidth. When the actual bandwidth is higher than the requested bandwith it is possible that this extra traffic will be carried over the *LSP*. Since this is possible, the value of this attribute may exceed 100%.

If the utilization exceeds 65535% then 65535 is displayed. If the *Lsp* has a bandwidth of 0, then 0 is displayed for the utilization.

Values — Decimal (0..65535)

Units — %

COLLECTED STATS SignallingChannel E1Cas

Description	The statistics record generated by the SignallingChannel E1Cas component.

ATTRIBUTE SigChan E1Cas **totalCallsOutgoing**

Description	This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE SigChan E1Cas **totalCallsIncoming**

Description	This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE SigChan E1Cas **seizeFailures**

Description	This spooled statistic counts the number of outgoing node call attempts to this link for which the link failed to respond correctly upon receiving a seize signal in the last statistics collection interval. That is no seizure acknowledgment or wink was returned from link.
Values	Decimal (0..65535)

ATTRIBUTE SigChan E1Cas **releaseFailures**

Description	This spooled statistic counts the number of times that the link failed to respond correctly during the disconnect sequence of a call in the last statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE SigChan E1Cas **outgoingAnsweredCalls**

Description	This spooled statistic counts the number of outgoing node calls to this link that were answered by the link in the last statistics collection interval.
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE SigChan E1Cas incomingAnsweredCalls

Description — This spooled statistic counts the number of incoming link calls that were answered by this node, connect signals transmitted by this node out to the link in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan E1Cas peakActiveChannels

Description — This spooled statistic counts the maximum number of channels that have been simultaneously active on this signalling channel during the last statistics collection interval.

Values — Decimal (0..30)

COLLECTED STATS SignallingChannel Ds1Cas

Description — The statistics record generated by the SignallingChannel Ds1Cas component.

ATTRIBUTE SigChan Ds1Cas totalCallsOutgoing

Description — This spooled statistic counts the number of outgoing node call attempts made to this link in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas totalCallsIncoming

Description — This attribute counts the number of incoming link call attempts made to this node in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE SigChan Ds1Cas seizeFailures

ATTRIBUTE SigChan Mcdn frmFromIf

Description

This collected statistic counts the number of frames received from the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE SigChan Mcdn octetFromIf

Description The number of bytes received from the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE SigChan Mcdn octetToIf

Description The number of bytes sent to the link interface by *Framer* in the last statistics collection interval.

Values Decimal (0..4294967295)

COLLECTED STATS VoiceRoute

Description The statistics record generated by the VoiceRoute component.

ATTRIBUTE VRoute totalCallsFromSubnet

Description This spooled statistic counts the calls that have been received from the subnet in the last statistics collection interval, including calls that fail.

Values Decimal (0..65535)

ATTRIBUTE VRoute callsClearedNoChannel

Description This spooled statistic counts the calls from the subnet that were rejected when all of the in-service channels were busy in the last statistics collection interval. When a call is rejected for this reason, the cause code sent to the originator is 34, no circuit/channel available.

Values Decimal (0..65535)

ATTRIBUTE VRoute callsClearedOutOfService

Description This spooled statistic counts the calls from the subnet that were rejected because all of the channels were out-of-service in the last statistics collection interval. A channel is considered out-of-service if it is unavailable for any reason other than it is being engaged in handling a call. That is, an operator lock of any of the components required for the channel's operation, or problems which interfere with the connection to the PBX, will cause the channel to be considered out-of-service. When a call is rejected for this reason, the cause code sent back to the originator is 27, destination out-of-service.

Values Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE VRoute callsRejected

Description — This spooled statistic counts the calls from the subnet that were rejected in the last statistics collection interval because they were:
1) voice calls to a *typeOfRoute* which is set *to* ***data***,
2) data calls to a *typeOfRoute* which is set to ***voice***,
3) using a signalling protocol which is incompatible with this end.

Values — Decimal (0..65535)

COLLECTED STATS VoiceSubroute

Description — The statistics record generated by the VoiceSubroute component.

ATTRIBUTE Vsr totalCallsFromIf

Description — This spooled statistic counts the number of calls that have been received by this *VoiceSubroute* from the PBX in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE Vsr totalFailedCallsFromIf

Description — This spooled statistic counts the number of calls that have been received by this *VoiceSubroute* from the PBX which failed to be successfully routed through the subnet in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE Vsr invalidNumberingPlanCalls

Description — This spooled statistic counts the calls from the interface for which the type of number and the numbering plan identification was not associated with a diallingPlan in the last statistics collection interval. The numbering plan types *diallingPlan0, diallingPlan1, diallingPlan2* are provisioned in the *VoiceRoute*.

Values — Decimal (0..65535)

ATTRIBUTE Vsr addressResolutionFailedCalls

Description — This spooled statistic counts the calls from the interface which had dialled numbers that had no entry in the *VoiceNetworkingCallServer* data base in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE Vsr addressIncompleteCalls

Description — This spooled statistic counts the calls from the interface which had dialled numbers with insufficient digits to resolve to a unique entry in the *VoiceNetworkingCallServer* data base in the last statistics collection interval.

Values — Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vsr pathAttributesNotMetCalls

Description — This spooled statistic counts the calls from the interface for which a path to the end point could not be established based on the attribute specified in the *VoiceProfile* in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE Vsr pathSetupTimeOutCalls

Description — This spooled statistic counts the calls from the interface for which a path to the end point could not be established due to a subnet path setup time-out in the last statistics collection interval.

Values — Decimal (0..65535)

ATTRIBUTE Vsr callsRejectedLocally

Description — This spooled statistic counts the calls from the interface which were rejected by the originating end in the last statistics collection interval because it was:
1) a data call on a voice only *VoiceRoute*, or
2) a voice call on a data only *VoiceRoute*, or
3) a data call to an end-point whose *VoiceProfile* prevents data calls from being made.

Values — Decimal (0..65535)

ATTRIBUTE Vsr callsRejectedByFarEnd

Description — This spooled statistic counts the calls from the interface which were rejected by the far-end in the last statistics collection interval.This rejection could be due to:
1) no free channels at the end-point, or
2) a voice call going to a data only *VoiceRoute*, or
3) a data call going to a voice only *VoiceRoute*, or
4) a signalling protocol incompatibility between end-points.

Values — Decimal (0..65535)

ATTRIBUTE Vsr peakActiveChannels

Description — This spooled statistic counts the peak number of B-channels that were active in the last statistics collection interval.

Values — Decimal (0..30)

ATTRIBUTE Vsr peakActiveVoiceChannels

Description — This spooled statistic counts the peak number of B-channels that were active carrying voice in the last statistics collection interval.

Values — Decimal (0..30)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vsr peakActiveModemChannels

Description	This spooled statistic counts the peak number of active B-channels that a 2100Hz tone was detected in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr peakActiveDataChannels

Description	This spooled statistic counts the maximum number of B-channels that were active carrying data in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr peakActiveFaxRelayChannels

Description	This spooled statistic counts the maximum number of B-channels that were active carrying fax relay calls in the last statistics collection interval.
Values	Decimal (0..30)

ATTRIBUTE Vsr totalCalls

Description	This spooled statistic counts the call attempts processed on this channel (in both directions) in the last statistics collection interval. This counter includes the number of unsuccessful as well as successful call attempts.
Vector of	Decimal (0..65535)
Index	Decimal (1..32)

ATTRIBUTE Vsr totalCallSeconds

Description	This spooled statistic counts the number of seconds that each channel is handling a call in the last statistics collection interval. This is regardless of whether the call is successful or not. In other words, this is the amount of time that the channel is not in the idle state.
Vector of	Decimal (0..65535)
Units	seconds
Index	Decimal (1..32)

ATTRIBUTE Vsr voiceRouteInstance

Description	This spooled statistic is the value of the *VoiceRoute* linked to this *VoiceSubRoute*.
Values	Decimal (1..16)

COLLECTED STATS VoiceSubroute SwitchedVoiceService Framer

Description	The statistics record generated by the VoiceSubroute SwitchedVoiceService Framer component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Vsr Svs Framer **rxBytes**

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Vsr Svs Framer **rxFrames**

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Vsr Svs Framer **txBytes**

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Vsr Svs Framer **txFrames**

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Vsr Svs Framer **rxTotalLinkUtil**

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS DataSignallingChannel TS014 Framer

Description — The statistics record generated by the DataSignallingChannel TS014 Framer component.

ATTRIBUTE DataSigChan TS014 Framer **rxBytes**

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DataSigChan TS014 Framer **rxFrames**

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DataSigChan TS014 Framer **txBytes**

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DataSigChan TS014 Framer **txFrames**

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DataSigChan TS014 Framer **rxTotalLinkUtil**

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS DataSignallingChannel Etsi Framer

Description — The statistics record generated by the DataSignallingChannel Etsi Framer component.

ATTRIBUTE DataSigChan Etsi Framer **rxBytes**

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DataSigChan Etsi Framer **rxFrames**

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DataSigChan Etsi Framer **txBytes**

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DataSigChan Etsi Framer **txFrames**

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE DataSigChan Etsi Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COLLECTED STATS DataSignallingChannel JapanIns Framer

Description The statistics record generated by the DataSignallingChannel JapanIns Framer component.

ATTRIBUTE DataSigChan Ins Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE DataSigChan Ins Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE DataSigChan Ins Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE DataSigChan Ins Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE DataSigChan Ins Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COLLECTED STATS DataSignallingChannel

Copyright © 2006, Nortel Nortel Confidential

NationalIsdn2 Framer

Description — The statistics record generated by the DataSignallingChannel NationalIsdn2 Framer component.

ATTRIBUTE DataSigChan Ni2 Framer rxBytes

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DataSigChan Ni2 Framer rxFrames

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DataSigChan Ni2 Framer txBytes

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DataSigChan Ni2 Framer txFrames

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DataSigChan Ni2 Framer rxTotalLinkUtil

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS DataSignallingChannel Nis Framer

Description — The statistics record generated by the DataSignallingChannel Nis Framer component.

ATTRIBUTE DataSigChan Nis Framer rxBytes

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DataSigChan Nis Framer **rxFrames**

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE DataSigChan Nis Framer **txBytes**

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DataSigChan Nis Framer **txFrames**

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE DataSigChan Nis Framer **rxTotalLinkUtil**

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS McsManager DprsMcsEndPointGroup EndPoint

Description — The statistics record generated by the McsManager DprsMcsEndPointGroup EndPoint component.

ATTRIBUTE McsMgr DprsMcsEpG Ep **remoteComponentName (remoteName)**

Description — This attribute indicates the component name of the remote *Ep,* learned from the remote end.
For example: *"EM/NODEY2D0 McsMgr DprsMcsEpG/1 Ep/1".*
The value will be a null string if the transport connection is down at the end of the statistics collection interval.

Values — String (0..46, ASCII)

ATTRIBUTE McsMgr DprsMcsEpG Ep **bandwidthHWM**

Description — This attribute indicates the high-water mark of the bandwidth at which the transport connection agrees to transfer data during the last statistics collection interval. The value for this attribute is equal to the provisioned bandwidth when the connection is up, and is 0 when the transport connection is down.
This attribute, when combined with *bandwidthLWM* can also be used to indicate a transport connection outage occurrence.

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..155000000)
Units	bit/s

ATTRIBUTE McsMgr DprsMcsEpG Ep bandwidthLWM

Description	This attribute indicates the low-water mark of the bandwidth at which the transport connection agrees to transfer data during the last statistics collection interval. The value for this attribute is equal to the provisioned bandwidth when the connection is up, and is 0 when the transport connection is down. This attribute, when combined with *bandwidthHWM* can also be used to indicate a transport connection outage occurrence.
Values	Decimal (0..155000000)
Units	bit/s

ATTRIBUTE McsMgr DprsMcsEpG Ep serviceCategory (sc)

Description	This attribute indicates the ATM service category of the transport connection.
Values	ubr cbr rtVbr nrtVbr

ATTRIBUTE McsMgr DprsMcsEpG Ep pktFromMcs

Description	This attribute indicates the number of packets received on the DPRS MCS Switched Path End Point for each discard priority in the last statistics collection interval. This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0(***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).
Vector of	Long Integer
Index	discardPriority0 (dp0) discardPriority1 (dp1) discardPriority2 (dp2) discardPriority3 (dp3)

ATTRIBUTE McsMgr DprsMcsEpG Ep octetsFromMcs

Description	This attribute indicates the octets received on the DPRS MCS Switched Path End Point for each discard priority in the last statistics collection interval. This attribute is a vector with four entries. Each vector entry is a counter

Copyright © 2006, Nortel Nortel Confidential

indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).

Vector of	Long Integer
Index	discardPriority0 (dp0) discardPriority1 (dp1) discardPriority2 (dp2) discardPriority3 (dp3)

ATTRIBUTE McsMgr DprsMcsEpG Ep **pktDiscCongestedFromMcs**

Description	This attribute indicates the number of packets received on the DPRS MCS Switched Path End Point for each discard priority that have been discarded at the transport card in the last statistics collection interval due to congestion at the access card. This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).
Vector of	Decimal (0..4294967295)
Index	discardPriority0 (dp0) discardPriority1 (dp1) discardPriority2 (dp2) discardPriority3 (dp3)

ATTRIBUTE McsMgr DprsMcsEpG Ep **pktDiscErroredFromMcs**

Description	This attribute the number of errored packets received on the DPRS MCS Switched Path End Point that have been discarded in the last statistics collection interval.
Values	Decimal (0..4294967295)

COLLECTED STATS McsManager DprsMcsEndPointGroup EndPoint CallAdmissionControl

Description	The statistics record generated by the McsManager DprsMcsEndPointGroup EndPoint CallAdmissionControl component.

ATTRIBUTE McsMgr DprsMcsEpG Ep Cac **effectiveBandwidth**

Description	This value indicates the level of effective bandwidth available during the last statistics collection interval, as indicated by the *effectiveBandwidth* attribute of the *McsMgr DprsMcsEpG/m EndPoint/n Cac* component in thousands of bits per second.
Values	Decimal (0..4294967295)
Units	kbit/s

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE McsMgr DprsMcsEpG Ep Cac effectiveBandwidthAvailableLWM

Description	This value indicates the lowest level of effective bandwidth available as indicated by the *effectiveBandwidthAvailable* attribute of the *McsMgr DprsMcsEp/m EndPoint/n Cac* component, in thousands of bits per second during the last statistics collection interval.
Values	Decimal (0..4294967295)
Units	kbit/s

ATTRIBUTE McsMgr DprsMcsEpG Ep Cac numberOfCallsActiveHWM

Description	This value indicates the highest level of the *numberOfCallsActive* attribute of the *McsMgr DprsMcsEp/m EndPoint/n Cac* component, during the last statistics collection interval.
Values	Decimal (0..512)

ATTRIBUTE McsMgr DprsMcsEpG Ep Cac numberOfCacFailures

Description	This value indicates the number of call admission failures in the last statistics collection interval. This value equals the increase in the *numberOfCacFailures* attribute of the *McsMgr DprsMcsEp/m EndPoint/n Cac* component during the last statistics collection interval.
Values	Decimal (0..4294967295)

COLLECTED STATS MpaNetworkLink Framer

Description	The statistics record generated by the MpaNetworkLink Framer component.

ATTRIBUTE MpanI Framer rxBytes

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE MpanI Framer rxFrames

Description	This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE MpanI Framer txBytes

Description	This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mpanl Framer **txFrames**

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Mpanl Framer **rxTotalLinkUtil**

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway AmrBasicRateGroup Mtp2

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway AmrBasicRateGroup Mtp2 component.

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 **insvFailures**

Description — This attribute indicates the number of in-service link outages over the collection interval. It does not include failures which occur during the alignment process.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 **msusTx**

Description — This attribute indicates the number of message signal units transmitted over the collection interval. This includes the MSUs retransmitted, indicated by the attribute *msuRetransmits.*

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 **msuRetransmits (msuReTx)**

Description — This attribute indicates the number of message signal units retransmitted because of negative acknowledgments over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 **msusRx**

Description — This attribute indicates the number of message signal units received over the collection interval. This includes the MSUs with errors, indicated by the attribute *msuErrors.*

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 msuErrors

Description — This attribute indicates the number of message signal units discarded because of sequence number, length or CRC errors over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 msuOctetsTx

Description — This attribute indicates the number of payload MSU octets transmitted over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs AmrBrag Mtp2 msuOctetsRx

Description — This attribute indicates the number of payload MSU octets received over the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway CsdBasicRateGroup Mtp2

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway CsdBasicRateGroup Mtp2 component.

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 insvFailures

Description — This attribute indicates the number of in-service link outages over the collection interval. It does not include failures which occur during the alignment process.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msusTx

Description — This attribute indicates the number of message signal units transmitted over the collection interval. This includes the MSUs retransmitted, indicated by the attribute *msuRetransmits.*

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 msuRetransmits (msuReTx)

Description — This attribute indicates the number of message signal units retransmitted because of negative acknowledgments over the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 **msusRx**

Description — This attribute indicates the number of message signal units received over the collection interval. This includes the MSUs with errors, indicated by the attribute *msuErrors.*

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 **msuErrors**

Description — This attribute indicates the number of message signal units discarded because of sequence number, length or CRC errors over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 **msuOctetsTx**

Description — This attribute indicates the number of payload MSU octets transmitted over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs CsdBrag Mtp2 **msuOctetsRx**

Description — This attribute indicates the number of payload MSU octets received over the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway Mtp2

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway Mtp2 component.

ATTRIBUTE Nsta Vgs Mtp2 **alignmentReadyTimeouts**

Description — This attribute counts the number of timeouts of the “Alignment Ready” timer (T1) represented by the attribute *alignmentReadyTimer* (defined in the *Nsta/n Vgs Mtp2Profile/n* component).

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 **notAlignedTimeouts**

Description — This attribute counts the number of timeouts of the “Not Aligned” timer (T2) represented by the attribute *notAlignedTimer* (defined in the *Nsta/n Vgs Mtp2Profile/n* component).

The counter counts the number of events in the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 alignedTimeouts

Description This attribute counts the number of timeouts of the “Aligned” timer (T3) represented by the attribute *alignedTimer* (defined in the *Nsta/n Vgs Mtp2Profile* component).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 congestionDetects

Description This attribute counts the number of times congestion was detected by the *MonitoredCommunicationsProtocol* dynamic subcomponent at the local end of the signalling link.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 congestionIndicationsSent

Description This attribute counts the number of congestion indications transmitted to the remote end of the signalling link. The congestion is detected locally by the *MonitoredCommunicationsProtocol* dynamic subcomponent and is transmitted to the remote end if it does not abate within the time interval specified by the *sendingSibTimer* (T5) attribute of the linked *Nsta/n Vgs Mtp2Profile/n* component.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 congestionIndicationsReceived

Description This attribute counts the number of congestion indications received from the remote end of the signalling link.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 ackTimeouts

Description This attribute counts the number of timeouts of the T7 Timer represented by the attribute *ackTimer* (defined in the *Nsta/n Vgs Mtp2Profile/n* component).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Mtp2 inServiceFailures

Description — This attribute counts the number of failures the *Mtp2* link has experienced while it was “In service”.

It does not include failures which occur during the alignment process.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuSent

Description — This attribute counts the number of Message Signal Units (MSU) transmitted. This includes the number of MSUs retransmitted, indicated by the attribute *msuRetransmits*.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuRetransmits

Description — This attribute counts the number of Message Signal Units (MSU) retransmitted because of negative acknowledgments.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuReceived

Description — This attribute counts the number of Message Signal Units (MSU) received. This includes the MSUs with errors, indicated by the attribute *msuErrors.*

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuErrors

Description — This attribute counts the number of ingress signal units discarded because of sequence number, length or Cyclic Redundancy Check (CRC) errors.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 msuOctetsSent

Description — This attribute counts the number of layer 3 payload octets transmitted within the Message Signal Units (MSU).

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Mtp2 msuOctetsReceived

Description — This attribute counts the number of layer 3 payload octets received within the Message Signal Units (MSU).

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway Mtp2 MonitoredCommunicationProtocol

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway Mtp2 MonitoredCommunicationProtocol component.

ATTRIBUTE Nsta Vgs Mtp2 MCP communicationFailures (commFailures)

Description — This attribute counts the number of communication failures between the neighbors being monitored.

The communication failure is detected in two ways:

- if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively.
- if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP messageTxFailures (msgTxFailures)

Description — This attribute counts the number of payload messages sent to the neighbor but were not received by the neighbor.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs Mtp2 MCP **messageRxFailures (msgRxFailures)**

Description — This attribute counts the number of payload messages that were sent by the neighbor but were not received by this component. This is detected by a gap in the Message Numbers received in payload messages from the neighbor.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableRequestsTx (enableReqsTx)**

Description — This attribute counts the number of Monitor Enable Request messages sent by this component to the neighbor.

The value of this attribute is incremented when a Monitor Enable Request message is sent in an attempt to establish monitoring communication between the neighbors to be monitored.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableRequestsRx (enableReqsRx)**

Description — This attribute counts the number of Monitor Enable Request messages received by this component.

The value of this attribute is incremented when a Monitor Enable Request message is received from the neighbor in an attempt to establish monitoring communication.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableResponsesTx (enableRspsTx)**

Description — This attribute counts the number of Monitor Enable Response messages sent by this component.

The value of this attribute is incremented when a Monitor Enable Response message is sent to the neighbor in response to a Monitor Enable Request message.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP **enableResponsesRx (enableRspsRx)**

Description — This attribute counts the number of Monitor Enable Response messages received by this component in response to the Monitor Enable Request message.

Copyright © 2006, Nortel Nortel Confidential

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP heartbeatsTx (hbsTx)

Description This attribute counts the number of Heartbeat messages sent by this component to the neighbor.

If no messages are sent by this component for the duration of the Heartbeat timer, then a Heartbeat message is sent to the neighbor and the value of this attribute is incremented. The Heartbeat timer is not provisionable and is set by the neighbors being monitored.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP heartbeatRx (hbsRx)

Description This attribute counts the number of Heartbeat messages received by this component.

The value of this attribute is incremented when the Heartbeat message is received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP messagesTx (msgsTx)

Description This attribute counts the number of payload messages sent by this component to the neighbor.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP messagesRx (msgsRx)

Description This attribute counts the number of payload messages received by this component.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP sequenceGapsTx (seqGapsTx)

Description This attribute counts the number of Sequencing Gap messages sent by this component.

When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap

Copyright © 2006, Nortel Nortel Confidential

message is sent and the value of this attribute is incremented. The Sequence Gap message shows the start and end of the gap in the Messages Numbers.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP sequenceGapsRx (seqGapsRx)

Description This attribute counts the number of Sequencing Gap messages received by this component.

When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent. The value of this attribute is incremented when this message is received. The Sequence Gap message shows the start and end of the gap in the Messages Numbers.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP unknownMessagesRx (unknownMsgsRx)

Description This attribute counts the number of messages received by this component that are not recognized by the MonitoredCommunicationProtocol (MCP).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs Mtp2 MCP messagesDiscarded (msgsDiscarded)

Description This attribute counts the number of messages that were discarded to avoid overflowing of the neighbor.

The number of messages that the neighbor can handle without overflowing is identified from the Available Capacity field in the messages received from the neighbor.

If the value of the Available Capacity field is zero, payload messages to be sent to the neighbor are discarded and the value of this counter is incremented.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway

Copyright © 2006, Nortel Nortel Confidential

M2ua

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway M2ua component.

ATTRIBUTE Nsta Vgs M2ua **connectionsRefused**

Description — This attribute counts the number of connection requests refused by the Message Transfer Part Layer 2 User Adaptation (M2UA) layer.

The most likely cause for the connection to be refused is that the requestor's IP address or port information is not configured under the *Nsta/n Vgs M2ua* hierarchy.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer InterfaceIdentifier

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer InterfaceIdentifier component.

ATTRIBUTE Nsta Vgs M2ua As Iid **dataMessagesReceived**

Description — This attribute counts the number of Data messages received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **dataMessagesSent**

Description — This attribute counts the number of Data messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **dataAcknowledgementsReceived**

Description — This attribute counts the number of Data Acknowledgement messages received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Iid **dataAcknowledgementsSent**

Description — This attribute counts the number of Data Acknowledgement messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **establishRequestsReceived**

Description — This attribute counts the number of Establish Request messages received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **establishRequestsSent**

Description — This attribute counts the number of Establish Request messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **establishConfirmsReceived**

Description — This attribute counts the number of Establish Confirm messages received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **establishConfirmsSent**

Description — This attribute counts the number of Establish Confirm messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **releaseRequestsReceived**

Description — This attribute counts the number of Release Request messages received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **releaseConfirmsSent**

Description — This attribute counts the number of Release Confirm messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Iid **releaseIndicationsSent**

Description — This attribute counts the number of Release Indication messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **stateRequestsReceived**

Description — This attribute counts the number of State Request messages received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **stateConfirmsSent**

Description — This attribute counts the number of State Confirm messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **stateIndicationsSent**

Description — This attribute counts the number of State Indication messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **dataRetrievalRequestsReceived**

Description — This attribute counts the number of Data Retrieval Request messages received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **dataRetrievalConfirmsSent**

Description — This attribute counts the number of Data Retrieval Confirm messages sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **dataRetrievalIndicationsSent**

Description — This attribute counts the number of Data Retrieval Indication messages sent.

The counter counts the number of events in the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **dataRetrievalCmpIIndicationsSent**

Description This attribute counts the number of Data Retrieval Complete Indication messages.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid **congestionIndicationsSent**

Description This attribute counts the number of Congestion Indication messages sent.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol

Description The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol component.

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **communicationFailures (commFailures)**

Description This attribute counts the number of communication failures between the neighbors being monitored.

The communication failure is detected in two ways:

- if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively.
- if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented.

The counter counts the number of events in the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messageTxFailures (msgTxFailures)

Description This attribute counts the number of payload messages sent to the neighbor but were not received by the neighbor.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP messageRxFailures (msgRxFailures)

Description This attribute counts the number of payload messages that were sent by the neighbor but were not received by this component. This is detected by a gap in the Message Numbers received in payload messages from the neighbor.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP enableRequestsTx (enableReqsTx)

Description This attribute counts the number of Monitor Enable Request messages sent by this component to the neighbor.

The value of this attribute is incremented when a Monitor Enable Request message is sent in an attempt to establish monitoring communication between the neighbors to be monitored.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP enableRequestsRx (enableReqsRx)

Description This attribute counts the number of Monitor Enable Request messages received by this component.

The value of this attribute is incremented when a Monitor Enable Request message is received from the neighbor in an attempt to establish monitoring communication.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP enableResponsesTx (enableRspsTx)

Description This attribute counts the number of Monitor Enable Response messages sent by this component.

The value of this attribute is incremented when a Monitor Enable Response message is sent to the neighbor in response to a Monitor

Copyright © 2006, Nortel Nortel Confidential

Enable Request message.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **enableResponsesRx (enableRspsRx)**

Description This attribute counts the number of Monitor Enable Response messages received by this component in response to the Monitor Enable Request message.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **heartbeatsTx (hbsTx)**

Description This attribute counts the number of Heartbeat messages sent by this component to the neighbor.

If no messages are sent by this component for the duration of the Heartbeat timer, then a Heartbeat message is sent to the neighbor and the value of this attribute is incremented. The Heartbeat timer is not provisionable and is set by the neighbors being monitored.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **heartbeatRx (hbsRx)**

Description This attribute counts the number of Heartbeat messages received by this component.

The value of this attribute is incremented when the Heartbeat message is received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **messagesTx (msgsTx)**

Description This attribute counts the number of payload messages sent by this component to the neighbor.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **messagesRx (msgsRx)**

Description This attribute counts the number of payload messages received by this component.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **sequenceGapsTx (seqGapsTx)**

Description This attribute counts the number of Sequencing Gap messages sent by this component.

When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent and the value of this attribute is incremented. The Sequence Gap message shows the start and end of the gap in the Messages Numbers.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **sequenceGapsRx (seqGapsRx)**

Description This attribute counts the number of Sequencing Gap messages received by this component.

When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent. The value of this attribute is incremented when this message is received. The Sequence Gap message shows the start and end of the gap in the Messages Numbers.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **unknownMessagesRx (unknownMsgsRx)**

Description This attribute counts the number of messages received by this component that are not recognized by the MonitoredCommunicationProtocol (MCP).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Iid MCP **messagesDiscarded (msgsDiscarded)**

Description This attribute counts the number of messages that were discarded to avoid overflowing of the neighbor.

The number of messages that the neighbor can handle without overflowing is identified from the Available Capacity field in the messages received from the neighbor.

If the value of the Available Capacity field is zero, payload messages to be sent to the neighbor are discarded and the value of this counter is

Copyright © 2006, Nortel Nortel Confidential

incremented.

The counter counts the number of events in the collection interval.

ATTRIBUTE Nsta Vgs M2ua As Asp **heartbeatAcksReceived**

Description	This attribute counts the number of Heartbeat Acknowledgement (BEAT ACK) messages received. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **notifyMsgsSent**

Description	This attribute counts the number of Notify (NTFY) messages sent. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **errorsSent**

Description	This attribute counts the number of Error (ERR) messages sent. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **errorsReceived**

Description	This attribute counts the number of Error (ERR) messages received. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **invalidVersionErrorsSent**

Description	This attribute counts the number of "Invalid Version" errors sent. This corresponds to error code 0x1 defined in RFC 3331. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **invalidVersionErrorsReceived**

Description	This attribute counts the number of "Invalid Version" errors received. This corresponds to error code 0x1 defined in RFC 3331. The counter counts the number of events in the collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **invalidlidErrorsSent**

Description	This attribute counts the number of "Invalid Interface Identifier" errors sent. This corresponds to error code 0x2 defined in RFC 3331. This error occurs when the Application Server Process (ASP) references

Copyright © 2006, Nortel Nortel Confidential

an Interface Identifier (IID) that is not locally configured.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp invalidIidErrorsReceived

Description This attribute counts the number of "Invalid Interface Identifier" errors received. This corresponds to error code 0x2 defined in RFC 3331.

This error occurs when the remote Application Server Process (ASP) does not recognize the Interface Identifier (IID) that it has received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp unsupportedTypeErrorsSent

Description This attribute counts the number of following errors sent that are defined in RFC 3331:
- "Unsupported Message Class" (error code 0x3)
- "Unsupported Message Type" (error code 0x4)
- "Unsupported Traffic Handling Mode" (error code 0x5).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp unsupportedTypeErrorsReceived

Description This attribute counts the number of following errors received that are defined in RFC 3331:
- "Unsupported Message Class" (error code 0x3)
- "Unsupported Message Type" (error code 0x4)
- "Unsupported Traffic Handling Mode" (error code 0x5).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp protocolErrorsSent

Description This attribute counts the number of protocol errors detected locally.

This corresponds to the following errors defined in RFC 3331:
- "Unexpected Message" (error code 0x6)
- "Protocol Error" (error code 0x7)
- "Invalid Parameter Value" (error code 0x11)
- "Parameter Field Error" (error code 0x12)
- "Unexpected Parameter" (error code 0x13)
- "Missing Parameter" (error code 0x16).

The counter counts the number of events in the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp protocolErrorsReceived

Description This attribute counts the number of protocol errors detected by the remote Application Server Process (ASP).

This corresponds to the following errors defined in RFC 3331:
- "Unexpected Message" (error code 0x6)
- "Protocol Error" (error code 0x7)
- "Invalid Parameter Value" (error code 0x11)
- "Parameter Field Error" (error code 0x12)
- "Unexpected Parameter" (error code 0x13)
- "Missing Parameter" (error code 0x16).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp invalidStreamIdErrorsSent

Description This attribute counts the number of "Invalid Stream Identifier" errors sent.

This corresponds to error code 0x9 defined in RFC 3331. This error is sent if a management message is received on a stream other than "0".

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp invalidStreamIdErrorsReceived

Description This attribute counts the number of "Invalid Stream Identifier" errors received

This corresponds to error code 0x9 defined in RFC 3331. Receipt of this error indicates that the remote node received a message on an unexpected Stream Control Transmission Protocol (SCTP) stream.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp sendFailures

Description This attribute counts the times the User Adaptation application was unable to send a Stream Control Transmission Protocol (SCTP) message to the remote Application Server Process (ASP).

The most likely cause of a send failure is congestion on the remote node. Messages that the SCTP layer is unable to send are discarded.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Asp **sctpEstablishIndications**

Description — This attribute counts the number of M-SCTP Establish Indications received for this Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***server***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **sctpEstablishRequests**

Description — This attribute counts the number of M-SCTP Establish Requests sent for this Application Server Process (ASP).

This attribute counts the number of the attempts to establish a Stream Control Transmission Protocol (SCTP) association with the remote ASP.

This counter is incremented only when the value of the *localRole* attribute is set to ***client***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **sctpEstablishFailures**

Description — This attribute counts the number of M-SCTP Establish Requests that failed to successfully establish a Stream Control Transmission Protocol (SCTP) association with the remote Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***client***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp **sctpReleaseIndications**

Description — This attribute counts the number of M-SCTP Release Indications received for this Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***server***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Asp **sctpRestartIndications**

Description — This attribute counts the number of M-SCTP Restart Indications received for this Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***server***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer ApplicationServerProcess SctpAssociation

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway M2ua ApplicationServer ApplicationServerProcess SctpAssociation component.

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **packetsSent**

Description — This attribute counts the number of IP packets sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **packetsReceived**

Description — This attribute counts the number of IP packets received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **bytesSent**

Description — This attribute counts the number of bytes sent.

This count includes the Stream Control Transmission Protocol (SCTP) message headers and chunk headers but does not include the IP header.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **bytesReceived**

Description — This attribute counts the number of bytes received.

This count includes the Stream Control Transmission Protocol (SCTP)

message headers and chunk headers but does not include the IP header.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **dataChunksSent**

Description This attribute counts the number of Payload Data (DATA) chunks sent.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **dataChunksReceived**

Description This attribute counts the number of Payload Data (DATA) chunks received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **sackChunksSent**

Description This attribute counts the number of Selective Acknowledgement (SACK) chunks sent.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **sackChunksReceived**

Description This attribute counts the number of Selective Acknowledgement (SACK) chunks received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **heartbeatChunksSent**

Description This attribute counts the number of Heartbeat Request (HEARTBEAT) chunks sent.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **heartbeatChunksReceived**

Description This attribute counts the number of Heartbeat Request (HEARTBEAT) chunks received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **heartbeatAckChunksSent**

Description — This attribute counts the number of Heartbeat Acknowledgement (HEARTBEAT ACK) chunks sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **heartbeatAckChunksReceived**

Description — This attribute counts the number of Heartbeat Acknowledgement (HEARTBEAT ACK) chunks received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **errorChunksSent**

Description — This attribute counts the number of Operation Error (ERROR) chunks sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **errorChunksReceived**

Description — This attribute counts the number of Operation Error (ERROR) chunks received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **invalidStreamIdErrorsSent**

Description — This attribute counts the number of "Invalid Stream Identifier" errors sent.

This corresponds to cause code 1 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **invalidStreamIdErrorsReceived**

Description — This attribute counts the number of "Invalid Stream Identifier" errors received.

This corresponds to cause code 1 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **protocolErrorsSent**

Description — This attribute counts the number of protocol errors sent.

This corresponds to the cause codes defined in RFC 2960:
2 - "Missing Mandatory Parameter"
6 - "Unrecognized Chunk Type"
7 - "Invalid Mandatory Parameter"
8 - "Unrecognized Parameters"
9 - "No User Data"

It also corresponds to cause code 13 for "Protocol Violation" defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **protocolErrorsReceived**

Description — This attribute counts the number of protocol errors received.

This corresponds to the cause codes defined in RFC 2960:
2 - "Missing Mandatory Parameter"
6 - "Unrecognized Chunk Type"
7 - "Invalid Mandatory Parameter"
8 - "Unrecognized Parameters"
9 - "No User Data"

It also corresponds to cause code 13 for "Protocol Violation" defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **outOfResourceErrorsSent**

Description — This attribute counts the number of "Out of Resource" errors sent.

This corresponds to error code 4 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **outOfResourceErrorsReceived**

Description — This attribute counts the number of "Out of Resource" errors received.

This corresponds to error code 4 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **invalidAssocRestartErrorsSent**

Description This attribute counts the number of "Restart of an association with new addresses" errors sent.

This corresponds to error code 11 defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **invalidAssocRestartErrorsReceived**

Description This attribute counts the number of "Restart of an association with new addresses" errors received.

This corresponds to error code 11 defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **userInitiatedAbortsSent**

Description This attribute counts the number of "User Initiated Abort" indications sent by the local Stream Control Transmission Protocol (SCTP) user.

This corresponds to error code 12 defined in the SCTP Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **userInitiatedAbortsReceived**

Description This attribute counts the number of "User Initiated Abort" indications received from the peer Stream Control Transmission Protocol (SCTP) user.

This corresponds to error code 12 defined in the SCTP Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **checksumErrors**

Description This attribute counts the number of incoming packets that were discarded due to checksum verification failure.

Copyright © 2006, Nortel Nortel Confidential

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **retransmittedChunks**

Description This attribute counts the number of Payload Data (DATA) chunks retransmitted.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **gapAcknowledgementsSent**

Description This attribute counts the number of chunks reported to the far end in "Gap Ack" reports. This provides an indication of the number of chunks that were locally received out of order.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **gapAcknowledgementsReceived**

Description This attribute counts the number of chunks reported by the far end in "Gap Ack" reports. This provides an indication of the number of chunks that were received out of order by the far end.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **duplicateChunkReportsSent**

Description This attribute counts the number of chunks reported to the far end in "Duplicate TSN" reports. This provides an indication of the number of duplicate data chunks that were locally received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs M2ua As Asp SctpAssoc **duplicateChunkReportsReceived**

Description This attribute counts the number of chunks reported by the far end in "Duplicate TSN" reports. This provides an indication of the number of duplicate data chunks that were received by the far end.

The counter counts the number of events in the collection interval.

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway SgV5UserAdaptation ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol

Description The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway SgV5UserAdaptation ApplicationServer InterfaceIdentifier MonitoredCommunicationProtocol component.

ATTRIBUTE Nsta Vgs SgV5 As Iid MCP communicationFailures (commFailures)

Description This attribute counts the number of communication failures between the neighbors being monitored.

The communication failure is detected in two ways:

- if no messages are received from the neighbor for a predetermined number of consecutive Heartbeat timer expiries, the value of this attribute is incremented. The value of the Heartbeat timer and retries is not provisionable, but it is negotiated between the monitored parent components. The value of the Heartbeat timer and retries can be determined from the operational attributes *heartbeatTimer* and *heartbeatRetries* respectively.
- if communication monitoring is not established between the two neighbors, the value of this attribute is incremented. Monitor Enable Request messages are sent to the neighbor when the Heartbeat timer expires and if the Monitor Enable Response message is not received prior to the predetermined number of Heartbeat timer expiries, then it is assumed that monitoring communication could not be established and the value of this attribute is incremented.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Iid MCP messageTxFailures (msgTxFailures)

Description This attribute counts the number of payload messages sent to the neighbor but were not received by the neighbor.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Iid MCP messageRxFailures (msgRxFailures)

Description This attribute counts the number of payload messages that were sent by the neighbor but were not received by this component. This is detected by a gap in the Message Numbers received in payload messages from the

Copyright © 2006, Nortel Nortel Confidential

neighbor.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP enableRequestsTx (enableReqsTx)

Description This attribute counts the number of Monitor Enable Request messages sent by this component to the neighbor.

The value of this attribute is incremented when a Monitor Enable Request message is sent in an attempt to establish monitoring communication between the neighbors to be monitored.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP enableRequestsRx (enableReqsRx)

Description This attribute counts the number of Monitor Enable Request messages received by this component.

The value of this attribute is incremented when a Monitor Enable Request message is received from the neighbor in an attempt to establish monitoring communication.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP enableResponsesTx (enableRspsTx)

Description This attribute counts the number of Monitor Enable Response messages sent by this component.

The value of this attribute is incremented when a Monitor Enable Response message is sent to the neighbor in response to a Monitor Enable Request message.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP enableResponsesRx (enableRspsRx)

Description This attribute counts the number of Monitor Enable Response messages received by this component in response to the Monitor Enable Request message.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **heartbeatsTx (hbsTx)**

Description

This attribute counts the number of Heartbeat messages sent by this component to the neighbor.

If no messages are sent by this component for the duration of the Heartbeat timer, then a Heartbeat message is sent to the neighbor and the value of this attribute is incremented. The Heartbeat timer is not provisionable and is set by the neighbors being monitored.

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **heartbeatRx (hbsRx)**

Description

This attribute counts the number of Heartbeat messages received by this component.

The value of this attribute is incremented when the Heartbeat message is received.

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **messagesTx (msgsTx)**

Description

This attribute counts the number of payload messages sent by this component to the neighbor.

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **messagesRx (msgsRx)**

Description

This attribute counts the number of payload messages received by this component.

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **sequenceGapsTx (seqGapsTx)**

Description

This attribute counts the number of Sequencing Gap messages sent by this component.

When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent and the value of this attribute is incremented. The Sequence Gap message shows the start and end of the gap in the Messages Numbers.

Copyright © 2006, Nortel Nortel Confidential

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **sequenceGapsRx (seqGapsRx)**

Description This attribute counts the number of Sequencing Gap messages received by this component.

When a gap in the sequence of Message Numbers in the payload messages received from the neighbor is identified, a Sequence Gap message is sent. The value of this attribute is incremented when this message is received. The Sequence Gap message shows the start and end of the gap in the Messages Numbers.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **unknownMessagesRx (unknownMsgsRx)**

Description This attribute counts the number of messages received by this component that are not recognized by the MonitoredCommunicationProtocol (MCP).

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As lid MCP **messagesDiscarded (msgsDiscarded)**

Description This attribute counts the number of messages that were discarded to avoid overflowing of the neighbor.

The number of messages that the neighbor can handle without overflowing is identified from the Available Capacity field in the messages received from the neighbor.

If the value of the Available Capacity field is zero, payload messages to be sent to the neighbor are discarded and the value of this counter is incremented.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

Description — This attribute counts the number of "Invalid Version" errors sent. This corresponds to error code 0x1 defined in RFC 3331.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **invalidVersionErrorsReceived**

Description — This attribute counts the number of "Invalid Version" errors received. This corresponds to error code 0x1 defined in RFC 3331.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **invalidIidErrorsSent**

Description — This attribute counts the number of "Invalid Interface Identifier" errors sent. This corresponds to error code 0x2 defined in RFC 3331.

This error occurs when the Application Server Process (ASP) references an Interface Identifier (IID) that is not locally configured.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp **invalidIidErrorsReceived**

Description

This attribute counts the number of "Invalid Interface Identifier" errors received. This corresponds to error code 0x2 defined in RFC 3331.

This error occurs when the remote Application Server Process (ASP) does not recognize the Interface Identifier (IID) that it has received.

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **unsupportedTypeErrorsSent**

Description

This attribute counts the number of following errors sent that are defined in RFC 3331:
- "Unsupported Message Class" (error code 0x3)
- "Unsupported Message Type" (error code 0x4)
- "Unsupported Traffic Handling Mode" (error code 0x5).

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **unsupportedTypeErrorsReceived**

Description

This attribute counts the number of following errors received that are defined in RFC 3331:
- "Unsupported Message Class" (error code 0x3)
- "Unsupported Message Type" (error code 0x4)
- "Unsupported Traffic Handling Mode" (error code 0x5).

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **protocolErrorsSent**

Description

This attribute counts the number of protocol errors detected locally.

This corresponds to the following errors defined in RFC 3331:
- "Unexpected Message" (error code 0x6)
- "Protocol Error" (error code 0x7)
- "Invalid Parameter Value" (error code 0x11)
- "Parameter Field Error" (error code 0x12)
- "Unexpected Parameter" (error code 0x13)
- "Missing Parameter" (error code 0x16).

The counter counts the number of events in the collection interval.

Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp **protocolErrorsReceived**

Description

This attribute counts the number of protocol errors detected by the remote Application Server Process (ASP).

This corresponds to the following errors defined in RFC 3331:
- "Unexpected Message" (error code 0x6)
- "Protocol Error" (error code 0x7)
- "Invalid Parameter Value" (error code 0x11)
- "Parameter Field Error" (error code 0x12)
- "Unexpected Parameter" (error code 0x13)
- "Missing Parameter" (error code 0x16).

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **invalidStreamIdErrorsSent**

Description

This attribute counts the number of "Invalid Stream Identifier" errors sent.

This corresponds to error code 0x9 defined in RFC 3331. This error is sent if a management message is received on a stream other than "0".

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **invalidStreamIdErrorsReceived**

Description

This attribute counts the number of "Invalid Stream Identifier" errors received

This corresponds to error code 0x9 defined in RFC 3331. Receipt of this error indicates that the remote node received a message on an unexpected Stream Control Transmission Protocol (SCTP) stream.

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **sendFailures**

Description

This attribute counts the times the User Adaptation application was unable to send a Stream Control Transmission Protocol (SCTP) message to the remote Application Server Process (ASP).

The most likely cause of a send failure is congestion on the remote node. Messages that the SCTP layer is unable to send are discarded.

The counter counts the number of events in the collection interval.

Values

Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp **sctpEstablishIndications**

Description — This attribute counts the number of M-SCTP Establish Indications received for this Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***server***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **sctpEstablishRequests**

Description — This attribute counts the number of M-SCTP Establish Requests sent for this Application Server Process (ASP).

This attribute counts the number of the attempts to establish a Stream Control Transmission Protocol (SCTP) association with the remote ASP.

This counter is incremented only when the value of the *localRole* attribute is set to ***client***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **sctpEstablishFailures**

Description — This attribute counts the number of M-SCTP Establish Requests that failed to successfully establish a Stream Control Transmission Protocol (SCTP) association with the remote Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***client***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp **sctpReleaseIndications**

Description — This attribute counts the number of M-SCTP Release Indications received for this Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***server***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp **sctpRestartIndications**

Description — This attribute counts the number of M-SCTP Restart Indications received for this Application Server Process (ASP).

This counter is incremented only when the value of the *localRole* attribute is set to ***server***.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS NarrowbandServicesTrunkOverATM VoiceGateway SgV5UserAdaptation ApplicationServer ApplicationServerProcess SctpAssociation

Description — The statistics record generated by the NarrowbandServicesTrunkOverATM VoiceGateway SgV5UserAdaptation ApplicationServer ApplicationServerProcess SctpAssociation component.

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **packetsSent**

Description — This attribute counts the number of IP packets sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **packetsReceived**

Description — This attribute counts the number of IP packets received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **bytesSent**

Description — This attribute counts the number of bytes sent.

This count includes the Stream Control Transmission Protocol (SCTP) message headers and chunk headers but does not include the IP header.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **bytesReceived**

Description — This attribute counts the number of bytes received.

This count includes the Stream Control Transmission Protocol (SCTP)

Copyright © 2006, Nortel Nortel Confidential

message headers and chunk headers but does not include the IP header.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **dataChunksSent**

Description This attribute counts the number of Payload Data (DATA) chunks sent.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **dataChunksReceived**

Description This attribute counts the number of Payload Data (DATA) chunks received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **sackChunksSent**

Description This attribute counts the number of Selective Acknowledgement (SACK) chunks sent.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **sackChunksReceived**

Description This attribute counts the number of Selective Acknowledgement (SACK) chunks received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **heartbeatChunksSent**

Description This attribute counts the number of Heartbeat Request (HEARTBEAT) chunks sent.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **heartbeatChunksReceived**

Description This attribute counts the number of Heartbeat Request (HEARTBEAT) chunks received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **heartbeatAckChunksSent**

Description — This attribute counts the number of Heartbeat Acknowledgement (HEARTBEAT ACK) chunks sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **heartbeatAckChunksReceived**

Description — This attribute counts the number of Heartbeat Acknowledgement (HEARTBEAT ACK) chunks received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **errorChunksSent**

Description — This attribute counts the number of Operation Error (ERROR) chunks sent.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **errorChunksReceived**

Description — This attribute counts the number of Operation Error (ERROR) chunks received.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **invalidStreamIdErrorsSent**

Description — This attribute counts the number of "Invalid Stream Identifier" errors sent.

This corresponds to cause code 1 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **invalidStreamIdErrorsReceived**

Description — This attribute counts the number of "Invalid Stream Identifier" errors received.

This corresponds to cause code 1 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **protocolErrorsSent**

Description — This attribute counts the number of protocol errors sent.

This corresponds to the cause codes defined in RFC 2960:
2 - "Missing Mandatory Parameter"
6 - "Unrecognized Chunk Type"
7 - "Invalid Mandatory Parameter"
8 - "Unrecognized Parameters"
9 - "No User Data"

It also corresponds to cause code 13 for "Protocol Violation" defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **protocolErrorsReceived**

Description — This attribute counts the number of protocol errors received.

This corresponds to the cause codes defined in RFC 2960:
2 - "Missing Mandatory Parameter"
6 - "Unrecognized Chunk Type"
7 - "Invalid Mandatory Parameter"
8 - "Unrecognized Parameters"
9 - "No User Data"

It also corresponds to cause code 13 for "Protocol Violation" defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **outOfResourceErrorsSent**

Description — This attribute counts the number of "Out of Resource" errors sent.

This corresponds to error code 4 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **outOfResourceErrorsReceived**

Description — This attribute counts the number of "Out of Resource" errors received.

This corresponds to error code 4 defined in RFC 2960.

The counter counts the number of events in the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **invalidAssocRestartErrorsSent**

Description This attribute counts the number of "Restart of an association with new addresses" errors sent.

This corresponds to error code 11 defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **invalidAssocRestartErrorsReceived**

Description This attribute counts the number of "Restart of an association with new addresses" errors received.

This corresponds to error code 11 defined in the Stream Control Transmission Protocol (SCTP) Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **userInitiatedAbortsSent**

Description This attribute counts the number of "User Initiated Abort" indications sent by the local Stream Control Transmission Protocol (SCTP) user.

This corresponds to error code 12 defined in the SCTP Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **userInitiatedAbortsReceived**

Description This attribute counts the number of "User Initiated Abort" indications received from the peer Stream Control Transmission Protocol (SCTP) user.

This corresponds to error code 12 defined in the SCTP Implementer's Guide.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **checksumErrors**

Description This attribute counts the number of incoming packets that were discarded due to checksum verification failure.

Copyright © 2006, Nortel Nortel Confidential

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **retransmittedChunks**

Description This attribute counts the number of Payload Data (DATA) chunks retransmitted.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **gapAcknowledgementsSent**

Description This attribute counts the number of chunks reported to the far end in "Gap Ack" reports. This provides an indication of the number of chunks that were locally received out of order.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **gapAcknowledgementsReceived**

Description This attribute counts the number of chunks reported by the far end in "Gap Ack" reports. This provides an indication of the number of chunks that were received out of order by the far end.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **duplicateChunkReportsSent**

Description This attribute counts the number of chunks reported to the far end in "Duplicate TSN" reports. This provides an indication of the number of duplicate data chunks that were locally received.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Nsta Vgs SgV5 As Asp SctpAssoc **duplicateChunkReportsReceived**

Description This attribute counts the number of chunks reported by the far end in "Duplicate TSN" reports. This provides an indication of the number of duplicate data chunks that were received by the far end.

The counter counts the number of events in the collection interval.

Values Decimal (0..4294967295)

COLLECTED STATS DcmeLink VoiceService Framer

Description — The statistics record generated by the DcmeLink VoiceService Framer component.

ATTRIBUTE Dcl Vs Framer rxBytes

Description — This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Dcl Vs Framer rxFrames

Description — This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values — Long Integer

ATTRIBUTE Dcl Vs Framer txBytes

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Dcl Vs Framer txFrames

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Dcl Vs Framer rxTotalLinkUtil

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS PCUSupportApplication Connection PcmLink

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink component.

ATTRIBUTE Pcusa Conn PcmLk pduDn (pduDn)

Description — This attribute counts the BSSGP PDUs received from the SGSN by all the BVCs associated to this PCM link during the statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk **pduUp (pduUp)**

Description — This attribute counts the BSSGP PDUs transmitted to the SGSN by all the BVCs associated to this PCM link during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk **octetsDn (octDn)**

Description — This attribute counts the octets received by all the BVCs associated to this PCM link during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk **octetsUp (octUp)**

Description — This attribute counts the octets sent by all the BVCs associated to this PCM link during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk **psPaging (psPag)**

Description — This attribute counts the BSSGP PAGING PS PDUs received from the SGSN by this PCM link during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk **csPaging (csPag)**

Description — This attribute counts the BSSGP PAGING CS PDUs received from the SGSN by this PCM link during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk **dyAgprsLackOfTimeslots (dyAgprsLTs)**

Description — This attribute counts the number of time that the PCU has not been able to satisfy the request sent by the most loaded cell on which appears a lack of resource during the statistics collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS PCUSupportApplication Connection PcmLink LapdSignaling

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink LapdSignaling component.

ATTRIBUTE Pcusa Conn PcmLk LapdSig **framesLostOverflowUp (fLovfUp)**

Description — This attribute counts the uplink frames lost due to data overrun or receive buffer overflow during the statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk LapdSig **framesLostOverflowDn (fLovfDn)**

Description — This attribute counts the downlink frames which were not sent because of buffer overflow during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk LapdSig **errorsCRC (errCRC)**

Description — This attribute counts the frames with CRC errors which were received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk LapdSig **framesLostAlignment (fLAlign)**

Description — This attribute counts the frames lost due to abort or lack of alignment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk LapdSig **iFramesUp (iFrmUp)**

Description — This attribute counts the I frames received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk LapdSig **uiFramesUp (uiFrmUp)**

Description — This attribute counts the unnumbered I frames received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk LapdSig **iFramesDn (iFrmDn)**

Description — This attribute counts the I frames transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk LapdSig **uiFramesDn (uiFrmDn)**

Description — This attribute counts the unnumbered I frames transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS PCUSupportApplication Connection PcmLink Cell

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink Cell component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell **cellBVCI**

Description	This attribute indicates the corresponding BSSGP Virtual Channel Identifier during the statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Pcusa Conn PcmLk Cell **upMultiSlotRequests (upMSlotReq)**

Description	This attribute counts the multislot allocation requests received by the PCU from the mobile station during the statistics collection interval. Index 1 counts the number of 1- timeslot allocation requests. Index 2 counts the number of 2- timeslot allocation requests. Index 3 counts the number of 3- timeslot allocation requests. Index 4 counts the number of 4- or more timeslot allocation requests.
Vector of	Decimal (0..4294967295)
Index	Decimal (1..4)

ATTRIBUTE Pcusa Conn PcmLk Cell **upMultiSlotAllocations (upMSlotAll)**

Description	This attribute counts the multislot granted allocations received by the PCU from the mobile station during the statistics collection interval. Index 1 counts the number of 1- timeslot granted allocations. Index 2 counts the number of 2- timeslot granted allocations. Index 3 counts the number of 3- timeslot granted allocations. Index 4 counts the number of 4- or more timeslot granted allocations.
Vector of	Decimal (0..4294967295)
Index	Decimal (1..4)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnMultiSlotRequests (dnMSlotReq)**

Description	This attribute counts the multislot allocation requests received by the mobile station from the PCU during the statistics collection interval. Index 1 counts the number of 1- timeslot allocation requests. Index 2 counts the number of 2- timeslot allocation requests. Index 3 counts the number of 3- timeslot allocation requests. Index 4 counts the number of 4- or more timeslot allocation requests.
Vector of	Decimal (0..4294967295)
Index	Decimal (1..4)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnMultiSlotAllocations (dnMSlotAll)**

Description	This attribute counts the multislot granted allocations received by the mobile station from the PCU during the statistics collection interval. Index 1 counts the number of 1- timeslot granted allocations. Index 2 counts the number of 2- timeslot granted allocations.

Index 4 counts the number of 4- or more timeslot granted allocations.

Vector of — Decimal (0..4294967295)

Index — Decimal (1..4)

ATTRIBUTE Pcusa Conn PcmLk Cell fullDuplexTbfEstablishment (fdTbfEst)

Description — This attribute counts how many full duplex TBFs were established during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell upTbfReleases (upTbfRel)

Description — This attribute counts how many uplink TBFs were released during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell cumulativeTimeUpTbf (cumTimeUpTbf)

Description — This attribute indicates the cumulative duration of all uplink TBFs released during the statistics collection interval.

Values — Decimal (0..4294967295)

Units — seconds

ATTRIBUTE Pcusa Conn PcmLk Cell allocatedBlocksUpTbf (allBUpTbf)

Description — This attribute counts the blocks allocated for the uplink TBFs during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell nonAckUpTbfEstablishment (nAckUpTbfEst)

Description — This attribute counts the non-acknowledged uplink TBFs established during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell ackUpTbfEstablishment (ackUpTbfEst)

Description — This attribute counts the acknowledged uplink TBFs established during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell closeEndedUpTbfEstablishment (closeEndUpTbfEst)

Description — This attribute counts the close-ended uplink TBFs established during the statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfReleases (dnTbfRel)**

Description	This attribute counts how many downlink TBFs were released during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **cumulativeTimeDnTbf (cumTimeDnTbf)**

Description	This attribute indicates the cumulative duration of all downlink TBFs released during the statistics collection interval.
Values	Decimal (0..4294967295)
Units	seconds

ATTRIBUTE Pcusa Conn PcmLk Cell **nonAckDnTbfEstablishment (nAckDnTbfEst)**

Description	This attribute counts the non-acknowledged downlink TBFs established during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **ackDnTbfEstablishment (ackDnTbfEst)**

Description	This attribute counts the acknowledged downlink TBFs established during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dyAgprsNbModif (dyAgprsNbMod)**

Description	This attribute counts the modifications of Agprs timeslots allocated in the cell during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dyAgprsAvgNbTimeslots (dyAgprsAvgNbTs)**

Description	This attribute indicates the average number of Agprs timeslots allocated in the cell during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dyAgprsMinNbTimeslots (dyAgprsMinNbTs)**

Description	This attribute indicates the minimum number of Agprs timeslots allocated in the cell during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dyAgprsMaxNbTimeslots (dyAgprsMaxNbTs)**

Description	This attribute indicates the maximum number of Agprs timeslots allocated in the cell during the statistics collection interval.
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell **dyAgprsAvgLoadCriterion (dyAgprsAvgLdCrit)**

Description	This attribute indicates the average Agprs load criterion value during the statistics collection interval.
Values	Decimal (0..100)
Units	%

ATTRIBUTE Pcusa Conn PcmLk Cell **dyAgprsMaxLoadCriterion (dyAgprsMaxLdCrit)**

Description	This attribute indicates the maximum Agprs load criterion value during the statistics collection interval.
Values	Decimal (0..100)
Units	%

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfGoldSatisfactMore90pCent (dnTbfGSatM90)**

Description	This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfGoldSatisfactBet5090pCent (dnTbfGSatB5090)**

Description	This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfGoldSatisfactLess50pCent (dnTbfGSatL50)**

Description	This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfGoldRejectedForMinTput (dnTbfGRejMinTput)**

Description	This attribute counts the downlink TBFs with gold QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfSilverSatisfactMore90pCent (dnTbfSSatM90)**

Description	This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval.
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfSilverSatisfactBet5090pCent (dnTbfSSatB5090)**

Description — This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfSilverSatisfactLess50pCent (dnTbfSSatL50)**

Description — This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfSilverRejectedForMinTput (dnTbfSRejMinTput)**

Description — This attribute counts the downlink TBFs with silver QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfBronzeSatisfactMore90pCent (dnTbfBSatM90)**

Description — This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfBronzeSatisfactBet5090pCent (dnTbfBSatB5090)**

Description — This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfBronzeSatisfactLess50pCent (dnTbfBSatL50)**

Description — This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell **dnTbfBronzeRejectedForMinTput (dnTbfBRejMinTput)**

Description — This attribute counts the downlink TBFs with bronze QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval.

COLLECTED STATS PCUSupportApplication

Copyright © 2006, Nortel Nortel Confidential

Connection PcmLink Cell Tdma

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink Cell Tdma component.

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **localBusy (locBus)**

Description — This attribute counts the blocks sent with the window stalled indicator set during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **remoteBusy (remBus)**

Description — This attribute counts the blocks received with the window stalled indicator set during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **configuredTimeslots (cfgTs)**

Description — This attribute indicates the number of configured timeslots at the end of the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeUnavailableTimeslots (cumUnavailTs)**

Description — This attribute indicates the cumulative number of unavailable timeslots at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeUpActiveTimeslots (cumUpActTs)**

Description — This attribute indicates the cumulative number of active uplink timeslots bearing at least one TBF at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeUpTbfPerTimeslots (cumUpTbfPerTs)**

Description — This attribute indicates the cumulative number of uplink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeDnActiveTimeslots (cumDnActTs)**

Description This attribute indicates the cumulative number of active downlink timeslots bearing at least one TBF at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeDnTbfPerTimeslots (cumDnTbfPerTs)**

Description This attribute indicates the cumulative number of downlink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **nbSamples (nbS)**

Description This attribute indicates how many samples were taken during the statistics collection interval.

This value can be used with the cumulative attribute for average calculs.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **llcPacketsUp (llcPktUp)**

Description This attribute counts the LLC packets reassembled and transmitted to the LLC relay during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **dataBlocksUp (dataBUp)**

Description This attribute counts the uplink RLC data blocks received during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **controlBlocksUp (ctrlBUp)**

Description This attribute counts the uplink RLC control blocks received during the statistics collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **invalidBlocksUp (invalidBUp)**

Description — This attribute counts the uplink invalid radio blocks received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **invalidProtocolErrorBlocksUp (invalidProtErrBUp)**

Description — This attribute counts the uplink invalid radio blocks received with invalid RLC protocol during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **outOfSequenceBlocksUp (outOfSeqBUp)**

Description — This attribute counts the data blocks received uplink with Block Sequence Number outside the received window during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **packetAckNackUp (pktANUp)**

Description — This attribute counts the PACKET-UPLINK-ACK-NACK messages received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **totalRetransmissionRequested (totRtxReq)**

Description — This attribute counts the RLC/MAC block retransmission requests during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeUpRxQual (cumUpRxQual)**

Description — This attribute indicates the cumulative uplink RxQual value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeUpRxLev (cumUpRxLev)**

Description — This attribute indicates the cumulative uplink RxLev value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **nbSamplesUpQuality (nbSamplesUpQuality)**

Description — This attribute counts the samples for RxQual and RxLev cumulative values during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **llcPacketsDn (llcPktDn)**

Description — This attribute counts the LLC packets segmented into RLC data blocks received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **dataBlocksDn (dataBDn)**

Description — This attribute counts the downlink RLC data blocks transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **controlBlocksDn (ctrlBDn)**

Description — This attribute counts the downlink RLC control blocks transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **retransmittedDataBlocksDn (rtxDataBDn)**

Description — This attribute counts the data blocks retransmitted downlink during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **packetAckNackDn (pktANDn)**

Description — This attribute counts the PACKET-DOWNLINK-ACK-NACK messages transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **cumulativeDnRxQual (cumDnRxQual)**

Description — This attribute indicates the cumulative downlink RxQual value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **nbSamplesDnQuality (nbSamplesDnQuality)**

Description — This attribute counts the samples for RxQual cumulative values during the statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **tbfNormalReleaseUp (tbfNormRelUp)**

Description — This attribute counts the uplink TBFs which terminated normally during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **tbfNormalReleaseDn (tbfNormRelDn)**

Description — This attribute counts the downlink TBFs which terminated normally during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **noPacketResourceReq (noPktResReq)**

Description — This attribute counts the TBFs abnormally released due to non receipt of Packet Resource Request during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **lossOfComNN002Max (lOCNN002Max)**

Description — This attribute counts the TBFs abnormally released due to V(Q) non progression during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **lossOfComT3169 (lOCT3169)**

Description — This attribute counts the TBFs abnormally released due to timer T3169 expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **lossOfComNT0001 (lOCNT0001)**

Description — This attribute counts the TBFs abnormally released due to NT0001 timer expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **lossOfComT3195 (lOCT3195)**

Description — This attribute counts the TBFs abnormally released due to T3195 timer expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Tdma **lossOfComT3191 (lOCT3191)**

Description — This attribute counts the TBFs abnormally released due to T3191 timer expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS PCUSupportApplication

Copyright © 2006, Nortel Nortel Confidential

Connection PcmLink Cell Ccch

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink Cell Ccch component.

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfImmediateAssignment (immAssUp)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT messages generated by the PCU to the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfImmAssigRejectNoPdch (noPdch)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfImmAssigRejectNoTs (noTs)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfImmAssigRejectNoTbf (noTbf)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **channelRequest (chanReq)**

Description — This attribute counts CHANNEL-REQUEST messages received by the PCU from the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **packetResourceRequest (pktResReq)**

Description — This attribute counts PACKET-RESOURCE-REQUEST messages received by the PCU from the mobile station in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **deleteIndicationUp (delIndUp)**

Description — This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for uplink transfer is dropped during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **packetUpAssignment (pktUpAss)**

Description — This attribute counts PACKET-UPLINK-ASSIGNMENT messages generated by the PCU after a PACKET-RESOURCE-REQUEST in the second phase of the two_phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfPacketAccessRejectNoPdch (pktNoPdch)**

Description — This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfPacketAccessRejectNoTs (pktNoTs)**

Description — This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfPacketAccessRejectNoTbf (pktUpNoTbf)**

Description — This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **dnTbfImmediateAssignment (immAssDn)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT messages sent for a downlink TBF establishment from the PCU to the mobile station during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **pagingRequest (pagReq)**

Description — This attribute counts PAGING-REQUEST messages generated by the PCU to the mobile station during the statistics collection interval.

ATTRIBUTE Pcusa Conn PcmLk Bvc **maxSizeDataDn**

Description	This attribute indicates the largest size of LLC frame received during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **maxSizeDataUp**

Description	This attribute indicates the biggest size of LLC frames sent during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvcBlockRequests (bvcBReq)**

Description	This attribute counts BVC-BLOCK PDU messages sent by the BVC during the statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvcUnBlockRequests (bvcUBReq)**

Description	This attribute counts BVC-UNBLOCK PDU messages sent by the BVC during the statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvct1TimeOuts (t1TO)**

Description	This attribute counts BVC-BLOCK-ACK and BVC-UNBLOCK-ACK timer expiries during the statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvcResetRequestsUp (bvcResReqUp)**

Description	This attribute counts BVC-RESET PDU messages sent by a BVC during the statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvcResetRequestsDn (bvcResReqDn)**

Description	This attribute counts BVC-RESET PDU messages received by the BVC during the statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvct2TimeOuts (t2TO)**

Description	This attribute counts BVC-RESET-ACK timer expiries during the statistics collection interval.
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvcFlowControlRequests (bvcFCtrlReq)**

Description	This attribute counts FLOW-CONTROL-BVC PDUs sent by the BVC during the statistics collection interval.
Values	Decimal (0..65535)

ATTRIBUTE Pcusa Conn PcmLk Bvc **msFlowControlRequests (msFCtrlReq)**

Description	This attribute counts FLOW-CONTROL-MS PDUs sent by the BVC during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **llcDiscardedPdu (llcDiscPdu)**

Description	This attribute counts LLC-DISCARDED PDUs sent by the BVC during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **llcDiscardedOctets (llcDiscOct)**

Description	This attribute counts the octets discarded with a LLC-DISCARDED-INDICATION message sent by the BVC during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **nmStatusUp (nmStusUp)**

Description	This attribute counts NM-STATUS PDUs sent by a BVC during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **nmStatusDn (nmStusDn)**

Description	This attribute counts NM-STATUS PDUs received by a BVC during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **msFlushLLRequest (msFlushLLReq)**

Description	This attribute counts FLUSH-LL PDUs sent from the SGSN to the PCU during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **msRadioStatusInd (msRadStusInd)**

Description	This attribute counts INDICATION messages reporting that a radio exception condition occurred on the radio interface in the BVC during the statistics collection interval.
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk Bvc **msSuspendReq (msSusReq)**

Description — This attribute counts SUSPEND PDUs sent by the BVC during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **msRaCapabilityInd (msRaCapInd)**

Description — This attribute counts RA-CAPABILITY-INDICATION PDUs received by the BVC during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **msRaCapabilityUpdateReq (msRaCapUpdateReq)**

Description — This attribute counts RA-CAPABILITY-UPDATE PDUs sent by the BVC during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvct3TimeOuts (t3TO)**

Description — This attribute counts SUSPEND-ACK timer expiries during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvct5TimeOuts (t5TO)**

Description — This attribute counts RA-CAPABILITY-UPDATE-ACK timer expiries during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Bvc **msCellTransitionDn (msCellTransDn)**

Description — This attribute counts FLUSH-LL PDUs sent by the SGSN to the PCU when the mobile station located on a cell indicated by the BVCI has moved to another cell indicated to the new BVCI.

Values — Decimal (0..4294967295)

COLLECTED STATS PCUSupportApplication Connection PcmLink CgiCell

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink CgiCell component.

ATTRIBUTE Pcusa Conn PcmLk CgiCell **cellBVCI**

Description — This attribute indicates the corresponding BSSGP Virtual Channel Identifier during the statistics collection interval.

Values — Decimal (0..65535)

Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldSatisfactLess50pCent (dnTbfGSatL50)

Description	This attribute counts the downlink TBFs with gold QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfGoldRejectedForMinTput (dnTbfGRejMinTput)

Description	This attribute counts the downlink TBFs with gold QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverSatisfactMore90pCent (dnTbfSSatM90)

Description	This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell dnTbfSilverSatisfactBet5090pCent (dnTbfSSatB5090)

Description	This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval.
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk CgiCell **dnTbfSilverSatisfactLess50pCent (dnTbfSSatL50)**

Description — This attribute counts the downlink TBFs with silver QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell **dnTbfSilverRejectedForMinTput (dnTbfSRejMinTput)**

Description — This attribute counts the downlink TBFs with silver QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell **dnTbfBronzeSatisfactMore90pCent (dnTbfBSatM90)**

Description — This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate greater or equal to 90 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell **dnTbfBronzeSatisfactBet5090pCent (dnTbfBSatB5090)**

Description — This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate between 50 to 90 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell **dnTbfBronzeSatisfactLess50pCent (dnTbfBSatL50)**

Description — This attribute counts the downlink TBFs with bronze QOS that have a satisfaction rate lower than 50 per cent during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell **dnTbfBronzeRejectedForMinTput (dnTbfBRejMinTput)**

Description — This attribute counts the downlink TBFs with bronze QOS rejected at the establishment due to non allocation of corresponding minimum throughput during the statistics collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS PCUSupportApplication Connection PcmLink CgiCell Tdma

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink CgiCell Tdma component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **localBusy (locBus)**

Description — This attribute counts the blocks sent with the window stalled indicator set during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **remoteBusy (remBus)**

Description — This attribute counts the blocks received with the window stalled indicator set during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **configuredTimeslots (cfgTs)**

Description — This attribute indicates the number of configured timeslots at the end of the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **cumulativeUnavailableTimeslots (cumUnavailTs)**

Description — This attribute indicates the cumulative number of unavailable timeslots at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **cumulativeUpActiveTimeslots (cumUpActTs)**

Description — This attribute indicates the cumulative number of active uplink timeslots bearing at least one TBF at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **cumulativeUpTbfPerTimeslots (cumUpTbfPerTs)**

Description — This attribute indicates the cumulative number of uplink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **cumulativeDnActiveTimeslots (cumDnActTs)**

Description — This attribute indicates the cumulative number of active downlink timeslots bearing at least one TBF at the sample time during the statistics collection

Copyright © 2006, Nortel Nortel Confidential

interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma cumulativeDnTbfPerTimeslots (cumDnTbfPerTs)

Description This attribute indicates the cumulative number of downlink TBFs per timeslots for all the timeslots in the TDMA at the sample time during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma nbSamples (nbS)

Description This attribute indicates how many samples were taken during the statistics collection interval.

This value can be used with the cumulative attribute for average calculs.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma llcPacketsUp (llcPktUp)

Description This attribute counts the LLC packets reassembled and transmitted to the LLC relay during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma dataBlocksUp (dataBUp)

Description This attribute counts the uplink RLC data blocks received during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma controlBlocksUp (ctrlBUp)

Description This attribute counts the uplink RLC control blocks received during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma invalidBlocksUp (invalidBUp)

Description This attribute counts the uplink invalid radio blocks received during the statistics collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **invalidProtocolErrorBlocksUp (invalidProtErrBUp)**

Description — This attribute counts the uplink invalid radio blocks received with invalid RLC protocol during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **outOfSequenceBlocksUp (outOfSeqBUp)**

Description — This attribute counts the data blocks received uplink with Block Sequence Number outside the received window during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **packetAckNackUp (pktANUp)**

Description — This attribute counts the PACKET-UPLINK-ACK-NACK messages received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **totalRetransmissionRequested (totRtxReq)**

Description — This attribute counts the RLC/MAC block retransmission requests during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **cumulativeUpRxQual (cumUpRxQual)**

Description — This attribute indicates the cumulative uplink RxQual value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **cumulativeUpRxLev (cumUpRxLev)**

Description — This attribute indicates the cumulative uplink RxLev value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **nbSamplesUpQuality (nbSamplesUpQuality)**

Description — This attribute counts the samples for RxQual and RxLev cumulative values during the statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **llcPacketsDn (llcPktDn)**

Description — This attribute counts the LLC packets segmented into RLC data blocks received during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **dataBlocksDn (dataBDn)**

Description — This attribute counts the downlink RLC data blocks transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **controlBlocksDn (ctrlBDn)**

Description — This attribute counts the downlink RLC control blocks transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **retransmittedDataBlocksDn (rtxDataBDn)**

Description — This attribute counts the data blocks retransmitted downlink during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **packetAckNackDn (pktANDn)**

Description — This attribute counts the PACKET-DOWNLINK-ACK-NACK messages transmitted during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **cumulativeDnRxQual (cumDnRxQual)**

Description — This attribute indicates the cumulative downlink RxQual value during the statistics collection interval.

The average can be calculated by dividing this attribute value by the *nbSamples* value.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **nbSamplesDnQuality (nbSamplesDnQuality)**

Description — This attribute counts the samples for RxQual cumulative values during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **tbfNormalReleaseUp (tbfNormRelUp)**

Description — This attribute counts the uplink TBFs which terminated normally during the statistics collection interval.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **tbfNormalReleaseDn (tbfNormRelDn)**

Description — This attribute counts the downlink TBFs which terminated normally during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **noPacketResourceReq (noPktResReq)**

Description — This attribute counts the TBFs abnormally released due to non receipt of Packet Resource Request during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **lossOfComNN002Max (lOCNN002Max)**

Description — This attribute counts the TBFs abnormally released due to V(Q) non progression during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **lossOfComT3169 (lOCT3169)**

Description — This attribute counts the TBFs abnormally released due to timer T3169 expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **lossOfComNT0001 (lOCNT0001)**

Description — This attribute counts the TBFs abnormally released due to NT0001 timer expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **lossOfComT3195 (lOCT3195)**

Description — This attribute counts the TBFs abnormally released due to T3195 timer expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Tdma **lossOfComT3191 (lOCT3191)**

Description — This attribute counts the TBFs abnormally released due to T3191 timer expiry during the statistics collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS PCUSupportApplication Connection PcmLink CgiCell Ccch

Description — The statistics record generated by the PCUSupportApplication Connection PcmLink CgiCell Ccch component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **upTbfImmediateAssignment (immAssUp)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT messages generated by the PCU to the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **upTbfImmAssigRejectNoPdch (noPdch)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **upTbfImmAssigRejectNoTs (noTs)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **upTbfImmAssigRejectNoTbf (noTbf)**

Description — This attribute counts IMMEDIATE-ASSIGNMENT-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **channelRequest (chanReq)**

Description — This attribute counts CHANNEL-REQUEST messages received by the PCU from the mobile station in the first phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **packetResourceRequest (pktResReq)**

Description — This attribute counts PACKET-RESOURCE-REQUEST messages received by the PCU from the mobile station in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **deleteIndicationUp (delIndUp)**

Description — This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for uplink transfer is dropped during the statistics collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **packetUpAssignment (pktUpAss)**

Description This attribute counts PACKET-UPLINK-ASSIGNMENT messages generated by the PCU after a PACKET-RESOURCE-REQUEST in the second phase of the two_phase access uplink TBF establishment during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **upTbfPacketAccessRejectNoPdch (pktNoPdch)**

Description This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **upTbfPacketAccessRejectNoTs (pktNoTs)**

Description This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **upTbfPacketAccessRejectNoTbf (pktUpNoTbf)**

Description This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **dnTbfImmediateAssignment (immAssDn)**

Description This attribute counts IMMEDIATE-ASSIGNMENT messages sent for a downlink TBF establishment from the PCU to the mobile station during the statistics collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **pagingRequest (pagReq)**

Description This attribute counts PAGING-REQUEST messages generated by the PCU to the mobile station during the statistics collection interval.

Values Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **deleteIndicationDn (delIndDn)**

Description — This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for downlink transfer is dropped during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **packetDnAssignment (pktDnAss)**

Description — This attribute counts PACKET-DOWNLINK-ASSIGNMENT messages generated by the PCU to the mobile station in the downlink TBF establishment phase during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk CgiCell Ccch **dnTbfPacketAccessRejectNoPdch (pktDnNoPdch)**

Description — This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Piwf MIFramer txBytes

Description — This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Piwf MIFramer txFrames

Description — This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values — Long Integer

ATTRIBUTE Piwf MIFramer rxTotalLinkUtil

Description — This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values — Decimal (0..100)

COLLECTED STATS SignallingSystem7 MessageTransferPartLayer3

Description — The statistics record generated by the SignallingSystem7 MessageTransferPartLayer3 component.

ATTRIBUTE Ss7 Mtp3 linkSetsUnavailable (lsUnavail)

Description — This attribute indicates the number of linkset unavailable conditions over the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS SignallingSystem7 MessageTransferPartLayer3 Linkset Link

Description — The statistics record generated by the SignallingSystem7 MessageTransferPartLayer3 Linkset Link component.

ATTRIBUTE Ss7 Mtp3 Ls Lk pdusRx

Description — This attribute indicates the number of Protocol Data Units (PDUs) received from layer 2 over the collection interval.

This includes the PDUs with and without user payload.

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ss7 Mtp3 Ls Lk payloadPdusRx

Description — This attribute indicates the number of Protocol Data Units (PDUs) with payload received from layer 2 over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Mtp3 Ls Lk pdusTx

Description — This attribute indicates the number of Protocol Data Units (PDUs) sent to layer 2 over the collection interval.

This includes PDUs with and without user payload.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Mtp3 Ls Lk payloadPdusTx

Description — This attribute indicates the number of Protocol Data Units (PDUs) with payload sent to layer 2 over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Mtp3 Ls Lk invalidPdusRx

Description — This attribute indicates the number of number of invalid Protocol Data Units received over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Mtp3 Ls Lk sltFailures

Description — This attribute indicates the number of signalling link test message failure conditions over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Mtp3 Ls Lk changeovers

Description — This attribute indicates the number of link changeover conditions over the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS SignallingSystem7 SignallingConnControlPart

Description — The statistics record generated by the SignallingSystem7 SignallingConnControlPart component.

ATTRIBUTE Ss7 Sccp activeConnections

Description — This attribute indicates the number of the current open signalling connections for the *Ss7SignallingConnControlPart c*omponent at the end of the collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp rejectedConnections

Description This attribute indicates the number of rejected signalling connections for the *Ss7SignallingConnControlPart* component over the collection interval. The reasons include the subsystem being down, the number of open connections exceeding the limit specified by the attribute *maxConnections* and so on, at the end of the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp maxConnectionsExhausted

Description This attribute indicates the number of times a signalling connection establishment request by the application was refused because the number of open connections reached the limit specified by the attribute *maxConnections,* over the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp lostConnections

Description This attribute indicates the number of the open signalling connections lost due to unavailability of the SCCP Subsystem over the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp invalidMessages

Description This attribute indicates the number of invalid (syntax error or undecodable) messages received over the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp messagesTx

Description This attribute indicates the number of the messages sent to layer 3 over the collection interval. This includes maintenance messages.

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp payloadMessagesTx

Description This attribute indicates the number of payload messages transmitted over the collection interval.

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp messagesRx

Description This attribute indicates the number of the messages received from layer 3 over the collection interval. This includes maintenance messages.

Values Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp payloadMessagesRx

Description — This attribute indicates the number of payload messages received over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp localRoutingFailures

Description — This attribute indicates the number of the routing failures to the local subsystem over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp remoteRoutingFailures

Description — This attribute indicates the number of the routing failures to the remote subsystem over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 Sccp attemptedConnections (attCon)

Description — This attribute indicates the number of signalling connections that this *Ss7SignallingConnControlPart c*omponent has attempted to establish during the collection interval.

Values — Decimal (0..4294967295)

COLLECTED STATS SignallingSystem7 SaalNni

Description — The statistics record generated by the SignallingSystem7 SaalNni component.

ATTRIBUTE Ss7 SaalNni insvFailures

Description — This attribute indicates the number of in-service link outages over the collection interval. It does not include failures which occur during the alignment process.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 SaalNni pdusTx

Description — This attribute indicates the number of protocol data units transmitted over the collection interval.

Values — Decimal (0..4294967295)

ATTRIBUTE Ss7 SaalNni pdusRx

Description — This attribute indicates the number of protocol data units received over the collection interval.

Values — Decimal (0..4294967295)

COMPONENT HIERARCHY (EM)

Scope	Device
Description	*Em/string* This component represents the local node. An instance of the *EM* component class (with the local node name as its instance string) is automatically created as the root of the component hierarchy; that is, all of the top level components are its subcomponents. The local node name is provisioned as the *nodeName* attribute of the *ModuleData* component. An operator need not enter the *EM* component at the start of a component name; the local node is assumed by default. However, to specify some

Copyright © 2006, Nortel

Nortel Confidential

	other node, it must be entered. Similarly, on output, the local node name is suppressed.

Appendix: Data types

Attributes have data types that specify the structure of an attribute's data (for example, decimal, hexadecimal, enumeration, vector and array). Component instances also have data types.

The appendix is organized by data type. Each data type description includes information on the nature of the data type (that is, its structure and what it represents), and gives examples.

Attribute value data types

At their highest level, data types can be divided into *single-value* data types and *multiple-value* data types, as follows:

- Single-value data types represent a single value for the attribute. This group consists of the following:
  - signed integer
  - integer sequence
  - decimal number
  - fixed point decimal
  - hexadecimal number
  - hexadecimal string
  - dashed hexadecimal string
  - IP address
  - enumeration
  - string
  - Extended string
  - BCD
  - component name
  - link
  - time

Copyright © 2006, Nortel

Nortel Confidential

- Multiple-value data types are types that have more than one value associated with the attribute. Included in this group are:
  - set of...
  - list of...
  - vector of...
  - array of...
  - replicated

Component instance value data types

Component instance value data types represent a single value for the component. For details, refer to Component name type (page 580). Included in this group are:

- signed integer
- integer sequence
- decimal number
- hexadecimal number
- hexadecimal string
- dashed hexadecimal string
- IP address
- enumeration
- string
- BCD
- time

Component instances have one multiple-value data type: it is the multi-indexed component.

Syntax conventions

All command descriptions in this chapter follow these conventions:

- **bold** indicates a keyword explicitly typed by the operator
- square brackets, [], indicate optional parameters
- curled brackets, { }, indicates a choice of one of the items inside the brackets
- *<italic>* indicates a user-specified parameter
- an asterisk, *, indicates one or more of the previous items unless otherwise specified

Copyright © 2006, Nortel Nortel Confidential

Signed integer type

The *signed integer* type represents a 32-bit signed integer value. The supported values range from -2,147,483,648 to +2,147,483,647. On a text interface device, a signed integer type appears as follows:

attribute_name attribute_value

where:

attribute_value = [<sign>]<digit> [<digit>]* (that is, one or more digits)

where

sign = one of { **+, -** }

digit = one of { **0, 1, 2, 3, 4, 5, 6, 7, 8, 9** }

Examples
0, -0, +0, 00000

-123, 123, +123, 000123

Integer sequence type

The *integer sequence* type is used for Decnet addresses, AppleTalk addresses, and ObjectIds. On a text interface device, an integer sequence type appears as follows:

attribute_name attribute_value

where

attribute_value = <number>[<period><number>...]

where

number = ranges from { **0** to **4,294,967,295** }

period = { **.** }

Examples
1.3.5.1.2.1.10.18
(object identifier for ISO.org.dod.internet.mgmt.
Mib-2.transmission.ds1)

65535.255(highest AppleTalk address)

63.1023(highest DECnet address)

Decimal number type

The *decimal number* type represents a 32-bit or 64-bit decimal value. On a text interface device, you can set a decimal number type as follows:

set component_name attribute_name attribute_value

Copyright © 2006, Nortel Nortel Confidential

where:
attribute_value = <digit> [<digit>]* (that is, one or more digits)
digit = one of {0, 1, 2, 3, 4, 5, 6, 7, 8, 9}

Example

> set lp/3 customerIdentifier 55

Fixed point decimal type

The *fixed point decimal* type represents a scaled decimal number. On a text interface device, a fixed point decimal type is entered as follows:

set component_name attribute_name attribute_value

where:

attribute_value = <digits> [.<digits>]

digits = one or more of {0, 1, 2, 3, 4, 5, 6, 7, 8, 9}

Example
1.234

Hexadecimal number type

The *hex number* type represents a 32-bit numeric value which is input and output as a hexadecimal number. On a text interface device, a hex number type is entered as follows:

set component_name attribute_name attribute_value

where:

attribute_value = <hex_digit><hex_digit> [<hex_digit><hex_digit>] * (that is, from one to four pairs of hex digits)

hex_digit = one of { **0, 1, 2, 3, 4, 5, 6, 7, 8, 9, a, b, c, d, e, f, A, B, C, D, E, F**}

Example
aC15

Hexadecimal string type

The *hex string* type represents an *integer* value which is input and output as a hexadecimal number. On a text interface device, a hex string type is entered as follows:

attribute_name attribute_value

where:

attribute_value = [<hex_digit><hex_digit>] * (that is, zero or more pairs of hex digits)

hex_digit = one of { **0, 1, 2, 3, 4, 5, 6, 7, 8, 9, a, b, c, d, e, f, A, B, C, D, E, F**}

Copyright © 2006, Nortel Nortel Confidential

Example
15aC

Dashed hexadecimal string type

The *dashed hexadecimal string* type allows for IEEE802MAC addresses to be parsed and formatted. On a text interface device, a dashed hexadecimal string type appears as follows:

attribute_name attribute_value

where:

attribute_value = [<quote>] <hexDigit><hexDigit>[<dash> <hexDigit><hexDigit>...] [<quote>]

where:

quote = { **“** }

hexDigit = { **0 - 9, a - f, A - F** }

dash = { **-** }

Examples
3a

3a-fc

“ “ (zero hex characters for use within list, vectors, arrays, and replicated attributes)

3abc(missing dash, will be formatted with dash)

IP address type

The *IP address* type represents an IP address. On a text interface device, you can set an IP address type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = <number>.<number>.<number>.<number>
number = <digit>[<digit>[<digit>]] (that is, up to three digits. The value range is 0-255.)

Example
> set ipivc ipaddress 47.208.133.201

Enumeration type

The *enumeration* type represents a finite set of constants that are referred to symbolically by their name. On a text interface device, you can set an enumeration type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = <name> (the constant corresponding to desired value)

Copyright © 2006, Nortel Nortel Confidential

Example

> set shelf card/5 cardType DS1

String type

The *string* type represents an ASCII string. On a text interface device, you can set a string type as follows:

set component_name attribute_name attribute_value

where:

- for an ASCII string

  attribute_value = <ascii_only>
  ascii_only = [<printable_character>]*

  Note: If an ASCII string type contains the characters, {space,(!~/-} or), then the entire string must be enclosed by double quotes.

  printable_character = any printable character on the keyboard, including the space (no carriage returns, line feeds, tabs, or control characters)

  Note: For the component string instance values, characters are converted to upper case. Except for a single $, white space, empty strings, and < > / : * ” all string data type characters are valid.

- for a HEX string

  attribute_value = <hex>
  hex = [<hex_digit> <hex_digit>]* [<hex_ascii_toggle> <ascii_only> [<hex_ascii_toggle> <hex>]]*

  Note: If a hex string type contains the characters, {space,(!~/-} or), then the entire string must be enclosed by double quotes.

  hex_digit = one of {0, 1, 2, 3, 4, 5, 6, 7, 8, 9, a, b, c, d, e, f, A, B, C, D, E, F}

  hex_ascii_toggle = \x

Example

> set ac userid/JOE loginDirectory “/spooled/open”

Note: If the string is used as an attribute value, it is case-sensitive (as in the above example: “/spooled/open”). If the string is used as an instance value, it is not case-sensitive (as in the above example: JOE).

Extended string type

The *extended string* type allows for the parsing and displaying of mostly ASCII characters. However, extended characters are parsed and displayed through an escape syntax. The extended string type looks like a *string* type with an escape mechanism to enter non-ASCII characters. On a text interface device, an extended string type appears as follows:

attribute_name attribute_value

Copyright © 2006, Nortel Nortel Confidential

where:

attribute_value = <quoted string> | <unquoted string>]

where:

quoted string = { <quote> <any char> <any char>...<quote> }

where

quote = { " }

any char = { <ascii char> | <escaped hex> | <exception> }

ascii char = { any ASCII character other than <slash> or <quote> }

escaped hex = { <slash><hex digit><hex digit> }

exception = { <slash><slash> | <slash><quote> }

slash = { / }

hex digit = { a-f | A-F | 0-9 }

unquoted string = { <char><char><char>... }

char = { <alphanumeric> | <escaped hex> | <escaped ascii> }

alphanumeric = { a-z | A-Z | 0-9 }

escaped ascii = { <slash> <other ascii character> }

other ascii character = { any non-alphanumeric char }

Examples

Hello

"Hello, how are you?"(spaces and punctuation marks)

R\e9sum\E9(Résumé)

" R\e9sum\e9"(Résumé)

"She said \"Hello\"."(the " character)

"\ \"(the \ character)

hello\ there(the space character)

"" empty

Note: In some cases, the output may contain unexpected characters. For example, "é" may not represent "\e9" on some platforms.

Binary-coded decimal type

The binary-coded decimal (BCD) type represents a BCD entity (such as DNA). On a text interface device, you can set a BCD type as follows:

set component_name attribute_name attribute_value

Copyright © 2006, Nortel Nortel Confidential

where:

- for wildcarded BCD:

  attribute_value = [<digit>]* (that is, zero or more digits)
  digit = one of {0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ?}

Example

> set callRouter NPI/x121 dna/37498?736?53

- for other BCD:

  attribute_value = [<digit>]* (that is, zero or more digits)
  digit = one of {0, 1, 2, 3, 4, 5, 6, 7, 8, 9}

Example

> set fruni/34 dna dataNetworkAddress 374984736253

Component name type

The component name type represents the full name of a given component. On a text interface device, you can set a component name type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = [<component_type>[<separator> <component_instance>]]*
component_type = the type of component
separator = /
component_instance = simple or multi-indexed

simple = <decimal value> (see Decimal number type (page 575))
OR <enum_value> (see Enumeration type (page 577))
OR <hex_value> (see Hexadecimal string type (page 576))
OR <dashed_hex_string_value> (see Dashed hexadecimal string type (page 577))
OR <ip_address_value> (see IP address type (page 577))
OR <string_value> (see String type (page 578))
OR <bcd_value> (see Binary-coded decimal type (page 579))
OR <signed_integer_value> (see Signed integer type (page 575))
OR <integer_sequence_value> (see Integer sequence type (page 575))

multi-indexed = <simple>, <simple>, ...

Example

> set trk/111 addressplan addressPlanName routing dpn

Link type

The link type represents a bidirectional pointer between two components. The value of this data type consists of a component name. This “remote” component must contain an attribute whose value is compatible with the “local” component’s attribute value.

Copyright © 2006, Nortel Nortel Confidential

The text interface format for the link type is identical to that of the component name type.

Example

> set lp/1 mainCard shelf card/1

Time type

The time type represents a specific absolute time. On the text interface device, you can set a time type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = [<date> <separator>] <time> OR <date> [<separator> <time>]
date = <year> <dash> <month> <dash> <day>
year = <digit><digit><digit><digit>
month = <digit><digit>
day = <digit><digit>
separator = one of {SPACE, T}
time = <hours> [<colon> <minutes> [<colon> <seconds>]]
hours = <digit><digit>
minutes = <digit><digit>
seconds = <digit><digit>
digit = one of {0, 1, 2, 3, 4, 5, 6, 7, 8, 9}
dash = -
colon = :

Example

> set time networkTime 1995-09-11 13:34:02

Set of...type

The set of... type represents a collection of values whose elements must be from a fixed, discrete range of values. Each value in the set must only appear once. For example, if the set represents the 12 months of the year, then July, one month in the set, could only appear once.

The set of... type is available for the following single-value data types:

- decimal (see Decimal number type (page 575))
- enumeration (see Enumeration type (page 577))
- hex number (see Hexadecimal number type (page 576).)

All possible set type attribute values and the defaults are defined. For example, under the components *Nmis Session* the *dataStreams* attribute values are:

Set of alarm (ala) debug (deb) log scn
Default No default

There are no default values for the above example.

Copyright © 2006, Nortel Nortel Confidential

On a text interface device, you can set a set of... type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = <set_value> [<set_value>]*
set_value = <empty> (to empty the set) OR <delete> <value> (to delete a value) OR <value> (to add a value to the set)
empty = !
delete= ~
value = <decimal_value> OR <enumeration_value>

Note: You may be unfamiliar with the use of the tilde "~" character to remove values, therefore exercise extreme caution when using it in string types.

Example
The following example uses enum as the base data type.

> set nmis telnet session/1 dataStreams !

True sets and sets of flags
True sets only list those values that are ON. Sets of flags list every value. In tabular format, "*" indicates ON and "." indicates OFF; in nontabular format, nothing indicates ON, and "~" indicates ON. The figure, True sets (page 582), shows the tabular and nontabular output of true sets and the figure, Sets of flags (page 583), shows the tabular and nontabular output of sets of flags.

True sets

True set - tabular output

```
+==+-----+-----------------------------------------

                                                nothing = ON
                                                      ~ = OFF
```

List of... type

The list of... type represents a collection of values whose elements (in general) are not restricted to any fixed range. Each value in the list must only appear once. The number of values in a list may or may not be bounded.The list of... type is available for the following single-value data types:

- decimal (see Decimal number type (page 575))
- hex (see Hexadecimal string type (page 576))
- hex number (see Hexadecimal number type (page 576))
- dashed hex strings (see Dashed hexadecimal string type (page 577))
- IP Address (see IP address type (page 577))
- enumeration (see Enumeration type (page 577))
- string (see String type (page 578))
- extended ASCII string (see Extended string type (page 578))
- integer sequence (see Integer sequence type (page 575))

Copyright © 2006, Nortel Nortel Confidential

- signed numbers (see Signed integer type (page 575))
- fixed point decimal (see Fixed point decimal type (page 576))
- BCD (see Binary-coded decimal type (page 579))
- component name (see Component name type (page 580))
- link (see Link type (page 580))
- time (see Time type (page 581))

All possible values are specified for list of..types. If the size of the list is not specified, the list of values is limitless. The default value appears below the list of values.

Under the component *ModuleData*, the attribute *nodeId* defines all possible values as any number between 1 and 4095:

List of Decimal (1..4095)
Default No default

The default value is listed under the list of possible values. There are no default values set for the above example.

Under the Components *ModuleData, VirtualCircuitSystem*, the complete list of values for the attribute *segmentSize* appears as follows:

List of 1 2 4 6 8 16 32 64 128 256 512 1024 2048 4096
Default 128

The default value is 128.

On the text interface device, you can set a list of... type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = <list_value> [<list_value>]*
list_value = <empty> (to empty the list) OR <delete> <value> (to delete a value) OR <value> (to add a value to the list)
empty = !
delete = ~
value = <any single-value data type>

Example

> set sw avList base_AA0042 networking_AA0042 frameRelay_AA0042

Vector of... type

The vector of... type represents an indexed collection of values. The number of values in a vector is always fixed.

The vector of... type is available for the following types:

- decimal (see Decimal number type (page 575))

Copyright © 2006, Nortel Nortel Confidential

- fixed point decimal (see Fixed point decimal type (page 576))
- hex (see Hexadecimal string type (page 576))
- hex numbers (see Hexadecimal number type (page 576))
- dashed hex strings (see Dashed hexadecimal string type (page 577))
- IP address (see IP address type (page 577))
- enumeration (see Enumeration type (page 577))
- string (see String type (page 578))
- extended ASCII string (see Extended string type (page 578))
- signed number (see Signed integer type (page 575))
- BCD (see Binary-coded decimal type (page 579))

A vector of... type's index can be of the following types:

- decimal (see Decimal number type (page 575))
- enumeration (see Enumeration type (page 577))

The index values are included in the vector value information. The attribute c*onnectionPoolCapacity* belongs to the *AtmResourceControl* Component which resides under the *LogicalProcessor* component. The values are written as follows:

Vector of Decimal (0;512..4096)
Index Decimal (0..2)
Default ([3] 1536)

Vector of refers to the attribute type. Decimal refers to the type of value (decimal or enumeration). The numbers that appear in parenthesis define the possible values that each vector value may have. In the example, each vector value may be 0 or any number between 512 and 4096.

You can determine the size of the vector from the index numbers. The index numbers in the example are 0, 1 and 2. Therefore, there are 3 index values for this attribute.

The default values for the example is 1536. The 3 in square brackets denotes that the proceeding value is used the next three times. The vector default numbers for the example look like this:

Index	Attribute value
0	1536
1	1536
2	1536

Index values may be enumerated values or decimal values. The *frmSize* attribute under the *Test* component under *AtmIf* appears as follows:

Copyright © 2006, Nortel Nortel Confidential

Vector of Decimal (16..16000)
Index lowPriority
highPriority
Default (lowPriority: 8192, highPriority: 56)

The attribute values can be any number between 16 and 16,000. There are 2 index values; each one has a unique default value. This vector's default values can be illustrated as follows:

Index value	Attribute value
low priority	8192
high priority	56

On a text interface device, you can set a vector of... type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = <vector_value> [<vector_value>]*
vector_value = <index> <value>
index = <decimal_value> OR <enumeration_value>
value = <single-value data type>

Example
> set shelf card/5 test frmSize lowPriority 8100 highPriority 65

Array of... type

The array of... type represents a double-indexed (two-dimensional) collection of values. The number of values in an array is always fixed.

The array of... type is available for the following types:

- decimal (see Decimal number type (page 575))
- fixed point decimal (see Fixed point decimal type (page 576))
- hex (see Hexadecimal string type (page 576))
- hex numbers (see Hexadecimal number type (page 576))
- dashed hex strings (see Dashed hexadecimal string type (page 577))
- IP address (see IP address type (page 577))
- enumeration (see Enumeration type (page 577))
- string (see String type (page 578))
- extended ASCII string (see Extended string type (page 578))
- signed number (see Signed integer type (page 575))
- BCD (see Binary-coded decimal type (page 579))

Copyright © 2006, Nortel Nortel Confidential

An array of... type's index can be of the following types:

- decimal (see Decimal number type (page 575))
- enumeration (see Enumeration type (page 577))

Read the values of Nortel Multiservice Switch arrays from left to right.

The values of the *windowSize* attribute of the component *WindowOptions*, under the *ModuleData* component appears as follows:

Array of Decimal (1..63)
Row packet Size (pkt) [16 32 64 128 256 512 1024 2048 4096 8192 32768 65535]
Column throughput class (tpt) [Decimal (0..15)]
Default ([12*16] 4)

In the first line, the attribute type is defined as an array with possible values between 1 and 63 inclusive.

The index name for the row is packet size. The index numbers are listed, as they appear from left to right.

The column is named throughput class. The index numbers, from top to bottom, begin at 0 and increment by one up to and including 15.

All default values in the example are 4. In square brackets the 12 refers to the number of index items across the row. The 16 refers to the number of index items in the column. The 4 refers to the default value. Each default value is displayed when the values of each cell are different.

On a text interface, you can set an array of... type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = <array_value> [<array_value>]*
array_value = <index_name> <index> <index_name> <index> <value>
index = <decimal_value> OR <enumeration_value>
value = <single-value data type>

Example

> set mod vcs windowSize packetSize 16 throughputClass 0 8

Replicated types

A replicated type is a general indexed collection of values. The number of values in the replicated type (in general) is not set.

Replicated types support the following types for index and value:

- decimal (see Decimal number type (page 575))
- fixed point decimal (see Fixed point decimal type (page 576))

Copyright © 2006, Nortel Nortel Confidential

- hex (see Hexadecimal string type (page 576))
- dashed hex strings (see Dashed hexadecimal string type (page 577))
- IP address (see IP address type (page 577))
- enumeration (see Enumeration type (page 577))
- string (see String type (page 578))
- extended ASCII string (see Extended string type (page 578))
- integer sequence (see Integer sequence type (page 575))
- signed number (see Signed integer type (page 575))
- BCD (see Binary-coded decimal type (page 579))
- component name (see Component name type (page 580))
- time (see Time type (page 581))

On a text interface device, you can set a replicated type as follows:

set component_name attribute_name attribute_value

where:
attribute_value = <empty> (to empty all values) OR <remove> <index> (to delete a value) OR <index> <value> (to add a value)
empty = !
remove = ~
index = <any single-value data type>
value = <any single-value data type>

Example

> set fruni/34 dlci/18 dc natlFax 1 64

COMPONENT PortBridgeGroup (Pbg)

Instance	Decimal (0..15999)
Groups	GROUP Pbg CustomerIdentifierData (CidData) GROUP Pbg Provisioned (Prov) GROUP Pbg OsiState (State)
Scope	Device
Description	*PortBridgeGroup/n* This component manages the port bridging of a SONET interface. During software migration, the *PortBridgeGroup* component ensures that the traffic in and out of a SONET line on a migrating card is bridged to the card that is providing service. **Note**: There must be two *Pbg* components provisioned to achieve a Hitless Software Migration. **Note**: The *Lp/n Sonet/m Test* component functionality is not supported when that line is provisioned as either working or protection line of the *Pbg* component.
Mib	no_mib
Opt. Subcomp.	COMPONENT Pbg Sts
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Pbg CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Copyright © 2006, Nortel

Nortel Confidential

Mib	no_mib

ATTRIBUTE Pbg customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	no_mib
Values	Decimal (0; 1..8191)
Default	0

GROUP Pbg Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *Pbg* component.
Mib	no_mib

ATTRIBUTE Pbg workingLine (working)

Access	Read and write
Criticality	Process
Description	This attribute is a link to the *Sonet* component that provides the working line for the *Pbg* component. A value must be defined for this attribute. A pair of valid *workingLine* and *bridgeLine* pairs must exist. The following semantic checks exist for the *workingLine* and *bridgeLine* attributes: - the *workingLine* and *bridgeLine* attributes must link ports on two different LPs. - the instance numbers of *Sonet* and *SonetBridge* must match (for example, *Lp*/m *Sonet*/0 and *Lp*/n *SonetBridge*/0).

Copyright © 2006, Nortel Nortel Confidential

- the *Sonet* component specified by the *workingLine* attribute must not have any subcomponents.
- each LP component must link to exactly one card (the *Lp/n spareCard* attribute is not allowed to be set on either LP*).*
- each LP component must link to the same type of card (the *Shelf Card/n cardType* attribute must be identical for both cards).
- the two cards must be in adjacent slots in the shelf, with the lower-numbered slot being an even number.
- each LP component must link to the same *LogicalProcessorType* component.
- the connection pool attributes of the *Lp/n Eng Arc* components for the two LPs must have the same values.

Mib	no_mib
Values	Link (Hardware, lineAutomaticProtectionSwitch)
Default	No default

ATTRIBUTE Pbg bridgeLine (bridge)

Access	Read and write
Criticality	Process
Description	This attribute is a link to the *SonetBridge* component, which provides port bridging for the *Pbg* component. A value must be defined for this attribute. A pair of valid *workingLine* and *bridgeLine* pairs must exist as described in the *workingLine* attribute.
Mib	no_mib
Values	Link (Hardware, portBridgeGroupLink)
Default	No default

GROUP Pbg OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Pbg adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Pbg operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Pbg usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: no_mib

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Pbg availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions,

Copyright © 2006, Nortel Nortel Confidential

	the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.
Mib	no_mib
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Pbg proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: no_mib

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Pbg controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: no_mib

Set of:
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default	No default

ATTRIBUTE Pbg alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	no_mib
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Pbg standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

Copyright © 2006, Nortel Nortel Confidential

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: no_mib

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE Pbg unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: no_mib

Values:
false
true

Default: false

Description	This group contains the common operational data for the component.
Mib	no_mib

ATTRIBUTE Pbg Sts lopAlarm (lop)

Access	Read only
Description	This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have

Copyright © 2006, Nortel Nortel Confidential

been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib: no_mib

Values:
on
off

Default: No default

ATTRIBUTE Pbg Sts rxAisAlarm (ais)

Access: Read only

Description

This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib: no_mib

Values:
on
off

Default: No default

ATTRIBUTE Pbg Sts rxRfiAlarm (rfi)

Access: Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib: no_mib

Values:
on
off

Default: No default

ATTRIBUTE Pbg Sts signalLabelMismatch (slm)

Access: Read only

Description

This attribute displays whether the Path Payload Label Mismatch (P-PLM) or Path Unequipped (P-UNEQ) failure conditions have been entered.

A P-PLM failure condition is entered when P-PLM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A P-PLM defect occurs when detecting an unexpected path signal label. If the P-PLM defects are intermittently occurring, the P-PLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Payload Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

A P-UNEQ failure condition is entered when P-UNEQ defects have been observed and accumulated for a period of 2.5 seconds =/-0.5 seconds. A P-UNEQ defect occurs when detecting an unequipped path signal label. If the P-UNEQ defects are intermittently occurring, the P-UNEQ defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Unequipped failure condition is cleared. The condition is cleared when the P-UNEQ defect is absent for 10 seconds +/- 0.5 seconds.

Copyright © 2006, Nortel Nortel Confidential

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib: no_mib

GROUP Pbg Sts Provisioned (ChProv)

Properties	Provisioned
Description	This group contains the provisioning data for *Sts* components provisioned under *Sonet* components that support channelization..
Mib	no_mib

ATTRIBUTE Pbg Sts txPathTrace

Access	Read and write
Description	This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. The path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SONET frames. At the remote end, the path trace is reassembled, and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued. The functionality supported by this attribute is not available.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	String (0..64, ASCII)
Default	""

ATTRIBUTE Pbg Sts expectedRxPathTrace

Access	Read and write
Description	This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. The functionality supported by this attribute is not available.
Mib	no_mib
Values	String (0..64, ASCII)
Default	""

ATTRIBUTE Pbg Sts concatNumber

Access	Read and write
Criticality	Process
Description	This attribute specifies the STS concatenation level for the *Sts* component on channelized cards. It must be set to a concatenation level supported by the FP upon which the *Sts* is defined, except for non-channelized cards, in which case it must be set to 0. For example, a value of 1 in this attribute would represent STS-1 concatenation, while a value of 3 would represent STS-3c, a value of 12 would represent STS-12c, and so forth. *Sts* channelization to the tributary level is supported only if this attribute is set to 1.
Mib	no_mib
Values	Decimal (0; 1; 3; 12; 48)
Default	No default

COMPONENT Pbg Sts AtmCell (Cell)

Groups	GROUP Pbg Sts Cell Provisioned (Prov) GROUP Pbg Sts Cell Operational (Oper) GROUP Pbg Sts Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM

Copyright © 2006, Nortel Nortel Confidential

cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

GROUP Pbg Sts Cell Provisioned (Prov)

Properties Provisioned

Description
This group contains the provisioning attributes for the *AtmCell* component.

Mib no_mib

ATTRIBUTE Pbg Sts Cell alarmActDelay (act)

Access Read and write

Description
This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib no_mib

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Pbg Sts Cell scrambleCellPayload (scramble)

Access Read and write

Description
Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	off on
Default	No default

ATTRIBUTE Pbg Sts Cell correctSingleBitHeaderErrors

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	no_mib
Values	off on
Default	off

ATTRIBUTE Pbg Sts Cell clearDelay (clear)

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	no_mib
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Pbg Sts Cell hecSampleInterval (hSample)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: no_mib

Values: Decimal (0..25)

Units: seconds

Default: 0

ATTRIBUTE Pbg Sts Cell hecErrorLimit (hLimit)

Access: Read and write

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: no_mib

Values: Decimal (1..250000)

Default: No default

ATTRIBUTE Pbg Sts Cell lcdStateDelay (delay)

Access: Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The

Copyright © 2006, Nortel Nortel Confidential

valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	no_mib
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Pbg Sts Cell hecErrorIntervalLimit (hIntLimit)

Access	Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	no_mib
Values	Decimal (1..25)
Default	1

GROUP Pbg Sts Cell Operational (Oper)

Properties	Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib	no_mib

ATTRIBUTE Pbg Sts Cell lcdAlarm (lcd)

Access	Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure

Copyright © 2006, Nortel Nortel Confidential

alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

GROUP Pbg Sts Vt1dot5 CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib no_mib

ATTRIBUTE Pbg Sts Vt1dot5 customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib no_mib

Values Decimal (0; 1..8191)

Default 0

GROUP Pbg Sts Vt1dot5 OsiState (State)

Properties Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Pbg Sts Vt1dot5 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: no_mib

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Pbg Sts Vt1dot5 **usageState (osiUsage)**

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: no_mib

Values: idle
active (activ)
busy

Default: idle

ATTRIBUTE Pbg Sts Vt1dot5 **availabilityStatus (osiAvail)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	no_mib
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE **Pbg Sts Vt1dot5** **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: no_mib

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Pbg Sts Vt1dot5 controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: no_mib

Set of:
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

ATTRIBUTE Pbg Sts Vt1dot5 **alarmStatus (osiAlarm)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib: no_mib

Set of:
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	no_mib
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Pbg Sts Vt1dot5 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	no_mib
Values	false true
Default	false

Copyright © 2006, Nortel Nortel Confidential

GROUP Pbg Sts Vt1dot5 **IfEntryProv (IfEntry)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 **ifAdminStatus (ifState)**

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Pbg Sts Vt1dot5 **ifIndex (ifI)**

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	no_mib
Values	Decimal (1..65535)
Default	No default

GROUP Pbg Sts Vt1dot5 **OperationalStatus (OperStatus)**

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 **snmpOperStatus**
