COMPONENT Aal1CircuitEmulationService (Aal1Ces)

Instance	Decimal (1..65535)
Groups	GROUP Aal1Ces CustomerIdentifierData (CidData) GROUP Aal1Ces Provisioned (Prov) GROUP Aal1Ces OsiState (State) GROUP Aal1Ces Operational (Oper) GROUP Aal1Ces Statistics (Stats)
Scope	Application
Description	*Aal11CircuitEmulationService/n* An *Aal1Ces* component identifies an instance of the AAL1 Circuit Emulation Service. A separate instance of this component is required for each logical channel of a port which is offering a constant bit rate service to a customer. Instance numbers, which are used to uniquely identify *Aal1Ces* component instances, are arbitrary.

GROUP Aal1Ces CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	CircuitEmulationService
Values	Decimal (0; 1..8191)
Default	0

GROUP Aal1Ces Provisioned (Prov)

Properties	Provisioned
Description	This group contains basic provisioning data for the AAL1 Circuit Emulation Service.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces serviceType (servType)

Access	Read and write
Criticality	Process
Description	This attribute specifies the service type for the CES. In an ***unstructured*** service, the entire data stream at the service interface (including any framing bits which may be present) is passed across the network transparently.

Copyright © 2006, Nortel Nortel Confidential

The unstructured service uses the Unstructured Data Transfer (UDT) mode of AAL1.

In a structured service, an Nx64kbit/s fraction of the data stream at the service interface is passed across the network. Two modes of structured service are supported: ***basicStructured*** and ***casStructured***. In a ***casStructured*** service, the Channel Associated Signalling (CAS) bits are carried in a separate data structure from the Nx64 payload. In a ***basicStructured*** service, they are not.

The structured service uses the Structured Data Transfer (SDT) mode as defined in ITU-T Recommendation I.363.1.

The ***4pDS1Aal1*** and ***4pE1Aal1*** cards can support either a combination of ***casStructured*** and ***basicStructured*** services, or ***unstructured*** services. A combination of structured (either ***casStructured*** or ***basicStructured***) and ***unstructured*** services on the same ***4pDS1Aal1*** or ***4pE1Aal1*** card is not supported.

Mib	CircuitEmulationService
Values	unstructured basicStructured casStructured
Default	unstructured

ATTRIBUTE Aal1Ces bufferSize (bufSize)

Access	Read and write
Criticality	Component
Description	On ***4pDS1Aal1*** and ***4pE1Aal1*** cards, this attribute specifies the size of the AAL1 receive segment reassembly buffer in bytes. On initialization the buffer is filled to a level determined by *cellDelayVariationTolerance.* Thereafter the buffer is emptied as TDM frames are transmitted, and is filled as ATM cells are received. If the buffer overflows, sufficient data is discarded to bring the level down to that set after initialization. The cause of a buffer overflow may be one or a combination of any of the following: cell-arrival-jitter, initialization with delayed ATM cells, or TDM clock difference or wander. On ***4pDS1Aal1*** and ***4pE1Aal1*** cards, if this attribute is ***autoConfigure***, the buffer size applied is equivalent to two times *cellDelayVariationTolerance*. A provisioned numeric value of *bufferSize* must be higher than the equivalent *cellDelayVariationTolerance*, plus an allowance of one ATM Cell for the quantization of data in cells, and an allowance, if applicable, for the ATM overheads of structured CES. On the ***4pDS3ChAal1***, ***4pOC3ChSmIr***, ***2pSTM1eCh***, ***2pSTM1Ch*** and MSA cards, this attribute's value must be ***autoConfigure***, to acknowledge

Copyright © 2006, Nortel Nortel Confidential

	that *maximumBufferDelay* is provisioned instead of this attribute. Setting this attribute too low allows traffic with normal CDV to cause unnecessary loss of data on the service interface. Setting this attribute too high permits the buffer to introduce an unnecessarily high propagation delay.
Mib	CircuitEmulationService
Values	Decimal (94..15651) autoConfigure
Units	bytes
Default	autoConfigure

ATTRIBUTE Aal1Ces cellLossIntegrationPeriod (lossPeriod)

Access	Read and write
Description	This attribute specifies the cell loss integration period. This period defines the interval of time (in milliseconds) for which a loss of cells condition must persist before a buffer underflow alarm is raised. A loss of cells condition occurs when the flow of cells to the AAL1 reassembly buffer stops, causing a buffer underflow or starvation condition. The operational attribute *cellLossStatus* will be set to ***loss*** when the buffer underflow alarm is raised. Value ***noLoss*** indicate it has not experienced any cell loss. The minimum value of this attribute is 10 seconds for the ***4pDS3ChAal1*** card. The value ***autoConfigure*** corresponds to a period of 10 seconds on the ***4pDS3ChAal1*** card, and 2 seconds on all other cards.
Mib	CircuitEmulationService
Values	Decimal (1000..60000) autoConfigure
Units	msec
Default	autoConfigure

ATTRIBUTE Aal1Ces interfaceName (ifName)

Access	Read and write
Criticality	Component
Description	This attribute identifies the instance of *Chan* to which an instance of *Aal1Ces* is linked.
Mib	CircuitEmulationService

Copyright © 2006, Nortel Nortel Confidential

Values	Link (Hardware, applicationFramerName)
Default	No default

ATTRIBUTE Aal1Ces partialFill (partFill)

Access	Read and write
Criticality	Component
Description	A significant source of delay in a structured service is the amount of time it takes to collect enough data to fill a cell. This period of time can be reduced by sending cells that are only partially filled with data (*idlePattern* octets are added to the ATM payload beyond the partial fill level). This attribute specifies the number of payload octets to fill with data. It is applicable to structured services only, and must be set to ***47*** for unstructured services. On a given AAL1 Function Processor, the maximum cell rate that can be sustained is dependent upon the combined bandwidths of the provisioned services, and (for structured services) the levels of *partialFill*. The smaller the *partialFill* level, the greater the cell rate and hence the fewer the services that can be sustained at that fill level. On the ***4pDS3ChAal1***, ***4pOC3ChSmIr*** , ***2pSTM1eCh*** and ***2pSTM1Ch*** cards, the only allowed value for this attribute is ***47***.
Mib	CircuitEmulationService
Values	Decimal (8..47)
Units	octets
Default	47

ATTRIBUTE Aal1Ces idlePattern (idlePat)

Access	Read and write
Criticality	Component
Description	This attribute sets the unused byte fill pattern when using *partialFill*. All bytes in the cell above the *partialFill* level will be set to this pattern.
Mib	CircuitEmulationService
Values	Hex (H.0..H.ff)
Default	H.7e

ATTRIBUTE Aal1Ces cellLossRecoveryPeriod (recPeriod)

Access	Read and write
Description	This attribute specifies the cell loss recovery period. This period defines the interval of time (in seconds) for which a loss of cells condition must

Copyright © 2006, Nortel Nortel Confidential

desist before the buffer underflow alarm is cleared.

The operational attribute *cellLossStatus* will be set to ***noLoss*** when the buffer underflow alarm is cleared.

Mib	CircuitEmulationService
Values	Decimal (0..60)
Units	seconds
Default	20

ATTRIBUTE Aal1Ces dummyDataByte

Access	Read and write
Criticality	Component
Description	This attribute specifies the pattern which is played out onto the service interface to maintain bit integrity when data is unavailable from the ATM network. For an unstructured service (*serviceType* is set to ***unstructured***), *dummyDataByte* must be set to ***0xFF***. On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.
Mib	CircuitEmulationService
Values	Hex (H.0..H.ff)
Default	H.ff

ATTRIBUTE Aal1Ces maximumBufferDelay (maxBufDelay)

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum delay that a Cell Delay Variation buffer is permitted to add to the egress stream. The delay in the buffer is modified in response to variation in the egress cell stream. At the point that the delay would be modified in excess of the maximum, sufficient data is discarded that the delay returns to *cellDelayVariationTolerance*. Setting this attribute too low allows traffic with normal CDV to cause unnecessary loss of data on the service interface. Setting this attribute too high permits the buffer to introduce an unnecessarily high propagation delay. If this attribute is ***autoConfigure***, the maximum delay tolerated in the buffer is two times *cellDelayVariationTolerance.* On MSA cards, “best-effort” applies on a channel with high

Copyright © 2006, Nortel Nortel Confidential

cellDelayVariationTolerance and low ATM bandwidth. The value applied is the same as the range limit on provisioned *maximumBufferDelay* on that channel.

On MSA cards this attribute's value is rounded up to the nearest multiple of 0.125 ms when applied to the buffer. The range is nominally 0.12 to 63.62 ms, but the upper limit may be reduced by up to 6 ms one a channel with high *cellDelayVariationTolerance* and low ATM bandwidth.

On ***4pDS1Aal1*** and ***4pE1Aal1*** cards this attribute's value is rounded up to the nearest multiple of 1 ms when applied to the buffer. The upper limit is roughly inverse- proportional to the ATM bandwidth of the channel.

On the ***4pDS3ChAal1***, ***4pOC3ChSmlr***, ***2pSTM1eCh*** and ***2pSTM1Ch*** cards, this attribute's value is rounded up to the nearest multiple of 1 ms when applied to the buffer. The range is 2 to 32 ms in steps of 1 ms. Note that the *maximumBufferDelay* must be at least 1 ms greater than the *cellDelayVariationTolerance.*

Mib	CircuitEmulationService
Values	Decimal (0.01..655.00) autoConfigure
Units	msec
Default	autoConfigure

ATTRIBUTE Aal1Ces cellDelayVariationTolerance (cdvt)

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum time that a cell may arrive late, compared to a nominal time established at buffer initialization, without producing errors on the service interface. The nominal time of a cell's arrival is predicted according to the time interval required to transmit a cell's worth of data on the service interface. This attribute's value is the delay that the Cell Delay Variation Tolerance buffer adds to the egress stream immediately after the buffer initializes. The buffer absorbs variation in the arrival time of cells from the network, so that a steady stream of data appears on the service interface. If the buffer underflows, due to a late cell, fill-in data is output on the service interface while the buffer re-initializes. When the buffer has re-initialized, normal data is output on the service interface and the delay in the buffer is restored to the value of this attribute. This attribute must have a value lower than a numeric value of *maximumBufferDelay*. The relationship between this attribute and *bufferSize* is described under that attribute.

Copyright © 2006, Nortel Nortel Confidential

Setting this attribute too low allows traffic with normal CDV to cause unnecessary loss of data on the service interface. Setting this attribute too high imposes an unnecessarily high propagation delay on the egress stream.

On MSA cards this attribute's provisionable range is 0.01 to 31.87ms and the value applied is rounded up to the nearest multiple of 0.125ms. On ***4pOC3ChSmIr*** card, this attribute's provisionable range is 1 to 31ms in steps of 1ms. On ***2pSTM1Ch*** and ***2pSTM1eCh*** cards, this attribute's provisionable range is 1 to 28ms in steps of 1 ms.

On ***4pDS1Aal1*** and ***4pE1Aal1*** cards, this attribute's provisionable range is strongly dependent on the bandwidth of the channel, and the value applied is rounded up to the nearest whole number of milliseconds, then rounded down to the equivalent number of cells.

Mib	CircuitEmulationService
Values	Decimal (0.01..655.00)
Units	msec
Default	1.00

ATTRIBUTE Aal1Ces remoteEndType (remEndType)

Access	Read and write
Criticality	Process
Description	If this attribute is set to ***ces***, then the remote end Inter Working Function (IWF) is a CES IWF as defined by the ATM Forum. This is the default value for all card types. If this attribute is set to ***pvgExclusivePrs***, the remote end IWF is a CES IWF in a VSP (Voice Services function Processor) and the TDM channel is used as a PVG TDM service channel. Furthermore, the primary rate stream (that is, E1 or DS1 stream) that this CES uses cannot be shared with another CES with *remoteEndType* set to ***pvgExclusivePrs*** or ***pvgSharedPrs***. The Primary Rate Stream (PRS) may be shared with other *Aal1Ces* components with *remoteEndType* set to ***ces***. If this attribute is set to ***pvgSharedPrs***, the remote end IWF is a CES IWF in a VSP FP and the TDM channel is used as a PVG TDM service channel. The PRS may be shared with other *Aal1Ces* components with *remoteEndType* set to ***pvgSharedPrs*** or ***ces***.
Mib	CircuitEmulationService
Values	ces pvgSharedPrs pvgExclusivePrs
Default	ces

GROUP Aal1Ces OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	CircuitEmulationService
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Aal1Ces operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	CircuitEmulationService
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Aal1Ces usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	CircuitEmulationService
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Aal1Ces availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

Copyright © 2006, Nortel Nortel Confidential

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	CircuitEmulationService
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Aal1Ces proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	CircuitEmulationService
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Aal1Ces controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib	CircuitEmulationService
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Aal1Ces alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	CircuitEmulationService
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Aal1Ces standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	CircuitEmulationService
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Aal1Ces unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

Copyright © 2006, Nortel Nortel Confidential

	The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	CircuitEmulationService
Values	false true
Default	false

GROUP Aal1Ces Operational (Oper)

Properties	Operational
Description	This group contains status information about the AAL1 Circuit Emulation Service.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces cellLossStatus (cellLoss)

Access	Read only
Description	This attribute is set to ***loss*** when a buffer underflow alarm is raised (see *cellLossIntegrationPeriod*). A value of ***loss*** indicates that the connection is either currently experiencing cell loss, or has experienced some cell loss in the past, possibly during connection setup. A value of ***noLoss*** indicates that the connection has not experienced any cell loss.
Mib	CircuitEmulationService
Values	noLoss loss
Default	noLoss

ATTRIBUTE Aal1Ces aal1LayerLossStatus (aal1Loss)

Access	Read only
Description	This attribute is set to ***loss*** when an AAL1 layer alarm is raised, and ***noLoss*** when it is clear. This attribute and the AAL1 layer alarm are not supported by the ***4pDS3ChAal1***, ***4pOC3ChSmlr*** , ***2pSTM1eCh*** and ***2pSTM1Ch*** cards. Thus, this attribute does not appear for these two cards.
Mib	CircuitEmulationService
Values	noLoss loss
Default	noLoss

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Aal1Ces connectionStatus (connStatus)

Access	Read only
Description	This attribute indicates whether a service is non-operational because of a problem with the service interface side of the service (in which case, it is set to ***channelNotReady***) or because of a problem with the ATM side of the service (in which case, it is set to ***atmNotConfigured*** or ***atmNotReady***). When this attribute is set to ***channelNotReady***, it is an indication that the corresponding *Chan* component (as defined by the attribute *interfaceName*) or the *Chan* component's parent port component (*Lp/n Ds1/m* or *Lp/n E1/m*) is locked. When this attribute is set to ***atmNotConfigured***, it is an indication that no sub-component has been provisioned, and thus no ATM connection has been configured for the service. When this attribute is set to ***atmNotReady***, it is an indication that the ATM connection with which the service is associated (as defined by a sub-component) has been lost or that it is currently unable to carry CES data. This attribute is set to ***connected*** when a service is operational (that is, the OSI attribute *operationalState* is ***enabled***.)
Mib	CircuitEmulationService
Values	connected channelNotReady atmNotReady atmNotConfigured
Default	channelNotReady

GROUP Aal1Ces Statistics (Stats)

Properties	Operational
Description	This group contains statistical data for an AAL1 Circuit Emulation Service.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces cellsTransmitted (txCells)

Access	Read only
Description	This attribute counts the total number of cells transmitted to the backplane (ingress direction). This includes cells containing CBR data, trunk conditioning cells (structured services), and unframed AIS cells (unstructured services). The counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Aal1Ces cellsReceived (rxCells)

Access	Read only
Description	This attribute counts the total number of cells received from the backplane (egress direction). This includes CBR user data cells, cells with AAL1 header errors (correctable and non-correctable) and cells with AAL1 sequencing errors. The counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Long Integer
Default	No default

ATTRIBUTE Aal1Ces lostCells (lostCells)

Access	Read only
Description	This attribute counts the number of cells declared as never received by the AAL1 protocol layer. The counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Aal1Ces bufferUnderflows (uFlows)

Access	Read only
Description	This attribute counts the number of times the AAL1 reassembly buffer underflows. In the case of a continuous buffer starvation, a single buffer underflow event will be counted. The counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Aal1Ces bufferOverflows (oFlows)

Access	Read only
Description	This attribute counts the number of times the AAL1 reassembly buffer overflows. Buffer overflows occur when AAL1 cells arrive at a rate above that which is expected. Occurrences of this condition may be reduced by increasing the value of the attribute *bufferSize* or *maximumBufferDelay*. The buffer overflow counter wraps when the maximum value is exceeded.

Copyright © 2006, Nortel Nortel Confidential

Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Aal1Ces reassembledCells (reassCells)

Access	Read only
Description	This attribute counts the number of received cells whose payload has been played out to the service interface. The counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Long Integer
Default	No default

ATTRIBUTE Aal1Ces headerErrors (hdrErrors)

Access	Read only
Description	This attribute counts the number of cells received with AAL1 header errors. The counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Aal1Ces pointerReframes (ptrReframes)

Access	Read only
Description	This attribute counts the number of times that the AAL1 reassembly unit found an SDT pointer where it was not expected to be, and as a result had to reacquire it. Errors of this kind can occur because of problems at the far end. This attribute is meaningful for structured services only, and will be 0 for unstructured services. This counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Aal1Ces pointerParityErrors (ptrParityErrors)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of times that the AAL1 reassembly unit detects a parity check failure at the point where an SDT pointer is expected. Errors of this kind can occur because of problems at the far end. This attribute is meaningful for structured services only, and will be 0 for unstructured services. This counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Aal1Ces aal1SequenceErrors (seqErrors)

Access	Read only
Description	This attribute counts the number of times that the sequence number of an incoming AAL1 Type 1 SAR-PDU gets out of synchronization, as defined by ITU-T Recommendation I.363.1. This counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Aal1Ces misinsertedCells (misinsertCells)

Access	Read only
Description	This attribute counts the number of AAL1 sequence violations which the AAL convergence sublayer interprets as misinserted cells, as defined by ITU-T I.363.1. This counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Default	0

COMPONENT Aal1Ces NailedUpAdaptationPoint (Nap)

Groups	GROUP Aal1Ces Nap Provisioned (Prov)
Scope	Application
Description	*Aal1Ces/n NailedUpAdaptationPoint* A *NailedUpAdaptationPoint* is a nailed-up point which straddles the CBR/ATM domains and which is associated with the adaptation of CBR data to/

Copyright © 2006, Nortel Nortel Confidential

from ATM cells.

If a *NailedUpAdaptationPoint* component is provisioned under an *Aal1Ces* component, no other components may be provisioned under the same *Aal1Ces* component.

Mib — CircuitEmulationService

Common Verbs — Help, List, Display, Add, DELete

GROUP Aal1Ces Nap Provisioned (Prov)

Properties — Provisioned

Description — This group contains the provisioning data for the *NailedUpAdaptationPoint* component.

Mib — CircuitEmulationService

ATTRIBUTE Aal1Ces Nap atmConnection (ac)

Access — Read and write

Criticality — Component

Description — This attribute specifies the identity of the component to which the *NailedUpAdaptationPoint* is linked. This is an *AtmIf Vcc NailedUpEndPoint or an AtmIf Vpt Vcc NailedUpEndPoint* (the AAL1 cells are transported off the switch over an ATM UNI, where they are routed to the appropriate AAL1 entity at the other end by the ATM bearer service).

Mib — CircuitEmulationService

Values — Link (Service, applicationName)

Default — No default

COMPONENT Aal1Ces ActiveEndPoint (Aep)

Groups — GROUP Aal1Ces Aep ProvisionedEndPointAddresses (ProvEndPointAddr)
GROUP Aal1Ces Aep Provisioned (Prov)
GROUP Aal1Ces Aep EndPointAddressOper (EpOper)
GROUP Aal1Ces Aep ActiveEndPointOper (Out)

Scope — Application

Description — *Aal1Ces/n ActiveEndPoint*

The *ActiveEndPoint* component attempts to set up a switched virtual circuit automatically between two *Aal1Ces* components.

Copyright © 2006, Nortel Nortel Confidential

The *ActiveEndPoint* component will make connection setup attempts periodically whenever a connection has not been established. The component will cease connection setup attempts after a number of consecutive failed attempts, as specified by the *retryLimit* attribute.

The *ActiveEndPoint* component may also accept an incoming setup request if a connection is not already established. To be accepted, an incoming connection setup request must have originated from *remoteAddress*. Additionally, either connection attempts must have been ceased due to *retryLimit* consecutive failures, or the *localAddress* of the incoming connection setup request must be smaller than the *remoteAddress* of the request.

If an *ActiveEndPoint* component is provisioned under an *Aal1Ces* component, no other components may be provisioned under the same *Aal1Ces* component.

VERB Restart Aal1Ces Aep

Impact — Service

Description — This command is used to restart the automatic connections procedure. The operational attributes *retryTimerValue* and *retryFailures* will also be reset.

This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed, as specified by *retryLimit*, or before the limit has been reached.

This command may also be used when a connection has been established, in which case the connection will first be released.

This command will fail if the *channel* associated with the parent *Aal1Ces* component is disabled, or if *svcStatus* has the value ***initialising***. If *svcStatus* has the value ***failed***, this command may fail.

GROUP Aal1Ces Aep **ProvisionedEndPointAddresses (ProvEndPointAddr)**

Properties — Provisioned

Description — This group contains NSAP address provisioning data for components using switched virtual circuits.

Mib — CircuitEmulationService

ATTRIBUTE Aal1Ces Aep expectedRemoteAddress (expectedAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the expected remote address prefix for an incoming connection setup request. If *expectedRemoteAddress* is not empty, only matching connections will be considered for acceptance. If *expectedRemoteAddress* is 40 characters long, the remote address must match exactly to be accepted. If *expectedRemoteAddress* is less than 40 characters long, the remote address must begin with *expectedRemoteAddress* to be accepted. If *expectedRemoteAddress* is empty, the component will process connection requests from any remote address.
Mib	CircuitEmulationService
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Aal1Ces Aep localAddress (localAddr)

Access	Read and write
Criticality	Component
Description	This attribute specifies the local NSAP address. If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) has been provisioned, a default value for *localAddress* based on *nodePrefix* will be provided. If *ModuleData nodePrefix* has not been provisioned and one or more alternate switch prefixes (the *alternatePorsPrefixes* attribute of the *ModuleData* component) have been provisioned, a default value for *localAddress* based on the first provisioned *alternatePorsPrefix* value will be provided. If no switch prefixes have been provisioned, *localAddress* will default to an empty string. To obtain a valid default *localAddress* in this case, either or both of the *ModuleData nodePrefix* and *ModuleData alternatePorsPrefixes* attributes must be provisioned, and this end point component must then be deleted and re-added.
Mib	CircuitEmulationService
Values	String (40, ASCII)
Default	No default

GROUP Aal1Ces Aep Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data specific to the *ActiveEndPoint* component.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces Aep addressToCall (addrToCall)

Access	Read and write
Criticality	Component
Description	This attribute specifies the remote NSAP address which this *ActiveEndPoint* will call.
Mib	CircuitEmulationService
Values	String (40, ASCII)
Default	No default

ATTRIBUTE Aal1Ces Aep routingOption (routing)

Access	Read and write
Criticality	Component
Description	This attribute specifies the type of routing to use for establishing the connection: The ***4pDS3ChAal1***, ***4pOC3Chsmlr*** , ***2pSTM1eCh*** and ***2pSTM1Ch*** cards accept only ***atmOnly***. Multi-Service Access cards accept all four options and have a default value of ***porsOnly***. All other CES cards accept only ***porsOnly***. ***porsOnly*** means that only the Path Oriented Routing System may be used in establishing a connection. ***atmOnly*** means that only the native ATM Routing may be used in establishing a connection. ***porsFirst*** means that the switch tries to establish a connection using the Path Oriented Routing System first, and, if the connection cannot be established, it tries native ATM Routing instead. ***atmFirst*** means that the switch tries to establish a connection using native ATM Routing first, and, if the connection cannot be established, it tries the Path Oriented Routing System instead.
Mib	CircuitEmulationService
Values	porsOnly atmOnly

Copyright © 2006, Nortel Nortel Confidential

	porsFirst atmFirst
Default	No default

ATTRIBUTE Aal1Ces Aep profile (profile)

Access	Read and write
Criticality	Component
Description	This attribute specifies the PORS routing profile to use for this connection. If *profile* is empty, PORS will provide a default profile.
Mib	CircuitEmulationService
Values	Link (Service, users)
Default	No default

ATTRIBUTE Aal1Ces Aep firstRetryInterval (int)

Access	Read and write
Criticality	Component
Description	This attribute specifies the time to wait, in seconds, before attempting to establish the connection after the first failed attempt. The time to wait between subsequent call attempts will generally differ due to a backoff scheme. This attribute is not applicable for ***4pDS3ChAal1*** and ***4pOC3ChSmIr*** cards.
Mib	CircuitEmulationService
Values	Decimal (1..3600)
Units	seconds
Default	10

ATTRIBUTE Aal1Ces Aep retryLimit (limit)

Access	Read and write
Criticality	Component
Description	*retryLimit* specifies the maximum number of consecutive unsuccessful connection setup attempts that may be made before further attempts are abandoned. If this limit is reached, the *Restart* verb may be used to restart connection attempts.

Copyright © 2006, Nortel Nortel Confidential

If *retryLimit* is ***0***, there is no limit; attempts will continue indefinitely until a successful connection is established.

Mib	CircuitEmulationService
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Aal1Ces Aep activeEndPointType (type)

Access	Read and write
Criticality	Component
Description	*activeEndPointType* specifies the type of end point: ***svc*** or ***softPvc***. The default is ***svc***. When *activeEndPointType* is ***svc***, *calledVpiVci* is not relevant. When *activeEndPointType* is ***softPVC***, *routingOption* must be ***atmOnly***, and *profile* is not relevant.
Mib	CircuitEmulationService
Values	svc softPVC
Default	svc

ATTRIBUTE Aal1Ces Aep calledVpiVci (vc)

Access	Read and write
Criticality	Component
Description	*calledVpiVci* specifies the identity of the PVC at the remote ATM node on which the softPVC connection terminates. *calledVpiVci* is relevant only when *activeEndPointType* is set to ***softPVC***. The default value is ***0.1***
Mib	CircuitEmulationService
Values	Integer Sequence (0..4095; 1..65535)
Default	No default

GROUP Aal1Ces Aep EndPointAddressOper (EpOper)

Properties	Operational
Description	This group contains general operational attributes for components using switched virtual circuits.
Mib	CircuitEmulationService

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Aal1Ces Aep remoteAddress (remoteAddr)

Access	Read only
Criticality	Component
Description	*remoteAddress* is the address of the remote end point. If a connection is currently established, *remoteAddress* will contain the address of the remote end point. If a connection is not established, *remoteAddress* will be ***Unknown***.
Mib	CircuitEmulationService
Values	String (7..40, ASCII)
Default	No default

ATTRIBUTE Aal1Ces Aep lastTearDownCause (cause)

Access	Read only
Description	*lastTearDownCause* indicates the cause of the last connection tear down. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	CircuitEmulationService
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Aal1Ces Aep lastTearDownDiagnostic (diag)

Access	Read only
Description	*lastTearDownDiagnostic* provides a diagnostic to supplement the *lastTearDownCause* attribute.
Mib	CircuitEmulationService
Values	String (0..8, ASCII)

GROUP Aal1Ces Aep ActiveEndPointOper (Out)

Properties	Operational
Description	This group contains status information about the AAL1 Circuit Emulation Service *ActiveEndPoint* component.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces Aep svcStatus (status)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	*svcStatus* indicates the status of the incoming and outgoing connections. When this attribute has the value ***initialising***, it indicates that the component is initialising when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests will be processed. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***idle***, it indicates that a connection has not been established, and that no incoming setup requests will be processed. When this attribute has the value ***failed***, it indicates that the connections is in a state other than those described above.
Mib	CircuitEmulationService
Values	initialising connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Aal1Ces Aep lastSetupFailureCause (failCause)

Access	Read only
Description	*lastSetupFailureCause* indicates the cause of the last connection setup failure. The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.
Mib	CircuitEmulationService
Values	Decimal (0..255)
Default	No default

Description	*lastSetupFailureDiagnostic* provides a diagnostic to supplement the *lastSetupFailureCause* attribute.
Mib	CircuitEmulationService
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Aal1Ces Aep retryTimeRemaining (timer)

Access	Read only
Description	*retryTimerValue* is the current value of the retry timer for this connection; it indicates the number of seconds before the next connection attempt will be made. *retryTimerValue* is initialized when a connection attempt fails. When *retryTimerValue* reaches ***0***, an attempt will be made to establish the connection. When the timer is not running, for example when the connection has been established, *retryTimerValue* will be ***0***.
Mib	CircuitEmulationService
Values	Decimal (0..86400)
Units	seconds
Default	No default

ATTRIBUTE Aal1Ces Aep retryFailures (failures)

Access	Read only
Description	*retryFailures* counts the number of consecutive failed connection attempts. *retryFailures* is reset to ***0*** whenever a connection is successfully established, or the connection is restarted using the *Restart* verb. The counter wraps when the maximum value is exceeded.
Mib	CircuitEmulationService
Values	Decimal (0..2147483647)
Default	No default

COMPONENT Aal1Ces PassiveEndPoint (Pep)

Groups	GROUP Aal1Ces Pep ProvisionedEndPointAddresses (ProvEndPointAddr) GROUP Aal1Ces Pep EndPointAddressOper (EpOper) GROUP Aal1Ces Pep PassiveEndPointOper (PassiveOper)
Scope	Application
Description	*Aal1Ces/n PassiveEndPoint*

Copyright © 2006, Nortel Nortel Confidential

The *PassiveEndPoint* component provides a passive end point for a switched virtual connection between two applications.

A *PassiveEndPoint* awaits incoming connection setup requests. A setup request will only be accepted if a connection is not already established, and the request originated from *expectedRemoteAddress*.

If a *PassiveEndPoint* component is provisioned under an *Aal1Ces* component, no other components may be provisioned under the same *Aal1Ces* component.

Copyright © 2006, Nortel Nortel Confidential

VERB RERoute Aal1Ces LCo

Impact	Service
Description	RERoute ..Lc This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified. This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively. When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path. If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP Aal1Ces LCo PathData

Properties	Operational
Description	This group contains all operational attributes for the path oriented LCo.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces LCo state

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.
Mib	CircuitEmulationService
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Aal1Ces LCo overrideRemoteName (orn)

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	CircuitEmulationService
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Aal1Ces LCo end

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	CircuitEmulationService
Values	calling called
Default	No default

ATTRIBUTE Aal1Ces LCo costMetric (cost)

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	CircuitEmulationService
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Aal1Ces LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established.

Copyright © 2006, Nortel Nortel Confidential

	The delay for an LCo that is originated and terminated on the same module is 0.
Mib	CircuitEmulationService
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE Aal1Ces LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	CircuitEmulationService
Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE Aal1Ces LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.
Mib	CircuitEmulationService
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Aal1Ces LCo holdingPriority (hpri)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	CircuitEmulationService
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Aal1Ces LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Aal1Ces LCo requiredRxBandwidth (rbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value
Mib	CircuitEmulationService
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Aal1Ces LCo requiredTrafficType (rttyp)

Access	Read only
Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic

Copyright © 2006, Nortel Nortel Confidential

allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.

Mib	CircuitEmulationService
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE Aal1Ces LCo permittedTrunkTypes (pttyp)

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	CircuitEmulationService
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE Aal1Ces LCo requiredSecurity (rsec)

Access	Read only
Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	CircuitEmulationService

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..7)
Default	No default

ATTRIBUTE Aal1Ces LCo requiredCustomerParameter (rcparm)

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	CircuitEmulationService
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Aal1Ces LCo emissionPriority (epri)

Access	Read only
Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority*. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	CircuitEmulationService
Values	Decimal (0..2)
Default	No default

ATTRIBUTE Aal1Ces LCo discardPriority (dpri)

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority*. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces LCo pathType (pType)

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	CircuitEmulationService
Values	normal manual forced
Default	No default

ATTRIBUTE Aal1Ces LCo retryCount (rcount)

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.
Mib	CircuitEmulationService
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Aal1Ces LCo pathFailureCount (pfcount)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.
Mib	CircuitEmulationService
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Aal1Ces LCo reasonForNoRoute (rnr)

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

Default	none

ATTRIBUTE Aal1Ces LCo lastTearDownReason

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:

Copyright © 2006, Nortel Nortel Confidential

none - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.
normalShutDown - This path has gone down due to normal call termination.
insufficientTxLcOrBandwidth - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.
insufficientRxLcOrBandwidth - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
trunkFailure- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
trunkCardFailure- A trunk FP card has failed along the path.
accessCardFailure- The FP on which the peer access service was running has failed.
operatorForced- The path has terminated due to the operator locking a trunk along the path.
lostLcnClash- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
networkCongestion - The path has failed due to control information being lost and not recoverable.
trunkNotFound - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
farEndNotFound - The far end is not provisioned or is not up. Check remote Name.
wrongModuleReached - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
farEndBusy - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
callLoopedBack - This LCo is provisioned to call itself. Re-provision since this is invalid.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
remoteNameMismatch - The remote end has alarmed and rejected this setup due to remoteName provisioning.
serviceTypeMismatch - The remote Service Type does not match this service type. Check provisioning.
reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.

Copyright © 2006, Nortel Nortel Confidential

trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

ATTRIBUTE Aal1Ces LCo pathFailureAction

Access — Read only

Description — This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are

Copyright © 2006, Nortel Nortel Confidential

different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Mib	CircuitEmulationService
Values	reRoutePath disconnectConnection
Default	No default

ATTRIBUTE Aal1Ces LCo bumpPreference (bpref)

Access	Read only
Description	This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.
Mib	CircuitEmulationService
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE Aal1Ces LCo optimization (opt)

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

ATTRIBUTE Aal1Ces Reroute Ov protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature. ***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.
Mib	CircuitEmulationService
Values	localGlobal localOnly globalOnly localEbr ebrOnly sameAsARtgPnniReroute (sameAs)
Default	sameAsARtgPnniReroute

ATTRIBUTE Aal1Ces Reroute Ov numOptAttempts

Access	Read and write
Description	This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the

Copyright © 2006, Nortel Nortel Confidential

connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Mib	CircuitEmulationService
Values	Decimal (0..15) sameAsARtgPnniReroute (sameAs)

Default	No default

ATTRIBUTE Aal1Ces RerInfo localTimeOfLastRecovery (lTime)

Access	Read only
Description	This attribute indicates the date and time of the last local connection recovery. This attribute is only present if the connection segment has been granted the local rerouting protocol.
Mib	CircuitEmulationService
Values	Time (DHMS)
Default	No default

GROUP Aal1Ces RerInfo GlobalOperational (GOper)

Properties	Operational
Description	This group contains attributes that indicate the global rerouting characteristics of a connection. This group is only present if the connection segment has been granted the global rerouting protocol.
Mib	CircuitEmulationService

ATTRIBUTE Aal1Ces RerInfo globalRecoverySubscribed (gRecSub)

Access	Read only
Description	This attribute indicates whether the connection segment is subscribed to global connection recovery. This attribute is only present if the connection segment has been granted the global rerouting protocol.
Mib	CircuitEmulationService
Values	no yes

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Aal1Ces RerInfo globalOptimizationSubscribed (gOptSub)

Access	Read only
Description	This attribute indicates whether the connection segment is subscribed to global path optimization. This attribute is only present if the connection segment has been granted the global rerouting protocol.
Mib	CircuitEmulationService
Values	no yes
Default	No default

ATTRIBUTE Aal1Ces RerInfo globalOptimizationMetricValue (gOptVal)

Access	Read only
Description	This attribute indicates the global optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes. The ***primary*** and ***alternate*** values are used to denote optimization values for Specified Path connections. This attribute is only present if the connection segment has been granted the global rerouting protocol.
Mib	CircuitEmulationService
Values	Decimal (0..4294967292) primary alternate
Default	No default

ATTRIBUTE Aal1Ces RerInfo globalOptimalMetricValue (gOptMetVal)

Access	Read only
Description	This attribute indicates the global optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***globalOptimizationValue*** whenever a connection is optimized onto a path that has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous nodes.The ***primary*** and ***alternate*** values are used to denote the optimization values for Specified Path connections. This attribute is only present if the connection segment has been granted the global rerouting protocol.

Copyright © 2006, Nortel Nortel Confidential

Mib	CircuitEmulationService
Values	Decimal (0..4294967292) primary alternate
Default	No default

ATTRIBUTE Aal1Ces RerInfo globalOptimizationState (gOptSt)

Access	Read only
Description	This attribute indicates the current global optimization state of the connection segment. One of the following values is indicated: ***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value. ***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment that is greater than the value specified by the optimal metric value. ***optimized:*** This value represents the state when the connection segment has moved to a path that is better than the recovered path but not as good as the optimal path. This attribute is only present if the connection segment has been granted the global rerouting protocol.
Mib	CircuitEmulationService
Values	optimal recovered optimized
Default	No default

ATTRIBUTE Aal1Ces RerInfo globalTimeOfLastRecovery (gTime)

Access	Read only
Description	This attribute indicates the date and time of the last global connection recovery. This attribute is only present if the connection segment has been granted the global rerouting protocol.
Mib	CircuitEmulationService
Values	Time (DHMS)
Default	No default

COMPONENT ActiveAlarmServices (AAServ)

Scope	Device
Description	ActiveAlarmServices This component manages active alarms each of which resides on a running card. The term “active alarms” refers to a list of SET alarms without the matching CLR alarms that are generated by applications. The number of active alarms that a LP can store can be engineered via the *Lp Eng AAList Ov* component.
Mib	ActiveAlarmList
Common Verbs	Help List Display

VERB Replay AAServ

Impact	Passive
Description	Replay AAServ This verb causes all active alarms to be reissued to the NMIS session which issued the replay command. The maximum number of replay sessions allowed is eight. Also, concurrent replays from the same NMIS session are not supported. This verb is intended for use by MDM only and not recommended to be used by operators directly.

Nortel Confidential

VERB Clear **AAServ**

Impact	System_admin
Description	Clear -notificationId(<**id**>) -comment(<**text**>) AAServ This verb removes an alarm containing the specified notificationId from a list of active alarms. If the active alarm corresponding to the specified notificationId is removed successfully, a CLR alarm is issued. The alarm is sent to all active NMIS sessions including SNMP. If an alarm with the specified notificationId does not exist, then the command fails. **Options**: -notificationId(<id>) specifies the notification id of an active alarm to be removed. If the argument id is not specified, an error response is generated. -comment(<text>) specifies a comment text to be added to the CLR alarm when the active alarm is successfully removed.

Nortel Confidential

Mib	MgmtInterfaces
Set of	telnet
Default	No default

COMPONENT Ac Userid

Instance	String (1..8, ASCII)
Groups	GROUP Ac Userid Provisioned (Prov)
Scope	Application
Description	*AccessControl Userid/<string>* The *Userid* component holds all provisionable attributes for a userid. Every Network Management Interface requires a user to supply a valid userid and password to log in, like most computer systems. The instance value must be the userid string itself, consisting of 1-8 alphanumeric (letters and numbers) characters. Letters in the userid string are case-insensitive.
Mib	MgmtInterfaces
Common Verbs	Help List Display Add : System_admin DELete : System_admin

GROUP Ac Userid Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for a *Userid* component.
Mib	MgmtInterfaces

ATTRIBUTE Ac Userid password (passwd)

Access	Read: Illegal Write: System_admin
Description	This attribute holds a password for this user only if this user is to be authenticated locally by the node. If this user is to be authenticated remotely (for example, via a RADIUS server) then the password is left blank. This is a write-only attribute to provide additional security for passwords. The password string consists of 5-8 characters, which may be any printable ASCII characters. If the password string includes any non-alphanumeric character, such as $ or *, the entire string must be enclosed in double quotes. Letters in the password string are case-sensitive.
Mib	MgmtInterfaces
Values	String (0..8, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Ac Userid customerIdentifier (cid)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the Customer Identifier (CID) assigned to the user. The CID is used in Customer Network Management (CNM). A CNM operator may only send commands to components provisioned with the same CID as the operator. A CNM operator will only receive event data, such as alarms, which is generated by components provisioned with the same CID as the operator. The special CID of 0 is reserved for the network owner, known as the Netman. The CID attribute is compatible with DPN-100 Netman and Basic CIDs.
Mib	MgmtInterfaces
Values	Decimal (0..8191)
Default	0

ATTRIBUTE Ac Userid commandScope (scope)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the command scope assigned to the user. The scope determines the importance of the components on which the userid will be allowed to execute commands. Scope has three levels: 1) ***network*** scope implies the userid can manage components that affect the operation of the entire network, such as trunks. 2) ***device*** scope implies the userid can manage components that affect the operation of the entire node, such as processors or the file system. 3) ***application*** scope implies the userid can manage components that affect the operation of a single application. Note that scope is hierarchical: A user provisioned with ***network*** scope can also manage components with a scope of ***device*** or ***application***.
Mib	MgmtInterfaces
Values	network device application
Default	application

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ac Userid commandImpact (impact)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the command impact assigned to the user. The impact determines the importance of the commands which the userid will be allowed to execute. Impact has five levels: 1) ***debug*** impact implies the userid can issue all debugging commands. Debug is the highest impact level. 2) ***systemAdministration*** impact implies the userid can issue provisioning commands on security components. This means the userid can *Add*, *Delete*, *Display*, or *Set* the *Userid* and *IpAccess* subcomponents of *AccessControl*. 3) ***configuration*** impact implies the userid can issue provisioning commands to alter the provisioned configuration of the node, such as *Start Prov*, *Add*, *Delete*, and *Set*. 4) ***service*** impact implies the userid can issue operational commands which may affect the service of running components, such as *Lock* and *Unlock*. 5) ***passive*** impact implies the userid can only issue query commands which display unrestricted information but otherwise do not affect the operation or configuration of the node, such as *List* and *Display.* Passive is the lowest impact level. Note that impact is hierarchical: A user provisioned with ***debug*** impact can also issue all other commands at lower impact levels.
Mib	MgmtInterfaces
Values	debug systemAdministration configuration service passive
Default	passive

ATTRIBUTE Ac Userid allowedAccess (nmifs)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the set of network management interfaces through which the user will be allowed incoming access to the node. The *allowedAccess* attribute can be used to restrict a userid to a desired subset of the network management interfaces provided.

Copyright © 2006, Nortel Nortel Confidential

Mib	MgmtInterfaces
Set of	local remote (telnetSsh) fmip ftp
Default	(local)

ATTRIBUTE Ac Userid loginDirectory (dir)

Access	Read: System_admin Write: System_admin
Description	This attribute is the login directory for file system commands or FTP commands. The user will initially be placed in this directory upon logging in via Telnet, FMIP, Local, FTP or Ssh. The default value of "/" is the root of the /sfs/ shadowed file system.
Mib	MgmtInterfaces
Values	String (1..128, ASCII)
Default	/

ATTRIBUTE Ac Userid allowedOutAccess (outAccess)

Access	Read: System_admin Write: System_admin
Description	This attribute specifies whether the user is allowed to initiate outgoing Telnet access from the node.
Mib	MgmtInterfaces
Set of	telnet
Default	No default

ATTRIBUTE Ac Userid timeoutProtocol

Access	Read: System_admin Write: System_admin
Description	This attribute specifies whether the user's sessions will override the *timeoutPeriod* attribute of the *Telnet* or *Ssh* component. ***enabled***: The time-out protocol provisioned under the *Telnet* or *Ssh* component will be followed. ***disabled:*** The *Userid* is exempt from the time-out protocol.
Mib	MgmtInterfaces
Values	disabled enabled

Copyright © 2006, Nortel Nortel Confidential

Default	enabled

ATTRIBUTE Ac Userid remoteAuth

Access	Read: System_admin Write: System_admin
Description	This attribute specifies whether the user is to be authenticated locally by the node or remotely by an off-switch device such as a RADIUS server. The *password* attribute needs to be specified when the value of this attribute is set to ***disabled***. The default is ***disabled***. ***disabled***: The user is authenticated locally on the node. ***enabled:*** The user is authenticated remotely.
Mib	MgmtInterfaces
Values	disabled enabled
Default	disabled

COMPONENT Ac IpAccess

Instance	IP address
Groups	GROUP Ac IpAccess Provisioned (Prov)
Scope	Application
Description	*AccessControl IpAccess/<IP address>* This component represents a single “friendly” remote IP address which is permitted to call into the Telnet, FTP, FMIP or Ssh Interfaces on the node. All the friendly IP addresses must be provisioned as *IpAccess* components. The *IpAccess* components, taken together, form a complete list of all the IP addresses which are allowed access to the node’s Network Management Interfaces. This set of friendly IP addresses excludes all other addresses, restricting access only to the friendly computers. The instance value is the IP address itself, or an IP subnetwork address, entered in Internet nnn.nnn.nnn.nnn notation. An IP subnetwork address, in combination with the *ipAddressMask* attribute described below, may be provisioned to include an entire IP subnetwork into the friendly list with a single *IpAccess* component. Note that with the introduction of Telnet client capability, the *IpAccess* lists

Copyright © 2006, Nortel Nortel Confidential

must allow for the fact that Telnet access may now be from another node in the network, not just management workstations.

Mib: MgmtInterfaces

Common Verbs:
Help
List
Display
Add : System_admin
DELete : System_admin

GROUP Ac IpAccess Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for an *IpAccess* component.

Mib: MgmtInterfaces

ATTRIBUTE Ac IpAccess ipAddressMask (mask)

Access:
Read: System_admin
Write: System_admin

Description: This attribute indicates the bit mask indicating the significant bits which are used in the comparison of an incoming IP address against the “friendly” IP address in the instance value of the *IpAccess* component. This bit mask is ANDed to the incoming IP address, and ANDed to the instance value, before the comparison.

An IP subnetwork address, in combination with this bit mask attribute, may be provisioned to include an entire IP subnetwork into the friendly IP address list with a single *IpAccess* component.

Mib: MgmtInterfaces

Values: IP address

Default: 255.255.255.255

COMPONENT Ac Radius (Radius)

Groups:
GROUP Ac Radius Operational (Oper)
GROUP Ac Radius Provisioned (Prov)

Scope: Device

Description:
Ac Radius
This component contains all the provisioned and operational information necessary to support the RADIUS protocol as specified in RFC 2865.

The *Radius* component represents the on-switch RADIUS client that communicates with a RADIUS server to authenticate usernames and passwords for Telnet, FTP, FMIP, and Local sessions. The RADIUS server

Copyright © 2006, Nortel
Nortel Confidential

sends back user settings that are used to start a session. This component also represents the state of the node as a Network Access Server (NAS).

The *Radius* component must have at least one *Server* subcomponent provisioned. Note that a *Server* subcomponent is created automatically when the *Radius* component is first created.

Mib	OamRadius
Subcomponents	COMPONENT Ac Radius Server (Server)
Common Verbs	Help List Display Add : System_admin DELete : System_admin

GROUP Ac Radius Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Radius* component.
Mib	OamRadius

ATTRIBUTE Ac Radius badServerAddressPdus (badServerAdd)

Access	Read only
Description	This attribute counts the PDUs which are dropped because the source address in the PDU does not match the *serverIpAddress* specified by one *Ac Radius Server* component. Access to the node is rejected even if the rest of the contents of the RADIUS response PDU are correct. An increase in the value of this attribute may indicate an unauthorized attempt to gain entry into the node. The counter wraps to zero when it exceeds its maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

GROUP Ac Radius Provisioned (Prov)

Properties	Provisioned
Description	This group controls the provisioned attributes of the *Radius* component
Mib	OamRadius

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ac Radius nasIdentifier (nasId)

Access	Read: Service Write: System_admin
Description	This attribute specifies the IP address used by the node to communicate with the RADIUS server. This IP address must exist as a valid instance under the *VirtualRouter ProtocolPort IpPort LogicalInterface* component and the instance of the *VirtualRouter* component must have the *managementAccess* attribute set to ***enabled***. The IP Address specified by this attribute is known as a NAS (Network Access Server). ***In order to interoperate with a RADIUS server, the IP address specified by this attribute must be configured on the RADIUS server.*** The significance of this IP address is that it is sent as part of the RADIUS Access-Request PDU. The IP address is also used to configure the RADIUS server to allow authentication attempts from the node.
Mib	OamRadius
Values	IP address
Default	No default

ATTRIBUTE Ac Radius numberOfRetries (numRetries)

Access	Read: Service Write: System_admin
Description	This attribute specifies the number of times that a RADIUS Access-Request PDU is resent to a RADIUS server if a time-out occurs. If a time-out occurs while attempting to authenticate with a RADIUS server, the *timeouts* attribute under the *Server* subcomponent is incremented by one.
Mib	OamRadius
Values	Decimal (1..5)
Default	3

ATTRIBUTE Ac Radius requestTimeout (reqto)

Access	Read: Service Write: System_admin
Description	This attribute specifies the amount of time to wait for a RADIUS response from a RADIUS server after a RADIUS Access-Request PDU has been sent before declaring a time-out. This value should be increased if there are a large number of time-outs that occur due to latencies in the network or if a RADIUS server is slow to respond.

Copyright © 2006, Nortel Nortel Confidential

This value should be decreased if the authentication wait time needs to be reduced. However, decreasing the value may cause more authentication failures because the time specified is not sufficient to receive a RADIUS response PDU from the RADIUS server. Furthermore, a smaller value may result in more time-outs and therefore more retransmissions to occur.

Mib	OamRadius
Values	Decimal (1..15)
Units	seconds
Default	8

COMPONENT Ac Radius Server (Server)

Instance	Decimal (0..1)
Groups	GROUP Ac Radius Server OsiState (State) GROUP Ac Radius Server Operational (Oper) GROUP Ac Radius Server Provisioned (Prov)
Scope	Device
Description	*Ac Radius Server/n* The *Server* component contains all the provisioned and operational information necessary to describe interactions with a RADIUS server. When this component is in a locked state, authentication with the RADIUS server specified by the *serverIpAddress* attribute under the *Server* component is not possible. When this component is in an unlocked state, it becomes available to use for authentication. Note that there must be at least one *Server* component that is in an unlocked state at any time. If only one *Server* instance exists, it is not possible to lock it. The RADIUS server selected to use for authentication is the last one from which the RADIUS client has received a response to an authentication request, provided that the *Server* component is not locked. If the RADIUS client has not received a response from any servers, the servers are tried in numeric order. There must exist at least one instance of this component.
Mib	OamRadius
Common Verbs	Help List Display Add DELete LOCK Unlock

Copyright © 2006, Nortel Nortel Confidential

GROUP Ac Radius Server **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	OamRadius

ATTRIBUTE Ac Radius Server **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	OamRadius
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ac Radius Server **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	OamRadius
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Ac Radius Server **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	OamRadius
Values	idle active (activ) busy
Default	idle

GROUP Ac Radius Server **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the *Server* component.
Mib	OamRadius

ATTRIBUTE Ac Radius Server **accessRequests (req)**

Access	Read only
Description	This attribute counts the RADIUS Access-Request PDUs that are sent to this particular RADIUS server. The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **accessAccepts (acc)**

Access	Read only
Description	This attribute counts the RADIUS Access-Accept PDUs that are received from the RADIUS server with the minimum number of required Vendor-

Copyright © 2006, Nortel Nortel Confidential

	Specific Attributes (VSAs). The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **accessRejects (rej)**

Access	Read only
Description	This attribute counts the RADIUS Access-Reject PDUs that are received from this RADIUS server. The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **packetsDropped (pktdrop)**

Access	Read only
Description	This attribute counts the RADIUS PDUs that are dropped. A RADIUS PDU is dropped if there are no matching Access-Request PDUs for it. The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **accessRetransmissions (retran)**

Access	Read only
Description	This attribute counts the RADIUS Access-Request PDUs that are retransmitted to a RADIUS server due to a time-out. The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **timeouts (to)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the time-outs that have occurred for the *Server* component. A time-out occurs when a RADIUS Access-Request PDU has been sent, but a corresponding RADIUS Access-Accept or Access-Reject PDU has not been received from the RADIUS server within the time specified by the *requestTimeout* attribute under the *Radius* component. When a time-out occurs, the node retries the same server if the number of attempts on the same server is less than the number specified by the *numberOfRetries* attribute under the R*adius* component. If the number of attempts is greater than the *numberOfRetries* attribute, the next available RADIUS server is attempted. If a retry is attempted, the *accessRetransmissions* attribute is incremented. The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server badAuthenticators (badauth)

Access	Read only
Description	This attribute counts the RADIUS Access-Accept or Access-Reject PDUs that are received from this RADIUS server with an incorrect response authenticator. An increase in this attribute value may indicate that there is an attempt by a malicious attacker to gain access to the switch by “spoofing” RADIUS response PDUs. The response authenticator consists of a one-way MD-5 hash of the RADIUS PDU type, RADIUS PDU identifier, request authenticator, attributes, and the shared secret as specified in RFC 2865. The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server pendingRequests (pendReqs)

Access	Read only
Description	This attribute counts the RADIUS Access-Request packets destined for RADIUS server that have not yet timed-out or received a response. This variable is incremented when an Access-Request is sent. It is decremented when a matching RADIUS Access-Accept or Access-Reject PDU is received, or a time-out occurs.

Copyright © 2006, Nortel Nortel Confidential

Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **unknownTypes (unkwn)**

Access	Read only
Description	This attribute counts the RADIUS PDUs which are received from a RADIUS port that are of an unsupported RADIUS PDU type. The only RADIUS PDU types supported by the node are RADIUS Access-Accept and Access-Reject. All other RADIUS PDU types received by the node are considered invalid. The counter wraps to zero when it exceeds its maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **malformedAccessResponses (malResp)**

Access	Read only
Description	This attribute counts the malformed AccessResponses that are received by this Server. Malformed responses include RADIUS type PDUs with incorrect fields, non-RADIUS PDUs that are sent to this port, and Access-Accept PDUs that do not have the minimum number of required Vendor-Specific Attributes (VSAs). The counter wraps to zero when it exceeds the maximum value.
Mib	OamRadius
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Ac Radius Server **roundTripTime (rtt)**

Access	Read only
Description	This attribute measures the time interval between the most recent RADIUS Access-Request PDU sent to a RADIUS server and the corresponding RADIUS Access-Accept PDU or RADIUS Access-Reject PDU from that RADIUS server.
Mib	OamRadius
Values	Decimal (0..4294967295)

Units	seconds
Default	No default

GROUP Ac Radius Server **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisioned attributes of the *Server* component.
Mib	OamRadius

ATTRIBUTE Ac Radius Server **sharedSecret (secret)**

Access	Read: Illegal Write: System_admin
Description	This attribute specifies the key used for the MD-5 hashing algorithm for encrypting a password for transmission to a RADIUS server. It is stored using a symmetrical encryption algorithm. Since the key is large, it is recommended that it be generated randomly to further make the *sharedSecret* attribute difficult to guess by an attacker. It is also recommended that this attribute be changed in accordance with the encryption key change policies used by the network operator. This includes algorithms used for generating the *sharedSecret* string and frequency of change policies.
Mib	OamRadius
Values	String (16..64, ASCII)
Default	No default

ATTRIBUTE Ac Radius Server **serverIpAddress (servip)**

Access	Read: Service Write: System_admin
Description	This attribute specifies the IP address of the RADIUS server that is used by the node to authenticate usernames and passwords. IP addresses ending with 0 or 255 are not allowed. No IP address must end with 0 or 255 as these are typically used as broadcast addresses. In addition, the IP address cannot be greater than 224.0.0.0.
Mib	OamRadius
Values	IP address
Default	No default

ATTRIBUTE Ac Radius Server **serverPortNumber (servport)**

Access	Read: Service Write: System_admin

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the UDP port the node uses to send and receive RADIUS PDUs. The valid port addresses to use according to the RFC are 1645 or 1812. Port 1812 is specified by the latest RFC 2865.
Mib	OamRadius
Values	1645 1812
Default	1812

ATTRIBUTE Ac Radius Server ipStack

Access	Read: Service Write: System_admin
Description	This attribute specifies the IP stack to use for transmitting and receiving RADIUS PDUs between the node and RADIUS Server. If a value of ***ipiFrIpiVc*** is selected, then an *IpiFr* or *IpiVc* component must be provisioned on this module. If a value of ***vrIp*** is selected, then IP must be provisioned under the management VR on this module.
Mib	OamRadius
Values	ipiFrIpiVc vrIp
Default	ipiFrIpiVc

COMPONENT Ac Role

Instance	String (1..128, ASCII)
Groups	GROUP Ac Role Provisioned (Prov)
Scope	Application
Description	*AccessControl Role/<string>* A *Role* component represents a job function for a group of users. This component holds the provisionable attributes for a role. The instance value is the name of the role itself. The value is a string consisting of 1-128 alphanumeric (letters and numbers) characters. Letters in the *Role* component instance are case-insensitive.
Mib	MgmtInterfaces
Common Verbs	Help List Display Add : System_admin DELete : System_admin

GROUP Ac Role Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the provisionable attributes for a *Role* component.
Mib	MgmtInterfaces

ATTRIBUTE Ac Role customerIdentifier (cid)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the Customer Identifier (CID) assigned to the *Role* component. The CID is used in Customer Network Management (CNM). A CNM operator may only send commands to components provisioned with the same CID as the operator. A CNM operator will only receive event data, such as alarms, which is generated by components provisioned with the same CID as the operator. The special CID of 0 is reserved for the network owner, known as the Netman. The CID attribute is compatible with DPN-100 Netman and Basic CIDs.
Mib	MgmtInterfaces
Values	Decimal (0..8191)
Default	0

ATTRIBUTE Ac Role commandScope (scope)

Access	Read: System_admin Write: System_admin
Description	This attribute specifies the command scope assigned to the users with this role. The scope determines the components on which a user with this role will be allowed to operate on (that is, issue the display, set, add, and delete verbs). Scope has three levels: 1) ***network*** scope implies a user with this role can manage components that affect the operation of the entire network, such as trunks. 2) ***device*** scope implies a user with this role can manage components that affect the operation of the entire node, such as processors or the file system. 3) ***application*** scope implies a user with this role can manage components that affect the operation of a single application. Note that scope is hierarchical: A user provisioned with ***network*** scope can also manage components with a scope of ***device*** or ***application***.
Mib	MgmtInterfaces
Values	network device application
Default	application

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ac Role commandImpact (impact)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the command impact assigned to users with this role. The impact determines the importance of the commands which the users with this role will be allowed to execute. The impact has five levels: 1) ***debug*** impact implies a user with this role can issue all debugging commands. Debug is the highest impact level. 2) ***systemAdministration*** impact implies a user with this role can issue provisioning commands on security components. This means the users with this role can *Add*, *Delete*, *Display*, or *Set* the *Userid, Role* and *IpAccess* subcomponents of *AccessControl*. 3) ***configuration*** impact implies a user with this role can issue provisioning commands to alter the provisioned configuration of the node, such as *Start Prov*, *Add*, *Delete*, and *Set*. 4) ***service*** impact implies a user with this role can issue operational commands which may affect the service of running components, such as *Lock* and *Unlock*. 5) ***passive*** impact implies a user with this role can only issue query commands which display unrestricted information but otherwise do not affect the operation or configuration of the node., such as *List* and *Display*. Passive is the lowest impact level. Note that the impact is hierarchical: A user provisioned with ***debug*** impact can also issue all other commands at lower impact levels.
Mib	MgmtInterfaces
Values	debug systemAdmin config service passive
Default	passive

ATTRIBUTE Ac Role allowedAccess (nmifs)

Access	Read: System_admin Write: System_admin
Description	This attribute indicates the set of network management interfaces through which a user with this role will be allowed incoming access to the node. The *allowedAccess* attribute can be used to restrict a user with this role to a desired subset of the network management interfaces provided.

Copyright © 2006, Nortel Nortel Confidential

Mib	MgmtInterfaces
Set of	local remote (telnetSsh) fmip ftp
Default	(local)

ATTRIBUTE Ac Role allowedOutAccess (outAccess)

Access	Read: System_admin Write: System_admin
Description	This attribute specifies whether a user with this role is allowed to initiate outgoing Telnet access from the node.
Mib	MgmtInterfaces
Set of	telnet
Default	No default

ATTRIBUTE Ac Role loginDirectory (dir)

Access	Read: System_admin Write: System_admin
Description	This attribute is the login directory for file system commands or FTP commands. A user with this role will initially be placed in this directory upon logging in via Telnet, FMIP, Local, FTP or Ssh. The default value of "/" is the root of the /sfs/ shadowed file system.
Mib	MgmtInterfaces
Values	String (1..128, ASCII)
Default	/

ATTRIBUTE Ac Role timeoutProtocol

Access	Read: System_admin Write: System_admin
Description	This attribute specifies whether a user session with this role will override the *timeoutPeriod* attribute of the *Telnet* or *Ssh* component. ***enabled***: The time-out protocol provisioned under the *Telnet* or *Ssh* component will be followed. ***disabled:*** Users with this role are exempt from the time-out protocol.
Mib	MgmtInterfaces
Values	disabled enabled

Copyright © 2006, Nortel Nortel Confidential

Default	enabled

ATTRIBUTE Ac Role remoteOverride

Access	Read: System_admin Write: System_admin
Description	This attribute specifies whether or not remotely defined access privileges will override the privileges defined for this role. ***disabled***: The privileges assigned to this role are used. ***enabled:*** Privileges provided remotely will override any privileges defined for this role.
Mib	MgmtInterfaces
Values	disabled enabled
Default	enabled

COMPONENT AutomaticProtectionSwitching (Aps)

Instance	Decimal (0..15999)
Groups	GROUP Aps CustomerIdentifierData (CidData) GROUP Aps Provisioned (Prov) GROUP Aps OsiState (State) GROUP Aps Operational (Oper)
Scope	Device
Description	*AutomaticProtectionSwitching/n* This component manages the line protection of a SONET or SDH interface. Automatic Protection Switching (APS) can switch traffic from an active line onto a standby line when a failure or degradation occurs on the active line. The *Aps* component must have a valid *workingLine* attribute and a valid *protectionLine* attribute. **Note**: A *Test* component provisioned under *Lp/n Sonet/m* is dynamically deleted when that line is added into an APS group. This is because the *Aps* component has a dynamic test component of its own for testing the active line. The *Aps* component may be provisioned only on the Nortel Networks Multiservice 7400. The equivalent component on the Nortel Networks Multiservice Switch 15000 and the Nortel Networks Multiservice Switch 20000 is the *Laps* component.

VERB PROTECTIONLOCKOUT (PROTLOCK) Aps

Impact: Service

Description:

ProtectionLockout Aps/n
This command instructs the *Aps* component to lock out the protection line from being used as the receive active line, using the *nearEndRequest* ***lockoutOfProtection***. If the protection line is active when the *ProtectionLockout* command is entered the working line is made active, even if there is a failure or degradation present on the working line.

If the provisioned *mode* is ***unidirectional*** and a *nearEndRequest* of ***lockoutOfProtection*** is already in effect then this command is ignored. If the provisioned *mode* is ***bidirectional*** and a *nearEndRequest* or *farEndRequest* of ***lockoutOfProtection*** is already in effect then this command is ignored.

This command can be issued if the *Aps* component is either unlocked or locked. It remains in effect until cancelled with the *Clear* command.

VERB SWITCH Aps

Impact: Service

Description:

Switch [-force] [-workingToProtection] [-protectionToWorking] Aps/n
This command instructs the *Aps* component to switch the *nearEndRxActiveLine* attribute from the working line to the protection line (or vice versa) using the *nearEndRequest attribute to* ***manualSwitch***.

If the *-force* option is specified, the *Aps* component is instructed to switch using the higher priority value of ***forcedSwitch for the*** *nearEndRequest attribute*.

If the *-workingToProtection* option is specified, the *Aps* component switches the *nearEndRxActiveLine* from the working line to the protection line.

If the *-protectionToWorking* option is specified, the *Aps* component switches the *nearEndRxActiveLine* attribute from the protection line to the working line.

If a *nearEndRequest* of equal or higher priority is already in effect then this command will be ignored. The command will also be ignored if the provisioned *mode* is ***bidirectional*** and a *farEndRequest* of equal or higher priority is already in effect. For the list of request priorities refer to the description of the *nearEndRequest* attribute of the *Aps* component.

If the *-force* option is specified, this command can be issued when the *Aps* component is either unlocked or locked; otherwise it can only be issued when the *Aps* component is unlocked. It remains in effect until cancelled with the *Clear* command, or until a *nearEndRequest* (or *farEndRequest* if the provisioned *mode* is ***bidirectional***) of higher priority goes into effect.

Copyright © 2006, Nortel Nortel Confidential

VERB CLEAR Aps

Impact	Service
Description	*Clear Aps/n* This command clears the *nearEndRequest*s ***lockoutOfProtection***, ***forcedSwitch***, and ***manualSwitch***. This command can be issued when the *Aps* component is either unlocked or locked.

GROUP Aps CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Aps

ATTRIBUTE Aps customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Aps
Values	Decimal (0; 1..8191)
Default	0

GROUP Aps Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *Aps* component.
Mib	Aps

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Aps applicationFramerName (framer)

Access	Read and write
Description	This attribute is a link to the service component which utilizes the protected *Sonet* or *Sdh* interface managed by the *Aps* component.
Mib	Aps
Values	Link (Service, interfaceName)
Default	No default

ATTRIBUTE Aps workingLine (working)

Access	Read and write
Description	This attribute is a link to the *Path* component whose parent *Sonet* or *Sdh* component provides the *Aps* component's working line. A value must be defined for this component. The working line must exist under the same *Lp* component as the protection line and must link to a *Path* component under the same type of port component (*Sonet* or *Sdh*) as the protection line. Valid *workingLine* attribute and *protectionLine* attribute pairs must exist. For APS compatible cards the *workingLine* attribute and *protectionLine* attribute pairs must be provisioned on consecutive ports. For example, port 0 would be paired with port 1 and port 2 with port 3, and if the *workingLine* attribute is linked to a *path* component on port 0, then the *protectionLine* attribute must be linked to a *path* component on port 1. Sonet APS is available on cards of type ***2pOC3SmAtm2 and 2pOC3MmAtm2.***
Mib	Aps
Values	Link (Service, applicationFramerName)
Default	No default

ATTRIBUTE Aps protectionLine (protection)

Access	Read and write
Criticality	Process
Description	This attribute is a link to the *Path* component whose parent *Sonet* or *Sdh* component provides the *Aps* component's protection line. A value must be defined for this component. This attribute is critical because the APS process runs on the LP associated with the protectionLine. The protection line must exist under the same *Lp* component as the working line, and must link to a *Path* component under the same type of port component (*Sonet* or *Sdh*) as the working line.

Copyright © 2006, Nortel Nortel Confidential

Valid *workingLine* attribute and *protectionLine* attribute pairs must exist. For APS compatible cards the *workingLine* attribute and *protectionLine* attribute pairs must be provisioned on consecutive ports. For example, port 0 would be paired with port 1 and port 2 with port 3, and if the *workingLine* attribute is linked to a *path* component on port 0, then the *protectionLine* attribute must be linked to a *path* component on port 1.

Sonet APS is available on cards of type ***2pOC3SmAtm2***, ***and 2pOC3MmAtm2.***

Mib	Aps
Values	Link (Hardware, applicationFramerName)
Default	No default

ATTRIBUTE Aps mode

Access	Read and write
Description	This attribute specifies the protection mode to use. It has possible values of ***unidirectional*** and ***bidirectional***. The ***unidirectional*** mode allows the *Aps* component to decide independently of the far end which channel, either working or protection, is active for receive. For this value, the transmit and receive may be on different channels. Therefore one end may receive from the protection line while the other end receives from the active line. The ***bidirectional*** mode instructs the *Aps* component to decide jointly with the far end which channel, either working or protection, is active for receive.For this value, the transmit and receive is to be on the same channel. Therefore both the ends receive from the same line. Note that if either end is set to ***unidirectional***, the link operates in ***unidirectional*** mode. Note that while an *Aps Test* component is being run, the *Aps* component operates in unidirectional mode, regardless of the actual provisioned mode.
Mib	Aps
Values	unidirectional bidirectional
Default	unidirectional

ATTRIBUTE Aps revertive

Access	Read and write
Description	This attribute specifies whether revertive switching is to be used.

Copyright © 2006, Nortel Nortel Confidential

When this attribute is ***no***, the *Aps* component will not revert the receive active line from protection back to working when a working line request is cleared.

When this attribute is ***yes***, the *Aps* component will revert the receive active line from protection back to working when a working line request is cleared, after the provisioned *waitToRestorePeriod* has expired.

Note that it is acceptable for the near end and far end to be provisioned with a mix of revertive and non-revertive switching; one end can be revertive and the other non-revertive.

Mib	Aps
Values	no yes
Default	no

ATTRIBUTE Aps holdOffTime (hoTime)

Access	Read and write
Description	This attribute specifies delay between the detection of a Signal Fail or Signal Degrade on the active line and the initiation of a switchover.
Mib	Aps
Values	Decimal (0.0..10.0)
Units	seconds
Default	0.0

ATTRIBUTE Aps waitToRestorePeriod (wtrPeriod)

Access	Read and write
Description	This attribute specifies the time during which the protection line will remain the receive active line after the working line recovers from the fault that caused the switch. This attribute is only applicable when the provisionable attribute *revertive* has a value of ***yes***.
Mib	Aps
Values	Decimal (5..12)
Units	minutes
Default	5

ATTRIBUTE Aps signalDegradeRatio (sdRatio)

Access	Read and write
Description	This attribute specifies the minimum bit error ratio (BER) for which a Signal Degrade failure is declared. Its value is the exponent of the BER, with

Copyright © 2006, Nortel Nortel Confidential

possible values of ***-5*** through ***-9*** inclusive, which correspond to a BER range of 10e-5 through 10e-9.

The switch initiation time for a Signal Degrade varies depending on the observed BER (*not* the provisioned *signalDegradeRatio*), as described in the following table.

BER - Switch Initiation Time
10e-3 - 10 milliseconds
10e-4 - 100 milliseconds
10e-5 - 1 second
10e-6 - 10 seconds
10e-7 - 100 seconds
10e-8 - 16 minutes 40 seconds
10e-9 - 2 hours 46 minutes 40 seconds

The clearing threshold for a Signal Degrade is one-tenth the *signalDegradeRatio*; for example, if the provisioned *signalDegradeRatio* is ***-5***, the corresponding clearing threshold will be 10e-6. The clearing time varies depending on the clearing threshold (*not* the observed BER), and can be determined from the above table.

Mib — Aps

Values — Signed (-9..-5)

Default — -5

GROUP Aps OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — Aps

ATTRIBUTE Aps adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Aps
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Aps operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Aps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Aps usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Aps
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Aps availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which

Copyright © 2006, Nortel Nortel Confidential

	represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.
Mib	Aps
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Aps proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	Aps
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Aps controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.

Default	No default

ATTRIBUTE Aps alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	Aps
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Aps standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the

Copyright © 2006, Nortel Nortel Confidential

backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	Aps

Default	notSet

ATTRIBUTE Aps unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Aps
Values	false true
Default	false

GROUP Aps Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Aps* component.
Mib	Aps

ATTRIBUTE Aps nearEndRxActiveLine (neRxLine)

Access	Read only
Description	This attribute indicates which near end line is active for receiving data from the far end.
Mib	Aps
Values	protection working
Default	No default

ATTRIBUTE Aps nearEndRequest (neReq)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the request currently being transmitted to the far end in the SONET/SDH line overhead K1 byte of the protection line. Requests are prioritized so that high priority requests preempt or block those with a lower priority. The possible requests, in order of priority from highest to lowest, are as follows. ***lockoutOfProtection*** — the working line is prevented from switching to the protection line under any circumstances due to an *ProtectionLockout* command being in effect. ***forcedSwitch*** — the line indicated by attribute *nearEndRequestChannel* has a *Switch -force* command in effect against it. Note that a ***signalFail*** on the protection line has higher priority than a ***forcedSwitch***. ***signalFail*** — the line indicated by attribute *nearEndRequestChannel* is experiencing a signal failure (SF). Failures include LOS, LOF, received AIS-L, a signal BER exceeding 10^{-3}, LOP, received AIS-P, LCD, or a locked *Sonet*, *Sdh*, or *Path* component. Note that a ***signalFail*** on the protection line has higher priority than a ***forcedSwitch***. ***signalDegrade*** — the line indicated by attribute *nearEndRequestChannel* is experiencing a signal degradation (SD). ***manualSwitch*** — the line indicated by attribute *nearEndRequestChannel* has a *Switch* command in effect against it. ***waitToRestore*** — the protection line is active, provisioned attribute *revertive* is ***yes***, and the working line has recovered from a Signal Fail or Signal Degrade. After the period defined by attribute *waitToRestorePeriod* the working line will automatically revert to being the receive active line and the request will change to ***noRequest***. ***reverseRequest*** — the line indicated by attribute *nearEndRequestChannel* is active due to a request from the far end. This request is only applicable when the provisioned *mode* is ***bidirectional***. ***doNotRevert*** — the protection line is active, provisioned attribute *revertive* is ***no***, and either: (1) the working line has recovered from a ***signalFail*** or ***signalDegrade***; or (2) a ***forcedSwitch*** or ***manualSwitch*** request has been cleared. The receive active line will not automatically revert to the working line. ***noRequest*** — the working line is active and no other requests are in effect.

ATTRIBUTE Aps farEndRequest (feReq)

Access — Read only

Description — This attribute indicates the request currently being received from the far end in the SONET/SDH line overhead K1 byte of the protection line. Requests are prioritized so that high priority requests preempt or block those with a lower priority. The possible requests, in order of priority from highest to lowest, are as follows.

lockoutOfProtection — the working line is prevented from switching to the protection line under any circumstances due to an *ProtectionLockout* command being in effect.

forcedSwitch — the line indicated by attribute *nearEndRequestChannel* has a *Switch -force* command in effect against it. Note that a ***signalFail*** on the protection line has higher priority than a ***forcedSwitch***.

signalFail — the line indicated by attribute *nearEndRequestChannel* is experiencing a signal failure (SF). Failures include LOS, LOF, received AIS-L, a signal BER exceeding 10^{-3}, LOP, received AIS-P, LCD, or a locked *Sonet*, *Sdh*, or *Path* component. Note that a ***signalFail*** on the protection line has higher priority than a ***forcedSwitch***.

signalDegrade — the line indicated by attribute *nearEndRequestChannel* is experiencing a signal degradation (SD).

manualSwitch — the line indicated by attribute *nearEndRequestChannel* has a *Switch* command in effect against it.

waitToRestore — the protection line is active, provisioned attribute *revertive* is ***yes***, and the working line has recovered from a Signal Fail or Signal Degrade. After the period defined by attribute *waitToRestorePeriod*

Copyright © 2006, Nortel Nortel Confidential

the working line will automatically revert to being the receive active line and the request will change to ***noRequest***.

exercise — exercise the protocol for a protection switch of the specified channel, unless a request of equal or higher priority is in effect, by issuing an ***exercise*** request for that channel and checking the response on the APS channel.

reverseRequest — the line indicated by attribute *nearEndRequestChannel* is active due to a request from the far end. This request is only applicable when the provisioned *mode* is ***bidirectional***.

doNotRevert — the protection line is active, provisioned attribute *revertive* is ***no***, and either: (1) the working line has recovered from a ***signalFail*** or ***signalDegrade***; or (2) a ***forcedSwitch*** or ***manualSwitch*** request has been cleared. The receive active line will not automatically revert to the working line.

noRequest — the working line is active and no other requests are in effect.

Description	This attributes counts the number of times that a switchover of the active line has occurred since the *Aps* component became active.
Mib	Aps
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Aps timeUntilRestore

Access	Read only
Description	This attribute indicates the amount of time until the receive active line is automatically switched back from the protection line to the working line. It is only applicable for *Aps* components that are provisioned to be revertive, and which currently have the protection line as the receive active line and a *nearEndRequest* of ***waitToRestore***.
Mib	Aps
Values	Decimal (0..12)
Units	minutes
Default	No default

ATTRIBUTE Aps protocolFailureAlarm (pfAlarm)

Access	Read only
Description	This attribute indicates whether the *Aps* component is experiencing an APS protocol failure alarm. Protocol failure alarms include the protection switching byte mismatch alarm (code 7011 5270) and the channel mismatch failure alarm (code 7011 5271).
Mib	Aps
Values	on off
Default	No default

ATTRIBUTE Aps modeMismatchAlarm (mmAlarm)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates whether the *Aps* component is experiencing an APS mode mismatch alarm (code 7011 5272). This alarm indicates either: (1) that the far end is operating with a 1:n switching architecture, as opposed to 1+1; or (2) that the far end's provisioned *mode* is not the same as the nears end's provisioned *mode*. When a mode mismatch occurs: (1) if the far end is operating with a 1:n switching architecture it will operate as 1+1; and (2) if either end has a provisioned *mode* of ***unidirectional*** then both ends will operate unidirectionally.
Mib	Aps
Values	on off
Default	No default

COMPONENT Aps Test (Test)

Groups	GROUP Aps Test OsiState (State) GROUP Aps Test Setup (Setup) GROUP Aps Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.

Common Verbs	Help List Display

VERB START Aps Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Aps Test

Impact	Service
Description	This command stops a test running on the hardware component.

Copyright © 2006, Nortel Nortel Confidential

GROUP Aps Test OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Aps

ATTRIBUTE Aps Test adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Aps
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Aps Test operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Aps
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Aps Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Aps
Values	idle active (activ) busy
Default	idle

GROUP Aps Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	Aps

ATTRIBUTE Aps Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Aps
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Aps Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include

Copyright © 2006, Nortel Nortel Confidential

the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

ATTRIBUTE Aps Test frmSize (size)

Access: Read and write

Description:

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Copyright © 2006, Nortel Nortel Confidential

Mib	Aps
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Aps Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Aps
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Aps Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Aps
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Aps Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Aps
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Aps Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Aps
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Aps Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Aps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Aps Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Aps

ATTRIBUTE Aps Test causeOfTermination

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

	patternSyncFailed patternSyncLost
Default	neverStarted

ATTRIBUTE Aps Test bitsTx

Access	Read only
Description	This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.
Mib	Aps
Values	Long Integer
Default	No default

ATTRIBUTE Aps Test bytesTx

Access	Read only
Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	Aps
Values	Long Integer
Default	No default

ATTRIBUTE Aps Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Aps
Values	Long Integer
Default	No default

ATTRIBUTE Aps Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	Aps
Values	Long Integer
Default	No default

ATTRIBUTE Aps Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Aps
Values	Long Integer
Default	No default

ATTRIBUTE Aps Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Aps
Values	Long Integer
Default	No default

ATTRIBUTE Aps Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Aps
Values	Long Integer
Default	No default

ATTRIBUTE Aps Test bitErrorRate

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Aps
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Aps Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	Aps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Aps Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Aps
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

Values	Decimal (0..4294967295)
Default	No default

GROUP ARtg Provisioned (Prov)

Properties	Provisioned
Description	This group contains the generic provisionable attributes of a *ARtg* component.
Mib	AtmRouting

ATTRIBUTE ARtg useBestMatchAddrOnCrankback (useBma)

Access	Read: All Write: All
Description	This attribute specifies when the ATM routing system should be using best match addresses for a crankback. By default, when performing a crankback, the ATM routing system only considers addresses that are equal to the length of the address used during the first routing attempt. With this attribute, you may specify that the ATM routing system also considers best match addresses for a crankback when this node is the DTL originating node, the DTL terminating node, or acts as both the DTL originating and terminating node. The possible values for this attribute are: **none**: specifies that the DTL originator and the DTL terminator are not using best match address resolution when calculating a route. **originatingOnly**: specifies that only the DTL originator uses best match address resolution.

Copyright © 2006, Nortel Nortel Confidential

terminatingOnly: specifies that only the DTL terminator uses best match address resolution.
originatingTerminating: specifies that both the DTL originator and the DTL terminator use best match address resolution.

Mib: AtmRouting

Values:
none
originatingOnly (origOnly)
terminatingOnly (termOnly)
originatingTerminating (origTerm)

Default: none

ATTRIBUTE ARtg discardCallsOnOverload (discCallsOnOverId)

Access:
Read: All
Write: All

Description: This attribute specifies whether or not ATM signalling overload control is in effect on this node for each FP.

A value of ***enabled*** causes new incoming calls to be discarded on overloaded egress FPs. Overload is detected when more than 39% of signalling message buffers are in use, or more than 63 SSCOP PDUs have not been acknowledged.

Set the attribute to ***enabled*** when low call setup latency is preferred over calls being discarded.

GROUP ARtg Dna DestInfo Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *DestInfo* component.
Mib	AtmRouting

ATTRIBUTE ARtg Dna DestInfo type

Access	Read: All Write: Illegal
Description	This attribute indicates the type of the address at the destination interface. Provisioned addresses are assigned a type of ***primary*** or ***alternate***; ATM routing will try primary routes and then the alternate routes if none of the primary routes succeed. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVC addresses. The type ***ebr*** indicates addresses used by Edge Based Rerouting.
Mib	AtmRouting
Values	primary alternate registered default reroute
Default	No default

ATTRIBUTE ARtg Dna DestInfo scope

Access	Read: All Write: Illegal
Description	This attribute indicates the highest level (meaning the lowest numeric value) in the hierarchy where the address will be advertised.

Copyright © 2006, Nortel Nortel Confidential

	A value of -1 indicates that the scope is not applicable because this node has not been configured as a PNNI node.
Mib	AtmRouting
Values	Signed (-1..104)
Default	No default

ATTRIBUTE ARtg Dna DestInfo componentName

Access	Read: All Write: Illegal
Description	This attribute indicates the component name of the interface through which the address can be reached.
Mib	AtmRouting
Values	The name of the component
Default	No default

ATTRIBUTE ARtg Dna DestInfo reachability (reach)

Access	Read: All Write: Illegal
Description	This attribute indicates whether the address is ***internal*** or ***exterior*** to this domain.
Mib	AtmRouting
Values	internal exterior
Default	No default

GROUP ARtg Pnni Provisioned (Prov)

Properties	Provisioned
Description	This group contains the generic provisionable attributes of a *Pnni* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni nodeAddressPrefix

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM address prefix of this node for all levels of the hierarchy. If this attribute is set to the null string, then a default node address prefix is computed as follows: the value provisioned for the *ModuleData* component's *nodePrefix* attribute, followed by a unique MAC address (6 octets). If a value is assigned, it must be exactly 38 characters long. All characters must be hexadecimal with the following restrictions: - the first two characters must be a number between 10 and FE, inclusive. - if the first two characters are'45', the 18th character must be an 'F' or an 'f'.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmRouting
Values	String (0..19, Hex)
Default	No default

ATTRIBUTE ARtg Pnni defaultScope

Access	Read: All Write: All
Description	This attribute specifies the default PNNI scope for ATM addresses associated with this node. The PNNI scope determines the level to which the address is advertised within the PNNI routing domain. A provisioned *Addr* component may override the default scope in a *PnniInfo* subcomponent. The defaultScope can't be used for default address advertizement unless the prefix of the default address is different from that of the node address. A value of 0 means that all addresses which do not have provisioned scopes is advertised globally within the PNNI routing domain. The value specified must be numerically smaller than or equal to that of the lowest level at which this node is configured in the PNNI hierarchy.
Mib	AtmRouting
Values	Decimal (0..104)
Default	0

ATTRIBUTE ARtg Pnni domain

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the routing domain name. This attribute should be set identically for all nodes in the same routing domain.
Mib	AtmRouting
Values	String (1..32, ASCII)
Default	1

ATTRIBUTE ARtg Pnni maxAlternateRoutesOnCrankback (maxAltRtsOnCrankbck)

Access	Read: All Write: All
Description	This attribute specifies the number of rerouting attempts before a call requiring crank-back is rejected.
Mib	AtmRouting

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..20)
Default	1

ATTRIBUTE ARtg Pnni horizontalLinkInactivityTime

Access	Read: All Write: All
Description	This attribute specifies the length of time a node continues to advertise a horizontal (logical) link for which it has not received an LGN Horizontal Link Information Group. Increasing this timer allows the link to increase tolerance of Information Group packet loses, but also increases the duration of advertising a stale link. Decreasing the timer has the reverse effect.
Mib	AtmRouting
Values	Decimal (30..3600)
Units	seconds
Default	120

ATTRIBUTE ARtg Pnni pathDiversity

Access	Read: All Write: All
Description	This attribute specifies, as a percentage, how diverse the alternate paths should be relative to each other. For example, diversity degree of 60% means that the alternate paths have at least 60% of their links distinct. Setting this attribute to 0 means that all alternate paths are accepted.
Mib	AtmRouting
Values	Decimal (0..100)
Units	%
Default	50

ATTRIBUTE ARtg Pnni outgoingNccileFormat (nccile)

Access	Read: All Write: All
Description	This attribute specifies the Network Call Correlation Identifier (NCCI) IE format in outgoing SETUP messages for all PNNI interfaces on this node. ***backwardsCompatible*** selects both the Nortel Networks proprietary 0xF0 NCCI IE format and the ATM Forum standard 0xEF NCCI IE format. The Nortel Networks Multiservice Switch is able to differentiate the 0xF0 MDCR IE from 0xF0 NCCI IE. ***atmForum*** selects the ATM Forum0xEF NCCI IE format.

Copyright © 2006, Nortel Nortel Confidential

backwardsCompatible should be selected if any node within the network is not running the software release containing this *outgoingNccileFormat* attribute.

atmForum should only be selected if all nodes within the network have been upgraded to the software release containing this *outgoingNccileFormat* attribute.

Mib: AtmRouting

Values: backwardsCompatible
atmForum

Default: No default

ATTRIBUTE ARtg Pnni optimizationMetric (optMetric)

Access: Read: All
Write: All

Description: This attribute is a vector that specifies the optimization metric for each ATM service category. The optimization metric is used during Generic Connection Admission Control (GCAC) route computation.

Setting the value to ***cdv*** for a particular service category causes GCAC to optimize for cell delay variation on call setups requiring that service category.

Setting the value to ***maxCtd*** for a particular service category causes GCAC to optimize for maximum cell transfer delay on call setups requiring that service category.

Setting the value to ***aw*** for a particular service category causes GCAC to optimize for administrative weight on call setups requiring that service category.

Mib: AtmRouting

Vector of: cdv
maxCtd
aw

Index: cbr
rtVbr
nrtVbr
ubr

Default: (aw, aw, aw, aw)

ATTRIBUTE ARtg Pnni uniToPnniScopeMap

Access: Read: All
Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the mapping of the UNI scope into a PNNI routing level. The mapping applies to the membership scope which is passed across the UNI via ILMI address registration. The PNNI routing level is then advertised along with the corresponding reachable address. The mapping also applies to the connection scope of an incoming SETUP message for Anycast call requests. The PNNI routing level then specifies the routing range for the call. The table must be provisioned in descending order.
Mib	AtmRouting
Vector of	Decimal (0..104)
Index	Decimal (1..15)
Default	([3] 96, [2] 80, [2] 72, [3] 64, [2] 48, [2] 32, 0)

GROUP ARtg Pnni PglElectionParms (PglParms)

Properties	Provisioned
Description	This group contains the default provisionable attributes for the peer group leader election timer parameters of a *Pnni* component. These attributes can be overridden by setting the corresponding attribute in *cfgnode* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni pglInitTime

Access	Read: All Write: All
Description	This attribute specifies how long this node delays advertising its choice of preferred peer group leader after having reached the full peer state with at least one neighbor in the peer group. Increasing this timer allows the node to be more informed before choosing a leader, thus fewer rounds of elections are required, but more time is required for each round of election.
Mib	AtmRouting
Values	Decimal (0..65535)
Units	seconds
Default	15

ATTRIBUTE ARtg Pnni overrideDelay

Access	Read: All Write: All
Description	This attribute specifies how long a node waits for itself to be declared the preferred peer group leader by unanimous agreement among its peers. On

Copyright © 2006, Nortel Nortel Confidential

	timeout, if the node receives 2/3 majority, it declares itself as leader; otherwise, election enters the ***HungElection*** state.
Mib	AtmRouting
Values	Decimal (1..65535)
Units	seconds
Default	30

ATTRIBUTE ARtg Pnni reElectionInterval

Access	Read: All Write: All
Description	This attribute specifies how long this node waits, after losing connectivity to the current peer group leader, before re-starting the process of electing a new peer group leader.
Mib	AtmRouting
Values	Decimal (1..65535)
Units	seconds
Default	15

GROUP ARtg Pnni HelloParms (HlParms)

Properties	Provisioned
Description	This group contains the default provisionable Hello protocol parameters.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni helloHoldDown (hhd)

Access	Read: All Write: All
Description	This attribute specifies the rate at which this node sends out Hello packets. It specifies the default minimum length of time between successive Hellos used by routing control channels on this node. A provisioning check is made to ensure that this value cannot be greater than *helloInterval*. The value can be overridden on a per interface or per VPT basis by changing the *Atmif Pnni Rcc* or *Atmif Vpt Pnni Rcc helloHoldDown* attribute.
Mib	AtmRouting
Values	Decimal (0.1..65535.0)
Units	seconds
Default	1.0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE ARtg Pnni helloInterval (hli)

Access	Read: All Write: All
Description	This attribute specifies the default duration of the Hello Timer for routing control channels on this node. Every *helloInterval* seconds, this node sends out a Hello packet to the neighbor node, subject to the *helloHoldDown* timer having expired at least once since the last Hello packet was sent. A provisioning check is made to ensure that this value cannot be less than *helloHoldDown*. The value can be overridden on a per interface or per VPT basis by changing the *Atmif Pnni Rcc* or *Atmif Vpt Pnni Rcc helloInterval* attribute.
Mib	AtmRouting
Values	Decimal (1..65535)
Units	seconds
Default	15

ATTRIBUTE ARtg Pnni helloInactivityFactor (hif)

Access	Read: All Write: All
Description	This attribute specifies the number of Hello intervals allowed to pass without receiving a Hello from a neighbor, before an attempt is made to re-stage the RCC to that neighbor. The hello inactivity timer is enabled if the *helloState* of the *RCC* component is ***oneWayInside***, ***twoWayInside***, ***oneWayOutside***, ***twoWayOutside*** or ***commonOutside***. The value can be overridden on a per interface or per VPT basis by changing the *Atmif Pnni Rcc* or *Atmif Vpt Pnni Rcc helloInactivityFactor* attribute.
Mib	AtmRouting
Values	Decimal (1..65535)
Default	5

GROUP ARtg Pnni PTSETimerParms (PtseParms)

Properties	Provisioned
Description	This group contains the provisionable attributes for the PTSE timer values of a *Pnni* component. Group *AtmPnniPtseTimerParms* also exist under *ARtg Pnni CfgNode/<n>* that can override values specified here.
Mib	AtmRouting

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE ARtg Pnni ptseHoldDown (ptHldDn)

Access	Read: All Write: All
Description	This attribute is used to limit the rate at which this node sends out PTSE packets. It specifies the minimum length of time that this node must wait between sending successive PTSE packets. The value of this attribute is constraint by the equation: *ptseHoldDown* * 2 < *ptseRefreshInterval* * *ptseLifetimeFactor.*
Mib	AtmRouting
Values	Decimal (0.1..65535.0)
Units	seconds
Default	1.0

ATTRIBUTE ARtg Pnni ptseRefreshInterval (ptRefInt)

Access	Read: All Write: All
Description	This attribute specifies the duration of the PTSE Timer. Every *ptseRefreshInterval* seconds, this node sends out a self-originated PTSE packet to the neighbor node, subject to the ptseHoldDown timer having expired at least once since the last PTSE packet was sent. The value of this attribute is constraint by the equation: *ptseHoldDown* * 2 < *ptseRefreshInterval* * *ptseLifetimeFactor.*
Mib	AtmRouting
Values	Decimal (300..65535)
Units	seconds
Default	1800

ATTRIBUTE ARtg Pnni ptseLifetimeFactor (ptLifeFac)

Access	Read: All Write: All
Description	This attribute specifies the PTSE lifetime multiplier. The result of multiplying the *ptseRefreshInterval* by this value is used as the initial lifetime that this node places into PTSEs. The value of this attribute is constraint by the equation: *ptseHoldDown* * 2 < *ptseRefreshInterval* * *ptseLifetimeFactor.*
Mib	AtmRouting
Values	Decimal (101..1000)
Units	%

Copyright © 2006, Nortel Nortel Confidential

Default	200

ATTRIBUTE ARtg Pnni requestRxmtInterval (reqRxInt)

Access	Read: All Write: All
Description	This attribute specifies the period between retransmissions of unacknowledged Database Summary packets, PTSE Request packets and PTSPs.
Mib	AtmRouting
Values	Decimal (1..65535)
Units	seconds
Default	5

ATTRIBUTE ARtg Pnni peerDelayedAckInterval (peerDAckInt)

Access	Read: All Write: All
Description	This attribute specifies the minimum length of time between transmissions of delayed PTSE acknowledgment packets.
Mib	AtmRouting
Values	Decimal (0.1..65535.0)
Units	seconds
Default	1.0

GROUP ARtg Pnni ChangeThresholds (ThreshParms)

Properties	Provisioned
Description	This group contains the provisionable attributes for the change thresholds of an *ARtg Pnni* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni avcrMt

Access	Read: All Write: All
Description	This attribute multiplied by the Maximum Cell Rate specifies the minimum threshold used in the algorithms that determine significant change for average cell rate parameters.
Mib	AtmRouting
Values	Decimal (1..99)
Units	%

Copyright © 2006, Nortel Nortel Confidential

Default	3

ATTRIBUTE ARtg Pnni avcrPm

Access	Read: All Write: All
Description	This attribute multiplied by the current Available Cell Rate specifies the threshold used in the algorithms that determine significant change for AvCR parameters. If the resulting threshold is lower than the minimum threshold, the minimum threshold is used. Increasing the value of this attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability.
Mib	AtmRouting
Values	Decimal (1..99)
Units	%
Default	50

ATTRIBUTE ARtg Pnni cdvPm

Access	Read: All Write: All
Description	This attribute specifies the proportional multiplier used in the algorithms that determine significant change for CDV metrics. Increasing the value of this attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability.
Mib	AtmRouting
Values	Decimal (1..99)
Units	%
Default	25

ATTRIBUTE ARtg Pnni ctdPm

Access	Read: All Write: All
Description	This attribute specifies the proportional multiplier used in the algorithms that determine significant change for CTD metrics. Increasing the value of the attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability.
Mib	AtmRouting
Values	Decimal (1..99)

Units	%
Default	50

GROUP ARtg Pnni Operational (Oper)

Properties	Operational
Description	This group contains the generic operational attributes of an *ARtg Pnni* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni topologyMemoryExhaustion (topMemExhaustion)

Access	Read: All Write: Illegal
Description	This attribute indicates whether the topology database is overloaded. A node goes into a database overload state when it fails to store the complete topology database due to insufficient memory in the node. A node in this state performs resynchronization periodically by restarting all its Neighbor Peer Finite State Machines. The node stays in this state until it synchronizes with all of its neighbors without any overload problems. When this attribute is set an alarm is issued.
Mib	AtmRouting
Values	false true
Default	No default

ATTRIBUTE ARtg Pnni ptsesInDatabase

Access	Read: All Write: Illegal
Description	This attribute indicates the number of PTSEs stored in this node's topology database for this level.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	No default

GROUP ARtg Pnni Statistics (Stats)

Properties	Operational
Description	This group contains the statistical operational attributes of an *ARtg Pnni* component.
Mib	AtmRouting

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE ARtg Pnni successfulRoutingAttempts

Access	Read: All Write: Illegal
Description	This attribute counts successful PNNI routing attempts. The counter wraps to zero when it exceeds the maximum value.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE ARtg Pnni failedRoutingAttempts

Access	Read: All Write: Illegal
Description	This attribute counts all calls routed through PNNI which failed. The counter wraps to zero when it exceeds the maximum value.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE ARtg Pnni alternateRoutingAttempts

Access	Read: All Write: Illegal
Description	This attribute counts successful PNNI alternate routing attempts. The counter wraps to zero when it exceeds the maximum value.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	No default

GROUP ARtg Pnni SvccBasedRccParms (SvccRcc)

Properties	Provisioned
Description	This group contains the default attributes of SVCC-based Rcc. Group *AtmPnniDefaultSvccBasedRccParms* also exists under *ARtg Pnni Cfgnode* that can override the values specified here.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni svccInitTime (iTime)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the default time this node delays initiating establishment of an SVCC to a neighbor after determining that such an SVCC should be established.
Mib	AtmRouting
Values	Decimal (0..120)
Units	seconds
Default	4

ATTRIBUTE ARtg Pnni svccRetryTime (rTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node delays before attempting to re-establish the SVCC-base RCC. This condition occurs when an RCC cannot be established, either during the initial setup, or is unexpectedly torn down.
Mib	AtmRouting
Values	Decimal (20..60)
Units	seconds
Default	30

ATTRIBUTE ARtg Pnni svccCallingIntegrityTime (clgIntegTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node waits for an SVCC to become fully established before giving up and tearing it down. The condition occurs when the node initiates establishment of the SVCC as the calling party.
Mib	AtmRouting
Values	Decimal (10..3600)
Units	seconds
Default	35

ATTRIBUTE ARtg Pnni svccCalledIntegrityTime (cldIntegTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node waits for an SVCC to become fully established before giving up and tearing it down. This condition occurs when the node has accepted the SVCC setup as the called party.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmRouting
Values	Decimal (25..3615)
Units	seconds
Default	50

ATTRIBUTE ARtg Pnni svccEstablishIntegrityTime (estIntegTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node waits for an SVCC SETUP message from a neighbor, from which a SVCC SETUP message is expected, once the node knows of the existence of that neighbor. An alarm is raised when the *svccEstablishIntegrityTimer* expires.
Mib	AtmRouting
Values	Decimal (15..3600)
Units	seconds
Default	60

COMPONENT ARtg Pnni RouteFinder (Rf)

Groups	GROUP ARtg Pnni Rf Criteria
Scope	Device
Description	*ARtg Pnni RouteFinder* This component is used to compute a list of routes to a specified destination that satisfy certain traffic and routing requirements. To display a list of computed routes: - set the route computation criteria - issue the *Run* command
Mib	AtmRouting
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

VERB Run **ARtg Pnni Rf**

Impact	Passive
Description	Run ARtg Pnni RouteFinder This verb computes a list of routes according to the specified routing criteria and displays the results. The results are in the following format: Route 1: node id = <node ID > node name@level = <EM/node name@level> port id = <port ID> interface name = <atmif/number> node id = <node ID > node name@level = <EM/node name@level> port id = <port ID> interface name = <atmif/number> ... node id = <node ID> node name@level = <EM/node name@level> Route 2: node id = <node ID > node name@level = <EM/node name@level> port id = <port ID> interface name = <atmif/number> node id = <node ID > node name@level = <EM/node name@level> port id = <port ID> interface name = <atmif/number> ... node id = <node ID> node name@level = <EM/node name@level> ... ... Route n: node id = <node ID > node name@level = <EM/node name@level> *port id = <port ID>* *interface name = <atmif/number>* *...*

Copyright © 2006, Nortel Nortel Confidential

node id = <node ID>
node name@level = <EM/node name@level>

The *interface name*'s value can take one of the following forms:
(a) ***AtmIf/<1-4095>*** - If the interface is an Atm Interface.
(b) ***AtmIf/<1-4095> Vpt/<1-4095>*** - If the interface is a VPT interface.
(c) Values ***<0-4294967295>*** - If the link is a logical link.

If the port id is not decoded (for example, on nodes that are not a Nortel Networks Multiservice switch), the *interface name* is left blank.

If the node name is not available, the *node name@level* is left blank.

GROUP ARtg Pnni Rf Criteria

Properties	Operational
Description	This group contains the attributes specifying the routing criteria for the route computation.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni Rf destinationAddress (destAddr)

Access	Read: All Write: All
Description	This attribute specifies the destination NSAP address to be used for the computation. If this attribute specifies an invalid address then no routes will be found.
Mib	AtmRouting
Values	String (1..20, Hex)
Default	No default

ATTRIBUTE ARtg Pnni Rf maxRoutes

Access	Read: All Write: All
Description	This attribute specifies the maximum number of local and PNNI routes to be computed and displayed. When the *lbMethod* attribute is set to ***maxAvCr***, ***random***, ***avCrProb***, ***optMetricProb***, or ***avCrOptMetricProb***, a single PNNI route will be displayed in the result of the *RouteFinder* because only one path is computed during the PNNI routing process. When the *lbMethod* attribute is set to ***none***, the number of PNNI routes that will be displayed is limited by the smallest of the number of best paths found or the *Artg Pnni Lb/ <srvCat> maxPaths* attribute.
Mib	AtmRouting
Values	Decimal (1..15)

ATTRIBUTE ARtg Pnni Rf atmServiceCategory (service)

Copyright © 2006, Nortel
Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. If this attribute is set to other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduced value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate that varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. VBR real time service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications that have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS. For those cells that are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, the application expects a bound on the mean cell transfer delay. VBR non-real time service may support statistical multiplexing of connections. The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to either the cell loss ratio experienced by a UBR connection, or the cell transfer delay experienced by cells on the connection.

ATTRIBUTE ARtg Pnni Rf **bearerClassBbc (bcBbc)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. This attribute must either be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport

Copyright © 2006, Nortel
Nortel Confidential

service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***) and timing requirements are user defined (that is, transparent to the network).When ***x*** is set the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Default: derivedFromServiceCategory

ATTRIBUTE ARtg Pnni Rf transferCapabilityBbc (tcBbc)

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability - TrafficType, Timing>
0 - NoIndication, NoIndication
1 - NoIndication, yes
2 - NoIndication, no
5 - CBR, yes
8 - VBR, NoIndication
9 - VBR, yes
10 - VBR, no

A value of ***notApplicable*** specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The NoIndication for traffic type is used if the user has not set the traffic type; this is also the case for end-to-end timing.

The yes for end-to-end timing indicates that end-to-end timing is required.

The no for end-to-end timing indicates that end-to-end timing is not

Copyright © 2006, Nortel Nortel Confidential

required.

The value ***derivedFromServiceCategory*** specifies that the actual value used for this connection is derived from the value of the *atmServiceCategory*. This attribute must either be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE ARtg Pnni Rf optimizationMetric (optMetric)

Access	Read: All Write: All
Description	This attribute specifies the optimization metric to be used in the route computation; one of cell delay variation (***cdv***), maximum cell transfer delay (***maxCtd***), or administrative weight (***aw***).
Mib	AtmRouting
Values	cdv maxCtd aw
Default	aw

ATTRIBUTE ARtg Pnni Rf routingLevelScope

Access	Read: All Write: All
Description	This attribute specifies the highest PNNI level used for the route computation. Routes are not computed beyond this level.
Mib	AtmRouting
Values	Decimal (0..104)
Default	0

ATTRIBUTE ARtg Pnni Rf lbMinVariance (minVar)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the minimum variance value to be used for the *RouteFinder*'s optimization metric and service category. A larger variance allows more usable paths to be considered for load balancing. A minimum variance of zero means that only the *lbSlopeVariance* attribute is used in determining the acceptable variance. The maximum range boundaries for each of the optimization metrics are: **- *cdv***: 2147483647 (for cbr and rtVbr only). **- *maxCtd***: 2147483647 (for cbr and rtVbr only). **- *aw***: 4294967295. The acceptable variance is calculated based on the following formula: *acceptableVariance* = *lbMinVariance* + *optM* * *lbSlopeVariance*/**100** where *optM* represents the optimization metric value of the best path.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE ARtg Pnni Rf lbSlopeVariance (slopeVar)

Access	Read: All Write: All
Description	This attribute specifies the slope of the acceptable variance for the *RouteFinder*'s optimization metric and service category. A *lbSlopeVariance* of zero means that the acceptable variance is given only by the *lbMinVariance* attribute. If both *lbMinVariance* and *lbSlopeVariance* attributes are zero, means that only the best paths of equal value to the *optimizationMetric* will be considered for load balancing. The acceptable variance is calculated based on the following formula: *acceptableVariance* = *lbMinVariance* + *optM* * *lbSlopeVariance*/100 where *optM* represents the optimization metric value of the best path.
Mib	AtmRouting
Values	Decimal (0..1900)
Units	%
Default	0

ATTRIBUTE ARtg Pnni Rf lbMethod (method)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the load balancing method for the selected service category of the call. ***maxAvCr***. PNNI routing chooses the path that has the maximum available cell rate as the routing path. ***random***. The routing path is chosen randomly from all the acceptable paths. ***avCrProb***. The routing path is chosen with a probability in proportion to its available cell rate. This method will result in the more frequent selection of a route having a higher available cell rate over that with a lower available cell rate. ***optMetricProb***. The routing path is chosen with a probability inversely proportional to the optimization metric. This method will result in the more frequent selection of a route having the lowest value of the optimization metric over that with a higher optimization metric. ***avCrOptMetricProb***. The routing path is chosen with a probability that is based on both the proportional value of the available cell rate and the inverse proportional value of the optimization metric. ***none***. The routing path is chosen such that only the best path(s) will be displayed. No load balancing is applied. When this attribute is set to ***maxAvCr***, ***random***, ***avCrProb***, ***optMetricProb***, or ***avCrOptMetricProb***, a single PNNI route will be displayed in the result of the *RouteFinder* because only one path is selected during the PNNI routing process for these methods. When this attribute is set to ***none***, the number of PNNI routes that will be displayed is limited by the smallest of, the *maxRoutes* attribute, the number of best paths found, or the *Artg Pnni Lb/<srvCat> maxPaths* attribute.
Mib	AtmRouting
Values	maxAvCr random avCrProb optMetricProb avCrOptMetricProb none
Default	random

ATTRIBUTE ARtg Pnni Rf useRouteCaching (useRc)

Access	Read: All Write: All
Description	This attribute specifies whether to look in the route cache before doing an on-demand route computation.

Copyright © 2006, Nortel Nortel Confidential

Setting *useRouteCaching* to ***no*** causes *RouteFinder* to use on-demand route computation and displays the resulting list of computed routes. Acceptable paths found in this computation are not stored in the *Cache*.

Setting *useRouteCaching* to ***yes***, and using the same values as the provisioned *LoadBalancing* variance attributes, causes *RouteFinder* to search the cache for an acceptable route before performing an on-demand route computation. The acceptable paths are displayed and the newly computed routes are stored in the cache.

Setting *useRouteCaching* to ***yes*** and applying load balancing on this iteration of the *RouteFinder*, uses the regular *LoadBalancing minVariance* and *slopeVariance* values since all routes stored in the cache are within these provisioned multi_path variance parameters.

Setting the *RouteFinder* attributes to a different value from their *LoadBalancing* counterparts is the same as setting *useRouteCaching* to ***no***.

Mib — AtmRouting

Values — no
yes

Default — no

ATTRIBUTE ARtg Pnni Rf rxTrafficDescParm (rxTdp)

Access — Read: All
Write: All

Description — This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and minimum cell rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. The value of CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for usage parameter control (UPC).

When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused).

When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused).

When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic

Copyright © 2006, Nortel Nortel Confidential

with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2 or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or

Copyright © 2006, Nortel
Nortel Confidential

I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute will be taken from the *txTrafficDescParm*.

Vector of	Decimal (0..2147483647)
Index	Decimal (1..5)
Default	([5] 0)

ATTRIBUTE ARtg Pnni Rf txTrafficDescParm (txTdp)

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP

Copyright © 2006, Nortel Nortel Confidential

equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9*** the transmit traffic will be shaped at the next rate less than the PCR.

Copyright © 2006, Nortel Nortel Confidential

For *txTrafficDescType* ***6***, ***7*** and ***8***, the transmit traffic will be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic will be shaped at the next rate above the PCR.

GROUP ARtg Pnni CfgNode Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of a *ConfiguredNode* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode nodeId

Access	Read: All Write: All
Criticality	Component
Description	This attribute allows explicit specification of a node ID for this configured node. If a value is assigned in this attribute, it overrides any system computed node ID for this configured node. If this attribute is empty, then the node ID is computed by the system in *opNodeId*.
Mib	AtmRouting
Values	String (0..22, Hex)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode peerGroupId (pgId)

Access	Read: All Write: All
Criticality	Component
Description	This attribute allows explicit specification of the peer group ID of the Logical Group Node (LGN). The peer group ID is specified by 14 octets where the first octet specifies the level of the node and the remaining 13 octets form the identifier information. The value in the identifier information field must be encoded with the 104-n right-most bits set to zero, where n is the level. If this value is set to null, then the peer group ID is computed by the system and displayed under attribute *opPeerGroupId*.
Mib	AtmRouting
Values	String (0..14, Hex)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode restrictTransit

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies whether the *configurednode* should restrict tandeming of SVCs.

Copyright © 2006, Nortel Nortel Confidential

If this attribute is set to ***true***, then other nodes in the PNNI hierarchy avoids traversing this node during route computation.

Mib	AtmRouting
Values	false true
Default	false

ATTRIBUTE ARtg Pnni CfgNode **horizontalLinkInactivityTime**

Access	Read: All Write: All
Description	This attribute specifies the length of time a node continues to advertise a horizontal (logical) link for which it has not received and processed an LGN Horizontal Link Information Group. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni horizontalLinkInactivityTime*.
Mib	AtmRouting
Values	Decimal (30..3600) sameAsPnni
Units	seconds
Default	sameAsPnni

GROUP ARtg Pnni CfgNode **Operational (Oper)**

Properties	Operational
Description	This group contains the generic operational attributes of a *ConfiguredNode* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode **nodeAddress**

Access	Read: All Write: Illegal
Description	This attribute indicates the address of the node at this level. At the lowest level, the *nodeAddress* is determined by the value of the *nodeAddressPrefix* attribute (19 octets) for the *ARtg Pnni* component followed by the level of this *CfgNode* (1 octet). For LGNs, the *nodeAddress* is the same as the *nodeAddress* of the node at the lowest level, with the selector field set to the level of the peer group containing the LGN.
Mib	AtmRouting

Copyright © 2006, Nortel Nortel Confidential

Values	String (20, Hex)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode opNodeId

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the node id of the node at this level. The default node id is computed as follows. If this is the lowest level node, then the default node id is computed as the level (one octet), followed by the integer value 160 (one octet), followed by the node address (20 octets). If this is not the lowest level node, then the default node id is computed as the level (one octet), followed by the 14 octet peer group id of the child peer group which the LGN represents, followed by the ESI specified in the node address (6 octets), followed by the integer value 0 (one octet).
Mib	AtmRouting
Values	String (22, Hex)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode opPeerGroupId (pgIdOp)

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the peer group id of the node at this level. The value is determined by the provisioned *peerGroupId* attribute. If the *peerGroupId* is a null string then the peer group id is computed as follows: The peer group id for a lowest level node is computed to be the node's level (one octet), followed by the first <level> bits of the *nodeAddress*, followed by zero or more padding 0 bits. The peer group id for an LGN is computed to be the LGN's level (one octet), followed by the first <level> bits of the id of the peer group which this LGN represents, followed by zero or more padding 0 bits.
Mib	AtmRouting
Values	String (14, Hex)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode numNeighbors

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the number of PNNI nodes which are neighbors of this node at this level.
Mib	AtmRouting
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode pglElectionState

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the peer group leader election process. Possible values for this attribute are: ***notApplicable***: the node is inactive (***lgnState*** = inactive) ***starting***: the initial state of the state machine. ***awaiting***: the node has started the Hello Finite State Machine on at least one link, and no peer has been found yet. ***awaitingFull***: no database synchronization process has been completed yet but at least one neighboring peer has been found. ***initialDelay***: Database synchronization has been completed with at least one neighboring peer. The node must wait *pglInitTime* seconds before it can select and advertise its preferred Peer Group Leader (PGL). ***calculating***: the node is in the process of calculating what its new choice for preferred PGL. ***operNotPgl***: a non PGL node is in the process of determining which node has the highest priority to be PGL by examining PTSEs sent by other nodes. ***operPgl***: a PGL node is in the process of determining whether another node has a higher priority than itself by examining PTSEs sent by other nodes. ***awaitUnanimity***: the node has chosen itself as PGL. If the node has been elected unanimously, it generates a Unanimity event. It waits for unanimity or expiration of the *overrideDelay* timer before declaring itself peer group leader. ***hungElection***: the node has chosen itself as PGL with less than 2/3 of the other nodes advertising it as their preferred PGL. In this case either this node should change its choice of preferred PGL, or the other nodes are

Copyright © 2006, Nortel Nortel Confidential

going to accept it as PGL.

awaitReElection: the node has lost connectivity to the current PGL. The connectivity must be reestablished before the *reElectionInterval* timer fires, otherwise the election is done again.

ATTRIBUTE ARtg Pnni CfgNode preferredPglLeadershipPriority

Access	Read: All Write: Illegal
Description	This attribute indicates the leadership priority of the node that this node believes should be the peer group leader at this point in time.
Mib	AtmRouting
Values	Decimal (0..255)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode opLeadershipPriority

Access	Read: All Write: Illegal
Description	This attribute indicates the leadership priority advertised by this node.
Mib	AtmRouting
Values	Decimal (0..255)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode preferredPglNodeName

Access	Read: All Write: Illegal
Description	This attribute indicates the value of the *nodeName* attribute for the node that this node believes should be the peer group leader. This attribute corresponds to the Node ID value that the node is currently advertising in the 'Preferred Peer Group Leader Node Id' field of its nodal information group within the given peer group. If this attribute is empty, it indicates the preferred PGL node name is unknown.
Mib	AtmRouting
Values	String (0..12, ASCII)
Default	No default

GROUP ARtg Pnni CfgNode HelloParms (HlParms)

Properties	Provisioned
Description	This group contains the default provisionable Hello protocol parameters.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode helloHoldDown (hhd)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the rate at which this node sends out Hello packets. It specifies the default minimum length of time between successive Hellos used by routing control channels on this node at this level. This value cannot be greater than *helloInterval*. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni helloHoldDown.*
Mib	AtmRouting
Values	Decimal (0.1..65535.0) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode helloInterval (hli)

Access	Read: All Write: All
Description	This attribute specifies the default duration of the Hello Timer for routing control channels on this node. Every *helloInterval* seconds, this node sends out a Hello packet to the neighbor node, subject to the *helloHoldDown* timer having expired at least once since the last Hello packet was sent. This value cannot be less than *helloHoldDown*. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni helloInterval*.
Mib	AtmRouting
Values	Decimal (1..65535) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode helloInactivityFactor (hif)

Access	Read: All Write: All
Description	This attribute specifies the number of Hello intervals allowed to pass without receiving a Hello from a neighbor, before an attempt is made to re-stage the RCC to that neighbor. The hello inactivity timer is enabled when the *helloState* is one of ***oneWayInside***, ***twoWayInside***, ***oneWayOutside***, ***twoWayOutside*** or ***commonOutside***. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni helloInactivityFactor.*
Mib	AtmRouting

Values	Decimal (1..65535) sameAsPnni
Default	sameAsPnni

GROUP ARtg Pnni CfgNode PTSETimerParms (PtseParms)

Properties	Provisioned
Description	This group contains the provisionable attributes for the PTSE timer values of a *CfgNode* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode ptseHoldDown (ptHldDn)

Access	Read: All Write: All
Description	This attribute is used to limit the rate at which this node sends out PTSE packets. It specifies the minimum length of time that this node must wait between sending successive PTSE packets. The value of this attribute is constraint by the equation: *ptseHoldDown* * 2 < *ptseRefreshInterval* * *ptseLifetimeFactor.* If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni ptseHoldDown.*
Mib	AtmRouting
Values	Decimal (0.1..65535.0) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode ptseRefreshInterval (ptRefInt)

Access	Read: All Write: All
Description	This attribute specifies the duration of the PTSE Timer. Every *ptseRefreshInterval* seconds, this node sends out a self-originated PTSE packet to the neighbor node, subject to the ptseHoldDown timer having expired at least once since the last PTSE packet was sent. The value of this attribute is constraint by the equation: *ptseHoldDown* * 2 < *ptseRefreshInterval* * *ptseLifetimeFactor.* If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni ptseRefreshInterval.*
Mib	AtmRouting
Values	Decimal (300..65535) sameAsPnni
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode ptseLifetimeFactor (ptLifeFac)

Access	Read: All Write: All
Description	This attribute specifies the PTSE lifetime multiplier. The result of multiplying the *ptseRefreshInterval* by this value is used as the initial lifetime that this node places into PTSEs. The value of this attribute is constraint by the equation: *ptseHoldDown* * 2 < *ptseRefreshInterval* * *ptseLifetimeFactor.* If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni ptseLifetimeFactor.*
Mib	AtmRouting
Values	Decimal (101..1000) sameAsPnni
Units	%
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode requestRxmtInterval (reqRxInt)

Access	Read: All Write: All
Description	This attribute specifies the period between retransmissions of unacknowledged Database Summary packets, PTSE Request packets and PTSPs. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni requestRxmtInterval*.
Mib	AtmRouting
Values	Decimal (1..65535) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode peerDelayedAckInterval (peerDAckInt)

Access	Read: All Write: All
Description	This attribute specifies the minimum length of time between transmissions of delayed PTSE acknowledgment packets. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni peerDelayedAckInterval*.
Mib	AtmRouting
Values	Decimal (0.1..65535.0) sameAsPnni

Units	seconds
Default	sameAsPnni

GROUP ARtg Pnni CfgNode SvccBasedRccParms (SvccRcc)

Properties	Provisioned
Description	This group contains the attributes of SVCC-based Rcc for this *cfgnode*. A similar group exists under *ARtg Pnni*.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode svccInitTime (iTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node delays initiating establishment of an SVCC to a neighbor after determining that such an SVCC should be established. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni svccInitTime*.
Mib	AtmRouting
Values	Decimal (0..120) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode svccRetryTime (rTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node delays before attempting to re-establish the SVCC-base RCC. This condition occurs when an RCC cannot be established, either during the initial setup, or is unexpectedly torn down. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni svccRetryTime*.
Mib	AtmRouting
Values	Decimal (20..60) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode svccCallingIntegrityTime (clgIntegTime)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the length of time this node waits for an SVCC to become fully established before giving up and tearing it down. The condition occurs when the node initiates establishment of the SVCC as the calling party. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni svccCallingIntegrityTime*.
Mib	AtmRouting
Values	Decimal (10..3600) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode svccCalledIntegrityTime (cldIntegTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node waits for an SVCC to become fully established before giving up and tearing it down. This condition occurs when the node has decided to accept the SVCC setup as the called party. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni svccCalledIntegrityTime*.
Mib	AtmRouting
Values	Decimal (25..3615) sameAsPnni
Units	seconds
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode svccEstablishIntegrityTime (estIntegTime)

Access	Read: All Write: All
Description	This attribute specifies the length of time this node waits for an SVCC SETUP message from its neighbor once the node knows the existence of the neighbor. An alarm is raised when the timer expires. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni svccEstablishIntegrityTime*.

GROUP ARtg Pnni CfgNode **ChangeThresholds (ThreshParms)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the change thresholds of a *ARtg Pnni* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode **avcrMt**

Access	Read: All Write: All
Description	This attribute multiplied by the Maximum Cell Rate specifies the minimum threshold used in the algorithms that determine significant change for average cell rate parameters. This value is used for logical links only. For physical links, the value in *ARtg Pnni avcrMt* is used. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrMt.*
Mib	AtmRouting
Values	Decimal (1..99) sameAsPnni
Units	%
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode **avcrPm**

Access	Read: All Write: All
Description	This attribute multiplied by the current Available Cell Rate specifies the threshold used in the algorithms that determine significant change for AvCR parameters. This value is used for logical links only. For physical links, the value in *ARtg Pnni avcrPm* is used. If the resulting threshold is lower than the minimum threshold, the minimum threshold is used. Increasing the value of the attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrPm*.
Mib	AtmRouting
Values	Decimal (1..99) sameAsPnni
Units	%
Default	sameAsPnni

ATTRIBUTE ARtg Pnni CfgNode **cdvPm**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the proportional multiplier used in the algorithms that determine significant change for CDV metrics. Increasing the value of the attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni cdvPm.*

Groups	GROUP ARtg Pnni CfgNode SAddr Provisioned (Prov) GROUP ARtg Pnni CfgNode SAddr Operational (Oper)
Scope	Device
Description	*ARtg Pnni CfgNode/<level> SummaryAddress/<address>, <prefixLength>, <reachability>* A summary address is an abbreviation of a set of addresses, represented by an address prefix that all of the summarized addresses have in

Copyright © 2006, Nortel Nortel Confidential

common.
A suppressed summary address is used to suppress the advertisement of addresses which match this prefix, regardless of scope.

The *prefixLength* specifies the number of significant bits of the address. *reachability* specifies whether the address is to summarize internal or exterior addresses.

An ***internal*** address is an address of a destination that is directly attached to the logical node. An ***exterior*** address is an address of a destination that is located outside of the PNNI routing domain but can be reached through a port attached to the logical node.

Mib: AtmRouting

Common Verbs: Help, List, Display, Add, DELete

GROUP ARtg Pnni CfgNode SAddr Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes of a *SummaryAddress* component.

A summary address is an abbreviation of a set of addresses, represented by an address prefix that all of the summarized addresses have in common.
A suppressed summary address is used to suppress the advertisement of addresses which match this prefix, regardless of scope.

Mib: AtmRouting

ATTRIBUTE ARtg Pnni CfgNode SAddr suppress

Access: Read: All
Write: All

Description: This attribute specifies whether or not the address should be suppressed. If this attribute is set to ***true***, then all addresses matching that prefix will not be advertised above this level.

Mib: AtmRouting

Values: false
true

Default: false

GROUP ARtg Pnni CfgNode SAddr Operational (Oper)

Properties: Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the operational attributes of a *SummaryAddress* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode SAddr state

Access	Read: All Write: Illegal
Description	This attribute indicates the state of the address: one of ***advertising***, ***suppressing*** or ***inactive***. ***inactive***: the summary address has been configured but is not suppressing or summarizing any ATM addresses. ***suppressing***: the summary address has suppressed at least one ATM address on the node. ***advertising***: the summary address is summarizing at least one ATM address on the node.
Mib	AtmRouting
Values	advertising suppressing inactive
Default	No default

ATTRIBUTE ARtg Pnni CfgNode SAddr scope

Access	Read: All Write: Illegal
Description	This attribute indicates the scope of the summary address. The scope corresponds to the scope of the underlying summarized address with the highest advertised scope. A value of -1 means the scope is unknown.
Mib	AtmRouting
Values	Signed (-1..104)
Default	No default

COMPONENT ARtg Pnni CfgNode Neighbor (Nbr)

Instance	String (22, Hex)
Groups	GROUP ARtg Pnni CfgNode Nbr Operational (Oper) GROUP ARtg Pnni CfgNode Nbr Statistics (Stats)
Scope	Device
Description	*ARtg Pnni CfgNode/n Neighbor/<node id>* This component represents a neighbor node at this level. If this *cfgnode* is not an LGN and the *Neighbor* node is not an LGN (in other words, both the *cfgnode* and its *Neighbor* are physical nodes), the *rccList* attribute indicates the component names of all Routing Control

Copyright © 2006, Nortel Nortel Confidential

Channels (RCC) to that neighboring node. Under this condition, there is no *RCC* subcomponent under this *Neighbor*.

If this *cfgnode* and/or the *Neighbor* node is a Logical Group Node (LGN) at this level, the *Rcc* subcomponent indicates the SVCC-based RCC to the *Neighbor*. The *rccList* attribute, in this case, points to the *Rcc* subcomponent.

component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib AtmRouting

ATTRIBUTE ARtg Pnni CfgNode Rcc adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib AtmRouting

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE ARtg Pnni CfgNode Rcc operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib AtmRouting

Values enabled (ena)
disabled (dis)

Default disabled

ATTRIBUTE ARtg Pnni CfgNode Rcc usageState (osiUsage)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmRouting
Values	idle active (activ) busy
Default	idle

GROUP ARtg Pnni CfgNode Rcc **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for an *RoutingControlChannel* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni CfgNode Rcc **negotiatedVersion**

Access	Read: All Write: Illegal
Description	This attribute indicates the PNNI version negotiated with the neighbor node.
Mib	AtmRouting
Values	unsupported version1point0
Default	No default

ATTRIBUTE ARtg Pnni CfgNode Rcc **neighborId (neighbor)**

Access	Read: All Write: Illegal
Description	This attribute indicates the neighbor node id associated with the SvccRcc.
Mib	AtmRouting
Values	String (22, Hex)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode Rcc **helloState**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the state of the Hello protocol exchange over this *Svcc Rcc* link. The following are the possible values for this attribute: ***down***: The link is down; no PNNI routing packets will be sent or received over such a link. This is the initial state of the Hello Finite State Machine. It can also be reached when lower-level protocols have indicated that the link is not usable. ***attempt***: No Hello packets, or Hello packets with mismatched information, have been received recently from the neighbor. Attempts are made to contact the neighbor node by sending out Hello packets every *helloInterval* seconds. ***oneWayInside***: Hello packets have been recently received from the neighbor and it has been established that both nodes are members of the same peer group, but the remote node ID and remote port ID in the neighbor's Hello packets were set to zero. A Hello packet is sent to the neighbor and the Hello timer is restarted. ***twoWayInsid***e: Bidirectional communication over this link between this node and the neighbor node has been achieved.
Mib	AtmRouting
Values	notApplicable down attempt oneWayInside twoWayInside
Default	No default

ATTRIBUTE ARtg Pnni CfgNode Rcc remoteAddress

Access	Read: All Write: Illegal
Description	This attribute indicates the neighboring peer LGN's address.
Mib	AtmRouting
Values	String (20, Hex)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode Rcc neighborName

Access	Read: All Write: Illegal
Description	This attribute indicates the node name of the neighbor associated with the SvccRcc.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmRouting
Values	String (0..12, ASCII)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode Rcc **retryCount**

Access	Read: All Write: Illegal
Description	This attribute counts the attempts to set up this Routing Control Channel since the last successful attempt.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode Rcc **lastFailureCauseCode**

Access	Read: All Write: Illegal
Description	This attribute contains the cause code in the last transmitted signaling message for this Routing Control Channel that contained the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. A value of 0 means that no failure has occurred since the last successful attempt.
Mib	AtmRouting
Values	Decimal (0..255)
Default	No default

ATTRIBUTE ARtg Pnni CfgNode Rcc **lastFailureDiagCode**

Access	Read: All Write: Illegal
Description	This attribute contains the diagnostic code in the last transmitted signaling message for this Routing Control Channel. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is empty.
Mib	AtmRouting
Values	String (0..28, ASCII)
Default	No default

COMPONENT ARtg Pnni Cache

Groups	GROUP ARtg Pnni Cache Provisioned (Prov) GROUP ARtg Pnni Cache Operational (Oper)
Scope	Device
Description	*Artg Pnni Cache* This component represents the PNNI Routing Cache. It enhances call setup performance by providing a call setup request with a previously computed route from the *Cache*, whenever possible. The *Cache* must be populated with previously computed routes before it is usable and it reduces the number of on-demand route computations once populated. The *Cache* stores and maintains entries to several destinations and uses them to provide suitable routing paths for subsequent call setup requests. The *clear* verb removes all *Cache* entries. A *Cache* route entry consists of multiple alternate routes to a destination node. The number of alternate routes is set by the *maxPaths* value under the *Artg Pnni lb<svcCat>*component.

VERB Clear ARtg Pnni Cache

Impact	Configuration
Description	*Clear Artg Pnni Cache* This verb clears all the previously computed route entries stored in the PNNI cache.

GROUP ARtg Pnni Cache **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Artg Pnni Cache* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni Cache **agingPeriod**

Access	Read: All Write: All
Description	This attribute specifies the maximum lifetime of a *Cache* entry. Specifying a low *agingPeriod* is useful when many SVCs are expected to be routed through the network to ensure that the *Cache* is periodically refreshed. Specifying a high *agingPeriod* is useful when many permanent connections are expected to be routed through the network. As the fluctuations in the available network resources become more frequent, the value of *agingPeriod* should be decreased to reflect the dynamic nature of the network.
Mib	AtmRouting
Values	Decimal (180..7200)
Units	seconds
Default	1800

ATTRIBUTE ARtg Pnni Cache **maxNumEntries**

Access	Read: All Write: All
Description	This attribute specifies the maximum number of the cache entries to be stored in the routing cache. Reducing the *maxNumEntries* below the current *Cache* size causes the *Cache* to shrink by purging the oldest entries. A larger value of *maxNumEntries* causes more CP memory to be used.

Copyright © 2006, Nortel Nortel Confidential

Write: All

Description This attribute specifies whether to purge the whole route cache entry when a path becomes invalid, or to remove only the invalid path.

A route cache entry consists of one or more paths and support calls of certain traffic requirements. A path becomes invalid if it can no longer support the traffic requirements of the associated route. This may happen if any link along the path fails, or its capacity is reduced.

If this attribute is set to *yes*, the whole route cache entry will be purged after a path becomes invalid. If this attribute is set to *no*, only the path will be removed.
For most networks, it is desirable to purge the whole route cache entry when one path becomes invalid since this allows for better load balancing. However, for some network scenarios, this behavior is not desirable, because it may lead to many unnecessary route cache purges at high network utilization.

The default value of this attribute is *yes*. It should only be changed if recommended by Nortel Networks.

Mib AtmRouting

Values
no
yes

Default yes

ATTRIBUTE ARtg Pnni Cache maxPathsToIntermediateNode

Access
Read: All
Write: All

Description This attribute specifies the maximum number of equal cost paths that are kept to an intermediate node during on-demand route computation. The default value is 1.

Setting this attribute to a value greater than 1 benefits customers who want to calculate more than 3 alternate paths to the destination and store them in the cache. This helps them achieve better load balancing across their network. However, changing the default value to more than 1 will

Copyright © 2006, Nortel Nortel Confidential

degrade route calculation performance. It should only be changed from the default if recommended by Nortel Networks.

Mib	AtmRouting
Values	Decimal (1..20)
Default	1

GROUP ARtg Pnni Cache Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the routing cache.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni Cache currentNumEntries

Access	Read: All Write: Illegal
Description	This attribute indicates the number of route entries currently stored in the cache. The *currentNumEntries* value should be used for diagnostic or engineering purposes in conjunction with the other operational indicators for *Cache* entries: *avgLifetime*, *numReplacements*, *numCrankbackInvalidations*, *numTopologyInvalidations*, and *numAgedEntries*. Together, these attributes indicate the utilization of the Route Cache.
Mib	AtmRouting
Values	Decimal (0..10000)
Default	No default

ATTRIBUTE ARtg Pnni Cache peakNumEntries (pkEntries)

Access	Read: All Write: Illegal
Description	This attribute indicates the highest number of entries stored in the cache since the cache was last created or cleared by using the *Clear* command. The *peakNumEntries* value is a useful diagnostic and engineering tool in evaluating the memory impacts of the *Cache*. If the *peakNumEntries* equals the *maxNumEntries* for a significant amount of time, then the *maxNumEntries* may need to be increased.
Mib	AtmRouting
Values	Decimal (0..10000)
Default	No default

ATTRIBUTE ARtg Pnni Cache hitRatio

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the percentage of PNNI routing requests fulfilled using the routing cache since the time the cache was last created or cleared by using the *clear* command. If the *cacheHits* value is low, then this is an indication that the cache is not engineered properly or is not appropriate for the profile of the network traffic. A low value of *cacheHits* may indicate that the traffic profiles are constantly changing are not being reused. If this is the case, the *Cache* may need to be disabled on this node. An equilibrium has to be reached within the network before an accurate value from *cacheHits* is obtained.
Mib	AtmRouting
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE ARtg Pnni Cache cacheUptime (uptime)

Access	Read: All Write: Illegal
Description	This attribute indicates the time since the routing Cache was last created or cleared.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Units	minutes
Default	No default

ATTRIBUTE ARtg Pnni Cache avgLifetime

Access	Read: All Write: Illegal
Description	This attribute indicates the average lifetime of the route entries in the cache. The *avgLifetime* can be used for diagnostic or engineering purposes in setting an appropriate value for the *agingPeriod*. An *avgLifetime* value lower than the *agingPeriod* indicates that some fraction of the *Cache* entries are removed before they are normally aged. When the *avgLifetime* equals the *agingPeriod*, this indicates that the *agingPeriod* value might have to be increased. However, note that other

Copyright © 2006, Nortel Nortel Confidential

	conditions in the network can also cause this condition, such as very stable network topology. The *avgLifetime* value should be used for diagnostic or engineering purposes in conjunction with the other operational indicators for *Cache* entries: *currentNumEntries*, *numReplacements*, *numCrankbackInvalidations*, *numTopologyInvalidations*, and *numAgedEntries*.
Mib	AtmRouting
Values	Decimal (0..7200)
Units	seconds
Default	No default

ATTRIBUTE ARtg Pnni Cache numReplacements (nRep)

Access	Read: All Write: Illegal
Description	This attribute counts the entries that have been removed from the *Cache* in order to make room for newer entries. It is set to zero when the *Cache* is created or cleared using the *Clear* command. The *numReplacements* value wraps to zero when the maximum value is exceeded or when the *totalEntriesRemoved* value is exceeded. If the number of entries removed from the *Cache* due to replacement operations is high, the *maxPaths* value may need to be increased. The *numReplacements* value should be used for diagnostic or engineering purposes in conjunction with the other operational indicators for *Cache* entries: *currentNumEntries*, *avgLifetime*, *numCrankbackInvalidations*, *numTopologyInvalidations*, and *numAgedEntries*, *totalEntriesRemoved*.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE ARtg Pnni Cache numCrankbackInvalidations (nCrank)

Access	Read: All Write: Illegal
Description	This attribute counts the entries removed from the *Cache* due to crankback purging operations. It is set to zero when the *Cache* is created or cleared using the *Clear* command. The *numCrankbackInvalidations* value wraps to zero when the maximum value is exceeded or when the *totalEntriesRemoved* value is exceeded.

Copyright © 2006, Nortel Nortel Confidential

If this value is high, it suggests that the route entries in the *Cache* are becoming invalid during their lifetime. This means that the *agingPeriod* might have to be decreased. Reroutes due to crankbacks are resource-intensive and add to network latency. Therefore *numCrankbackInvalidations* takes precedence over the *avgLifetime* status.

The *numCrankbackInvalidations* value should be used for diagnostic or engineering purposes in conjunction with the other operational indicators for *Cache* entries: *currentNumEntries*, *avgLifetime*, *numReplacements*, *numTopologyInvalidations*, and *numAgedEntries*, *totalEntriesRemoved*.

Mib: AtmRouting

Values: Decimal (0..4294967295)

Default: No default

ATTRIBUTE ARtg Pnni Cache numTopologyInvalidations (nTopInv)

Access: Read: All
Write: Illegal

Description: This attribute indicates the number of entries in the *Cache* that have replaced older entries due to significant changes in known resources within the PNNI network. It is set to zero when the *Cache* is created or cleared using the *Clear* command.

The *numTopologyInvalidations* value wraps to zero when the maximum value is exceeded or when the *totalEntriesRemoved* wraps to zero.

If this value is high, it indicates that the dynamic nature of the network topology may be decreasing the effectiveness of the *Cache*.

The *numTopologyInvalidations* value must be used for diagnostic or engineering purposes in conjunction with the other operational indicators for *Cache* entries: *currentNumEntries*, *avgLifetime*, *numReplacements*, *numCrankbackInvalidations*, *numAgedEntries*, *totalEntriesRemoved*.

Mib: AtmRouting

Values: Decimal (0..4294967295)

Default: No default

ATTRIBUTE ARtg Pnni Cache numAgedEntries (nAged)

Access: Read: All
Write: Illegal

Description: This attribute counts the entries that have aged out of the *Cache* since the *Cache* was last created or cleared using the *clear* command. It is set to zero when the *Cache* is created or cleared using the *clear* command.

The *numAgedEntries* value wraps to zero when the maximum value is exceeded or when the *totalEntriesRemoved* wraps to zero.

Copyright © 2006, Nortel Nortel Confidential

If this value is low, either the *agingPeriod* is either too high or the other *Cache* purging operations occur very frequently.

The *numAgedEntries* value should be used for diagnostic or engineering purposes in conjunction with the other operational indicators for *Cache* entries: *currentNumEntries*, *avgLifetime*, *numReplacements*, *numCrankbackInvalidations*, *numTopologyInvalidations*, and *totalEntriesRemoved*.

Mib AtmRouting

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE ARtg Pnni Cache totalEntriesRemoved (totRm)

Access Read: All
Write: Illegal

Description This attribute counts the *Cache* entries that have been removed from the *Cache*. The counter starts from zero when the *Cache* is created or cleared using the *clear* command.

The counter wraps to zero when the maximum value is exceeded.

This value should be used for diagnostic or engineering purposes in conjunction with other operational indicators for *Cache* entries: *currentNumEntries*, *avgLifetime*, *numReplacements*, *numCrankbackInvalidations*, *numTopologyInvalidations*, and *numAgedEntries*.

Mib AtmRouting

Values Decimal (0..4294967295)

Default No default

ATTRIBUTE ARtg Pnni Cache numHits

Access Read: All
Write: Illegal

Description This attribute indicates the actual number of PNNI routing requests fulfilled using the routing cache since the time the cache was last created or cleared by using the *Clear* command.

An increase in the value after a call setup request is an indication that the call setup request was satisfied using the routing cache.

avCrOptMetricProb

Default — random

ATTRIBUTE ARtg Pnni Lb maxPaths

Access
Read: All
Write: All

Description

This attribute specifies the maximum number of paths to be used for load balancing and route caching.

Setting this attribute to ***1*** turns the load balancing off for all load balancing technique except for ***maxAvCr***. This load balancing technique requires *maxPaths* to be set to ***1***.

When the *Artg Pnni Cache* component is provisioned, this attribute also specifies the maximum number of paths to be stored in a route *Cache* entry for each destination node.

Setting this attribute to a value greater than ***3*** is not recommended except for certain specific topologies. In these cases, it allows a better load distribution when route cache is used. However, for other topologies, it will significantly slow down on-demand route computation. Also when this attribute is set to a value greater than ***3***, the *Artg Pnni lb<srvCat> method* attribute can only be set to ***random***.

When this attribute is set to a value greater than ***3***, *maxNumEntries* in the *Artg Pnni Cache* subcomponent is limited to ensure that maximum memory consumption by the route cache on the CP does not increase

Copyright © 2006, Nortel
Nortel Confidential

when *maxPaths* is greater than ***3***. *maxNumEntries* may not exceed the value of ***30000***/ *maxPaths*.

Mib	AtmRouting
Values	Decimal (1..20)
Default	2

ATTRIBUTE ARtg Pnni Lb minVariance (minVar)

Access	Read: All Write: All
Description	This attribute specifies the minimum variance value to be used for each optimization metric supported by the service category of this *LoadBalancing* instance. This attribute is a vector indexed by the optimization metric. Note that the values of this vector are explicit values as opposed to the factors required to set the *slopeVariance* attribute. A larger variance allows more usable paths to be considered for load balancing. A low variance of zero means that only the *slopeVariance* attribute is used in determining the acceptable variance. The maximum range boundaries for each of the optimization metrics are: ***- cdv***: 2147483647 (for cbr and rtVbr only). ***- maxCtd***: 2147483647 (for cbr and rtVbr only). ***- aw***: 4294967295. The acceptable variance is calculated based on the following formula: *acceptableVariance = minVariance + optM * slopeVariance/100* where *optM* represents the optimization metric value of the best path.
Mib	AtmRouting
Vector of	Decimal (0..4294967295)
Index	cdv maxCtd aw
Default	(0, 0, 0)

ATTRIBUTE ARtg Pnni Lb slopeVariance (slopeVar)

Access	Read: All Write: All
Description	This attribute specifies the slope of the acceptable variance, for each optimization metric supported by the service category of this *LoadBalancing* instance. This attribute is a vector indexed by optimization metric. The values of this vector are factors.

Copyright © 2006, Nortel Nortel Confidential

A larger variance allows more usable paths to be considered for load balancing.

A *slopeVariance* of zero means that only the acceptable variance is given by the *minVariance* attribute. If both *minVariance* and *slopeVariance* attributes are zero, means that only the best paths of equal value to the *optimizationMetric* will be considered in load balancing.

The acceptable variance is calculated based on the following formula:
*acceptableVariance = minVariance + optM * slopeVariance/100*
where *optM* represents the optimization metric value of the best path.

ATTRIBUTE ARtg Pnni Reroute protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols which are requested by connection segments for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with

Copyright © 2006, Nortel Nortel Confidential

	the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the last rendezvous node is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***localEbr***: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature. ***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.
Mib	AtmRouting
Values	localGlobal localOnly globalOnly localEbr ebrOnly
Default	localGlobal

ATTRIBUTE ARtg Pnni Reroute localDomain (domain)

Access	Read and write
Description	This attribute specifies the local domain for the node. This value is advertised to all PNNI neighbors to determine the type of local domain link. Use of the default value, ***unspecified***, will result in a warning being issued, since it is recommended that this value be initialized. If the value is set to ***intraDomain***, all PNNI neighbors will identify their connecting links as intra-domain links.
Mib	AtmRouting
Values	Decimal (2..1024) intraDomain (intra) unspecified (unspec)
Default	unspecified

ATTRIBUTE ARtg Pnni Reroute numOptAttempts

Access	Read and write
Description	This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization attempts to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection

Copyright © 2006, Nortel Nortel Confidential

segment. Subsequent path optimizations do not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization does not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

Mib: AtmRouting

Values: Decimal (0..15)

Default: 1

ATTRIBUTE ARtg Pnni Reroute **moduleOptimizationConnections**

Access: Read and write

Description: This attribute specifies which connection segments are considered by a module optimization pass.

One of the following values can be specified:
none: No connection segments are considered for path optimization.
recoveredOnly: Only connection segments which are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is found under *RerouteInfo* component. If the rerouting protocol is Ebr then the *ebrOptimalMetricValue* attribute indicated the best known optimization metric value. If the local rerouting protocol is actived to this connection segment then the *localOptimalMetricValue* attribute indicated the best known optimization metric value for the local segment. If the global rerouting protocol is actived to this connection segment then the *globalOptimalMetricValue* attribute indicated the best known optimization metric value for the global connection segment.
allSubscribed: All connection segments subscribed to path optimization are considered.

Mib: AtmRouting

Values:
none
recoveredOnly
allSubscribed

Default: recoveredOnly

ATTRIBUTE ARtg Pnni Reroute **switchoverMechanism**

Access: Read and write

Description: This attribute specifies the mechanism used for switchover of a rerouted connection segment.

Copyright © 2006, Nortel Nortel Confidential

	One of the following values can be specified: ***standard***: The mechanism described in the ATM Forum "Domain based Rerouting" specification is used for switchover. This value ensures interoperability with other vendors' equipment running ATM Forum "Domain based Rerouting". ***rcl***: The Reduced Cell Loss (RCL) mechanism is used for switchover. RCL is a value-added extension to the standard mechanism that allows faster switchover time.
Mib	AtmRouting
Values	standard rcl
Default	standard

ATTRIBUTE ARtg Pnni Reroute localConnectionRecoverySubscr (IConRec)

Access	Read and write
Description	This attribute specifies which connection segments request subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator. Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local connection recovery. Connection segments of the specified type(s) which request ***localEbr*** request subscription to the local connection recovery. Only one will be granted. One or more of the following values can be specified: ***svcSvp***: If this value is set, all SVC and SVP connection segments request subscription to local connection recovery. ***sourceSpvcSpvp***: If this value is set, all source SPVC and SPVP connection segments request subscription to local connection recovery. ***transitSpvcSpvp***: If this value is set, all transit SPVC and SPVP connection segments request subscription to local connection recovery.
Mib	AtmRouting
Set of	svcSvp (svc) sourceSpvcSpvp (source) transitSpvcSpvp (transit)
Default	(svcSvp, sourceSpvcSpvp, transitSpvcSpvp)

ATTRIBUTE ARtg Pnni Reroute localPathOptimizationSubscr (IPathOpt)

Access	Read and write
Description	This attribute specifies which connection segments request subscription to local path optimization. This attribute only affects connection segments

that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***localOnly*** protocols request subscription to local path optimization.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to the local path optimization. Only one will be granted.

One or more of the following values can be specified:
svcSvp: If this value is set, all SVC and SVP connection segments request subscription to local path optimization.
sourceSpvcSpvp: If this value is set, all source SPVC and SPVP connection segments request subscription to local path optimization.
transitSpvcSpvp: If this value is set, all transit SPVC and SPVP connection segments request subscription to local path optimization.

Mib	AtmRouting
Set of	svcSvp (svc) sourceSpvcSpvp (source) transitSpvcSpvp (transit)
Default	(svcSvp, sourceSpvcSpvp, transitSpvcSpvp)

ATTRIBUTE ARtg Pnni Reroute globalConnectionRecoverySubscr (gConRec)

Access	Read and write
Description	This attribute specifies which connection segments request subscription to global or Ebr connection recovery. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute affects connection segments for a node that is a DTL originator. Connection segments of the specified type(s) which request ***localGlobal*** or ***globalOnly*** protocols request subscription to global connection recovery. Connection segments of the specified type(s) which request ***EbrOnly*** protocol request subscription to EBR connection recovery. Connection segments of the specified type(s) which request ***localEbr*** request subscription to the EBR connection recovery. Only one will be granted. One or more of the following values can be specified: ***svcSvp***: If this value is set, all SVC and SVP connection segments request subscription to global or EBR connection recovery. ***sourceSpvcSpvp***: If this value is set, all source SPVC and SPVP connection segments request subscription to global or EBR connection recovery.

Copyright © 2006, Nortel Nortel Confidential

transitSpvcSpvp: If this value is set, all transit SPVC and SPVP connection segments request subscription to global or EBR connection recovery.

ATTRIBUTE ARtg Pnni Reroute **globalPathOptimizationSubscr (gPathOpt)**

Access — Read and write

Description — This attribute specifies which connection segments request subscription to global or EBR path optimization. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute affects connection segments for a node that is a DTL originator.

Connection segments of the specified type(s) which request ***localGlobal*** or ***globalOnly*** protocols request subscription to global path optimization.

Connection segments of the specified type(s) which request ***ebrOnly*** protocols request subscription to EBR path optimization.

Connection segments of the specified type(s) which request ***localEbr*** request subscription to the EBR path optimization. Only one is granted.

One or more of the following values can be specified:
svcSvp: If this value is set, all SVC and SVP connection segments request subscription to global or EBR path optimization.
sourceSpvcSpvp: If this value is set, all source SPVC and SPVP connection segments request subscription to global or EBR path optimization.
transitSpvcSpvp: If this value is set, all transit SPVC and SPVP connection segments request subscription to global or EBR path optimization.

Mib — AtmRouting

Set of — svcSvp (svc)
sourceSpvcSpvp (source)
transitSpvcSpvp (transit)

Default — (svcSvp, sourceSpvcSpvp, transitSpvcSpvp)

ATTRIBUTE ARtg Pnni Reroute **optimizationTime (optTime)**

Access — Read and write

Description — This attribute specifies the times at which a module optimization pass occurs. A maximum of 12 times can be specified. If no times are

Copyright © 2006, Nortel Nortel Confidential

	provisioned, then the module optimization pass only occurs when triggered manually using the *Optimize* verb.
Mib	AtmRouting
List of	Time (HM)
List Size	12
Default	No default

GROUP ARtg Pnni Reroute Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *ARtg Pnni Reroute* component.
Mib	AtmRouting

ATTRIBUTE ARtg Pnni Reroute optimizationState (state)

Access	Read only
Description	This attribute indicates the current state of module optimization. One of the following values is indicated: ***idle:*** There is no module optimization pass currently in progress. The next pass will occur at the next available time specified by the *optimizationTime* attribute, or when the operator issues the *Optimize* command against this component. ***active***: A module optimization pass is in progress and the module is attempting to optimize eligible connections.
Mib	AtmRouting
Values	idle active
Default	No default

ATTRIBUTE ARtg Pnni Reroute optimizationProgress (progress)

Access	Read only
Description	This attribute indicates the percentage of eligible interfaces that have been sent an optimization request as part of a module optimization pass. This value is reset to zero at the beginning of each module optimization pass.
Mib	AtmRouting
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE ARtg Pnni Reroute pathsOptimized

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates how many paths have been successfully optimized during the latest module optimization pass. Successfully optimized paths are paths that switched to a better route. This value is reset to zero at the beginning of each module optimization pass.
Mib	AtmRouting
Values	Decimal (0..4294967295)
Default	No default

COMPONENT ARtg PhysicalPort (Port)

Instance	Decimal (0..4294967295)
Groups	GROUP ARtg Port Operational (Oper)
Scope	Device
Description	*ARtg PhysicalPort/<n>* This component represents a port on this node within the ATM routing domain. The index is the port ID used to uniquely identify this port.
Mib	AtmRouting
Common Verbs	Help List Display

GROUP ARtg Port Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of a *Port* component.
Mib	AtmRouting

ATTRIBUTE ARtg Port componentName

Access	Read: All Write: Illegal
Description	This attribute indicates the component name of the port.
Mib	AtmRouting
Values	The name of the component
Default	No default

COMPONENT ARtg SparedServices (SpServ)

Groups	GROUP ARtg SpServ Provisioned (Prov) GROUP ARtg SpServ OsiState (State)
Scope	Device

Copyright © 2006, Nortel Nortel Confidential

Description	*ARtg SparedServices* This component represents the Hitless ATM Routing capability. This capability reduces the length of routing outage during CP switchover and Hitless Software Migration.
Mib	AtmSparedServices
Common Verbs	Help List Display

GROUP ARtg SpServ Provisioned (Prov)

Properties	Provisioned
Description	This group contains the generic provisionable attributes of the *ARtg SparedServices* component.
Mib	AtmSparedServices

ATTRIBUTE ARtg SpServ sparing

Access	Read: All Write: All
Description	This attribute specifies the administrative state of ATM Spared Services. When this attribute is set to ***enabled***, the ATM routing system on the CP is hot-spared, resulting in a reduced ATM routing outage during CP switchover and Hitless Software Migration. This attribute may be set to ***enabled*** only if the *shelf cpEquipmentProtection* attribute is set to ***hot*** and the *prov journaling* attribute is set to ***enabled***. When the value of this attribute is changed from ***enabled*** to ***disabled***, the standby CP restarts.
Mib	AtmSparedServices
Values	disabled enabled
Default	disabled

GROUP ARtg SpServ OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this

Copyright © 2006, Nortel Nortel Confidential

group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — AtmSparedServices

ATTRIBUTE ARtg SpServ adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — AtmSparedServices

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE ARtg SpServ operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — AtmSparedServices

Copyright © 2006, Nortel Nortel Confidential

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE ARtg SpServ usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	AtmSparedServices
Values	idle active (activ) busy
Default	idle

ATTRIBUTE ARtg SpServ availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib — AtmSparedServices

Set of
inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default — No default

ATTRIBUTE ARtg SpServ proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	AtmSparedServices
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE ARtg SpServ controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — AtmSparedServices

Set of — subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE ARtg SpServ alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — AtmSparedServices

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE ARtg SpServ standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	AtmSparedServices
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE ARtg SpServ unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	AtmSparedServices
Values	false true
Default	false

GROUP AtmIf CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	AtmCore

ATTRIBUTE AtmIf customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	AtmCore
Values	Decimal (0; 1..8191)
Default	0

GROUP AtmIf Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *AtmIf* component.
Mib	AtmCore

ATTRIBUTE AtmIf interfaceName

Access	Read and write
Criticality	Process
Description	This attribute associates the *AtmIf* component with a specific interface on a Function Processor—for example, *Lp/1 Ds3/0*. This implicitly defines the logical processor on which the *AtmIf* component is activated.
Mib	AtmCore
Values	Link (Hardware, applicationFramerName)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf oamSegmentBoundary (sb)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the interface is on an OAM segment boundary. When the value is ***yes***, the interface is on an OAM segment boundary and all connections passing through the interface terminate OAM segment cells. When the value is ***no***, the interface is not on an OAM segment boundary and the interface permits segment OAM cells to be passed transparently.
Mib	AtmCore
Values	no yes
Default	yes

ATTRIBUTE Atmlf maxVpiBits (vpiBits)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of VPI bits that may be active for this *AtmIf* component. These bits start at the least significant bit position and are contiguous. In general, the maximum VPI which may be used on the interface is 2***maxVpiBits* - 1. The value of the remaining (inactive) VPI bits is ignored on cells received from the link. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, and ***2pJ6MAtm*** cards, the value of this attribute must be ***8***. The maximum VPI supported is 255. For all other cards, the value of this attribute may be ***8*** or ***12***. The maximum VPI supported is 4095. An exception is for the ***8pE1Atm***, and ***8pDS1Atm*** cards, which do not support VPI 4095. The maximum VPI supported on these cards is 4094. If a *Uni* or an *Iisp* component is present directly under the *AtmIf* component, the value of this attribute must be ***8***.
Mib	AtmCore
Values	Decimal (8; 12)
Default	8

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmIf remoteAtmInterfaceLabel (remoteAtmIf)

Access	Read and write
Description	This attribute specifies a unique indication of the remote ATM service or interface component connected to this one. The value of this attribute can be used by network management applications to discover the network's ATM topology from its configuration information. The syntax of the value, such as component ID, address, or other numerical identifier, must follow the conventions of the network management platform. In absence of such convention or platform, the value should be left empty. The value is only stored by the module. It is neither validated nor used to perform any form of remote connectivity validation.
Mib	AtmCore
Values	String (0..60, ASCII)
Default	""

ATTRIBUTE AtmIf txCellMemory

Access	Read and write
Criticality	Component
Description	This attribute specifies the percentage of total transmit cell memory which is available for use by connections under this *AtmIf* component. Transmit cell memory is used for storing ATM cells to be transmitted by connections under this *AtmIf* component. This attribute is not applicable, and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. If the value of this attribute is ***100***, connections under this *AtmIf* may use up to 100% of the total transmit cell memory. If the value of this attribute is less than ***100***, then only that percentage of the total transmit cell memory may be used by connections under this *AtmIf* component. The minimum value for this attribute is ***1*** since some cell memory is always required for connections. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, the total transmit cell memory is indicated in the *Lp/x Eng Arc Aqm/x txCellMemoryThresholds* 0 attribute. For ***3pDS3Atm2***, ***3pE3Atm2***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***12pDS3Atm***, and ***12pE3Atm*** cards, the total transmit cell memory of an *Aqm*

Copyright © 2006, Nortel Nortel Confidential

component is shared across multiple *AtmIf* interfaces of the card. Specifying a value of ***100*** for each *AtmIf* enables complete overbooking of the total transmit cell memory by the *AtmIf* components which share the *Aqm* component. Specifying values for this attribute such that the value for each *AtmIf* is less than ***100*** but the sum for all *AtmIf* components is more than 100% enables partial overbooking of the transmit cell memory. Specifying values for this attribute such that the sum for all *AtmIf* components is exactly 100%, ensures that each *AtmIf* has a dedicated pool of transmit cells with no overbooking. Specifying values for this attribute such that the sum for all *AtmIf* components is less than 100% restricts the total size of the free list. This can be used to ensure the functioning of port aggregation even with a small number of connections.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, and ***4pOC3SmIrAtm*** cards, the total transmit cell memory of an *Aqm* component is dedicated to a single *AtmIf* interface of the card. Specifying a value for this attribute that is less than ***100*** restricts the total size of the free list. This can be used to ensure the functioning of port aggregation even with a small number of connections.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the total transmit cell memory is indicated in the *Lp/x Eng Arc txCellMemoryThresholds* 0 attribute. The total transmit cell memory of the *Arc* component is shared across all *AtmIf* interfaces of the card. Specifying a value of ***100*** for each *AtmIf* enables complete overbooking of the total transmit cell memory by the *AtmIf* components. Specifying values for this attribute such that the value for each *AtmIf* is less than ***100*** but the sum for all *AtmIf* components is more than 100% enables partial overbooking of the transmit cell memory. Specifying values for this attribute such that the sum for all *AtmIf* components is exactly 100%, ensures that each *AtmIf* has a dedicated pool of transmit cells with no overbooking. Specifying values for this attribute such that the sum for all *AtmIf* components is less than 100% restricts the total size of the free list. The attribute value does not affect the transmit cell memory allocated for common queues used by any of the service categories.

Mib	AtmCore
Values	Decimal (1..100)
Units	%
Default	100

ATTRIBUTE AtmIf faultHoldOffTime (faultHOT)

Access	Read and write
Description	This attribute specifies the delay before faults detected at the VP layer are propagated to the VC layer, and thus to the application using the connection. If the value is ***0***, applications using a *VirtualPathTerminator* component are

Copyright © 2006, Nortel Nortel Confidential

immediately notified of faults detected by the VP. Using this value allows these applications to be advised of faults without requiring loopbacks on each *Vcc* component. Typically, the application goes out of service when advised of a fault.

If the value is ***infinity***, applications using a *VirtualPathTerminator* component are not notified of VP layer faults. Using this value allows the applications to survive transient VP layer fault conditions.

The value chosen applies only to Vpts and Vccs directly beneath a *Vpt*.

Mib — AtmCore

Values
0
infinity

Default — infinity

ATTRIBUTE Atmlf ctdCalculation (ctdCalc)

Access — Read and write

Description — This attribute specifies whether cell transfer delay calculation should be performed on loopback cells for each SPVC and SPVP connection under this interface.

Cell transfer delay is calculated as half of the measured segment round trip delay of a loopback cell.

Cell transfer delay calculation is only supported when segment switch side loopback is enabled on the source segment endpoint. Cell transfer delay calculation is only performed on supported connections when the *accountCollection* attribute of the *AtmIf Uni* or *AtmIf Iisp* component has a non-empty reason. Cell transfer delay calculation is not provided for connections under the *Vpt*.

Attribute value *version2on* is currently not supported. To enable cell transfer delay calculation, value *version1on* should be used.

Mib — AtmCore

Values
off
version1on (on)
version2on

Default — off

ATTRIBUTE Atmlf txCellDiscardThreshold

Access — Read and write

Description — This attribute specifies the threshold for a minor alarm for discarded outgoing cells for all ATM services.

If the count of discarded outgoing cells is greater than the provisioned

Copyright © 2006, Nortel Nortel Confidential

value of this attribute in a 15 minute interval, the alarm is set.

While the alarm is set, if the count of discarded outgoing cells is still greater than the provisioned value of this attribute in the subsequent 15 minute intervals, the alarm is not set again. If the count of discarded outgoing cells drops below the provisioned value of this attribute in a 15 minute interval the alarm is cleared.

Provisioned value of '0' means discarded outgoing cells are not monitored and no alarm is generated.

While the alarm is set, if the value of this attribute is changed, the alarm is cleared.

This attribute is not applicable for ***3pOC3MmAtm, 3pOC3SmAtm, 3pE3Atm, 3pDS3Atm, 3pE1Atm, 3pDS1Atm, 8pE1Atm, 8pDS1Atm*** and ***2pJ6MAtm*** cards.

This attribute is not applicable for ***4pOC12SmIrAtm*** and ***4pOC12SmLrAtm*** cards when channelized.

Mib	AtmCore
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE AtmIf txFrameDiscardThreshold

Access	Read and write
Description	This attribute specifies the threshold for a minor alarm for discarded outgoing frames for all ATM services. If the count of discarded outgoing frames is greater than the provisioned value of this attribute in a 15 minute interval, the alarm is set. While the alarm is set, if the count of discarded outgoing frames is still greater than the provisioned value of this attribute in the subsequent 15 minute intervals, the alarm is not set again. If the count of discarded outgoing frames drops below the provisioned value of this attribute in a 15 minute interval the alarm is cleared. Provisioned value of '0' means discarded outgoing frames are not monitored and no alarm is generated. While the alarm is set, if the value of this attribute is changed, the alarm is cleared. This attribute is not applicable for ***3pOC3MmAtm, 3pOC3SmAtm, 3pE3Atm, 3pDS3Atm, 3pE1Atm, 3pDS1Atm, 8pE1Atm, 8pDS1Atm, 2pJ6MAtm, 4pOC12SmIrAtm, 4pOC12SmLrAtm*** and ***16pOC3SmIrAtm*** cards.

GROUP Atmlf Loopback (Lbk)

Properties	Provisioned
Description	This group contains the default loopback attribute values for all *Vcc, Vpc, and Vpt* components. Note that these attribute values can be overridden by setting different values in the *Vcd* component of a provisioned *Vcc* component, or the *Vpd* component of a provisioned *Vpc* or *Vpt* component. Certain loopback requests may not be possible on a given connection. In such cases, the value of the corresponding operational loopback attribute in the *AtmStatus* group of the *Vcc*, *Vpc,* or *Vpt* component is ***notApplicable*** and the requested loopback is not performed.
Mib	AtmCore

ATTRIBUTE Atmlf segLinkSideLoopback (segLkLbk)

Access	Read and write
Description	This attribute specifies the default value for link-side segment loopback insertion for all connections under this interface. Link-side segment loopback is not possible if the value of the *oamSegmentBoundary* attribute of the *AtmIf* component is ***no***.
Mib	AtmCore
Values	on off
Default	off

ATTRIBUTE Atmlf segSwitchSideLoopback (segSwLbk)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the default value for switch-side segment loopback insertion for all connections under this interface. Switch-side segment loopback is not possible if the value of the *oamSegmentBoundary* attribute of the *AtmIf* component is ***no***.
Mib	AtmCore
Values	on off
Default	off

ATTRIBUTE Atmlf endToEndLoopback (eeLbk)

Access	Read and write
Description	This attribute specifies the default value for end-to-end loopback insertion for all connections under this interface. End-to-end loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***, or ***segmentEndPoint***. End-to-end loopback insertion is possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectionEndPoint***. End-to-end loopback insertion is always possible on a *Vpt* component.
Mib	AtmCore
Values	on off
Default	off

GROUP Atmlf OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmCore

ATTRIBUTE Atmlf adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: AtmCore

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Atmlf operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: AtmCore

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Atmlf usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	AtmCore
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Atmlf availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost

Copyright © 2006, Nortel Nortel Confidential

always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	AtmCore
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Atmlf proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some

Copyright © 2006, Nortel Nortel Confidential

processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Atmlf controlStatus (osiCntrl)

Access — Read only

Description

If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — AtmCore

Set of
subjectToTest (subTst)

ATTRIBUTE Atmlf alarmStatus (osiAlarm)

Access — Read only

Copyright © 2006, Nortel Nortel Confidential

Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	AtmCore
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Atmlf standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

Copyright © 2006, Nortel Nortel Confidential

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: AtmCore

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE AtmIf unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: AtmCore

Values:
false
true

Default: false

GROUP AtmIf Operational (Oper)

Properties: Operational

Description: This group contains operational attributes which show the status of the *AtmIf* component.

Mib: AtmCore

ATTRIBUTE AtmIf txCellMemoryCongestionState (txCellCcState)

Access: Read only

Description: This attribute indicates the congestion state of the transmit cell memory for this *AtmIf* component. The congestion state is used to determine if cells of a particular discard priority are discarded or queued for transmit.

This attribute is not applicable and is not displayed for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards.

Copyright © 2006, Nortel Nortel Confidential

The congestion state of transmit cell memory is indicated by a numeric value ranging from ***3*** to ***0***. A value of ***3*** indicates no congestion and a value of ***0*** indicates maximum congestion. When transmit cell memory is in congestion state “x”, traffic with discard priority greater than “x” is discarded. Traffic with discard priority less than “x” may be queued for transmit, depending on the congestion level of the connection transmit queue. Traffic with discard priority equal to “x” may either be queued or discarded depending on how close the value of the *txCellMemoryUsage* attribute is to the next threshold as indicated by the value of the *txCellMemoryThreshold* attribute. For example, discard priority 3 traffic is queued until the value of the *txCellMemoryUsage* attribute equals the value of the *txCellMemoryThreshold* 3 attribute. At that point, discard priority 3 traffic is discarded.

This attribute indicates which *txCellMemoryThreshold* attribute corresponds to the current value of the *txCellMemoryUsage* attribute.

Mib	AtmCore
Values	Decimal (0..3)
Default	No default

ATTRIBUTE Atmlf txCellMemoryUsage

Access	Read only
Description	This attribute indicates the current number of cells that are stored in transmit cell memory for this *AtmIf* component. Transmit cell memory is used for storing ATM cells to be transmitted by connections under this *AtmIf* component. This attribute is not applicable and is not displayed for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, the value of this attribute includes all cells for nrt-VBR, and UBR connections. It also includes cells for CBR, and rt-VBR connections which are doing per-VC queuing. It does not include cells for CBR, or rt-VBR connections that are doing common queuing. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the value of this attribute only includes cells used by per-connection queues of all service categories. The attribute value does not include the transmit cell memory consumed by common queues for any of the service categories. Each emission priority also has a minimum buffer space reserved, which may be used by the per connection queues. The cells occupying this minimum buffer space will not be counted as part of this attribute.

Mib	AtmCore
Values	Decimal (0..4294967295)
Units	cells
Default	No default

ATTRIBUTE Atmlf txCellMemoryThreshold

Access	Read only
Description	This attribute is a vector which indicates the size and three discard thresholds for transmit cell memory for this *AtmIf* component. Transmit cell memory used for storing ATM cells to be transmitted by connections under this *AtmIf* component. This attribute is not applicable and is not displayed for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. The threshold 0 value indicates the transmit cell memory size. It is the multiplication of the total transmit cell memory by the value of the *txCellMemory* attribute of this *AtmIf* component. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, the threshold 1 value is set at approximately 90 percent of the threshold 0 value. The threshold 2 value is set at approximately 85 percent of the threshold 0 value. The threshold 3 value is set at approximately 75 percent of the threshold 0 value. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the threshold 1 value is set at approximately 90 percent of the threshold 0 value. The threshold 2 value is set at approximately 80 percent of the threshold 0 value. The threshold 3 value is set at approximately 60 percent of the threshold 0 value. The current value of the *txCellMemoryUsage* attribute together with the vector of values in the *txCellMemoryThreshold* attribute determines the value of the *txCellMemoryCongestionState* attribute. The congestion state determines whether cells of a given discard priority are discarded or queued for transmit. When the value of the *txCellMemoryUsage* attribute is between the threshold 0 and threshold 1 values, the value of the *txCellMemoryCongestionState* attribute is ***0***. In congestion state 0, traffic with discard priority greater than 0 is discarded. When the value of the *txCellMemoryUsage* attribute is between the threshold 1 and threshold 2 values, the value of the

Copyright © 2006, Nortel Nortel Confidential

txCellMemoryCongestionState attribute is ***1***. In congestion state 1, traffic with discard priority greater than 1 is discarded.

When the value of the *txCellMemoryUsage* attribute is between the threshold 2 and threshold 3 values, the value of the *txCellMemoryCongestionState* attribute is ***2***. In congestion state 2, traffic with discard priority greater than 2 is discarded.

When the value of the *txCellMemoryUsage* attribute is below the threshold 3 value, the value of the *txCellMemoryCongestionState* attribute is ***3***. In congestion state 3, all traffic is queued for transmit.

ATTRIBUTE AtmIf txCellEfci

Access	Read only
Description	This attribute counts cells transmitted from the ATM interface which have the EFCI bit set to 1. This count is included in the *txCell* attribute. This attribute is not supported and is not displayed on ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. The counter is reset to zero when the component is activated, or when any critical attribute of the component is changed. The counter wraps to zero when it exceeds its maximum value of ***(2**64)-1***.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE AtmIf txCellDiscard

Access	Read only
Description	This attribute counts cells discarded and not transmitted out the ATM interface. Since cells are discarded before they are transmitted, this count is not included in the *txCell* attribute. This count is independent of the value of the *txFrameDiscard* attribute. This attribute is not applicable and is not displayed on ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards. This attribute is not supported and is not displayed for ***4pOC12SmIrAtm***, and ***4pOC12SmIrAtm*** cards when channelized. Transmit cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled. For ***16pOC3SmIrAtm*** cards, this attribute is updated at the end of every five-minute cycle. The counter is reset to zero when the component is activated, or when any critical attribute of the component is changed. The counter wraps to zero when it exceeds its maximum value of ***(2**64)-1***.

ATTRIBUTE AtmIf rxCell

Access	Read only
Description	This attribute counts valid cells received from the ATM interface. Valid cells are any cell with a correct HEC field in the ATM header. This count includes cells which may be subsequently discarded. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***,

Copyright © 2006, Nortel Nortel Confidential

3pDS3Atm2, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***1pOC48ChSmIrAtm***, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, this count includes cells that are received with a VPI.VCI value that does not translate to any connection on the *AtmIf* component. These cells may also be counted in the *droppedRxCell* attribute. The value of this *rxCell* attribute should be greater than or equal to the sum of the *droppedRxCell* attribute and all of the connection *rxCell* attributes under this *AtmIf* component.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this count does not include cells that are received with a VPI.VCI value that does not translate to any connection on the *AtmIf* component. These cells are counted in the *droppedRxCell* attribute.

For ***3pOC3MmAtm, 3pOC3SmAtm, 3pDS3Atm, 3pE3Atm, 3pDS1Atm, 3pE1Atm, 2pJ6MAtm, 8pDS1Atm,*** and ***8pE1Atm*** cards, this count will be increased when either a PVC, PVP, SPVC or SPVP connection is down regardless of whether only user traffic or F4 and F5 OAM cells are transmitted.

For ***2pOC3MmAtm2, 2pOC3SmAtm2, 2pSTM1eAtm, 2pSTM1eChAtm, 4pOC3MmAtm, 4pOC3SmIrAtm, 3pDS3Atm2, 4pDS3ChAtm, 12pDS3Atm, 3pE3Atm2,*** and ***12pE3Atm*** cards, if only user traffic is transmitted, this count will be increased when a PVC, PVP, SPVC or SPVP connection is down. If only F4 and F5 OAM cells are transmitted, this count will be reset to 0 when either a PVC or PVP connection is down, while be increased when either a SPVC or SPVP connection is down.

For ***4pOC12SmIrAtm, 4pOC12SmLrAtm*** and ***16pOC3SmIrAtm*** cards, if only user traffic is transmitted, this count will not be increased when either a PVC, PVP, SPVC or SPVP connection is down. If F4 and F5 OAM cells are transmitted, this count will be reset to 0 when either a PVC or PVP connection is down, and will be increased when either a SPVC or SPVP connection is down.

For ***16pOC3PosAtm*** card, if only the user traffic is transmitted, this count will be increased when either a PVC, PVP, SPVC or SPVP connection is down. If F4 and F5 OAM cells are transmitted, this count will be reset to 0 when either a PVC or PVP connection is down, and is increased when either a SPVC or SPVP connection is down.

The counter is reset to zero when the component is activated, or when any critical attribute of the component is changed. The counter wraps to zero when it exceeds its maximum value of ***(2**64)-1***.

ATTRIBUTE AtmIf rxCellDiscardClp

Access	Read only
Description	This attribute counts valid cells received from the ATM interface that have the CLP bit set to 1, which have been discarded. This count is included in the *rxCell* and *rxCellDiscard* attributes. This attribute is not supported and is not displayed on ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. This count includes cells discarded due to non-conformance with UPC, Partial Packet Discard (PPD), Early Packet Discard (EPD), and cells received while the ingress data path is down. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, for connections that reassemble incoming cells into frames, this count also includes cells discarded due to AAL5 frame reassembly error, processor (CPU) congestion, and insufficient frame memory. This counter is reset to zero when the component is activated, or when any critical attribute of the component is changed. The counter wraps to zero when it exceeds its maximum value of ***(2**64)-1***.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE AtmIf rxFrameDiscard

Access	Read only
Description	This attribute counts frames received from the ATM interface which have been discarded. This count includes the value of the *rxFrameDiscardClp* and *aal5RxErrors* attributes. It is independent of the value of the *rxCellDiscard* attribute. This attribute is not supported and is not displayed on ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. This count includes frames discarded due to AAL5 frame reassembly error, Early Packet Discard (EPD), processor (CPU) congestion, and

Copyright © 2006, Nortel Nortel Confidential

insufficient frame memory. The amount of available frame memory is determined by the *Lp Eng Arc Ov* component.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, this count does not include frames discarded due to Early Packet Discard (EPD), or insufficient frame memory. It also does not include frames discarded at layer 3. These discards are counted in the layer 3 statistics.

This attribute is applicable only for connections that reassemble incoming cells into frames. Connections that reassemble cells into frames have the value of the *connectionPointType* attribute displayed as ***connectionEndPoint***. AAL1 connections are an exception to this rule; even though they have the value of the *connectionPointType* attribute displayed as ***connectionEndPoint***, they do not do adaptation at this point.

The counter is reset to zero when the component is activated, or when any critical attribute of the component is changed. The counter wraps to zero when it exceeds its maximum value of ***(2**64)-1***.

ATTRIBUTE AtmIf droppedRxCells (drRxCells)

Access	Read only
Description	This attribute counts cells received from the interface that were dropped because they contained a VPI.VCI value that did not translate to any connection on the *AtmIf* component. The VPI and VCI of the last dropped cell are indicated in the *lastDroppedRxCellConnection* attribute. Idle cells and unassigned cells are ignored without being counted as dropped cells. This attribute is not supported and is not displayed on ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, this count is included in the *rxCell* attribute for the interface. The counter is reset to zero when the component is created, or when any critical attribute of the component is changed. The counter wraps to zero when it exceeds its maximum value of ***(2**64)-1***. For ***3pOC3MmAtm, 3pOC3SmAtm, 3pDS3Atm, 3pE3Atm, 3pDS1Atm, 3pE1Atm, 2pJ6MAtm, 8pDS1Atm*** and ***8pE1Atm*** cards, if only user traffic is transmitted, this count will not be increased when either a PVC or PVP connection is down, while be increased when either a SPVC or SPVP connection is down. If only F4 and F5 OAM cells are transmitted, this count will not be increased when either a PVC or PVP connection is down, while be increased when either a SPVC or SPVP connection is down. For ***2pOC3MmAtm2, 2pOC3SmAtm2, 2pSTM1eAtm, 2pSTM1eChAtm, 4pOC3MmAtm, 4pOC3SmIrAtm, 3pDS3Atm2, 4pDS3ChAtm, 12pDS3Atm, 3pE3Atm2*** and ***12pE3Atm*** cards, this count will not be increased when either a PVC, PVP, SPVC or SPVP connection is down regardless of whether only user traffic or F4 and F5 OAM cells are transmitted. For ***16pOC3PosAtm*** card, if only user traffic is transmitted, this count will

Copyright © 2006, Nortel Nortel Confidential

be increased when either a PVC, PVP, SPVC or SPVP connection is down. If only F4 and F5 OAM cells are transmitted, this attribute value will not be increased when either a PVC or PVP connection is down while be increased when either a SPVC or SPVP connection is down.

For ***1pOC48ChSmIrAtm*** cards, it is possible that this count may not reset to zero. This is a known occurrence during FP resets that cannot be fixed for this FP. Any additional readings should subtract this initial value to obtain the correct cell dropped value.

Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE AtmIf lastDroppedRxCellConnection (lastDropped)

Access	Read only
Description	This attribute indicates the VPI and VCI of the last cell that was dropped. Cells are dropped if they contain a VPI.VCI value that does not translate to any connection on the *AtmIf* component. Dropped cells are counted in the *droppedRxCells* attribute. This attribute is not supported and is not displayed on ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. For ***3pOC3MmAtm, 3pOC3SmAtm, 3pDS3Atm, 3pE3Atm, 3pDS1Atm, 3pE1Atm, 2pJ6MAtm, 8pDS1Atm*** and ***8pE1Atm*** cards, if only user traffic is transmitted, this count will not be increased when either a PVC or PVP connection is down, while be increased when either a SPVC or SPVP connection is down. If only F4 and F5 OAM cells are transmitted, this attribute will not be increased when either a PVC or PVP connection is down, and is increased when either a SPVC or SPVP connection is down. For ***2pOC3MmAtm2, 2pOC3SmAtm2, 2pSTM1eAtm, 2pSTM1eChAtm, 4pOC3MmAtm, 4pOC3SmIrAtm, 3pDS3Atm2, 4pDS3ChAtm, 12pDS3Atm, 3pE3Atm2*** and ***12pE3Atm*** cards, this count will not be increased when either a PVC, PVP, SPVC or SPVP connection is down regardless of whether only the user traffic or the F4 and F5 OAM cells are transmitted. For ***16pOC3PosAtm*** card, if only user traffic is transmitted, this count will be increased when either a PVC, PVP, SPVC or SPVP connection is down. If only F4 and F5 OAM cells are transmitted, this attribute value will not be increased when either a PVC or PVP connection is down, and is increased when either a SPVC or SPVP connection is down. For ***1pOC48ChSmIrAtm*** cards, this attribute may not reset to 0.0 during card resets or when any critical attribute of the component is changed. It may initially indicate a connection that does not exist.

Values	Decimal (0..65535)
Units	%
Default	No default

COLLECTED STATS AtmInterface

Description	The statistics record generated by the AtmInterface component.

ATTRIBUTE AtmIf remoteInstance

Description	This attribute indicates the remote ATM interface, as provisioned in the *remoteAtmInterfaceLabel*.
Values	String (0..60, ASCII)

ATTRIBUTE AtmIf provRate

Description	This attribute indicates the provisioned bandwidth for this ATM interface.
Values	Decimal (0..4294967295)
Units	cell/s

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmIf actualRate

Description	This attribute indicates the actual bandwidth for this ATM interface. When no errors occur it has a value equal to *provRate*. When the link (or IMA group) is down for the entire collection interval it has a value of zero. When the link goes down during the collection interval it has a value representing the average bandwidth during the collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE AtmIf txUtilization

Description	This attribute indicates the average transmit traffic rate over the most recent collection interval expressed as a percentage of the ATM link bandwidth. On *AtmIf*s linked to MPLS POS interfaces, the ATM link is the *LSP*. Many *LSP*s could share the same POS link. If the POS link is underutilized it is possible for an *LSP* to carry more traffic than it has been assigned. This occurs as bandwidth on an *LSP* is allocated based on determining whether the requested bandwidth exceeds the available bandwidth on an *LSP*, not on whether the actual bandwidth exceeds the available bandwidth. When the actual bandwidth is higher than the requested bandwith it is possible that this extra traffic will be carried over the *LSP*. Since this is possible, the value of this attribute may exceed 100%. If the utilization exceeds 65535% then 65535 is displayed. If the *Lsp* has a bandwidth of 0, then 0 is displayed for the utilization.
Values	Decimal (0..65535)
Units	%

ATTRIBUTE AtmIf rxUtilization

Description	This attribute indicates the average receive traffic rate over the most recent collection interval expressed as a percentage of the ATM link bandwidth. On *AtmIf*s linked to MPLS POS interfaces, the ATM link is the *LSP*. Many *LSP*s could share the same POS link. If the POS link is underutilized it is possible for an *LSP* to carry more traffic than it has been assigned. This occurs as bandwidth on an *LSP* is allocated based on determining whether the requested bandwidth exceeds the available bandwidth on an *LSP*, not on whether the actual bandwidth exceeds the available bandwidth. When the actual bandwidth is higher than the requested bandwith it is possible that this extra traffic will be carried over the *LSP*. Since this is possible, the value of this attribute may exceed 100%. If the utilization exceeds 65535% then 65535 is displayed. If the *Lsp* has a bandwidth of 0, then 0 is displayed for the utilization.

GROUP AtmIf ConnMap Operational (Oper)

Properties Operational

Description This group contains operational attributes that indicate the VCC space supported by an ATM interface. The VCC space consists of an optional VPI Zero VCC Space and an optional Programmable VCC Space. Only VPI and VCI values that lie within the VCC space may be used for VCC connections.

The VPI Zero VCC Space is used for VCCs with a VPI of zero. The VCI values in this space range from ***0*** to an optionally provisioned maximum of (*numVccsForVpiZero* - 1).

The Programmable VCC Space is used for VCCs with a VPI other than zero. The VPI values in this space lie in a single contiguous range from *firstNonZeroVpiForVccs* to (*firstNonZeroVpiForVccs* + *numNonZeroVpisForVccs* - 1). The VCI values in this space range from ***0*** to an optionally provisioned maximum of (*numVccsPerNonZeroVpi* - 1).

Any VPI values not assigned to the VCC space are, by implication, assigned to the VPC space. Only VPI values that lie within the VPC space may be used for VPC connections.

The number of connection resources in the VCC and VPC space (not all of which are available for user connections) must not exceed the maximum value supported by the card.

Mib AtmCore

ATTRIBUTE AtmIf ConnMap numVccsForVpiZero (nZVccs)

Access Read only

Description This attribute indicates the number of VCCs supported for the VPI Zero VCC Space. The VCI values of these VCCs range from ***0*** to *(numVccsForVpiZero* - 1).

For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***,

Copyright © 2006, Nortel Nortel Confidential

3pE1Atm, ***3pDs1Atm***, and ***2pJ6MAtm***, the maximum value of this attribute is ***16128.***

For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the maximum value of this attribute is ***16384.***

To override the system default, see the *AtmIf ConnMap Ov* attribute *numVccsForVpiZero.*

Mib	AtmCore
Values	Decimal (0..16384)
Default	No default

ATTRIBUTE AtmIf ConnMap numNonZeroVpisForVccs (nVpis)

Access	Read only
Description	This attribute indicates the number of contiguous VPIs supported in the optional Programmable VCC Space. If the value of the *numNonZeroVpisForVccs* attribute is ***0***, then the Programmable VCC Space does not exist. If the value of the *numNonZeroVpisForVccs* attribute is greater than ***0***, then the Programmable VCC Space exists and covers the VPI values ranging from *firstNonZeroVpiForVccs* to *(firstNonZeroVpiForVccs* + *numNonZeroVpisForVccs* - 1). For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDs1Atm***, and ***2pJ6MAtm***, the maximum value of this attribute is ***255.*** For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the maximum value of this attribute is ***255*** for UNI applications and ***4095*** for NNI applications. To override the system default, see the *AtmIf ConnMap Ov* attribute *numNonZeroVpisForVccs.*
Mib	AtmCore
Values	Decimal (0..4095)
Default	No default

ATTRIBUTE AtmIf ConnMap firstNonZeroVpiForVccs (firstVpi)

Access	Read only
Description	This attribute indicates the initial VPI of the optional Programmable VCC Space. If the value of the *numNonZeroVpisForVccs* attribute is ***0***, then the Programmable VCC Space does not exist and the value of this attribute is

Copyright © 2006, Nortel Nortel Confidential

ignored. If the value of the *numNonZeroVpisForVccs* attribute is greater than ***0***, then the Programmable VCC Space exists and covers the VPI values ranging from *firstNonZeroVpiForVccs* to *(firstNonZeroVpiForVccs* + *numNonZeroVpisForVccs* - 1).

For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDs1Atm***, and ***2pJ6MAtm***, the maximum value of this attribute is ***240***.

For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the maximum value of this attribute is ***255*** for UNI applications and ***4095*** for NNI applications.

To override the system default, see the *AtmIf ConnMap Ov* attribute *firstNonZeroVpiForVccs*.

Mib	AtmCore
Values	Decimal (1..4095)

Default	No default

COMPONENT AtmIf ConnMap Override (Ov)

Groups	GROUP AtmIf ConnMap Ov Provisioned (Prov)
Scope	Device
Description	*AtmIf/n ConnMap Override* The *Override* component is used to specify the VCC space to be

Copyright © 2006, Nortel Nortel Confidential

supported on an ATM interface on card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***. Only VPI and VCI values that lie within the VCC space may be used for VCC connections.

Any VPI values not assigned to the VCC space are, by implication, consigned to the VPC space. Only VPI values that lie within the VPC space may be used for VPC connections.

This component is used to override the default values used for the parent *ConnectionMapping* component.

Mib: AtmCore

Common Verbs: Help, List, Display

GROUP AtmIf ConnMap Ov Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisionable attributes which specify the VCC space to be supported by this ATM interface. The VCC space consists of an optional “VPI Zero VCC Space” and an optional “Programmable VCC Space”. Only VPI and VCI values that lie within the VCC space may be used for VCC connections.

Any VPI values not assigned to the VCC space are, by implication, assigned to the VPC space. Only VPI values that lie within the VPC space may be used for VPC connections.

In order to allow SVCs to be established within the “Programmable VCC space”, the VPI selection must be within the range defined by the *minAutoSelectedVpi* attribute value and the *maxAutoSelectedVpi* attribute value under *AtmIf CA* component.

For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDs1Atm***, and ***2pJ6MAtm***, the values of all attributes provisioned in this group must adhere to the following rules:

The VPI Zero VCC Space is used for VCCs with a VPI of zero. The VCI values supported in this space range from ***0*** to an optionally provisioned maximum of (*numVccsForVpiZero* - 1).The value of the *numVccsForVpiZero* attribute must either be ***0*** or a multiple of 256 up to a maximum value of ***16128***. A value of ***0*** implies that no programmable VCCs can be used. In this case, the value of the *numNonZeroVpisForVccs* attribute must also be ***0***.

The Programmable VCC Space is used for VCCs with a VPI other than

Copyright © 2006, Nortel Nortel Confidential

zero. The VPI values in this space lie in a single contiguous range from *firstNonZeroVpiForVccs* to (*firstNonZeroVpiForVccs* + *numNonZeroVpisForVccs* - 1). The VCI values in this space range from ***0*** to an optionally provisioned maximum of (*numVccsPerNonZeroVpi* - 1). The Programmable VCC Space (should it exist) must adhere to the following rules:

The value of the *firstNonZeroVpiForVccs* attribute must either be ***1*** or a non-zero multiple of 16, up to a maximum value of ***240***.

If *(firstNonZeroVpiForVccs* = 1) THEN
(*numNonZeroVpisForVccs* + 1) * *numVccsPerNonZeroVpi*
must be a multiple of 256
OTHERWISE
numNonZeroVpisForVccs * *numVccsPerNonZeroVpi*
must be a multiple of 256

The number of connection resources in the VCC and VPC space must not exceed the capacity of the port to which the interface is linked. If the *Lp* component has an *Eng Arc Cqc Ov* component provisioned with a non-zero *connectionPoolCapacity* attribute, then the port's capacity is specified by this attribute. Otherwise the port's capacity is indicated by the value of the *Lp/n Eng Arc connectionPoolAvailable* attribute divided by the number of physical ports on the card.

The number of connection resources in the VCC and VPC space can be determined as follows:

IF (*numNonZeroVpisForVccs* = 0) THEN
number of connection resources =
256 + numVccsForVpiZero
OTHERWISE IF (*firstNonZeroVpiForVccs* = 1) THEN
number of connection resources =
256 + numVccsForVpiZero +
(*numNonZeroVpisForVccs* + 1) * *numVccsPerNonZeroVpi*
OTHERWISE
number of connection resources =
256 + *numVccsForVpiZero* +
(*numNonZeroVpisForVccs* * *numVccsPerNonZeroVpi*)

For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the values of all attributes provisioned in this group must adhere to the following rules:

The VPI Zero VCC Space is used for VCCs with a VPI of zero. The VCI values supported in this space range from ***0*** to an optionally provisioned maximum of (*numVccsForVpiZero* - 1).The value of *numVccsForVpiZero* attribute must either be ***1*** or a power of 2.

The Programmable VCC Space is used for VCCs with a VPI other than zero. The VPI values in this space lie in a single contiguous range from

Copyright © 2006, Nortel Nortel Confidential

firstNonZeroVpiForVccs to (*firstNonZeroVpiForVccs* + *numNonZeroVpisForVccs* - 1). The VCI values in this space range from ***0*** to an optionally provisioned maximum of (*numVccsPerNonZeroVpi* - 1). The VPI values in this space must not exceed ***255*** for UNI applications and ***4095*** for NNI applications.

For the ***4pOC12SmIrAtm*** and ***4pOC12SmLrAtm*** cards, the number of connection resources in the VCC and VPC space must not exceed the capacity of the port to which the interface is linked. The port's capacity is the physical maximum of 113664 connection resources.

For the ***16pOC3SmIrAtm*** card, the total number of connection resources in the VCC and VPC space must not exceed 113664 for each of the four port groupings on the card. Each port grouping consists of ATM interfaces linked to ports 0-3, 4-7, 8-11, and 12-15.

The number of connection resources in the VCC and VPC space can be determined as follows:

For UNI applications the number of connection resources = *numVccsForVpiZero* + (*numNonZeroVpisForVccs * numVccsPerNonZeroVpi*) + 2 * (255 - *numNonZeroVpisForVccs*)

For NNI applications the number of connection resources = *numVccsForVpiZero* + (*numNonZeroVpisForVccs * numVccsPerNonZeroVpi*) + 2 * (4095 - *numNonZeroVpisForVccs*)

Mib — AtmCore

ATTRIBUTE **AtmIf ConnMap Ov** **numVccsForVpiZero (nZVccs)**

Access — Read and write

Criticality — Process

Description — This attribute specifies the number of VCCs supported for the VPI Zero VCC Space. The VCI values of these VCCs range from ***0*** to *(numVccsForVpiZero* - 1).

A value of ***autoConfigure*** means an appropriate value is selected based on the card type.

For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDs1Atm***, and ***2pJ6MAtm***, the default value of this attribute is ***768*** and the maximum value is ***16128***.

For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the default value of this attribute is ***1024*** and the maximum value is ***16384***.

Copyright © 2006, Nortel Nortel Confidential

The values of all attributes provisioned in this group must adhere to the guidelines laid down in the description of the *Provisioned* group.

ATTRIBUTE AtmIf ConnMap Ov **numNonZeroVpisForVccs (nVpis)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of contiguous VPIs supported in the optional Programmable VCC Space. If the value of the *numNonZeroVpisForVccs* attribute is ***0***, then the Programmable VCC Space does not exist. If the value of the *numNonZeroVpisForVccs* attribute is greater than ***0***, then the Programmable VCC Space exists and covers the VPI values ranging from *firstNonZeroVpiForVccs* to *(firstNonZeroVpiForVccs* + *numNonZeroVpisForVccs* - 1). For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDs1Atm***, and ***2pJ6MAtm***, the maximum value of this attribute is ***255***. For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the maximum value of this attribute is ***255*** for UNI applications and ***4095*** for NNI applications. The values of all attributes provisioned in this group must adhere to the guidelines laid down in the description of the *Provisioned* group.
Mib	AtmCore
Values	Decimal (0..4095)
Default	0

ATTRIBUTE AtmIf ConnMap Ov **firstNonZeroVpiForVccs (firstVpi)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the initial VPI of the optional Programmable VCC Space. If the value of the *numNonZeroVpisForVccs* attribute is ***0,*** then the Programmable VCC Space does not exist and the value of this attribute is

Copyright © 2006, Nortel Nortel Confidential

ignored. If the value of the *numNonZeroVpisForVccs* attribute is greater than ***0***, then the Programmable VCC Space exists and covers the VPI values ranging from *firstNonZeroVpiForVccs* to *(firstNonZeroVpiForVccs* + *numNonZeroVpisForVccs* - 1). This range must be within the range defined by *minAutoSelectedVpi* attribute value and the *maxAutoSelectedVpi* attribute value under *AtmIf CA* component.

For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDs1Atm***, and ***2pJ6MAtm***, the maximum value of this attribute is ***240***.

For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the maximum value of this attribute is ***255*** for UNI applications and ***4095*** for NNI applications.

The values of all attributes provisioned in this group must adhere to the guidelines laid down in the description of the *Provisioned* group.

Mib — AtmCore

Values — Decimal (1..4095)

Default — 1

ATTRIBUTE AtmIf ConnMap Ov **numVccsPerNonZeroVpi (nVccs)**

Access — Read and write

Criticality — Process

Description — This attribute specifies the number of VCCs supported for each VPI in the Programmable VCC Space. The VCI values of these VCCs range from ***0*** to *(numVccsPerNonZeroVpi* - 1) for each VPI in this space.

For card types ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDs1Atm***, and ***2pJ6MAtm***, the maximum value of this attribute is ***2048***.

For card types ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm***, the maximum value of this attribute is ***16384***.

The values of all attributes provisioned in this group must adhere to the guidelines laid down in the description of the *Provisioned* group.

Common Verbs	Help List Display

GROUP AtmIf CA Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioned attributes which specify the behavior of Connection Admission Control (CAC) for the ATM connections configured on an ATM interface. Note that the names of some of the attributes follow the conventions of UNI 4.0 for forward compatibility reasons. This does not imply conformance in general with the UNI 4.0 specification.
Mib	AtmCore

ATTRIBUTE AtmIf CA maxVccs (vccs)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of VCCs (and *Vpt* VCCs) that can be activated on this *AtmIf* component. For ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, and ***2pJ6MAtm*** cards, the value of this attribute must not exceed the number of *Vcc* identifiers in the *Vcc* space supported by this *AtmIf* component (which is specified by the *AtmIf ConnectionMapping* component). For cards other than ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, and ***2pJ6MAtm***, the sum of

Copyright © 2006, Nortel Nortel Confidential

(*maxVccs* + *maxVpcs* + (*maxVpts* * 3) + 1) across all spared *AtmIf*s linked to an *Lp* must not exceed the value of the *protectedConnectionPoolCapacity* attribute of the *Lp Eng Arc Ov* component. The sum of (*maxVccs* + *maxVpcs* + (*maxVpts* * 3) + 1) across all unspared *AtmIf*s linked to an *Lp* must not exceed the value of the *connectionPoolCapacity* attribute of the *Lp Eng Arc Ov* component. Note that 3 connections are used for every standard *Vpt* component and 2 for each basic *Vpt* component. If the *Lp Eng Arc Ov* component is not provisioned, the default values of the *connectionPoolCapacity* and *protectedConnectionPoolCapacity* attributes are used as the limit.

A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***2pSTM1eCh***, ***2pSTM1Ch*** and MSA32 cards, the value is ***100***. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, and ***4pMRPosAtm*** cards, the value is ***127***. For all other cards, the value is ***255***.

Values	Decimal (0..16384) autoConfigure
Default	autoConfigure
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA minMulticastBranches (minMcast)

Access	Read and write
Criticality	Process
Description	This attribute specifies the guaranteed number of switched multicast branches that can be activated on this *AtmIf* component, including those activated beneath a *Vpt* component. For all spared *AtmIfs* linked to an *Lp*, the number of *minMulticastBranches* plus the number of branches consumed by all *Msrcs* plus the number of provisioned branches listed in the *nextHop* attribute of all *Mnrps* must not exceed the value of the *protectedMcstBranchesCapacity* attribute of the *Lp Eng Arc Ov* component. For all unspared *AtmIfs* linked to an *Lp*, the number of *minMulticastBranches* plus the number of branches consumed by all *Msrcs* plus the number of provisioned branches listed in the *nextHop* attribute of all *Mnrps* must not exceed the value of the *multicastBranchesCapacity* attribute of the *Lp Eng Arc Ov* component. If the value of the *minMulticastBranches* attribute is non zero, the *Lp Eng Arc Ov* component must exist and have a *multicastBranchesCapacity* attribute, or the *protectedMcstBranchesCapacity* attribute set to a value greater than or equal to the *minMulticastBranches* attribute. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***,

Copyright © 2006, Nortel Nortel Confidential

3pDS1Atm, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value of the attribute can not exceed ***10752***.

Mib	AtmCore

Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA bandwidthPool (bwPool)

Access	Read and write
Description	Link capacity is partitioned into five bandwidth pools. This attribute specifies the percentage of link bandwidth that is allowed for each pool. The percentage for each pool ranges from 0% to 12,800%. This allows for both under and over subscription of the link. Under subscription occurs when the sum of the percentages assigned to the five pools is less than 100%. Over subscription occurs when the sum of the percentages for the five pools exceeds 100%.

Access	Read and write
Criticality	Process
Description	This attribute specifies the default cell delay variation tolerance (CDVT) for all connections of the CBR service category (excluding connections managed by a *Vpt CA*). An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component.

Copyright © 2006, Nortel Nortel Confidential

	This attribute is used by the Connection Admission Control (CAC) algorithm to compute the equivalent cell rate (ECR) required by a given CBR connection. The larger the value of CDVT, the larger is its ECR. If Usage Parameter Control (UPC) is enabled for a connection, CDVT is used by the UPC function to decide whether a cell is conforming or non-conforming based on the connection's traffic descriptor type. The larger the CDVT value, the more tolerant is the UPC of bandwidth usage beyond the traffic contract.

Values	Decimal (1..10000)
Units	microsec
Default	250
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA Cbr cdv

Access	Read and write
Description	This attribute specifies the peak-to-peak cell delay variation (CDV) which is contributed to the entire ATM Interface for CBR traffic (excluding connections managed by a *Vpt CA*). The CDV is a measure of the delay jitter introduced mostly by traffic buffering and cell scheduling. The worst case value of this attribute can be computed as the value of the *txQueueLimit* attribute divided by the link rate of this ATM Interface. This attribute is used by PNNI in the Resource Availability Information Group (RAIG) topology updates and route selection. It is also used by CAC at connection set-up time to determine whether this ATM Interface can meet the CDV requirement for that connection. If so, the value of this attribute is added to the cumulative CDV field of the extended QoS information element.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	microsec
Default	250

ATTRIBUTE AtmIf CA Cbr maxCtd

Access	Read and write
Description	This attribute specifies the maximum cell transfer delay (MaxCTD) which is applied to the entire ATM Interface for CBR traffic (excluding connections managed by a *Vpt CA*).

Copyright © 2006, Nortel Nortel Confidential

MaxCTD is the sum of the fixed delay and the CDV. The components of the fixed delay include propagation delay through the physical media, delays induced by the transmission system and fixed components of switch processing delay.

This attribute is used by PNNI in the Resource Availability Information Group (RAIG) topology updates and route selection. It is also used by CAC at connection set-up time to determine whether this ATM Interface can meet the ATM connection's MaxCTD requirement.

Mib	AtmCore
Values	Decimal (0..16777215)
Units	microsec
Default	1000

ATTRIBUTE Atmlf CA Cbr cellLossRatio (clr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the tolerable cell loss ratio (CLR) for CBR traffic (excluding connections managed by a *Vpt CA*). The value specified is the negative base 10 logarithm of the CLR. For example, if the target CLR = 1E-10 then the value of the *cellLossRatio* attribute is ***10***. The value of this attribute must be the same as the value of the *RtVbr cellLossRatio* attribute since CBR and rt-VBR traffic have the same discard priority. This attribute is used by the Connection Admission Control (CAC) algorithm to compute the equivalent cell rate (ECR) required for CBR connections. There is a trade-off between the service category CLR and the achievable link utilization. To guarantee an excellent service category, the CLR should be as small as possible (for example, 1E-10). However, a smaller CLR results in a larger equivalent cell rate for a given connection and hence a lower link utilization. A value of ***anyClrValue*** means that no bandwidth is reserved for CBR connections, and CAC is effectively turned off. All CBR connections are admitted.
Mib	AtmCore
Values	Decimal (1..15) anyClrValue
Default	10
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf CA Cbr txQueueLimit (txql)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the default maximum queue length for the emission queues used to buffer the traffic of the CBR service category. It is used as the basis for setting both the queue length and the discard thresholds on both common and per-VC queues. For the common queue, the discard thresholds are set at approximately 35, 75, and 90 percent of the value of this attribute for traffic at discard priority 3 (DP=3), DP=2 and DP=1 respectively. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, common queuing is not available for the CBR service category. For a per-VC queue, the actual queue length may be reduced depending on the shaping rate of the connection (for standard *Vpt VCCs*, this is the shaping rate of the *Vpt* component). The discard thresholds are set at approximately 35, 75 and 90 percent of the scaled queue limit for traffic at discard priority 3 (DP=3), DP=2 and DP=1 respectively. However, a reduction will never result in a value that is less than the value of the *minPerVcQueueLimit* attribute. The per-VC queue limit may be overridden for a provisioned connection by specifying a value in the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, per-VC queues are not available for the CBR service category. For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the maximum size of the link-class queue for buffering the egress traffic of the CBR service category. This is similar to common queuing, except that each CBR connection maintains a per-VC utilization limit of the common queue specified for a provisioned connection by the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute. A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***16pOC3SmIrAtm***, and ***16pOC3PosAtm*** cards the value is ***96***. For ***1pOC12SmLrAtm*** cards, the value is ***350***. For ***4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards, the value is ***384***. For ***4pMRPosAtm*** cards, the value is ***386*** for OC-12 ports and ***1544*** for OC-48 ports. For ***1pOC48ChSmIrAtm*** cards, the value is ***2176.*** The operational value of the maximum length of a queue (common or per-VC) is indicated by the *Vcc Tm, Vpc Tm,* or *Vpt Tm txQueueThresholds* attribute.

Copyright © 2006, Nortel Nortel Confidential

For standard VPTs, this attribute only applies when using common queuing. When using per-VC queuing, regardless of the *Vpt's* service category, standard VPTs use the *AtmIf CA NrtVbr txQueueLimit* attribute value as their default.

This attribute does not apply to basic VPTs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards the valid range for this attribute is from ***5*** to ***30000*** inclusive.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***63488*** inclusive.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***512000*** inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

ATTRIBUTE AtmIf CA Cbr holdingPriority (hpri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the default holding priority which applies to SVP and SVC CBR connections. It takes a value from 0 (highest priority) to 4 (lowest priority). In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. This attribute does not apply to *Vpt* VCCs. When bandwidth fluctuates, the entire *Vpt* component, along with all *Vpt* VCCs is released as a unit, according to the *Vpt*'s *holdingPriority*.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf CA Cbr **minPerVcQueueLimit (minpervcql)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the minimum queue limit for the per-VC queues of connections of the CBR service category. This attribute is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm***, cards, because they do not support per-VC queues for the CBR service category.

Copyright © 2006, Nortel Nortel Confidential

The queue limit of a per-VC queue is obtained by scaling down the *txQueueLimit* attribute based on the shaping rate of that queue (shaping rate for the connection and for standard *Vpt VCCs*, the shaping rate of the *Vpt* component). This produces a constant delay for various queue lengths. The value of the *txQueueLimit* attribute provides an upper bound while the value of the *minPerVcQueueLimit* attribute provides the lower bound.

The value of this attribute must not be greater than the value of the *txQueueLimit* attribute. If this service category is used by Trunks, the value of the *minPerVcQueueLimit* attribute must be at least ***88***.

For VPTs, this attribute does not apply. Regardless of the *Vpt*'s service category, standard VPTs always use the *AtmIf CA NrtVbr minPerVcQueueLimit* value as their default. To determine the queue limit of a standard *Vpt Vcc*, the *txQueueLimit* attribute is scaled down by the *Vpt* shaping rate.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***63488*** inclusive.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***36*** to ***512000*** inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

ATTRIBUTE Atmlf CA Cbr perVcQueueLimitReferenceRate (refrate)

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping rate to be used in computing the tolerable delay for per-VC queues of connections of the CBR service category. The delay is computed as the *txQueueLimit* divided by the value of this attribute.

Copyright © 2006, Nortel Nortel Confidential

This attribute is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, because they do not support traffic shaping for the CBR service category.

A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***16pOC3SmIrAtm***, and ***16pOC3PosAtm*** cards the value is ***65511***. For ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***3685***. For MSA32 cards, the value is ***65511*** for OC-3 channels, and ***3685*** for DS1, or E1 channels. For ***4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards, the value is ***262044***. For ***4pMRPosAtm*** cards, the value is ***262044*** for OC-12 ports and ***1048176*** for OC-48 ports.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards the maximum value is ***1416905***. For ***16pOC3PosAtm*** cards, the maximum value is ***353207***. For ***4pMRPosAtm*** cards, the maximum value is ***1412830*** for OC-12 ports and ***5651320*** for OC-48 ports. For all other cards, the maximum value is ***943396***.

For VPTs, this attribute does not apply. Regardless of the *Vpt's* service category, standard VPTs always use the *AtmIf CA NrtVbr perVcQueueLimitReferenceRate* attribute value as their default.

ATTRIBUTE **AtmIf CA Cbr** **emissionPriority (ep)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the emission priority (EP) which is used to transmit traffic of the CBR service category. A lower numerical value for this attribute specifies a higher emission priority. 0 is the highest EP and 7 is the lowest. Cells at a higher emission priority receive higher preference for link bandwidth. EP 0 and EP 1 are in the absolute priority range and are unaffected by any minimum bandwidth guarantees. EP 2 through EP 7 are in the guaranteed bandwidth range and may achieve a priority which is different from the strict hierarchical priority, if a minimum bandwidth guarantee is provisioned. A minimum bandwidth guarantee is specified in the *AtmIf*/n *Ep*/m component.

Copyright © 2006, Nortel Nortel Confidential

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC12SmLrAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= ABR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.
3. CBR and rt-VBR may be placed either in the absolute priority range (EP 0 or 1) or in the guaranteed bandwidth range (EP 2 through 7).
4. If both CBR and rt-VBR are shaped, rt-VBR must share the same EP with CBR or ABR. If either one of CBR or rt-VBR are not shaped, then they cannot share the same EP.
5. ABR service category is always deemed to be shaped. If nrt-VBR is shaped, it must share the same EP with ABR. If nrt-VBR is not shaped it must have a higher EP than ABR.
6. If UBR is shaped, it must share the same EP with ABR. If UBR is not shaped, it must have a lower EP than ABR.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.
3. EP 0 must be used if traffic shaping is required.
4. EP 5 and EP 6 are not supported.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.

For ***1pOC48ChSmIrAtm*** cards, only the default value is supported.

ATTRIBUTE **AtmIf CA Cbr** **trafficShaping (trShaping)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default traffic shaping option for connections of the CBR service category. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. A value of ***disabled*** means traffic shaping cannot be enabled for any CBR connections. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled*** since traffic shaping is not supported for CBR connections on these cards. If the *Vcc Tm*, *Vpc Tm*, or *Vpt Tm*, *txTrafficDescType* attribute indicates type 1 or 2, this attribute is ignored and traffic shaping is not applicable for that connection. A value of ***inverseUpc*** means traffic shaping for a connection is enabled according to the value of the *Vcc Tm, Vpc Tm,* or *Vpt Tm* *txTrafficDescType* attribute. A value of ***inverseUpc*** when the *txTrafficDescType* is 3, 4, or 5, means linear traffic shaping is enabled. Linear traffic shaping uses a single static traffic shaping rate. A value of ***inverseUpc*** when the *txTrafficDescType* is 6, 7, or 8, means inverse-UPC (also referred to as VBR or dual leaky bucket) traffic shaping is enabled. Inverse-UPC traffic shaping can burst above the sustained cell rate to the peak cell rate for the duration defined by the maximum burst size. Inverse-UPC traffic shaping exactly conforms to the requirements of a dual leaky bucket UPC enforcer. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the value ***inverseUpc*** is not available. A value of ***enabled*** when the *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, means linear traffic shaping is enabled. Enabling or disabling traffic shaping may require a matching change to the *emissionPriority* attribute and the *unshapedTransmitQueueing* attribute for this service category. Refer to those attributes for the complete description of the interactions.

Values	enabled disabled inverseUpc
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA Cbr** **shapeRecoupPolicy (recoup)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping recoup policy for the CBR service category. This is the policy which is used to recoup shaping opportunities which are lost when more than one connection schedules a cell for the same transmit opportunity. In this case, one connection is scheduled and the cell from the other connection is delayed by one cell time. This attribute affects how the transmit time is calculated for the next cell on the delayed connection. This attribute is ignored if this service category is not shaped. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. This attribute is not applicable and is ignored for ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. When the connection which was delayed schedules the next cell to transmit, it may calculate the time as a difference from either the previous actual cell transmit time, or the time when the previous cell should have been transmitted. A value of ***maximumEfficiency*** results in each connection trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell should originally have been sent. Cell delay variation (CDV) occurs in this case since the cells are sent with less than the shaping delay between them. However, in general the shaper recovers (recoups) lost opportunities and improves efficiency. A value of ***minimumCdv*** results in connections not trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell was actually transmitted. This minimizes CDV, but results in missed cell opportunities.
Mib	AtmCore
Values	minimumCdv maximumEfficiency
Default	minimumCdv
Flags	HCA_SUPPORT

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf CA Cbr **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default queuing option for unshaped connections of the CBR service category. This attribute controls whether common or per-VC queuing is used. A value of ***perVc*** means that each connection has its own buffering and queue limits. A value of ***common*** means that cells are queued in First In First Out order on a common queue for this service category. The common queue has one set of congestion control levels for all cells enqueued on it. If traffic shaping for this service category is specified, the value of this attribute must be ***perVc***. This attribute does not apply to basic VPTs and standard *Vpt* VCCs. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***common*** since these cards do not support per-VC queuing for the CBR service category. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards the value of this attribute must be ***perVc*** since these cards do not support common queuing for the CBR service category. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, no more than 32,000 connections on the FP can use per-VC queuing. The remaining connections must use common queuing. The *Lp Eng Arc perVcQueueUsage* attribute indicates the number per-VC queues that are currently in use.
Mib	AtmCore
Values	perVc common
Default	common
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf CA Cbr **weightPolicy**

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the policy which is applied when calculating the fairness weight for unshaped connections of the CBR service category. The fairness weight for a connection determines the relative amount of bandwidth which that connection obtains, compared to other connections in the same service category. Connections with equal weight get equal transmit opportunities. Connections with higher weights get more transmit opportunities compared with connections that have lower weights. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. The fairness weight for a connection is directly proportional to the value of one of the traffic descriptor parameters for that connection. This attribute specifies which traffic descriptor parameter is used for connections of the CBR service category. A value of ***scr*** means the fairness weight is proportional to the transmit sustained cell rate (SCR) of a connection. Connections with a higher SCR have a higher fairness weight. For connections with *txTrafficDescType* 3, which have no SCR, the sustained cell rate is assumed to be equal to the peak cell rate. A value of ***pcr*** means the fairness weight is proportional to the transmit peak cell rate (PCR) of a connection. Connections with a higher PCR have a higher fairness weight. Connections with *txTrafficDescType* 1 or 2 get a minimum weight, which is 1. A value of ***ecr*** means the fairness weight is proportional to the equivalent cell rate (ECR) of a connection as calculated by connection admission control (CAC). Connections with a higher ECR have a higher fairness weight. Connections with an ECR of 0 get a minimum weight, which is 1. The weight of a connection is visible in the *Vcc Tm, Vpc Tm,* or *Vpt Tm weight* attribute. This attribute does not apply to basic VPTs and standard *Vpt* VCCs. This attribute is ignored if the value of the *unshapedTransmitQueueing* attribute is ***common***. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards.

ATTRIBUTE Atmlf CA Cbr **usageParameterControl (upc)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default usage parameter control (UPC) option for connections of the CBR service category. This attribute is ignored if the *rxTrafficDescriptorType* indicates 1 or 2. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. A value of ***enforced*** means UPC is enforced for each connection. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*.

Copyright © 2006, Nortel Nortel Confidential

A value of ***monitored*** means UPC conformance checking is performed, except, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on unchanged.

A value of ***disabled*** means UPC is disabled on the receive path for all CBR connections.

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported. This value has the same effect as ***disabled***.

For ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled***.

Mib	AtmCore

ATTRIBUTE **AtmIf CA Cbr** **txCellDiscardThreshold**

Access	Read and write
Description	This attribute specifies the threshold for a minor alarm for discarded outgoing cells for CBR service category. If the count of discarded outgoing CBR cells is greater than the provisioned value of this attribute in a 15 minute interval, the alarm is set. While the alarm is set, if the count of discarded outgoing CBR cells is still greater than the provisioned value of this attribute in the subsequent 15 minute intervals, the alarm is not set again. If the count of discarded outgoing CBR cells drops below the provisioned value of this attribute in a 15 minute interval the alarm is cleared. Provisioned value of '0' means discarded outgoing CBR cells are not monitored and no alarm is generated. While the alarm is set, if the value of this attribute is changed, the alarm is cleared. This attribute is not applicable for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm*** and ***2pJ6MAtm*** cards.

GROUP AtmIf CA Cbr Operational (Oper)

Properties	Operational
Description	This group contains operational attributes for the CBR service category.
Mib	AtmCore

ATTRIBUTE AtmIf CA Cbr epdOffset (epdO)

Access	Read only
Description	This attribute indicates the Early Packet Discard (EPD) offset which is currently in use for this service category. The EPD offset is used to derive the EPD thresholds for each CC level. Any connection under this service category which requires the transmit Packet Wise Discard feature must specify a transmit queue limit which is at least 5.71 times this offset. This ensures that the derived Epd threshold will never be less than 17.5% of the transmit queue limit. If this is not done, txPacketWiseDiscard for the connection will be automatically disabled. The value of this EPD offset is specified in the *Lp Eng Arc Aqm Ov* component. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***1pOC48ChSmIrAtm***, ***16pOC3PosAtm***, and ***4pMRPosAtm*** cards, this attribute is not available and is filtered from the display.

ATTRIBUTE AtmIf CA RtVbr pool

Access	Read and write
Criticality	Process
Description	This attribute specifies the bandwidth pool which is to be used to support the real-time variable bit rate (rt-VBR) service category (excluding connections managed by a *Vpt CA*). The percentage of link capacity reserved for the given bandwidth pool is the maximum bandwidth that can be allocated to rt-VBR traffic. The percentage allocated to each bandwidth pool can be provisioned through the *bandwidthPool* attribute of the *CA* component.
Mib	AtmCore
Values	pool1 pool2 pool3 pool4 pool5
Default	pool1
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA RtVbr cdvt

Access	Read and write
Criticality	Process
Description	This attribute specifies the default cell delay variation tolerance (CDVT) for all connections of the rt-VBR service category (including connections managed by a *Vpt CA*). An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component.

Copyright © 2006, Nortel Nortel Confidential

If Usage Parameter Control (UPC) is enabled for a connection, CDVT is used by the UPC function to decide whether a cell is conforming or non-conforming based on the connection's traffic descriptor type. The larger the CDVT value, the more tolerant is the UPC of bandwidth usage beyond the traffic contract.

Mib	AtmCore
Values	Decimal (1..1200000)
Units	microsec
Default	250
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA RtVbr** **cdv**

Access	Read and write
Description	This attribute specifies the peak-to-peak cell delay variation (CDV) which is contributed to the entire ATM Interface for rt-VBR traffic (excluding connections managed by a *Vpt CA*). The CDV is a measure of the delay jitter introduced mostly by traffic buffering and cell scheduling. The worst case value of this attribute can be computed as the *txQueueLimit* attribute divided by the link rate of this ATM Interface. This attribute is used by PNNI in the Resource Availability Information Group (RAIG) topology updates and route selection. It is also used by CAC at connection set-up time to determine whether this ATM Interface can meet the CDV requirement for that connection. If so, the value of this attribute is added to the cumulative CDV field of the extended QoS information element.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	microsec
Default	1268

ATTRIBUTE **AtmIf CA RtVbr** **maxCtd**

Access	Read and write
Description	This attribute specifies the maximum cell transfer delay (MaxCTD) which is applied to the entire ATM Interface for rt-VBR traffic (excluding connections managed by a *Vpt CA*). MaxCTD is the sum of the fixed delay and the CDV. The components of the fixed delay include propagation delay through the physical media, delays induced by the transmission system and fixed components of

Copyright © 2006, Nortel Nortel Confidential

switch processing delay.

This attribute is used by PNNI in the Resource Availability Information Group (RAIG) topology updates and route selection. It is also used by CAC at connection set-up time to determine whether this ATM Interface can meet the ATM connection's MaxCTD requirement.

Mib	AtmCore
Values	Decimal (0..16777215)
Units	microsec
Default	2000

ATTRIBUTE AtmIf CA RtVbr **cellLossRatio (clr)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the tolerable cell loss ratio (CLR) for rt-VBR traffic (excluding connections managed by a *Vpt CA*). The value specified is the negative base 10 logarithm of the CLR. For example, if the target CLR = 1E-10 then the value of the *cellLossRatio* attribute is ***10***. The value of this attribute must be the same as the value of the *Cbr cellLossRatio* attribute since CBR and rt-VBR traffic have the same discard priority. The value if this attribute must also be greater than or equal to the value of the *NrtVbr cellLossRatio* attribute since rt-VBR traffic has a higher discard priority. This attribute is used by the Connection Admission Control (CAC) algorithm to compute the equivalent cell rate (ECR) required for rt-VBR connections. There is a trade-off between the service category CLR and the achievable link utilization. To guarantee an excellent service category, the CLR should be as small as possible (for example, 1E-10). However, a smaller CLR results in a larger equivalent cell rate for a given connection and hence a lower link utilization. A value of ***anyClrValue*** means that no bandwidth is reserved for rt-VBR connections, and CAC is effectively turned off. All rt-VBR connections are admitted.
Mib	AtmCore
Values	Decimal (1..15) anyClrValue
Default	10
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA RtVbr **txQueueLimit (txql)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the default maximum queue length for the emission queues used to buffer the traffic of the rt-VBR service category. It is used as the basis for setting both the queue length and the discard thresholds on both common and per-VC queues. For the common queue, the discard thresholds are set at approximately 35, 75, and 90 percent of the value of this attribute for traffic at discard priority 3 (DP=3), DP=2, and DP=1 respectively. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, common queuing is not available for the rt-VBR service category. For a per-VC queue, the actual queue length may be reduced depending on the shaping rate of the connection (for standard *Vpt* VCCs, this is the shaping rate of the *Vpt* component). The discard thresholds are set at approximately 35, 75, and 90 percent of the scaled queue limit for traffic at discard priority 3 (DP=3), DP=2, and DP=1, respectively. However, a reduction will never result in a value that is less than the value of the *minPerVcQueueLimit* attribute. The per-VC queue limit may be overridden for a provisioned connection by specifying a value in the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, per-VC queues are not available for the rt-VBR service category. For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the maximum size of the link-class queue for buffering the egress traffic of the rt-VBR service category. This is similar to common queuing, except that each rt-VBR connection maintains a per-VC utilization limit of the common queue specified for a provisioned connection by the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute. A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, and ***16pOC3SmIrAtm*** cards, the value is ***480***. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***288***. For MSA32 cards, the value is ***480*** for OC-3 channels, and ***288*** for DS1, or E1 channels. For ***16pOC3PosAtm*** cards, the value is ***1280***. For ***1pOC12SmLrAtm*** cards, the value is ***2048***. For ***4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards, the value is ***1920***. For ***4pMRPosAtm*** cards, the value is ***5120*** for OC-12 ports and ***20480*** for OC-48 ports. For ***1pOC48ChSmIrAtm*** cards, the value is ***12288.*** The operational value of the maximum length of a queue (common or per-VC) is indicated by the *Vcc Tm, Vpc Tm,* or *Vpt Tm txQueueThresholds* attribute.

Copyright © 2006, Nortel Nortel Confidential

For standard VPTs, this attribute only applies when using common queuing. When using per-VC queuing, regardless of the *Vpt's* service category, standard VPTs use the *AtmIf CA NrtVbr txQueueLimit* attribute value as their default.

This attribute does not apply to basic VPTs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards the valid range for this attribute is from ***5*** to ***30000*** inclusive.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***160000*** inclusive.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***512000*** inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

Units	cells
Default	autoConfigure
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA RtVbr** **minPerVcQueueLimit (minpervcql)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the minimum queue limit for the per-VC queues of connections of the rt-VBR service category. This attribute is ignored for ***1pOC12SmLrAtm*** cards, because they do not support per-VC queues for the rt-VBR service category. The queue limit of a per-VC queue is obtained by scaling down the *txQueueLimit* attribute based on the shaping rate of that queue (shaping rate for the connection and for standard *Vpt* VCCs, the shaping rate of the *Vpt* component). This produces a constant delay for various queue

Copyright © 2006, Nortel Nortel Confidential

lengths. The value of the *txQueueLimit* attribute provides an upper bound while the value of the *minPerVcQueueLimit* attribute provides the lower bound.

The value of this attribute must not be greater than the value of the *txQueueLimit* attribute. If this service category is used by Trunks, the value of the *minPerVcQueueLimit* attribute must be at least ***88***.

For VPTs, this attribute does not apply. Regardless of the *Vpt's* service category, standard VPTs always use the *AtmIf CA NrtVbr minPerVcQueueLimit* value as their default. To determine the queue limit of a standard *Vpt Vcc*, the *txQueueLimit* attribute is scaled down by the *Vpt* shaping rate.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***160000*** inclusive.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***36*** to ***512000*** inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

ATTRIBUTE **AtmIf CA RtVbr** **perVcQueueLimitReferenceRate (refrate)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping rate to be used in computing the tolerable delay for per-VC queues of connections of the rt-VBR service category. The delay is computed as the *txQueueLimit* divided by the value of this attribute. This attribute is ignored for ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, because they do not support traffic shaping for the rt-VBR service category.

Copyright © 2006, Nortel Nortel Confidential

A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, and ***4pOC3SmIrAtm*** cards, the value is ***14740***. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***3685***. For MSA32 cards, the value is ***14740*** for OC-3 channels, and ***3685*** for DS1, or E1 channels. For ***4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards, the value is ***262044***. For ***4pMRPosAtm*** cards, the value is ***157228*** for OC-12 ports and ***628912*** for OC-48 ports. For ***16pOC3SmIrAtm*** cards, the value is ***65511***. For ***16pOC3PosAtm*** cards, the value is ***39307***.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards the maximum value is ***1416905***. For ***16pOC3PosAtm*** cards, the maximum value is ***353207***. For ***4pMRPosAtm*** cards, the maximum value is ***1412830*** for OC-12 ports and ***5651320*** for OC-48 ports. For all other cards, the maximum value is ***943396***.

For VPTs, this attribute does not apply. Regardless of the *Vpt's* service category, standard VPTs always use the *AtmIf CA NrtVbr perVcQueueLimitReferenceRate* attribute value as their default.

ATTRIBUTE Atmlf CA RtVbr **svcMpHoldingPriority (svcMpHpri)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the holding priority which applies to SVC rt-VBR point-to-multipoint connections. It takes a value from 0 (highest priority) to 4 (lowest priority). In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. This attribute does not apply to *Vpt* VCCs, When bandwidth fluctuates, the entire *Vpt* component, along with all *Vpt* VCCs, is released as a unit, according to the *Vpt*'s *holdingPriority.*
Mib	AtmCore
Values	0 1 2 3 4
Default	3
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf CA RtVbr **emissionPriority (ep)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the emission priority (EP) which is used to transmit traffic of the rt-VBR service category. A lower numerical value for this attribute specifies a higher emission priority. 0 is the highest EP and 7 is the lowest. Cells at a higher emission priority receive higher preference for link bandwidth. EP 0 and EP 1 are in the absolute priority range and are unaffected by any minimum bandwidth guarantees. EP 2 through EP 7 are in the guaranteed bandwidth range and may achieve a priority which is different from the

Copyright © 2006, Nortel Nortel Confidential

strict hierarchical priority, if a minimum bandwidth guarantee is provisioned. A minimum bandwidth guarantee is specified in the *AtmIf*/n *Ep*/m component.

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC12SmLrAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= ABR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.
3. CBR and rt-VBR may be placed either in the absolute priority range (EP 0 or 1) or in the guaranteed bandwidth range (EP 2 through 7).
4. If both CBR and rt-VBR are shaped, rt-VBR must share the same EP with CBR or ABR. If either one of CBR or rt-VBR are not shaped, then they cannot share the same EP.
5. ABR service category is always deemed to be shaped. If nrt-VBR is shaped, it must share the same EP with ABR. If nrt-VBR is not shaped it must have a higher EP than ABR.
6. If UBR is shaped, it must share the same EP with ABR. If UBR is not shaped, it must have a lower EP than ABR.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.
3. EP 0 must be used if traffic shaping is required.
4. EP 5 and EP 6 are not supported.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.

For ***1pOC48ChSmIrAtm*** cards, only the default value is supported. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm,*** and ***16pOC3SmIrAtm*** cards the default value is ***2***.

ATTRIBUTE **AtmIf CA RtVbr** **trafficShaping (trShaping)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default traffic shaping option for connections of the rt-VBR service category. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. A value of ***disabled*** means traffic shaping cannot be enabled for any rt-VBR connections. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled*** since traffic shaping is not supported for rt-VBR connections on these cards. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value of this attribute may be ***enabled*** only if the interface supports shaping, as defined by the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component. If that component does not exist, the value of this attribute must be ***disabled***. If the *Vcc Tm, Vpc Tm,* or *Vpt Tm, txTrafficDescType* attribute indicates type 1 or 2, this attribute is ignored and traffic shaping is not applicable for that connection. A value of ***inverseUpc*** means traffic shaping for a connection is enabled according to the value of the *Vcc Tm, Vpc Tm,* or *Vpt Tm txTrafficDescType* attribute. A value of ***inverseUpc*** when the *txTrafficDescType* is 3, 4, or 5, means linear traffic shaping is enabled. Linear traffic shaping uses a single static traffic shaping rate. A value of ***inverseUpc*** when the *txTrafficDescType* is 6, 7, or 8, means inverse-UPC (also referred to as VBR or dual leaky bucket) traffic shaping is enabled. Inverse-UPC traffic shaping can burst above the sustained cell rate to the peak cell rate for the duration defined by the maximum burst size. Inverse-UPC traffic shaping exactly conforms to the requirements of a dual leaky bucket UPC enforcer. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the value ***inverseUpc*** is not available.

Copyright © 2006, Nortel Nortel Confidential

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***inverseUpc*** is not supported and is equivalent to the value ***enabled***.

A value of ***enabled*** when the *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, means traffic shaping for a connection is enabled using linear shaping.

Enabling or disabling traffic shaping may require a matching change to the *emissionPriority* attribute, and the *unshapedTransmitQueueing* attribute for this service category. Refer to those attributes for the complete description of the interactions.

Mib	AtmCore
Values	enabled disabled inverseUpc
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA RtVbr** **shapeRecoupPolicy (recoup)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping recoup policy for the rt-VBR service category. This is the policy which is used to recoup shaping opportunities which are lost when more than one connection schedules a cell for the same transmit opportunity. In this case, one connection is scheduled and the cell from the other connection is delayed by one cell time. This attribute affects how the transmit time is calculated for the next cell on the delayed connection. This attribute is ignored if this service category is not shaped. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. This attribute is not applicable and is ignored for ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards. When the connection which was delayed schedules the next cell to transmit, it may calculate the time as a difference from either the previous actual cell transmit time, or the time when the previous cell should have been transmitted. A value of ***maximumEfficiency*** results in each connection trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell should originally have been sent. Cell delay variation (CDV) occurs in this case since the cells are sent with less than the shaping delay between them. However, in

Copyright © 2006, Nortel Nortel Confidential

general the shaper recovers (recoups) lost opportunities and improves efficiency.

A value of ***minimumCdv*** results in connections not trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell was actually transmitted. This minimizes CDV, but results in missed cell opportunities.

Mib	AtmCore
Values	minimumCdv maximumEfficiency
Default	minimumCdv
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA RtVbr** **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default queuing option for unshaped connections of the rt-VBR service category. This attribute controls whether common or per-VC queuing is used. A value of ***perVc*** means that each connection has its own buffering and queue limits. A value of ***common*** means that cells are queued in First In First Out order on a common queue for this service category. The common queue has one set of congestion control levels for all cells enqueued on it. This attribute does not apply to basic VPTs and standard *Vpt* VCCs. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, if the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component permits shaping for this interface, then this attribute may take any of the three values. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing. If the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component does not permit shaping for this interface, then this attribute may take the values ***common***, or ***autoConfigure***. In this case, the value ***autoConfigure*** is interpreted to mean common queuing. An override to this default may be specified for a provisioned connection under the *Vcd Tm*, or *Vpd Tm* component. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmlrAtm*** cards, the value ***perVc*** is not supported since these cards do not support per-VC queuing. The value ***autoConfigure*** is interpreted to mean common queuing. For ***4pOC12SmlrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmlrAtm*** cards,

Copyright © 2006, Nortel Nortel Confidential

the value ***common*** is not supported since these cards do not support common queuing. The value ***autoConfigure*** is interpreted to mean per-VC queuing.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, if traffic shaping for this service category is disabled, this attribute may take any of the three values. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing. If traffic shaping for this service category is not disabled, the only permitted values are ***perVc*** and ***autoConfigure***. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, no more than 32,000 connections on the FP can use per-VC queuing. The remaining connections must use common queuing. The *Lp Eng Arc perVcQueueUsage* attribute indicates the number per-VC queues that are currently in use.

The value of the operational *opUnshapedTransmitQueueing* attribute of this component indicates whether the transmit queuing is ***perVc***, or ***common***.

Mib	AtmCore
Values	perVc common autoConfigure
Default	autoConfigure
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA RtVbr** **usageParameterControl (upc)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default usage parameter control (UPC) option for connections of the rt-VBR service category. This attribute is ignored if the *rxTrafficDescriptorType* indicates 1 or 2. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. A value of ***enforced*** means UPC is enforced for each connection. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*. A value of ***monitored*** means UPC conformance checking is performed, except, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on

Copyright © 2006, Nortel Nortel Confidential

unchanged.

A value of ***disabled*** means UPC is disabled on the receive path for all rt-VBR connections.

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported. This value has the same effect as ***disabled***.

For ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled***.

Mib	AtmCore
Values	enforced disabled monitored
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA RtVbr** **weightPolicy**

Access	Read and write
Criticality	Process
Description	This attribute specifies the policy which is applied when calculating the fairness weight for unshaped connections of the rt-VBR service category. The fairness weight for a connection determines the relative amount of bandwidth which that connection obtains, compared to other connections in the same service category. Connections with equal weight get equal transmit opportunities. Connections with higher weights get more transmit opportunities compared with connections that have lower weights. An override to this default may be specified for a provisioned connection under the *Vcd Tm*, or *Vpd Tm* component. The fairness weight for a connection is directly proportional to the value of one of the traffic descriptor parameters for that connection. This attribute specifies which traffic descriptor parameter is used for connections of the rt-VBR service category. A value of ***scr*** means the fairness weight is proportional to the transmit sustained cell rate (SCR) of a connection. Connections with a higher SCR have a higher fairness weight. For connections with *txTrafficDescType* 3, which have no SCR, the sustained cell rate is assumed to be equal to the peak cell rate. A value of ***pcr*** means the fairness weight is proportional to the transmit peak cell rate (PCR) of a connection. Connections with a higher PCR have

Copyright © 2006, Nortel Nortel Confidential

a higher fairness weight. Connections with *txTrafficDescType* 1 or 2 get a minimum weight, which is 1.

A value of ***ecr*** means the fairness weight is proportional to the equivalent cell rate (ECR) of a connection as calculated by connection admission control (CAC). Connections with a higher ECR have a higher fairness weight. Connections with an ECR of 0 get a minimum weight, which is 1.

The weight of a connection is visible in the *Vcc Tm, Vpc Tm,* or *Vpt Tm weight* attribute.

This attribute does not apply to basic VPTs and standard *Vpt* VCCs.

This attribute is ignored if the value of the *unshapedTransmitQueueing* attribute is ***common***.

This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards.

ATTRIBUTE Atmlf CA RtVbr **forceTagging (tag)**

Access — Read and write

Criticality — Process

Description

This attribute specifies the default force tagging (CLP=1) value of all cells for rt-VBR permanent connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component.

A value of ***enabled*** means CLP is set to 1 for all cells.

A value of ***disabled*** means CLP is unchanged for all cells.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction.

This attribute does not apply to any type of *Vpt* component.

This attribute does not apply to switched rt-VBR connections.

ATTRIBUTE AtmIf CA RtVbr **opUnshapedTransmitQueueing (opUnshap)**

Access	Read only
Description	This attribute indicates the type of transmit queuing for unshaped rt-VBR connections.

Copyright © 2006, Nortel Nortel Confidential

A value of ***perVc*** indicates that unshaped connections use per-VC queuing. A value of ***common*** indicates unshaped connections use the common queue for this service category.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, the value ***common*** is always indicated since these cards do not support per-VC queuing.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the value ***perVc*** is always indicated since these cards do not support common queuing.

Mib — AtmCore

Values — perVc
common

Default — No default

ATTRIBUTE AtmIf CA RtVbr **epdOffset (epdO)**

Access — Read only

Description — This attribute indicates the Early Packet Discard (EPD) offset which is currently in use for this service category. The EPD offset is used to derive the EPD thresholds for each CC level.

Any connection under this service category which requires the transmit Packet Wise Discard feature must specify a transmit queue limit which is at least 5.71 times this offset. This ensures that the derived Epd threshold will never be less than 17.5% of the transmit queue limit. If this is not done, txPacketWiseDiscard for the connection will be automatically disabled.

The value of this EPD offset is specified in the *Lp Eng Arc Aqm Ov* component.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***1pOC48ChSmIrAtm***, ***16pOC3PosAtm***, and ***4pMRPosAtm*** cards, this attribute is not available and is filtered from the display.

Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA NrtVbr txQueueLimit (txql)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default maximum queue length for the emission queues used to buffer the traffic of the nrt-VBR service category. It is used as the basis for setting both the queue length and the discard thresholds on both common and per-VC queues. For the common queue, the discard thresholds are set at approximately 35, 75, and 90 percent of the value of this attribute for traffic at discard priority 3 (DP=3), DP=2, and DP=1 respectively. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, common queuing is not available for the nrt-VBR service category. For a per-VC queue, the actual queue length may be reduced depending on the shaping rate of the connection (for standard *Vpt* VCCs, this is the shaping rate of the *Vpt*). The discard thresholds are set at approximately 35, 75, and 90 percent of the scaled queue limit for traffic at discard priority 3 (DP=3), DP=2, and DP=1 respectively. However, a reduction will never result in a value that is less than the value of the *minPerVcQueueLimit* attribute. The per-VC queue limit may be overridden for a permanent connection by specifying a value in the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, per-VC queues are not available for the nrt-VBR service category. For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the maximum size of the link-class queue for buffering the egress traffic of the nrt-VBR service category. This is similar to common queuing, except that each nrt-VBR connection maintains a per-VC utilization limit of the common queue

Copyright © 2006, Nortel Nortel Confidential

specified for a provisioned connection by the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute.

A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***1792***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, and ***3pDS3Atm*** cards, the value is ***2304***. For ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, and ***16pOC3PosAtm*** cards, the value is ***10240***. For MSA32 cards, the value is ***10240*** for OC-3 channels, and ***1792*** for DS1, or E1 channels. For ***4pMRPosAtm*** cards, the value is ***40960***. For ***1pOC12SmLrAtm*** cards, the value is ***7680***. For ***1pOC48ChSmIrAtm*** cards, the value is ***118784.***

The operational value of the maximum length of a queue (common or per-VC) is indicated by the *Vcc Tm, Vpc Tm,* or *Vpt Tm txQueueThresholds* attribute.

When using per-VC queuing, this attribute is used as the default *txQueueLimit* for all standard VPTs, regardless of the *Vpt's* service category.

This attribute does not apply to basic VPTs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr* and *Ubr* components and the valid range is from ***5*** to ***30000*** inclusive.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***160000*** inclusive.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***512000*** inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

ATTRIBUTE **AtmIf CA NrtVbr** **minPerVcQueueLimit (minpervcql)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the minimum queue limit for the per-VC queues of connections of the nrt-VBR service category. This attribute is ignored for ***1pOC12SmLrAtm*** cards, because they do not support per-VC queues for the nrt-VBR service category. The queue limit of a per-VC queue is obtained by scaling down the *txQueueLimit* attribute based on the shaping rate of that queue (shaping rate for the connection and for standard *Vpt* VCCs, the shaping rate of the *Vpt*). This produces a constant delay for various queue lengths. The value of the *txQueueLimit* attribute provides an upper bound while the value of the *minPerVcQueueLimit* attribute provides the lower bound. The value of this attribute must not be greater than the value of the *txQueueLimit* attribute. If this service category is used by Trunks, the value of the *minPerVcQueueLimit* attribute must be at least ***88***. This attribute is used as the default *minPerVcQueueLimit* for all standard VPTs, regardless of the *Vpt's* service category. This attribute does not apply to basic VPTs. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr* and *Ubr* components. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***160000*** inclusive. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***43*** to ***512000*** inclusive. For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive. For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

ATTRIBUTE AtmIf CA NrtVbr perVcQueueLimitReferenceRate (refrate)

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping rate to be used in computing the tolerable delay for per-VC queues of connections of the nrt-VBR service category. The delay is computed as the *txQueueLimit* divided by the value of this attribute. This attribute is ignored for ***1pOC12SmLrAtm*** and ***1pOC48ChSmlrAtm*** cards, because they do not support traffic shaping for the nrt-VBR service category. A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***3685***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, and ***3pDS3Atm*** cards, the value is ***14740***. For ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmlrAtm***, ***16pOC3SmlrAtm***, and ***16pOC3PosAtm*** cards, the value is ***65511***. For MSA32 cards, the value is ***65511*** for OC-3 channels, and ***3685*** for DS1, or E1 channels. For ***4pOC12SmlrAtm***, ***4pOC12SmLrAtm***, and 4***pMRPosAtm*** cards, the value is ***262044***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr*, and *Ubr* components. For ***4pOC12SmlrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmlrAtm*** cards the maximum value is ***1416905***. For ***16pOC3PosAtm*** cards, the maximum value is ***353207***. For ***4pMRPosAtm*** cards, the maximum value is ***1412830*** for OC-12 ports and ***5651320*** for OC-48 ports. For all other cards, the maximum value is ***943396***. This attribute is used as the default *perVcQueueLimitReferenceRate* for all standard VPTs, regardless of the *Vpt's* service category. This attribute does not apply to basic VPTs.

ATTRIBUTE Atmlf CA NrtVbr svcMpHoldingPriority (svcMpHpri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the default holding priority which applies to SVC nrt-VBR point-to-multipoint connections. It takes a value from 0 (highest priority) to 4 (lowest priority). In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. This attribute does not apply to *Vpt* VCCs. When bandwidth fluctuates, the entire *Vpt* component, along with all *Vpt* VCCs, is released as a unit, according to the *Vpt*'s *holdingPriority.*

ATTRIBUTE AtmIf CA NrtVbr emissionPriority (ep)

Access	Read and write
Criticality	Process
Description	This attribute specifies the emission priority (EP) which is used to transmit traffic of the nrt-VBR service category. A lower numerical value for this attribute specifies a higher emission priority. 0 is the highest EP and 7 is the lowest. Cells at a higher emission priority receive higher preference for link bandwidth. EP 0 and EP 1 are in the absolute priority range and are unaffected by any minimum bandwidth guarantees. EP 2 through EP 7 are in the guaranteed bandwidth range and may achieve a priority which is different from the strict hierarchical priority, if a minimum bandwidth guarantee is provisioned. A minimum bandwidth guarantee is specified in the *AtmIf*/n *Ep*/m component. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch, 4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC12SmLrAtm*** cards, emission priority setting must comply with all of the following constraints: 1. The emission priority numbers must be in the following order: CBR <= rt-VBR <= nrt-VBR <= ABR <= UBR 2. Two different ATM service categories may share the same EP only if they are both shaped. 3. CBR and rt-VBR may be placed either in the absolute priority range (EP 0 or 1) or in the guaranteed bandwidth range (EP 2 through 7). 4. If both CBR and rt-VBR are shaped, rt-VBR must share the same EP with CBR or ABR. If either one of CBR or rt-VBR are not shaped, then they cannot share the same EP. 5. ABR service category is always deemed to be shaped. If nrt-VBR is shaped, it must share the same EP with ABR. If nrt-VBR is not shaped it must have a higher EP than ABR. 6. If UBR is shaped, it must share the same EP with ABR. If UBR is not

Copyright © 2006, Nortel Nortel Confidential

shaped, it must have a lower EP than ABR.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.
3. EP 0 must be used if traffic shaping is required.
4. EP 5 and EP 6 are not supported.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.

For ***1pOC48ChSmIrAtm*** cards, only the default value is supported.

Mib	AtmCore
Values	Decimal (0..7)
Default	4
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA NrtVbr** **trafficShaping (trShaping)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default traffic shaping option for connections of the nrt-VBR service category. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. A value of ***disabled*** means traffic shaping cannot be enabled for any nrt-VBR connections. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled*** since traffic shaping is not supported for nrt-VBR connections on these cards. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value of this attribute may be ***enabled*** only if the interface supports shaping, as defined by the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component. If that component does not exist, the value of this attribute must be ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

If the *Vcc Tm, Vpc Tm,* or *Vpt Tm txTrafficDescType* attribute indicates type 1 or 2, this attribute is ignored and traffic shaping is not applicable for that connection.

A value of ***inverseUpc*** means traffic shaping for a connection is enabled according to the value of the *Vcc Tm, Vpc Tm,* or *Vpt Tm txTrafficDescType* attribute.

A value of ***inverseUpc*** when the *txTrafficDescType* is 3, 4, or 5, means linear traffic shaping is enabled. Linear traffic shaping uses a single static traffic shaping rate.

A value of ***inverseUpc*** when the *txTrafficDescType* is 6, 7, or 8, means inverse-UPC (also referred to as VBR or dual leaky bucket) traffic shaping is enabled. Inverse-UPC traffic shaping can burst above the sustained cell rate to the peak cell rate for the duration defined by the maximum burst size. Inverse-UPC traffic shaping exactly conforms to the requirements of a dual leaky bucket UPC enforcer.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the value ***inverseUpc*** is not available.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***inverseUpc*** is not supported and is equivalent to the value ***enabled***.

A value of ***enabled*** when the *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, means traffic shaping for a connection is enabled using linear shaping.

Enabling or disabling traffic shaping may require a matching change to the *emissionPriority* attribute, and the *unshapedTransmitQueueing* attribute for this service category. Refer to those attributes for the complete description of the interactions.

Mib	AtmCore
Values	enabled disabled inverseUpc
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA NrtVbr** **shapeRecoupPolicy (recoup)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping recoup policy for the nrt-VBR service category. This is the policy which is used to recoup shaping opportunities

Copyright © 2006, Nortel Nortel Confidential

which are lost when more than one connection schedules a cell for the same transmit opportunity. In this case, one connection is scheduled and the cell from the other connection is delayed by one cell time. This attribute affects how the transmit time is calculated for the next cell on the delayed connection. This attribute is ignored if this service category is not shaped.

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

This attribute is not applicable and is ignored for ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards.

When the connection which was delayed schedules the next cell to transmit, it may calculate the time as a difference from either the previous actual cell transmit time, or the time when the previous cell should have been transmitted.

A value of ***maximumEfficiency*** results in each connection trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell should originally have been sent. Cell delay variation (CDV) occurs in this case since the cells are sent with less than the shaping delay between them. However, in general the shaper recovers (recoups) lost opportunities and improves efficiency.

A value of ***minimumCdv*** results in connections not trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell was actually transmitted. This minimizes CDV, but results in missed cell opportunities.

Mib	AtmCore
Values	minimumCdv maximumEfficiency
Default	maximumEfficiency
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA NrtVbr** **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default queuing option for unshaped connections of the nrt-VBR service category. This attribute controls whether common or per-VC queuing is used. A value of ***perVc*** means that each connection has its own buffering and queue limits. A value of ***common*** means that cells are queued in First In First Out order

Copyright © 2006, Nortel Nortel Confidential

on a common queue for this service category. The common queue has one set of congestion control levels for all cells enqueued on it.

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, if the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component permits shaping for this interface, then this attribute may take any of the three values. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing. If the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component does not permit shaping for this interface, then this attribute may take the values ***common***, or ***autoConfigure***. In this case, the value ***autoConfigure*** is interpreted to mean common queuing. An override to this default may be specified for a provisioned connection under the *Vcd Tm*, or *Vpd Tm* component. There is one common queue which is shared by the nrt-VBR, ABR, and UBR service categories.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, the value ***perVc*** is not supported since these cards do not support per-VC queuing. The value ***autoConfigure*** is interpreted to mean common queuing.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the value ***common*** is not supported since these cards do not support common queuing. The value ***autoConfigure*** is interpreted to mean per-VC queuing.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***16pOC3PosAtm***, and ***4pMRPosAtm*** cards, if traffic shaping for this service category is disabled, this attribute may take any of the three values. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing. If traffic shaping for this service category is not disabled, the only permitted values are ***perVc*** and ***autoConfigure***. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, no more than 32,000 connections on the FP can use per-VC queuing. The remaining connections must use common queuing. The *Lp Eng Arc perVcQueueUsage* attribute indicates the number per-VC queues that are currently in use.

The value of the operational *opUnshapedTransmitQueueing* attribute of this component indicates whether the transmit queuing is ***perVc*** or ***common***.

Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA NrtVbr **usageParameterControl (upc)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default usage parameter control (UPC) option for connections of the nrt-VBR service category. This attribute is ignored if the *rxTrafficDescriptorType* indicates 1 or 2. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. A value of ***enforced*** means UPC is enforced for each connection. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*. A value of ***monitored*** means UPC conformance checking is performed, except, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on unchanged. A value of ***disabled*** means UPC is disabled on the receive path for all rt-VBR connections. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported. This value has the same effect as ***disabled***. For ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled***.
Mib	AtmCore
Values	enforced disabled monitored
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA NrtVbr **weightPolicy**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the policy which is applied when calculating the fairness weight for unshaped connections of the nrt-VBR service category. The fairness weight for a connection determines the relative amount of bandwidth which that connection obtains, compared to other connections in the same service category. Connections with equal weight get equal transmit opportunities. Connections with higher weights get more transmit opportunities compared with connections that have lower weights. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. The fairness weight for a connection is directly proportional to the value of one of the traffic descriptor parameters for that connection. This attribute specifies which traffic descriptor parameter is used for connections of the nrt-VBR service category. A value of ***scr*** means the fairness weight is proportional to the transmit sustained cell rate (SCR) of a connection. Connections with a higher SCR have a higher fairness weight. For connections with *txTrafficDescType* 3, which have no SCR, the sustained cell rate is assumed to be equal to the peak cell rate. A value of ***pcr*** means the fairness weight is proportional to the transmit peak cell rate (PCR) of a connection. Connections with a higher PCR have a higher fairness weight. Connections with *txTrafficDescType* 1 or 2 get a minimum weight, which is 1. A value of ***ecr*** means the fairness weight is proportional to the equivalent cell rate (ECR) of a connection as calculated by connection admission control (CAC). Connections with a higher ECR have a higher fairness weight. Connections with an ECR of 0 get a minimum weight, which is 1. The weight of a connection is visible in the *Vcc Tm, Vpc Tm,* or *Vpt Tm weight* attribute. This attribute does not apply to basic VPTs and standard *Vpt* VCCs. This attribute is ignored if the value of the *unshapedTransmitQueueing* attribute is ***common***. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards.

ATTRIBUTE AtmIf CA NrtVbr **forceTagging (tag)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default force tagging (CLP=1) value of all cells for nrt-VBR permanent connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. A value of ***enabled*** means CLP is set to 1 for all cells. A value of ***disabled*** means CLP is unchanged for all cells. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction. This attribute does not apply to any type of *Vpt* component. This attribute does not apply to switched nrt-VBR connections. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards.
Mib	AtmCore
Values	enabled disabled
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf CA NrtVbr **cellLossRatio (clr)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the tolerable cell loss ratio (CLR) for nrt-VBR traffic (excluding connections managed by a *Vpt CA*). The value specified is the negative base 10 logarithm of the CLR. For example, if the target CLR = 1E-10 then the value of the *cellLossRatio* attribute is ***10***. The value if this attribute must be less than or equal to the value of the *RtVbr cellLossRatio*

Copyright © 2006, Nortel Nortel Confidential

attribute since rt-VBR traffic has a higher discard priority.

This attribute is used by the Connection Admission Control (CAC) algorithm to compute the equivalent cell rate (ECR) required for nrt-VBR connections.

There is a trade-off between the service category CLR and the achievable link utilization. To guarantee an excellent service category, the CLR should be as small as possible (for example, 1E-10). However, a smaller CLR results in a larger equivalent cell rate for a given connection and hence a lower link utilization.

A value of ***anyClrValue*** means that no bandwidth is reserved for nrt-VBR connections and CAC is effectively turned off. All nrt-VBR connections are admitted.

Mib	AtmCore
Values	Decimal (1..15) anyClrValue
Default	7
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf CA NrtVbr** **txCellDiscardThreshold**

Access	Read and write
Description	This attribute specifies the threshold for a minor alarm for discarded outgoing cells for nrt-VBR service category. If the count of discarded outgoing nrt-VBR cells is greater than the provisioned value of this attribute in a 15 minute interval, the alarm is set. While the alarm is set, if the count of discarded outgoing nrt-VBR cells is still greater than the provisioned value of this attribute in the subsequent 15 minute intervals, the alarm is not set again. If the count of discarded outgoing nrt-VBR cells drops below the provisioned value of this attribute in a 15 minute interval the alarm is cleared. Provisioned value of '0' means discarded outgoing nrt-VBR cells are not monitored and no alarm is generated. While the alarm is set, if the value of this attribute is changed, the alarm is cleared. This attribute is not applicable for ***3pOC3MmAtm, 3pOC3SmAtm, 3pE3Atm, 3pDS3Atm, 3pE1Atm, 3pDS1Atm, 8pE1Atm, 8pDS1Atm*** and ***2pJ6MAtm*** cards. This attribute is not applicable for ***4pOC12SmIrAtm*** and ***4pOC12SmLrAtm*** cards when channelized.

ATTRIBUTE AtmIf CA NrtVbr **rxFrameDiscardThreshold**

Access Read and write

Description This attribute specifies the threshold for a minor alarm for discarded incoming frames for nrt-VBR service category.

If the count of discarded incoming nrt-VBR frames is greater than the provisioned value of this attribute in a 15 minute interval, the alarm is set.

While the alarm is set, if the count of discarded incoming nrt-VBR frames is still greater than the provisioned value of this attribute in the subsequent 15 minute intervals, the alarm is not set again. If the count of discarded incoming nrt-VBR frames drops below the provisioned value of this attribute in a 15 minute interval the alarm is cleared.

Provisioned value of '0' means discarded incoming nrt-VBR frames are not monitored and no alarm is generated.

While the alarm is set, if the value of this attribute is changed, the alarm is cleared.

This attribute is not applicable for ***3pOC3MmAtm, 3pOC3SmAtm, 3pE3Atm, 3pDS3Atm, 3pE1Atm, 3pDS1Atm, 8pE1Atm, 8pDS1Atm, 2pJ6MAtm, 4pOC12SmIrAtm, 4pOC12SmLrAtm*** and ***16pOC3SmIrAtm*** cards.

GROUP Atmlf CA NrtVbr **Operational (Oper)**

Properties	Operational
Description	This group contains operational attributes for the nrt-VBR service category.
Mib	AtmCore

ATTRIBUTE Atmlf CA NrtVbr **opUnshapedTransmitQueueing (opUnshap)**

Access	Read only
Description	This attribute indicates the type of transmit queuing for unshaped nrt-VBR connections. A value of ***perVc*** indicates that unshaped connections use per-VC queuing. A value of ***common*** indicates that unshaped connections use the common queue for this service category. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, the value ***common*** is always indicated since these cards do not support per-VC queuing. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the value ***perVc*** is always indicated since these cards do not support common queuing.
Mib	AtmCore
Values	perVc common
Default	No default

ATTRIBUTE Atmlf CA NrtVbr **epdOffset (epdO)**

Access	Read only
Description	This attribute indicates the Early Packet Discard (EPD) offset which is currently in use for this service category. The EPD offset is used to derive the EPD thresholds for each CC level. Any connection under this service category which requires the transmit Packet Wise Discard feature must specify a transmit queue limit which is at least 5.71 times this offset. This ensures that the derived Epd threshold will never be less than 17.5% of the transmit queue limit. If this is not done, txPacketWiseDiscard for the connection will be automatically disabled. The value of this EPD offset is specified in the *Lp Eng Arc Aqm Ov* component. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***,

Common Verbs	Help List Display Add

GROUP AtmIf CA Abr Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioned attributes which control the ABR service category for this interface.
Mib	AtmCore

ATTRIBUTE AtmIf CA Abr pool

Access	Read and write
Criticality	Process
Description	This attribute specifies the bandwidth pool which is to be used to support the available bit rate (ABR) service category (excluding connections managed by a *Vpt CA*). The percentage of link capacity reserved for the given bandwidth pool is the maximum bandwidth that can be allocated to

Copyright © 2006, Nortel Nortel Confidential

ABR traffic. The percentage allocated to each bandwidth pool can be provisioned through the *bandwidthPool* attribute of the *CA* component.

Mib	AtmCore
Values	pool1 pool2 pool3 pool4 pool5
Default	pool1

ATTRIBUTE Atmlf CA Abr cdvt

Access	Read and write
Criticality	Process
Description	This attribute specifies the default cell delay variation tolerance (CDVT) for all connections of the ABR service category (including connections managed by a *Vpt CA*). An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. This attribute is used by the dynamic generic cell rate algorithm (DGCRA) policer on ATM cards which support this feature. On cards that do not support this feature, ABR UPC is enforced using PCR and CDVT.
Mib	AtmCore
Values	Decimal (1..1200000)
Units	microsec
Default	250

ATTRIBUTE Atmlf CA Abr txQueueLimit (txql)

Access	Read and write
Criticality	Process
Description	This attribute specifies the default maximum queue length for the emission queues used to buffer the traffic of the ABR service category. It is used as the basis for setting the discard thresholds on ABR per-VC queues. For a per-VC queue, the actual queue length may be reduced depending on the peak cell rate. The discard thresholds are set at approximately 35, 75 and 90 percent of the scaled queue limit for traffic at discard priority 3 (DP=3), DP=2 and DP=1 respectively. However, a reduction will never result in a value that is less than the value of the *minPerVcQueueLimit* attribute. The per-VC queue limit may be overridden for a permanent connection by specifying a value in the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute. A value of ***autoConfigure*** means an appropriate value is selected based

Copyright © 2006, Nortel Nortel Confidential

on the card type. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***1792***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, and ***3pDS3Atm*** cards, the value is ***2304***. For ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, the value is ***10240***. For ***4pMRPosAtm*** cards, the value is ***40960*** for OC-12 ports. For MSA32 cards, the value is ***10240*** for OC-3 channels, and ***1792*** for DS1, or E1 channels. For ***1pOC12SmLrAtm*** cards, the value is ***6144***.

The operational value of the maximum length of a queue (common or per-VC) is indicated by the *Vcc Tm, Vpc Tm,* or *Vpt Tm txQueueThresholds* attribute.

For VPTs, this attribute does not apply. Regardless of the *Vpt's* service category, standard VPTs always use the *AtmIf CA NrtVbr txQueueLimit* value as their default.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr* and *Ubr* components and the valid range is from ***5*** to ***30000*** inclusive.

Mib	AtmCore
Values	Decimal (5..63488) autoConfigure
Units	cells
Default	autoConfigure

ATTRIBUTE **AtmIf CA Abr** **minPerVcQueueLimit (minpervcql)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the minimum queue limit for the per-VC queues of connections of the ABR service category. This attribute is ignored for ***1pOC12SmLrAtm*** cards, because they do not support per-VC queues for the ABR service category. The queue limit of a per-VC queue is obtained by scaling down the *txQueueLimit* attribute based on the peak cell rate of that queue (for standard *Vpt* VCCs, the shaping rate of the *Vpt*). This produces a constant delay for various queue lengths. The value of the *txQueueLimit* attribute provides an upper bound while the value of the *minPerVcQueueLimit* attribute provides the lower bound. The value of this attribute must not be greater than the value of the

Copyright © 2006, Nortel Nortel Confidential

txQueueLimit attribute. If this service category is used by Trunks, the value of the *minPerVcQueueLimit* attribute must be at least ***88***.

For VPTs, this attribute does not apply. Regardless of the *Vpt's* service category, standard VPTs always use the *AtmIf CA NrtVbr minPerVcQueueLimit* value as their default.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr* and *Ubr* components.

Mib	AtmCore
Values	Decimal (5..63488)
Units	cells
Default	88

ATTRIBUTE AtmIf CA Abr perVcQueueLimitReferenceRate (refrate)

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping rate to be used in computing the tolerable delay for per-VC queues of connections of the ABR service category. The delay is computed as the *txQueueLimit* divided by the value of this attribute. This attribute is ignored for ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, because they do not support traffic shaping for the ABR service category. A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***3685***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, and ***3pDS3Atm*** cards, the value is ***14740***. For ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***16pOC3SmIrAtm***, and ***16pOC3PosAtm*** cards, the value is ***65511***. For ***4pMRPosAtm*** cards, the value is ***262044*** for OC-12 ports. For MSA32 cards, the value is ***65511*** for OC-3 channels, and ***3685*** for DS1, or E1 channels. For ***4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards, the value is ***262044***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr*, and *Ubr* components. For VPTs, this attribute does not apply. Regardless of the *Vpt's* service category, standard VPTs always use the *AtmIf CA NrtVbr perVcQueueLimitReferenceRate* value as their default.

Values	Decimal (1..943396) autoConfigure
Units	cell/s
Default	autoConfigure

ATTRIBUTE **AtmIf CA Abr** **emissionPriority (ep)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the emission priority (EP) which is used to transmit traffic of the ABR service category. A lower numerical value for this attribute specifies a higher emission priority. 0 is the highest EP and 7 is the lowest. Cells at a higher emission priority receive higher preference for link bandwidth. EP 0 and EP 1 are in the absolute priority range and are unaffected by any minimum bandwidth guarantees. EP 2 through EP 7 are in the guaranteed bandwidth range and may achieve a priority which is different from the strict hierarchical priority, if a minimum bandwidth guarantee is provisioned. A minimum bandwidth guarantee is specified in the *AtmIf*/n *Ep*/m component. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC12SmLrAtm*** cards, emission priority setting must comply with all of the following constraints: 1. The emission priority numbers must be in the following order: CBR <= rt-VBR <= nrt-VBR <= ABR <= UBR 2. Two different ATM service categories may share the same EP only if they are both shaped. 3. CBR and rt-VBR may be placed either in the absolute priority range (EP 0 or 1) or in the guaranteed bandwidth range (EP 2 through 7). 4. If both CBR and rt-VBR are shaped, rt-VBR must share the same EP with CBR or ABR. If either one of CBR or rt-VBR are not shaped, then they cannot share the same EP. 5. ABR service category is always deemed to be shaped. If nrt-VBR is shaped, it must share the same EP with ABR. If nrt-VBR is not shaped it must have a higher EP than ABR. 6. If UBR is shaped, it must share the same EP with ABR. If UBR is not shaped, it must have a lower EP than ABR.

Default	6

ATTRIBUTE Atmlf CA Abr **fairnessPolicy**

Access	Read and write
Criticality	Process
Description	This attribute specifies the fairness policy which is applied to available bandwidth when performing the ER calculation in the ABR service category. This applies to any connection point performing explicit rate calculations. Each ABR connection is assigned a weight. Connections with a higher weight get a greater proportion of the available ABR bandwidth compared with connections that have lower weights. A value of ***mcr*** means the congestion fairness weight is based on the Minimum Cell Rate (MCR) of the connection. A value of ***pcr*** means the congestion fairness weight is based on the Peak Cell Rate (PCR) of the connection. A value of ***pcrMinusMcr*** means the congestion fairness weight is based on the difference between the Peak Cell Rate and the Minimum Cell Rate (PCR - MCR) of the connection. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards.
Mib	AtmCore
Values	mcr pcr pcrMinusMcr
Default	pcrMinusMcr

ATTRIBUTE Atmlf CA Abr **frttPortion**

Access	Read and write
Criticality	Process
Description	This attribute specifies the portion of the Fixed Round Trip Time (FRTT) which is added to each ABR call setup which traverses this interface. The FRTT for the entire call is the sum of the FRTT portions for each interface traversed by the call. FRTT is used by the ABR Source or Virtual Source to adjust the value of ICR according to the rules specified in the ATM Forum TM Version 4.0 specification. The *frttPortion* attribute includes propagation delay through the physical

Copyright © 2006, Nortel Nortel Confidential

media, plus delays included by the transmission system, plus fixed components of switch processing delay.

This attribute is used by ATM Networking at call set-up time for ABR connections directed over this interface.

Mib	AtmCore
Values	Decimal (0..10000)
Units	msec
Default	5

ATTRIBUTE Atmlf CA Abr **abrConnectionType (abrType)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default type for ABR connections. It may be overridden for a permanent connection by specifying a value in the *abrConnectionType* attribute of the *Vcd Tm* or *Vpd Tm* component, or by other configuration options. For example, for ABR end point connections originating at this switch, the *Vcc Tm abrConnectionType* will show ***sourceDest*** regardless of the setting of this attribute. If the value is ***abrSwitch***, traversing ABR connections default to type ***abrSwitchEr*** or ***abrSwitchEfci***, depending on the card type. If the interface to which traffic is directed across the backplane is configured as type ***virtualSourceDest*** and this is a ATM IP FP, then connection points under this *AtmIf* are activated as type ***virtualSourceDest***. If the value is ***virtualSourceDest***, traversing ABR connections may be instantiated as one of the following types: ***abrSwitchEr***, ***abrSwitchEfci***, or ***virtualSourceDest***. A Virtual Source-Virtual Destination (VS/VD) boundary forms a break in the end to end flow of RM cells as defined in the ATM Forum Specification for Traffic Management Version 4.0. On ATM IP cards, a VS/VD boundary can be configured for a connection providing all of the following conditions are met: 1. the ABR connection is traversing (not terminating at) this interface; 2. both this interface and next hop interface to which traffic is directed across the backplane are located on ATM IP cards; 3. one or both connecting points are configured as ***virtualSourceDest***, 4. the next hop interface to which traffic is directed across the backplane is not configured as ***nonAbrInterworking***. If this attribute is set to ***nonAbrInterworking***, this interface is defined as a point of interworking between an ABR and a non-ABR connection. In this case the next hop interface to which traffic is directed across the backplane is activated as type ***sourceDest***.

Copyright © 2006, Nortel Nortel Confidential

The *Vcc Tm* or *Vpc Tm abrConnectionType* operational attribute indicates what type of ABR connection was activated.

Mib: AtmCore

Values:
abrSwitch
virtualSourceDest
nonAbrInterworking

Default: abrSwitch

ATTRIBUTE Atmlf CA Abr **usageParameterControl (upc)**

Access: Read and write

Criticality: Process

Description: This attribute specifies the default usage parameter control (UPC) option for connections of the ABR service category. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component.

A value of ***enforced*** means UPC is enforced for each connection. When UPC is enforced on an ABR connection, non-conforming cells are discarded.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, a value of ***enforced*** means UPC for ABR connection is enforced as a Dynamic Generic Cell Rate Algorithm (DGCRA) based on the connection traffic descriptor.

For all other cards, a value of ***enforced*** means the connection enforces a single GCRA policer at the defined PCR and CDVT for this connection.

A value of ***monitored*** means UPC conformance checking is performed, except, instead of the non-conforming cells being discarded, they are merely counted in the UPC violations counts and passed on unchanged.

A value of ***disabled*** means UPC is disabled on the receive path for all ABR connections.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported. This value has the same effect as ***disabled***.

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

Mib: AtmCore

Values:
enforced
disabled
monitored

Default	disabled

ATTRIBUTE Atmlf CA Abr **initialCellRate (icr)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default Initial Cell Rate (ICR) parameter for ABR connections. ICR is the rate at which a source should send initially and after an idle period. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component, or signaled in the ABR Setup Parameters Information Element. A value of ***useMcr*** means ICR is set to the same value as the Minimum Cell Rate (MCR) for the connection. A value of ***usePcr*** means ICR is set to the same value as the Peak Cell Rate (PCR) for the connection. When the value is an explicit number, that number is used as the ICR, provided it is between MCR and PCR. If the value is below MCR, then MCR is used as ICR. If the value is above PCR, then PCR is used as ICR.
Mib	AtmCore
Values	Decimal (0..16777215) useMcr usePcr
Units	cell/s
Default	usePcr

ATTRIBUTE Atmlf CA Abr **rateDecreaseFactor (rdf)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default Rate Decrease Factor (RDF) for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component, or signaled in the ABR Setup Parameters Information Element. The RDF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is ***8***, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (B-RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

Mib	AtmCore
Values	Decimal (0..15)
Default	15

ATTRIBUTE Atmlf CA Abr **rateIncreaseFactor (rif)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default Rate Increase Factor (RIF) for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component, or signaled in the ABR Setup Parameters Information Element. The RIF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is ***6***, RIF is 2E-6 = 1/64. RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (B-RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR.
Mib	AtmCore
Values	Decimal (0..15)
Default	0

ATTRIBUTE Atmlf CA Abr **maxCellPerRmCell (nrm)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default number of user cells per Resource Management cell (NRM) for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component, or signaled as the NRM parameter in the ABR Additional Parameters Information Element. NRM is the maximum number of cells an ABR source may transmit for each forward Resource Management (F-RM) cell. The count of the cells transmitted includes user cells, OAM cells, backward RM cells and the forward RM cell. Note that a value of 2 is not recommended even though it is permitted according to the ATM Forum standard. When this attribute is set to a value of 2, it is possible that only one forward and one backward RM cell are

Copyright © 2006, Nortel Nortel Confidential

repeatedly transmitted and all data traffic is queued up indefinitely.

This attribute is ignored under all conditions where the *Vcc Tm* or *Vpc Tm* operational attribute *abrConnectionType* indicates ***explicitRateMarking***.

Mib	AtmCore
Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256)
Units	cells
Default	256

ATTRIBUTE Atmlf CA Abr **maxTimeBetweenRmCell (trm)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default time between Resource Management cells (TRM) for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component, or signaled in the ABR Additional Parameters Information Element. TRM provides an upper bound on the time interval between forward Resource Management (F-RM) cells for an ABR source. Since the last F-RM cell was sent, if at least TRM time has elapsed and at least 2 other cells have been sent, the next cell to be transmitted would be a forward RM cell. This attribute is ignored under all conditions where the *Vcc Tm* or *Vcd Tm* operational attribute *abrConnectionType* is displayed as ***explicitRateMarking***. The provisioned value of 781 is signaled in the ABR Additional Parameters Information Element as 0. 1563 is signaled as 1. 3125 is signaled as 2. 6250 is signaled as 3. 12500 is signaled as 4. 25000 is signaled as 5. 50000 is signaled as 6. 100000 is signaled as 7.
Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)
Units	microsec
Default	100000

ATTRIBUTE Atmlf CA Abr **cutoffDecreaseFactor (cdf)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the default Cutoff Decrease Factor (CDF) parameter for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component, or signaled in the ABR Additional Parameters Information Element. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero. CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the CRM parameter. CRM is the limit of the number of forward Resource Management (F-RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the MCR, in which case the ACR is set to MCR.
Mib	AtmCore
Values	Decimal (0; 1; 2; 4; 8; 16; 32; 64)
Default	16

ATTRIBUTE Atmlf CA Abr acrDecreaseTimeFactor (adtf)

Access	Read and write
Criticality	Process
Description	This attribute specifies the default Allowed Cell Rate Decrease Time Factor (ADTF) parameter for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component, or signaled in the ABR Additional Parameters Information Element. ADTF is the time interval permitted between sending forward Resource Management (F-RM) cells before the Allowed Cell Rate (ACR) is decreased to the Initial Cell Rate (ICR). In other words, if the source does not transmit a forward RM cell for a period of ADTF centi-seconds (hundredths of a second), it will reduce its ACR to the value of its ICR. If ACR is already at or below ICR, further rate reductions are defined by the CRM ABR parameter.

Values	Decimal (0..1023)
Units	centiseconds
Default	50

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf CA Abr dgcraMaximumDelay (dgcraMaxDelay)

Access	Read and write
Criticality	Process
Description	This attribute specifies the default maximum delay for Dynamic General Cell Rate Algorithm (DGCRA) rate changes for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component. This attribute specifies an upper bound on the delay after which the rate change induced by a backward Resource Management (B-RM) cell departing from this interface (in the backward direction) is expected to be observed at the interface (in the forward connection). This upper bound may be approximated as the round trip sum of the fixed and propagation delays and the maximum queuing delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the DGCRA. A larger value for this attribute implies a more lenient policer. When there is a decrease in the Allowed Cell Rate (ACR), the policer waits a correspondingly longer period of time before it enforces the new cell rate. The value of this attribute must be greater than or equal to *dgcraMinimumDelay*, since the maximum delay must be greater than or equal to the minimum delay.
Mib	AtmCore
Values	Decimal (1..16700000)
Units	microsec
Default	10000

ATTRIBUTE Atmlf CA Abr dgcraMinimumDelay (dgcraMinDelay)

Access	Read and write
Criticality	Process
Description	This attribute specifies the default minimum delay for Dynamic General Cell Rate Algorithm (DGCRA) rate changes for ABR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm Abr* or *Vpd Tm Abr* component. This attribute specifies a lower bound on the delay after which the rate change induced by a backward Resource Management (B-RM) cell departing from this interface (in the backward direction) is expected to be observed at the interface (in the forward connection).

Copyright © 2006, Nortel Nortel Confidential

This lower bound may be approximated as the round trip sum of the fixed and propagation delays between the ABR source and this interface.

The value of this attribute is used in policing an ABR connection using the DGCRA. A smaller value for this attribute implies a more lenient policer. When there is an increase in the Allowed Cell Rate (ACR), the policer waits for a correspondingly shorter period of time before it enforces the new cell rate.

The value of this attribute must be less than or equal to *dgcraMaximumDelay*, since the maximum delay must be greater than or equal to the minimum delay.

Mib	AtmCore
Values	Decimal (1..16700000)
Units	microsec
Default	1

ATTRIBUTE Atmlf CA Abr **holdingPriority (hpri)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default holding priority which applies to SVP and SVC ABR connections. It takes a value from 0 (highest priority) to 4 (lowest priority). In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. This attribute does not apply to *Vpt* VCCs. When bandwidth fluctuates, the entire *Vpt* component, along with all *Vpt* VCCs is released as a unit, according to the *Vpt*'s *holdingPriority.*

GROUP Atmlf CA Abr **Operational (Oper)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains operational attributes for the ABR service category. There is no support for ABR connections on any ATM cards at this time.
Mib	AtmCore

ATTRIBUTE Atmlf CA Abr **epdOffset (epdO)**

Access	Read only
Description	This attribute indicates the Early Packet Discard (EPD) offset which is currently in use for this service category. The EPD offset is used to derive the EPD thresholds for each CC level. Any connection under this service category which requires the transmit Packet Wise Discard feature must specify a transmit queue limit which is at least 5.71 times this offset. This ensures that the derived Epd threshold will never be less than 17.5% of the transmit queue limit. If this is not done, txPacketWiseDiscard for the connection will be automatically disabled. The value of this EPD offset is specified in the *Lp Eng Arc Aqm Ov* component. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***1pOC48ChSmIrAtm***, ***16pOC3PosAtm***, and ***4pMRPosAtm*** cards, this attribute is not available and is filtered from the display.

ATTRIBUTE AtmIf CA Ubr **pool**

Access — Read and write

Criticality — Process

Description — This attribute specifies the bandwidth pool which is to be used to support the unspecified bit rate (UBR) service category (excluding connections managed by a *Vpt CA*). The percentage of link capacity reserved for the given bandwidth pool is the maximum bandwidth that can be allocated to UBR traffic. The percentage allocated to each bandwidth pool can be provisioned through the *bandwidthPool* attribute of the *CA* component.

The amount of bandwidth reserved for each UBR connection is specified in the *minimumCellRate* attribute.

Mib — AtmCore

Values	pool1 pool2 pool3 pool4 pool5
Default	pool1

ATTRIBUTE Atmlf CA Ubr minimumCellRate (mcr)

Access	Read and write
Description	This attribute specifies the minimum cell rate (MCR) which is allocated from the UBR bandwidth pool for each UBR connection which is admitted using Connection Admission Control (CAC) (excluding connections managed by a *Vpt CA*). UBR connections normally are serviced on a best effort basis, but this attribute allows allocation of a default minimum bandwidth for each connection.
Mib	AtmCore
Values	Decimal (0..2147483647)
Units	cell/s
Default	0

ATTRIBUTE Atmlf CA Ubr txQueueLimit (txql)

Access	Read and write
Criticality	Process
Description	This attribute specifies the default maximum queue length for the emission queues used to buffer the traffic of the UBR service category. It is used as the basis for setting both the queue length and the discard thresholds on both common and per-VC queues. For the common queue, the discard thresholds are set at approximately 35, 75, and 90 percent of the value of this attribute for traffic at discard priority 3 (DP=3), DP=2, and DP=1 respectively. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, common queuing is not available for the UBR service category. For a per-VC queue, the actual queue length may be reduced depending on the shaping rate of the connection (for standard *Vpt* VCCs, this is the shaping rate of the *Vpt*). The discard thresholds are set at approximately 35, 75, and 90 percent of the scaled queue limit for traffic at discard priority 3 (DP=3), DP=2, and DP=1 respectively. However, a reduction will never result in a value that is less than the value of the *minPerVcQueueLimit* attribute. The per-VC queue limit may be overridden for a provisioned connection by specifying a value in the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, per-VC queues are not available for the UBR service category.

Copyright © 2006, Nortel Nortel Confidential

For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the maximum size of the link-class queue for buffering the egress traffic of the UBR service category. This is similar to common queuing, except that each UBR connection maintains a per-VC utilization limit of the common queue specified for a provisioned connection by the *Vcd Tm* or *Vpd Tm txQueueLimit* attribute.

A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***1792***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, and ***3pDS3Atm*** cards, the value is ***2304***. For ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, ***4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards, the value is ***10240***. For MSA32 cards, the value is ***10240*** for OC-3 channels, and ***1792*** for DS1, or E1 channels. For ***4pMRPosAtm*** cards, the value is ***40960***. For ***1pOC12SmLrAtm*** cards, the value is ***4096***. For ***1pOC48ChSmIrAtm*** cards, the value is ***20480.***

The operational value of the maximum length of a queue (common or per-VC) is indicated by the *Vcc Tm, Vpc Tm,* or *Vpt Tm txQueueThresholds* attribute.

For standard VPTs, this attribute only applies when using common queuing. When using per-VC queuing, regardless of the *Vpt's* service category, standard VPTs use the *AtmIf CA NrtVbr txQueueLimit* attribute value as their default.

This attribute does not apply to basic VPTs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr* and *Ubr* components and the valid range is from ***5*** to ***30000*** inclusive.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***63488*** inclusive.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***512000*** inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

ATTRIBUTE AtmIf CA Ubr **minPerVcQueueLimit (minpervcql)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the minimum queue limit for the per-VC queues of connections of the UBR service category. This attribute is ignored for ***1pOC12SmLrAtm*** cards, because they do not support per-VC queues for the UBR service category. The queue limit of a per-VC queue is obtained by scaling down the *txQueueLimit* attribute based on the shaping rate of that queue (shaping rate for the connection and for standard *Vpt* VCCs, the shaping rate of the *Vpt*). This produces a constant delay for various queue lengths. The value of the *txQueueLimit* attribute provides an upper bound while the value of the *minPerVcQueueLimit* attribute provides the lower bound. The value of this attribute must not be greater than the value of the *txQueueLimit* attribute. If this service category is used by Trunks the value of the *minPerVcQueueLimit* attribute must be at least ***88***. For VPTs, this attribute does not apply. Regardless of *Vpt*'s service category, standard VPTs always use the *AtmIf CA NrtVbr minPerVcQueueLimit* value as their default. To determine the queue limit of a standard *Vpt Vcc*, the *txQueueLimit* attribute is scaled down by the *Vpt* shaping rate. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr*, and *Ubr* components. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC48ChSmIrAtm*** cards, the valid range for this attribute is from ***5*** to ***160000*** inclusive. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm*** and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from ***92*** to ***512000*** inclusive. For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

Copyright © 2006, Nortel Nortel Confidential

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

Mib	AtmCore
Values	Decimal (5..1011840)
Units	cells
Default	88

ATTRIBUTE **AtmIf CA Ubr** **perVcQueueLimitReferenceRate (refrate)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping rate to be used in computing the tolerable delay for per-VC queues of connections of the UBR service category. The delay is computed as the *txQueueLimit* divided by the value of this attribute. This attribute is ignored for ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, because they do not support traffic shaping for the UBR service category. A value of ***autoConfigure*** means an appropriate value is selected based on the card type. For ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***2pSTM1eCh***, ***2pSTM1Ch*** and ***4pDS3ChAtm*** cards, the value is ***3685***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, and ***3pDS3Atm*** cards, the value is ***14740***. For ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***16pOC3SmIrAtm***, and ***16pOC3PosAtm*** cards, the value is ***65511***. For MSA32 cards, the value is ***65511*** for OC-3 channels, and ***3685*** for DS1, or E1 channels. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***4pMRPosAtm cards,*** the value is ***262044***. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute must be set to the same value for *CA NrtVbr*, *Abr*, and *Ubr* components. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards the maximum value is ***1416905***. For ***16pOC3PosAtm*** cards, the maximum value is ***353207***. For ***4pMRPosAtm*** cards, the maximum value is ***1412830*** for OC-12 ports and ***5651320*** for OC-48 ports. For all other cards, the maximum value is ***943396***. For VPTs, this attribute does not apply. Regardless of the *Vpt's* service category, standard VPTs always use the *AtmIf CA NrtVbr perVcQueueLimitReferenceRate* value as their default.
Mib	AtmCore

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..5651320) autoConfigure
Units	cell/s
Default	autoConfigure

ATTRIBUTE **AtmIf CA Ubr** **emissionPriority (ep)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the emission priority (EP) which is used to transmit traffic of the UBR service category. A lower numerical value for this attribute specifies a higher emission priority. 0 is the highest EP and 7 is the lowest. Cells at a higher emission priority receive higher preference for link bandwidth. EP 0 and EP 1 are in the absolute priority range and are unaffected by any minimum bandwidth guarantees. EP 2 through EP 7 are in the guaranteed bandwidth range and may achieve a priority which is different from the strict hierarchical priority, if a minimum bandwidth guarantee is provisioned. A minimum bandwidth guarantee is specified in the *AtmIf*/n *Ep*/m component. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC12SmLrAtm*** cards, emission priority setting must comply with all of the following constraints: 1. The emission priority numbers must be in the following order: CBR <= rt-VBR <= nrt-VBR <= ABR <= UBR 2. Two different ATM service categories may share the same EP only if they are both shaped. 3. CBR and rt-VBR may be placed either in the absolute priority range (EP 0 or 1) or in the guaranteed bandwidth range (EP 2 through 7). 4. If both CBR and rt-VBR are shaped, rt-VBR must share the same EP with CBR or ABR. If either one of CBR or rt-VBR are not shaped, then they cannot share the same EP. 5. ABR service category is always deemed to be shaped. If nrt-VBR is shaped, it must share the same EP with ABR. If nrt-VBR is not shaped it must have a higher EP than ABR. 6. If UBR is shaped, it must share the same EP with ABR. If UBR is not shaped, it must have a lower EP than ABR. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards,

Copyright © 2006, Nortel Nortel Confidential

emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.
3. EP 0 must be used if traffic shaping is required.
4. EP 5 and EP 6 are not supported.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, emission priority setting must comply with all of the following constraints:
1. The emission priority numbers must be in the following order:
CBR <= rt-VBR <= nrt-VBR <= UBR
2. Two different ATM service categories may share the same EP only if they are both shaped.

For ***1pOC48ChSmIrAtm*** cards, only the default value is supported.

Mib — AtmCore

Values — Decimal (0..7)

Default — 7

ATTRIBUTE Atmlf CA Ubr **trafficShaping (trShaping)**

Access — Read and write

Criticality — Process

Description — This attribute specifies the default traffic shaping option for connections of the UBR service category. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component.

This attribute does not apply to basic VPTs, or standard *Vpt VCCs*.

A value of ***disabled*** means traffic shaping cannot be enabled for any UBR connections.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled*** since traffic shaping is not supported for UBR connections on these cards.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value of this attribute may be ***enabled*** only if the interface supports shaping, as defined by the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component. If that component does not exist, the value of this attribute must be ***disabled***.

If the *Vcc Tm, Vpc Tm,* or *Vpt Tm txTrafficDescType* attribute indicates type 1 or 2, this attribute is ignored and traffic shaping is not applicable for that connection.

Copyright © 2006, Nortel Nortel Confidential

A value of ***inverseUpc*** means traffic shaping for a connection is enabled according to the value of the *Vcc Tm, Vpc Tm,* or *Vpt Tm txTrafficDescType*.

A value of ***inverseUpc*** when the *txTrafficDescType* is 3, 4, 5, or 9 (for UBR with MDCR connections), means linear traffic shaping is enabled. Linear traffic shaping uses a single static traffic shaping rate.

A value of ***inverseUpc*** when the *txTrafficDescType* is 6, 7, or 8, means inverse-UPC (also referred to as VBR or dual leaky bucket) traffic shaping is enabled. Inverse-UPC traffic shaping can burst above the sustained cell rate to the peak cell rate for the duration defined by maximum burst size. Inverse-UPC traffic shaping exactly conforms to the requirements of a dual leaky bucket UPC enforcer.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the value ***inverseUpc*** is not available.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***inverseUpc*** is not supported and is equivalent to the value ***enabled***.

A value of ***enabled*** when the *txTrafficDescType* is 3, 4, 5, 6, 7, 8, or 9 (for UBR with MDCR connections), means traffic shaping for a connection is enabled using linear shaping.

Enabling or disabling traffic shaping may require a matching change to the *emissionPriority* attribute, and the *unshapedTransmitQueueing* attribute for this service category. Refer to those attributes for the complete description of the interactions.

Mib	AtmCore
Values	enabled disabled inverseUpc
Default	disabled

ATTRIBUTE **AtmIf CA Ubr** **shapeRecoupPolicy (recoup)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the shaping recoup policy for the UBR service category. This is the policy which is used to recoup shaping opportunities which are lost when more than one connection schedules a cell for the same transmit opportunity. In this case, one connection is scheduled and the cell from the other connection is delayed by one cell time. This attribute affects how the transmit time is calculated for the next cell on the delayed connection. This attribute is ignored if this service category is not shaped.

Copyright © 2006, Nortel Nortel Confidential

This attribute does not apply to basic VPTs, or standard *Vpt* VCCs.

This attribute is not applicable and is ignored for ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards.

When the connection which was delayed schedules the next cell to transmit, it may calculate the time as a difference from either the previous actual cell transmit time, or the time when the previous cell should have been transmitted.

A value of ***maximumEfficiency*** results in each connection trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell should originally have been sent. Cell delay variation (CDV) occurs in this case since the cells are sent with less than the shaping delay between them. However, in general the shaper recovers (recoups) lost opportunities and improves efficiency.

A value of ***minimumCdv*** results in connections not trying to recoup or regain any delays in scheduling. The transmit time for the next cell is calculated from the time when the previous cell was actually transmitted. This minimizes CDV, but results in missed cell opportunities.

Mib	AtmCore
Values	minimumCdv maximumEfficiency
Default	maximumEfficiency

ATTRIBUTE **Atmlf CA Ubr** **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default queuing option for unshaped connections of the UBR service category. This attribute controls whether common or per-VC queuing is used. A value of ***perVc*** means that each connection has its own buffering and queue limits. A value of ***common*** means that cells are queued in First In First Out order on a common queue for this service category. The common queue has one set of congestion control levels for all cells enqueued on it. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, if the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component

Copyright © 2006, Nortel Nortel Confidential

permits shaping for this interface, then this attribute may take any of the three values. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing. If the *perVcQueueInterfaces* attribute of the *Lp Eng Arc Cqc Ov* component does not permit shaping for this interface, then this attribute may take the values ***common***, or ***autoConfigure***. In this case, the value ***autoConfigure*** is interpreted to mean common queuing. An override to this default may be specified for a provisioned connection under the *Vcd Tm*, or *Vpd Tm* component. There is one common queue which is shared by the nrt-VBR, ABR, and UBR service categories.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmlrAtm*** cards, the value ***perVc*** is not supported since these cards do not support per-VC queuing. The value ***autoConfigure*** is interpreted to mean common queuing.

For ***4pOC12SmlrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmlrAtm*** cards, the value ***common*** is not supported since these cards do not support common queuing. The value ***autoConfigure*** is interpreted to mean per-VC queuing.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmlrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, if traffic shaping for this service category is disabled, this attribute may take any of the three values. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing. If traffic shaping for this service category is not disabled, the only permitted values are ***perVc*** and ***autoConfigure***. In this case, the value ***autoConfigure*** is interpreted to mean per-VC queuing.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, no more than 32,000 connections on the FP can use per-VC queuing. The remaining connections must use common queuing. The *Lp Eng Arc perVcQueueUsage* attribute indicates the number per-VC queues that are currently in use.

The value of the operational *opUnshapedTransmitQueueing* attribute of this component indicates whether the transmit queuing is ***perVc*** or ***common***.

Mib	AtmCore
Values	perVc common autoConfigure
Default	autoConfigure

ATTRIBUTE **Atmlf CA Ubr** **usageParameterControl (upc)**

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the default usage parameter control (UPC) option for connections of the UBR service category. This attribute is ignored if the *rxTrafficDescriptorType* indicates 1 or 2. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. A value of ***enforced*** means UPC is enforced for each connection. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*. A value of ***monitored*** means UPC conformance checking is performed, except, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on unchanged. A value of ***disabled*** means UPC is disabled on the receive path for all UBR connections. This attribute does not apply to basic VPTs, or standard *Vpt* VCCs. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported. This value has the same effect as ***disabled***. For ***1pOC48ChSmIrAtm*** cards, the value of this attribute must be ***disabled***.
Mib	AtmCore
Values	enforced disabled monitored
Default	disabled

ATTRIBUTE **Atmlf CA Ubr** **weightPolicy**

Access	Read and write
Criticality	Process
Description	This attribute specifies the policy which is applied when calculating the fairness weight for unshaped connections of the UBR service category. The fairness weight for a connection determines the relative amount of bandwidth which that connection obtains, compared to other connections in the same service category. Connections with equal weight get equal transmit opportunities. Connections with higher weights get more transmit opportunities compared with connections that have lower weights. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. The fairness weight for a connection is directly proportional to the value of one of the traffic descriptor parameters for that connection. This attribute

Copyright © 2006, Nortel Nortel Confidential

specifies which traffic descriptor parameter is used for connections of the UBR service category.

A value of ***mcr*** means the fairness weight is proportional to the default minimum cell rate (MCR) for UBR connections. If the default minimum cell rate is 0, all UBR connections get a minimum weight, which is 1.

A value of ***pcr*** means the fairness weight is proportional to the transmit peak cell rate (PCR) of a connection. Connections with a higher PCR have a higher fairness weight. Connections with *txTrafficDescType* 1 or 2 get a minimum weight, which is 1.

A value of ***ecr*** means the fairness weight is proportional to the equivalent cell rate (ECR) of a connection as calculated by connection admission control (CAC). Connections with a higher ECR have a higher fairness weight. Connections with an ECR of 0 get a minimum weight, which is 1.

The weight of a connection is visible in the *Vcc Tm, Vpc Tm,* or *Vpt Tm weight* attribute.

This attribute does not apply to basic VPTs and standard *Vpt* VCCs.

This attribute is ignored if the value of the *unshapedTransmitQueueing* attribute is ***common***.

This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards.

Mib — AtmCore

Values
mcr
pcr
ecr

Default — ecr

ATTRIBUTE Atmlf CA Ubr **forceTagging (tag)**

Access — Read and write

Criticality — Process

Description — This attribute specifies the default force tagging (CLP=1) value of all cells for all UBR connections. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component.

A value of ***enabled*** means CLP is set to 1 for all cells. This is in conformance with the ATM Forum TM4.0 UBR.2 service definition.

A value of ***disabled*** means CLP is unchanged for all cells. This is in conformance with the ATM Forum TM4.0 UBR.1 service definition.

Copyright © 2006, Nortel Nortel Confidential

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction.

This attribute does not apply to any type of *Vpt*.

This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards.

Mib	AtmCore
Values	enabled disabled
Default	disabled

ATTRIBUTE Atmlf CA Ubr **cdvt**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default cell delay variation tolerance (CDVT) for all connections of the UBR service category (including connections managed by a *Vpt CA*). An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. If Usage Parameter Control (UPC) is enabled for a connection, CDVT is used by the UPC function to decide whether a cell is conforming or non-conforming based on the connection's traffic descriptor type. The larger the CDVT value, the more tolerant is the UPC of bandwidth usage beyond the traffic contract.
Mib	AtmCore
Values	Decimal (1..1200000)
Units	microsec
Default	250

ATTRIBUTE Atmlf CA Ubr **holdingPriority (hpri)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the default holding priority which applies to SVP and SVC UBR connections. It takes a value from 0 (highest priority) to 4 (lowest priority). In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released.

Copyright © 2006, Nortel Nortel Confidential

This attribute does not apply to *Vpt* VCCs. When bandwidth fluctuates, the entire *Vpt* component, along with all *Vpt* VCCs is released as a unit, according to the *Vpt*'s *holdingPriority.*

Default: 3

ATTRIBUTE Atmlf CA Ubr txCellDiscardThreshold

Access: Read and write

Description: This attribute specifies the threshold for a minor alarm for discarded outgoing cells for UBR service category.

If the count of discarded outgoing UBR cells is greater than the provisioned value of this attribute in a 15 minute interval, the alarm is set.

While the alarm is set, if the count of discarded outgoing UBR cells is still greater than the provisioned value of this attribute in the subsequent 15

Copyright © 2006, Nortel Nortel Confidential

minute intervals, the alarm is not set again. If the count of discarded outgoing UBR cells drops below the provisioned value of this attribute in a 15 minute interval the alarm is cleared.

Provisioned value of '0' means discarded outgoing UBR cells are not monitored and no alarm is generated.

While the alarm is set, if the value of this attribute is changed, the alarm is cleared.

This attribute is not applicable for ***3pOC3MmAtm, 3pOC3SmAtm, 3pE3Atm, 3pDS3Atm, 3pE1Atm, 3pDS1Atm, 8pE1Atm, 8pDS1Atm*** and ***2pJ6MAtm*** cards.

This attribute is not applicable for ***4pOC12SmIrAtm*** and ***4pOC12SmLrAtm*** cards when channelized.

Mib — AtmCore

Values — Decimal (0..4294967295)

Default — 0

ATTRIBUTE Atmlf CA Ubr **rxCellDiscardThreshold**

Access — Read and write

Description — This attribute specifies the threshold for a minor alarm for discarded incoming cells for UBR service category.

If the count of discarded incoming UBR cells is greater than the provisioned value of this attribute in a 15 minute interval, the alarm is set.

While the alarm is set, if the count of discarded incoming UBR cells is still greater than the provisioned value of this attribute in the subsequent 15 minute intervals, the alarm is not set again. If the count of discarded incoming UBR cells drops below the provisioned value of this attribute in a 15 minute interval the alarm is cleared.

Provisioned value of '0' means discarded incoming UBR cells are not monitored and no alarm is generated.

While the alarm is set, if the value of this attribute is changed, the alarm is cleared.

This attribute is not applicable for ***3pOC3MmAtm, 3pOC3SmAtm, 3pE3Atm, 3pDS3Atm, 3pE1Atm, 3pDS1Atm, 8pE1Atm, 8pDS1Atm*** and ***2pJ6MAtm*** cards.

This attribute is not applicable for ***4pOC12SmIrAtm*** and ***4pOC12SmLrAtm*** cards when channelized.

Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Atmlf CA Ubr **epdOffset (epdO)**

Access	Read only
Description	This attribute indicates the Early Packet Discard (EPD) offset which is currently in use for this service category. The EPD offset is used to derive the EPD thresholds for each CC level. Any connection under this service category which requires the transmit Packet Wise Discard feature must specify a transmit queue limit which is at least 5.71 times this offset. This ensures that the derived Epd threshold will never be less than 17.5% of the transmit queue limit. If this is not done, txPacketWiseDiscard for the connection will be automatically disabled. The value of this EPD offset is specified in the *Lp Eng Arc Aqm Ov* component. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***1pOC48ChSmIrAtm***, ***16pOC3PosAtm***, and ***4pMRPosAtm*** cards, this attribute is not available and is filtered from the display.

VERB TRACE **AtmIf Vpc**

Impact: Service

Description:

TRACE AtmIf/n Vpc/vpi
TRACE -s -v -a -e AtmIf/n Vpc/vpi
TRACE -p AtmIf/n Vpc/vpi

This command traces the path of an intra-network segment of a connection. It displays the names of interface and connection components found along this segment of a connection path. The trace output also includes the *Virtual Path Terminator (VPT)* at the end of the path, should one exist.

The option for the OAM trace is as follows:

-p: Selects the Nortel Networks proprietary OAM Connection Management Trace instead of the proprietary OAM Legacy Loopback Trace. If no options are provided, the default configuration uses the Legacy Loopback Trace.

The options for the signaling trace are as follows:

-s: Selects the PNNI signaling call trace instead of the Nortel Networks proprietary OAM-based trace procedure. Option *-s* must be present if any one of options *-v, -a*, and *-e* are present. Otherwise, it defaults to the OAM-based trace procedure.

-v: Requests that vpi value should be collected along the trace. This option is only valid when the *-s* option is present.

-a: Requests that the call reference/end point reference values be collected along the trace. This option is only valid when the *-s* option is present.

-e: Used on point-to-multipoint connections to specify the end point reference value that indicates which party to trace. If no *-e* option is used for a point-to-multipoint connection, the default traces the path with the endpoint reference 0, which is the first party. This option is only valid when the *-s* option is present.

Only one connection trace is supported at a time. An error message is returned if a response from the network is not received within 30 seconds.

If the verb is issued with the *-s* option for the *Vpc/vpi* values that are not active or were not created by signaling (for example, control channels), the command is refused.

Copyright © 2006, Nortel Nortel Confidential

VERB CLEAR **Atmlf Vpc**

Impact	Service
Description	*CLEAR AtmIf/n Vpc/vpi* The *Clear* command applies to a dynamic *AtmIf/n Vpc/vpi* created for an SVP, or for the SVP segments of an SPVP. It does not apply to a provisioned *AtmIf/n Vpc/vpi*. This means that an SPVP can be cleared from its destination end or at any intermediate point, but not from the source end.

GROUP **Atmlf Vpc** **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmCore

ATTRIBUTE **Atmlf Vpc** **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmCore
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE **Atmlf Vpc** **operationalState (osiOper)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmCore
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vpc usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmCore
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpc Operational (Oper)

Properties	Operational
Description	This group contains operational information for a *Vcc, Vpc,* or *Vpt* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpc connectionPointType (cpt)

Access	Read only
Description	This attribute reflects the role of the connection component at this interface. A value of ***connectionEndPoint*** indicates that user cells, end-to-end OAM

Copyright © 2006, Nortel Nortel Confidential

cells, and segment OAM cells are processed by the connection component.

A value of ***segmentEndPoint*** indicates that user cells and end-to-end OAM cells are relayed by the connection component, while segment OAM cells are processed by the connection component.

A value of ***connectingPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are relayed by the connection component.

A value of ***unknown*** indicates that the connection component is inactive.

Mib	AtmCore
Values	connectionEndPoint segmentEndPoint connectingPoint unknown
Default	No default

GROUP Atmlf Vpc ConnectionInfo (ConnInfo)

Properties	Operational
Description	This group contains operational connection characteristics information for a *Vcc* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpc distributionType (distrbt)

Access	Read only
Description	This attribute indicates the way data is distributed in the connection. A value of ***pointToPoint*** indicates this connection point is part of a point-to-point connection. A value of ***pointToMultipoint*** indicates this connection point is part of a point-to-multipoint connection.
Mib	AtmCore
Values	pointToPoint pointToMultipoint
Default	pointToPoint

ATTRIBUTE Atmlf Vpc numLeaves (nlvs)

Access	Read only
Description	This attribute indicates the number of destination leaves of the connection. If the *distributionType* is ***pointToPoint*** the value of this attribute is 0.

ATTRIBUTE Atmlf Vpc callDirection (cdir)

Access	Read only
Description	This attribute indicates the direction of the call setup request for an SVC. A value of ***fromLink*** means that the call setup originated from the link. A value of ***toLink*** means that the call setup was directed to the link. For PVC connections, the value of this attribute is ***notApplicable.*** For SPVC connections, the value of this attribute is ***notApplicable*** for *Vccs* with the *SourcePVC* and *DestinationPVC* subcomponents. For Signaling channels, the value of this attribute is ***notApplicable***.
Mib	AtmCore
Values	fromLink toLink notApplicable
Default	notApplicable

GROUP Atmlf Vpc Status

Properties	Operational
Description	This group contains operational status information for a *Vcc, Vpc* or *Vpt* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpc operStatus (opStat)

Access	Read only
Description	This attribute indicates the present operational status of the *Vcc, Vpc* or *Vpt* component. Its value is dependent upon the current state of the *segLinkSideLoopbackState* and *endToEndLoopbackState* attributes. The value is ***end2endUp*** when the *endToEndLoopbackState* is ***good*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***end2endDown*** when the *endToEndLoopbackState* is ***bad*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***unknown*** and the *segLinkSideLoopbackState*

Default No default

ATTRIBUTE AtmIf Vpc localFailureCause

Access Read only

Description This attribute indicates the failure cause of the *Vcc, Vpc* or *Vpt* component. A value of ***noFailure*** indicates that there is currently no bandwidth related failure for this connection.

A value of ***portDown*** indicates that the interface corresponding to the parent *AtmIf* is down.

A value of ***localBwLoss*** indicates that the *AtmIf* has lost some, but not all bandwidth, and as a result, this connection has been released.

A value of ***notAdmitted*** indicates that this connection has failed to be admitted by the Connection Admission Control (CAC) algorithm.

A value of ***appNotRegistered*** indicates that there is no application registered to use this connection. This may be the case, for example when there is a *Vcc Test* application, but the test has not been started. Check the status of the application to determine why it is not functional.

A value of ***disabledByApp*** indicates that the application using this connection has requested that the connection be disabled. An example is a connection used by a trunk application where the trunk has timed out on an attempt to stage. Check the application to determine why it is not fully functional.

A value of ***bwReduced*** indicates that this connection is operating in a reduced bandwidth state. It is a bandwidth elastic connection which

Copyright © 2006, Nortel Nortel Confidential

currently has been allocated less than the requested (equivalent) bandwidth.

A value of ***vpDown*** indicates that this connection has been notified of a fault detected at the associated VP-layer. A value of ***vpDown*** is applicable for *Vpt Vcc*s only.

Mib	AtmCore
Values	noFailure localBwLoss portDown notAdmitted appNotRegistered disabledByApp bwReduced vpDown
Default	No default

ATTRIBUTE Atmlf Vpc troubled

Access	Read only
Description	This attribute indicates whether or not the connection is in a troubled state. Connections become troubled because of OAM failures; when one of the attributes *segLinkSideLoopbackState*, *segSwitchSideLoopbackState*, *endToEndLoopbackState*, *aisState* (when receiving AIS cells only) or *rdiState* go bad, this attribute is set to ***yes***; otherwise it is set to ***no***.
Mib	AtmCore
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpc segLinkSideLoopbackState (segLkLbkState)

Access	Read only
Description	This attribute contains the current state of the link-side segment loopback for this connection. Link-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the link (port). The value of this attribute is dependent upon the current setting of the *segLinkSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable). The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***.

Copyright © 2006, Nortel Nortel Confidential

The value is ***good*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the segment link side loopback is working.

The value is ***bad*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the link side segment loopback is not working.

The value is ***unknown*** when the *segLinkSideLoopback* is ***off***.

The value is ***unknown*** when the value of the *segLinkSideLoopback* attribute is ***on***, the *connectionPointType* attribute is set to ***segmentEndPoint*** or ***connectionEndPoint***, and the segment link side loopback has not yet been determined.

The state of this attribute determines, in part, the value of the *operStatus* attribute.

ATTRIBUTE Atmlf Vpc **segSwitchSideLoopbackState (segSwLbkState)**

Access — Read only

Description — This attribute contains the current state of the switch-side segment loopback for this connection. Switch-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the bus. The value of this attribute is dependent upon the current setting of the *segSwitchSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable).

The value is only applicable when the *connectionPointType* is a ***segmentEndPoint***.

The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or ***connectionEndPoint***.

The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***.

The value is ***good*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback is working.

The value is ***bad*** when the *segSwitchSideLoopback* is ***on***, the

ATTRIBUTE Atmlf Vpc endToEndLoopbackState (eeLbkState)

Access: Read only

Description: This attribute contains the current state of the end-to-end loopback for this connection. Its value is dependent upon the current setting of the *endToEndLoopback* provisionable attribute and the connection point type as specified by the *connectionPointType* attribute.

The value is only applicable when the *connectionPointType* is a ***connectionEndPoint***.

The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or s***egmentEndPoint***.

The value is ***notApplicable*** when the *distributionType* is a ***pointToMultipoint***.

The value is ***good*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is working.

The value is ***bad*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is not working.

The value is ***unknown*** when the *endToEndLoopback* is ***off***.

The value is ***unknown*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback status has not been determined.

The state of this attribute determines, in part, the value of the *operStatus* attribute.

ATTRIBUTE Atmlf Vpc rxOamCellCongestionState (rxOamCongState)

Access	Read only
Description	This attribute contains the current state of the receive side OAM cell congestion for this connection. Its value reflects whether the rate of received OAM cells for this connection is below a specified threshold. The connection maintains a count of the number of OAM cells which are terminated per second. Once that count exceeds the specified threshold, extraction of all OAM cells for this connection is disabled for a period of one minute. This is a congestion management mechanism to prevent the processor from being overloaded with handling OAM cells for a particular connection. This mechanism ensures that tasks, such as trunks obtain enough processor cycles to remain in service, and are not adversely affected by excessive rate of OAM cells on a particular connection. The value is ***good*** when the rate of received OAM cells is less than the allowed threshold. The value is ***bad*** when the arrival rate has exceeded the allowed threshold. It remains ***bad*** for one minute, before returning to ***good*** again. During this timeout, extraction of all OAM cells is disabled for this connection. As a result, other loopback failure conditions may occur. The value is ***unknown*** when the application has not yet begun to use this connection. An example is the *Test* component before a test has been started. Each type of OAM cell is counted separately. The threshold for AIS cells is three cells per second. If more than three AIS cells are received within a one second interval, this attribute is set to ***bad***. The threshold for RDI cells and each loopback type is also three, but the threshold for trace cells is 250 per second. The state of this attribute has no direct effect on the value of the *operStatus* attribute or on the number of troubled connections.

ATTRIBUTE Atmlf Vpc rxUpcViolationOnEnforcer1 (rxEnforcer1)

Access Read only

Description This attribute counts the number of UPC violations observed by the Generic Cell Rate Algorithm (GCRA) Enforcer 1. This attribute is only applicable if UPC is enforced or monitored on the connection.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, and ***1pOC48ChSmIrAtm*** cards, this attribute is not applicable and is not displayed.

When the value of the *rxTrafficDescType* attribute for this connection is 3, 4, 5, 6, 7, 8, or 9 (for UBR with MDCR connections) Enforcer 1 enforces conformance of traffic received from the interface to PCR CLP0+1.

When the value of the *rxTrafficDescType* attribute for this connection is 9 (for ABR connections), Enforcer 1 performs the Dynamic Generic Cell Rate Algorithm (DGCRA) used for the Available Bit Rate (ABR) service category.

If UPC is enforced all non-conforming cells are discarded by this enforcer. These discarded cells are included in the *rxCellDiscard* attribute.

For basic *Vpt*s, this attribute provides an aggregated total of all *rxUpcViolationOnEnforcer1* values for all *Vcc*s associated with the *Vpt*. This attribute is not applicable for standard *Vpt Vcc*s.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

ATTRIBUTE Atmlf Vpc rxUpcViolationOnEnforcer2 (rxEnforcer2)

Access Read only

Description This attribute counts the number of UPC violations observed by the Generic Cell Rate Algorithm (GCRA) Enforcer 2. This attribute is only

Copyright © 2006, Nortel Nortel Confidential

applicable if UPC is enforced or monitored on the connection.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, and ***1pOC48ChSmIrAtm*** cards, this attribute is not applicable and is not displayed.

This attribute is only applicable if the value of the *rxTrafficDescType* attribute for this connection is 4, 5, 6, 7, or 8.

When the value of the *rxTrafficDescType* attribute is 4, or 5**,** Enforcer 2 enforces conformance of traffic received from the interface to PCR CLP0.

When the value of the *rxTrafficDescType* attribute is 6**,** Enforcer 2 enforces conformance of traffic received from the interface to SCR CLP0+1.

When the value of the *rxTrafficDescType* attribute is 7, or 8, Enforcer 2 enforces conformance of traffic received from the interface to SCR CLP0.

If UPC is enforced, Enforcer 2 discards non-conforming cells for *rxTrafficDescType* values of 4, 6, and 7. It tags non-conforming cells for *rxTrafficDescType* values of 5, and 8. Discarded cells are counted in the rxCellDiscard attribute.

For basic *Vpt*s, this attribute provides an aggregated total of all *rxUpcViolationOnEnforcer2* values for all *Vcc*s associated with the *Vpt*. This attribute is not applicable for standard *Vpt Vcc*s.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

ATTRIBUTE Atmlf Vpc rxAal5FrameError (rxfer)

Access	Read only
Description	This attribute counts the number of frames received from the interface on this connection that have AAL5 length errors or AAL5 CRC errors. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed. AAL5 length or CRC errors typically occur because of cell discards due to congestion, UPC, or due to corruption of data between the AAL5 segmentation and reassembly end points.

Copyright © 2006, Nortel Nortel Confidential

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameError* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpc **rxAal5FrameAbort (rxfa)**

Access	Read only

Description

This attribute counts the number of frames received from the interface on this connection that have the AAL5 length field set to zero.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed.

An AAL5 length of zero is an indication by the far end segmentation point, to this reassembly point, that the frame is to be discarded without reassembly. This mechanism is typically used by a segmentation point if it detects an error in a frame after some of the cells belonging to that frame have already been transmitted.

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameAbort* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

GROUP Atmlf Vpc Performance (Perf)

Properties	Operational
Description	This group contains operational attributes which keep performance statistics about the behavior of the connection.
Mib	AtmCore

ATTRIBUTE Atmlf Vpc lastMinimumCtd (lastminctd)

Access	Read only
Description	This attribute indicates the minimum calculated cell transfer delay value for this connection from the previous TODA (time of day accounting) interval if TODA is enabled; or for the previous 12 hour interval if TODA is disabled. Cell transfer delay is calculated as half of the measured segment round trip delay of a loopback cell. The value is ***noMeasurement*** when the *ctdCalculation* attribute of the *AtmIf* component is ***off***. The value is ***noMeasurement*** when the *accountCollection* attribute of the *AtmIf Uni* or *AtmIf Iisp* component has a non-empty reason. The value is ***noMeasurement*** when the *segSwitchSideLoopback* attribute value is ***off*** for the connection. The value is ***noMeasurement*** when the switch-side loopback is not working. The value is ***noMeasurement*** when the switch-side loopback status cannot be determined.
Mib	AtmCore

GROUP AtmIf Vpc Vpd Loopback (Lbk)

Properties	Provisioned
Description	This group contains the provisionable loopback attributes for a *Vcc, Vpc,* or *Vpt* component. Note that certain loopback requests may not be possible on a given connection. In such cases, the corresponding operational loopback attribute in the *Status* group of the *Vcc, Vpc,* or *Vpt* component indicates ***notApplicable*** and the requested loopback is not performed. If loopbacks are provisioned to be on, and for any reason the segment or end-to-end OAM loopback cells are not relayed, the connection component becomes troubled, and user cell traffic may be discarded. If loopbacks are provisioned to be on, all of the nodes in the segment, and external networks which are in the end-to-end connection must relay the OAM loopback cells.
Mib	AtmCore

ATTRIBUTE AtmIf Vpc Vpd segLinkSideLoopback (segLkLbk)

Access	Read and write
Description	This attribute specifies whether link-side segment loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the link-side segment loopback insertion for the connection is based on the *segLinkSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has link-side segment loopback insertion turned on, then link-side segment loopback insertion is also on for the connection. A value of ***on***, or ***off*** means link-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component. Note that link-side segment loopback insertion is not possible if the value

Copyright © 2006, Nortel Nortel Confidential

of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***. Link-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint***. In such cases, the operational *segLinkSideLoopbackState* attribute indicates ***notApplicable*** and link-side segment loopback insertion is not performed.

Link-side segment loopback insertion is always possible on a *Vpt*.

Mib: AtmCore

Values:
on

ATTRIBUTE AtmIf Vpc Vpd Tm fwdQosClass (fwdQos)

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for the forward direction for this connection. This attribute is only used for SPVC connections.

Copyright © 2006, Nortel Nortel Confidential

Class 1 supports a QOS that meets Service Class A performance requirements (circuit emulation, constant bit rate video).

Class 2 supports a QOS that meets Service Class B performance requirements (variable bit rate audio and video).

Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class 0 is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Mib	AtmCore
Values	0 1 2 3 4
Default	0

ATTRIBUTE **Atmlf Vpc Vpd Tm txQueueLimit (txQlim)**

Access	Read and write
Criticality	Component
Description	This attribute specifies an override to the default transmit queue limit for this connection. A value of ***sameAsCa*** means that the default common or per-VC transmit queue limit, as defined by the CA service category, is used for this connection. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***sameAsCa*** must be specified. A value from 5 to 512,000 means that the connection transmit queue limit differs from the default common or per-VC transmit queue limit, as defined by the CA service category. A value other than ***sameAsCa*** is ignored for connections where common queuing is specified for the service category. For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the per-VC utilization limit of the service category common queue. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from 5 to 512000 inclusive. For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

Copyright © 2006, Nortel Nortel Confidential

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

On all other cards, the valid range for this attribute is from 5 to 63488 inclusive.

The actual transmit queue limit for a connection is visible in the *Vcc Tm*, *Vpc Tm* or *Vpt txQueueThresholds* attribute.

This attribute is not applicable for basic *Vpt*s.

Mib	AtmCore
Values	Decimal (5..1011840) sameAsCa
Units	cells
Default	sameAsCa

ATTRIBUTE **AtmIf Vpc Vpd Tm** **holdingPriority (hpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. The default holding priority for a provisioned connection is higher then default holding priorities for dynamic (SVC) connections. The value of this attribute may be overridden by certain applications, for example *Vcc Test*, which use this connection. This attribute is not applicable for *Vpt Vcc*s.
Mib	AtmCore
Values	0 1 2 3 4
Default	2

ATTRIBUTE **AtmIf Vpc Vpd Tm** **rxTrafficDescType (rxTdt)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the type of traffic management which is applied to the receive direction of this connection as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute. The value ***sameAsTx*** means the *rxTrafficDescType* as well as the *rxTrafficDescParm* attribute values are taken from the values of the *txTrafficDescType* and *txTrafficDescParm* attributes.
Mib	AtmCore
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE **Atmlf Vpc Vpd Tm** **bwdQosClass (bwdQos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for the backward direction for this connection. This attribute is only used for SPVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified bit rate QOS class; no objective is specified for the performance parameters. The ***sameAsFwd*** selection sets the backward quality of service to be the same as the forward quality of service.
Mib	AtmCore

Copyright © 2006, Nortel Nortel Confidential

Values	0 1 2 3 4 sameAsFwd
Default	sameAsFwd

ATTRIBUTE **AtmIf Vpc Vpd Tm** **atmServiceCategory (service)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The value ***derivedFromBBC*** may only be used if the *Src* or *Dst* component is provisioned under this connection. Otherwise a specific ATM service category must be specified. A value of ***derivedFromBBC*** means the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. A value other than ***derivedFromBBC*** means the value of this attribute is used to override the provisioned BBC Information Element parameters. In this case, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. The ***rtVariableBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real-time VBR service may support statistical multiplexing of real-time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non real-time VBR service may support statistical multiplexing of

Copyright © 2006, Nortel Nortel Confidential

connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non real-time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

ATTRIBUTE Atmlf Vpc Vpd Tm **trafficShaping (trShaping)**

Access — Read and write

Criticality — Component

Description

This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.

This attribute is ignored if the *atmServiceCategory* is ***availableBitRate***.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, traffic shaping is not available, therefore this attribute is ignored.

A value of ***sameAsCa*** means traffic shaping for the connection is based on the value of the *trafficShaping* attribute of the connection's service category component under the *CA.* If the service category has *trafficShaping* set to ***enabled*** or ***inverseUpc***, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm, Vpc Tm,* or *Vpt Tm* components.

A value of ***disabled*** means traffic shaping for this connection is disabled

Copyright © 2006, Nortel Nortel Confidential

regardless of the provisioning of the connection's service category component.

Mib	AtmCore
Values	disabled sameAsCa
Default	sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the transmit queuing method for this connection if it is unshaped. The two possible methods are per-VC queuing and common queuing. This attribute does not apply if the connection is shaped. A value of ***sameAsCa*** means the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *CA*. A value of ***common*** means transmit traffic on this unshaped connection is destined for the common queue. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, ***1pOC48ChSmIrAtm***, and ***4pMRPosAtm*** cards, this attribute must have the value ***sameAsCa***. This attribute is ignored in the following situations: - if the connection has *trafficShaping* ***enabled*** or ***inverseUpc***, or - if the *atmServiceCategory* is ***availableBitRate***, or - if the *atmServiceCategory* is ***constantBitRate***, or - for basic *Vpt*s and standard *Vpt Vcc*s.
Mib	AtmCore
Values	common sameAsCa
Default	sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm **weight**

Access	Read and write
Criticality	Component
Description	This attribute specifies an override for the weight of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, and basic *Vpt*s.

Copyright © 2006, Nortel Nortel Confidential

A value of ***sameAsCa*** means the weight is determined by the *weightPolicy* attribute under the *CA* service category component for all but standard *Vpt Vcc*s. For standard *Vpt Vcc*s, the weight is determined by the *Vcc*'s service category, when the value is set to ***sameAsCa***.

A value from 1 to 4095 means that value is used for the fairness weight of this connection relative to other connections. For all but standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the *Vpt*.

A value of ***upToQueueLimit*** means the fairness weight is limited only by the *txQueueLimit*.

This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, the value ***upToQueueLimit*** is not permitted.

Mib	AtmCore
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa

ATTRIBUTE **Atmlf Vpc Vpd Tm** **forceTagging (tagging)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether force tagging of the CLP bit is enforced for cells of this connection. Force tagging can be enabled for permanent connections of any service category and on switched connections of UBR service category. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards, and for *Vpt*s, this attribute is not applicable and is ignored. A value of ***sameAsCa*** means the force tagging functionality is determined by the *forceTagging* attribute under the *CA* service category component.

Copyright © 2006, Nortel Nortel Confidential

A value of ***enabled*** means force tagging is enabled. When this option is selected, the CLP bit is set to 1 for all cells on the connection.

A value of ***disabled*** means force tagging is disabled. When this option is selected, the CLP bit is unchanged for cells on the connection.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction. In this case, cells which are tagged are counted in the *txCellClp* attribute.

Mib	AtmCore
Values	sameAsCa enabled disabled
Default	sameAsCa

ATTRIBUTE **AtmIf Vpc Vpd Tm** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enables usage parameter control (UPC) when receiving traffic from the ATM interface. The value ***sameAsCa*** means UPC for the connection is based on the value of the *usageParameterControl* attribute of the service category component under the *AtmIf CA.* If the service category has UPC ***enforced*** or ***monitored***, then UPC is enabled on the connection. The value ***disabled*** means UPC for this connection is disabled regardless of the provisioning of the service category. The value ***enforced*** means UPC for this connection is enforced regardless of the provisioning of the service category. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*. The value ***monitored*** means UPC for this connection is monitored regardless of the provisioning of the service category. When UPC is monitored, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on unchanged. Note that setting UPC to ***enforced*** or ***monitored*** may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc, Vpc,* and *Vpt* components. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***,

Copyright © 2006, Nortel Nortel Confidential

3pDS1Atm, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported.

For ***1pOC48ChSmIrAtm*** cards, the values ***enforced***, and ***monitored***, are not supported.

ATTRIBUTE Atmlf Vpc Vpd Tm **bearerClassBbc (bcBbc)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the bearer capability. This attribute is only used for SPVC and SPVP connections. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***) and timing requirements are user defined (that is, transparent to the network).When ***x*** is set the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class **vp** service is used to specify a transparent VP service. When the value of this attribute is vp, the user is requesting an ATM only service

Copyright © 2006, Nortel Nortel Confidential

from the network. In this case, the network shall not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except or VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP connections.

ATTRIBUTE **AtmIf Vpc Vpd Tm** **transferCapabilityBbc (tcBbc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> 0: NoIndication, NoIndication 1: NoIndication, yes 2: NoIndication, no 5: CBR, yes 8: VBR, NoIndication 9: VBR, yes 10: VBR, no The value ***notApplicable*** specifies that the user does not want to specify the transfer capability. The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data. The value no indication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing. The value yes for end-to-end timing indicates that end-to-end timing is required. The value no for end-to-end timing indicates that end-to-end timing is not required. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the

Copyright © 2006, Nortel Nortel Confidential

atmServiceCategory. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Vpc Vpd Tm txWredThreshold

Access: Read and write

Criticality: Component

Description

This attribute specifies the threshold for weighted random early detection (WRED). This threshold is calculated as a percentage of the early packet discard (EPD) threshold, which is 85% of the transmit queue length. When the value is ***25%***, WRED starts as soon as the queue is 25% of the way to the EPD threshold. When the value is ***50%***, WRED starts later, after the queue is 50% of the way to the EPD threshold. When the value is ***75%***, WRED starts only when the queue is 75% of the way to the EPD threshold.

This attribute is ignored if the value of the *txWredMode* or *txPacketWiseDiscard* attributes is ***disabled.***

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

ATTRIBUTE **AtmIf Vpc Vpd Tm** **txPacketWiseDiscard (txpd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the transmit data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s.

Copyright © 2006, Nortel Nortel Confidential

Packet-wise functions increase the “goodput” of the link. The transmit packet-wise functions are Early Packet Discard (EPD) and Partial Packet Discard (PPD).

EPD allows the connection to discard an entire frame once the transmit queue has reached the EPD threshold. EPD increases the “goodput” of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell.

PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the packet-wise discard functions are PPD and EPD. PPD is applicable at cell-transfer points. PPD is not applicable at frame-to-cell conversion points, and is not applicable for *Vpc*s. PPD is configured by this attribute. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded. EPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Both PPD and EPD are controlled by this attribute. This attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply

Copyright © 2006, Nortel Nortel Confidential

to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. This attribute may safely be set to ***enabled*** for VCCs since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

A value of ***enabled*** means packet-wise discard functions are applied to transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the backward direction. When this attribute is set to ***disabled***, backward frame discard is not requested in the SPVC call setup.

The transmit packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute.

Mib	AtmCore
Values	disabled enabled
Default	disabled

ATTRIBUTE **AtmIf Vpc Vpd Tm** **rxPacketWiseDiscard (rxpd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the receive data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s. Packet-wise functions increase the “goodput” of the link. The receive packet-wise function is Partial Packet Discard (PPD). PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted. For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD is available at all VCC connection points where UPC may be activated. PPD is not applicable for *Vpcs*. Packet-wise discards should only be enabled for

Copyright © 2006, Nortel Nortel Confidential

connections carrying AAL5 segmentation traffic. Setting the value to ***enabled*** for any other traffic type may result in traffic being discarded. PPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, this attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***1pOC48ChSmIrAtm*** cards, this attribute may safely be set to ***enabled*** for VCCs, since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. A value of ***enabled*** for the *rxPacketWiseDiscard* attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in enabling packet-wise discard functions on these cards. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

A value of ***enabled*** means packet-wise discard functions are applied to receive traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward direction. When this attribute is set to ***disabled***, forward frame discard is not requested in the SPVC call setup.

The receive packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm rxPacketWiseDiscard* operational attribute.

ATTRIBUTE Atmlf Vpc Vpd Tm **txWredMode**

Access	Read and write
Criticality	Component
Description	This attribute specifies the activation of weighted random early detection (WRED) functionality. WRED is considered a packet-wise discard function and as such applies only to AAL5 frame traffic. WRED is applied in the transmit direction for this connection. WRED function should be enabled only for connections which are transferring TCP/IP traffic. WRED acts to prevent synchronization of multiple TCP/IP sources by randomly discarding a small percentage of frames when transmit queue congestion reaches the designated level. WRED may also be used to differentiate service on VCC's by preferentially discarding one VCC before another. Discards start at 0% of cells, when the queue is part-way to the Early Packet Discard (EPD) threshold, and rise to 100% of cells discarded at the EPD threshold. WRED discards all the cells in a frame. A value of ***enabled*** means WRED is enabled for all applications linked to the given *Vcc*. A value of ***perFlow*** means each TCP application has individual control over whether to enable or disable WRED. If the value of the *txPacketWiseDiscard* attribute is ***disabled***, or if the value of this attribute is ***disabled***, WRED functionality is disabled. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, the value of this attribute must be ***disabled***. If WRED is active, it is visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute. This attribute is not applicable for *Vpt*s or *Vpt Vcc*s.
Mib	AtmCore
Values	disabled enabled perFlow
Default	disabled

ATTRIBUTE Atmlf Vpc Vpd Tm **abrConnectionType (abrType)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the type of ABR behavior which is to be enforced at this connection. This attribute is only applicable if the value of the

Copyright © 2006, Nortel Nortel Confidential

atmServiceCategory attribute is ***availableBitRate***. If the value of the *atmServicecategory* attribute is not ***availableBitRate***, this attribute is ignored.

The value ***sameAsCa*** is used to request the default behavior as specified in the *CA Abr* component for this *Vcc*. Otherwise, this attribute overrides the default behavior.

The value ***virtualSourceDest*** is used to request that this connection point function as a virtual source/virtual destination.

The value ***sourceDest*** requires that this connection point function as a S/D for RM cells. S/D mode is automatically invoked at this connection point either if this is a connection end point, or if the next hop connection point is configured as ***nonAbrInterworking***.

The value ***nonAbrInterworking*** is used to request that this connection point function as an interworking between ABR and non-ABR service categories. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.

The value ***abrSwitch*** is used to request ABR switch behavior for this connection point. The ABR switch behavior is first, to conform to ***virtualSourceDest*** or ***nonAbrInterworking*** setting on the next hop, and otherwise to implement ABR ER switch behavior.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the only allowable values are ***sameAsCa***, ***nonAbrInterworking*** or ***abrSwitch***. If ***abrSwitch*** is selected, EFCI marking behavior is implemented.

For ***1pOC12SmLrAtm*** cards, the only allowable values are ***sameAsCa*** or ***abrSwitch.*** If ***abrSwitch*** is selected, EFCI marking behavior is implemented.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the only allowable value is ***sameAsCa***.

The actual ABR functionality which is in effect is visible in the *Vcc/Vpc/Vpt Tm abrConnectionType* operational attribute.

ATTRIBUTE **AtmIf Vpc Vpd Tm** **txTrafficDescParm (txTdp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR, MCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *txTrafficDescType* is 1 or 2, all of the parameters must be set to zero. When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or

Copyright © 2006, Nortel Nortel Confidential

equal to parameter 2.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 4 and parameter 5 represent are not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may be optionally zero.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate. When the *atmServiceCategory* is ***availableBitRate*** (ABR), the shaping rate is dynamically chosen, based on the ABR flow control mechanism, as a value between the MCR and the PCR or the requested shaping rate if applicable.

For *txTrafficDescType* 3, 4 and 5, the transmit traffic is shaped at the next available shaping rate less than the PCR.

For *txTrafficDescType* 6, 7 and 8 if linear traffic shaping is selected, the transmit traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

For *txTrafficDescType* 3 ,4,5,6,7 and 8, with ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, parameter 4 must be less than or equal to 643,000.

For *txTrafficDescType* 6, 7 and 8 if inverse-UPC traffic shaping is selected, the transmit traffic is shaped at a variable rate which conforms to the PCR, SCR and MBS of the connection traffic descriptor.

ATTRIBUTE Atmlf Vpc Vpd Tm **rxTrafficDescParm (rxTdp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. If the value of the *rxTrafficDescType* attribute is ***sameAsTx***, the values provisioned in this attribute are ignored. The traffic parameters for the receive direction are taken from the *txTrafficDescParm* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), and Minimum Cell Rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. The value of CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for usage parameter control (UPC). When *rxTrafficDescType* is 1 or 2, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2. When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to

Copyright © 2006, Nortel Nortel Confidential

0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameter 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

If the value of CDVT either in parameter 2 or in parameter 4 is zero, the CDVT is taken from the *CA* defaults for the particular *atmServiceCategory* of this connection.

Parameter 5 of the *rxTrafficDescParm* is always unused.

When *rxTrafficDescriptorType* is 3 through 8, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware. The *check prov* command detects such cases and generates an error message. If this happens, adjust the parameters until they fall within the supported limits.
To calculate the limits, use the following formulae:
I1 = 1,000,000,000 / PCR
L1 = CDVT * 1000
I2 = 1,000,000,000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is 6 through 8.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, I1 and I2 must be less than or equal to 335,523,840. I1 + L1 must be less than or equal to 1,342,156,800. I2 + L2 must be less than or equal to 1,342,156,800. If the values of I1, L1, I2 or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41,940,480 or
I2 > 41,940,480 or
I1 + L1 > 167,769,600 or
I2 + L2 > 167,769,600
then both I1 and I2 must be greater than 20,480.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, L2 must be less than or equal to 2,674,011,406.

Copyright © 2006, Nortel Nortel Confidential

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, L2 must be less than or equal to 17,179,869,180.

ATTRIBUTE Atmlf Vpc Vpd Tm fwdQosParameters (fqp)

Access	Read and write
Criticality	Component
Description	This attribute is a vector of three elements that specify the quality of service parameters for the forward direction for this connection. This attribute is used for SPVC connections. The *cdv* element specifies the acceptable peak-to-peak Cell Delay Variation (CDV) of real-time connections (CBR and rt-VBR). It is signaled through the extended QoS information element. For nrt-VBR and UBR the CDV is irrelevant, and its value is forced to the default. The *ctd* specifies the acceptable maximum Cell Transfer Delay (maxCtd) of real-time connections (CBR and rt-VBR). It is signaled through the end to end transit delay information element. For nrt-VBR and UBR the CTD is irrelevant, and its value is forced to the default. The *clr* specifies the acceptable Cell Loss Ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections. It is signaled through the extended QoS information element. For UBR the CLR is irrelevant, and its value is forced to the default.

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **initialCellRate (icr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. The value ***sameAsCa*** means the initial cell rate is determined by the *AtmIf CA Abr*/0 *icr* attribute. The value ***useMcr*** means ICR is set to the same value as the Minimum Cell Rate (MCR) for the connection. The value ***usePcr*** means ICR is set to the same value as the Peak Cell Rate (PCR) for the connection. If the value is less than the MCR of the connection, then the MCR is used as the ICR. If the value is more than PCR of the connection, then PCR is used as the ICR. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..16777215) sameAsCa useMcr usePcr
Units	cell/s
Default	sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **transientBufferExposure (tbe)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the source to send during start-up periods, before the first Resource Management (RM) cell returns. TBE divided by *fixedRoundTripTime* determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. TBE divided by *maxCellsPerRmCell* specifies the operational value of *forwardRmCellLimit*, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received

Copyright © 2006, Nortel Nortel Confidential

backward RM cells.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* is set to ***erSwitch***.

Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	16777215

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **fixedRoundTripTime (frtt)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. The value of *transientBufferExposure* divided by the value of FRTT (in seconds) determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec
Default	5000000

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **rateDecreaseFactor (rdf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

Copyright © 2006, Nortel Nortel Confidential

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib: AtmCore

Values: Decimal (0..15)
sameAsCa

Default: sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **rateIncreaseFactor (rif)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64.

RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib: AtmCore

Values: Decimal (0..15)
sameAsCa

Default: sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **maxCellPerRmCell (nrm)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell.

A value of 2 is not recommended although it is permitted according to the ATM Forum standard. When this attribute is set to a value of 2, it is possible that only one forward and one backward RM cell are repeatedly transmitted, and all data traffic is queued up indefinitely.

Copyright © 2006, Nortel Nortel Confidential

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib: AtmCore

Values: Decimal (2; 4; 8; 16; 32; 64; 128; 256)
sameAsCa

Units: cells

Default: sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **maxTimeBetweenRmCells (trm)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the TRM parameter for this connection.

TRM provides an lower bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least two other cells have been sent, then the next cell to be transmitted would be a forward RM cell.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

The provisioned value of 781 is signaled as TRM = 0, in the ABR Additional Parameters Information Element.
1563 is signaled as TRM = 1.
3125 is signaled as TRM = 2.
6250 is signaled as TRM = 3.
12500 is signaled as TRM = 4
25000 is signaled as TRM = 5.
50000 is signaled as TRM = 6.
100000 is signaled as TRM = 7.

Mib: AtmCore

Values: Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)
sameAsCa

Units: microsec

Default: sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **cutoffDecreaseFactor (cdf)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is

Copyright © 2006, Nortel Nortel Confidential

computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero.

CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the CRM parameter, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

The value of CRM is indicated by the *forwardRmCellLimit* attribute.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.

Mib	AtmCore

Default	sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **acrDecreaseTimeFactor (adtf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection. ADTF is the maximum time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..1023) sameAsCa
Units	centiseconds
Default	sameAsCa

ATTRIBUTE Atmlf Vpc Vpd Tm Abr **dgcraMaximumDelay (dgcraMaxDelay)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies an upper bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward direction). This upper bound may be approximated as the sum of the round trip fixed and propagation delays and the maximum queuing delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When there is a reduction in the Allowed Cell Rate (ACR), the policer waits for a correspondingly longer period of time before it enforces at the new cell rate. The value of this attribute must not be less than the *dgcraMinimumDelay* attribute.
Mib	AtmCore
Values	Decimal (1..16700000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE **Atmlf Vpc Vpd Tm Abr** **dgcraMinimumDelay (dgcraMinDelay)**

Access	Read and write
Criticality	Component
Description	This attribute specifies a lower bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward connection). This lower bound may be approximated as the sum of the round trip fixed and propagation delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A smaller value for this attribute implies a more lenient policer. When there is a increase in the Allowed Cell Rate (ACR), the policer waits for a correspondingly shorter period of time before it enforces at the new cell rate.

Default	sameAsInterface

ATTRIBUTE Atmlf Vpc Nrp **bandwidthElastic (bwElastic)**

Access	Read and write
Criticality	Component
Description	This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the *bandwidthReduction* attribute. A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Nrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid. A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority*.
Mib	AtmBearerService
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpc Nrp **overrideHoldingPriority (ohpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used.

Description	This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmNetworking
Values	String (0..8, ASCII)
Default	No default

GROUP Atmlf Vpc Src **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpc Src **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vpc Src **operationalState (osiOper)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmNetworking
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vpc Src usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmNetworking
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpc Src CallRedirectionOper (RedirectOp)

Properties	Operational
Description	This group contains the operational attributes associated with the *CallRedirection* subcomponent.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpc Src currentDestination

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current destination of the soft PVC or soft PVP. A ***notConnected*** status indicates that the connection is not established. A ***primary*** status indicates that the connection is established to the remote destination specified by *calledAddress* and *calledVpiVci/calledVpi* attributes under *Atmif Vcc Src* or *Atmif Vpc Src* or *Atmif Vpt Vcc Src* Component. A ***secondary*** status indicates that the connection is established to the remote destination specified by *secondaryCalledAddress* and *secondaryCalledVpiVci/secondaryCalledVpi* attributes under *Atmif Vcc Src CallRedirection* or *Atmif Vpc Src CallRedirection* or *Atmif Vpt Vcc Src CallRedirection* Component.
Mib	AtmNetworking
Values	notConnected primary secondary
Default	No default

ATTRIBUTE Atmif Vpc Src **primaryAdminState**

Access	Read: All Write: Illegal
Description	This attribute indicates the OSI Administrative State of the primary destination. The value ***locked*** indicates that the primary destination is precluded from call setup attempts. The value ***unlocked*** indicates that the primary destination is considered in call setup attempts.
Mib	AtmNetworking
Values	locked unlocked
Default	No default

ATTRIBUTE Atmif Vpc Src **secondaryAdminState**

Access	Read: All Write: Illegal
Description	This attribute indicates the OSI Administrative State of the secondary destination. The value ***locked*** indicates that the secondary destination is precluded from call setup attempts. The value ***unlocked*** indicates that the secondary destination is considered in call setup attempts.
Mib	AtmNetworking
Values	locked unlocked

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Vpc Src lastSecondaryFailureCauseCode

Access	Read: All Write: Illegal
Description	This attribute indicates the cause code value of the last signalling message to the secondary destination which contained the CAUSE information element. If there has been no previous failure, the value for this attribute is 0.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpc Src lastSecondaryFailureDiagCode

Access	Read: All Write: Illegal
Description	This attribute indicates the diagnostic code associated with the *lastSecondaryFailureCauseCode* attribute. If the diagnostic code was not provided with that CAUSE information element or if there has been no previous failure, this attribute is empty.
Mib	AtmNetworking
Values	String (0..8, ASCII)
Default	No default

COMPONENT Atmlf Vpc Src CallRedirection (Redirect)

Groups	GROUP Atmlf Vpc Src Redirect Provisioned (Prov)
Scope	Device
Description	*Atmif/n Vpc/vpi SrcPvp CallRedirection* This component represents the secondary destination information for the source end of a soft PVP. The addition of this subcomponent is not critical to the parent SPVP. Deletion of this subcomponent or changes to its attributes will impact service of the SPVP if it is established to the secondary destination.
Mib	AtmNetworking

VERB LOCK **AtmIf Vpc Src Redirect**

Impact	Service
Description	*Lock Atmif Vpc Src CallRedirection* *Lock -primary Atmif Vpc Src CallRedirection* *Lock -secondary Atmif Vpc Src CallRedirection* This verb selectively precludes a provisioned destination address from consideration during call setup attempts for a Src PVP. If [*-primary*] option is present, then the primary destination address is precluded from call setup attempts. If the connection is established to the primary destination address at the time of issuing the command, the connection is torn down and an immediate attempt is made to re-establish the connection to the secondary destination address. If [*-secondary*] option is present, then the secondary destination address is precluded from call setup attempts. If the connection is established to the secondary destination address at the time of issuing the command, the connection is torn down and an immediate attempt is made to re-establish the connection to the primary destination address. If no option is present, the secondary destination is locked. This command will have the same effect as providing the *secondary* option. Only one of the primary or the secondary addresses may be locked at any given time.

Copyright © 2006, Nortel Nortel Confidential

VERB UNLOCK Atmlf Vpc Src Redirect

Impact	Service
Description	*Unlock Atmif Vpc Src CallRedirection* *Unlock -primary Atmif Vpc Src CallRedirection* *Unlock -secondary Atmif Vpc Src CallRedirection* *Unlock -primary -secondary Atmif Vpc Src CallRedirection* This verb selectively unlocks a destination address. The indicated address will be considered in subsequent call setup attempts. If [*-primary*] option is present, then the primary destination address is unlocked and it is considered for subsequent call setup attempts. This action does not have any impact on the established connections. If [*-secondary*] option is present, then the secondary destination address is unlocked and it is considered in subsequent call setup attempts. This action does not have any impact on the established connections. If no option is present, the secondary destination address is unlocked. It has the same impact as *secondary* option. If both options are provided, either of the primary or the secondary address which may have been locked will be unlocked.

GROUP Atmlf Vpc Src Redirect **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes of the Source PVP *CallRedirection* component.

COMPONENT Atmlf Vpc Src ManualDtl (Mdtl)

Groups	GROUP Atmlf Vpc Src Mdtl Provisioned (Prov) GROUP Atmlf Vpc Src Mdtl Operational (Oper)
Scope	Device
Description	*Atmlf/n Vcc/vpi.vci SrcPvc ManualDtl* *Atmlf/n Vpc/vpi SrcPvp ManualDtl* *Atmlf/n Vpt/vpi Vcc/vci SrcPvc ManualDtl* This component represents the ability to specify the PNNI path on a per connection basis for provisioned SPVC and SPVP connections. The addition or deletion of this component is critical to the parent SPVC or SPVP. Changes to the attributes contained under this component are not critical.
Mib	AtmNetworking
Common Verbs	Help List Display Add DELete

VERB REConnect Atmlf Vpc Src Mdtl

Impact	Service
Description	*REConnect Atmlf/n Vcc/vpi.vci Src Mdtl* *REConnect -primary Atmlf/n Vcc/vpi.vci Src Mdtl* *REConnect -alternate Atmlf/n Vcc/vpi.vci Src Mdtl* *REConnect -automatic Atmlf/n Vcc/vp.vci Src Mdtl* This command is used to trigger a connection to attempt to connect using the requested path. The behavior of this command differs for connections which do and do not subscribe to Path Optimization capabilities provided by rerouting services. To summarize: 1. Non-reroute Subscribed connections A reconnect comand will result in the connection being taken down and re-establishment attempts being made. By default (if no option is specified), the primary path is attempted first otherwise the path specified by the option is first attempted. In the event of reconnect failure, subsequent re-establishment attempts will be progressed through a sequence of primary, alternate and automatic (traditional PNNI routing) paths.

Copyright © 2006, Nortel Nortel Confidential

2. Reroute Subscribed connections
A reconnect comand will utilize make-before-break functionality. If an option is specified then only that path will be attempted. If a connection can be established, then datapath switching will be used to replace the existing connection minimizing cell loss. If no option is specified, the connection establishment attempts will be progressed through a sequence of primary, alternate and automatic (traditional PNNI routing) paths only until such time that a successfully established connection would be deemed more optimal than the incumbent. For instance, if a reconnect command is issued for a connection which is on it's alternate path and establishment on the primary path fails then the reconnect operation is considered complete and the connection will remain on the alternate path.

GROUP Atmlf Vpc Src Mdtl **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the Manual DTL selection paths for provisioned connections. The normal sequence for connection retry is: First try to establish the connection using the *primaryPath*. If the connection is not successful and if the *alternatePath* has been provisioned, try to connect using the *alternatePath*. If the connection is still unsuccessful, use the PNNI routing protocol to generate the path.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpc Src Mdtl **primaryPath (priPath)**

Access	Read and write
Description	This attribute specifies the name of the primary MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni*.
Mib	AtmNetworking
Values	String (1..32, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpc Src Mdtl **alternatePath (altPath)**

Access	Read and write
Description	This attribute specifies the name of the alternate MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni.* An empty string disables the alternate path.
Mib	AtmNetworking
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpc Src Mdtl **automaticFallback (auto)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies whether PNNI routing is to be used to establish a connection if connection attempts using the primary and alternate paths fail. If the value is ***enable***, PNNI routing will be attempted; if the value is ***disable***, it will not.
Mib	AtmNetworking
Values	disable enable
Default	enable

ATTRIBUTE Atmlf Vpc Src Mdtl **mdtlVersion (vers)**

Access	Read and write
Description	This attribute indicates a version number for Specified Paths and will ensure that the reroute behaviors (not subscribed) are maintained following a software migration to a software version where global rerouting is supported for Specified Path connections. This is an internal attribute intended for the above purpose only and should not be altered.
Mib	AtmNetworking
Values	notRerouteCapable rerouteCapable
Default	notRerouteCapable

GROUP Atmlf Vpc Src Mdtl **Operational (Oper)**

Properties	Operational
Description	This attribute group contains the operational attributes associated with the *atmSrcMdtl* component
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpc Src Mdtl **currentPath (curPath)**

Access	Read: All Write: Illegal
Description	This attribute indicates the current connection status of the Specified Path connection. A ***not connected*** status indicates that the connection is not established. The retry sequence did not succeed. The network operator can issue the *Reconnect* command to restart the retry sequence. A ***primary*** status indicates that the connection is using the path specified by the *primaryPath* attribute. An ***alternate*** status indicates that the connection is using the path specified by the *alternatePath* attribute. An ***automatic*** status indicates that the connection is using the path generated by the PNNI routing protocol.

Copyright © 2006, Nortel Nortel Confidential

An ***unknown*** status indicates that the provisioning data for the path upon which the connection is established has been altered.
A ***waiting connection*** status indicates that the connection is in a retry phase.

Mib	AtmNetworking
Values	not connected primary alternate automatic unknown waiting connection
Default	"not connected"

ATTRIBUTE Atmlf Vpc Src Mdtl **primaryPathFailCause (priPathFail)**

Access	Read: All Write: Illegal
Description	This attribute identifies the last cause code failure for the primary path. The value is reset to zero when the *primaryPath* attribute is set to a new value.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpc Src Mdtl **alternatePathFailCause (altPathFail)**

Access	Read: All Write: Illegal
Description	This attribute identifies the last cause code failure for the alternate path. The value is set to zero when the *alternatePath* attribute is set to a new value.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

This component represents the ability to override rerouting capability subscription options on a per connection basis for provisioned SPVC and SPVP connections.

The addition of this component and changes to the attributes contained in this component are critical to the parent SPVC or SPVP. However, the deletion of this component is not a critical change for the connection. If this component is deleted, the connection remains active with the last provisioned subscription options. Subscription is lost when the connection goes down and re-establishes.

VERB OPTIMIZE **AtmIf Vpc Src RerOv**

Impact Service

Description
OPTimize AtmIf/n Vcc/<vpi.vci> Src RerOv
OPTimize AtmIf/n Vpc/<vpi> Src RerOv
OPTimize AtmIf/n Vpt/<vpi> Vcc/<vci> Src RerOv
OPTimize FrAtm/n Dlci/x Siwf RerOv

This command triggers path optimization for the connection segment. If the interface is already processing a path optimization request, then the *Optimize* command is cancelled.

Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP **AtmIf Vpc Src RerOv** **Provisioned (Prov)**

Properties Provisioned

Description This group contains the provisionable attributes related to rerouting subscription options for provisioned connections.

Mib AtmNetworking

ATTRIBUTE **AtmIf Vpc Src RerOv** **protocol**

Access Read and write

Description This attribute specifies the rerouting protocols that are requested by the connection segment. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

Copyright © 2006, Nortel Nortel Confidential

One of the following values can be specified:
sameAsInterface: The requested rerouting protocols are specified by the *protocol* attribute under the *Reroute Ov* component for the interface.
localGlobal: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
localOnly: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
globalOnly: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Description: This attribute indicates the current number of cells in the transmit queue for this connection.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the length of the common queue which is used for this ATM service category.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***fifo***, this attribute indicates the number of cells for this connection which are enqueued in a first-in-first-out queuing method for this ATM service category. This will only occur for connections on ATM IP cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the length of the per-VC queue.

For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current number of cells in the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

ATTRIBUTE Atmlf Vpc Tm txQueueCongestionState (txQCong)

Access	Read only
Description	This attribute indicates the congestion state of the transmit queue for this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the congestion state of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the congestion state of the per-VC queue. The congestion state of a queue is indicated by a numeric value ranging from 0 to 3. When a queue is in a congested state x, only traffic with discard priority (DP) 0 to x are enqueued. Traffic with DP > x is discarded. For example, if the congestion state is 3, there is no congestion and all traffic is enqueued. Likewise, when the congestion state is 0, there is maximum congestion and only traffic with DP=0 is enqueued on that queue. For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current congestion state of the link class queue used by this connection to buffer its traffic. This attribute does not apply to basic *Vpt*s.
Mib	AtmCore
Values	Decimal (0..3)
Default	No default

ATTRIBUTE Atmlf Vpc Tm holdingPriority (hpri)

Access	Read only
Description	This attribute indicates the actual holding priority in effect for this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. Some applications, for example *Vcc Test*, may override the provisioned holding priority. A value of ***notApplicable*** is displayed when this is an elastic connection.

Copyright © 2006, Nortel Nortel Confidential

Holding priority does not apply to bandwidth elastic connections.

Holding priority has no effect if the equivalent cell rate (ECR) for a connection is zero.

This attribute does not apply to *Vpt Vcc*s.

ATTRIBUTE Atmlf Vpc Tm rxQosClass (rxQos)

Access: Read only

Description: This attribute indicates the quality of service for the called to calling direction for this connection. This is only applicable to Soft PVC and SVC connections.

Class 1 supports a QOS that meets Service Class A performance requirements (circuit emulation, constant bit rate video).

Class 2 supports a QOS that meets Service Class B performance requirements (variable bit rate audio and video).

Copyright © 2006, Nortel Nortel Confidential

Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class 0 is the unspecified QOS class; no objective is specified for the performance parameters.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

ATTRIBUTE Atmlf Vpc Tm **atmServiceCategory (service)**

Access: Read only

Description: This attribute indicates the ATM service category used for traffic in both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to have significantly reduced value for the application.

The ***rtVariableBitRate*** service category is intended for real time applications; that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer

Copyright © 2006, Nortel Nortel Confidential

delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Default — No default

ATTRIBUTE Atmlf Vpc Tm **trafficShaping (trShaping)**

Access — Read only

Description — This attribute indicates the traffic shaping state of the connection.

A value of ***notApplicable*** indicates that traffic shaping is not applicable or not supported for this connection. This is the case:
- when the *txTrafficDescType* is 1 or 2.
- for standard *Vpt Vcc*s and basic *Vpt*s.
- for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, when the *atmServiceCategory* is ***constantBitRate***.

In these cases, the value of ***notApplicable*** is indicated regardless of whether traffic shaping is enabled or disabled in the provisioning data.

A value of ***disabled*** indicates that traffic shaping is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***linear*** or ***inverseUpc*** indicates that traffic shaping is applicable and supported for the type of connection and has been turned on in the provisioning data. This is the only case that indicates that traffic shaping is performed on the connection. In this case, the actual shaping rate is

Copyright © 2006, Nortel Nortel Confidential

reflected in the *txTrafficDescParm* attribute, parameter number 4. A value of ***linear*** indicates that traffic is being shaped at the constant rate indicated in *txTrafficDescParm* 4. A value of ***inverseUpc*** indicates that the shaper strictly conforms to the requirements of a dual leaky bucket UPC enforcer. This value is indicated if traffic shaping is enabled, and the *txTrafficDescType* for this connection is 6, 7 or 8.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, traffic shaping is not available, therefore this attribute is always ***disabled***.

Traffic shaping for connections with *atmServiceCategory* as ***availableBitRate*** (*txTrafficDescType* 9) depends upon the *abrConnectionType* attribute. If *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, the value of this attribute is ***linear***. If *abrConnectionType* is ***erSwitch*** or ***efciSwitch***, this attribute is ***notApplicable***.

Mib	AtmCore
Values	disabled linear inverseUpc notApplicable
Default	No default

ATTRIBUTE Atmlf Vpc Tm **bearerClassBbc (bcBbc)**

Access	Read only
Description	This attribute indicates the bearer capability for this connection.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is displayed, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements.When ***c*** is displayed, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class vp service is used to indicate a transparent VP service when the user is requesting an ATM only service from the network. In this case, the

Copyright © 2006, Nortel Nortel Confidential

network does not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except for VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP and SVP connections.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Mib: AtmCore

Values:
a
c
x
vp
notApplicable

Default: No default

ATTRIBUTE Atmlf Vpc Tm transferCapabilityBbc (tcBbc)

Access: Read only

Description: This attribute indicates the transfer capability for this connection. Uni 3.0/3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance, or in the case that the transfer capability in the call request was set to NoIndication.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value NoIndication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

The value yes for end-to-end timing indicates that end-to-end timing is required for the connection.

The value no for end-to-end timing indicates that end-to-end timing is not required for the connection.

ATTRIBUTE Atmlf Vpc Tm clippingBbc (cBbc)

Access	Read only
Description	This attribute indicates the value of the clipping susceptibility parameter in the broadband bearer capability (BBC) Information Element. Clipping is an impairment in which the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through. A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.
Mib	AtmCore
Values	no yes notApplicable
Default	No default

ATTRIBUTE Atmlf Vpc Tm unshapedTransmitQueueing (unshap)

Access	Read only
Description	This attribute indicates the unshaped transmit queuing state of the connection. A value of ***common*** indicates that transmit traffic is being enqueued onto the common transmit queue for this service category. The *txQueueLength* attribute indicates the current length of the common transmit queue. A value of ***fifo*** indicates that transmit traffic is being queued in a first-in-first-out basis for this service category. This is similar to ***common*** queuing, but the *txQueueLength* attribute indicates the number of cells in this connection queue. A value of ***fifo*** will only be indicated for connections on ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards

Copyright © 2006, Nortel Nortel Confidential

with *atmServiceCategory* of ***nrtVbr*** or ***ubr***.

A value of ***perVc*** indicates that transmit traffic is being enqueued onto a per-VC queue for this connection.

A value of ***notApplicable*** indicates that transmit traffic is being shaped for this connection, or that unshaped transmit queuing is not applicable for this type of connection. Transmit traffic for a shaped connection is enqueued onto a per-VC queue, but this attribute is only applicable for unshaped connections. Unshaped transmit queuing is not applicable for basic *Vpt*s.

ATTRIBUTE Atmlf Vpc Tm forceTagging (tagging)

Access — Read only

Description — This attribute indicates the state of force tagging option for this connection. Force tagging refers to setting the CLP bit for all cells on a connection.

A value of ***enabled*** indicates that the CLP bit is being set to 1 for all cells in the transmit direction on this connection.

Copyright © 2006, Nortel Nortel Confidential

A value of ***disabled*** indicates that the CLP bit is unchanged for cells in the transmit direction on this connection. The value ***disabled*** is always displayed for *Vpt*s since forced tagging is applied on a per *Vpt Vcc* basis.

Mib — AtmCore

Values — disabled
enabled

Default — No default

ATTRIBUTE AtmIf Vpc Tm weight

Access — Read only

Description — This attribute indicates the relative weight of this unshaped connection. Connections with a larger weight get a larger proportion of the link bandwidth or in the case of standard *Vpt Vcc*s, the *Vpt* bandwidth.

For all but standard *Vpt Vcc*s, the default connection weight is determined by the weight policy for a service category and the traffic descriptor for a connection. For standard *Vpt Vcc*s, the default connection weight is determined by the *Vcc*'s service category.

A value from 1 to 4095 indicates an actual weight. The value ***upToQueueLimit*** indicates that the weight of a connection is up to the transmit queue limit for this connection and is used for connections which have the value of the *unshapedTransmitQueueing* attribute displayed as ***fifo***.

This attribute has a displayed value of ***notApplicable*** in the following cases:
- This connection has the value of the *trafficShaping* attribute displayed as either ***linear*** or ***inverseUpc***.
- This connection has the value of the *trafficShaping* attribute displayed as ***disabled***, but the connection's service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc***.
- This connection has the value of the *unshapedTransmitQueueing* attribute displayed as ***common***.
- This is a basic *Vpt* connection.
- For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, since per-connection weight is not supported.

Mib — AtmCore

Values — Decimal (1..4095)

notApplicable

Default — No default

ATTRIBUTE AtmIf Vpc Tm usageParameterControl (upc)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the UPC state of the connection. A value of ***notApplicable*** indicates that UPC is not applicable or not supported for the connection. This is the case: - when the connection's *rxTrafficDescType* is 1 or 2. - for standard *Vpt Vcc*s and basic *Vpt*s. A value of ***notApplicable*** is set regardless of whether UPC is disabled or enabled in provisioning data. A value of ***disabled*** indicates that UPC is applicable and supported for the type of connection but has been turned off in the provisioning data. A value of ***enforced*** indicates that UPC is actively checking conformance for the connection and is discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. On some ATM cards, the counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes. A value of ***monitored*** indicates that UPC is actively checking conformance for the connection and counting the violations, but is not discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. The counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt. rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes. If the *atmServiceCategory* for this connection is ***availableBitRate***, a value of ***enforced*** indicates that Dynamic Generic Cell Rate Algorithm (DGCRA) is active for the connection. The traffic descriptor parameters used for DGCRA enforcement are reflected in the *rxTrafficDescParm* of the connection.
Mib	AtmCore
Values	enforced disabled monitored notApplicable
Default	No default

ATTRIBUTE Atmlf Vpc Tm txPacketWiseDiscard (txpd)

Access	Read only
Description	This attribute indicates the current set of packet-wise discard functions in effect in the transmit data direction at this connection point.

Copyright © 2006, Nortel Nortel Confidential

This attribute is not applicable for *Vpt*s.

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point.

A value of ***wred*** indicates that Weighted Random Early Detection is in effect at this connection point. W-RED can be enabled by provisioning for PVCs and SPVCs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Packet-wise functions are not applicable to virtual path connections (VPCs) on these cards.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

Mib	AtmCore
Set of	ppd epd wred
Default	No default

ATTRIBUTE Atmlf Vpc Tm **rxPacketWiseDiscard (rxpd)**

Access	Read only
Description	This attribute indicates the current set of packet-wise discard functions in effect in the receive data direction at this connection point. This attribute is not applicable for *Vpt*s.

Copyright © 2006, Nortel Nortel Confidential

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, packet-wise functions are not applicable to virtual path connections (VPCs).

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch, 4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs.

For ***1pOC48ChSmIrAtm*** card, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Note that a provisioned value of ***enabled*** for the *Vcc/Vpc Vcd/Vpd Tm rxPacketWiseDiscard* provisionable attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in actually enabling packet-wise discard functions in the receive data direction of a connection locally on these cards, thus does not affect the operational value displayed.

Mib	AtmCore
Set of	ppd epd
Default	No default

ATTRIBUTE Atmlf Vpc Tm bandwidthElastic (bwElastic)

Access	Read only
Description	This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail,

Copyright © 2006, Nortel Nortel Confidential

such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application (for example, *Trunk*) running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced is displayed in the *bandwidthReduction* attribute.

A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection is not released.

A value of ***no*** indicates that the bandwidth for this connection is not reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority*.

Bandwidth elasticity has no effect for connections which have an equivalent cell rate (ECR) of zero.

This attribute is not applicable for *Vpt*s and *Vpt Vcc*s.

Mib	AtmCore
Values	no yes
Default	No default

ATTRIBUTE Atmlf Vpc Tm **bandwidthReduction (bwReduction)**

Access	Read only
Description	This attribute shows the amount by which the bandwidth has been reduced for this connection. This value is non-zero only for connections which have *bandwidthElastic* displayed as ***yes***, and which are also operating in a reduced bandwidth mode. This is typically the case for selected connections running over an IMA link. This attribute takes a value from 0 (no reduction) up to the ECR. For all connections which are running at their full allocated bandwidth, *bwReduction* has the value 0. Connections which have been reduced in allocated bandwidth have a positive number for this attribute. The *bwReduction* may be subtracted from the ECR (which is displayed as *txTrafficDescParm* 5) to determine the actual bandwidth allocated to this connection.
Mib	AtmCore
Values	Decimal (0..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Atmlf Vpc Tm **abrConnectionType (abrType)**

Access	Read only
Description	This attribute indicates the type of ABR behavior which is in effect at this connection. This attribute is only applicable if the *atmServiceCategory*

Copyright © 2006, Nortel Nortel Confidential

attribute is ***availableBitRate***. If the *atmServiceCategory* attribute is not ***availableBitRate***, this attribute value is set to ***notApplicable***.

For ATM cards which do not support ABR connections, the possible values for this attribute are ***notApplicable***, ***efciSwitch***, or ***nonAbrInterworking***. In EFCI marking mode, the Explicit Forward Congestion Indication (EFCI) field in the data cell headers is used to indicate transmit queue congestion.

For ATM cards which do support ABR connections, if the *connectionPointType* is ***connectionEndPoint***, the value of this attribute is ***sourceDest***. In this mode, the ABR Source and Destination behavior is in effect at this connection. This attribute is also ***sourceDest*** in the case where the next hop connection is specified as ***nonAbrInterworking***. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component.

If the *connectionPointType* is not ***connectionEndPoint***, the value of this attribute depends upon the *abrConnectionType* provisioning and the card type to which the traffic is forwarded on the backplane. The default *abrConnectionType* is provisioned at the *CA Abr abrConnectionType* attribute, and may be overridden for a provisioned connection in the *Vcd Tm abrConnectionType* or *Vpd Tm abrConnectionType* attribute. If the *CA Abr abrConnectionType* attribute is ***virtualSourceDest*** at either one of the two connection points, and if both the connection points are defined on ATM cards which support ABR connections, virtual source and destination behavior is applied to the connection. In this instance, the attribute displays the value ***virtualSourceDest***.

This attribute has the value ***erSwitch*** if ABR explicit rate functionality is in effect at this connection. In this mode, the switch may modify the Explicit Rate (ER) field of backward Resource Management (RM) cells to indicate the status of congestion at this connection point.

This attribute has the value ***nonAbrInterworking*** in the case where this connection point is functioning as an SPVC origin for an ABR connection where the link side of this connection is configured as a non-ABR ATM service category. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.

Mib	AtmCore
Values	erSwitch efciSwitch virtualSourceDest sourceDest nonAbrInterworking notApplicable
Default	No default

ATTRIBUTE Atmlf Vpc Tm txTrafficDescParm (txTdp)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute is a vector of five transmit traffic parameters whose mapping is defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR), actual cell rate (ACR), explicit rate (ER), equivalent cell rate (ECR), and actual shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. When *txTrafficDescType* is 1 or 2, parameters 1 through 5 are unused. In this description, PCR is the greater of either the PCR or the requested shaping rate (parameter 1 or parameter 5) specified in the *txTrafficDescParm* attribute under the *Vcd Tm* or *Vpd Tm* component. When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 or 1 traffic; parameters 2 and 3 are unused. When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic. When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. When *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, parameter 4 reflects the actual shaping rate in cell/s for this connection. For CQC-based ATM cards, the set of available shaping rates is based on the number of interfaces doing shaping (attribute *perVcQueueInterfaces*), and the *shapingScalingFactor* attribute of the *Arc Cqc Override* component. A rate of zero (0) indicates that shaping is not performed, or that the interface is down.

Copyright © 2006, Nortel Nortel Confidential

When *txTrafficDescType* is 9**,** parameter 1 represents the PCR; parameter 2 represents the Cell Delay Variation Toleration (CDVT); parameter 3 represents the Minimum Cell Rate (MCR); the meaning of parameter 4 depends upon the value of the *abrConnectionType* attribute. if *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, parameter 4 represents the Allowed Cell Rate (ACR); If *abrConnectionType* is ***erSwitch***, parameter 4 represents the Explicit Rate (ER); and if *abrConnectionType* is ***efciSwitch***, parameter 4 reflects the actual shaping rate in cell/s for this connection.

When *txTrafficDescType* is 3, 4, 5, 6, 7, 8, or 9, parameter 5 reflects the equivalent cell rate in cell/s for this connection as determined by the Connection Admission Control (CAC) algorithm. The equivalent cell rate is useful in determining the admission characteristics of this connection.

ATTRIBUTE Atmlf Vpc Tm **txQueueThresholds (txQThresh)**

Access	Read only
Description	This attribute indicates the queue limit and the discard thresholds for the transmit queue of this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the thresholds of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the thresholds of the per-VC queue. The first element indicates the queue limit. The provisioned value of the transmit queue limit is derived from the *txQueueLimit* attribute under the service category subcomponents of the *CA* component for the service category of this connection. The second element is the threshold that marks the transition from congestion state 1 to congestion state 0. This is the threshold at which traffic with discard priority (DP) = 1 is discarded. This threshold is set at approximately 90 percent of the first parameter, the operational queue limit. The third element is the threshold that marks the transition from congestion state 2 to congestion state 1. This is the threshold at which traffic with DP = 2 is discarded. This threshold is set at approximately 75 percent of the first parameter, the operational queue limit. The fourth element is the threshold that marks the transition from

Copyright © 2006, Nortel Nortel Confidential

congestion state 3 to congestion state 2. This is the threshold at which traffic with DP = 3 is discarded. This threshold is set at approximately 35 percent of the first parameter, the operational queue limit.

For ***1pOC48ChSmIrAtm*** cards, this attribute displays the thresholds of the link class queue used by this connection to buffer it traffic.

This attribute does not apply to basic *Vpt*s.

Vector of	Decimal (0..1011840)
Units	cells
Index	Decimal (0..3)
Default	No default

ATTRIBUTE **AtmIf Vpc Tm** **rxTrafficDescParm (rxTdp)**

Access	Read only
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. Cell delay variation tolerance (CDVT) is expressed in microseconds. When *rxTrafficDescType* is 1 or 2, none of the parameters are used. When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; parameter 4 represents the CDVT. When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; parameter 4 represents the CDVT. When *rxTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP

Copyright © 2006, Nortel Nortel Confidential

equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents CDVT; parameter 3 represents the MCR; parameter 4 is not used.

If *upc* is ***disabled*** for this connection, the values of PCR, SCR, MBS and CDVT are the provisioned parameters.

If *upc* is ***enabled***, the values of PCR, SCR, MBS, and CDVT are exactly the values used by the usage parameter control hardware in policing the arriving traffic. These may vary slightly from the provisioned values due to granularity of the hardware. In the case where the PCR is equal to the SCR, the effective MBS is zero.

GROUP Atmlf Vpc Tm Abr Operational (Oper)

Properties	Operational
Description	This group contains operational attributes for connections using ABR service category.
Mib	AtmCore

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpc Tm Abr **initialCellRate (icr)**

Access	Read only
Description	This attribute indicates the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. For nailed-up connections, this attribute is determined by the provisioned value of the *initialCellRate* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element. The ICR for a connection is a value between the MCR and the PCR. Furthermore, ICR has an upper bound determined by the *transientBufferExposure* divided by *fixedRoundTripTime*.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	cell/s
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **transientBufferExposure (tbe)**

Access	Read only
Description	This attribute indicates the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the resource to send during start-up periods, before the first Resource Management (RM) cell returns. For nailed-up connections, this attribute is determined by the provisioned value of the *transientBufferExposure* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **fixedRoundTripTime (frtt)**

Access	Read only
Description	This attribute indicates the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. For nailed-up connections, this attribute is determined by the provisioned value of the *fixedRoundTripTime* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **rateDecreaseFactor (rdf)**

Access	Read only
Description	This attribute indicates the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. For nailed-up connections, this attribute is determined by the provisioned value of the *rateDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **rateIncreaseFactor (rif)**

Access	Read only
Description	This attribute indicates the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64. RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR. For nailed-up connections, this attribute is determined by the provisioned value of the *rateIncreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Mib	AtmCore
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **maxCellPerRmCell (nrm)**

Access	Read only
Description	This attribute indicates the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell. For nailed-up connections, this attribute is determined by the provisioned value of the *maxCellsPerRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **maxTimeBetweenRmCell (trm)**

Access	Read only
Description	This attribute indicates the TRM parameter for this connection. TRM provides an upper bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least 2 other cells have been sent, the next cell to be transmitted would be a forward RM cell. For nailed-up connections, this attribute is determined by the provisioned value of the *maxTimeBetweenRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)
Units	microsec
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **cutoffDecreaseFactor (cdf)**

Access	Read only
Description	This attribute indicates the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the

Copyright © 2006, Nortel Nortel Confidential

value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero.

CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the *forwardRmCellLimit* attribute, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

For nailed-up connections, this attribute is determined by the provisioned value of the *cutoffDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Mib	AtmCore
Values	Decimal (0; 1; 2; 4; 8; 16; 32; 64)
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **acrDecreaseTimeFactor (adtf)**

Access	Read only
Description	This attribute indicates the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection. ADTF is the time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*. For nailed-up connections, this attribute is determined by the provisioned value of the *acrDecreaseTimeFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..1023)
Units	centiseconds
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **forwardRmCellLimit (crm)**

Access	Read only
Description	This attribute indicates the CRM parameter for this connection. CRM is the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the Allowed Cell Rate (ACR) value would be

Copyright © 2006, Nortel Nortel Confidential

	decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. The value of CRM is obtained as *transientBufferExposure* divided by *maxCellsPerRmCell*.
Mib	AtmCore
Values	Decimal (1; 3; 7; 15; 31; 63; 127; 255; 511; 1023; 2047; 4095)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **txRateChangeInfo (txrci)**

Access	Read only
Description	This attribute indicates the rate change information put into the last forward Resource Management (RM) cell turned around as a backward-RM cell. For connections configured as an ABR Source or Destination, the turned around backward-RM cell is sent over the interface. For connections configured as an ABR Virtual Source or Virtual Destination, the turned around backward-RM cell is sent over the backplane.
Mib	AtmCore
Values	congestionIndicated noIncreaseIndicated explicitRateIndicated
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **acrRateChangeInfo (arci)**

Access	Read only
Description	This attribute indicates the type of change in the Allowed Cell Rate (ACR) as a result of the information in the last backward Resource Management (B-RM) cell received from the interface. This attribute value is only applicable when the *Vcc Tm* or *Vpc Tm* *abrConnectionType* attribute is ***sourceDest*** or ***VirtualSourceDest***. In all other cases, this attribute value is ***notApplicable***. A value of ***noChange*** indicates that the rate did not change as a result of the last backward RM cell received. A value of ***decreasedByRdf*** or ***increasedByRif*** indicates that the ACR was increased or decreased by the corresponding factor. This change is as a result of the CI or NI bit setting in the last backward RM cell, or an ADTF timeout.

Copyright © 2006, Nortel Nortel Confidential

	A value of ***setToExplicitRate*** indicates that the ACR was set to the ER value in the last backward RM cell.
Mib	AtmCore
Values	noChange decreasedByRdf increasedByRif setToExplicitRate notApplicable
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **txFwdRmCells**

Access	Read only
Description	This attribute counts the number of forward Resource Management (RM) cells sent over the interface since the last backward RM-cell was received from the interface. If the value of this attribute is greater than or equal to the value of *forwardRmCellLimit*, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. This counter is reset to zero each time a backward-RM cell is received. This counter does not wrap to zero if it reaches its maximum value of 4095 in order to indicate that no backward RM cell has been received.
Mib	AtmCore
Values	Decimal (0..4095)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Tm Abr **rxEfci**

Access	Read only
Description	This attribute indicates the value of the Explicit Forward Congestion Indication (EFCI) bit of the last data cell received from the interface. When a forward Resource Management (RM) cell is turned around as a backward-RM cell, the Congestion Indication (CI) field of the backward-RM cell is set to 1, if the value of this attribute is ***indicated***. This attribute is set to ***notIndicated*** each time a backward-RM cell is transmitted.

GROUP Atmlf Vpc Mnrp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Mnrp* component.
Mib	AtmBearerService

ATTRIBUTE Atmlf Vpc Mnrp oamSegmentBoundary (sb)

Access	Read and write
Criticality	Component
Description	This attribute specifies the OAM segment boundary desired for a *Mnrp* component. It affects the connection point type value visible in the parent component's *connectionPointType* attribute. The desired OAM segment boundary can be specified directly as ***yes***, ***no*** or ***sameAsInterface***. If ***sameAsInterface*** is specified, the OAM segment boundary is same as the *oamSegmentBoundary* attribute of the associated *AtmIf* and the switch will set the *connectionPointType*, choosing ***segmentEndPoint*** for a segment-boundary ATM interface and ***connectingPoint*** for a non-segment-boundary ATM interface.
Mib	AtmBearerService
Values	no yes sameAsInterface

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsInterface

ATTRIBUTE Atmlf Vpc Mnrp **bandwidthElastic (bwElastic)**

Access	Read and write
Criticality	Component
Description	This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the *bandwidthReduction* attribute. A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Mnrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid. A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority*.
Mib	AtmBearerService
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpc Mnrp **overrideHoldingPriority (ohpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used.

Description	This attribute indicates the Availability Ratio (AR) measurement status of the connection. The value ***inactive*** indicates the test is inactive. The value ***activating*** indicates the test is activating. The value ***active*** indicates the test is in progress The value ***activationFailed*** indicates the test failed to be activated. Refer to the *failureCause* attribute for the failure cause.
Mib	AtmCore
Values	inactive activating active activationFailed
Default	inactive

ATTRIBUTE Atmlf Vpc Pm **failureCause (cause)**

Access	Read only
Description	This attribute indicates the failure cause of Performance Monitoring (PM) measurements. The following are possible causes: The value ***noError*** indicates no error. The value ***unknownCause*** indicates unknown failure cause. The value ***softwareResourcesUnavailable*** indicates software resources reserved for a maximum of 255 active PMs on the local FP card have been used up. The value ***hardwareResourcesUnavailable*** indicates hardware resources reserved for a maximum of 512 active PMs CLR card have been used up on the Link Side local card. The value ***remoteEndNoResponse*** indicates no response from remote end during activation. The value ***activationCollision*** indicates activation collision was detected. Usually this is caused by both ends of the connection being provisioned to request PM. Only one end should be so provisioned. The value ***remoteEndRejectedActivation*** indicates the remote end has rejected an activation request. Usually this is due to the remote end reaching a resource limit. The value ***pcrUnsupported*** indicates the Tx or Rx PCR is out of range.

Copyright © 2006, Nortel Nortel Confidential

The PCR value must be between 0 and 409601.

The value ***nextHopConnectionUnsupported*** indicates the next hop card type or connection type do not allow access to the necessary hardware to support PM measurements.

The value ***upcNotDisabled*** indicates UPC is not disabled on the local next hop card for this connection. PM measurements are not supported when UPC is either enforced or monitored.

ATTRIBUTE Atmlf Vpc Pm fwdTotalUserCellsTx0

Access	Read only
Description	This attribute indicates the number of cells with CLP=0 transmitted from the local end over the total Cell Loss Ratio (CLR) measurement interval in the forward direction.
Mib	AtmCore
Values	Long Integer
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Pm fwdTotalUserCellsRx01

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the number of cells with CLP=0+1 received at the remote end over the total Cell Loss Ratio (CLR) measurement interval in the forward direction.
Mib	AtmCore
Values	Long Integer
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Pm fwdTotalUserCellsTx01

Access	Read only
Description	This attribute indicates the number of cells with CLP=0+1 transmitted from the local end over the total CLR measurement interval in the forward direction.
Mib	AtmCore
Values	Long Integer
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Pm fwdPmCellDiscardCount

Access	Read only
Description	This attribute indicates the total number of Performance Monitoring (PM) cells discarded in the forward direction.
Mib	AtmCore
Values	Decimal (0..4294967295)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpc Pm fwdClr0

Access	Read only
Description	This attribute indicates the CLR for CLP=0 traffic calculated for the total measurement interval in the forward direction.
Mib	AtmCore
Values	Decimal (0.000000000..1.000000000)
Default	No default

ATTRIBUTE Atmlf Vpc Pm fwdClr01

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the CLR for CLP=0+1 traffic calculated for the total measurement interval in the forward direction.
Mib	AtmCore
Values	Decimal (0.000000000..1.000000000)
Default	No default

GROUP Atmlf Vpc Pm BwdClrMeasurements (BwdClr)

Properties	Operational
Description	This group contains Cell Loss Ratio (CLR) measurements for the backward direction of the connection. The local end is always the provisioned end which sends the activation request, and the remote end is the end which receives the activation request.
Mib	AtmCore

ATTRIBUTE Atmlf Vpc Pm bwdTotalClrInterval

Access	Read only
Description	This attribute indicates the total time duration over which Cell Loss Ratio (CLR) measurement has been calculated in the backward direction.
Mib	AtmCore
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Atmlf Vpc Pm bwdTotalUserCellsRx0

Access	Read only

Access	Read only
Description	This attribute indicates the CLR for CLP=0 traffic calculated for the total measurement interval in the backward direction.
Mib	AtmCore
Values	Decimal (0.000000000..1.000000000)
Default	No default

ATTRIBUTE Atmlf Vpc Pm **bwdClr01**

Access	Read only
Description	This attribute displays the CLR for CLP=0+1 traffic calculated for the total measurement interval in the backward direction.
Mib	AtmCore
Values	Decimal (0.000000000..1.000000000)
Default	No default

GROUP Atmlf Vpc Pm **ArMeasurements (Ar)**

Properties	Operational
Description	This group contains Availability Ratio (AR) measurements of the connection.
Mib	AtmCore

ATTRIBUTE Atmlf Vpc Pm **currentAvailabilityStatus**

Access	Read only
Description	This attribute indicates the current status of the bidirectional connection for purposes of Availability Ratio (AR) computation. The value ***notApplicable*** means AR measurement was not requested on this connection. The value ***available*** means AR is running and considers the connection available (that is, the *arAvailableTime* attribute is being incremented). The value ***unavailable*** means AR measurement was requested but the connection is currently unavailable.
Mib	AtmCore
Values	notApplicable available unavailable
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpc Pm arTotalTime

Access	Read only
Description	This attribute indicates the total time used for calculating Availability Ratio (AR) of the bi-directional connection.
Mib	AtmCore
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Atmlf Vpc Pm arAvailableTime

Access	Read only
Description	This attribute indicates the total time the connection was available.
Mib	AtmCore
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Atmlf Vpc Pm arAvailabilityRatio

Access	Read only
Description	This attribute indicates the ratio of network availability representing the ratio of available time to the total time of the connection.
Mib	AtmCore
Values	Decimal (0.0000000..1.0000000)
Default	No default

COMPONENT Atmlf Vpc PathTraceRecord (PTRecord)

Groups	GROUP Atmlf Vpc PTRecord Operational (Oper)

GROUP AtmIf Vpc PTRecord Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the path trace record component.
Mib	AtmNetworking

ATTRIBUTE AtmIf Vpc PTRecord status

Access	Read: All Write: Illegal
Description	This attribute indicates the status of the trace. The string is one of the following: ***Completed normally**:* The trace completed normally. ***Incomplete**:* Partial trace returned. ***Exceeded information element length limitations**:* The number of traced nodes exceeded the maximum number of hops. ***Exceeded message length limitations**:* The message length exceeded the maximum allowed size.
Mib	AtmNetworking
Values	Completed normally Incomplete Exceeded information element length limitations Exceeded message length limitations
Default	No default

ATTRIBUTE AtmIf Vpc PTRecord timeStamp

Access	Read: All Write: Illegal
Description	This attribute records the date and time of when the trace is completed.
Mib	AtmNetworking

Copyright © 2006, Nortel Nortel Confidential

Values	Time (DHMS)
Default	No default

ATTRIBUTE AtmIf Vpc PTRecord **srcPortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmNetworking
Values	Decimal (1..4294967295)
Default	No default

ATTRIBUTE AtmIf Vpc PTRecord **srcPortName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmNetworking
Values	String (40, ASCII)
Default	No default

ATTRIBUTE AtmIf Vpc PTRecord **causeCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE AtmIf Vpc PTRecord **diagCode**

Access	Read: All Write: Illegal
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmNetworking
Values	String (0..8, ASCII)
Default	No default

COMPONENT AtmIf Vpc PTRecord Hop

Instance	Decimal (0..200)
Groups	GROUP AtmIf Vpc PTRecord Hop Operational (Oper)

ATTRIBUTE Atmlf Vpc PTRecord Hop **ingressVpiVci (vpiVci)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the VPI.VCI values used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. This attribute is displayed for ATM interfaces only. The VPI.VCI values are included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	AtmNetworking
Values	Integer Sequence (0..4095; 0..65535)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **ingressDlci (dlci)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the DLCI value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. This attribute is displayed for FrAtm interfaces only. The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	AtmNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **ingressCallReference (callref)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. The call reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value
Mib	AtmNetworking
Values	Hex (H.0..H.ffffff)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **ingressEndPointReference (epref)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint.
Mib	AtmNetworking
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **nodeId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the lowest level node ID traversed for this hop.
Mib	AtmNetworking
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **nodeName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the *nodeName* under the *ModuleData* component for this hop. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmNetworking
Values	String (12, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **portId**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages.
Mib	AtmNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **portName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmNetworking
Values	String (55, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **pnniTraceContRefusalIndPresent (refusal)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.
Mib	AtmNetworking
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpc PTRecord Hop **crankbackDestNodeIndPresent (dest)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback

Copyright © 2006, Nortel Nortel Confidential

	Received at Trace Destination Node" indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface.
Mib	AtmNetworking
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpc PTRecord Hop **pnniCrankbackGapIndPresent (gap)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the "PNNI Crankback Gap" indicator is present. The "PNNI Crankback Gap" indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback.
Mib	AtmNetworking
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpc PTRecord Hop **crankBackCause (cause)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	AtmNetworking
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **blockedTransitType (type)**

Access	Read: All Write: Illegal
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the blocked transit type. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	AtmNetworking
Values	Succeeding end blocked Blocked node Blocked link
Default	No default

ATTRIBUTE **AtmIf Vpc PTRecord Hop** **blockedNodeId (bNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked node ID during the call setup request. The blocked node ID identifies the logical node where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked node.***
Mib	AtmNetworking
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf Vpc PTRecord Hop** **blockedLinkPrecedingNodeId (pNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's preceding node ID during the call setup request. The blocked link's preceding node ID identifies the logical node preceding a link, where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked link***.
Mib	AtmNetworking
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf Vpc PTRecord Hop** **blockedLinkPortId (bPortId)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's port identifier used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's preceding node identifier. This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***
Mib	AtmNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **blockedLinkSucceedingNodeId (sNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's succeeding node ID during the call setup request. The blocked link's succeeding node ID identifies the logical node succeeding a link where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***
Mib	AtmNetworking
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **dstVpiVci**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the VPI.VCI values on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for ATM interfaces. The VPI.VCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	AtmNetworking
Values	Integer Sequence (0..4095; 0..65535)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **dstDlci**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the DLCI value on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for FrAtm interfaces. The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	AtmNetworking
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **dstCallReference (dcr)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the call reference value on the destination side. This attribute only appears in the trace result for the trace destination node. The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value.
Mib	AtmNetworking
Values	Hex (H.0..H.ffffff)
Default	No default

ATTRIBUTE Atmlf Vpc PTRecord Hop **dstEndPointReference (depr)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the end point call reference value on the destination side. This attribute only appears in the trace result for the trace destination node. The call reference value is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint.
Mib	AtmNetworking

Copyright © 2006, Nortel Nortel Confidential

Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE AtmIf Vpc PTRecord Hop **specifiedPath**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether this hop is the originator of this manually configured path. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmNetworking
Values	no yes
Default	no

COMPONENT AtmIf Vpc PTRecord Hop **VendorSpecificInfo (Vsi)**

Instance	Decimal (0..10)
Groups	GROUP AtmIf Vpc PTRecord Hop Vsi Operational (Oper)
Scope	Device

GROUP Atmlf Vpc RerInfo **EbrOperational (EOper)**

Properties	Operational
Description	This group contains attributes that indicate the EBR rerouting characteristics of a connection segment. This group is only present if the connection segment has been granted the EBR rerouting protocol.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpc RerInfo **ebrRecoverySubscribed (eRecSub)**

Access	Read only
Description	This attribute indicates whether the connection segment is subscribed to EBR connection recovery. This attribute is only present if the connection segment has been granted the EBR protocol.
Mib	AtmNetworking
Values	no yes
Default	No default

ATTRIBUTE Atmlf Vpc RerInfo **ebrOptimizationSubscribed (eOptSub)**

Access	Read only
Description	This attribute indicates whether the connection segment is subscribed to EBR path optimization. This attribute is only present if the connection segment has been granted the EBR protocol.
Mib	AtmNetworking
Values	no yes
Default	No default

ATTRIBUTE Atmlf Vpc RerInfo **ebrOptimizationMetricValue (eOptVal)**

Access	Read only
Description	This attribute indicates the EBR optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes. The ***primary*** and ***alternate*** values are used to denote optimization values for Specified Path connections.

Copyright © 2006, Nortel Nortel Confidential

This attribute is only present if the connection segment has been granted the EBR protocol.

Mib — AtmNetworking

Values — Decimal (0..4294967292)
primary
alternate

Default — No default

ATTRIBUTE AtmIf Vpc RerInfo ebrOptimalMetricValue (eOptMetVal)

Access — Read only

Description — This attribute indicates the EBR optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***localOptimizationValue*** whenever a connection is optimized onto a path that has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous nodes. The ***primary*** and ***alternate*** values are used to denote optimization values for Specified Path connections.

This attribute is only present if the connection segment has been granted the EBR protocol.

Mib — AtmNetworking

Values — Decimal (0..4294967292)
primary
alternate

Default — No default

ATTRIBUTE AtmIf Vpc RerInfo ebrOptimizationState (eOptSt)

Access — Read only

Description — This attribute indicates the current EBR optimization state of the connection segment.

One of the following values is indicated:
optimal: This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value.
recovered: This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment that is greater than the value specified by the optimal metric value.
optimized: This value represents the state when the connection segment has moved to a path that is better than the recovered path but not as good as the optimal path.

Default	No default

ATTRIBUTE AtmIf Vpc RerInfo localOptimizationMetricValue (lOptVal)

Access	Read only
Description	This attribute indicates the local optimization metric value that was collected for the call during the most recent call establishment. It represents the segment of the connection between the rerouting and rendezvous nodes. A value of ***undefined*** indicates that the local optimization metric value is undetermined. This attribute is only present if the connection segment has been granted the local rerouting protocol.
Mib	AtmNetworking
Values	Decimal (0..4294967294) undefined
Default	No default

ATTRIBUTE AtmIf Vpc RerInfo localOptimalMetricValue (lOptMetVal)

Access	Read only
Description	This attribute indicates the local optimization metric value of the connection's best path. It is initialized to the value collected during initial call establishment. It is set to the ***localOptimizationValue*** whenever a connection is optimized onto a path that has a better optimization value or when the number of optimization attempts is exhausted. It represents the segment of the connection between the rerouting and rendezvous nodes.A value of ***undefined*** indicates that the local optimal optimization metric value is undetermined. This attribute is only present if the connection segment has been granted the local rerouting protocol.

ATTRIBUTE AtmIf Vpc RerInfo **localOptimizationState (lOptSt)**

Access	Read only
Description	This attribute indicates the current local optimization state of the connection segment. One of the following values is indicated: ***optimal:*** This is the initial value when the connection segment is first established. The connection segment is in optimal state whenever the optimization metric value of the connection segment is equal to the best known value. ***recovered:*** This value represents the state when the connection segment has been recovered to a path with an optimization metric value for the connection segment that is greater than the value specified by the optimal metric value. ***optimized:*** This value represents the state when the connection segment has moved to a path that is better than the recovered path but not as good as the optimal path. This attribute is only present if the connection segment has been granted the local rerouting protocol.
Mib	AtmNetworking
Values	optimal recovered optimized
Default	No default

ATTRIBUTE AtmIf Vpc RerInfo **localTimeOfLastRecovery (lTime)**

Access	Read only
Description	This attribute indicates the date and time of the last local connection recovery. This attribute is only present if the connection segment has been granted the local rerouting protocol.

COMPONENT AtmIf Vpc MplsConnection (MplsCon)

Groups	GROUP AtmIf Vpc MplsCon MplsConFec (Mcf) GROUP AtmIf Vpc MplsCon MplsConServLabel (Mcsl) GROUP AtmIf Vpc MplsCon Operational (Oper)
Scope	Device
Description	*AtmIf/n Vpc/vpi MplsCon* This component is used to establish an emulated ATM Vpc cell relay service over an MPLS network. By linking together an *MplsCon* component with an *Lsp Fec Ipv4Epa* component using the *transportFec* attribute, the associated connections are configured to relay ATM cells to one another. The *MplsCon* component requires exclusive use of its parent *Vpc* and cannot co-exist with other ATM service components (such as *Nrp*, *Src, Mnrp* and *Loop*). The attributes *transportFec*, *incomingServiceLabel*, and *outgoingServiceLabel* must be provisioned. Also, the *incomingServiceLabel* attribute value must be unique for this node. If an *MplsCon* component is added under the *Vpc* component, then the *Vr Dsd* component must have an *AtmServiceMap* subcomponent.
Mib	AtmCore
Common Verbs	Help List Display Add DELete

GROUP AtmIf Vpc MplsCon MplsConFec (Mcf)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *MplsCon* component.
Mib	AtmCore

ATTRIBUTE AtmIf Vpc MplsCon transportFec (tFec)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the underlying transport LSP that carries the service traffic with which this *MplsCon* component is associated. A sample value is ***Vr/0 Mpls LspG Fec Ipv4Epa/47.138.152.83,32***. This attribute must be provisioned.
Mib	AtmCore
Values	The name of the component
Default	No default

ATTRIBUTE Atmlf Vpc MplsCon **remoteProviderEdge (rPE)**

Access	Read and write
Description	This attribute specifies the remote Provider Edge node information of the transport LSP. The operator can store either the name or the Primary IP Address of the remote PE node. This label is not a mandatory field that is required to set up this connection.
Mib	AtmCore
Values	String (0..82, ASCII)
Default	""

GROUP Atmlf Vpc MplsCon **MplsConServLabel (Mcsl)**

Properties	Provisioned
Description	This group contains the service labels used by an ATM Vpc connection to transmit and receive data for the *MplsCon* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpc MplsCon **incomingServiceLabel (isl)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the incoming service label carried by the transport LSP with which this *MplsCon* component is associated. The incoming service label on this node must match the outgoing service label on the remote Provider Edge node.
Mib	AtmCore
Values	Decimal (262144..264191) undefined
Default	undefined

ATTRIBUTE Atmlf Vpc MplsCon **outgoingServiceLabel (osl)**

VERB TRACE AtmIf Vcc

Impact	Service
Description	*TRACE AtmIf/n Vcc/vpi.vci* *TRACE -s -v -a -e AtmIf/n Vcc/vpi.vci* *TRACE -p AtmIf/n Vcc/vpi.vci* This command traces the path of an intra-network segment of a connection. It displays the names of interface and connection components along this segment of a connection. The Trace response for a *Vcc* does not show any hops of a VCC which are conveyed on a path connection (VPC). In this case the Trace command only shows the VCC hop points. Note however, that if the connection traverses a *Vcc* which resides beneath a *Vpt*, the *Vpt/vpi Vcc/vci* hierarchy is displayed in the trace results. The option for the OAM trace is as follows: *-p*: Selects the Nortel Networks proprietary OAM Connection Management Trace instead of the proprietary OAM Legacy Loopback Trace. If no options are provided, the default configuration uses the Legacy Loopback

Copyright © 2006, Nortel Nortel Confidential

Trace.

The options for the signaling trace are as follows:

-s: Selects the PNNI signaling call trace instead of the Nortel Networks proprietary OAM-based trace. Option *-s* must be present if any one of options *-v, -a,* and *-e* are present, otherwise it defaults to the OAM-based trace.

-v: Request that the VPI.VCI values be collected along the trace. This option is only valid when the *-s* option is present.

-a: Request that the call reference/end point reference values be collected along the trace. This option is only valid when the *-s* option is present.

-e: Used on point-to-multipoint connections to specify the end point reference value indicating which party to trace. If no *-e* option is used for a point-to-multipoint connection, the default traces the path with the endpoint reference 0, which is the first party. This option is only valid when the *-s* option is present.

Only one connection trace is supported at a time. An error message is returned if a response from the network is not received within 30 seconds.

If the verb is issued with the *-s* option for the *vcc/vpi.vci* values that are not active or were not created by signaling (for example, control channels), the command is refused.

VERB CLEAR **Atmlf Vcc**

Impact	Service
Description	*CLEAR AtmIf/n Vcc/vpi.vci* This command is used to clear a switched connection.

GROUP **Atmlf Vcc** **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmCore

ATTRIBUTE **Atmlf Vcc** **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — AtmCore

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Atmlf Vcc operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — AtmCore

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Atmlf Vcc usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — AtmCore

Values
idle
active (activ)
busy

Default — idle

GROUP Atmlf Vcc Operational (Oper)

Properties — Operational

Description — This group contains operational information for a *Vcc, Vpc,* or *Vpt* component.

Mib — AtmCore

ATTRIBUTE Atmlf Vcc connectionPointType (cpt)

Access — Read only

Description — This attribute reflects the role of the connection component at this interface.

A value of ***connectionEndPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are processed by the connection component.

A value of ***segmentEndPoint*** indicates that user cells and end-to-end OAM cells are relayed by the connection component, while segment OAM cells are processed by the connection component.

A value of ***connectingPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are relayed by the connection component.

A value of ***unknown*** indicates that the connection component is inactive.

Mib — AtmCore

Values
connectionEndPoint
segmentEndPoint
connectingPoint
unknown

Default — No default

GROUP Atmlf Vcc ConnectionInfo (ConnInfo)

Properties — Operational

Description — This group contains operational connection characteristics information for a *Vcc* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore

ATTRIBUTE Atmlf Vcc distributionType (distrbt)

Access	Read only
Description	This attribute indicates the way data is distributed in the connection. A value of ***pointToPoint*** indicates this connection point is part of a point-to-point connection. A value of ***pointToMultipoint*** indicates this connection point is part of a point-to-multipoint connection.
Mib	AtmCore
Values	pointToPoint pointToMultipoint
Default	pointToPoint

ATTRIBUTE Atmlf Vcc numLeaves (nlvs)

Access	Read only
Description	This attribute indicates the number of destination leaves of the connection. If the *distributionType* is ***pointToPoint*** the value of this attribute is 0.
Mib	AtmCore
Values	Decimal (0..2147483647)
Default	0

ATTRIBUTE Atmlf Vcc callDirection (cdir)

Access	Read only
Description	This attribute indicates the direction of the call setup request for an SVC. A value of ***fromLink*** means that the call setup originated from the link. A value of ***toLink*** means that the call setup was directed to the link. For PVC connections, the value of this attribute is ***notApplicable.*** For SPVC connections, the value of this attribute is ***notApplicable*** for *Vccs* with the *SourcePVC* and *DestinationPVC* subcomponents. For Signaling channels, the value of this attribute is ***notApplicable***.
Mib	AtmCore
Values	fromLink toLink notApplicable

Copyright © 2006, Nortel Nortel Confidential

Default	notApplicable

GROUP Atmlf Vcc Status

Properties	Operational
Description	This group contains operational status information for a *Vcc, Vpc* or *Vpt* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc operStatus (opStat)

Access	Read only
Description	This attribute indicates the present operational status of the *Vcc, Vpc* or *Vpt* component. Its value is dependent upon the current state of the *segLinkSideLoopbackState* and *endToEndLoopbackState* attributes. The value is ***end2endUp*** when the *endToEndLoopbackState* is ***good*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***end2endDown*** when the *endToEndLoopbackState* is ***bad*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***unknown*** and the *segLinkSideLoopbackState* is ***good***. The value is ***localDown*** when *segLinkSideLoopbackState* is ***bad***. The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***notApplicable*** and the *segLinkSideLoopbackState* is ***good***. The value is ***unknown*** when the *endToEndLoopbackState* is either ***unknown*** or ***notApplicable*** and the *segLinkSideLoopbackState* is ***unknown***.
Mib	AtmCore
Values	unknown end2endUp end2endDown localUpEnd2endUnknown localDown
Default	No default

ATTRIBUTE Atmlf Vcc localFailureCause

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the failure cause of the *Vcc, Vpc* or *Vpt* component. A value of ***noFailure*** indicates that there is currently no bandwidth related failure for this connection. A value of ***portDown*** indicates that the interface corresponding to the parent *AtmIf* is down. A value of ***localBwLoss*** indicates that the *AtmIf* has lost some, but not all bandwidth, and as a result, this connection has been released. A value of ***notAdmitted*** indicates that this connection has failed to be admitted by the Connection Admission Control (CAC) algorithm. A value of ***appNotRegistered*** indicates that there is no application registered to use this connection. This may be the case, for example when there is a *Vcc Test* application, but the test has not been started. Check the status of the application to determine why it is not functional. A value of ***disabledByApp*** indicates that the application using this connection has requested that the connection be disabled. An example is a connection used by a trunk application where the trunk has timed out on an attempt to stage. Check the application to determine why it is not fully functional. A value of ***bwReduced*** indicates that this connection is operating in a reduced bandwidth state. It is a bandwidth elastic connection which currently has been allocated less than the requested (equivalent) bandwidth. A value of ***vpDown*** indicates that this connection has been notified of a fault detected at the associated VP-layer. A value of ***vpDown*** is applicable for *Vpt Vcc*s only.
Mib	AtmCore
Values	noFailure localBwLoss portDown notAdmitted appNotRegistered disabledByApp bwReduced vpDown
Default	No default

ATTRIBUTE AtmIf Vcc troubled

Access	Read only
Description	This attribute indicates whether or not the connection is in a troubled state. Connections become troubled because of OAM failures; when one of the attributes *segLinkSideLoopbackState*, *segSwitchSideLoopbackState*,

Copyright © 2006, Nortel Nortel Confidential

endToEndLoopbackState, *aisState* (when receiving AIS cells only) or *rdiState* go bad, this attribute is set to ***yes***; otherwise it is set to ***no***.

Mib	AtmCore
Values	no yes
Default	no

ATTRIBUTE Atmlf Vcc **segLinkSideLoopbackState (segLkLbkState)**

Access	Read only
Description	This attribute contains the current state of the link-side segment loopback for this connection. Link-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the link (port). The value of this attribute is dependent upon the current setting of the *segLinkSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable). The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***. The value is ***good*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the segment link side loopback is working. The value is ***bad*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the link side segment loopback is not working. The value is ***unknown*** when the *segLinkSideLoopback* is ***off***. The value is ***unknown*** when the value of the *segLinkSideLoopback* attribute is ***on***, the *connectionPointType* attribute is set to ***segmentEndPoint*** or ***connectionEndPoint***, and the segment link side loopback has not yet been determined. The state of this attribute determines, in part, the value of the *operStatus* attribute.
Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vcc **segSwitchSideLoopbackState (segSwLbkState)**

Access	Read only
Description	This attribute contains the current state of the switch-side segment loopback for this connection. Switch-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the bus. The value of this attribute is dependent upon the current setting of the *segSwitchSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable). The value is only applicable when the *connectionPointType* is a ***segmentEndPoint***. The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or ***connectionEndPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***. The value is ***good*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback is working. The value is ***bad*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the switch side segment loopback is not working. The value is ***unknown*** when the *segSwitchSideLoopback* is ***off***. The value is ***unknown*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback has not been determined.
Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

ATTRIBUTE Atmlf Vcc **endToEndLoopbackState (eeLbkState)**

Access	Read only
Description	This attribute contains the current state of the end-to-end loopback for this connection. Its value is dependent upon the current setting of the *endToEndLoopback* provisionable attribute and the connection point type as specified by the *connectionPointType* attribute.

Copyright © 2006, Nortel Nortel Confidential

The value is only applicable when the *connectionPointType* is a ***connectionEndPoint***.

The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or s***egmentEndPoint***.

The value is ***notApplicable*** when the *distributionType* is a ***pointToMultipoint***.

The value is ***good*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is working.

The value is ***bad*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is not working.

The value is ***unknown*** when the *endToEndLoopback* is ***off***.

The value is ***unknown*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback status has not been determined.

The state of this attribute determines, in part, the value of the *operStatus* attribute.

Values	good bad unknown notApplicable
Default	No default

ATTRIBUTE Atmlf Vcc rxOamCellCongestionState (rxOamCongState)

Access	Read only
Description	This attribute contains the current state of the receive side OAM cell congestion for this connection. Its value reflects whether the rate of received OAM cells for this connection is below a specified threshold. The connection maintains a count of the number of OAM cells which are terminated per second. Once that count exceeds the specified threshold, extraction of all OAM cells for this connection is disabled for a period of one minute. This is a congestion management mechanism to prevent the processor from being overloaded with handling OAM cells for a particular connection. This mechanism ensures that tasks, such as trunks obtain enough processor cycles to remain in service, and are not adversely affected by excessive rate of OAM cells on a particular connection. The value is ***good*** when the rate of received OAM cells is less than the allowed threshold.

Copyright © 2006, Nortel Nortel Confidential

The value is ***bad*** when the arrival rate has exceeded the allowed threshold. It remains ***bad*** for one minute, before returning to ***good*** again. During this timeout, extraction of all OAM cells is disabled for this connection. As a result, other loopback failure conditions may occur.

The value is ***unknown*** when the application has not yet begun to use this connection. An example is the *Test* component before a test has been started.

Each type of OAM cell is counted separately. The threshold for AIS cells is three cells per second. If more than three AIS cells are received within a one second interval, this attribute is set to ***bad***. The threshold for RDI cells and each loopback type is also three, but the threshold for trace cells is 250 per second.

The state of this attribute has no direct effect on the value of the *operStatus* attribute or on the number of troubled connections.

ATTRIBUTE Atmlf Vcc aisState

Access: Read only

Description: This attribute contains the current state of the Alarm Indication Signal for this connection.

A value of ***good*** indicates that the connection's application is active and no alarm has occurred.

A value of ***bad*** indicates that the connection's application is active and an alarm has occurred.

A value of ***unknown*** indicates that the connection's application is inactive.

A value of ***notApplicable*** occurs when the *connectionPointType* is either a ***segmentEndPoint*** or a ***connectingPoint***.

Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc txCellDiscard (txcd)

Access	Read only
Description	This attribute counts the number of cells received from the backplane on this connection that have been discarded. Discarded cells are not counted in the *txCell* attribute. Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point. For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscard* values for all connections associated with the *Vpt*. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc txCellDiscardClp (txcdClp)

Access	Read only
Description	This attribute counts the number of cells received from the backplane on this connection with CLP=1 that have been discarded.

Copyright © 2006, Nortel Nortel Confidential

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

This count is included in the *txCellDiscard* attribute. Discarded cells are not counted in the *txCellClp* attribute.

Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscardClp* values for all connections associated with the *Vpt*.

When both ingress and egress of a port is down, txcells are silently discarded.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc txFrameDiscard (txfd)

Access	Read only
Description	This attribute counts the number of frames received from the backplane on this connection that have been discarded.

Frames are discarded due to congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection interface is disabled.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtmcards***, this attribute does not count frames discarded due to congestion at the main traffic management device toward the link.

This count is independent of the *txCell* or *txCellDiscard* attribute.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is

ATTRIBUTE Atmlf Vcc rxAal5FrameError (rxfer)

Access	Read only
Description	This attribute counts the number of frames received from the interface on this connection that have AAL5 length errors or AAL5 CRC errors. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed. AAL5 length or CRC errors typically occur because of cell discards due to congestion, UPC, or due to corruption of data between the AAL5 segmentation and reassembly end points. This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point. For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameError* values for all connections associated with the *Vpt*. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc rxAal5FrameAbort (rxfa)

Access	Read only
Description	This attribute counts the number of frames received from the interface on this connection that have the AAL5 length field set to zero. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed.

Copyright © 2006, Nortel Nortel Confidential

An AAL5 length of zero is an indication by the far end segmentation point, to this reassembly point, that the frame is to be discarded without reassembly. This mechanism is typically used by a segmentation point if it detects an error in a frame after some of the cells belonging to that frame have already been transmitted.

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameAbort* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Common Verbs	Help List Display

GROUP Atmlf Vcc Vcd Loopback (Lbk)

Properties	Provisioned
Description	This group contains the provisionable loopback attributes for a *Vcc, Vpc,* or *Vpt* component. Note that certain loopback requests may not be possible on a given connection. In such cases, the corresponding operational loopback attribute in the *Status* group of the *Vcc, Vpc,* or *Vpt* component indicates ***notApplicable*** and the requested loopback is not performed. If loopbacks are provisioned to be on, and for any reason the segment or end-to-end OAM loopback cells are not relayed, the connection component becomes troubled, and user cell traffic may be discarded. If loopbacks are provisioned to be on, all of the nodes in the segment, and external networks which are in the end-to-end connection must relay the OAM loopback cells.

Mib	AtmCore

ATTRIBUTE Atmlf Vcc Vcd segLinkSideLoopback (segLkLbk)

Access	Read and write
Description	This attribute specifies whether link-side segment loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the link-side segment loopback insertion for the connection is based on the *segLinkSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has link-side segment loopback insertion turned on, then link-side segment loopback insertion is also on for the connection. A value of ***on***, or ***off*** means link-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component. Note that link-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***. Link-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint***. In such cases, the operational *segLinkSideLoopbackState* attribute indicates ***notApplicable*** and link-side segment loopback insertion is not performed. Link-side segment loopback insertion is always possible on a *Vpt*.
Mib	AtmCore
Values	on off sameAsInterface
Default	sameAsInterface

ATTRIBUTE Atmlf Vcc Vcd segSwitchSideLoopback (segSwLbk)

Access	Read and write
Description	This attribute specifies whether switch-side segment loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the switch-side segment loopback insertion for the connection is based on the *segSwitchSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has switch-side segment loopback insertion turned on, then switch-side segment loopback insertion is also on for the connection. A value of ***on***, or ***off*** means switch-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component.

Copyright © 2006, Nortel Nortel Confidential

Note that switch-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint*** or ***connectionEndPoint***. Switch-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint*** In such cases, the operational *segSwitchSideLoopbackState* attribute indicates ***notApplicable*** and switch-side segment loopback insertion is not performed.

Switch-side segment loopback is never possible on a *Vpt*.

ATTRIBUTE Atmlf Vcc Vcd Tm **fwdQosClass (fwdQos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for the forward direction for this connection. This attribute is only used for SPVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (variable bit rate audio and video). Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified bit rate QOS class; no objective is specified for the performance parameters.
Mib	AtmCore
Values	0 1 2 3 4
Default	0

ATTRIBUTE Atmlf Vcc Vcd Tm **txQueueLimit (txQlim)**

Access	Read and write
Criticality	Component
Description	This attribute specifies an override to the default transmit queue limit for this connection. A value of ***sameAsCa*** means that the default common or per-VC transmit queue limit, as defined by the CA service category, is used for this connection. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***sameAsCa*** must be specified. A value from 5 to 512,000 means that the connection transmit queue limit differs from the default common or per-VC transmit queue limit, as defined by the CA service category. A value other than ***sameAsCa*** is ignored for connections where common queuing is specified for the service category.

Copyright © 2006, Nortel Nortel Confidential

For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the per-VC utilization limit of the service category common queue.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from 5 to 512000 inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

On all other cards, the valid range for this attribute is from 5 to 63488 inclusive.

The actual transmit queue limit for a connection is visible in the *Vcc Tm*, *Vpc Tm* or *Vpt txQueueThresholds* attribute.

This attribute is not applicable for basic *Vpt*s.

Mib	AtmCore
Values	Decimal (5..1011840) sameAsCa
Units	cells
Default	sameAsCa

ATTRIBUTE **Atmlf Vcc Vcd Tm** **holdingPriority (hpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. The default holding priority for a provisioned connection is higher then default holding priorities for dynamic (SVC) connections. The value of this attribute may be overridden by certain applications, for example *Vcc Test*, which use this connection. This attribute is not applicable for *Vpt Vcc*s.
Mib	AtmCore
Values	0 1 2

ATTRIBUTE Atmlf Vcc Vcd Tm **rxTrafficDescType (rxTdt)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the type of traffic management which is applied to the receive direction of this connection as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute. The value ***sameAsTx*** means the *rxTrafficDescType* as well as the *rxTrafficDescParm* attribute values are taken from the values of the *txTrafficDescType* and *txTrafficDescParm* attributes.
Mib	AtmCore
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE Atmlf Vcc Vcd Tm **bwdQosClass (bwdQos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for the backward direction for this connection. This attribute is only used for SPVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance

Copyright © 2006, Nortel Nortel Confidential

requirements (Connectionless Data Transfer).

Class 0 is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

The ***sameAsFwd*** selection sets the backward quality of service to be the same as the forward quality of service.

Mib	AtmCore
Values	0 1 2 3 4 sameAsFwd
Default	sameAsFwd

ATTRIBUTE Atmlf Vcc Vcd Tm atmServiceCategory (service)

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The value ***derivedFromBBC*** may only be used if the *Src* or *Dst* component is provisioned under this connection. Otherwise a specific ATM service category must be specified. A value of ***derivedFromBBC*** means the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. A value other than ***derivedFromBBC*** means the value of this attribute is used to override the provisioned BBC Information Element parameters. In this case, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. The ***rtVariableBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are

Copyright © 2006, Nortel Nortel Confidential

delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real-time VBR service may support statistical multiplexing of real-time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non real-time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non real-time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Mib	AtmCore
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) availableBitRate (abr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE **AtmIf Vcc Vcd Tm** **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. This attribute is ignored if the *atmServiceCategory* is ***availableBitRate***. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, traffic shaping is not available, therefore this attribute is ignored. A value of ***sameAsCa*** means traffic shaping for the connection is based

Copyright © 2006, Nortel Nortel Confidential

on the value of the *trafficShaping* attribute of the connection's service category component under the *CA.* If the service category has *trafficShaping* set to ***enabled*** or ***inverseUpc***, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm, Vpc Tm,* or *Vpt Tm* components.

A value of ***disabled*** means traffic shaping for this connection is disabled regardless of the provisioning of the connection's service category component.

Mib — AtmCore

Values — disabled
sameAsCa

Default — sameAsCa

ATTRIBUTE Atmlf Vcc Vcd Tm unshapedTransmitQueueing (unshap)

Access — Read and write

Criticality — Component

Description — This attribute specifies the transmit queuing method for this connection if it is unshaped. The two possible methods are per-VC queuing and common queuing. This attribute does not apply if the connection is shaped.

A value of ***sameAsCa*** means the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *CA*.

A value of ***common*** means transmit traffic on this unshaped connection is destined for the common queue.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, ***1pOC48ChSmIrAtm***, and ***4pMRPosAtm*** cards, this attribute must have the value ***sameAsCa***.

This attribute is ignored in the following situations:
- if the connection has *trafficShaping* ***enabled*** or ***inverseUpc***, or
- if the *atmServiceCategory* is ***availableBitRate***, or
- if the *atmServiceCategory* is ***constantBitRate***, or
- for basic *Vpt*s and standard *Vpt Vcc*s.

Mib — AtmCore

Values — common
sameAsCa

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsCa

ATTRIBUTE AtmIf Vcc Vcd Tm **weight**

Access	Read and write
Criticality	Component
Description	This attribute specifies an override for the weight of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, and basic *Vpt*s. A value of ***sameAsCa*** means the weight is determined by the *weightPolicy* attribute under the *CA* service category component for all but standard *Vpt Vcc*s. For standard *Vpt Vcc*s, the weight is determined by the *Vcc*'s service category, when the value is set to ***sameAsCa***. A value from 1 to 4095 means that value is used for the fairness weight of this connection relative to other connections. For all but standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the *Vpt*. A value of ***upToQueueLimit*** means the fairness weight is limited only by the *txQueueLimit*. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, the value ***upToQueueLimit*** is not permitted.
Mib	AtmCore
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa

ATTRIBUTE AtmIf Vcc Vcd Tm **forceTagging (tagging)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether force tagging of the CLP bit is enforced for cells of this connection. Force tagging can be enabled for permanent connections of any service category and on switched connections of UBR

Copyright © 2006, Nortel Nortel Confidential

service category.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards, and for *Vpt*s, this attribute is not applicable and is ignored.

A value of ***sameAsCa*** means the force tagging functionality is determined by the *forceTagging* attribute under the *CA* service category component.

A value of ***enabled*** means force tagging is enabled. When this option is selected, the CLP bit is set to 1 for all cells on the connection.

A value of ***disabled*** means force tagging is disabled. When this option is selected, the CLP bit is unchanged for cells on the connection.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction. In this case, cells which are tagged are counted in the *txCellClp* attribute.

Mib	AtmCore
Values	sameAsCa enabled disabled
Default	sameAsCa

ATTRIBUTE **Atmlf Vcc Vcd Tm** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enables usage parameter control (UPC) when receiving traffic from the ATM interface. The value ***sameAsCa*** means UPC for the connection is based on the value of the *usageParameterControl* attribute of the service category component under the *AtmIf CA.* If the service category has UPC ***enforced*** or ***monitored***, then UPC is enabled on the connection. The value ***disabled*** means UPC for this connection is disabled regardless of the provisioning of the service category. The value ***enforced*** means UPC for this connection is enforced regardless of the provisioning of the service category. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*. The value ***monitored*** means UPC for this connection is monitored regardless of the provisioning of the service category. When UPC is monitored, instead of the non-conforming cells being tagged or discarded,

Copyright © 2006, Nortel Nortel Confidential

they are merely counted in the UPC violations counts and passed on unchanged.

Note that setting UPC to ***enforced*** or ***monitored*** may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc, Vpc,* and *Vpt* components.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported.

For ***1pOC48ChSmIrAtm*** cards, the values ***enforced***, and ***monitored***, are not supported.

Mib	AtmCore
Values	enforced disabled sameAsCa monitored
Default	sameAsCa

ATTRIBUTE **Atmlf Vcc Vcd Tm** **bearerClassBbc (bcBbc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the bearer capability. This attribute is only used for SPVC and SPVP connections. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both. Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents. Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Copyright © 2006, Nortel Nortel Confidential

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***) and timing requirements are user defined (that is, transparent to the network).When ***x*** is set the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class **vp** service is used to specify a transparent VP service. When the value of this attribute is vp, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except or VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP connections.

Mib: AtmCore

Values:
a
c
x
vp
derivedFromServiceCategory

Default: derivedFromServiceCategory

ATTRIBUTE Atmlf Vcc Vcd Tm **transferCapabilityBbc (tcBbc)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

The value ***notApplicable*** specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.
The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value no indication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

Copyright © 2006, Nortel Nortel Confidential

The value yes for end-to-end timing indicates that end-to-end timing is required.

The value no for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Vcc Vcd Tm **txWredThreshold**

Access: Read and write

Criticality: Component

Description

This attribute specifies the threshold for weighted random early detection (WRED). This threshold is calculated as a percentage of the early packet discard (EPD) threshold, which is 85% of the transmit queue length. When the value is ***25%***, WRED starts as soon as the queue is 25% of the way to the EPD threshold. When the value is ***50%***, WRED starts later, after the queue is 50% of the way to the EPD threshold. When the value is ***75%***, WRED starts only when the queue is 75% of the way to the EPD threshold.

This attribute is ignored if the value of the *txWredMode* or *txPacketWiseDiscard* attributes is ***disabled.***

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

ATTRIBUTE Atmlf Vcc Vcd Tm **txPacketWiseDiscard (txpd)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the transmit data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s. Packet-wise functions increase the “goodput” of the link. The transmit packet-wise functions are Early Packet Discard (EPD) and Partial Packet Discard (PPD). EPD allows the connection to discard an entire frame once the transmit queue has reached the EPD threshold. EPD increases the “goodput” of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell. PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted. For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the packet-wise discard functions are PPD and EPD. PPD is applicable at cell-transfer points. PPD is not applicable at frame-to-cell conversion points, and is not applicable for *Vpc*s. PPD is configured by this attribute. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded. EPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Both PPD and EPD are controlled by this attribute. This attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards,

Copyright © 2006, Nortel Nortel Confidential

packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. This attribute may safely be set to ***enabled*** for VCCs since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

A value of ***enabled*** means packet-wise discard functions are applied to transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the backward direction. When this attribute is set to ***disabled***, backward frame discard is not requested in the SPVC call setup.

The transmit packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute.

Mib	AtmCore
Values	disabled enabled
Default	disabled

ATTRIBUTE Atmlf Vcc Vcd Tm rxPacketWiseDiscard (rxpd)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the receive data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s. Packet-wise functions increase the “goodput” of the link. The receive packet-wise function is Partial Packet Discard (PPD). PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The

Copyright © 2006, Nortel Nortel Confidential

PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD is available at all VCC connection points where UPC may be activated. PPD is not applicable for *Vpcs*. Packet-wise discards should only be enabled for connections carrying AAL5 segmentation traffic. Setting the value to ***enabled*** for any other traffic type may result in traffic being discarded. PPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, this attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***1pOC48ChSmIrAtm*** cards, this attribute may safely be set to ***enabled*** for VCCs, since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. A value of ***enabled*** for the *rxPacketWiseDiscard* attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in enabling packet-wise discard functions on these cards. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

A value of ***enabled*** means packet-wise discard functions are applied to receive traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward direction. When this attribute is set to ***disabled***, forward frame discard is not requested in the SPVC call setup.

Copyright © 2006, Nortel Nortel Confidential

The receive packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm rxPacketWiseDiscard* operational attribute.

ATTRIBUTE Atmlf Vcc Vcd Tm txWredMode

Access: Read and write

Criticality: Component

Description: This attribute specifies the activation of weighted random early detection (WRED) functionality. WRED is considered a packet-wise discard function and as such applies only to AAL5 frame traffic.

WRED is applied in the transmit direction for this connection. WRED function should be enabled only for connections which are transferring TCP/IP traffic. WRED acts to prevent synchronization of multiple TCP/IP sources by randomly discarding a small percentage of frames when transmit queue congestion reaches the designated level. WRED may also be used to differentiate service on VCC's by preferentially discarding one VCC before another. Discards start at 0% of cells, when the queue is part-way to the Early Packet Discard (EPD) threshold, and rise to 100% of cells discarded at the EPD threshold. WRED discards all the cells in a frame.

A value of ***enabled*** means WRED is enabled for all applications linked to the given *Vcc*.

A value of ***perFlow*** means each TCP application has individual control over whether to enable or disable WRED.

If the value of the *txPacketWiseDiscard* attribute is ***disabled***, or if the value of this attribute is ***disabled***, WRED functionality is disabled.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, the value of this attribute must be ***disabled***.

If WRED is active, it is visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute.

This attribute is not applicable for *Vpt*s or *Vpt Vcc*s.

ATTRIBUTE Atmlf Vcc Vcd Tm **abrConnectionType (abrType)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the type of ABR behavior which is to be enforced at this connection. This attribute is only applicable if the value of the *atmServiceCategory* attribute is ***availableBitRate***. If the value of the *atmServicecategory* attribute is not ***availableBitRate***, this attribute is ignored. The value ***sameAsCa*** is used to request the default behavior as specified in the *CA Abr* component for this *Vcc*. Otherwise, this attribute overrides the default behavior. The value ***virtualSourceDest*** is used to request that this connection point function as a virtual source/virtual destination. The value ***sourceDest*** requires that this connection point function as a S/D for RM cells. S/D mode is automatically invoked at this connection point either if this is a connection end point, or if the next hop connection point is configured as ***nonAbrInterworking***. The value ***nonAbrInterworking*** is used to request that this connection point function as an interworking between ABR and non-ABR service categories. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***. The value ***abrSwitch*** is used to request ABR switch behavior for this connection point. The ABR switch behavior is first, to conform to ***virtualSourceDest*** or ***nonAbrInterworking*** setting on the next hop, and otherwise to implement ABR ER switch behavior. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the only allowable values are ***sameAsCa***, ***nonAbrInterworking*** or ***abrSwitch***. If ***abrSwitch*** is selected, EFCI marking behavior is implemented. For ***1pOC12SmLrAtm*** cards, the only allowable values are ***sameAsCa*** or ***abrSwitch.*** If ***abrSwitch*** is selected, EFCI marking behavior is implemented. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the only allowable value is ***sameAsCa***. The actual ABR functionality which is in effect is visible in the *Vcc/Vpc/Vpt Tm abrConnectionType* operational attribute.

Default	sameAsCa

ATTRIBUTE **AtmIf Vcc Vcd Tm** **txTrafficDescParm (txTdp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR, MCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *txTrafficDescType* is 1 or 2, all of the parameters must be set to zero. When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP

Copyright © 2006, Nortel Nortel Confidential

equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 4 and parameter 5 represent are not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may be optionally zero.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate. When the *atmServiceCategory* is ***availableBitRate*** (ABR), the shaping rate is dynamically chosen, based on the ABR flow control mechanism, as a value between the MCR and the PCR or the requested shaping rate if applicable.

For *txTrafficDescType* 3, 4 and 5, the transmit traffic is shaped at the next available shaping rate less than the PCR.

For *txTrafficDescType* 6, 7 and 8 if linear traffic shaping is selected, the transmit traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

Copyright © 2006, Nortel Nortel Confidential

For *txTrafficDescType* 3 ,4,5,6,7 and 8, with ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, parameter 4 must be less than or equal to 643,000.

For *txTrafficDescType* 6, 7 and 8 if inverse-UPC traffic shaping is selected, the transmit traffic is shaped at a variable rate which conforms to the PCR, SCR and MBS of the connection traffic descriptor.

ATTRIBUTE **Atmlf Vcc Vcd Tm** **rxTrafficDescParm (rxTdp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. If the value of the *rxTrafficDescType* attribute is ***sameAsTx***, the values provisioned in this attribute are ignored. The traffic parameters for the receive direction are taken from the *txTrafficDescParm* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), and Minimum Cell Rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. The value of CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for usage parameter control (UPC). When *rxTrafficDescType* is 1 or 2, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to

Copyright © 2006, Nortel Nortel Confidential

0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameter 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

If the value of CDVT either in parameter 2 or in parameter 4 is zero, the CDVT is taken from the *CA* defaults for the particular *atmServiceCategory* of this connection.

Parameter 5 of the *rxTrafficDescParm* is always unused.

When *rxTrafficDescriptorType* is 3 through 8, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware. The *check prov* command detects such cases and generates an error message. If this happens, adjust the parameters until they fall within the supported limits.
To calculate the limits, use the following formulae:
I1 = 1,000,000,000 / PCR
L1 = CDVT * 1000
I2 = 1,000,000,000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is 6 through 8.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, I1 and I2 must be less than or equal to 335,523,840. I1 + L1 must be less than or equal to 1,342,156,800. I2 + L2 must be less than or equal to 1,342,156,800. If the values of I1, L1, I2 or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41,940,480 or
I2 > 41,940,480 or
I1 + L1 > 167,769,600 or

Copyright © 2006, Nortel Nortel Confidential

	I2 + L2 > 167,769,600 then both I1 and I2 must be greater than 20,480. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, L2 must be less than or equal to 2,674,011,406. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, L2 must be less than or equal to 17,179,869,180.

Groups	GROUP AtmIf Vcc Vcd Tm Abr Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Vcd Tm AvailableBitRate,* *AtmIf/n Vpc/vci Vpd Tm AvailableBitRate,* *AtmIf/n Vpt/vpi Vpd Tm AvailableBitRate,* *AtmIf/n Vpt/vpi Vcc/vci Vcd Tm AvailableBitRate* This component contains provisioned ABR-related attributes of a connection. It is an optional subcomponent of the *Vcd Tm* and *Vpd Tm* component. It is used to override DGCRA-related defaults in the *CA Abr* component. It contains the specific configuration for the ABR connection at this connection point. If this is the source of an SPVC connection, this component also contains the ABR parameters required for the SPVC call request.
Mib	AtmCore
Common Verbs	Help List Display Add DELete

GROUP Atmlf Vcc Vcd Tm Abr Provisioned (Prov)

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group contains provisioned attributes for the ABR ATM connections configured on an ATM interface.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **initialCellRate (icr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. The value ***sameAsCa*** means the initial cell rate is determined by the *AtmIf CA Abr*/0 *icr* attribute. The value ***useMcr*** means ICR is set to the same value as the Minimum Cell Rate (MCR) for the connection. The value ***usePcr*** means ICR is set to the same value as the Peak Cell Rate (PCR) for the connection. If the value is less than the MCR of the connection, then the MCR is used as the ICR. If the value is more than PCR of the connection, then PCR is used as the ICR. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..16777215) sameAsCa useMcr usePcr
Units	cell/s
Default	sameAsCa

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **transientBufferExposure (tbe)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the source to send during start-up periods, before the first Resource Management (RM) cell returns. TBE divided by *fixedRoundTripTime* determines an upper bound for the

Copyright © 2006, Nortel Nortel Confidential

operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period.

TBE divided by *maxCellsPerRmCell* specifies the operational value of *forwardRmCellLimit*, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* is set to ***erSwitch***.

Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	16777215

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **fixedRoundTripTime (frtt)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. The value of *transientBufferExposure* divided by the value of FRTT (in seconds) determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec
Default	5000000

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **rateDecreaseFactor (rdf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may

Copyright © 2006, Nortel Nortel Confidential

decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib: AtmCore

Values: Decimal (0..15)
sameAsCa

Default: sameAsCa

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **rateIncreaseFactor (rif)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64.

RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib: AtmCore

Values: Decimal (0..15)
sameAsCa

Default: sameAsCa

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **maxCellPerRmCell (nrm)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell.

Copyright © 2006, Nortel Nortel Confidential

A value of 2 is not recommended although it is permitted according to the ATM Forum standard. When this attribute is set to a value of 2, it is possible that only one forward and one backward RM cell are repeatedly transmitted, and all data traffic is queued up indefinitely.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib	AtmCore
Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256) sameAsCa
Units	cells
Default	sameAsCa

ATTRIBUTE **Atmlf Vcc Vcd Tm Abr** **maxTimeBetweenRmCells (trm)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the TRM parameter for this connection. TRM provides an lower bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least two other cells have been sent, then the next cell to be transmitted would be a forward RM cell. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***. The provisioned value of 781 is signaled as TRM = 0, in the ABR Additional Parameters Information Element. 1563 is signaled as TRM = 1. 3125 is signaled as TRM = 2. 6250 is signaled as TRM = 3. 12500 is signaled as TRM = 4 25000 is signaled as TRM = 5. 50000 is signaled as TRM = 6. 100000 is signaled as TRM = 7.
Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE **Atmlf Vcc Vcd Tm Abr** **cutoffDecreaseFactor (cdf)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero. CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the CRM parameter, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. The value of CRM is indicated by the *forwardRmCellLimit* attribute. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0; 1; 2; 4; 8; 16; 32; 64) sameAsCa
Default	sameAsCa

ATTRIBUTE **AtmIf Vcc Vcd Tm Abr** **acrDecreaseTimeFactor (adtf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection. ADTF is the maximum time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..1023) sameAsCa
Units	centiseconds

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsCa

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **dgcraMaximumDelay (dgcraMaxDelay)**

Access	Read and write
Criticality	Component
Description	This attribute specifies an upper bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward direction). This upper bound may be approximated as the sum of the round trip fixed and propagation delays and the maximum queuing delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When there is a reduction in the Allowed Cell Rate (ACR), the policer waits for a correspondingly longer period of time before it enforces at the new cell rate. The value of this attribute must not be less than the *dgcraMinimumDelay* attribute.
Mib	AtmCore
Values	Decimal (1..16700000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **dgcraMinimumDelay (dgcraMinDelay)**

Access	Read and write
Criticality	Component
Description	This attribute specifies a lower bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward connection). This lower bound may be approximated as the sum of the round trip fixed and propagation delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A smaller value for this attribute implies a more lenient policer. When there is a increase in the Allowed Cell Rate (ACR), the policer waits for a correspondingly shorter period of time before it enforces at the new cell rate.

Mib	AtmCore
Values	Decimal (1..16700000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **farEndAcrDecreaseTimeFactor (feAdtf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) of the far end ABR source. The value specified should be the same as the ADTF parameter at the far end of this ABR connection. The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the value of this attribute, the policer begins to limit enforce the incoming traffic at the initial cell rate (ICR) of the far end, as specified by the *farEndInitialCellRate* attribute.
Mib	AtmCore
Values	Decimal (0..1023)
Units	centiseconds
Default	50

ATTRIBUTE Atmlf Vcc Vcd Tm Abr **farEndInitialCellRate (feIcr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Initial Cell Rate (ICR) of the far end ABR source. The value specified should be the same as the ICR parameter at the far end of this ABR connection. The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the *farEndAcrDecreaseTimeFactor* attribute, the policer begins to enforce the incoming traffic at the value of this attribute. If this attribute is specified less than the MCR of the connection, then the MCR is used as the *feIcr*. If this attribute is more than the PCR of the connection, then PCR is used as the *feIcr*.

COMPONENT AtmIf Vcc Vcd PerformanceMonitoring (Pm)

Groups	GROUP AtmIf Vcc Vcd Pm Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/x.y Vcd PerformanceMonitoring* *AtmIf/n Vpt/x vcc/y Vcd PerformanceMonitoring* *AtmIf/n Vpc/x Vpd PerformanceMonitoring* This component represents the Performance Monitoring (Pm) function on a provisioned connection. No Performance Monitoring is done unless this component is present. The attribute values override corresponding values in the AtmIf Pm component. There can be a maximum of 255 Pms on one LP.
Mib	AtmCore
Common Verbs	Help List Display Add DELete

GROUP AtmIf Vcc Vcd Pm Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioned attributes which specify Performance Monitoring (PM) measurements, namely, Availability Ratio (AR) and Cell Loss Ratio (CLR), and control modes for the connection. The values specified in this group override those specified by the *AtmIf Pm* component.
Mib	AtmCore

ATTRIBUTE AtmIf Vcc Vcd Pm segSwitchSideMeasurement (segSwitchSide)

Access	Read and write
Description	This attribute specifies the set of Performance Monitoring (PM) measurements on the switch side configuration for the connection. A value of ***sameAsInterface*** means that the measurements specified by the *segSwitchSideMeasurement* attribute of the *AtmIf Pm* component will be performed. No other values may be specified if ***sameAsInterface*** is selected. If the value is empty, no switch side PM measurements are done.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore
Set of	availabilityRatio (ar) cellLossRatio (clr) sameAsInterface (sameAsIf)
Default	(sameAsInterface)

ATTRIBUTE Atmlf Vcc Vcd Pm **segLinkSideMeasurement (segLinkSide)**

Access	Read and write
Description	This attribute specifies the set of Performance Monitoring (PM) measurements on the link side configuration for the connection. A value of ***sameAsInterface*** means that the measurements specified by the *segLinkSideMeasurement* attribute of the *AtmIf Pm* component will be performed. No other values may be specified if ***sameAsInterface*** is selected. If the value is empty, no link side PM measurements are done.
Mib	AtmCore
Set of	availabilityRatio (ar) cellLossRatio (clr) sameAsInterface (sameAsIf)
Default	(sameAsInterface)

ATTRIBUTE Atmlf Vcc Vcd Pm **controlMode (mode)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the control mode of Performance Monitoring (PM) measurements for the connection. A value of ***autoStart*** means that PM activation procedures will start when the provisioned data is activated. A value of ***onDemand*** means that PM activation procedures will start when the operator issues the *Start* command. The PM measurements in this mode will continue until the operator issues the *Stop* command. A value of ***sameAsInterface*** means that the behavior will be as specified by the *controlMode* attribute of the *AtmIf Pm* component.
Mib	AtmCore
Values	autoStart (auto) onDemand (onDemand) sameAsInterface (sameAsIf)
Default	sameAsInterface

ATTRIBUTE Atmlf Vcc Vcd Pm **switchSideClrType (clrType)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies how the Cell Loss Ratio (CLR) Performance Monitoring (PM) is measured on a switch-side configuration for the connection. A value of ***complete*** indicates that egress discards at the segment end points are included in the CLR measurement as per ITU standards. A value of ***partial*** indicates that egress discards do not contribute to the CLR measurement. A value of ***sameAsInterface*** means that the behavior is as specified by the *switchSideClrType* attribute of the *AtmIf Pm* component.
Mib	AtmCore
Values	complete partial sameAsInterface (sameAsIf)
Default	sameAsInterface

COMPONENT Atmlf Vcc Loop (Loop)

Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Loop* The *Loop* component configures an ATM connection so that cells received from the ATM interface are retransmitted back to the interface through that connection. The *Loop* component requires exclusive use of its parent *Vcc* or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Nrp*, and *Test*).
Mib	AtmCore
Common Verbs	Help List Display Add DELete

COMPONENT Atmlf Vcc NailedUpRelayPoint (Nrp)

Groups	GROUP Atmlf Vcc Nrp Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Nrp* This component is used to establish a single hop of a nailed-up ATM Bearer Service (ABS) connection. By linking together two *Nrp*s within a module, the associated connections are configured to relay ATM cells to one another. The *Nrp* component requires exclusive use of its parent *Vcc*

Copyright © 2006, Nortel Nortel Confidential

	or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Test*, and *Loop*).
Mib	AtmBearerService
Common Verbs	Help List Display Add DELete

GROUP AtmIf Vcc Nrp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Nrp* component.
Mib	AtmBearerService

ATTRIBUTE AtmIf Vcc Nrp nextHop (nextHop)

Access	Read and write
Criticality	Component
Description	This attribute specifies the *Nrp* component with which this *Nrp* is associated. A sample value is *AtmIf/31 Vcc/0.32 Nrp.*
Mib	AtmBearerService
Values	Link (Service, nextHop)
Default	No default

ATTRIBUTE AtmIf Vcc Nrp oamSegmentBoundary (sb)

Access	Read and write
Criticality	Component
Description	This attribute specifies the OAM segment boundary desired for a *Nrp* component. It affects the connection point type value visible in the parent component's *connectionPointType* attribute. The desired OAM segment boundary can be specified directly as ***yes***, ***no*** or ***sameAsInterface***. If ***sameAsInterface*** is specified, the OAM segment boundary is same as the *oamSegmentBoundary* attribute of the associated *AtmIf* and the switch will set the *connectionPointType*, choosing ***segmentEndPoint*** for a segment-boundary ATM interface and ***connectingPoint*** for a non-segment-boundary ATM interface.
Mib	AtmBearerService
Values	no yes sameAsInterface

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsInterface

ATTRIBUTE Atmlf Vcc Nrp **bandwidthElastic (bwElastic)**

Access	Read and write
Criticality	Component
Description	This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the *bandwidthReduction* attribute. A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Nrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid. A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority*.
Mib	AtmBearerService
Values	no yes
Default	no

ATTRIBUTE Atmlf Vcc Nrp **overrideHoldingPriority (ohpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used.
Mib	AtmBearerService
Values	0 1 2 3

Copyright © 2006, Nortel Nortel Confidential

	4 noOverride
Default	noOverride

COMPONENT Atmlf Vcc NailedUpEndPoint (Nep)

Groups	GROUP Atmlf Vcc Nep Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Nep* The *NailedUpEndPoint* component is used to link a VCC to an application that sends and receives frames using the connection. The *Nep* component requires exclusive use of its parent *Vcc* and cannot co-exist with other ATM service components (such as *Nrp*, *Test*, and *Loop*).
Mib	AtmCore
Common Verbs	Help List Display Add DELete

GROUP Atmlf Vcc Nep Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *Nep* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc Nep applicationName (appName)

Access	Read only
Description	This attribute specifies the application that sends and receives frames using the VCC. This attribute is set, for example, by provisioning the *Trunk AtmAccess AtmConnection* attribute. If it is properly configured, this attribute will show a value such as “Trk/22 AtmAccess”.
Mib	AtmCore
Values	Link (Service, atmConnection)
Default	No default

COMPONENT Atmlf Vcc Test (Test)

Groups	GROUP Atmlf Vcc Test OsiState (State) GROUP Atmlf Vcc Test Setup (Setup) GROUP Atmlf Vcc Test Results (Results)
Scope	Device

Copyright © 2006, Nortel Nortel Confidential

Description	*AtmIf/n Vcc/vpi.vci Test* The *Test* component allows test traffic to be sent over an ATM connection. It is used to verify the integrity of hardware carrying ATM traffic, and provides test capabilities similar to those provided by non-ATM port and line tests. The *Test* component requires exclusive use of its parent *Vcc* and cannot co-exist with other ATM service components (such as *Nep*, *Nrp*, and *Loop*). An ATM connection test circulates traffic through a VCC having a *Test* component at one end and the other end configured to loop back ATM cells. The *Test* component generates test frames, transforms them into ATM cells using AAL5 segmentation, and transmits them through the VCC; the returned cells are received by the *Test* component, reassembled back into frames, and the frames are consumed. The test frames generated by the test are grouped into two independent streams. 1) The loading frame stream circulates a set of “loading frames” through the connection as rapidly as possible. The intent of this stream is to verify the operation of the connection under a controlled load. 2) The verification stream transmits a series of “verification frames” through the connection; as each frame is returned, the *Test* component verifies its contents and the next verification frame in the series is transmitted. The intent of this stream is to verify that frames are not being corrupted. The test can be configured to send frames from either or both streams. The size and content of the test frames can also be controlled.
Mib	AtmCore
Common Verbs	Help List Display Add DELete

VERB START **AtmIf Vcc Test**

Impact	Service
Description	*START AtmIf/n Vcc/vpi.vci Test* This verb invokes an ATM connection test. It has no effect when the test is already running.

VERB STOP **AtmIf Vcc Test**

Impact	Service
Description	*STOP AtmIf/n Vcc/vpi.vci Test* This verb stops an ATM connection test. It has no effect when the test is not running.

GROUP Atmlf Vcc Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmCore
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vcc Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vcc Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmCore
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vcc Test Setup (Setup)

Properties	Operational
Description	This group contains attributes that govern the operation of an ATM connection test. These attributes cannot be changed while the test is running.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc Test frmTypes (types)

Access	Read and write
Description	This attribute specifies the types of the test frames to be transmitted during the ATM connection test. It must contain at least one of the following: ***loading***: A set of “loading frames” is circulated over the link as rapidly as possible. This frame type should be selected when the test is intended to verify the operation of the connection under a specified load. These frames are not checked for bit errors. ***verification***: A single “verification frame” is transmitted over the link; when the frame is returned, its contents are verified and the next verification frame in the series is transmitted. This frame type should be selected when the test is intended to verify that frames are not being corrupted as they pass over the connection.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore
Set of	loading verification
Default	(loading, verification)

ATTRIBUTE Atmlf Vcc Test **frmSize (size)**

Access	Read and write
Description	This attribute defines the size of the test frames used in an ATM connection test.
Mib	AtmCore
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Atmlf Vcc Test **frmPatternType (fpt)**

Access	Read and write
Description	This attribute specifies the bit sequence used to fill the frames used in the ATM connection test. It must contain one of the following values: ***ccitt32kBitPattern***: a pseudo-random sequence of 32 Kbit is used ***ccitt8MBitPattern***: a pseudo-random sequence of 8Mbit is used ***customizedPattern***: the pattern defined in the *customizedPattern* attribute is used
Mib	AtmCore
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Atmlf Vcc Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute specifies a 32 bit sequence to be used to fill frames when the *framePatternType* attribute is set to ***customizedPattern***. The default value gives a pattern of alternating 0 and 1 bits.
Mib	AtmCore
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Atmlf Vcc Test **duration**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the maximum number of minutes that the ATM connection test is allowed to run. The maximum allowed value permits the test to be run for up to 21 days.
Mib	AtmCore
Values	Decimal (1..30240)
Units	minutes
Default	1

ATTRIBUTE Atmlf Vcc Test bandwidthElastic (bwElastic)

Access	Read and write
Description	This attribute specifies whether the connection (*VCC*) should be configured with elastic bandwidth or not. Elastic bandwidth is of importance in conjunction with IMA links, where some links fail and the resulting bandwidth is less than the requested bandwidth for all connections. In that case, some connections may be reduced in bandwidth based on the setting of the *bwElastic* attribute. If this attribute is set to ***yes***, the Test application signals to the connection that the bandwidth for this connection is elastic, and may be reduced in the case of IMA link failures. If the bandwidth is reduced, the rate of test cells which can be handled by the connection will also be reduced. If this attribute is set to ***no***, the Test application signals to the connection that the bandwidth for this connection must be maintained at the requested level. If the connection cannot maintain the full bandwidth, the connection may be released (cleared) based on the holding priority of the connection.
Mib	AtmCore
Values	no yes
Default	no

ATTRIBUTE Atmlf Vcc Test overrideHoldingPriority (ohpri)

Access	Read and write
Description	This attribute specifies the override holding priority which should be signaled to the *VCC* connection at the start of the test. Holding priority is of importance in conjunction with IMA links, where some links fail and the resulting bandwidth is less than the requested bandwidth for all connections. In that case, some connections may be released based on the connection's holding priority. ***Zero*** (0) is the highest holding priority, and ***four*** (4) is the lowest priority. A

Copyright © 2006, Nortel Nortel Confidential

setting of ***zero*** to ***four*** overrides whatever holding priority that has been configured at the connection (*VCC*). A setting of ***noOverride*** means that the connection should use its internally configured holding priority.

Mib	AtmCore
Values	0 1 2 3 4 noOverride
Default	noOverride

GROUP Atmlf Vcc Test **Results (Results)**

Properties	Operational
Description	This group contains attributes that show the result of an ATM connection test; if no test is running, the attribute group contains the results of the most recently completed test. The attributes of the *Results* group are reset to their initial values whenever a test is started or any attribute of the *Setup* group is set.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc Test **elapsedTime**

Access	Read only
Description	This attribute displays the number of minutes that the test has been running.
Mib	AtmCore
Values	Decimal (0..30240)
Units	minutes
Default	0

ATTRIBUTE Atmlf Vcc Test **timeRemaining**

Access	Read only
Description	This attribute displays the number of minutes that the test will continue to run before stopping automatically.
Mib	AtmCore
Values	Decimal (0..30240)
Units	minutes
Default	0

ATTRIBUTE Atmlf Vcc Test **causeOfTermination**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the reason the test ended. It contains one of the following values. ***testTimeExpired***: the test ran for the specified duration ***stoppedByOperator***: a *STOP* command was issued ***neverStarted***: the test has not been started ***testRunning***: the test is currently running
Mib	AtmCore
Values	testTimeExpired stoppedByOperator neverStarted testRunning
Default	neverStarted

ATTRIBUTE Atmlf Vcc Test bytesTx

Access	Read only
Description	This attribute displays the number of bytes sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test bytesRx

Access	Read only
Description	This attribute displays the number of bytes received during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test loadingFrmTx

Access	Read only
Description	This attribute displays the number of loading frames sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test loadingFrmRx

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the number of loading frames received during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test **loadingFrmLost**

Access	Read only
Description	This attribute displays the number of loading frames that were lost during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test **verificationFrmTx**

Access	Read only
Description	This attribute displays the number of verification frames sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test **verificationFrmRx**

Access	Read only
Description	This attribute displays the number of verification frames received during the test (including errored verification frames). The counter wraps to zero if it exceeds its maximum value of (2**64)-1. Note that the number of verification frames lost during the test can be computed by the expression *verificationFrmTx* - *verificationFrmRx*.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test **verificationFrmBad**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the number of errored verification frames received during the test. A verification frame is considered to be errored if it contains a recognizable verification frame header, but does not match the transmitted frame bit for bit. (Thus, a verification frame that returns after the succeeding verification frame has been transmitted is considered to be errored.) The counter wraps to zero if it exceeds its maximum value of (2**64)-1. Note that the number of correct verification frames received during the test can be computed by the expression *verificationFrmRx* - *verificationFrmBad*.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vcc Test **unrecognizableFrmRx**

Access	Read only
Description	This attribute displays the number of frames received during the test which do not contain a valid loading frame header or verification frame header. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

GROUP Atmlf Vcc Tm Operational (Oper)

Properties	Operational
Description	This group contains attributes for the *Tm* component to reflect operational traffic attributes.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc Tm txTrafficDescType (txTdt)

Access	Read only
Description	T his attribute indicates the type of traffic management which is applied to the transmit direction of this connection as defined in the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute.
Mib	AtmCore
Values	1 2 3 4 5 6 7 8 9
Default	No default

ATTRIBUTE Atmlf Vcc Tm txQosClass (txQos)

Access	Read only
Description	This attribute indicates the quality of service for the calling to called direction for this connection. This is only applicable to Soft PVC and SVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified QOS class; no objective is specified for the performance parameters.

Copyright © 2006, Nortel
Nortel Confidential

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Mib: AtmCore

Values:
0
1
2
3
4
notApplicable

Default: No default

ATTRIBUTE Atmlf Vcc Tm txQueueLength (txQLen)

Access: Read only

Description: This attribute indicates the current number of cells in the transmit queue for this connection.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the length of the common queue which is used for this ATM service category.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***fifo***, this attribute indicates the number of cells for this connection which are enqueued in a first-in-first-out queuing method for this ATM service category. This will only occur for connections on ATM IP cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***.

If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the length of the per-VC queue.

For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current number of cells in the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

Mib: AtmCore

Values: Decimal (0..1011840)

Units: cells

Default: No default

ATTRIBUTE Atmlf Vcc Tm txQueueCongestionState (txQCong)

Access: Read only

Description: This attribute indicates the congestion state of the transmit queue for this connection.

Copyright © 2006, Nortel Nortel Confidential

If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the congestion state of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the congestion state of the per-VC queue.

The congestion state of a queue is indicated by a numeric value ranging from 0 to 3. When a queue is in a congested state x, only traffic with discard priority (DP) 0 to x are enqueued. Traffic with DP > x is discarded.

For example, if the congestion state is 3, there is no congestion and all traffic is enqueued. Likewise, when the congestion state is 0, there is maximum congestion and only traffic with DP=0 is enqueued on that queue.

For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current congestion state of the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

Mib	AtmCore
Values	Decimal (0..3)
Default	No default

ATTRIBUTE **Atmlf Vcc Tm** **holdingPriority (hpri)**

Access	Read only
Description	This attribute indicates the actual holding priority in effect for this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. Some applications, for example *Vcc Test*, may override the provisioned holding priority. A value of ***notApplicable*** is displayed when this is an elastic connection. Holding priority does not apply to bandwidth elastic connections. Holding priority has no effect if the equivalent cell rate (ECR) for a connection is zero. This attribute does not apply to *Vpt Vcc*s.

Default	No default

ATTRIBUTE Atmlf Vcc Tm atmServiceCategory (service)

Access	Read only
Description	This attribute indicates the ATM service category used for traffic in both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to have significantly reduced value for the application. The ***rtVariableBitRate*** service category is intended for real time applications; that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections. The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications. The ***unspecifiedBitRate*** service is intended for non-real time applications,

Copyright © 2006, Nortel Nortel Confidential

that is those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Default — No default

ATTRIBUTE Atmlf Vcc Tm **trafficShaping (trShaping)**

Access — Read only

Description — This attribute indicates the traffic shaping state of the connection.

A value of ***notApplicable*** indicates that traffic shaping is not applicable or not supported for this connection. This is the case:
- when the *txTrafficDescType* is 1 or 2.
- for standard *Vpt Vcc*s and basic *Vpt*s.
- for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, when the *atmServiceCategory* is ***constantBitRate***.

In these cases, the value of ***notApplicable*** is indicated regardless of whether traffic shaping is enabled or disabled in the provisioning data.

A value of ***disabled*** indicates that traffic shaping is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***linear*** or ***inverseUpc*** indicates that traffic shaping is applicable and supported for the type of connection and has been turned on in the provisioning data. This is the only case that indicates that traffic shaping is performed on the connection. In this case, the actual shaping rate is reflected in the *txTrafficDescParm* attribute, parameter number 4. A value of ***linear*** indicates that traffic is being shaped at the constant rate indicated in *txTrafficDescParm* 4. A value of ***inverseUpc*** indicates that the shaper strictly conforms to the requirements of a dual leaky bucket UPC enforcer. This value is indicated if traffic shaping is enabled, and the *txTrafficDescType* for this connection is 6, 7 or 8.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, traffic shaping is not available, therefore this attribute is always ***disabled***.

Traffic shaping for connections with *atmServiceCategory* as

Copyright © 2006, Nortel Nortel Confidential

availableBitRate (*txTrafficDescType* 9) depends upon the *abrConnectionType* attribute. If *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, the value of this attribute is ***linear***. If *abrConnectionType* is ***erSwitch*** or ***efciSwitch***, this attribute is ***notApplicable***.

inverseUpc
notApplicable

Default — No default

ATTRIBUTE Atmlf Vcc Tm bearerClassBbc (bcBbc)

Access — Read only

Description — This attribute indicates the bearer capability for this connection.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is displayed, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements.When ***c*** is displayed, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class vp service is used to indicate a transparent VP service when the user is requesting an ATM only service from the network. In this case, the network does not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except for VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP and SVP connections.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

ATTRIBUTE Atmlf Vcc Tm transferCapabilityBbc (tcBbc)

Access	Read only
Description	This attribute indicates the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> 0: NoIndication, NoIndication 1: NoIndication, yes 2: NoIndication, no 5: CBR, yes 8: VBR, NoIndication 9: VBR, yes 10: VBR, no A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance, or in the case that the transfer capability in the call request was set to NoIndication. The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data. The value NoIndication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing. The value yes for end-to-end timing indicates that end-to-end timing is required for the connection. The value no for end-to-end timing indicates that end-to-end timing is not required for the connection.

Default	No default

ATTRIBUTE Atmlf Vcc Tm **clippingBbc (cBbc)**

Access	Read only
Description	This attribute indicates the value of the clipping susceptibility parameter in the broadband bearer capability (BBC) Information Element. Clipping is an impairment in which the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through. A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.
Mib	AtmCore
Values	no yes notApplicable
Default	No default

ATTRIBUTE Atmlf Vcc Tm **unshapedTransmitQueueing (unshap)**

Access	Read only
Description	This attribute indicates the unshaped transmit queuing state of the connection. A value of ***common*** indicates that transmit traffic is being enqueued onto the common transmit queue for this service category. The *txQueueLength* attribute indicates the current length of the common transmit queue. A value of ***fifo*** indicates that transmit traffic is being queued in a first-in-first-out basis for this service category. This is similar to ***common*** queuing, but the *txQueueLength* attribute indicates the number of cells in this connection queue. A value of ***fifo*** will only be indicated for connections on ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***. A value of ***perVc*** indicates that transmit traffic is being enqueued onto a per-VC queue for this connection. A value of ***notApplicable*** indicates that transmit traffic is being shaped for this connection, or that unshaped transmit queuing is not applicable for this type of connection. Transmit traffic for a shaped connection is enqueued onto a per-VC queue, but this attribute is only applicable for unshaped connections. Unshaped transmit queuing is not applicable for basic *Vpt*s.

Values	indicated notIndicated notApplicable
Default	No default

ATTRIBUTE Atmlf Vcc Tm forceTagging (tagging)

Access	Read only
Description	This attribute indicates the state of force tagging option for this connection. Force tagging refers to setting the CLP bit for all cells on a connection. A value of ***enabled*** indicates that the CLP bit is being set to 1 for all cells in the transmit direction on this connection. A value of ***disabled*** indicates that the CLP bit is unchanged for cells in the transmit direction on this connection. The value ***disabled*** is always displayed for *Vpt*s since forced tagging is applied on a per *Vpt Vcc* basis.
Mib	AtmCore
Values	disabled enabled
Default	No default

ATTRIBUTE Atmlf Vcc Tm weight

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the relative weight of this unshaped connection. Connections with a larger weight get a larger proportion of the link bandwidth or in the case of standard *Vpt Vcc*s, the *Vpt* bandwidth. For all but standard *Vpt Vcc*s, the default connection weight is determined by the weight policy for a service category and the traffic descriptor for a connection. For standard *Vpt Vcc*s, the default connection weight is determined by the *Vcc*'s service category. A value from 1 to 4095 indicates an actual weight. The value ***upToQueueLimit*** indicates that the weight of a connection is up to the transmit queue limit for this connection and is used for connections which have the value of the *unshapedTransmitQueueing* attribute displayed as ***fifo***. This attribute has a displayed value of ***notApplicable*** in the following cases: - This connection has the value of the *trafficShaping* attribute displayed as either ***linear*** or ***inverseUpc***. - This connection has the value of the *trafficShaping* attribute displayed as ***disabled***, but the connection's service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc***. - This connection has the value of the *unshapedTransmitQueueing* attribute displayed as ***common***. - This is a basic *Vpt* connection. - For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, since per-connection weight is not supported.
Mib	AtmCore
Values	Decimal (1..4095) upToQueueLimit notApplicable
Default	No default

ATTRIBUTE Atmlf Vcc Tm usageParameterControl (upc)

Access	Read only
Description	This attribute indicates the UPC state of the connection. A value of ***notApplicable*** indicates that UPC is not applicable or not supported for the connection. This is the case: - when the connection's *rxTrafficDescType* is 1 or 2. - for standard *Vpt Vcc*s and basic *Vpt*s. A value of ***notApplicable*** is set regardless of whether UPC is disabled or enabled in provisioning data.

Copyright © 2006, Nortel Nortel Confidential

A value of ***disabled*** indicates that UPC is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***enforced*** indicates that UPC is actively checking conformance for the connection and is discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. On some ATM cards, the counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

A value of ***monitored*** indicates that UPC is actively checking conformance for the connection and counting the violations, but is not discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. The counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt. rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

If the *atmServiceCategory* for this connection is ***availableBitRate***, a value of ***enforced*** indicates that Dynamic Generic Cell Rate Algorithm (DGCRA) is active for the connection. The traffic descriptor parameters used for DGCRA enforcement are reflected in the *rxTrafficDescParm* of the connection.

ATTRIBUTE Atmlf Vcc Tm txPacketWiseDiscard (txpd)

Access — Read only

Description — This attribute indicates the current set of packet-wise discard functions in effect in the transmit data direction at this connection point.

This attribute is not applicable for *Vpt*s.

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point.

A value of ***wred*** indicates that Weighted Random Early Detection is in

Copyright © 2006, Nortel Nortel Confidential

effect at this connection point. W-RED can be enabled by provisioning for PVCs and SPVCs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Packet-wise functions are not applicable to virtual path connections (VPCs) on these cards.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

ATTRIBUTE Atmlf Vcc Tm **rxPacketWiseDiscard (rxpd)**

Access	Read only
Description	This attribute indicates the current set of packet-wise discard functions in effect in the receive data direction at this connection point. This attribute is not applicable for *Vpt*s. A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements. A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

Copyright © 2006, Nortel Nortel Confidential

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, packet-wise functions are not applicable to virtual path connections (VPCs).

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch, 4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs.

For ***1pOC48ChSmIrAtm*** card, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Note that a provisioned value of ***enabled*** for the *Vcc/Vpc Vcd/Vpd Tm rxPacketWiseDiscard* provisionable attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in actually enabling packet-wise discard functions in the receive data direction of a connection locally on these cards, thus does not affect the operational value displayed.

Default	No default

ATTRIBUTE **AtmIf Vcc Tm** **bandwidthElastic (bwElastic)**

Access	Read only
Description	This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application (for example, *Trunk*) running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced is displayed in the *bandwidthReduction* attribute. A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection is not released. A value of ***no*** indicates that the bandwidth for this connection is not reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority.*

Copyright © 2006, Nortel Nortel Confidential

Bandwidth elasticity has no effect for connections which have an equivalent cell rate (ECR) of zero.

This attribute is not applicable for *Vpt*s and *Vpt Vcc*s.

Mib	AtmCore
Values	no yes
Default	No default

ATTRIBUTE Atmlf Vcc Tm **bandwidthReduction (bwReduction)**

Access	Read only
Description	This attribute shows the amount by which the bandwidth has been reduced for this connection. This value is non-zero only for connections which have *bandwidthElastic* displayed as ***yes***, and which are also operating in a reduced bandwidth mode. This is typically the case for selected connections running over an IMA link. This attribute takes a value from 0 (no reduction) up to the ECR. For all connections which are running at their full allocated bandwidth, *bwReduction* has the value 0. Connections which have been reduced in allocated bandwidth have a positive number for this attribute. The *bwReduction* may be subtracted from the ECR (which is displayed as *txTrafficDescParm* 5) to determine the actual bandwidth allocated to this connection.
Mib	AtmCore
Values	Decimal (0..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Atmlf Vcc Tm **abrConnectionType (abrType)**

Access	Read only
Description	This attribute indicates the type of ABR behavior which is in effect at this connection. This attribute is only applicable if the *atmServiceCategory* attribute is ***availableBitRate***. If the *atmServiceCategory* attribute is not ***availableBitRate***, this attribute value is set to ***notApplicable***. For ATM cards which do not support ABR connections, the possible values for this attribute are ***notApplicable***, ***efciSwitch***, or ***nonAbrInterworking***. In EFCI marking mode, the Explicit Forward Congestion Indication (EFCI) field in the data cell headers is used to indicate transmit queue congestion. For ATM cards which do support ABR connections, if the *connectionPointType* is ***connectionEndPoint***, the value of this attribute is ***sourceDest***. In this mode, the ABR Source and Destination behavior is in effect at this connection. This attribute is also ***sourceDest*** in the case

Copyright © 2006, Nortel Nortel Confidential

where the next hop connection is specified as ***nonAbrInterworking***. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component.

If the *connectionPointType* is not ***connectionEndPoint***, the value of this attribute depends upon the *abrConnectionType* provisioning and the card type to which the traffic is forwarded on the backplane. The default *abrConnectionType* is provisioned at the *CA Abr abrConnectionType* attribute, and may be overridden for a provisioned connection in the *Vcd Tm abrConnectionType* or *Vpd Tm abrConnectionType* attribute. If the *CA Abr abrConnectionType* attribute is ***virtualSourceDest*** at either one of the two connection points, and if both the connection points are defined on ATM cards which support ABR connections, virtual source and destination behavior is applied to the connection. In this instance, the attribute displays the value ***virtualSourceDest***.

This attribute has the value ***erSwitch*** if ABR explicit rate functionality is in effect at this connection. In this mode, the switch may modify the Explicit Rate (ER) field of backward Resource Management (RM) cells to indicate the status of congestion at this connection point.

This attribute has the value ***nonAbrInterworking*** in the case where this connection point is functioning as an SPVC origin for an ABR connection where the link side of this connection is configured as a non-ABR ATM service category. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.

Mib	AtmCore
Values	erSwitch efciSwitch virtualSourceDest sourceDest nonAbrInterworking notApplicable
Default	No default

ATTRIBUTE **Atmlf Vcc Tm** **txTrafficDescParm (txTdp)**

Access	Read only
Description	This attribute is a vector of five transmit traffic parameters whose mapping is defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR), actual cell rate (ACR), explicit rate (ER), equivalent cell rate (ECR), and actual shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. When *txTrafficDescType* is 1 or 2, parameters 1 through 5 are unused.

Copyright © 2006, Nortel Nortel Confidential

In this description, PCR is the greater of either the PCR or the requested shaping rate (parameter 1 or parameter 5) specified in the *txTrafficDescParm* attribute under the *Vcd Tm* or *Vpd Tm* component.

When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 or 1 traffic; parameters 2 and 3 are unused.

When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard.

When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging.

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, parameter 4 reflects the actual shaping rate in cell/s for this connection. For CQC-based ATM cards, the set of available shaping rates is based on the number of interfaces doing shaping (attribute *perVcQueueInterfaces*), and the *shapingScalingFactor* attribute of the *Arc Cqc Override* component. A rate of zero (0) indicates that shaping is not performed, or that the interface is down.

When *txTrafficDescType* is 9**,** parameter 1 represents the PCR; parameter 2 represents the Cell Delay Variation Toleration (CDVT); parameter 3 represents the Minimum Cell Rate (MCR); the meaning of parameter 4 depends upon the value of the *abrConnectionType* attribute. if *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, parameter 4 represents the Allowed Cell Rate (ACR); If *abrConnectionType* is ***erSwitch***, parameter 4 represents the Explicit Rate (ER); and if *abrConnectionType* is ***efciSwitch***, parameter 4 reflects the actual shaping rate in cell/s for this connection.

When *txTrafficDescType* is 3, 4, 5, 6, 7, 8, or 9, parameter 5 reflects the equivalent cell rate in cell/s for this connection as determined by the

Copyright © 2006, Nortel Nortel Confidential

Connection Admission Control (CAC) algorithm. The equivalent cell rate is useful in determining the admission characteristics of this connection.

ATTRIBUTE Atmlf Vcc Tm txQueueThresholds (txQThresh)

Access	Read only
Description	This attribute indicates the queue limit and the discard thresholds for the transmit queue of this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the thresholds of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the thresholds of the per-VC queue. The first element indicates the queue limit. The provisioned value of the transmit queue limit is derived from the *txQueueLimit* attribute under the service category subcomponents of the *CA* component for the service category of this connection. The second element is the threshold that marks the transition from congestion state 1 to congestion state 0. This is the threshold at which traffic with discard priority (DP) = 1 is discarded. This threshold is set at approximately 90 percent of the first parameter, the operational queue limit. The third element is the threshold that marks the transition from congestion state 2 to congestion state 1. This is the threshold at which traffic with DP = 2 is discarded. This threshold is set at approximately 75 percent of the first parameter, the operational queue limit. The fourth element is the threshold that marks the transition from congestion state 3 to congestion state 2. This is the threshold at which traffic with DP = 3 is discarded. This threshold is set at approximately 35 percent of the first parameter, the operational queue limit. For ***1pOC48ChSmIrAtm*** cards, this attribute displays the thresholds of the link class queue used by this connection to buffer it traffic. This attribute does not apply to basic *Vpt*s.

ATTRIBUTE Atmlf Vcc Tm **rxTrafficDescParm (rxTdp)**

Access	Read only
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. Cell delay variation tolerance (CDVT) is expressed in microseconds. When *rxTrafficDescType* is 1 or 2, none of the parameters are used. When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; parameter 4 represents the CDVT. When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; parameter 4 represents the CDVT. When *rxTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents CDVT; parameter 3 represents the MCR; parameter 4 is not used. If *upc* is ***disabled*** for this connection, the values of PCR, SCR, MBS and CDVT are the provisioned parameters. If *upc* is ***enabled***, the values of PCR, SCR, MBS, and CDVT are exactly

Copyright © 2006, Nortel Nortel Confidential

	the values used by the usage parameter control hardware in policing the arriving traffic. These may vary slightly from the provisioned values due to granularity of the hardware. In the case where the PCR is equal to the SCR, the effective MBS is zero.

Properties	Operational
Description	This group contains operational attributes for connections using ABR service category.
Mib	AtmCore

ATTRIBUTE Atmlf Vcc Tm Abr initialCellRate (icr)

Access	Read only
Description	This attribute indicates the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. For nailed-up connections, this attribute is determined by the provisioned value of the *initialCellRate* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Copyright © 2006, Nortel Nortel Confidential

The ICR for a connection is a value between the MCR and the PCR. Furthermore, ICR has an upper bound determined by the *transientBufferExposure* divided by *fixedRoundTripTime*.

Mib	AtmCore
Values	Decimal (0..16777215)
Units	cell/s
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **transientBufferExposure (tbe)**

Access	Read only
Description	This attribute indicates the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the resource to send during start-up periods, before the first Resource Management (RM) cell returns. For nailed-up connections, this attribute is determined by the provisioned value of the *transientBufferExposure* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **fixedRoundTripTime (frtt)**

Access	Read only
Description	This attribute indicates the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. For nailed-up connections, this attribute is determined by the provisioned value of the *fixedRoundTripTime* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **rateDecreaseFactor (rdf)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. For nailed-up connections, this attribute is determined by the provisioned value of the *rateDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **rateIncreaseFactor (rif)**

Access	Read only
Description	This attribute indicates the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64. RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR. For nailed-up connections, this attribute is determined by the provisioned value of the *rateIncreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **maxCellPerRmCell (nrm)**

Access	Read only
Description	This attribute indicates the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of

Copyright © 2006, Nortel Nortel Confidential

	the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell. For nailed-up connections, this attribute is determined by the provisioned value of the *maxCellsPerRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **maxTimeBetweenRmCell (trm)**

Access	Read only
Description	This attribute indicates the TRM parameter for this connection. TRM provides an upper bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least 2 other cells have been sent, the next cell to be transmitted would be a forward RM cell. For nailed-up connections, this attribute is determined by the provisioned value of the *maxTimeBetweenRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)
Units	microsec
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **cutoffDecreaseFactor (cdf)**

Access	Read only
Description	This attribute indicates the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero. CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the *forwardRmCellLimit* attribute, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

Copyright © 2006, Nortel Nortel Confidential

For nailed-up connections, this attribute is determined by the provisioned value of the *cutoffDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

Mib	AtmCore
Values	Decimal (0; 1; 2; 4; 8; 16; 32; 64)
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **acrDecreaseTimeFactor (adtf)**

Access	Read only
Description	This attribute indicates the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection. ADTF is the time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*. For nailed-up connections, this attribute is determined by the provisioned value of the *acrDecreaseTimeFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..1023)
Units	centiseconds
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **forwardRmCellLimit (crm)**

Access	Read only
Description	This attribute indicates the CRM parameter for this connection. CRM is the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. The value of CRM is obtained as *transientBufferExposure* divided by *maxCellsPerRmCell*.
Mib	AtmCore

Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **txRateChangeInfo (txrci)**

Access	Read only
Description	This attribute indicates the rate change information put into the last forward Resource Management (RM) cell turned around as a backward-RM cell. For connections configured as an ABR Source or Destination, the turned around backward-RM cell is sent over the interface. For connections configured as an ABR Virtual Source or Virtual Destination, the turned around backward-RM cell is sent over the backplane.
Mib	AtmCore
Values	congestionIndicated noIncreaseIndicated explicitRateIndicated
Default	No default

ATTRIBUTE Atmlf Vcc Tm Abr **acrRateChangeInfo (arci)**

Access	Read only
Description	This attribute indicates the type of change in the Allowed Cell Rate (ACR) as a result of the information in the last backward Resource Management (B-RM) cell received from the interface. This attribute value is only applicable when the *Vcc Tm* or *Vpc Tm* *abrConnectionType* attribute is ***sourceDest*** or ***VirtualSourceDest***. In all other cases, this attribute value is ***notApplicable***. A value of ***noChange*** indicates that the rate did not change as a result of the last backward RM cell received. A value of ***decreasedByRdf*** or ***increasedByRif*** indicates that the ACR was increased or decreased by the corresponding factor. This change is as a result of the CI or NI bit setting in the last backward RM cell, or an ADTF timeout. A value of ***setToExplicitRate*** indicates that the ACR was set to the ER value in the last backward RM cell.
Mib	AtmCore
Values	noChange decreasedByRdf increasedByRif setToExplicitRate notApplicable
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vcc Tm Abr **txFwdRmCells**

Access	Read only
Description	This attribute counts the number of forward Resource Management (RM) cells sent over the interface since the last backward RM-cell was received from the interface. If the value of this attribute is greater than or equal to the value of *forwardRmCellLimit*, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. This counter is reset to zero each time a backward-RM cell is received. This counter does not wrap to zero if it reaches its maximum value of 4095 in order to indicate that no backward RM cell has been received.
Mib	AtmCore

Description	This attribute specifies whether OAM-AIS generation occurs on the connection towards this interface when the SPVC is down. If this attribute is ***enabled***, OAM-AIS cells are generated for this SPVC when the SPVC is not up. The only exception is that when the source SPVC attribute *adminControl* is set to ***permLocked***, OAM-AIS cells are not generated for the source SPVC. If this attribute is set to ***disabled***, OAM-AIS cells are not generated.
Mib	AtmNetworking
Values	enabled disabled
Default	disabled

GROUP Atmlf Vcc Src Operational (Oper)

Properties	Operational
Description	This attribute group contains the operational attributes associated with the *SrcPvp* or *SrcPvc* component.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vcc Src retryCount

Access	Read: All Write: Illegal
Description	This attribute indicates the number of failed attempts to set up the soft PVP or soft PVC since the last time the connection failed.
Mib	AtmNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Atmlf Vcc Src lastFailureCauseCode

Access	Read: All Write: Illegal
Description	This attribute contains the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. The default value for this attribute is set to 0.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vcc Src lastFailureDiagCode

Access	Read: All Write: Illegal
Description	This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmNetworking
Values	String (0..8, ASCII)
Default	No default

GROUP Atmlf Vcc Src **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vcc Src **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vcc Src **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmNetworking
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vcc Src usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmNetworking
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vcc Src CallRedirectionOper (RedirectOp)

Properties	Operational
Description	This group contains the operational attributes associated with the *CallRedirection* subcomponent.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vcc Src currentDestination

Access	Read: All Write: Illegal
Description	This attribute indicates the current destination of the soft PVC or soft PVP. A ***notConnected*** status indicates that the connection is not established. A ***primary*** status indicates that the connection is established to the remote destination specified by *calledAddress* and *calledVpiVci/calledVpi* attributes under *Atmif Vcc Src* or *Atmif Vpc Src* or *Atmif Vpt Vcc Src* Component. A ***secondary*** status indicates that the connection is established to the remote destination specified by *secondaryCalledAddress* and *secondaryCalledVpiVci/secondaryCalledVpi* attributes under *Atmif Vcc Src CallRedirection* or *Atmif Vpc Src CallRedirection* or *Atmif Vpt Vcc Src CallRedirection* Component.
Mib	AtmNetworking

Values	notConnected primary secondary
Default	No default

ATTRIBUTE Atmlf Vcc Src **primaryAdminState**

Access	Read: All Write: Illegal
Description	This attribute indicates the OSI Administrative State of the primary destination. The value ***locked*** indicates that the primary destination is precluded from call setup attempts. The value ***unlocked*** indicates that the primary destination is considered in call setup attempts.
Mib	AtmNetworking
Values	locked unlocked
Default	No default

ATTRIBUTE Atmlf Vcc Src **secondaryAdminState**

Access	Read: All Write: Illegal
Description	This attribute indicates the OSI Administrative State of the secondary destination. The value ***locked*** indicates that the secondary destination is precluded from call setup attempts. The value ***unlocked*** indicates that the secondary destination is considered in call setup attempts.
Mib	AtmNetworking
Values	locked unlocked
Default	No default

ATTRIBUTE Atmlf Vcc Src **lastSecondaryFailureCauseCode**

Access	Read: All Write: Illegal
Description	This attribute indicates the cause code value of the last signalling message to the secondary destination which contained the CAUSE information element. If there has been no previous failure, the value for this attribute is 0.
Mib	AtmNetworking
Values	Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Vcc Src lastSecondaryFailureDiagCode

Access	Read: All Write: Illegal
Description	This attribute indicates the diagnostic code associated with the *lastSecondaryFailureCauseCode* attribute. If the diagnostic code was not provided with that CAUSE information element or if there has been no previous failure, this attribute is empty.
Mib	AtmNetworking
Values	String (0..8, ASCII)
Default	No default

COMPONENT Atmlf Vcc Src CallRedirection (Redirect)

Groups	GROUP Atmlf Vcc Src Redirect Provisioned (Prov)
Scope	Device
Description	*Atmif/n Vcc/vpi.vci SrcPvc CallRedirection* *Atmif/n Vpt/vpi Vcc/vci SrcPvc CallRedirection* This component represents the secondary destination information for the source end of a soft PVC. The addition of this subcomponent is not critical to the parent SPVC. Deletion of this subcomponent or changes to its attributes will impact service of the SPVC if it is established to the secondary destination.
Mib	AtmNetworking
Common Verbs	Help List Display Add DELete

VERB LOCK **AtmIf Vcc Src Redirect**

Impact: Service

Description:

Lock Atmif Vcc Src CallRedirection
Lock -primary Atmif Vcc Src CallRedirection
Lock -secondary Atmif Vcc Src CallRedirection

Lock Atmif Vpt Vcc Src CallRedirection
Lock -primary Atmif Vpt Vcc Src CallRedirection
Lock -secondary Atmif Vpt Vcc Src CallRedirection

This verb selectively precludes a provisioned destination address from consideration during call setup attempts for a Src PVC.

If [*-primary*] option is present, then the primary destination address is precluded from call setup attempts. If the connection is established to the primary destination address at the time of issuing the command, the connection is torn down and an immediate attempt is made to re-establish the connection to the secondary destination address.

If [*-secondary*] option is present, then the secondary destination address is precluded from call setup attempts. If the connection is established to the secondary destination address at the time of issuing the command, the connection is torn down and an immediate attempt is made to re-establish the connection to the primary destination address.

If no option is present, the secondary destination is locked. This command will have the same effect as providing the *secondary* option.

Only one of the primary or the secondary addresses may be locked at any given time.

VERB UNLOCK **AtmIf Vcc Src Redirect**

Impact: Service

Description:

Unlock Atmif Vcc Src CallRedirection
Unlock -primary Atmif Vcc Src CallRedirection
Unlock -secondary Atmif Vcc Src CallRedirection
Unlock -primary -secondary Atmif Vcc Src CallRedirection

Unlock Atmif Vpt Vcc Src CallRedirection
Unlock -primary Atmif Vpt Vcc Src CallRedirection
Unlock -secondary Atmif Vpt Vcc Src CallRedirection
Unlock -primary -secondary Atmif Vpt Vcc Src CallRedirection

This verb selectively unlocks a destination address. The indicated address will be considered in subsequent call setup attempts.

If [*-primary*] option is present, then the primary destination address is

Copyright © 2006, Nortel Nortel Confidential

unlocked and it is considered for subsequent call setup attempts. This action does not have any impact on established connections.

If [*-secondary*] option is present, then the secondary destination address is unlocked and it is considered in subsequent call setup attempts. This action does not have any impact on established connections.

If no option is present the secondary destination address is unlocked. This command will have the same effect as providing the *secondary* option.

If both options are provided, either of the primary or the secondary address which may have been locked will be unlocked.

GROUP Atmlf Vcc Src Redirect **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes of the Source PVC *CallRedirection* component.

VERB REConnect **AtmIf Vcc Src Mdtl**

Impact Service

Description *REConnect AtmIf/n Vcc/vpi.vci Src Mdtl*
REConnect -primary AtmIf/n Vcc/vpi.vci Src Mdtl
REConnect -alternate AtmIf/n Vcc/vpi.vci Src Mdtl
REConnect -automatic AtmIf/n Vcc/vp.vci Src Mdtl

This command is used to trigger a connection to attempt to connect using the requested path. The behavior of this command differs for connections which do and do not subscribe to Path Optimization capabilities provided by rerouting services. To summarize:

1. Non-reroute Subscribed connections
A reconnect comand will result in the connection being taken down and re-establishment attempts being made. By default (if no option is specified), the primary path is attempted first otherwise the path specified by the option is first attempted. In the event of reconnect failure, subsequent re-establishment attempts will be progressed through a sequence of primary, alternate and automatic (traditional PNNI routing) paths.

2. Reroute Subscribed connections
A reconnect comand will utilize make-before-break functionality. If an option is specified then only that path will be attempted. If a connection can be established, then datapath switching will be used to replace the existing connection minimizing cell loss. If no option is specified, the connection establishment attempts will be progressed through a sequence of primary, alternate and automatic (traditional PNNI routing) paths only until such time that a successfully established connection would be deemed more optimal than the incumbent. For instance, if a reconnect command is issued for a connection which is on it's alternate path and establishment on the primary path fails then the reconnect operation is considered complete and the connection will remain on the alternate path.

GROUP **AtmIf Vcc Src Mdtl** **Provisioned (Prov)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group contains the provisionable attributes for the Manual DTL selection paths for provisioned connections. The normal sequence for connection retry is: First try to establish the connection using the *primaryPath*. If the connection is not successful and if the *alternatePath* has been provisioned, try to connect using the *alternatePath*. If the connection is still unsuccessful, use the PNNI routing protocol to generate the path.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vcc Src Mdtl **primaryPath (priPath)**

Access	Read and write
Description	This attribute specifies the name of the primary MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni*.
Mib	AtmNetworking
Values	String (1..32, ASCII)
Default	No default

ATTRIBUTE Atmlf Vcc Src Mdtl **alternatePath (altPath)**

Access	Read and write
Description	This attribute specifies the name of the alternate MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni.* An empty string disables the alternate path.
Mib	AtmNetworking
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Atmlf Vcc Src Mdtl **automaticFallback (auto)**

Access	Read and write
Description	This attribute specifies whether PNNI routing is to be used to establish a connection if connection attempts using the primary and alternate paths fail. If the value is ***enable***, PNNI routing will be attempted; if the value is ***disable***, it will not.
Mib	AtmNetworking
Values	disable enable
Default	enable

ATTRIBUTE Atmlf Vcc Src Mdtl **mdtlVersion (vers)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute indicates a version number for Specified Paths and will ensure that the reroute behaviors (not subscribed) are maintained following a software migration to a software version where global rerouting is supported for Specified Path connections. This is an internal attribute intended for the above purpose only and should not be altered.
Mib	AtmNetworking
Values	notRerouteCapable rerouteCapable
Default	notRerouteCapable

GROUP Atmlf Vcc Src Mdtl **Operational (Oper)**

Properties	Operational
Description	This attribute group contains the operational attributes associated with the *atmSrcMdtl* component
Mib	AtmNetworking

ATTRIBUTE Atmlf Vcc Src Mdtl **currentPath (curPath)**

Access	Read: All Write: Illegal
Description	This attribute indicates the current connection status of the Specified Path connection. A ***not connected*** status indicates that the connection is not established. The retry sequence did not succeed. The network operator can issue the *Reconnect* command to restart the retry sequence. A ***primary*** status indicates that the connection is using the path specified by the *primaryPath* attribute. An ***alternate*** status indicates that the connection is using the path specified by the *alternatePath* attribute. An ***automatic*** status indicates that the connection is using the path generated by the PNNI routing protocol. An ***unknown*** status indicates that the provisioning data for the path upon which the connection is established has been altered. A ***waiting connection*** status indicates that the connection is in a retry phase.
Mib	AtmNetworking
Values	not connected primary alternate automatic unknown waiting connection
Default	"not connected"

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vcc Src Mdtl primaryPathFailCause (priPathFail)

Access	Read: All Write: Illegal
Description	This attribute identifies the last cause code failure for the primary path. The value is reset to zero when the *primaryPath* attribute is set to a new value.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vcc Src Mdtl alternatePathFailCause (altPathFail)

Access	Read: All Write: Illegal
Description	This attribute identifies the last cause code failure for the alternate path. The value is set to zero when the *alternatePath* attribute is set to a new value.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

COMPONENT Atmlf Vcc Src RerouteOverride (RerOv)

Groups	GROUP Atmlf Vcc Src RerOv Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci SrcPvc RerouteOverride* *AtmIf/n Vpc/vpi SrcPvp RerouteOverride* *AtmIf/n Vpt/vpi Vcc/vci SrcPvc RerouteOverride* *FrAtm/n Dlci/x Siwf RerouteOverride* This component represents the ability to override rerouting capability subscription options on a per connection basis for provisioned SPVC and SPVP connections. The addition of this component and changes to the attributes contained in this component are critical to the parent SPVC or SPVP. However, the deletion of this component is not a critical change for the connection. If this component is deleted, the connection remains active with the last

VERB OPTIMIZE **AtmIf Vcc Src RerOv**

Impact — Service

Description

OPTimize AtmIf/n Vcc/<vpi.vci> Src RerOv
OPTimize AtmIf/n Vpc/<vpi> Src RerOv
OPTimize AtmIf/n Vpt/<vpi> Vcc/<vci> Src RerOv
OPTimize FrAtm/n Dlci/x Siwf RerOv

This command triggers path optimization for the connection segment. If the interface is already processing a path optimization request, then the *Optimize* command is cancelled.

Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP **AtmIf Vcc Src RerOv** **Provisioned (Prov)**

Properties — Provisioned

Description — This group contains the provisionable attributes related to rerouting subscription options for provisioned connections.

Mib — AtmNetworking

ATTRIBUTE **AtmIf Vcc Src RerOv** **protocol**

Access — Read and write

Description

This attribute specifies the rerouting protocols that are requested by the connection segment. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
sameAsInterface: The requested rerouting protocols are specified by the *protocol* attribute under the *Reroute Ov* component for the interface.
localGlobal: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
localOnly: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum

Copyright © 2006, Nortel
Nortel Confidential

	"Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature. ***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — AtmNetworking

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Atmlf Vcc Dst usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — AtmNetworking

Values	idle active (activ) busy
Default	idle

COMPONENT Atmlf Vcc Dst Configuration (Config)

Groups	GROUP AtmIf Vcc Dst Config DstProv
Scope	Device
Description	*Atmif/n Vcc/x.y Dst Override* This *Override* component contains provisioned attributes for this destination SPVC. If this component does not exist, the destination SPVC behaves as if this component had been provisioned with default values for all its attributes.
Mib	AtmNetworking
Common Verbs	Help List Display

GROUP Atmlf Vcc Dst Config DstProv

Properties	Provisioned
Description	This group contains provisionable attributes for destination SPVC/Ps.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vcc Dst Config aisGeneration (ais)

Access	Read and write
Description	This attribute specifies whether OAM-AIS generation occurs on the connection towards this interface when the SPVC or SPVP is down. If this attribute is ***enabled***, OAM-AIS cells are generated for this SPVC or SPVP when the SPVC or SPVP is not up. If this attribute is set to ***disabled***, OAM-AIS cells are not generated.
Mib	AtmNetworking
Values	enabled disabled
Default	disabled

COMPONENT Atmlf Vcc MulticastNailedUpRelayPoint (Mnrp)

Groups	GROUP AtmIf Vcc Mnrp Provisioned (Prov)

Copyright © 2006, Nortel Nortel Confidential

Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Mnrp* This component is used to establish a root of a multicast nailed-up ATM Bearer Service (ABS) connection. By linking a *Mnrp* to a *Nrp*, the associated connections are configured to relay ATM cells from *Mnrp* to *Nrp*. The *Mnrp* component requires exclusive use of its parent *Vcc* or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Test*, *Nrp* and *Loop*). This component is supported only on 4pOC3SmIrAtm and 4pOC3MmAtm cards.This component is not supported under *Vpt Vcc* and *Vpt Vpc*.
Mib	AtmBearerService
Common Verbs	Help List Display Add DELete

GROUP Atmlf Vcc Mnrp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Mnrp* component.
Mib	AtmBearerService

ATTRIBUTE Atmlf Vcc Mnrp oamSegmentBoundary (sb)

Access	Read and write
Criticality	Component
Description	This attribute specifies the OAM segment boundary desired for a *Mnrp* component. It affects the connection point type value visible in the parent component's *connectionPointType* attribute. The desired OAM segment boundary can be specified directly as ***yes***, ***no*** or ***sameAsInterface***. If ***sameAsInterface*** is specified, the OAM segment boundary is same as the *oamSegmentBoundary* attribute of the associated *AtmIf* and the switch will set the *connectionPointType*, choosing ***segmentEndPoint*** for a segment-boundary ATM interface and ***connectingPoint*** for a non-segment-boundary ATM interface.
Mib	AtmBearerService
Values	no yes sameAsInterface
Default	sameAsInterface

ATTRIBUTE Atmlf Vcc Mnrp bandwidthElastic (bwElastic)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the *bandwidthReduction* attribute. A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Mnrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid. A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority*.
Mib	AtmBearerService
Values	no yes
Default	no

ATTRIBUTE Atmlf Vcc Mnrp **overrideHoldingPriority (ohpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used.
Mib	AtmBearerService
Values	0 1 2 3 4 noOverride
Default	noOverride

ATTRIBUTE Atmlf Vcc Mnrp **nextHop (nextHop)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the list of *Nrp* components with which this *Mnrp* is associated. A sample value is *AtmIf/31 Vcc/0.32 Nrp.* This attribute must be provisioned with at least one Nrp component under a compatible connection type.
Mib	AtmBearerService

Mib	AtmCore
Values	inactive activating active activationFailed
Default	inactive

ATTRIBUTE Atmlf Vcc Pm failureCause (cause)

Access	Read only
Description	This attribute indicates the failure cause of Performance Monitoring (PM) measurements. The following are possible causes: The value ***noError*** indicates no error. The value ***unknownCause*** indicates unknown failure cause. The value ***softwareResourcesUnavailable*** indicates software resources reserved for a maximum of 255 active PMs on the local FP card have been used up. The value ***hardwareResourcesUnavailable*** indicates hardware resources reserved for a maximum of 512 active PMs CLR card have been used up on the Link Side local card. The value ***remoteEndNoResponse*** indicates no response from remote end during activation. The value ***activationCollision*** indicates activation collision was detected. Usually this is caused by both ends of the connection being provisioned to request PM. Only one end should be so provisioned. The value ***remoteEndRejectedActivation*** indicates the remote end has rejected an activation request. Usually this is due to the remote end reaching a resource limit. The value ***pcrUnsupported*** indicates the Tx or Rx PCR is out of range. The PCR value must be between 0 and 409601. The value ***nextHopConnectionUnsupported*** indicates the next hop card type or connection type do not allow access to the necessary hardware to support PM measurements. The value ***upcNotDisabled*** indicates UPC is not disabled on the local next hop card for this connection. PM measurements are not supported when UPC is either enforced or monitored.

Default	noError

ATTRIBUTE Atmlf Vcc Pm clrEnhancementStatus (enhanced)

Access	Read only
Description	This attribute indicates an enhanced mode of operation for Cell Loss Ratio (CLR) measurements by including cell discards from the remote segment end point which are not covered by the performance measurement (PM) cell. The value ***inactive*** indicates that CLR enhanced mode of operation has not been activated. The value ***active*** indicates that discards at the remote segment end point are being included in CLR measurements. The value ***remoteEndNotProvidingStatistics*** indicates that the remote end is not replying to proprietary requests for additional discard counts. This occurs when the remote end does not have the software necessary to recognize these requests.
Mib	AtmCore
Values	inactive active remoteEndNotProvidingStatistics
Default	inactive

GROUP Atmlf Vcc Pm FwdClrMeasurements (FwdClr)

Properties	Operational

disabled (dis)

Default: disabled

ATTRIBUTE Atmlf Vcc Msrc Party **usageState (osiUsage)**

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: AtmNetworking

Values: idle
active (activ)
busy

Default: idle

COMPONENT Atmlf **UserNetworkInterface (Uni)**

Groups: GROUP Atmlf Uni Provisioned (Prov)
GROUP Atmlf Uni Operational (Oper)
GROUP Atmlf Uni AccountingOptions (AcctOpt)

Scope: Device

Description: *Atmlf/n Uni*
This component represents an ATM UNI interface. If this component is provisioned the *Aini*, *Iisp,* or *Pnni* component can not be provisioned under

Copyright © 2006, Nortel Nortel Confidential

	that *AtmIf* component. If this component is deleted, then all associated *Vcc* components are deleted.

Common Verbs	Help List Display Add DELete

GROUP AtmIf Uni Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Uni* component.
Mib	AtmUni

ATTRIBUTE AtmIf Uni version

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies which specification the UNI complies with. The options are ATM FORUM 3.0, ATM FORUM 3.1 or ATM FORUM 4.0. If this attribute is changed then all switched *Vcc* components in this interface are cleared due to the fact that the two versions are incompatible.
Mib	AtmUni
Values	atmForum30 atmForum31 atmForum40
Default	atmForum40

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmIf Uni **side**

Access	Read: All Write: All
Criticality	Component
Description	This attribute indicates which side the interface is, user or network.
Mib	AtmUni
Values	network user
Default	network

ATTRIBUTE AtmIf Uni **softPvpAndPvcRetryPeriod**

Access	Read: All Write: All
Description	This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. Due to the group timer implementation, it can take from 100% to 150% of the provisioned timer value for the retry to be triggered.
Mib	AtmUni
Values	Decimal (20..999999)
Units	seconds
Default	60

ATTRIBUTE AtmIf Uni **softPvpAndPvcHoldOffTime (sHoldOffTime)**

Access	Read: All Write: All
Description	This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value.
Mib	AtmUni
Values	Decimal (0; 50..20000)
Units	msec
Default	0

ATTRIBUTE AtmIf Uni **loopPrevention**

Access	Read: All Write: Configuration

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether loop prevention is in effect on this interface. When the value is ***enabled***, incoming calls on this interface cannot be routed back out the same interface. When the value is ***disabled***, routing of incoming calls back out the same interface is permitted. The recommended value is ***enabled***. The value ***disabled*** should only be used if routing of incoming calls back out over this interface is actually required. As an example, the value ***disabled*** might be needed if the interface is connected to an end-user multiplexing device which has no routing capability. Note that setting the value to ***enabled*** prevents only routing loops which involve two network nodes.
Mib	AtmUni
Values	disabled enabled
Default	enabled

ATTRIBUTE AtmIf Uni interfaceType

Access	Read: All Write: All
Criticality	Component
Description	This attribute represents the *Type* of the interface, ***private*** or ***public***.
Mib	AtmUni
Values	public private
Default	private

GROUP AtmIf Uni Operational (Oper)

Properties	Operational
Description	This attribute group contains the operational attributes for the *Uni* component.
Mib	AtmUni

ATTRIBUTE AtmIf Uni macAddress

Access	Read only
Description	This attribute indicates the MAC address of the port, which is used for address registration of the user side as the default ESI.
Mib	AtmUni

Copyright © 2006, Nortel Nortel Confidential

Values	String (12, ASCII)
Default	No default

GROUP Atmlf Uni AccountingOptions (AcctOpt)

Properties	Provisioned
Description	This group contains the provisionable attributes for accounting.
Mib	AtmUni

ATTRIBUTE Atmlf Uni accountCollection (aco)

Access	Read: All Write: All
Description	This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit*** or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA changeover if TODA is enabled; - every 12 hours (per connection) if TODA is disabled; - on every call clear (a call record with final cell counts). If none of the reasons is present, then accounting will be suppressed. The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate.
Mib	AtmUni
Set of	bill test study audit force
Default	No default

ATTRIBUTE Atmlf Uni accountConnectionType (act)

Access	Read: All Write: All
Description	This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records. If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be

Copyright © 2006, Nortel Nortel Confidential

marked as ***terminating***.

If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.

Mib	AtmUni
Values	origTerm intermediate
Default	origTerm

ATTRIBUTE AtmIf Uni accountClass (acl)

Access	Read: All Write: All
Description	This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.
Mib	AtmUni
Values	Decimal (0..255)
Default	0

ATTRIBUTE AtmIf Uni serviceExchange (sre)

Access	Read: All Write: All
Description	This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate.
Mib	AtmUni
Values	Decimal (0..255)
Default	0

COMPONENT AtmIf Uni Ilmi

GROUP AtmIf Uni Ilmi OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmUni

ATTRIBUTE AtmIf Uni Ilmi adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmUni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE AtmIf Uni Ilmi operationalState (osiOper)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmUni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Uni Ilmi **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmUni
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Uni Ilmi **Provisioned (Prov)**

ATTRIBUTE AtmIf Uni Sig addressConversion

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.
Mib	AtmUni
Values	none nativeE164 nsap
Default	none

ATTRIBUTE AtmIf Uni Sig operatingMode

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	AtmUni
Values	normal provisionedOnly
Default	normal

Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.
Mib	AtmUni
Values	3 6 7 8
Default	6
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Uni Sig Vcd** **atmServiceCategory (service)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections. The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high

Copyright © 2006, Nortel Nortel Confidential

degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Mib	AtmUni
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr)
Default	rtVariableBitRate
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Uni Sig Vcd weight

Access	Read and write
Criticality	Component
Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT. When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.
Mib	AtmUni

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

ATTRIBUTE Atmlf Uni Sig Vcd **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping

Copyright © 2006, Nortel Nortel Confidential

enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Mib	AtmUni
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Uni Sig Vcd **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Uni Sig Vcd **usageParameterControl (upc)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmUni
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Uni Sig Vcd trafficDescParm (tdp)

Access	Read: All Write: All
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any

Copyright © 2006, Nortel Nortel Confidential

value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

COMPONENT Atmlf Uni Address (Addr)

Instance	address [String (1..40, ASCII)] addressType [primary alternate registered default]
Groups	GROUP Atmlf Uni Addr Operational (Oper)
Scope	Device
Description	*Atmlf/n Uni Address/address,type* *Atmlf/n Vpt/m Uni Address/address,type* This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wild-card ('?'), and a type. The type identifies whether the Address component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address. The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses. Virtual interfaces do not have addresses of type ***default***. The wild-card is only valid for provisioned addresses. If the address is a single wild-card, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wild-card static address, then the choice is made using a round robin algorithm. The round robin algorithm first tries the primary routes. If none of the primary routes succeed, then the alternate routes are tried. Note that the ***UniInfo*** and ***PnniInfo*** sub-components are mutually exclusive. Only one of these may be added under the ***Atmlf Uni Addr*** component.

ATTRIBUTE Atmlf Uni Ptf connectionConfiguration (config)

Access	Read: All Write: All
Description	This attribute specifies a type of topology (point-to-point or point-to-multipoint), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	AtmUni
Set of	ptp ptmp
Default	(ptp, ptmp)

ATTRIBUTE Atmlf Uni Ptf serviceCategory (svcCat)

Access	Read: All Write: All
Description	This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match successfully, the call is traced.
Mib	AtmUni
Set of	cbr rtVbr nrtVbr ubr
Default	(cbr, rtVbr, nrtVbr, ubr)

GROUP Atmlf Uni Ptf Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *PathTraceFilter* component.
Mib	AtmUni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Uni Ptf **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the filter. ***active***: Indicates the filter is active. ***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out.
Mib	AtmUni
Values	active inactive
Default	inactive

ATTRIBUTE Atmlf Uni Ptf **recordCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords,* which ever is less.
Mib	AtmUni
Values	Decimal (0..200)
Default	No default

ATTRIBUTE Atmlf Uni Ptf **matchedConnections**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of connections that match the criteria of this filter.
Mib	AtmUni
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Atmlf Uni Ptf **elapsedTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes that have elapsed since the start of the filter.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmUni
Values	Decimal (0..70560)
Units	minutes
Default	No default

ATTRIBUTE Atmlf Uni Ptf **timeRemaining**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes remaining before the filter terminates itself.
Mib	AtmUni
Values	Decimal (0..70560)
Units	minutes
Default	No default

GROUP Atmlf Uni Ptf **RecordControl (Record)**

Properties	Operational
Description	This group contains the operational attributes for the record control of the *PathTraceFilter* component.
Mib	AtmUni

ATTRIBUTE Atmlf Uni Ptf **traceTimeout**

Access	Read: All Write: All
Description	This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available.
Mib	AtmUni
Values	Decimal (1..70560)
Units	minutes
Default	60

ATTRIBUTE Atmlf Uni Ptf **maxTraceRecords (mRecords)**

Access	Read: All Write: All
Description	This attribute specifies the maximum number of records allowed to be stored with the filter. Once the maximum has been reached, the oldest record is removed.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmUni
Values	Decimal (1..200)
Default	2

Common Verbs	Help List Display

GROUP Atmlf Uni Ptf PTRecord Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the path trace record component.
Mib	AtmUni

ATTRIBUTE Atmlf Uni Ptf PTRecord status

Access	Read: All Write: Illegal
Description	This attribute indicates the status of the trace. The string is one of the following: ***Completed normally****:* The trace completed normally. ***Incomplete****:* Partial trace returned. ***Exceeded information element length limitations****:* The number of traced nodes exceeded the maximum number of hops.

Copyright © 2006, Nortel Nortel Confidential

***Exceeded message length limitations**:* The message length exceeded the maximum allowed size.

Mib	AtmUni
Values	Completed normally Incomplete Exceeded information element length limitations Exceeded message length limitations
Default	No default

ATTRIBUTE AtmIf Uni Ptf PTRecord **timeStamp**

Access	Read: All Write: Illegal
Description	This attribute records the date and time of when the trace is completed.
Mib	AtmUni
Values	Time (DHMS)
Default	No default

ATTRIBUTE AtmIf Uni Ptf PTRecord **srcPortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmUni
Values	Decimal (1..4294967295)
Default	No default

ATTRIBUTE AtmIf Uni Ptf PTRecord **srcPortName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmUni
Values	String (40, ASCII)
Default	No default

ATTRIBUTE AtmIf Uni Ptf PTRecord **causeCode**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmUni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Uni Ptf PTRecord **diagCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmUni
Values	String (0..8, ASCII)
Default	No default

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. The call reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value
Mib	AtmUni
Values	Hex (H.0..H.ffffff)
Default	No default

ATTRIBUTE Atmlf Uni Ptf PTRecord Hop **ingressEndPointReference (epref)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint.
Mib	AtmUni
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Atmlf Uni Ptf PTRecord Hop **nodeId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the lowest level node ID traversed for this hop.
Mib	AtmUni
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf Uni Ptf PTRecord Hop **nodeName**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the *nodeName* under the *ModuleData* component for this hop. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmUni
Values	String (12, ASCII)
Default	No default

ATTRIBUTE **AtmIf Uni Ptf PTRecord Hop** **portId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages.
Mib	AtmUni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE **AtmIf Uni Ptf PTRecord Hop** **portName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmUni
Values	String (55, ASCII)
Default	No default

ATTRIBUTE **AtmIf Uni Ptf PTRecord Hop** **pnniTraceContRefusalIndPresent (refusal)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.

Default	1

ATTRIBUTE Atmlf Uni Ptt **rxTrafficDescType (rxTdt)**

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management, which is applied to the receive direction of this connection, as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute When ***sameAsTx*** is selected, the *rxTrafficDescType* and the *rxTrafficDescParm* are taken from the transmit values.
Mib	AtmUni
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE Atmlf Uni Ptt **atmServiceCategory (service)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection.

Copyright © 2006, Nortel Nortel Confidential

If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications.

The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS.

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.

Mib	AtmUni
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE **Atmlf Uni Ptt** **fwdQosClass (fwdQos)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the quality of service for the forward direction for this connection. Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video). Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video).

Copyright © 2006, Nortel Nortel Confidential

Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer).

Class ***4*** supports a QOS that will meet Service Class D performance requirements (connection-less data transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

ATTRIBUTE Atmlf Uni Ptt **bearerClassBbc (bcBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network. The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both. Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents. Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on it. Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocols.
Mib	AtmUni
Values	a c x derivedFromServiceCategory
Default	derivedFromServiceCategory

ATTRIBUTE Atmlf Uni Ptt **transferCapabilityBbc (tcBbc)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> ***0***: NoIndication, NoIndication ***1***: NoIndication, yes ***2***: NoIndication, no ***5***: CBR, yes ***8***: VBR, NoIndication ***9***: VBR, yes ***10***: VBR, no ***NotApplicable*** specifies that the user does not want to specify the transfer capability. The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data. The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing. The value ***yes*** for end-to-end timing indicates that end-to-end timing is required. The value ***no*** for end-to-end timing indicates that end-to-end timing is not required. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Uni Ptt **clippingBbc (cBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the value for the clipping susceptibility parameter in the BBC IE. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes. Clipping is an impairment where the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.
Mib	AtmUni
Values	no yes
Default	no

ATTRIBUTE Atmlf Uni Ptt **bestEffort**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor IE. It is one of the Broadband Bearer Capability attributes. The value ***indicated*** implies that the quality of service for this connection is not guaranteed. The value ***notIndicated*** implies that the quality of service for this connection is guaranteed. The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection, is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Uni Ptt **txTrafficDescParm (txTdp)**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled.

When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero.

When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the

Copyright © 2006, Nortel Nortel Confidential

requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

ATTRIBUTE Atmlf Uni Ptt rxTrafficDescParm (rxTdp)

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate

Copyright © 2006, Nortel Nortel Confidential

(PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC).

When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused).

When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused).

When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the

Copyright © 2006, Nortel Nortel Confidential

ConnectionAdministrator defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

Impact — Service

Description

Optimize [-all] AtmIf/n Uni Reroute
Optimize [-all] AtmIf/n Aini Reroute
Optimize [-all] AtmIf/n Iisp Reroute
Optimize [-all] AtmIf/n Vpt/vpi Uni Reroute
Optimize [-all] AtmIf/n Vpt/vpi Aini Reroute
Optimize [-all] AtmIf/n Vpt/vpi Iisp Reroute

This command triggers path optimization for the connection segments managed by the Reroute component.

By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the localOptimalMetricValue attribute under the RerouteInfo component for the connection.

The -all option causes all connection segments subscribed to path optimization to be considered.

Using the Optimize command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

ATTRIBUTE AtmIf Uni Reroute Ov **protocol**

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***localEbr*:** Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature. ***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.
Mib	AtmUni
Values	localGlobal localOnly globalOnly localEbr ebrOnly sameAsARtgPnniReroute (sameAs)
Default	sameAsARtgPnniReroute

ATTRIBUTE AtmIf Uni Reroute Ov **numOptAttempts**

Access	Read and write
Description	This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are

Copyright © 2006, Nortel Nortel Confidential

eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Mib — AtmUni

Values — Decimal (0..15)

Default — sameAs

ATTRIBUTE Atmlf Uni Reroute Ov **moduleOptimizationConnections**

Access — Read and write

Description — This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component.

One of the following values can be specified:
sameAsARtgPnniReroute: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.
none: No connection segments are considered for path optimization.
recoveredOnly: Only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
allSubscribed: All connection segments subscribed to path optimization are considered.

ATTRIBUTE Atmlf Uni Reroute Ov **switchoverMechanism**

Access — Read and write

Description — This attribute specifies the mechanism used for switchover of a rerouted connection segment.

Copyright © 2006, Nortel Nortel Confidential

One of the following values can be specified:
sameAsARtgPnniReroute: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.
standard: The mechanism described in the ATM Forum "Domain based Rerouting" specification is used for switchover. This value ensures interoperability with other vendors' equipment running ATM Forum "Domain based Rerouting".
rcl: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Nortel Networks extension to the standard mechanism, allowing for faster switchover time.

GROUP Atmlf Uni Reroute Ov **LocalProvisioned (LProv)**

Properties: Provisioned

Description: This group contains the provisionable attributes for EBR and local rerouting protocols.

Mib: AtmUni

ATTRIBUTE Atmlf Uni Reroute Ov **localConnectionRecoverySubscr (lConRec)**

Access: Read and write

Description: This attribute specifies which connection segments on the interface request subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified types that request ***localGlobal*** or ***localOnly*** protocols request subscription to local connection recovery.

Connection segments of the specified types that request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
sameAsARtgPnniReroute: If this value is set, the local connection recovery subscription rule is determined by the *ARtg Pnni Reroute localConnectionRecoverySubscr* attribute. This value takes precedence over any other values.
svcSvp: If this value is set, all SVC and SVP connection segments request subscription to local connection recovery.
sourceSpvcSpvp: If this value is set, all source SPVC and SPVP connection segments request subscription to local connection recovery.

ATTRIBUTE Atmlf lisp side

Access	Read: All Write: All
Criticality	Component
Description	This attribute indicates which side the interface is, user or network.
Mib	Atmlisp
Values	networkSide userSide
Default	networkSide

ATTRIBUTE Atmlf lisp softPvpAndPvcRetryPeriod (sRetryPeriod)

Access	Read: All Write: All
Description	This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. Due to the group timer implementation, it can take from 100% to 150% of the provisioned timer value for the retry to be triggered.
Mib	Atmlisp
Values	Decimal (20..999999)
Units	seconds
Default	60

ATTRIBUTE Atmlf lisp softPvpAndPvcHoldOffTime (sHoldOffTime)

Access	Read: All Write: All
Description	This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value.
Mib	Atmlisp
Values	Decimal (0; 50..20000)
Units	msec
Default	0

ATTRIBUTE Atmlf lisp interDomainCrankback

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether the ATM Routing System inserts a Crankback information element (IE) when hop-by-hop routing crankback fails in a neighboring domain and this node is the DTL terminating node of the call. By default, the ATM Routing System, when behaving as a DTL terminating node of a call, only inserts a Crankback IE if the routing system fails to find a static routing port that matches the called address. If this attribute is set to enabled, then a Crankback IE is also inserted when hop-by-hop crankback fails. This attribute may be provisioned on IISP links that connect two PNNI domains. Note that the cause codes that trigger the insertion of the Crankback IE are the same as those that apply to PNNI crankback normally. Not all of these cause codes apply to hop-by-hop routing. The insertion of a Crankback IE can cause extra call setup attempts in certain configurations such as PNNI domains interconnected by IISP links.
Mib	AtmIisp
Values	disabled enabled
Default	disabled

GROUP **Atmlf lisp** **AccountingOptions (AcctOpt)**

Properties	Provisioned
Description	This group contains the provisionable attributes for accounting.
Mib	AtmIisp

ATTRIBUTE **Atmlf lisp** **accountCollection (aco)**

Access	Read: All Write: All
Description	This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA changeover if TODA is enabled; - every 12 hours (per connection) if TODA is disabled; - on every call clear (a call record with final cell counts). If none of the reasons is present, then accounting will be suppressed.

Copyright © 2006, Nortel Nortel Confidential

The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate.

Mib: Atmlisp

Set of:
bill
test
study
audit
force

Default: No default

ATTRIBUTE Atmlf lisp accountConnectionType (act)

Access:
Read: All
Write: All

Description: This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records.

If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***.

If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.

Mib: Atmlisp

Values:
origTerm
intermediate

Default: intermediate

ATTRIBUTE Atmlf lisp accountClass (acl)

Access:
Read: All
Write: All

Description: This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator.

Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.

Mib: Atmlisp

Values: Decimal (0..255)

Copyright © 2006, Nortel

ATTRIBUTE Atmlf lisp Sig **vci**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the signaling channel number.
Mib	Atmlisp
Values	Decimal (0..65535)
Default	5

ATTRIBUTE Atmlf lisp Sig **addressConversion**

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.
Mib	Atmlisp
Values	none nativeE164 nsap
Default	none

ATTRIBUTE Atmlf lisp Sig **operatingMode**

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	Atmlisp
Values	normal provisionedOnly

Copyright © 2006, Nortel Nortel Confidential

Default	normal

GROUP Atmlf lisp Sig **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Atmlisp

ATTRIBUTE Atmlf lisp Sig **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Atmlisp
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf lisp Sig **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Atmlisp
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf lisp Sig **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Atmlisp
Values	idle active (activ) busy
Default	idle

GROUP Atmlf lisp Sig **Operational (Oper)**

Properties	Operational
Description	This attribute contains the operational attributes for the AtmSignalling component.
Mib	Atmlisp

ATTRIBUTE Atmlf lisp Sig **lastTxCauseCode**

Access	Read: All Write: Illegal
Description	This attribute indicates the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	Atmlisp
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf lisp Sig **lastTxDiagCode**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0.
Mib	Atmlisp
Values	Hex (H.0..H.ff)
Default	No default

ATTRIBUTE Atmlf lisp Sig **lastRxCauseCode**

Access	Read: All Write: Illegal
Description	This attribute contains the cause code in the last received signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	Atmlisp
Values	Decimal (0..255)
Default	No default

Mib	Atmlisp

ATTRIBUTE Atmlf lisp Sig Vcd trafficDescType (tdt)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.
Mib	Atmlisp
Values	3 6 7 8
Default	6
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf lisp Sig Vcd atmServiceCategory (service)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of

Copyright © 2006, Nortel Nortel Confidential

significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Mib	AtmIisp
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr)
Default	rtVariableBitRate
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Iisp Sig Vcd** **weight**

Access	Read and write
Criticality	Component
Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but

Copyright © 2006, Nortel Nortel Confidential

	standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT. When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.
Mib	Atmlisp
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf lisp Sig Vcd** **qosClass (qos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values	0 1 2 3 4
Default	2
Flags	HCA_SUPPORT

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf lisp Sig Vcd **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components. When ***disabled*** is selected, traffic shaping for this connection is disabled.
Mib	Atmlisp
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf lisp Sig Vcd **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	Atmlisp

Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf lisp Sig Vcd **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	Atmlisp
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf lisp Sig Vcd **trafficDescParm (tdp)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

Copyright © 2006, Nortel Nortel Confidential

When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

COMPONENT Atmlf lisp Address (Addr)

Instance	address [String (1..40, ASCII)] addressType [primary alternate default]
Groups	GROUP Atmlf lisp Addr Operational (Oper)
Scope	Device
Description	*Atmlf/n Aini Address/address,type* *Atmlf/n lisp Address/address,type* *Atmlf/n Uni Address/address,type* *Atmlf/n Pnni Address/address,type* *Atmlf/n Vpt/m Aini Address/address,type* *Atmlf/n Vpt/m lisp Address/address,type* *Atmlf/n Vpt/m Uni Address/address,type* *Atmlf/n Vpt/m Pnni Address/address,type* This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wildcard ('?'), and a type. The type identifies whether the *Address* component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address. The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses.Virtual interfaces do not have addresses of type ***default***. The wildcard is only valid for provisioned addresses. If the address is a single wildcard, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wildcard static address, then the choice is driven through a round robin algorithm. The round robin algorithm tries the primary routes and then the alternate routes if none of the primary routes succeed. If this node participates in a PNNI hierarchy, then a *PnniInfo*

COMPONENT Atmlf lisp PathTraceFilter (Ptf)

Groups	GROUP Atmlf lisp Ptf Criteria GROUP Atmlf lisp Ptf Operational (Oper) GROUP Atmlf lisp Ptf RecordControl (Record)
Scope	Device

Copyright © 2006, Nortel Nortel Confidential

Description	*AtmIf/n Aini PathTraceFilter* *AtmIf/n Iisp PathTraceFilter* *AtmIf/n Uni PathTraceFilter* *AtmIf/n Pnni PathTraceFilter* *AtmIf/n Vpt/vpi Aini PathTraceFilter* *AtmIf/n Vpt/vpi Iisp PathTraceFilter* *AtmIf/n Vpt/vpi Uni PathTraceFilter* *AtmIf/n Vpt/vpi Pnni PathTraceFilter* This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced. When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop,* and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When *AtmPathTraceFilter* component is deleted, all records are cleared. Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted. The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

VERB START **AtmIf lisp Ptf**

Impact: Service

Description:

START AtmIf/n Aini PathTraceFilter
START AtmIf/n Iisp PathTraceFilter
START AtmIf/n Uni PathTraceFilter
START AtmIf/n Pnni PathTraceFilter
START AtmIf/n Vpt/vpi Aini PathTraceFilter
START AtmIf/n Vpt/vpi Iisp PathTraceFilter
START AtmIf/n Vpt/vpi Uni PathTraceFilter
START AtmIf/n Vpt/vpi Pnni PathTraceFilter

This command starts the path tracing based on the specified filtering criteria.

When the command is issued, the *traceTimeout* timer is reset.

VERB STOP **AtmIf lisp Ptf**

Impact: Service

Description:

STOP AtmIf/n Aini PathTraceFilter
STOP AtmIf/n Iisp PathTraceFilter
STOP AtmIf/n Uni PathTraceFilter
STOP AtmIf/n Pnni PathTraceFilter
STOP AtmIf/n Vpt/vpi Aini PathTraceFilter
STOP AtmIf/n Vpt/vpi Iisp PathTraceFilter
STOP AtmIf/n Vpt/vpi Uni PathTraceFilter
STOP AtmIf/n Vpt/vpi Pnni PathTraceFilter

This command causes the filter to stop, but keeps the trace records.

VERB CLEAR **AtmIf lisp Ptf**

Impact: Service

Description:

CLEAR AtmIf/n Aini PathTraceFilter
CLEAR AtmIf/n Iisp PathTraceFilter
CLEAR AtmIf/n Uni PathTraceFilter
CLEAR AtmIf/n Pnni PathTraceFilter
CLEAR AtmIf/n Vpt/vpi Aini PathTraceFilter
CLEAR AtmIf/n Vpt/vpi Iisp PathTraceFilter
CLEAR AtmIf/n Vpt/vpi Uni PathTraceFilter
CLEAR AtmIf/n Vpt/vpi Pnni PathTraceFilter

This command clears the path trace records associated with this filter. This command is rejected on an active filter.

ATTRIBUTE Atmlf lisp Ptf **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the filter. ***active***: Indicates the filter is active. ***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out.
Mib	Atmlisp
Values	active inactive
Default	inactive

ATTRIBUTE Atmlf lisp Ptf **recordCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords,* which ever is less.
Mib	Atmlisp
Values	Decimal (0..200)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf lisp Ptf **matchedConnections**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of connections that match the criteria of this filter.
Mib	Atmlisp
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Atmlf lisp Ptf **elapsedTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes that have elapsed since the start of the filter.
Mib	Atmlisp
Values	Decimal (0..70560)
Units	minutes
Default	No default

ATTRIBUTE Atmlf lisp Ptf **timeRemaining**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes remaining before the filter terminates itself.
Mib	Atmlisp
Values	Decimal (0..70560)
Units	minutes
Default	No default

GROUP Atmlf lisp Ptf **RecordControl (Record)**

Properties	Operational
Description	This group contains the operational attributes for the record control of the *PathTraceFilter* component.
Mib	Atmlisp

ATTRIBUTE Atmlf lisp Ptf **traceTimeout**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available.
Mib	Atmlisp
Values	Decimal (1..70560)
Units	minutes
Default	60

ATTRIBUTE Atmlf lisp Ptf maxTraceRecords (mRecords)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of records allowed to be stored with the filter. Once the maximum has been reached, the oldest record is removed.
Mib	Atmlisp
Values	Decimal (1..200)
Default	2

COMPONENT Atmlf lisp Ptf PathTraceRecord (PTRecord)

Groups	GROUP Atmlf lisp Ptf PTRecord Operational (Oper)
Scope	Device
Description	*Atmlf/n Aini Ptf PTRecord* *Atmlf/n lisp Ptf PTRecord* *Atmlf/n Uni Ptf PTRecord* *Atmlf/n Pnni Ptf PTRecord* *Atmlf/n Vpt/n Aini Ptf PTRecord* *Atmlf/n Vpt/n lisp Ptf PTRecord* *Atmlf/n Vpt/n Uni Ptf PTRecord* *Atmlf/n Vpt/n Pnni Ptf PTRecord* This component represents the path trace record for the last failed connection against this filter.

GROUP Atmlf lisp Ptf PTRecord **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the path trace record component.
Mib	Atmlisp

ATTRIBUTE Atmlf lisp Ptf PTRecord **status**

Access	Read: All Write: Illegal
Description	This attribute indicates the status of the trace. The string is one of the following: ***Completed normally****:* The trace completed normally. ***Incomplete****:* Partial trace returned. ***Exceeded information element length limitations****:* The number of traced nodes exceeded the maximum number of hops. ***Exceeded message length limitations****:* The message length exceeded the maximum allowed size.
Mib	Atmlisp
Values	Completed normally Incomplete Exceeded information element length limitations Exceeded message length limitations
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord **timeStamp**

Access	Read: All Write: Illegal
Description	This attribute records the date and time of when the trace is completed.
Mib	Atmlisp
Values	Time (DHMS)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord **srcPortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.

Copyright © 2006, Nortel Nortel Confidential

Mib	Atmlisp
Values	Decimal (1..4294967295)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord **srcPortName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	Atmlisp
Values	String (40, ASCII)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord **causeCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	Atmlisp
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord **diagCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	Atmlisp
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord Hop **ingressDlci (dlci)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the DLCI value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. This attribute is displayed for FrAtm interfaces only. The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord Hop **ingressCallReference (callref)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. The call reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value
Mib	Atmlisp
Values	Hex (H.0..H.ffffff)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord Hop **ingressEndPointReference (epref)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages.

Copyright © 2006, Nortel Nortel Confidential

	The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint.
Mib	Atmlisp
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE **AtmIf lisp Ptf PTRecord Hop** **nodeId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the lowest level node ID traversed for this hop.
Mib	Atmlisp
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf lisp Ptf PTRecord Hop** **nodeName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the *nodeName* under the *ModuleData* component for this hop. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	Atmlisp
Values	String (12, ASCII)
Default	No default

ATTRIBUTE **AtmIf lisp Ptf PTRecord Hop** **portId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE **AtmIf lisp Ptf PTRecord Hop** **portName**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	Atmlisp
Values	String (55, ASCII)
Default	No default

ATTRIBUTE **Atmlf lisp Ptf PTRecord Hop** **pnniTraceContRefusalIndPresent (refusal)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.
Mib	Atmlisp
Values	absent present
Default	absent

ATTRIBUTE **Atmlf lisp Ptf PTRecord Hop** **crankbackDestNodeIndPresent (dest)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface.
Mib	Atmlisp
Values	absent present
Default	absent

ATTRIBUTE **Atmlf lisp Ptf PTRecord Hop** **pnniCrankbackGapIndPresent (gap)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback.
Mib	Atmlisp
Values	absent present
Default	absent

ATTRIBUTE **Atmlf lisp Ptf PTRecord Hop** **crankBackCause (cause)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	Atmlisp
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE **Atmlf lisp Ptf PTRecord Hop** **blockedTransitType (type)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked transit type. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	Atmlisp
Values	Succeeding end blocked Blocked node Blocked link
Default	No default

ATTRIBUTE **Atmlf lisp Ptf PTRecord Hop** **blockedNodeId (bNodeId)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked node ID during the call setup request. The blocked node ID identifies the logical node where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked node.***
Mib	Atmlisp
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf lisp Ptf PTRecord Hop** **blockedLinkPrecedingNodeId (pNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's preceding node ID during the call setup request. The blocked link's preceding node ID identifies the logical node preceding a link, where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked link***.
Mib	Atmlisp
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf lisp Ptf PTRecord Hop** **blockedLinkPortId (bPortId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's port identifier used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's preceding node identifier. This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf lisp Ptf PTRecord Hop **blockedLinkSucceedingNodeId (sNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's succeeding node ID during the call setup request. The blocked link's succeeding node ID identifies the logical node succeeding a link where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***
Mib	Atmlisp
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord Hop **dstVpiVci**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the VPI.VCI values on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for ATM interfaces. The VPI.VCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	Atmlisp
Values	Integer Sequence (0..4095; 0..65535)
Default	No default

ATTRIBUTE Atmlf lisp Ptf PTRecord Hop **dstDlci**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the DLCI value on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for FrAtm interfaces. The DLCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	Atmlisp

COMPONENT Atmlf Iisp **PathTraceTestConnection (Ptt)**

Groups	GROUP Atmlf Iisp Ptt Operational (Oper)
Scope	Device
Description	*Atmlf/n Aini PathTraceTestConnection* *Atmlf/n Iisp PathTraceTestConnection* *Atmlf/n Uni PathTraceTestConnection* *Atmlf/n Pnni PathTraceTestConnection* *Atmlf/n Vpt/vpi Aini PathTraceTestConnection* *Atmlf/n Vpt/vpi Iisp PathTraceTestConnection* *Atmlf/n Vpt/vpi Uni PathTraceTestConnection* *Atmlf/n Vpt/vpi Pnni PathTraceTestConnection* This component provides the capability to control the Path Trace Test Connection. A test connection is one way to find the logical nodes and ports that a connection traverses to a destination interface. The *Trace* verb is used to initiate the test connection. The test connection is always released once it reaches the trace destination. The test

Copyright © 2006, Nortel Nortel Confidential

connection responds with the trace results collected during a complete or partial trace.

Mib: AtmIisp

Common Verbs: Help, List, Display

VERB TRACE Atmlf lisp Ptt

Impact: Passive

Description:

TRACE AtmIf/n Aini AtmPathTraceTest
TRACE AtmIf/n Iisp AtmPathTraceTest
TRACE AtmIf/n Uni AtmPathTraceTest
TRACE AtmIf/n Pnni AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Aini AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Iisp AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Uni AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Pnni AtmPathTraceTest

This command is used to initiate a Path Trace Test Connection and then responds with a list of logical nodes and ports from the trace source node to the trace destination node.

Only one *Trace* command is allowed at a time per signaling interface. If the test connection times out, the command fails.

GROUP Atmlf lisp Ptt Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *AtmPathTraceTest* component.

Mib: AtmIisp

ATTRIBUTE Atmlf lisp Ptt traceCrankback

Access: Read: All
Write: All

Description: This attribute controls what trace information the trace records include. If the option is turned on, all attempted paths are recorded including the final one. If the option is turned off, only the information of the final path is recorded. If the connection fails to reached the destination, no path information is returned.

ATTRIBUTE Atmlf lisp Ptt **txTrafficDescType (txTdt)**

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management applied to the transmit direction, as defined by the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute.
Mib	Atmlisp
Values	1 2 3 4 5 6 7 8 9
Default	1

ATTRIBUTE Atmlf lisp Ptt **rxTrafficDescType (rxTdt)**

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management, which is applied to the receive direction of this connection, as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute When ***sameAsTx*** is selected, the *rxTrafficDescType* and the *rxTrafficDescParm* are taken from the transmit values.
Mib	Atmlisp
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE Atmlf lisp Ptt **atmServiceCategory (service)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications. The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS. The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.
Mib	AtmIisp
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE Atmlf lisp Ptt fwdQosClass (fwdQos)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the quality of service for the forward direction for this connection. Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video). Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video). Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer). Class ***4*** supports a QOS that will meet Service Class D performance requirements (connection-less data transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.
Mib	AtmIisp
Values	0 1 2 3 4
Default	0

ATTRIBUTE **Atmlf Iisp Ptt** **bwdQosClass (bwdQos)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the quality of service for the backward direction for this connection. Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video). Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video). Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer). Class ***4*** supports a QOS that will meet Service Class D performance requirements (connection-less data transfer).

Copyright © 2006, Nortel Nortel Confidential

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

The ***sameAsFwd*** selection sets the backward quality of service to be the same as the forward quality of service.

Mib	AtmIisp
Values	0 1 2 3 4 sameAsFwd
Default	sameAsFwd

ATTRIBUTE Atmlf lisp Ptt bearerClassBbc (bcBbc)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network. The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both. Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents. Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on it. Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting

Copyright © 2006, Nortel Nortel Confidential

an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

Mib	AtmIisp
Values	a c x derivedFromServiceCategory
Default	derivedFromServiceCategory

ATTRIBUTE Atmlf lisp Ptt transferCapabilityBbc (tcBbc)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> ***0***: NoIndication, NoIndication ***1***: NoIndication, yes ***2***: NoIndication, no ***5***: CBR, yes ***8***: VBR, NoIndication ***9***: VBR, yes ***10***: VBR, no ***NotApplicable*** specifies that the user does not want to specify the transfer capability. The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data. The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing. The value ***yes*** for end-to-end timing indicates that end-to-end timing is required. The value ***no*** for end-to-end timing indicates that end-to-end timing is not required. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to

Copyright © 2006, Nortel Nortel Confidential

derivedFromServiceCategory or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf lisp Ptt **clippingBbc (cBbc)**

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the value for the clipping susceptibility parameter in the BBC IE. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes.

Clipping is an impairment where the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.

Mib: AtmIisp

Values:
no
yes

Default: no

ATTRIBUTE Atmlf lisp Ptt **bestEffort**

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor IE. It is one of the Broadband Bearer Capability attributes.

The value ***indicated*** implies that the quality of service for this connection is not guaranteed.

The value ***notIndicated*** implies that the quality of service for this connection is guaranteed.

Copyright © 2006, Nortel Nortel Confidential

	The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection, is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Atmlf lisp Ptt bwdQosParameters (bqp)

Access	Read and write
Description	This attribute is a vector of three elements that specify the quality of service parameters for the backward direction for this connection. This attribute is used for SPVC connections. The ***cdv*** element specifies the acceptable peak-to-peak cell delay variation (CDV) of real-time connections (CBR and rt-VBR). It is signaled through the extended QoS information element. The ***ctd*** specifies the acceptable maximum cell transfer delay (maxCtd) of real-time connections (CBR and rt-VBR). It is signaled through the end-to-end transit delay information element. The ***clr*** specifies the acceptable cell loss ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections. It is signaled through the extended QoS information element.

ATTRIBUTE **Atmlf Iisp Ptt txTrafficDescParm (txTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR.

Copyright © 2006, Nortel Nortel Confidential

Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if

Copyright © 2006, Nortel Nortel Confidential

there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

Vector of	Decimal (0..2147483647)
Index	Decimal (1..5)
Default	([5] 0)

ATTRIBUTE **AtmIf IispPtt** **rxTrafficDescParm (rxTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC). When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2. When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be

Copyright © 2006, Nortel Nortel Confidential

greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

VERB OPTIMIZE **Atmlf lisp Reroute**

Impact	Service
Description	*Optimize [-all] AtmIf/n Uni Reroute* *Optimize [-all] AtmIf/n Aini Reroute* *Optimize [-all] AtmIf/n Iisp Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Uni Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Aini Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Iisp Reroute* This command triggers path optimization for the connection segments managed by the Reroute component. By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the localOptimalMetricValue attribute under the RerouteInfo component for the connection. The -all option causes all connection segments subscribed to path optimization to be considered. Using the Optimize command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP **Atmlf lisp Reroute** **LocalOperational (LOper)**

GROUP AtmIf Iisp Reroute Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.
Mib	AtmIisp

ATTRIBUTE AtmIf Iisp Reroute Ov protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.

Copyright © 2006, Nortel Nortel Confidential

globalOnly: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Mib: AtmIisp

Values:
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE Atmlf Iisp Reroute Ov **numOptAttempts**

Access: Read and write

Description: This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Groups	GROUP AtmIf NAcct Provisioned (Prov)
Scope	Device
Description	*AtmIf/n NailedUpAccounting* This component represents the ATM accounting options for all nailed up connections (PVCs) on this ATM interface. The component must be provisioned in order to perform PVC ATM accounting on this ATM interface.
Mib	AtmCore
Common Verbs	Help List Display Add DELete

GROUP Atmlf NAcct Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for PVC accounting.
Mib	AtmCore

ATTRIBUTE Atmlf NAcct accountCollection (aco)

Access	Read: All Write: All
Description	This attribute specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit*** or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA (time of day accounting) changeover if TODA is enabled; - every 12 hours (per connection) if TODA is disabled;

Copyright © 2006, Nortel Nortel Confidential

- when the PVC is deleted (a call record is generated with final cell counts).

If none of the reasons is present, then accounting will be suppressed for all PVCs on this interface. Accounting can be suppressed on individual PVCs by specifying a null *correlationTag* attribute in the *AtmIf NAcct* component.

The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason,* as appropriate.

Mib: AtmCore

Set of:
bill
test
study
audit
force

Default: No default

ATTRIBUTE AtmIf NAcct accountConnectionType (act)

Access:
Read: All
Write: All

Description: This attribute specifies whether accounting records generated for the PVCs on this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record. It may be used by downstream accounting processing to correlate the records.

If the value is ***origTerm*** then the value of attribute *connPointType* in the accounting records generated for incoming calls will be ***originating*** and records generated for outgoing calls will be ***terminating***.

If the value is ***intermediate*** then the value of attribute *connPointType* in the accounting records generated for all calls will be ***intermediate***.

Mib: AtmCore

Values:
origTerm
intermediate

Default: origTerm

ATTRIBUTE AtmIf NAcct accountClass (acl)

Access:
Read: All

VERB TRACE AtmIf Vpt

Impact	Service
Description	*TRACE AtmIf/n Vpt/vpi* *TRACE -p AtmIf/n Vpt/vpi* This command traces the path of an intra-network segment of a connection. It displays the names of interface and connection components found along this segment of a connection path. The trace output also includes the *Virtual Path Terminator (VPT)* at the end of the path, should one exist. The option for the OAM trace is as follows: *-p*: Selects the Nortel Networks proprietary OAM Connection Management Trace instead of the proprietary OAM Legacy Loopback Trace. If no options are provided, the default configuration uses the Legacy Loopback Trace.

GROUP AtmIf Vpt OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore

ATTRIBUTE Atmlf Vpt adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmCore
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vpt operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmCore
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vpt usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmCore
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpt Operational (Oper)

Properties	Operational
Description	This group contains operational information for a *Vcc, Vpc,* or *Vpt* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt connectionPointType (cpt)

Access	Read only
Description	This attribute reflects the role of the connection component at this interface. A value of ***connectionEndPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are processed by the connection component. A value of ***segmentEndPoint*** indicates that user cells and end-to-end OAM cells are relayed by the connection component, while segment OAM cells are processed by the connection component. A value of ***connectingPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are relayed by the connection component. A value of ***unknown*** indicates that the connection component is inactive.
Mib	AtmCore
Values	connectionEndPoint segmentEndPoint connectingPoint unknown
Default	No default

GROUP Atmlf Vpt Status

Properties	Operational
Description	This group contains operational status information for a *Vcc, Vpc* or *Vpt* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt operStatus (opStat)

Access	Read only
Description	This attribute indicates the present operational status of the *Vcc, Vpc* or *Vpt* component. Its value is dependent upon the current state of the *segLinkSideLoopbackState* and *endToEndLoopbackState* attributes. The value is ***end2endUp*** when the *endToEndLoopbackState* is ***good*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***end2endDown*** when the *endToEndLoopbackState* is ***bad*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***unknown*** and the *segLinkSideLoopbackState* is ***good***. The value is ***localDown*** when *segLinkSideLoopbackState* is ***bad***. The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***notApplicable*** and the *segLinkSideLoopbackState* is ***good***. The value is ***unknown*** when the *endToEndLoopbackState* is either ***unknown*** or ***notApplicable*** and the *segLinkSideLoopbackState* is ***unknown***.
Mib	AtmCore
Values	unknown end2endUp end2endDown localUpEnd2endUnknown localDown
Default	No default

ATTRIBUTE Atmlf Vpt localFailureCause

Access	Read only
Description	This attribute indicates the failure cause of the *Vcc, Vpc* or *Vpt* component. A value of ***noFailure*** indicates that there is currently no bandwidth related failure for this connection.

Copyright © 2006, Nortel Nortel Confidential

A value of ***portDown*** indicates that the interface corresponding to the parent *AtmIf* is down.

A value of ***localBwLoss*** indicates that the *AtmIf* has lost some, but not all bandwidth, and as a result, this connection has been released.

A value of ***notAdmitted*** indicates that this connection has failed to be admitted by the Connection Admission Control (CAC) algorithm.

A value of ***appNotRegistered*** indicates that there is no application registered to use this connection. This may be the case, for example when there is a *Vcc Test* application, but the test has not been started. Check the status of the application to determine why it is not functional.

A value of ***disabledByApp*** indicates that the application using this connection has requested that the connection be disabled. An example is a connection used by a trunk application where the trunk has timed out on an attempt to stage. Check the application to determine why it is not fully functional.

A value of ***bwReduced*** indicates that this connection is operating in a reduced bandwidth state. It is a bandwidth elastic connection which currently has been allocated less than the requested (equivalent) bandwidth.

A value of ***vpDown*** indicates that this connection has been notified of a fault detected at the associated VP-layer. A value of ***vpDown*** is applicable for *Vpt Vcc*s only.

Mib	AtmCore
Values	noFailure localBwLoss portDown notAdmitted appNotRegistered disabledByApp bwReduced vpDown
Default	No default

ATTRIBUTE Atmlf Vpt troubled

Access	Read only
Description	This attribute indicates whether or not the connection is in a troubled state. Connections become troubled because of OAM failures; when one of the attributes *segLinkSideLoopbackState*, *segSwitchSideLoopbackState*, *endToEndLoopbackState*, *aisState* (when receiving AIS cells only) or *rdiState* go bad, this attribute is set to ***yes***; otherwise it is set to ***no***.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpt **segLinkSideLoopbackState (segLkLbkState)**

Access	Read only
Description	This attribute contains the current state of the link-side segment loopback for this connection. Link-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the link (port). The value of this attribute is dependent upon the current setting of the *segLinkSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable). The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***. The value is ***good*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the segment link side loopback is working. The value is ***bad*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the link side segment loopback is not working. The value is ***unknown*** when the *segLinkSideLoopback* is ***off***. The value is ***unknown*** when the value of the *segLinkSideLoopback* attribute is ***on***, the *connectionPointType* attribute is set to ***segmentEndPoint*** or ***connectionEndPoint***, and the segment link side loopback has not yet been determined. The state of this attribute determines, in part, the value of the *operStatus* attribute.
Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt **segSwitchSideLoopbackState (segSwLbkState)**

Access	Read only
Description	This attribute contains the current state of the switch-side segment loopback for this connection. Switch-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the bus. The value of this attribute is dependent upon the current setting of the *segSwitchSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable). The value is only applicable when the *connectionPointType* is a ***segmentEndPoint***. The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or ***connectionEndPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***. The value is ***good*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback is working. The value is ***bad*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the switch side segment loopback is not working. The value is ***unknown*** when the *segSwitchSideLoopback* is ***off***. The value is ***unknown*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback has not been determined.
Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt **endToEndLoopbackState (eeLbkState)**

Access	Read only
Description	This attribute contains the current state of the end-to-end loopback for this connection. Its value is dependent upon the current setting of the *endToEndLoopback* provisionable attribute and the connection point type as specified by the *connectionPointType* attribute.

Copyright © 2006, Nortel Nortel Confidential

The value is only applicable when the *connectionPointType* is a ***connectionEndPoint***.

The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or s***egmentEndPoint***.

The value is ***notApplicable*** when the *distributionType* is a ***pointToMultipoint***.

The value is ***good*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is working.

The value is ***bad*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is not working.

The value is ***unknown*** when the *endToEndLoopback* is ***off***.

The value is ***unknown*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback status has not been determined.

The state of this attribute determines, in part, the value of the *operStatus* attribute.

Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt rxOamCellCongestionState (rxOamCongState)

Access	Read only
Description	This attribute contains the current state of the receive side OAM cell congestion for this connection. Its value reflects whether the rate of received OAM cells for this connection is below a specified threshold. The connection maintains a count of the number of OAM cells which are terminated per second. Once that count exceeds the specified threshold, extraction of all OAM cells for this connection is disabled for a period of one minute. This is a congestion management mechanism to prevent the processor from being overloaded with handling OAM cells for a particular connection. This mechanism ensures that tasks, such as trunks obtain enough processor cycles to remain in service, and are not adversely affected by excessive rate of OAM cells on a particular connection. The value is ***good*** when the rate of received OAM cells is less than the allowed threshold.

Copyright © 2006, Nortel Nortel Confidential

The value is ***bad*** when the arrival rate has exceeded the allowed threshold. It remains ***bad*** for one minute, before returning to ***good*** again. During this timeout, extraction of all OAM cells is disabled for this connection. As a result, other loopback failure conditions may occur.

The value is ***unknown*** when the application has not yet begun to use this connection. An example is the *Test* component before a test has been started.

Each type of OAM cell is counted separately. The threshold for AIS cells is three cells per second. If more than three AIS cells are received within a one second interval, this attribute is set to ***bad***. The threshold for RDI cells and each loopback type is also three, but the threshold for trace cells is 250 per second.

The state of this attribute has no direct effect on the value of the *operStatus* attribute or on the number of troubled connections.

Mib: AtmCore

Values:

Properties	Operational
Description	This group contains traffic statistics for a *Vcc*, *Vpc,* or *Vpt* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt txCell

Access	Read only
Description	This attribute counts the number of cells that have been transmitted from the interface on this connection. The counter wraps to zero if it exceeds its maximum value of (2**64)-1. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, this attribute does not include locally generated AIS cells. Specifically AIS cells generated on the destination side of a SPVC or SPVP will not be included in this attribute, nor will AIS cells generated on the link side of a PVC or PVP.
Mib	AtmCore
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Vpt txCellClp (txClp)

Access	Read only
Description	This attribute counts the number of cells that have been transmitted from the interface on this connection with the CLP=1. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt txCellDiscard (txcd)

Access	Read only
Description	This attribute counts the number of cells received from the backplane on this connection that have been discarded. Discarded cells are not counted in the *txCell* attribute. Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point. For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscard* values for all connections associated with the *Vpt*. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt txCellDiscardClp (txcdClp)

Description	This attribute counts the number of cells received from the backplane on this connection with CLP=1 that have been discarded.

Copyright © 2006, Nortel Nortel Confidential

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

This count is included in the *txCellDiscard* attribute. Discarded cells are not counted in the *txCellClp* attribute.

Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscardClp* values for all connections associated with the *Vpt*.

When both ingress and egress of a port is down, txcells are silently discarded.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

ATTRIBUTE AtmIf Vpt rxCell

Access	Read only
Description	This attribute counts the number of cells that have been received from the interface on this connection. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this count does not include cells that have been discarded by the interface due to non-conformance with UPC. For ***3pOC3MmAtm, 3pOC3SmAtm, 3pDS3Atm, 3pE3Atm, 3pDS1Atm, 3pE1Atm, 2pJ6MAtm, 8pDS1Atm*** and ***8pE1Atm*** cards, if only user traffic is transmitted, this count will be increased when either the PVC or PVP connection is down, and is reset to 0 when either the SPVC or SPVP connection is down. If only the F4 and F5 OAM cells are transmitted, this count will be reset to 0 when either the PVC, PVP, SPVC or SPVP connection is down. For ***2pOC3MmAtm2, 2pOC3SmAtm2, 2pSTM1eAtm, 2pSTM1eChAtm, 4pOC3MmAtm, 4pOC3SmIrAtm, 3pDS3Atm2, 4pDS3ChAtm, 12pDS3Atm, 3pE3Atm2,*** and ***12pE3Atm*** cards, if only user traffic is transmitted, this count will be increased when the PVC, PVP, SPVC or SPVP connection is down. If only F4 and F5 OAM cells are transmitted, this count will be reset to 0 when either the PVC or PVP connection is down and is increased when either the SPVC or SPVP connection is down. For ***4pOC12SmIrAtm, 4pOC12SmLrAtm*** and***16pOC3SmIrAtm*** cards, this count will be reset to 0 when either the PVC, PVP, SPVC or SPVP connection is down regardless of whether only user traffic or the F4 and F5 OAM cells are transmitted. For ***16pOC3PosAtm*** card, this count will be reset to 0 when either the PVC, PVP, SPVC or SPVP connection is down regardless of whether only user traffic or the F4 and F5 OAM cells are transmitted. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

ATTRIBUTE Atmlf Vpt **rxCellClp (rxClp)**

Access	Read only
Description	This attribute counts the number of cells that have been received from the interface on this connection with the CLP=1. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt **rxCellDiscard (rxcd)**

Access	Read only
Description	This attribute counts the number of cells received from the interface on this connection that have been discarded. This count is included in the *rxCell* attribute. This count includes cells discarded due to non-conformance with UPC, cells which are part of a frame which has been discarded due to an AAL5 frame reassembly error, cells which are discarded due to congestion, or cells which are received while the next hop connection to which the traffic is directed across the backplane is down. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that reassemble cells into frames (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this count does not include cells discarded due to non-conformance with UPC. For *Vpt*s, this attribute provides an aggregated total of all *rxCellDiscard* values for all connections associated with the *Vpt*. Discards due to non-conformance with UPC at the VP layer, for a standard *Vpt Vcc,* are not included in this attribute. These discards are counted in the *Vcc*'s parent *Vpt rxCellDiscard* attribute. For ***3pOC3MmAtm, 3pOC3SmAtm, 3pDS3Atm, 3pE3Atm, 3pDS1Atm, 3pE1Atm, 2pJ6MAtm, 8pDS1Atm*** and ***8pE1Atm*** cards, if only user traffic

ATTRIBUTE Atmlf Vpt **rxUpcViolationOnEnforcer1 (rxEnforcer1)**

Access	Read only
Description	This attribute counts the number of UPC violations observed by the Generic Cell Rate Algorithm (GCRA) Enforcer 1. This attribute is only applicable if UPC is enforced or monitored on the connection. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, and ***1pOC48ChSmIrAtm*** cards, this attribute is not applicable and is not displayed. When the value of the *rxTrafficDescType* attribute for this connection is 3, 4, 5, 6, 7, 8, or 9 (for UBR with MDCR connections) Enforcer 1 enforces conformance of traffic received from the interface to PCR CLP0+1. When the value of the *rxTrafficDescType* attribute for this connection is 9

Copyright © 2006, Nortel Nortel Confidential

(for ABR connections), Enforcer 1 performs the Dynamic Generic Cell Rate Algorithm (DGCRA) used for the Available Bit Rate (ABR) service category.

If UPC is enforced all non-conforming cells are discarded by this enforcer. These discarded cells are included in the *rxCellDiscard* attribute.

For basic *Vpt*s, this attribute provides an aggregated total of all *rxUpcViolationOnEnforcer1* values for all *Vcc*s associated with the *Vpt*. This attribute is not applicable for standard *Vpt Vcc*s.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Mib	AtmCore

ATTRIBUTE Atmlf Vpt rxAal5FrameError (rxfer)

Access	Read only
Description	This attribute counts the number of frames received from the interface on this connection that have AAL5 length errors or AAL5 CRC errors. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed. AAL5 length or CRC errors typically occur because of cell discards due to congestion, UPC, or due to corruption of data between the AAL5 segmentation and reassembly end points. This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point. For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameError* values for all connections associated with the *Vpt*. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt rxAal5FrameAbort (rxfa)

Access	Read only
Description	This attribute counts the number of frames received from the interface on this connection that have the AAL5 length field set to zero. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed.

Copyright © 2006, Nortel Nortel Confidential

An AAL5 length of zero is an indication by the far end segmentation point, to this reassembly point, that the frame is to be discarded without reassembly. This mechanism is typically used by a segmentation point if it detects an error in a frame after some of the cells belonging to that frame have already been transmitted.

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameAbort* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

COLLECTED STATS AtmInterface VirtualPathTerminator

Description	The statistics record generated by the AtmInterface VirtualPathTerminator component.

ATTRIBUTE Atmlf Vpt remoteInstance

Description	This attribute indicates the remote ATM interface, as provisioned in the *remoteAtmInterfaceLabel*.
Values	String (0..60, ASCII)

ATTRIBUTE Atmlf Vpt provRate

Description	This attribute indicates the provisioned bandwidth for this ATM interface.
Values	Decimal (0..4294967295)
Units	cell/s

ATTRIBUTE Atmlf Vpt actualRate

Description	This attribute indicates the actual bandwidth for this ATM interface. When no errors occur it has a value equal to *provRate*. When the link (or IMA group) is down for the entire collection interval it has a value of zero. When the link goes down during the collection interval it has a value representing the average bandwidth during the collection interval.
Values	Decimal (0..4294967295)
Units	cell/s

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt txUtilization

Description	This attribute indicates the average transmit traffic rate over the most recent collection interval expressed as a percentage of the ATM link bandwidth. On *AtmIf*s linked to MPLS POS interfaces, the ATM link is the *LSP*. Many *LSP*s could share the same POS link. If the POS link is underutilized it is possible for an *LSP* to carry more traffic than it has been assigned. This occurs as bandwidth on an *LSP* is allocated based on determining whether the requested bandwidth exceeds the available bandwidth on an *LSP*, not on whether the actual bandwidth exceeds the available bandwidth. When the actual bandwidth is higher than the requested bandwith it is possible that this extra traffic will be carried over the *LSP*. Since this is possible, the value of this attribute may exceed 100%. If the utilization exceeds 65535% then 65535 is displayed. If the *Lsp* has a bandwidth of 0, then 0 is displayed for the utilization.
Values	Decimal (0..65535)
Units	%

ATTRIBUTE Atmlf Vpt rxUtilization

GROUP Atmlf Vpt Vpd Loopback (Lbk)

Properties	Provisioned
Description	This group contains the provisionable loopback attributes for a *Vcc, Vpc,* or *Vpt* component. Note that certain loopback requests may not be possible on a given connection. In such cases, the corresponding operational loopback attribute in the *Status* group of the *Vcc, Vpc,* or *Vpt* component indicates ***notApplicable*** and the requested loopback is not performed. If loopbacks are provisioned to be on, and for any reason the segment or end-to-end OAM loopback cells are not relayed, the connection component becomes troubled, and user cell traffic may be discarded. If loopbacks are provisioned to be on, all of the nodes in the segment, and external networks which are in the end-to-end connection must relay the OAM loopback cells.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vpd segLinkSideLoopback (segLkLbk)

Access	Read and write
Description	This attribute specifies whether link-side segment loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the link-side segment loopback insertion for the connection is based on the *segLinkSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has link-side segment loopback insertion turned on, then link-side segment loopback insertion is also on for the connection. A value of ***on***, or ***off*** means link-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component. Note that link-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***. Link-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint***. In such cases, the operational *segLinkSideLoopbackState* attribute indicates ***notApplicable*** and link-side segment loopback insertion is not performed. Link-side segment loopback insertion is always possible on a *Vpt*.
Mib	AtmCore
Values	on off sameAsInterface

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsInterface

ATTRIBUTE Atmlf Vpt Vpd **segSwitchSideLoopback (segSwLbk)**

Access	Read and write
Description	This attribute specifies whether switch-side segment loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the switch-side segment loopback insertion for the connection is based on the *segSwitchSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has switch-side segment loopback insertion turned on, then switch-side segment loopback insertion is also on for the connection. A value of ***on***, or ***off*** means switch-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component. Note that switch-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint*** or ***connectionEndPoint***. Switch-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint*** In such cases, the operational *segSwitchSideLoopbackState* attribute indicates ***notApplicable*** and switch-side segment loopback insertion is not performed. Switch-side segment loopback is never possible on a *Vpt*.
Mib	AtmCore
Values	on off sameAsInterface
Default	sameAsInterface

ATTRIBUTE Atmlf Vpt Vpd **endToEndLoopback (eeLbk)**

Access	Read and write
Description	This attribute specifies whether end-to-end loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the end-to-end loopback insertion for the connection is based on the *endToEndLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has end-to-end loopback insertion turned on, then end-to-end loopback insertion is also on for the connection. A value of ***on***, or ***off*** means end-to-end loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component.

Copyright © 2006, Nortel Nortel Confidential

Note that end-to-end loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***, or ***segmentEndPoint***. End-to-end loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint***. In such cases, the operational *endToEndLoopbackState* attribute indicates ***notApplicable*** and end-to-end loopback insertion is not performed.

End-to-end loopback insertion is always possible on a *Vpt*.

GROUP Atmlf Vpt Vpd Accounting (Acct)

Properties: Provisioned

Description: This group contains the provisionable ATM accounting attributes for a *Vcc, Vpc,* or *Vpt* component.

Mib: AtmCore

ATTRIBUTE Atmlf Vpt Vpd correlationTag (tag)

Access: Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a unique identifier for each end of a PVC. It that may be used by downstream processing systems to correlate accounting records issued at different nodes in the network. The attribute can be up to 64 bytes long. If it is less than 64 bytes, it is zero filled on the right to create a 64 byte value. The resulting value is recorded in the attribute *callConnId* for this PVC's ATM accounting records. If the value is a null string then this PVC does not have any accounting records generated for it.
Mib	AtmCore
Values	String (0..64, ASCII)
Default	""

GROUP **AtmIf Vpt Vpd** **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable ATM Virtual Path Descriptor attributes for a *Vpt* component.
Mib	AtmCore

ATTRIBUTE **AtmIf Vpt Vpd** **vptType**

Access	Read and write
Description	This attribute specifies the type of the *Vpt*. A value of ***basic*** configures one level of traffic management (TM) for the VPT, at the VC level. VCs within the VP are treated like independent VCC connections, and thus, are scheduled the same as other VCs under the *AtmIf*, with no scheduling done for the VP itself. A value of ***standard*** configures two levels of traffic management (TM) for the VPT, one level for VP TM and one level for VC TM. VCs within the VP use weighted fair queuing to schedule the VCs within the VPT, with VCs differentiated as either real-time (CBR, rt-VBR) or non-real-time (nrt-VBR, UBR) connections. The VP itself has a full range of emission scheduling and service category differentiation available between itself and the other connections under the *AtmIf*. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, ***1pOC48ChSmIrAtm,*** and ***4pMRPosAtm*** cards, all *Vpts* must be ***basic***. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, *Vpts* may be of any type.

ATTRIBUTE Atmlf Vpt Vpd Tm fwdQosClass (fwdQos)

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for the forward direction for this connection. This attribute is only used for SPVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (variable bit rate audio and video). Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified bit rate QOS class; no objective is specified for the performance parameters.
Mib	AtmCore
Values	0 1 2 3 4
Default	0

ATTRIBUTE Atmlf Vpt Vpd Tm txQueueLimit (txQlim)

Access	Read and write
Criticality	Component
Description	This attribute specifies an override to the default transmit queue limit for this connection. A value of ***sameAsCa*** means that the default common or per-VC transmit queue limit, as defined by the CA service category, is used for this

Copyright © 2006, Nortel Nortel Confidential

connection. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***sameAsCa*** must be specified.

A value from 5 to 512,000 means that the connection transmit queue limit differs from the default common or per-VC transmit queue limit, as defined by the CA service category. A value other than ***sameAsCa*** is ignored for connections where common queuing is specified for the service category.

For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the per-VC utilization limit of the service category common queue.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from 5 to 512000 inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

On all other cards, the valid range for this attribute is from 5 to 63488 inclusive.

The actual transmit queue limit for a connection is visible in the *Vcc Tm*, *Vpc Tm* or *Vpt txQueueThresholds* attribute.

This attribute is not applicable for basic *Vpt*s.

Mib	AtmCore
Values	Decimal (5..1011840) sameAsCa
Units	cells
Default	sameAsCa

ATTRIBUTE **AtmIf Vpt Vpd Tm** **holdingPriority (hpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. The default holding priority for a provisioned connection is higher then default holding priorities for dynamic (SVC) connections. The value of this attribute may be overridden by certain applications, for example *Vcc Test*, which use this connection.

Copyright © 2006, Nortel Nortel Confidential

This attribute is not applicable for *Vpt Vcc*s.

1
2
3
4
sameAsFwd

Default: sameAsFwd

ATTRIBUTE **Atmlf Vpt Vpd Tm** **atmServiceCategory (service)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the ATM service category for both directions of the connection.

The value ***derivedFromBBC*** may only be used if the *Src* or *Dst* component is provisioned under this connection. Otherwise a specific ATM service category must be specified.

A value of ***derivedFromBBC*** means the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection.

A value other than ***derivedFromBBC*** means the value of this attribute is used to override the provisioned BBC Information Element parameters. In this case, the BBC attributes are not used.

The ***constantBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced

Copyright © 2006, Nortel Nortel Confidential

value to the application.

The ***rtVariableBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real-time VBR service may support statistical multiplexing of real-time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non real-time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non real-time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Mib	AtmCore
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) availableBitRate (abr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE Atmlf Vpt Vpd Tm **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.

Copyright © 2006, Nortel Nortel Confidential

This attribute is ignored if the *atmServiceCategory* is ***availableBitRate***.

For ***1pOC12SmLrAtm*** and ***1pOC48ChSmlrAtm*** cards, traffic shaping is not available, therefore this attribute is ignored.

A value of ***sameAsCa*** means traffic shaping for the connection is based on the value of the *trafficShaping* attribute of the connection's service category component under the *CA.* If the service category has *trafficShaping* set to ***enabled*** or ***inverseUpc***, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm, Vpc Tm,* or *Vpt Tm* components.

A value of ***disabled*** means traffic shaping for this connection is disabled regardless of the provisioning of the connection's service category component.

Mib — AtmCore

Values — disabled
sameAsCa

Default — sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm **unshapedTransmitQueueing (unshap)**

Access — Read and write

Criticality — Component

Description — This attribute specifies the transmit queuing method for this connection if it is unshaped. The two possible methods are per-VC queuing and common queuing. This attribute does not apply if the connection is shaped.

A value of ***sameAsCa*** means the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *CA*.

A value of ***common*** means transmit traffic on this unshaped connection is destined for the common queue.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmlrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmlrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmlrAtm***, ***16pOC3PosAtm***, ***1pOC48ChSmlrAtm***, and ***4pMRPosAtm*** cards, this attribute must have the value ***sameAsCa***.

This attribute is ignored in the following situations:
- if the connection has *trafficShaping* ***enabled*** or ***inverseUpc***, or
- if the *atmServiceCategory* is ***availableBitRate***, or

Copyright © 2006, Nortel Nortel Confidential

- if the *atmServiceCategory* is ***constantBitRate***, or
- for basic *Vpt*s and standard *Vpt Vcc*s.

Mib	AtmCore
Values	common sameAsCa
Default	sameAsCa

ATTRIBUTE **AtmIf Vpt Vpd Tm** **weight**

Access	Read and write
Criticality	Component
Description	This attribute specifies an override for the weight of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, and basic *Vpt*s. A value of ***sameAsCa*** means the weight is determined by the *weightPolicy* attribute under the *CA* service category component for all but standard *Vpt Vcc*s. For standard *Vpt Vcc*s, the weight is determined by the *Vcc*'s service category, when the value is set to ***sameAsCa***. A value from 1 to 4095 means that value is used for the fairness weight of this connection relative to other connections. For all but standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the *Vpt*. A value of ***upToQueueLimit*** means the fairness weight is limited only by the *txQueueLimit*. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, the value ***upToQueueLimit*** is not permitted.
Mib	AtmCore
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa

ATTRIBUTE **AtmIf Vpt Vpd Tm** **forceTagging (tagging)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies whether force tagging of the CLP bit is enforced for cells of this connection. Force tagging can be enabled for permanent connections of any service category and on switched connections of UBR service category. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards, and for *Vpt*s, this attribute is not applicable and is ignored. A value of ***sameAsCa*** means the force tagging functionality is determined by the *forceTagging* attribute under the *CA* service category component. A value of ***enabled*** means force tagging is enabled. When this option is selected, the CLP bit is set to 1 for all cells on the connection. A value of ***disabled*** means force tagging is disabled. When this option is selected, the CLP bit is unchanged for cells on the connection. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction. In this case, cells which are tagged are counted in the *txCellClp* attribute.
Mib	AtmCore
Values	sameAsCa enabled disabled
Default	sameAsCa

ATTRIBUTE **AtmIf Vpt Vpd Tm** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enables usage parameter control (UPC) when receiving traffic from the ATM interface. The value ***sameAsCa*** means UPC for the connection is based on the value of the *usageParameterControl* attribute of the service category component under the *AtmIf CA.* If the service category has UPC ***enforced*** or ***monitored***, then UPC is enabled on the connection. The value ***disabled*** means UPC for this connection is disabled regardless of the provisioning of the service category. The value ***enforced*** means UPC for this connection is enforced regardless of the provisioning of the service category. When UPC is enforced, non-

Copyright © 2006, Nortel Nortel Confidential

conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*.

The value ***monitored*** means UPC for this connection is monitored regardless of the provisioning of the service category. When UPC is monitored, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on unchanged.

Note that setting UPC to ***enforced*** or ***monitored*** may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc, Vpc,* and *Vpt* components.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported.

For ***1pOC48ChSmIrAtm*** cards, the values ***enforced***, and ***monitored***, are not supported.

Mib	AtmCore
Values	enforced disabled sameAsCa monitored
Default	sameAsCa

ATTRIBUTE **Atmlf Vpt Vpd Tm** **bearerClassBbc (bcBbc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the bearer capability. This attribute is only used for SPVC and SPVP connections. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both. Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based

Copyright © 2006, Nortel Nortel Confidential

upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***) and timing requirements are user defined (that is, transparent to the network).When ***x*** is set the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class **vp** service is used to specify a transparent VP service. When the value of this attribute is vp, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except or VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP connections.

ATTRIBUTE Atmlf Vpt Vpd Tm **transferCapabilityBbc (tcBbc)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

The value ***notApplicable*** specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to traffic offered on services such as a constant

Copyright © 2006, Nortel Nortel Confidential

bit rate video service or a circuit emulation.
The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value no indication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

The value yes for end-to-end timing indicates that end-to-end timing is required.

The value no for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE **Atmlf Vpt Vpd Tm txWredThreshold**

Access: Read and write

Criticality: Component

Description

This attribute specifies the threshold for weighted random early detection (WRED). This threshold is calculated as a percentage of the early packet discard (EPD) threshold, which is 85% of the transmit queue length. When the value is ***25%***, WRED starts as soon as the queue is 25% of the way to the EPD threshold. When the value is ***50%***, WRED starts later, after the queue is 50% of the way to the EPD threshold. When the value is ***75%***, WRED starts only when the queue is 75% of the way to the EPD threshold.

This attribute is ignored if the value of the *txWredMode* or *txPacketWiseDiscard* attributes is ***disabled.***

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***,

Values	indicated notIndicated derivedFromServiceCategory (derived)
Default	derivedFromServiceCategory

ATTRIBUTE Atmlf Vpt Vpd Tm **txPacketWiseDiscard (txpd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the transmit data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s. Packet-wise functions increase the “goodput” of the link. The transmit packet-wise functions are Early Packet Discard (EPD) and Partial Packet Discard (PPD). EPD allows the connection to discard an entire frame once the transmit queue has reached the EPD threshold. EPD increases the “goodput” of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell. PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted. For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the packet-wise discard functions are PPD and EPD. PPD is applicable at cell-transfer points. PPD is not applicable at frame-to-cell conversion points, and is not applicable for *Vpc*s. PPD is configured by this attribute. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded. EPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute. For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Both PPD and EPD are controlled by

Copyright © 2006, Nortel Nortel Confidential

this attribute. This attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. This attribute may safely be set to ***enabled*** for VCCs since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

A value of ***enabled*** means packet-wise discard functions are applied to transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the backward direction. When this attribute is set to ***disabled***, backward frame discard is not requested in the SPVC call setup.

The transmit packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute.

Mib	AtmCore
Values	disabled enabled
Default	disabled

ATTRIBUTE **Atmlf Vpt Vpd Tm** **rxPacketWiseDiscard (rxpd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the receive data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s.

Copyright © 2006, Nortel Nortel Confidential

Packet-wise functions increase the “goodput” of the link. The receive packet-wise function is Partial Packet Discard (PPD).

PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD is available at all VCC connection points where UPC may be activated. PPD is not applicable for *Vpcs*. Packet-wise discards should only be enabled for connections carrying AAL5 segmentation traffic. Setting the value to ***enabled*** for any other traffic type may result in traffic being discarded. PPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, this attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***1pOC48ChSmIrAtm*** cards, this attribute may safely be set to ***enabled*** for VCCs, since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. A value of ***enabled*** for the *rxPacketWiseDiscard* attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in enabling packet-wise discard functions on these cards. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

A value of ***enabled*** means packet-wise discard functions are applied to receive traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic at this connection point.

Copyright © 2006, Nortel Nortel Confidential

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward direction. When this attribute is set to ***disabled***, forward frame discard is not requested in the SPVC call setup.

The receive packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm rxPacketWiseDiscard* operational attribute.

Mib	AtmCore
Values	disabled enabled
Default	disabled

ATTRIBUTE **AtmIf Vpt Vpd Tm txWredMode**

Access	Read and write
Criticality	Component
Description	This attribute specifies the activation of weighted random early detection (WRED) functionality. WRED is considered a packet-wise discard function and as such applies only to AAL5 frame traffic. WRED is applied in the transmit direction for this connection. WRED function should be enabled only for connections which are transferring TCP/IP traffic. WRED acts to prevent synchronization of multiple TCP/IP sources by randomly discarding a small percentage of frames when transmit queue congestion reaches the designated level. WRED may also be used to differentiate service on VCC's by preferentially discarding one VCC before another. Discards start at 0% of cells, when the queue is part-way to the Early Packet Discard (EPD) threshold, and rise to 100% of cells discarded at the EPD threshold. WRED discards all the cells in a frame. A value of ***enabled*** means WRED is enabled for all applications linked to the given *Vcc*. A value of ***perFlow*** means each TCP application has individual control over whether to enable or disable WRED. If the value of the *txPacketWiseDiscard* attribute is ***disabled***, or if the value of this attribute is ***disabled***, WRED functionality is disabled. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, the value of this attribute must be ***disabled***. If WRED is active, it is visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute. This attribute is not applicable for *Vpt*s or *Vpt Vcc*s.

Mib	AtmCore
Values	disabled enabled perFlow
Default	disabled

ATTRIBUTE Atmlf Vpt Vpd Tm **abrConnectionType (abrType)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the type of ABR behavior which is to be enforced at this connection. This attribute is only applicable if the value of the *atmServiceCategory* attribute is ***availableBitRate***. If the value of the *atmServicecategory* attribute is not ***availableBitRate***, this attribute is ignored. The value ***sameAsCa*** is used to request the default behavior as specified in the *CA Abr* component for this *Vcc*. Otherwise, this attribute overrides the default behavior. The value ***virtualSourceDest*** is used to request that this connection point function as a virtual source/virtual destination. The value ***sourceDest*** requires that this connection point function as a S/D for RM cells. S/D mode is automatically invoked at this connection point either if this is a connection end point, or if the next hop connection point is configured as ***nonAbrInterworking***. The value ***nonAbrInterworking*** is used to request that this connection point function as an interworking between ABR and non-ABR service categories. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***. The value ***abrSwitch*** is used to request ABR switch behavior for this connection point. The ABR switch behavior is first, to conform to ***virtualSourceDest*** or ***nonAbrInterworking*** setting on the next hop, and otherwise to implement ABR ER switch behavior. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the only allowable values are ***sameAsCa***, ***nonAbrInterworking*** or ***abrSwitch***. If ***abrSwitch*** is selected, EFCI marking behavior is implemented. For ***1pOC12SmLrAtm*** cards, the only allowable values are ***sameAsCa*** or ***abrSwitch.*** If ***abrSwitch*** is selected, EFCI marking behavior is implemented. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the only allowable value is

Copyright © 2006, Nortel Nortel Confidential

sameAsCa.

The actual ABR functionality which is in effect is visible in the *Vcc/Vpc/Vpt Tm abrConnectionType* operational attribute.

Default	sameAsCa

ATTRIBUTE **Atmlf Vpt Vpd Tm** **txTrafficDescParm (txTdp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR, MCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *txTrafficDescType* is 1 or 2, all of the parameters must be set to zero. When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell tagging; parameter 2 represents the PCR

Copyright © 2006, Nortel Nortel Confidential

for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 4 and parameter 5 represent are not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may be optionally zero.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate. When the *atmServiceCategory* is ***availableBitRate*** (ABR), the shaping rate is dynamically chosen, based on the ABR flow control mechanism, as a value between the MCR and the PCR or the requested shaping rate if applicable.

For *txTrafficDescType* 3, 4 and 5, the transmit traffic is shaped at the next

Copyright © 2006, Nortel Nortel Confidential

available shaping rate less than the PCR.

For *txTrafficDescType* 6, 7 and 8 if linear traffic shaping is selected, the transmit traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

For *txTrafficDescType* 3 ,4,5,6,7 and 8, with ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, parameter 4 must be less than or equal to 643,000.

For *txTrafficDescType* 6, 7 and 8 if inverse-UPC traffic shaping is selected, the transmit traffic is shaped at a variable rate which conforms to the PCR, SCR and MBS of the connection traffic descriptor.

ATTRIBUTE **Atmlf Vpt Vpd Tm** **rxTrafficDescParm (rxTdp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. If the value of the *rxTrafficDescType* attribute is ***sameAsTx***, the values provisioned in this attribute are ignored. The traffic parameters for the receive direction are taken from the *txTrafficDescParm* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), and Minimum Cell Rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. The value of CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for usage parameter control (UPC). When *rxTrafficDescType* is 1 or 2, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP

Copyright © 2006, Nortel Nortel Confidential

equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameter 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

If the value of CDVT either in parameter 2 or in parameter 4 is zero, the CDVT is taken from the *CA* defaults for the particular *atmServiceCategory* of this connection.

Parameter 5 of the *rxTrafficDescParm* is always unused.

When *rxTrafficDescriptorType* is 3 through 8, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware. The *check prov* command detects such cases and generates an error message. If this happens, adjust the parameters until they fall within the supported limits.
To calculate the limits, use the following formulae:
I1 = 1,000,000,000 / PCR
L1 = CDVT * 1000
I2 = 1,000,000,000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is 6 through 8.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, I1 and I2 must

Copyright © 2006, Nortel Nortel Confidential

be less than or equal to 335,523,840. I1 + L1 must be less than or equal to 1,342,156,800. I2 + L2 must be less than or equal to 1,342,156,800. If the values of I1, L1, I2 or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41,940,480 or
I2 > 41,940,480 or
I1 + L1 > 167,769,600 or
I2 + L2 > 167,769,600
then both I1 and I2 must be greater than 20,480.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, L2 must be less than or equal to 2,674,011,406.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, L2 must be less than or equal to 17,179,869,180.

ATTRIBUTE **Atmlf Vpt Vpd Tm** **fwdQosParameters (fqp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of three elements that specify the quality of service parameters for the forward direction for this connection. This attribute is used for SPVC connections. The *cdv* element specifies the acceptable peak-to-peak Cell Delay Variation (CDV) of real-time connections (CBR and rt-VBR). It is signaled through the extended QoS information element. For nrt-VBR and UBR the CDV is irrelevant, and its value is forced to the default. The *ctd* specifies the acceptable maximum Cell Transfer Delay (maxCtd) of real-time connections (CBR and rt-VBR). It is signaled through the end to end transit delay information element. For nrt-VBR and UBR the CTD is irrelevant, and its value is forced to the default. The *clr* specifies the acceptable Cell Loss Ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections. It is signaled through the extended QoS information element. For UBR the CLR is irrelevant, and its value is forced to the default.

GROUP Atmlf Vpt Vpd Tm Abr **Provisioned (Prov)**

Properties: Provisioned

Description: This group contains provisioned attributes for the ABR ATM connections configured on an ATM interface.

Mib: AtmCore

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **initialCellRate (icr)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period.

The value ***sameAsCa*** means the initial cell rate is determined by the *AtmIf CA Abr*/0 *icr* attribute.

The value ***useMcr*** means ICR is set to the same value as the Minimum Cell Rate (MCR) for the connection.

The value ***usePcr*** means ICR is set to the same value as the Peak Cell Rate (PCR) for the connection.

If the value is less than the MCR of the connection, then the MCR is used as the ICR. If the value is more than PCR of the connection, then PCR is used as the ICR.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **transientBufferExposure (tbe)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the source to send during start-up periods, before the first Resource Management (RM) cell returns. TBE divided by *fixedRoundTripTime* determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. TBE divided by *maxCellsPerRmCell* specifies the operational value of *forwardRmCellLimit*, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* is set to ***erSwitch***.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	16777215

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **fixedRoundTripTime (frtt)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. The value of *transientBufferExposure* divided by the value of FRTT (in seconds) determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec

Copyright © 2006, Nortel Nortel Confidential

Default	5000000

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **rateDecreaseFactor (rdf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.
Mib	AtmCore
Values	Decimal (0..15) sameAsCa
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **rateIncreaseFactor (rif)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64. RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.
Mib	AtmCore
Values	Decimal (0..15) sameAsCa

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **maxCellPerRmCell (nrm)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell. A value of 2 is not recommended although it is permitted according to the ATM Forum standard. When this attribute is set to a value of 2, it is possible that only one forward and one backward RM cell are repeatedly transmitted, and all data traffic is queued up indefinitely. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.
Mib	AtmCore
Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256) sameAsCa
Units	cells
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **maxTimeBetweenRmCells (trm)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the TRM parameter for this connection. TRM provides an lower bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least two other cells have been sent, then the next cell to be transmitted would be a forward RM cell. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***. The provisioned value of 781 is signaled as TRM = 0, in the ABR Additional Parameters Information Element. 1563 is signaled as TRM = 1. 3125 is signaled as TRM = 2. 6250 is signaled as TRM = 3. 12500 is signaled as TRM = 4 25000 is signaled as TRM = 5. 50000 is signaled as TRM = 6.

Copyright © 2006, Nortel Nortel Confidential

100000 is signaled as TRM = 7.

Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **cutoffDecreaseFactor (cdf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero. CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the CRM parameter, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. The value of CRM is indicated by the *forwardRmCellLimit* attribute. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0; 1; 2; 4; 8; 16; 32; 64) sameAsCa
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **acrDecreaseTimeFactor (adtf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection. ADTF is the maximum time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a

Copyright © 2006, Nortel Nortel Confidential

forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.

Mib	AtmCore
Values	Decimal (0..1023) sameAsCa
Units	centiseconds
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **dgcraMaximumDelay (dgcraMaxDelay)**

Access	Read and write
Criticality	Component
Description	This attribute specifies an upper bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward direction). This upper bound may be approximated as the sum of the round trip fixed and propagation delays and the maximum queuing delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When there is a reduction in the Allowed Cell Rate (ACR), the policer waits for a correspondingly longer period of time before it enforces at the new cell rate. The value of this attribute must not be less than the *dgcraMinimumDelay* attribute.
Mib	AtmCore
Values	Decimal (1..16700000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **dgcraMinimumDelay (dgcraMinDelay)**

Access	Read and write
Criticality	Component
Description	This attribute specifies a lower bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is

Copyright © 2006, Nortel Nortel Confidential

expected to be observed at this connection point (in the forward connection).

This lower bound may be approximated as the sum of the round trip fixed and propagation delays between the ABR source and this interface.

The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A smaller value for this attribute implies a more lenient policer. When there is a increase in the Allowed Cell Rate (ACR), the policer waits for a correspondingly shorter period of time before it enforces at the new cell rate.

Mib	AtmCore
Values	Decimal (1..16700000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **farEndAcrDecreaseTimeFactor (feAdtf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) of the far end ABR source. The value specified should be the same as the ADTF parameter at the far end of this ABR connection. The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the value of this attribute, the policer begins to limit enforce the incoming traffic at the initial cell rate (ICR) of the far end, as specified by the *farEndInitialCellRate* attribute.
Mib	AtmCore
Values	Decimal (0..1023)
Units	centiseconds
Default	50

ATTRIBUTE Atmlf Vpt Vpd Tm Abr **farEndInitialCellRate (feIcr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Initial Cell Rate (ICR) of the far end ABR source. The value specified should be the same as the ICR parameter at the far end of this ABR connection.

Copyright © 2006, Nortel Nortel Confidential

The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the *farEndAcrDecreaseTimeFactor* attribute, the policer begins to enforce the incoming traffic at the value of this attribute.

If this attribute is specified less than the MCR of the connection, then the MCR is used as the *felcr*. If this attribute is more than the PCR of the connection, then PCR is used as the *felcr*.

Access	Read and write
Criticality	Component
Description	This attribute specifies the default cell delay variation tolerance (CDVT) for connections of the CBR service category. An override to this default may be specified for a provisioned connection under the *Vcd Tm* or *Vpd Tm* component. This attribute is used by the Connection Admission Control (CAC) algorithm to compute the equivalent cell rate (ECR) required by a given CBR connection. The larger the value of CDVT, the larger is its ECR. If Usage Parameter Control (UPC) is enabled for a connection, CDVT is used by the UPC function to decide whether a cell is conforming or non-conforming based on the connection's traffic descriptor type. The larger the CDVT value, the more tolerant is the UPC of bandwidth usage beyond the traffic contract.
Mib	AtmCore
Values	Decimal (1..10000)
Units	microsec
Default	250

ATTRIBUTE Atmlf Vpt CA Cbr **cdv**

Access	Read and write
Description	This attribute specifies the peak-to-peak cell delay variation (CDV) which is contributed to all CBR connections associated with this *Vpt*. The CDV is a measure of the delay jitter introduced mostly by traffic buffering and cell scheduling. This attribute is used by PNNI in the Resource Availability Information Group (RAIG) topology updates and route selection. It is also used by CAC at connection set-up time to determine whether this *Vpt* can meet the CDV requirement for that connection. If so, the value of this attribute is added to the cumulative CDV field of the extended QoS information element.
Mib	AtmCore

Values	Decimal (0..16777215)
Units	microsec
Default	250

ATTRIBUTE Atmlf Vpt CA Cbr **maxCtd**

Access	Read and write
Description	This attribute specifies the maximum cell transfer delay (MaxCTD) which is applied to all CBR connections associated with this *Vpt*. MaxCTD is the sum of the fixed delay and the CDV. The components of the fixed delay include propagation delay through the physical media, delays induced by the transmission system and fixed components of switch processing delay. This attribute is used by PNNI in the Resource Availability Information Group (RAIG) topology updates and route selection. It is also used by CAC at connection set-up time to determine whether this *Vpt* can meet the ATM connection's MaxCTD requirement.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	microsec
Default	1000

ATTRIBUTE Atmlf Vpt CA Cbr **cellLossRatio (clr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the tolerable cell loss ratio (CLR) for CBR traffic. The value specified is the negative base 10 logarithm of the CLR. For example, if the target CLR = 1E-10 then the value of the *cellLossRatio* attribute is ***10***. The value of this attribute must be the same as the value of the *RtVbr cellLossRatio* attribute since CBR and rt-VBR traffic have the same discard priority. This attribute is used by the Connection Admission Control (CAC) algorithm to compute the equivalent cell rate (ECR) required for CBR connections. There is a trade-off between the service category CLR and the achievable *Vpt* bandwidth utilization. To guarantee an excellent service category, the CLR should be as small as possible (for example, 1E-10). However, a smaller CLR results in a larger equivalent cell rate for a given connection and hence a lower *Vpt* bandwidth utilization. A value of ***anyClrValue*** means that no bandwidth is reserved for CBR

GROUP Atmlf Vpt Iisp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Iisp* component.
Mib	Atmlisp

ATTRIBUTE Atmlf Vpt Iisp version

Access	Read: All Write: All
Criticality	Component
Description	This attribute indicates which specification the IISP interface complies with. The options are ***iisp10Sig30*** which refers to IISP version 1.0 with 3.0 signaling and ***iisp10Sig31*** which refers to IISP version 1.0 with 3.1 signaling. If this attribute is changed, all switched *Vcc* components in this interface are cleared due to the fact that the two versions are incompatible.
Mib	Atmlisp
Values	iisp10Sig30 iisp10Sig31
Default	iisp10Sig31

ATTRIBUTE Atmlf Vpt Iisp side

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute indicates which side the interface is, user or network.
Mib	Atmlisp
Values	networkSide userSide
Default	networkSide

ATTRIBUTE Atmlf Vpt lisp **softPvpAndPvcRetryPeriod (sRetryPeriod)**

Access	Read: All Write: All
Description	This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. Due to the group timer implementation, it can take from 100% to 150% of the provisioned timer value for the retry to be triggered.
Mib	Atmlisp
Values	Decimal (20..999999)
Units	seconds
Default	60

ATTRIBUTE Atmlf Vpt lisp **softPvpAndPvcHoldOffTime (sHoldOffTime)**

Access	Read: All Write: All
Description	This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value.
Mib	Atmlisp
Values	Decimal (0; 50..20000)
Units	msec
Default	0

ATTRIBUTE Atmlf Vpt lisp **interDomainCrankback**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether the ATM Routing System inserts a Crankback information element (IE) when hop-by-hop routing crankback fails in a neighboring domain and this node is the DTL terminating node of the call. By default, the ATM Routing System, when behaving as a DTL terminating node of a call, only inserts a Crankback IE if the routing system fails to find a static routing port that matches the called address. If this attribute is set to enabled, then a Crankback IE is also inserted when hop-by-hop crankback fails. This attribute may be provisioned on IISP links that connect two PNNI domains. Note that the cause codes that trigger the insertion of the Crankback IE are the same as those that apply to PNNI crankback normally. Not all of these cause codes apply to hop-by-hop routing. The insertion of a Crankback IE can cause extra call setup attempts in certain configurations such as PNNI domains interconnected by IISP links.
Mib	AtmIisp
Values	disabled enabled
Default	disabled

GROUP **AtmIf Vpt Iisp** **AccountingOptions (AcctOpt)**

Properties	Provisioned
Description	This group contains the provisionable attributes for accounting.
Mib	AtmIisp

ATTRIBUTE **AtmIf Vpt Iisp** **accountCollection (aco)**

Access	Read: All Write: All
Description	This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA changeover if TODA is enabled; - every 12 hours (per connection) if TODA is disabled; - on every call clear (a call record with final cell counts). If none of the reasons is present, then accounting will be suppressed.

Copyright © 2006, Nortel Nortel Confidential

	The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate.
Mib	Atmlisp
Set of	bill test study audit force
Default	No default

ATTRIBUTE Atmlf Vpt lisp accountConnectionType (act)

Access	Read: All Write: All
Description	This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records. If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***. If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.
Mib	Atmlisp
Values	origTerm intermediate
Default	intermediate

ATTRIBUTE Atmlf Vpt lisp accountClass (acl)

Access	Read: All Write: All
Description	This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.
Mib	Atmlisp
Values	Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Atmlf Vpt lisp **serviceExchange (sre)**

Access	Read: All Write: All
Description	This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate.
Mib	Atmlisp
Values	Decimal (0..255)
Default	0

Description	This attribute specifies the signaling channel number.
Mib	Atmlisp
Values	Decimal (0..65535)
Default	5

ATTRIBUTE AtmIf Vpt Iisp Sig addressConversion

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmIisp
Values	none nativeE164 nsap
Default	none

ATTRIBUTE Atmlf Vpt Iisp Sig **operatingMode**

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	AtmIisp
Values	normal provisionedOnly
Default	normal

GROUP Atmlf Vpt Iisp Sig **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmIisp

ATTRIBUTE Atmlf Vpt Iisp Sig **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — AtmIisp

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Atmlf Vpt lisp Sig **operationalState (osiOper)**

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — AtmIisp

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Atmlf Vpt lisp Sig **usageState (osiUsage)**

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — AtmIisp

Values — idle
active (activ)
busy

Default — idle

GROUP Atmlf Vpt lisp Sig **Operational (Oper)**

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute contains the diagnostic code in the last received signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0.

ATTRIBUTE AtmIf Vpt Iisp Sig Vcd atmServiceCategory (service)

Access: Read: All
Write: All

Criticality: Component

Copyright © 2006, Nortel
Nortel Confidential

Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections. The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

ATTRIBUTE **AtmIf Vpt Iisp Sig Vcd** **weight**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT. When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.
Mib	AtmIisp
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Iisp Sig Vcd** **qosClass (qos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance

Copyright © 2006, Nortel Nortel Confidential

requirements (Connection-Oriented Data Transfer).

Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values	0 1 2 3 4
Default	2
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt lisp Sig Vcd trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components. When ***disabled*** is selected, traffic shaping for this connection is disabled.
Mib	Atmlisp
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt lisp Sig Vcd unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA*

Copyright © 2006, Nortel Nortel Confidential

service category subcomponent for more details on the meaning of this attribute.

When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*.

When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Mib	AtmIisp
Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Iisp Sig Vcd** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

ATTRIBUTE **AtmIf Vpt Iisp Sig Vcd trafficDescParm (tdp)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2. When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2. When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or

Copyright © 2006, Nortel Nortel Confidential

equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

COMPONENT Atmlf Vpt Iisp Address (Addr)

Instance	address [String (1..40, ASCII)] addressType [primary alternate default]
Groups	GROUP AtmIf Vpt Iisp Addr Operational (Oper)
Scope	Device
Description	*AtmIf/n Aini Address/address,type* *AtmIf/n Iisp Address/address,type* *AtmIf/n Uni Address/address,type* *AtmIf/n Pnni Address/address,type* *AtmIf/n Vpt/m Aini Address/address,type* *AtmIf/n Vpt/m Iisp Address/address,type* *AtmIf/n Vpt/m Uni Address/address,type* *AtmIf/n Vpt/m Pnni Address/address,type*

This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wildcard (‘?’), and a type. The type identifies whether the *Address* component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address.

The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses.Virtual interfaces do not have addresses of

Copyright © 2006, Nortel Nortel Confidential

type ***default***.

The wildcard is only valid for provisioned addresses. If the address is a single wildcard, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wildcard static address, then the choice is driven through a round robin algorithm.

The round robin algorithm tries the primary routes and then the alternate routes if none of the primary routes succeed.
If this node participates in a PNNI hierarchy, then a *PnniInfo* subcomponent can be provisioned under the *AtmAddress* component to specify the level to which this address will be advertised.

Description	This attribute counts the incoming SVC calls which were rejected because none of the provisioned ATM addresses matched the applicable address in the incoming SVC call request. When the counter exceeds the maximum, it wraps to 0.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	0

COMPONENT AtmIf Vpt lisp CalledAScr Address (Addr)

Instance	address [String (1..40, ASCII)] addressAction [accept reject]
Scope	Device
Description	*AtmIf/n Aini CallingAScr Address/addr,action* *AtmIf/n Uni CallingAScr Address/addr,action* *AtmIf/n lisp CallingAScr Address/addr,action* *AtmIf/n Aini CalledAScr Address/addr,action* *AtmIf/n Uni CalledAScr Address/addr,action* *AtmIf/n lisp CalledAScr Address/addr,action* This component specifies a calling (or called) address with an action to accept or reject a connection request which contains a matching calling (or called) address. For the Calling Address Screening feature, if the specified action is ***accept***, any call whose calling address matches that address is accepted. If the specified action is ***reject***, any call whose calling address matches that address is rejected. For the Called Address Screening feature, if the specified action is ***accept***, any call whose called address matches that address, is accepted. If the specified action is ***reject***, any call whose called address matches that address is rejected. For both features, the incoming SVC call request is rejected if the address is not provisioned and the feature is ***enabled***.

Description	*AtmIf/n Aini PathTraceFilter* *AtmIf/n Iisp PathTraceFilter* *AtmIf/n Uni PathTraceFilter* *AtmIf/n Pnni PathTraceFilter* *AtmIf/n Vpt/vpi Aini PathTraceFilter* *AtmIf/n Vpt/vpi Iisp PathTraceFilter* *AtmIf/n Vpt/vpi Uni PathTraceFilter* *AtmIf/n Vpt/vpi Pnni PathTraceFilter* This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced. When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop,* and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When *AtmPathTraceFilter* component is deleted, all records are cleared. Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted. The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

Description	This group contains the operational criteria for the *PathTraceFilter* component.
Mib	Atmlisp

ATTRIBUTE Atmlf Vpt lisp Ptf traceInfo (tInfo)

Access	Read: All Write: All
Description	This attribute specifies the trace information that is included in the trace records. ***crankBack***: Crankback information is included if the connection is cranked back during the connection setup phase. If the option is turned on, all attempted paths including the final one are recorded. If the option is turned off, only the information of the final path is recorded. If the connection fails to reach the destination, no path information is returned. ***connId***: Connection Identifier information is included. ***callRef***: For point-to-point connections, the call reference is included. For point-to-multipoint connections, the call reference and end point reference are both included. Basic trace information, such as node and port identifiers, are always included.
Mib	Atmlisp
Set of	crankBack connId callRef
Default	(crankBack, connId, callRef)

ATTRIBUTE Atmlf Vpt lisp Ptf calledPartyPrefix (cldPref)

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the called party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	Atmlisp
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Ptf callingPartyPrefix (clgPref)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the calling party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	Atmlisp
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Ptf connectionType (type)

Access	Read: All Write: All
Description	This attribute specifies a connection type (SVC, SPVC, SVP, SPVP), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	Atmlisp
Set of	svc spvc svp spvp
Default	(svc, spvc, svp, spvp)

ATTRIBUTE Atmlf Vpt lisp Ptf connectionConfiguration (config)

Access	Read: All Write: All
Description	This attribute specifies a type of topology (point-to-point or point-to-multipoint), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	Atmlisp
Set of	ptp ptmp
Default	(ptp, ptmp)

ATTRIBUTE Atmlf Vpt lisp Ptf serviceCategory (svcCat)

Access	Read: All Write: All
Description	This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match

Copyright © 2006, Nortel Nortel Confidential

successfully, the call is traced.

Mib	Atmlisp
Set of	cbr rtVbr nrtVbr ubr
Default	(cbr, rtVbr, nrtVbr, ubr)

GROUP **AtmIf Vpt lisp Ptf** **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the *PathTraceFilter* component.
Mib	Atmlisp

ATTRIBUTE **AtmIf Vpt lisp Ptf** **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the filter. ***active***: Indicates the filter is active. ***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out.
Mib	Atmlisp
Values	active inactive
Default	inactive

ATTRIBUTE **AtmIf Vpt lisp Ptf** **recordCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords,* which ever is less.
Mib	Atmlisp
Values	Decimal (0..200)
Default	No default

ATTRIBUTE **AtmIf Vpt lisp Ptf** **matchedConnections**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the number of connections that match the criteria of this filter.
Mib	Atmlisp
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Ptf **elapsedTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes that have elapsed since the start of the filter.
Mib	Atmlisp
Values	Decimal (0..70560)
Units	minutes
Default	No default

ATTRIBUTE Atmlf Vpt lisp Ptf **timeRemaining**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes remaining before the filter terminates itself.
Mib	Atmlisp
Values	Decimal (0..70560)
Units	minutes
Default	No default

GROUP Atmlf Vpt lisp Ptf **RecordControl (Record)**

Properties	Operational
Description	This group contains the operational attributes for the record control of the *PathTraceFilter* component.
Mib	Atmlisp

ATTRIBUTE Atmlf Vpt lisp Ptf **traceTimeout**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available.
Mib	Atmlisp
Values	Decimal (1..70560)
Units	minutes
Default	60

ATTRIBUTE Atmlf Vpt lisp Ptf **maxTraceRecords (mRecords)**

Access	Read: All Write: All
Description	This attribute specifies the maximum number of records allowed to be stored with the filter. Once the maximum has been reached, the oldest record is removed.
Mib	Atmlisp
Values	Decimal (1..200)
Default	2

COMPONENT Atmlf Vpt lisp Ptf **PathTraceRecord (PTRecord)**

Groups	GROUP Atmlf Vpt lisp Ptf PTRecord Operational (Oper)

Description	This group contains the operational attributes for the path trace record component.
Mib	Atmlisp

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord **status**

Access	Read: All Write: Illegal
Description	This attribute indicates the status of the trace. The string is one of the following: ***Completed normally****:* The trace completed normally. ***Incomplete****:* Partial trace returned. ***Exceeded information element length limitations****:* The number of traced nodes exceeded the maximum number of hops. ***Exceeded message length limitations****:* The message length exceeded the maximum allowed size.
Mib	Atmlisp
Values	Completed normally Incomplete Exceeded information element length limitations Exceeded message length limitations
Default	No default

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord **timeStamp**

Access	Read: All Write: Illegal
Description	This attribute records the date and time of when the trace is completed.
Mib	Atmlisp
Values	Time (DHMS)
Default	No default

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord **srcPortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	Atmlisp

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..4294967295)
Default	No default

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord **srcPortName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	Atmlisp
Values	String (40, ASCII)
Default	No default

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord **causeCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	Atmlisp
Values	Decimal (0..255)
Default	No default

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord **diagCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	Atmlisp
Values	String (0..8, ASCII)
Default	No default

Criticality	Component
Description	This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	Atmlisp
Values	String (55, ASCII)
Default	No default

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord Hop **pnniTraceContRefusalIndPresent (refusal)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.
Mib	Atmlisp
Values	absent present
Default	absent

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord Hop **crankbackDestNodeIndPresent (dest)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface.
Mib	Atmlisp
Values	absent present
Default	absent

ATTRIBUTE AtmIf Vpt lisp Ptf PTRecord Hop **pnniCrankbackGapIndPresent (gap)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback.
Mib	Atmlisp
Values	absent present
Default	absent

ATTRIBUTE **AtmIf Vpt lisp Ptf PTRecord Hop** **crankBackCause (cause)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	Atmlisp
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE **AtmIf Vpt lisp Ptf PTRecord Hop** **blockedTransitType (type)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked transit type. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	Atmlisp
Values	Succeeding end blocked Blocked node Blocked link
Default	No default

ATTRIBUTE **AtmIf Vpt lisp Ptf PTRecord Hop** **blockedNodeId (bNodeId)**

TRACE AtmIf/n Vpt/vpi Uni AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Pnni AtmPathTraceTest

This command is used to initiate a Path Trace Test Connection and then responds with a list of logical nodes and ports from the trace source node to the trace destination node.

Only one *Trace* command is allowed at a time per signaling interface. If the test connection times out, the command fails.

GROUP Atmlf Vpt Iisp Ptt Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *AtmPathTraceTest* component.

Mib: AtmIisp

ATTRIBUTE Atmlf Vpt Iisp Ptt traceCrankback

Access: Read: All
Write: All

Description: This attribute controls what trace information the trace records include. If the option is turned on, all attempted paths are recorded including the final one. If the option is turned off, only the information of the final path is recorded. If the connection fails to reached the destination, no path information is returned.

ATTRIBUTE Atmlf Vpt lisp Ptt txTrafficDescType (txTdt)

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management applied to the transmit direction, as defined by the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute.
Mib	Atmlisp
Values	1 2 3 4 5 6 7 8 9
Default	1

ATTRIBUTE Atmlf Vpt lisp Ptt rxTrafficDescType (rxTdt)

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management, which is applied to the receive direction of this connection, as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute When ***sameAsTx*** is selected, the *rxTrafficDescType* and the *rxTrafficDescParm* are taken from the transmit values.
Mib	Atmlisp
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE Atmlf Vpt lisp Ptt atmServiceCategory (service)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications. The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS. The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.
Mib	AtmIisp
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE **AtmIf Vpt Iisp Ptt** **fwdQosClass (fwdQos)**

ATTRIBUTE **AtmIf Vpt Iisp Ptt** **bearerClassBbc (bcBbc)**

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

Values	a c x derivedFromServiceCategory
Default	derivedFromServiceCategory

ATTRIBUTE **Atmlf Vpt lisp Ptt** **transferCapabilityBbc (tcBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> ***0***: NoIndication, NoIndication ***1***: NoIndication, yes ***2***: NoIndication, no ***5***: CBR, yes ***8***: VBR, NoIndication ***9***: VBR, yes ***10***: VBR, no ***NotApplicable*** specifies that the user does not want to specify the transfer capability. The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data. The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing. The value ***yes*** for end-to-end timing indicates that end-to-end timing is required. The value ***no*** for end-to-end timing indicates that end-to-end timing is not required. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Vpt lisp Ptt **clippingBbc (cBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the value for the clipping susceptibility parameter in the BBC IE. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes. Clipping is an impairment where the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.
Mib	Atmlisp
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpt lisp Ptt **bestEffort**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor IE. It is one of the Broadband Bearer Capability attributes. The value ***indicated*** implies that the quality of service for this connection is not guaranteed. The value ***notIndicated*** implies that the quality of service for this connection is guaranteed. The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection, is derived from the value of the *atmServiceCategory*. Either this attribute must be set to

ATTRIBUTE **AtmIf Vpt Iisp Ptt** **txTrafficDescParm (txTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

Copyright © 2006, Nortel Nortel Confidential

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

ATTRIBUTE **AtmIf Vpt Iisp Ptt** **rxTrafficDescParm (rxTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC). When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2. When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for

Copyright © 2006, Nortel Nortel Confidential

CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

VERB OPTIMIZE Atmlf Vpt lisp Reroute

Impact	Service
Description	*Optimize [-all] AtmIf/n Uni Reroute* *Optimize [-all] AtmIf/n Aini Reroute* *Optimize [-all] AtmIf/n Iisp Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Uni Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Aini Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Iisp Reroute* This command triggers path optimization for the connection segments managed by the Reroute component. By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the localOptimalMetricValue attribute under the RerouteInfo component for the connection. The -all option causes all connection segments subscribed to path optimization to be considered. Using the Optimize command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

ATTRIBUTE Atmlf Vpt lisp Reroute **localIneligibleRecoveredCon (iirc)**

Access	Read only
Description	This attribute counts the connection segments that have been recovered by local rerouting but are not eligible for local path optimization. The value decreases as counted connections are released.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **localLastRrCauseCode (lrrcc)**

Access	Read only
Description	This attribute indicates the value of the last local rerouting cause code received at this interface.
Mib	Atmlisp
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **localPathsOptimized (lPathsOpt)**

Access	Read only
Description	This attribute counts the paths that were successfully optimized by local rerouting or EBR during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

GROUP Atmlf Vpt lisp Reroute **GlobalOperational (GOper)**

Properties	Operational
Description	This group contains the operational attributes that indicate the global and EBR rerouting activities at the interface level.
Mib	Atmlisp

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt lisp Reroute **globalSubscribedConnections (gsub)**

Access	Read only
Description	This attribute counts the connection segments that are subscribed to one or more global and EBR rerouting capabilities.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **globalEligibleRecoveredCon (gerc)**

Access	Read only
Description	This attribute counts the connections that have been recovered by global and EBR rerouting and are eligible for global or EBR path optimization.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **globalIneligibleRecoveredCon (girc)**

Access	Read only
Description	This attribute counts the connections that have been recovered by global and EBR rerouting but are not eligible for global or EBR path optimization. The value decreases as counted connections are released.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **globalLastRrCauseCode (grrcc)**

Access	Read only
Description	This attribute indicates the value of the last global or EBR rerouting cause code received at this interface.
Mib	Atmlisp
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **globalPathsOptimized (gPathsOpt)**

Access	Read only
Description	This attribute counts the paths that were successfully optimized by global and EBR rerouting during the last optimization pass at this interface.

Copyright © 2006, Nortel Nortel Confidential

	Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

GROUP Atmlf Vpt lisp Reroute **Statistics (Stats)**

Properties	Operational
Description	This group contains the rerouting statistics for the interface.
Mib	Atmlisp

ATTRIBUTE Atmlf Vpt lisp Reroute **totalLocalConnectionRecoveries (tLConRec)**

Access	Read only
Description	This attribute counts successful local connection recovery attempts. The counter wraps to zero when the maximum value is exceeded.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **totalLocalFailedRecoveries (lFailedRec)**

Access	Read only
Description	This attribute counts failed local connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment can not be established. The counter wraps to zero when the maximum value is exceeded.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt lisp Reroute **totalLocalPathOptimizations (tLPathOpt)**

Access	Read only
Description	This attribute counts successful local path optimization attempts. A successful path optimization attempt results in a switch to a better route. The counter wraps to zero when the maximum value is exceeded.
Mib	Atmlisp
Values	Decimal (0..4294967295)
Default	No default

GROUP AtmIf Vpt Iisp Reroute Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.
Mib	AtmIisp

ATTRIBUTE AtmIf Vpt Iisp Reroute Ov protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.

Copyright © 2006, Nortel Nortel Confidential

localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values:
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE AtmIf Vpt Iisp Reroute Ov **numOptAttempts**

Access: Read and write

Description: This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Mib: AtmIisp

Values:
Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

Default: sameAs

ATTRIBUTE AtmIf Vpt Iisp Reroute Ov **moduleOptimizationConnections**

Access: Read and write

Description: This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni*

Copyright © 2006, Nortel Nortel Confidential

Reroute component.

One of the following values can be specified:
sameAsARtgPnniReroute: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.
none: No connection segments are considered for path optimization.
recoveredOnly: Only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
allSubscribed: All connection segments subscribed to path optimization are considered.

Mib: AtmIisp

Values:
none
recoveredOnly
allSubscribed
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE Atmlf Vpt Iisp Reroute Ov **switchoverMechanism**

Access: Read and write

Description: This attribute specifies the mechanism used for switchover of a rerouted connection segment.

One of the following values can be specified:
sameAsARtgPnniReroute: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.
standard: The mechanism described in the ATM Forum “Domain based Rerouting” specification is used for switchover. This value ensures interoperability with other vendors’ equipment running ATM Forum “Domain based Rerouting”.
rcl: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Nortel Networks extension to the standard mechanism, allowing for faster switchover time.

Mib: AtmIisp

Values:

GROUP Atmlf Vpt Pnni Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the Pnni component.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni softPvpAndPvcRetryPeriod

Access	Read: All Write: All
Description	This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. Due to the group timer implementation, it can take from 100% to 150% of the provisioned timer value for the retry to be triggered.
Mib	AtmPnni
Values	Decimal (20..999999)
Units	seconds
Default	60

ATTRIBUTE Atmlf Vpt Pnni softPvpAndPvcHoldOffTime (sHoldOffTime)

Access	Read: All Write: All
Description	This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value.
Mib	AtmPnni
Values	Decimal (0; 50..20000)
Units	msec
Default	0

GROUP Atmlf Vpt Pnni AdminWeights

Properties	Provisioned
Description	This group contains the provisionable administrative weights for the *Pnni* component. These weights will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion.
Mib	AtmPnni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Pnni **cbrWeight (cbrWt)**

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Constant Bit Rate (CBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)
Default	5040

ATTRIBUTE Atmlf Vpt Pnni **rtVbrWeight (rtVbrWt)**

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Real-Time Variable Bit Rate (RT-VBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)
Default	5040

ATTRIBUTE Atmlf Vpt Pnni **nrtVbrWeight (nrtVbrWt)**

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Non Real-Time Variable Bit Rate (NRT-VBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)
Default	5040

ATTRIBUTE Atmlf Vpt Pnni **ubrWeight (ubrWt)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Unspecified Bit Rate (UBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)
Default	5040

GROUP Atmlf Vpt Pnni **AccountingOptions (AcctOpt)**

Properties	Provisioned
Description	This group contains the provisionable attributes for accounting.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni **accountCollection (aco)**

Access	Read: All Write: All
Description	This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA changeover if TODA is enabled; - every 12 hours (per connection) if TODA is disabled; - on every call clear (a call record with final cell counts). If none of the reasons is present, then accounting will be suppressed. The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate.
Mib	AtmPnni
Set of	bill test study audit force
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Pnni accountConnectionType (act)

Access	Read: All Write: All
Description	This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records. If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***. If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.
Mib	AtmPnni
Values	origTerm intermediate
Default	intermediate

ATTRIBUTE Atmlf Vpt Pnni accountClass (acl)

Access	Read: All Write: All
Description	This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.
Mib	AtmPnni
Values	Decimal (0..255)
Default	0

ATTRIBUTE Atmlf Vpt Pnni serviceExchange (sre)

Access	Read: All Write: All
Description	This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate.
Mib	AtmPnni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..255)
Default	0

GROUP Atmlf Vpt Pnni **Operational**

Properties	Operational
Description	This group contains the operational attributes for a *Pnni* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni **portId**

Access	Read: All Write: Illegal
Description	This attribute indicates the port id of the PNNI interface, which is the parent *AtmIf*'s instance number.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

GROUP Atmlf Vpt Pnni **VPnniProvisioned (VProv)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Pnni* component which are specific to virtual PNNI interfaces.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni **vpci**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the Virtual Path Connection Identifier (VPCI) to be used between this signaling entity and its peer. The VPCI of the peer virtual PNNI must have the same value for switched connections to be set up across the interface.
Mib	AtmPnni
Values	Decimal (0..255)
Default	0

GROUP Atmlf Vpt Pnni **Threshold**

Properties	Provisioned
Description	This group contains the provisionable attributes for the change threshold for the *Atmif Pnni* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni **avcrMt**

Access	Read: All Write: All
Description	This attribute, multiplied by the Maximum Cell Rate, specifies the minimum threshold used in the algorithms that determine significant change for average cell rate parameters for this interface. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrMt*.
Mib	AtmPnni
Values	Decimal (1..99) sameAsPnni
Units	%
Default	sameAsPnni

ATTRIBUTE Atmlf Vpt Pnni **avcrPm**

Access	Read: All Write: All
Description	This attribute multiplied by the current Available Cell Rate (AvCr) specifies the threshold used in the algorithms that determine significant change for AvCR parameters for this interface. If the resulting threshold is lower than the AvCr, the minimum threshold (*Atmif pnni avcrMt*) is used. Increasing the value of the attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrPm*.
Mib	AtmPnni
Values	Decimal (1..99) sameAsPnni
Units	%
Default	sameAsPnni

GROUP Atmlf Vpt Pnni **TraceProv (Trace)**

Properties	Provisioned
Description	This group contains the provisionable trace attributes for the Pnni component.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni **traceDestination (tDst)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies if this node is a trace destination. A PNNI interface may be a trace destination interface. By default, it's not. If an operator wants to trace only until this PNNI interface, this interface can be set to trace destination by setting this attribute.
Mib	AtmPnni
Values	no yes
Default	no

Description	This attribute specifies the signaling channel number.
Mib	AtmPnni
Values	Decimal (0..65535)
Default	5

ATTRIBUTE Atmlf Vpt Pnni Sig **addressConversion**

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.
Mib	AtmPnni
Values	none nativeE164 nsap
Default	none

ATTRIBUTE Atmlf Vpt Pnni Sig **operatingMode**

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	AtmPnni
Values	normal provisionedOnly
Default	normal

GROUP Atmlf Vpt Pnni Sig **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Sig **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmPnni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vpt Pnni Sig **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmPnni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vpt Pnni Sig **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmPnni
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpt Pnni Sig **Operational (Oper)**

Properties	Operational
Description	This attribute contains the operational attributes for the AtmSignalling component.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Sig **lastTxCauseCode**

Access	Read: All Write: Illegal
Description	This attribute indicates the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmPnni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Sig **lastTxDiagCode**

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0.
Mib	AtmPnni
Values	Hex (H.0..H.ff)
Default	No default

ATTRIBUTE AtmIf Vpt Pnni Sig **lastRxCauseCode**

Access	Read: All Write: Illegal
Description	This attribute contains the cause code in the last received signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmPnni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE AtmIf Vpt Pnni Sig **lastRxDiagCode**

GROUP Atmlf Vpt Pnni Sig Vcd **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable traffic attributes for a control channel.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Sig Vcd **trafficDescType (tdt)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.
Mib	AtmPnni
Values	3 6 7 8
Default	6
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Pnni Sig Vcd **atmServiceCategory (service)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may

Copyright © 2006, Nortel Nortel Confidential

support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Mib	AtmPnni
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr)
Default	rtVariableBitRate
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Vpt Pnni Sig Vcd** **weight**

Access	Read and write
Criticality	Component
Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell

Copyright © 2006, Nortel Nortel Confidential

opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT.

When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.

Mib	AtmPnni
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Pnni Sig Vcd** **qosClass (qos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.
Mib	AtmPnni
Values	0 1 2 3 4
Default	2
Flags	HCA_SUPPORT

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Pnni Sig Vcd **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components. When ***disabled*** is selected, traffic shaping for this connection is disabled.
Mib	AtmPnni
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Pnni Sig Vcd **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmPnni
Values	common sameAsCa

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Pnni Sig Vcd **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmPnni
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Pnni Sig Vcd **trafficDescParm (tdp)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5

Copyright © 2006, Nortel Nortel Confidential

overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

Values	Decimal (0..65535)
Default	18

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Pnni Rcc **aggregationToken**

Access	Read: All Write: All
Description	This attribute specifies the aggregation token for this interface at the local end of the link. The aggregation tokens at both ends are use to form the *derivedAggregationToken* for the link. The aggregation token controls how links are aggregated together. Except for the lowest level nodes, links between two logical nodes are aggregated together if they have the same aggregation token. Link aggregation is not done at the lowest level node, except in the degenerate node situation, where the lowest level node is a neighbor to an LGN. The value is ignored for links having a type value of ***unknown*** or ***lowestLevelHorizLink***.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	0

GROUP Atmlf Vpt Pnni Rcc **HelloParms (HlParms)**

Properties	Provisioned
Description	This group contains the provisionable Hello protocol parameters for an *Rcc* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Rcc **helloHoldDown (hhd)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the rate at which this node sends out Hello packets. It specifies the default minimum length of time between successive Hellos used by routing control channels on this node. A provisioning check is made to ensure that this value cannot be greater than *helloInterval*. A value of 0 specifies that the value provisioned for the *helloHoldDown* attribute of the *ARtg Pnni* component should be used.
Mib	AtmPnni
Values	Decimal (0.0..65535.0)
Units	seconds
Default	0.0

ATTRIBUTE Atmlf Vpt Pnni Rcc **helloInterval (hli)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the default duration of the Hello Timer for routing control channels on this node. Every *helloInterval* seconds, this node sends out a Hello packet to the neighbor node, subject to the *helloHoldDown* timer having expired at least once since the last Hello packet was sent. A provisioning check is made to ensure that this value cannot be less than *helloHoldDown*. A value of 0 specifies that the value provisioned for the *helloInterval* attribute of the *ARtg Pnni* component should be used.
Mib	AtmPnni
Values	Decimal (0..65535)
Units	seconds
Default	0

ATTRIBUTE Atmlf Vpt Pnni Rcc **helloInactivityFactor (hif)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the number of Hello intervals allowed to pass without receiving a Hello from a neighbor, before an attempt is made to stage the RCC to that neighbor. The hello inactivity timer is enabled when the *helloState* is one of ***oneWayInside***, ***twoWayInside***, ***oneWayOutside***, ***twoWayOutside*** or ***commonOutside***. A value of 0 specifies that the value provisioned for the *helloInactivityFactor* attribute of the *ARtg Pnni* component should be used.
Mib	AtmPnni
Values	Decimal (0..65535)
Default	0

GROUP Atmlf Vpt Pnni Rcc **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Access	Read: All Write: Illegal
Description	This attribute indicates the PNNI version negotiated with the neighbor node.
Mib	AtmPnni
Values	unsupported version1point0
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Rcc **helloState**

Access	Read: All Write: Illegal
Description	This attribute indicates the state of the Hello protocol exchange over this link. The following are the possible values for this attribute: ***down***: the link is down. No PNNI routing packets are sent or received over such a link. This is the initial state of the Hello Finite State Machine, and can also be reached when lower-level protocols have indicated that the link is not usable. ***attempt***: no Hello packets or Hello packets, with mismatched information, have been received recently from the neighbor. Attempts are made to contact the neighbor node by sending out Hello packets every *helloInterval* seconds. ***oneWayInside***: Hello packets have been recently received from the neighbor and it has been established that both nodes are members of the same peer group, but the remote node ID and remote port ID in the neighbor's Hello packets were set to zero. A Hello packet is sent to the neighbor and the Hello timer is restarted. ***twoWayInsid***e: Bidirectional communication over this link between this node and the neighbor node has been achieved. ***oneWayOutside***: Hello packets have been recently received from the neighbor and it has been established that both nodes are members of a different peer group, but the remote node ID and remote port ID in the neighbor's Hello packets were set to zero. ***twoWayOutside***: Hello packets have recently been received from the neighbor indicating that the neighbor node belongs to a different peer group. The correct remote node ID and remote port ID fields were included in the Hello packet, but the nodal hierarchy list did not include any common peer group. This state can also be reached if a hierarchy

Copyright © 2006, Nortel Nortel Confidential

mismatch occurs while in the ***commonOutside*** state.

commonOutside: A common level of the routing hierarchy has been found, in addition to achieving full bidirectional communication between the two nodes.

ATTRIBUTE Atmlf Vpt Pnni Rcc **remoteNodeId**

Access	Read: All Write: Illegal
Description	This attribute indicates the node id at the far end of the link.
Mib	AtmPnni
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Rcc **remotePortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the Port ID of the neighboring node, which is an unsigned integer of 32 bits. When the remote end of a PNNI physical link is terminated by a Nortel Networks Multiservice Switch, the first 16 bits of the hex encoded format represent the *Atmlf* instance of the PNNI link of the remote node, the next 12 bits correspond to the VPI of the PNNI link and the last 4 bits are unspecified (that is, it provide no value for physical interpretation).
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Rcc **derivedAggregationToken**

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the derived aggregation token value used on this link. The algorithm for computing the value of the derived aggregation token is: 1. If neighbors exchange identical values of the configured aggregation token, that value is the derived aggregation token value. 2. If the configured aggregation token value of one neighbor is zero (default), and that of the other neighbor is non-zero, the non-zero value is the derived aggregation token value. 3. If the configured aggregation token values of the neighbors are different and both non-zero, the derived aggregation token value is zero. The attribute is not displayed for links having a type value of ***unknown*** or ***lowestLevelHorizLink***.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Rcc **remoteNodeName**

Access	Read: All Write: Illegal
Description	This attribute indicates the node name and the hierarchy level for the node at the far end of the link. A typical value for this attribute has the following form: ***OBELIX@96***. Here, ***OBELIX*** is the node name and ***96*** is the hierarchy level for the up node. The ***@*** symbol is used to separate the node name from the hierarchy level in the display. The value of this attribute is an empty string if the far end is not a Nortel Networks Multiservice Switch.
Mib	AtmPnni
Values	String (1..16, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Rcc **remoteInterfaceName**

Access	Read: All Write: Illegal
Description	This attribute indicates the interface name of the node at the far end of the link. When the far end of the link is a Nortel Networks Multiservice Switch, this attribute's value can take one of the following forms: (a) ***Atmlf/<1-4095>*** - If the far end is an ATM interface. (b) ***Atmlf/<1-4095> Vpt/<1-4095>*** - If the far end is a VPT interface. (c) Values ***0-4294967295*** - If the link is a logical link.

Copyright © 2006, Nortel Nortel Confidential

	The value of this attribute is an empty string if the far end is not a Nortel Networks Multiservice Switch.

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.
Mib	AtmPnni
Values	3 6 7 8
Default	6
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Pnni Rcc Vcd** **atmServiceCategory (service)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of

Copyright © 2006, Nortel Nortel Confidential

connections.

The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Default	rtVariableBitRate
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Vpt Pnni Rcc Vcd** **weight**

Access	Read and write
Criticality	Component
Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT. When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.

ATTRIBUTE Atmlf Vpt Pnni Rcc Vcd **qosClass (qos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.
Mib	AtmPnni
Values	0 1 2 3 4
Default	2
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Pnni Rcc Vcd **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based

Copyright © 2006, Nortel Nortel Confidential

on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Mib: AtmPnni

Values: disabled
sameAsCa

Default: disabled

Flags: HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Pnni Rcc Vcd **unshapedTransmitQueueing (unshap)**

Access: Read and write

Criticality: Component

Description: This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute.

When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*.

When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Mib: AtmPnni

sameAsCa

Default: sameAsCa

Flags: HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Pnni Rcc Vcd **usageParameterControl (upc)**

Access: Read and write

Criticality: Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmPnni
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Vpt Pnni Rcc Vcd** **trafficDescParm (tdp)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any

Copyright © 2006, Nortel Nortel Confidential

value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

COMPONENT Atmlf Vpt Pnni Address (Addr)

Instance	address [String (1..40, ASCII)] addressType [primary alternate registered default]
Groups	GROUP Atmlf Vpt Pnni Addr Operational (Oper)
Scope	Device
Description	*Atmlf/n Aini Address/address,type* *Atmlf/n Iisp Address/address,type* *Atmlf/n Uni Address/address,type* *Atmlf/n Pnni Address/address,type* *Atmlf/n Vpt/m Aini Address/address,type* *Atmlf/n Vpt/m Iisp Address/address,type* *Atmlf/n Vpt/m Uni Address/address,type* *Atmlf/n Vpt/m Pnni Address/address,type* This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wildcard ('?'), and a type. The type identifies whether the *Address* component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address. The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses.Virtual interfaces do not have addresses of type ***default***. The wildcard is only valid for provisioned addresses. If the address is a single wildcard, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wildcard static address, then the choice is driven through a round robin algorithm. The round robin algorithm tries the primary routes and then the alternate routes if none of the primary routes succeed. If this node participates in a PNNI hierarchy, then a *PnniInfo*

Copyright © 2006, Nortel Nortel Confidential

subcomponent can be provisioned under the *AtmAddress* component to specify the level to which this address will be advertised.

Description	This group contains the operational criteria for the *PathTraceFilter* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Ptf traceInfo (tInfo)

Access	Read: All Write: All
Description	This attribute specifies the trace information that is included in the trace records. ***crankBack***: Crankback information is included if the connection is cranked back during the connection setup phase. If the option is turned on, all attempted paths including the final one are recorded. If the option is turned off, only the information of the final path is recorded. If the connection fails to reach the destination, no path information is returned. ***connId***: Connection Identifier information is included. ***callRef***: For point-to-point connections, the call reference is included. For point-to-multipoint connections, the call reference and end point reference are both included. Basic trace information, such as node and port identifiers, are always included.
Mib	AtmPnni
Set of	crankBack connId callRef
Default	(crankBack, connId, callRef)

ATTRIBUTE Atmlf Vpt Pnni Ptf calledPartyPrefix (cldPref)

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the called party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	AtmPnni
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptf callingPartyPrefix (clgPref)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the calling party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	AtmPnni
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptf connectionType (type)

Access	Read: All Write: All
Description	This attribute specifies a connection type (SVC, SPVC, SVP, SPVP), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	AtmPnni
Set of	svc spvc svp spvp
Default	(svc, spvc, svp, spvp)

ATTRIBUTE Atmlf Vpt Pnni Ptf connectionConfiguration (config)

Access	Read: All Write: All
Description	This attribute specifies a type of topology (point-to-point or point-to-multipoint), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	AtmPnni
Set of	ptp ptmp
Default	(ptp, ptmp)

ATTRIBUTE Atmlf Vpt Pnni Ptf serviceCategory (svcCat)

Access	Read: All Write: All
Description	This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match

Copyright © 2006, Nortel Nortel Confidential

successfully, the call is traced.

Mib	AtmPnni
Set of	cbr rtVbr nrtVbr ubr
Default	(cbr, rtVbr, nrtVbr, ubr)

GROUP **Atmlf Vpt Pnni Ptf** **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the *PathTraceFilter* component.
Mib	AtmPnni

ATTRIBUTE **Atmlf Vpt Pnni Ptf** **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the filter. ***active***: Indicates the filter is active. ***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out.
Mib	AtmPnni
Values	active inactive
Default	inactive

ATTRIBUTE **Atmlf Vpt Pnni Ptf** **recordCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords,* which ever is less.
Mib	AtmPnni
Values	Decimal (0..200)
Default	No default

ATTRIBUTE **Atmlf Vpt Pnni Ptf** **matchedConnections**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the number of connections that match the criteria of this filter.
Mib	AtmPnni
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptf **elapsedTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes that have elapsed since the start of the filter.
Mib	AtmPnni
Values	Decimal (0..70560)
Units	minutes
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptf **timeRemaining**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes remaining before the filter terminates itself.
Mib	AtmPnni
Values	Decimal (0..70560)
Units	minutes
Default	No default

GROUP Atmlf Vpt Pnni Ptf **RecordControl (Record)**

Properties	Operational
Description	This group contains the operational attributes for the record control of the *PathTraceFilter* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Ptf **traceTimeout**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available.
Mib	AtmPnni
Values	Decimal (1..70560)
Units	minutes
Default	60

ATTRIBUTE Atmlf Vpt Pnni Ptf **maxTraceRecords (mRecords)**

Access	Read: All Write: All
Description	This attribute specifies the maximum number of records allowed to be stored with the filter. Once the maximum has been reached, the oldest record is removed.
Mib	AtmPnni
Values	Decimal (1..200)
Default	2

COMPONENT Atmlf Vpt Pnni Ptf **PathTraceRecord (PTRecord)**

Common Verbs	Help List Display

GROUP Atmlf Vpt Pnni Ptf PTRecord **Operational (Oper)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Operational
Description	This group contains the operational attributes for the path trace record component.
Mib	AtmPnni

ATTRIBUTE AtmIf Vpt Pnni Ptf PTRecord **status**

Access	Read: All Write: Illegal
Description	This attribute indicates the status of the trace. The string is one of the following: ***Completed normally****:* The trace completed normally. ***Incomplete****:* Partial trace returned. ***Exceeded information element length limitations****:* The number of traced nodes exceeded the maximum number of hops. ***Exceeded message length limitations****:* The message length exceeded the maximum allowed size.
Mib	AtmPnni
Values	Completed normally Incomplete Exceeded information element length limitations Exceeded message length limitations
Default	No default

ATTRIBUTE AtmIf Vpt Pnni Ptf PTRecord **timeStamp**

Access	Read: All Write: Illegal
Description	This attribute records the date and time of when the trace is completed.
Mib	AtmPnni
Values	Time (DHMS)
Default	No default

ATTRIBUTE AtmIf Vpt Pnni Ptf PTRecord **srcPortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmPnni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..4294967295)
Default	No default

ATTRIBUTE AtmIf Vpt Pnni Ptf PTRecord **srcPortName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmPnni
Values	String (40, ASCII)
Default	No default

ATTRIBUTE AtmIf Vpt Pnni Ptf PTRecord **causeCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmPnni
Values	Decimal (0..255)
Default	No default

ATTRIBUTE AtmIf Vpt Pnni Ptf PTRecord **diagCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmPnni
Values	String (0..8, ASCII)
Default	No default

Description	This attribute indicates the call reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup message. The call reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value
Mib	AtmPnni
Values	Hex (H.0..H.ffffff)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptf PTRecord Hop **ingressEndPointReference (epref)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages.

Copyright © 2006, Nortel Nortel Confidential

The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint.

Mib	AtmPnni
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE **AtmIf Vpt Pnni Ptf PTRecord Hop** **nodeId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the lowest level node ID traversed for this hop.
Mib	AtmPnni
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf Vpt Pnni Ptf PTRecord Hop** **nodeName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the *nodeName* under the *ModuleData* component for this hop. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmPnni
Values	String (12, ASCII)
Default	No default

ATTRIBUTE **AtmIf Vpt Pnni Ptf PTRecord Hop** **portId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE **AtmIf Vpt Pnni Ptf PTRecord Hop** **portName**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmPnni
Values	String (55, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptf PTRecord Hop **pnniTraceContRefusalIndPresent (refusal)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.
Mib	AtmPnni
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpt Pnni Ptf PTRecord Hop **crankbackDestNodeIndPresent (dest)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface.
Mib	AtmPnni
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpt Pnni Ptf PTRecord Hop **pnniCrankbackGapIndPresent (gap)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback.
Mib	AtmPnni
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpt Pnni Ptf PTRecord Hop **crankBackCause (cause)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	AtmPnni
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptf PTRecord Hop **blockedTransitType (type)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked transit type. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	AtmPnni
Values	Succeeding end blocked Blocked node Blocked link
Default	No default

ATTRIBUTE Atmlf Vpt Pnni Ptt txTrafficDescType (txTdt)

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management applied to the transmit direction, as defined by the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute.
Mib	AtmPnni
Values	1 2 3 4 5 6 7 8 9
Default	1

ATTRIBUTE Atmlf Vpt Pnni Ptt rxTrafficDescType (rxTdt)

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management, which is applied to the receive direction of this connection, as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute When ***sameAsTx*** is selected, the *rxTrafficDescType* and the *rxTrafficDescParm* are taken from the transmit values.
Mib	AtmPnni
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE Atmlf Vpt Pnni Ptt atmServiceCategory (service)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications. The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS. The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.
Mib	AtmPnni
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) derivedFromBBC (derived)
Default	unspecifiedBitRate

Criticality Component

Description

This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

ATTRIBUTE Atmlf Vpt Pnni Ptt **transferCapabilityBbc (tcBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> ***0***: NoIndication, NoIndication ***1***: NoIndication, yes ***2***: NoIndication, no ***5***: CBR, yes ***8***: VBR, NoIndication ***9***: VBR, yes ***10***: VBR, no ***NotApplicable*** specifies that the user does not want to specify the transfer capability. The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data. The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing. The value ***yes*** for end-to-end timing indicates that end-to-end timing is required. The value ***no*** for end-to-end timing indicates that end-to-end timing is not required. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Default	derivedFromServiceCategory

ATTRIBUTE Atmlf Vpt Pnni Ptt **clippingBbc (cBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the value for the clipping susceptibility parameter in the BBC IE. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes. Clipping is an impairment where the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.
Mib	AtmPnni
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpt Pnni Ptt **bestEffort**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor IE. It is one of the Broadband Bearer Capability attributes. The value ***indicated*** implies that the quality of service for this connection is not guaranteed. The value ***notIndicated*** implies that the quality of service for this connection is guaranteed. The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection, is derived from the value of the *atmServiceCategory*. Either this attribute must be set to

ATTRIBUTE **Atmlf Vpt Pnni Ptt txTrafficDescParm (txTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

Copyright © 2006, Nortel Nortel Confidential

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

ATTRIBUTE **Atmlf Vpt Pnni Ptt** **rxTrafficDescParm (rxTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC). When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2. When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for

Copyright © 2006, Nortel Nortel Confidential

CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

VERB OPTIMIZE **AtmIf Vpt Pnni Reroute**

Impact	Service
Description	*Optimize [-all] AtmIf/n Pnni Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Pnni Reroute* This command triggers path optimization for the connection segments managed by the *Reroute* component. By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection. The *-all* option causes all connection segments subscribed to path optimization to be considered. Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

Common Verbs	Help List Display

GROUP Atmlf Vpt Pnni Reroute Ov **DomainProvisioned (DProv)**

Properties	Provisioned
Description	This group contains the provisionable attributes specific to rerouting on a PNNI interface.
Mib	AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Reroute Ov **localDomainLink (domain)**

Access	Read and write
Description	This attribute specifies the method used to identify the type of local domain link. One of the following values can be specified: ***sameAsARtgPnniReroute***: The type of the local domain link is determined by the exchange of the *ARtg Pnni Reroute localDomain* value with the PNNI neighbor.

Copyright © 2006, Nortel Nortel Confidential

intraDomainLink: The result of the exchange of the *localDomain* is ignored. The local domain link type is set to intra-domain link.
interDomainLink: The result of the exchange of the *localDomain* is ignored. The local domain link type is set to inter-domain link.

Mib — AtmPnni

interDomainLink (inter)

Default — sameAsARtgPnniReroute

GROUP Atmlf Vpt Pnni Reroute Ov **Provisioned (Prov)**

Properties — Provisioned

Description — This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.

Mib — AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Reroute Ov **protocol**

Access — Read and write

Description — This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
sameAsARtgPnniReroute: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute.
localGlobal: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
localOnly: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
globalOnly: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values	localGlobal localOnly globalOnly localEbr ebrOnly sameAsARtgPnniReroute (sameAs)
Default	sameAsARtgPnniReroute

ATTRIBUTE Atmlf Vpt Pnni Reroute Ov **numOptAttempts**

Access	Read and write
Description	This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization. If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization. If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.
Mib	AtmPnni
Values	Decimal (0..15) sameAsARtgPnniReroute (sameAs)
Default	sameAs

ATTRIBUTE Atmlf Vpt Pnni Reroute Ov **moduleOptimizationConnections**

Access	Read and write
Description	This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component. One of the following values can be specified: ***sameAsARtgPnniReroute***: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute. ***none***: No connection segments are considered for path optimization. ***recoveredOnly***: Only connection segments that are using a path with a greater optimization metric than the best known value are considered for

Copyright © 2006, Nortel Nortel Confidential

path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
allSubscribed: All connection segments subscribed to path optimization are considered.

Default — sameAsARtgPnniReroute

ATTRIBUTE Atmlf Vpt Pnni Reroute Ov **switchoverMechanism**

Access — Read and write

Description — This attribute specifies the mechanism used for switchover of a rerouted connection segment.

One of the following values can be specified:
sameAsARtgPnniReroute: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.
standard: The mechanism described in the ATM Forum "Domain based Rerouting" specification is used for switchover. This value ensures interoperability with other vendors' equipment running ATM Forum "Domain based Rerouting".
rcl: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Nortel Networks extension to the standard mechanism, allowing for faster switchover time.

GROUP Atmlf Vpt Pnni Reroute Ov **LocalProvisioned (LProv)**

Properties — Provisioned

Description — This group contains the provisionable attributes for EBR and local rerouting protocols.

Mib — AtmPnni

ATTRIBUTE Atmlf Vpt Pnni Reroute Ov **localConnectionRecoverySubscr (lConRec)**

Access — Read and write

Description — This attribute specifies which connection segments on the interface request subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols.

Copyright © 2006, Nortel Nortel Confidential

This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

Connection segments of the specified types that request ***localGlobal*** or ***localOnly*** protocols request subscription to local connection recovery.

Connection segments of the specified types that request ***localEbr*** request subscription to both local connection recovery and EBR connection recovery. Only one will be granted.

One or more of the following values can be specified:
sameAsARtgPnniReroute: If this value is set, the local connection recovery subscription rule is determined by the *ARtg Pnni Reroute localConnectionRecoverySubscr* attribute. This value takes precedence over any other values.
svcSvp: If this value is set, all SVC and SVP connection segments request subscription to local connection recovery.
sourceSpvcSpvp: If this value is set, all source SPVC and SPVP connection segments request subscription to local connection recovery.
transitSpvcSpvp: If this value is set, all transit SPVC and SPVP connection segments request subscription to local connection recovery.

Default	atmForum40

ATTRIBUTE Atmlf Vpt Uni side

Access	Read: All Write: All
Criticality	Component
Description	This attribute indicates which side the interface is, user or network.
Mib	AtmUni
Values	network user
Default	network

ATTRIBUTE Atmlf Vpt Uni softPvpAndPvcRetryPeriod

Access	Read: All Write: All
Description	This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. Due to the group timer implementation, it can take from 100% to 150% of the provisioned timer value for the retry to be triggered.
Mib	AtmUni
Values	Decimal (20..999999)
Units	seconds
Default	60

ATTRIBUTE Atmlf Vpt Uni softPvpAndPvcHoldOffTime (sHoldOffTime)

Access	Read: All Write: All
Description	This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value.
Mib	AtmUni
Values	Decimal (0; 50..20000)

Copyright © 2006, Nortel Nortel Confidential

Units	msec
Default	0

ATTRIBUTE Atmlf Vpt Uni **loopPrevention**

Access	Read: All Write: Configuration
Description	This attribute specifies whether loop prevention is in effect on this interface. When the value is ***enabled***, incoming calls on this interface cannot be routed back out the same interface. When the value is ***disabled***, routing of incoming calls back out the same interface is permitted. The recommended value is ***enabled***. The value ***disabled*** should only be used if routing of incoming calls back out over this interface is actually required. As an example, the value ***disabled*** might be needed if the interface is connected to an end-user multiplexing device which has no routing capability. Note that setting the value to ***enabled*** prevents only routing loops which involve two network nodes.
Mib	AtmUni
Values	disabled enabled
Default	enabled

ATTRIBUTE Atmlf Vpt Uni **interfaceType**

Access	Read: All Write: All
Criticality	Component
Description	This attribute represents the *Type* of the interface, ***private*** or ***public***.
Mib	AtmUni
Values	public private
Default	private

GROUP Atmlf Vpt Uni **AccountingOptions (AcctOpt)**

Properties	Provisioned
Description	This group contains the provisionable attributes for accounting.
Mib	AtmUni

ATTRIBUTE Atmlf Vpt Uni **accountCollection (aco)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit*** or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA changeover if TODA is enabled; - every 12 hours (per connection) if TODA is disabled; - on every call clear (a call record with final cell counts). If none of the reasons is present, then accounting will be suppressed. The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate.
Mib	AtmUni
Set of	bill test study audit force
Default	No default

ATTRIBUTE **Atmlf Vpt Uni** **accountConnectionType (act)**

Access	Read: All Write: All
Description	This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records. If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***. If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.
Mib	AtmUni
Values	origTerm intermediate
Default	origTerm

ATTRIBUTE **Atmlf Vpt Uni** **accountClass (acl)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.
Mib	AtmUni
Values	Decimal (0..255)
Default	0

ATTRIBUTE Atmlf Vpt Uni **serviceExchange (sre)**

Access	Read: All Write: All
Description	This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate.
Mib	AtmUni
Values	Decimal (0..255)
Default	0

Properties	Provisioned
Description	This attribute group contains the provisionable attributes for the *Signalling* component.
Mib	AtmUni

ATTRIBUTE Atmlf Vpt Uni Sig vci

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the signaling channel number.
Mib	AtmUni
Values	Decimal (0..65535)
Default	5

ATTRIBUTE Atmlf Vpt Uni Sig addressConversion

Copyright © 2006, Nortel
Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.
Mib	AtmUni
Values	none nativeE164 nsap
Default	none

ATTRIBUTE AtmIf Vpt Uni Sig **operatingMode**

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	AtmUni
Values	normal provisionedOnly
Default	normal

GROUP AtmIf Vpt Uni Sig **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmUni

ATTRIBUTE AtmIf Vpt Uni Sig **adminState (osiAdmin)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmUni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE **Atmlf Vpt Uni Sig** **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmUni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE **Atmlf Vpt Uni Sig** **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	AtmUni
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpt Uni Sig **Operational (Oper)**

Properties	Operational
Description	This attribute contains the operational attributes for the AtmSignalling component.
Mib	AtmUni

ATTRIBUTE Atmlf Vpt Uni Sig **lastTxCauseCode**

Access	Read: All Write: Illegal
Description	This attribute indicates the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmUni
Values	Decimal (0..255)
Default	No default
