Description

This group contains all of the provisioning data for a *DS1* component.

Mib no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 lineType (lineType)

Access Read and write

Description

This attribute defines the framing of the DS1 tributary.
d4 defines a framing pattern of 12 frames per multiframe.
esf defines a framing pattern of 24 frames per multiframe.
d4Cas defines a framing pattern of 12 frames per multiframe with channel associated signalling.
esfCas defines a framing pattern of 24 frames per multiframe with channel associated signalling.
unframed defines an unknown framing pattern for clear channels.

For the ***4pDS3ChAtm*** card, only ***d4*** and ***esf*** framing patterns are permitted.

The ***4pDS3ChAal1*** card supports the ***d4*** and ***esf*** framing patterns, as well as ***unframed***.

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **zeroCoding (zeroCoding)**

Access	Read and write
Criticality	Component
Description	This attribute defines the zero encoding on the DS1 tributary. ***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8. ***none*** does no zero encoding, it does not change any value of the bits in the timeslot. The value ***none*** is compatible with any zero coding scheme which transports all 8 data bits in a timeslot (this would include both ***ami*** and ***b8zs*** values of the *DS1 zeroCoding* attribute).
Mib	no_mib
Values	bit7Stuffing none
Default	none

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **clockingSource (clockingSource)**

Access	Read and write
Description	This attribute specifies the source of the transmit clock for the DS1 tributary. When the clocking source is ***local***, the crystal on the port generates the clocking for the DS1 tributary. When the clocking source is ***line***, the port synchronizes to the clock from the DS1 tributary. When the clocking source is ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP. When the clocking source is ***sameAsDs3***, the Ds1 port's clock synchronizes to the same clock source as that of its parent Ds3 port. On a ***1pDS3C*** card, if the *NetworkSynchronization (NS)* component is present, the default value of this attribute will be ***module***; otherwise it will be ***line***. On a ***2pDS3cAal*** card, the only valid values are ***local*** and ***module***. If the *NS* component is present, the default value of this attribute will be ***module***; otherwise it will be ***local***. On the ***4pDS3Ch***, ***4pDS3ChAtm***, and ***4pDS3ChAal1*** cards, the only valid value is ***sameAsDs3***. This is because a DS1 must have the same clocking source as its parent DS3.

GROUP Pbg Sts Vt1dot5 DS1 CustomerIdentifierData (CidData)

Properties — Provisioned

Description — This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib — no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 customerIdentifier (cid)

Access — Read and write

Description — This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib — no_mib

Values — Decimal (0; 1..8191)

Default — 0

GROUP Pbg Sts Vt1dot5 DS1 AdminInfo (AdminInfo)

GROUP Pbg Sts Vt1dot5 DS1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **usageState (osiUsage)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	no_mib
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE **Pbg Sts Vt1dot5 DS1** **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **controlStatus (osiCntrl)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **alarmStatus (osiAlarm)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	no_mib

Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **rxAisAlarm (rxAisAlarm)**

Access — Read only

Description

This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Mib — no_mib

Values — on
off

Default — off

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **lofAlarm (lofAlarm)**

Access — Read only

Description

This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Mib — no_mib

Values — on
off

Default — off

ATTRIBUTE Pbg Sts Vt1dot5 DS1 **rxRaiAlarm (rxRaiAlarm)**

Access — Read only

Description

This attribute indicates whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/-

Copyright © 2006, Nortel Nortel Confidential

0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds. The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Mib no_mib

Values on
off

Default off

ATTRIBUTE Pbg Sts Vt1dot5 DS1 txAisAlarm (txAisAlarm)

Access Read only

Description

This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the tributary is in a locked state.

Mib no_mib

Values on
off

Default off

ATTRIBUTE Pbg Sts Vt1dot5 DS1 txRaiAlarm (txRaiAlarm)

Access Read only

Description

This attribute indicates whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the tributary detects a LOF alarm condition.

Mib no_mib

Values on
off

Default off

GROUP Pbg Sts Vt1dot5 DS1 Statistics (Stats)

Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan timeslots (ts)

Access	Read and write
Criticality	Component
Description	This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component. For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.
Mib	no_mib
Set of	none 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **timeslotDataRate (dataRate)**

Access	Read and write
Criticality	Component
Description	This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute. When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s. When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s. On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card. On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***. One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.
Mib	no_mib
Values	56k doNotOverride
Default	doNotOverride

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **applicationFramerName**

Access	Read and write
Description	This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.
Mib	no_mib
Values	Link (Service, interfaceName)
Default	No default

GROUP Pbg Sts Vt1dot5 DS1 Chan **CustomerIdentifierData (CidData)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **customerIdentifier (cid)**

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	no_mib
Values	Decimal (0; 1..8191)
Default	0

GROUP Pbg Sts Vt1dot5 DS1 Chan **IfEntryProv (IfEntry)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.

Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **snmpOperStatus**

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Pbg Sts Vt1dot5 DS1 Chan **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **adminState (osiAdmin)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **usageState (osiUsage)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	no_mib
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: no_mib

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **controlStatus (osiCntrl)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **alarmStatus (osiAlarm)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	no_mib

Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Default No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test type (type)

Access Read and write

Description

This attribute is the type of test to be run. The available test types include the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.

Copyright © 2006, Nortel Nortel Confidential

lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Default: card

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **frmSize (size)**

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: no_mib

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **frmPatternType (fpt)**

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.

Copyright © 2006, Nortel Nortel Confidential

customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib: no_mib

Values:
ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default: ccitt32kBitPattern

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **customizedPattern (cp)**

Access: Read and write

Description:

This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Mib: no_mib

Values: Hex (H.0..H.ffffffff)

Units: Hex

Default: H.55555555

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **dataStartDelay (dsd)**

Access: Read and write

Description:

This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.

Mib: no_mib

Values: Decimal (0..1814400)

Units: seconds

Default: 0

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **displayInterval (di)**

Access: Read and write

Description:

This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	no_mib
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Pbg Sts Vt1dot5 DS1 Chan Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure

Copyright © 2006, Nortel Nortel Confidential

indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib: no_mib

Values:
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default: neverStarted

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **bitsTx**

Access: Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib: no_mib

Values: Long Integer

Default: No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **bytesTx**

Access: Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib no_mib

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

GROUP Pbg Sts Vt1dot5 DS1 Chan Cell **Provisioned (Prov)**

Properties Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

Mib no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **alarmActDelay (act)**

Access Read and write

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib no_mib

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **scrambleCellPayload (scramble)**

Access Read and write

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	off on
Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **correctSingleBitHeaderErrors**

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	no_mib
Values	off on
Default	off

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **clearDelay (clear)**

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	no_mib
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **hecSampleInterval (hSample)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: no_mib

Values: Decimal (0..25)

Units: seconds

Default: 0

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **hecErrorLimit (hLimit)**

Access: Read and write

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: no_mib

Values: Decimal (1..250000)

Default: No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **lcdStateDelay (delay)**

Access: Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The

Copyright © 2006, Nortel Nortel Confidential

valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: no_mib

Values: Decimal (1..50)

Units: msec

Default: No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access: Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: no_mib

Values: Decimal (1..25)

Default: 1

GROUP Pbg Sts Vt1dot5 DS1 Chan Cell **Operational (Oper)**

Properties: Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib: no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **lcdAlarm (lcd)**

Access: Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects

Copyright © 2006, Nortel Nortel Confidential

have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Mib: no_mib

Values:
on
off

Default: off

GROUP Pbg Sts Vt1dot5 DS1 Chan Cell **Statistics (Stats)**

Properties: Operational

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib: no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Cell **uncorrectableHeaderErrors (ucErr)**

Access: Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Mib: no_mib

COMPONENT Pbg Sts Vt1dot5 DS1 Chan **TrunkConditioning (Tc)**

Groups	GROUP Pbg Sts Vt1dot5 DS1 Chan Tc Provisioned (Prov) GROUP Pbg Sts Vt1dot5 DS1 Chan Tc Operational (Op)
Scope	Device
Description	*Lp/n Ds1/n Chan/n Tc* *Lp/n E1/n Chan/n Tc* *Lp/n Ds3/n Ds1/n Chan/n Tc* *Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc* *Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc* *Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c* *Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c* The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service. Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk

Copyright © 2006, Nortel Nortel Confidential

conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

Values	autoConfigure tc ais noResponse
Default	autoConfigure

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc signalOne (sigOne)

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.
Mib	no_mib
Vector of	Decimal (0..1)
Index	D C B A
Default	(1, 1, 1, 1)

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc signalTwo (sigTwo)

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.
Mib	no_mib
Vector of	Decimal (0..1)
Index	D C B A
Default	(1, 1, 1, 1)

Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc **ingressConditioning (inCon)**

Access	Read only
Description	This attribute indicates the status of locally generated trunk conditioning towards the ATM network. When trunk conditioning is being locally generated towards the ATM network, *ingressConditioning* is set to ***on.*** When trunk conditioning is not being locally generated towards the ATM network, *ingressConditioning* is set to ***off***. Trunk conditioning is transmitted towards the ATM network under the following conditions: lossOfSignal (LOS) lossOfFrame (LOF) remoteAlarmIndication (RAI) alarmIndicationSignal (AIS) bufferUnderflow (BU) and in addition for E1: lossOfMultiframe (LOMF) receiveMultiframeRemoteAlarmIndication (RMRAI)
Mib	no_mib
Values	off on
Default	off

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Chan Tc **egressConditioning (egCon)**

Access	Read only
Description	This attribute indicates the status of locally generated trunk conditioning towards the PDH line. When trunk conditioning is being locally generated towards the PDH line, *egressConditioning* is set to ***on.*** When trunk conditioning is not being locally generated towards the PDH line, *egressConditioning* is set to ***off***. Trunk conditioning is transmitted towards the PDH line under the following conditions: bufferUnderflow (BU) AAL1 protocol errors.

Groups	GROUP Pbg Sts Vt1dot5 DS1 Test OsiState (State) GROUP Pbg Sts Vt1dot5 DS1 Test Setup (Setup) GROUP Pbg Sts Vt1dot5 DS1 Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	no_mib
Common Verbs	Help List Display

VERB START Pbg Sts Vt1dot5 DS1 Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Pbg Sts Vt1dot5 DS1 Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Pbg Sts Vt1dot5 DS1 Test OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test adminState (osiAdmin)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare

Copyright © 2006, Nortel Nortel Confidential

capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib no_mib

Values idle
active (activ)
busy

Default idle

GROUP Pbg Sts Vt1dot5 DS1 Test **Setup (Setup)**

Properties Operational

Description

This group contains all of the operational data for a *Test* component.

Mib no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **purpose (purpose)**

Access Read and write

Description

This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Mib no_mib

Values String (0..40, ASCII)

Default No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **type (type)**

Access Read and write

Description

This attribute is the type of test to be run. The available test types include the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.

Copyright © 2006, Nortel Nortel Confidential

pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Values:
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **frmSize (size)**

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: no_mib

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **frmPatternType (fpt)**

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.

Copyright © 2006, Nortel Nortel Confidential

customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib no_mib

Values ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default ccitt32kBitPattern

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test customizedPattern (cp)

Access Read and write

Description

This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Mib no_mib

Values Hex (H.0..H.ffffffff)

Units Hex

Default H.55555555

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test dataStartDelay (dsd)

Access Read and write

Description

This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.

Mib no_mib

Values Decimal (0..1814400)

Units seconds

Default 0

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test displayInterval (di)

Access Read and write

Description

This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	no_mib
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Pbg Sts Vt1dot5 DS1 Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	no_mib

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure

Copyright © 2006, Nortel Nortel Confidential

indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib: no_mib

Values:
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default: neverStarted

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **bitsTx**

Access: Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib: no_mib

Values: Long Integer

Default: No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **bytesTx**

Access: Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib no_mib

Values Long Integer

Default No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **frmTx**

Access Read only

Description

This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Mib no_mib

Values Long Integer

Default No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **bitsRx**

Access Read only

Description

This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.

Mib no_mib

Values Long Integer

Default No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **bytesRx**

Access Read only

Description

This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.

Mib no_mib

Values Long Integer

Default No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **frmRx**

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	no_mib
Values	String (5, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	no_mib
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Pbg Sts Vt1dot5 DS1 Test **timeRemaining**

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	no_mib
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

Criticality	Component
Description	This attribute specifies the local Frame Relay connection identifier. This identifier is a Frame Relay Data Link Connection Identifier (DLCI) logical channel number. There must be a matching DLCI value at the peer *FrAtm* component. The combination of FrAtm and DLCI value must be unique across all instances of NS-VC for this NSEI.
Mib	WirelessNssBssPcu
Values	Decimal (16..1007)
Default	No default

GROUP PcGtl Nse Nsvc Operational (Oper)

Properties	Operational
Description	This group contains Network Service Virtual Connection (NS-VC) operational information.
Mib	WirelessNssBssPcu

ATTRIBUTE PcGtl Nse Nsvc state (st)

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the Network Service Virtual Connection (NS-VC). ***idle -*** This is the initial state of the NS-VC upon activation. ***unBlocked -*** Indicates that this NS-VC is unblocked and is now available for traffic.

Copyright © 2006, Nortel Nortel Confidential

localInitiatedBlocked - This state indicates that the NS-VC is blocked by a locally initiated Block Request. NS-UNITDATA Protocol Data Units (PDUs) received in this state are discarded.
netInitiatedBlocked - This state indicates that this NS-VC has been blocked by the remote node. NS-UNITDATA PDUs received in this state are discarded.
dead - This state indicates that the NS-VC is unavailable. This can be because the Frame Relay (FR) link is dead or if an operator locks the Data Link Connection Identifier (DLCI).

Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Pcusa
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Pcusa operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Pcusa
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Pcusa usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

VERB RESET Pcusa Conn

Impact: Service

Description:
Reset conn/n
The *Reset* verb is used to reset CAS operational counters under a *Connection*.

GROUP Pcusa Conn CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib: Pcusa

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Pcusa Conn customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Pcusa
Values	Decimal (0; 1..8191)
Default	0

GROUP Pcusa Conn Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioning data for the *Connection*.
Mib	Pcusa

ATTRIBUTE Pcusa Conn linkToNse (l2nse)

Access	Read and write
Criticality	Process
Description	This attribute specifies a link to an *NSE* component, which provides transport to the Frame Relay network.
Mib	Pcusa
Values	Link (Service, linkToPcuConn)
Default	No default

GROUP Pcusa Conn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Description	This attribute counts the octets sent by all the BVCs associated to this PCM link. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk **bvcsBlocked (bvcB)**

Access	Read only
Description	This attribute indicates the BVCs that are currently in blocked state.
Mib	Pcusa
Values	Decimal (0..120)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk **bvcsUnBlocked (bvcUB)**

Access	Read only
Description	This attribute indicates the BVCs that are currently in unblocked state.
Mib	Pcusa
Values	Decimal (0..120)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk **totalBvcs (totbvc)**

Access	Read only
Description	This attribute indicates the BVCs that currently exist within an NSE.
Mib	Pcusa
Values	Decimal (0..120)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk **psPaging (psPag)**

Access	Read only
Description	This attribute counts the BSSGP PAGING PS PDUs received from the SGSN by this PCM link. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusa
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Pcusa Conn PcmLk **csPaging (csPag)**

Access	Read only
Description	This attribute counts the BSSGP PAGING CS PDUs received from the SGSN by this PCM link. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk **dyAgprsLackOfTimeslots (dyAgprsLTs)**

Access	Read only
Description	This attribute counts the number of times that the PCU has not been able to satisfy the request sent by the most loaded cell that appears to have a lack of resource. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusa
Values	Decimal (0..4294967295)
Default	No default

GROUP Pcusa Conn PcmLk **PcmLkPcu (PcuOper)**

Properties	Operational
Description	This group contains status information about the PCM link coming from the PCU element.
Mib	Pcusa

ATTRIBUTE Pcusa Conn PcmLk **agprsVersion (agprsVer)**

Access	Read only
Description	This attribute indicates the AGPRS interface version requested by the BSC. When the version number is incorrect, an alarm is to be raised.
Mib	Pcusa
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk **pcuProvisioningState (pcuProvState)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates if the PCU element has received the provisioning information. ***notReceived*** - one of the provisioning messages has not been received. ***received*** - all the provisioning messages have been received.
Mib	Pcusa
Values	notReceived received
Default	No default

ATTRIBUTE Pcusa Conn PcmLk pcuConfiguration (pcuConfig)

Access	Read only
Description	This attribute indicates if the PCU element has received the configuration message from the BSC. ***pcuConfigMsgReceived*** - the pcuConfig message has been received. ***pcuConfigMsgNotReceived*** - the pcuConfig message has not been received.
Mib	Pcusa
Values	notReceived received
Default	No default

ATTRIBUTE Pcusa Conn PcmLk pcuGbState (pcuGbState)

Access	Read only
Description	This attribute indicates the transmission capability on the Gb interface for the related NSE. ***down*** - the transmission capability is null (that is, none of the related NSVCs are unblocked). ***up*** - the transmission capability is not null (that is, at least one of the related NSVCs is unblocked). ***notReceived*** - the transmission capability on the Gb interface has not been received by the PcuElement application.
Mib	Pcusa
Values	down up notReceived
Default	No default

ATTRIBUTE Pcusa Conn PcmLk pcuSigBvcState (pcuSigBvcState)

Access	Read only
Description	This attribute indicates the state of the signalization BVC on the Gb interface. ***down*** - the BSSGP BVCI 0 procedure has not been successfully

Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfPacketAccessRejectNoPdch (pktNoPdch)**

Description	This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfPacketAccessRejectNoTs (pktNoTs)**

Description	This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **upTbfPacketAccessRejectNoTbf (pktUpNoTbf)**

Description	This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum TBF per TDMA is reached” in the second phase of the two-phase access uplink TBF establishment during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **dnTbfImmediateAssignment (immAssDn)**

Description	This attribute counts IMMEDIATE-ASSIGNMENT messages sent for a downlink TBF establishment from the PCU to the mobile station during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **pagingRequest (pagReq)**

Description	This attribute counts PAGING-REQUEST messages generated by the PCU to the mobile station during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **deleteIndicationDn (delIndDn)**

Description	This attribute counts DELETE-INDICATION messages sent by the BTSs when an IMMEDIATE-ASSIGNMENT message for downlink transfer is dropped during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **packetDnAssignment (pktDnAss)**

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts PACKET-DOWNLINK-ASSIGNMENT messages generated by the PCU to the mobile station in the downlink TBF establishment phase during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **dnTbfPacketAccessRejectNoPdch (pktDnNoPdch)**

Description	This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “No PDCH available for GPRS” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **dnTbfPacketAccessRejectNoTs (pktDnNoTs)**

Description	This attribute counts PACKET-ACCESS-REJECT messages generated by the PCU to the mobile station with a cause of “Maximum MS per TS is reached” in the second phase of the two-phase access downlink TBF establishment during the statistics collection interval.
Values	Decimal (0..4294967295)

ATTRIBUTE Pcusa Conn PcmLk Cell Ccch **dnTbfPacketAccessRejectNoTbf (pktDnNoTbf)**

COLLECTED STATS PCUSupportApplication Connection PcmLink BssgpVirtualConnection

Scope	Device
Description	*Pcusa/n Conn/n PcmLink/n BssgpVirtualConnection/n* This dynamic component represents a BSSGP Virtual Connection. There is one *Bvc* per *Cell*. It is identified by a *Bvc* identifier coming from the PCU when the *Cell* is created.
Mib	Pcusa
Common Verbs	Help List Display

GROUP Pcusa Conn PcmLk Bvc Operational (Oper)

Properties	Operational
Description	This group contains operational attributes describing *Bvc* upon receipt of a *Cell* configuration request.
Mib	Pcusa

ATTRIBUTE Pcusa Conn PcmLk Bvc bvcState (state)

Access	Read only
Description	This attribute indicates the BVC state. The SGSN sends the BVC blocked and unblocked status to the PCU on the Gb interface. This attribute is set to ***blocked*** when the transmission or reception is stopped and ***unblocked*** when the transmission or reception is resumed.
Mib	Pcusa
Values	blocked unblocked
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc maxBucketSize (maxBktSize)

Access	Read only
Description	This attribute indicates the maximum bucket size for the BVC. This parameter sent by the PCU is used by the BVC flow control algorithm in SGSN.
Mib	Pcusa
Values	Decimal (0..32000)
Units	kbyte

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc **bucketLeakRate (bktLRate)**

Access	Read only
Description	This attribute indicates the maximum allowed BVC leak rate. The SGSN does not leak more traffic for a BVC to the PCU than is specified by this attribute.
Mib	Pcusa
Values	Decimal (0..6144)
Units	bit/s
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc **bufferSize (buffSize)**

Access	Read only
Description	This attribute indicates the number of bytes currently buffered for a BVC.
Mib	Pcusa
Values	Decimal (0..32000)
Units	kbyte
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc **cell**

Access	Read only
Description	This attribute indicates the cell identity number associated with this BVC.
Mib	Pcusa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvcCellLocationArea (bvcCLA)**

Access	Read only
Description	This attribute indicates the location area associated with the BVC and the cell. This attribute is used for paging.
Mib	Pcusa
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc **bvcCellRoutingArea (bvcCRA)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the routing area associated with the BVC and the cell.
Mib	Pcusa
Values	Decimal (0..256)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc bvcNumberMs (bvcNbMs)

Access	Read only
Description	This attribute indicates the number of mobiles in the cell that are currently transferring data.
Mib	Pcusa
Values	Decimal (0..960)
Default	No default

GROUP Pcusa Conn PcmLk Bvc Statistics (Stats)

Properties	Operational
Description	This group contains statistical data collected by counters.
Mib	Pcusa

ATTRIBUTE Pcusa Conn PcmLk Bvc pduDn

Access	Read only
Description	This attribute counts the PDUs received by this BVC from the Gb interface. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc pduUp

Access	Read only
Description	This attribute counts the PDUs sent by this BVC to the Gb interface. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc octetsDn (octDn)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the octets received by the BVC from the Gb interface. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Pcusa Conn PcmLk Bvc **octetsUp (octUp)**

Access	Read only

GROUP Pcusn Gtl NsProv

Properties	Provisioned
Description	This group contains provisionable attributes for the Network Service (NS) protocol layer of GPRS.
Mib	WirelessNssBssPcu

ATTRIBUTE Pcusn Gtl nsBlockTimer (tnsBlk)

Access	Read: All Write: All
Description	This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) BLOCK and UNBLOCK procedures. This is the time interval between an NS-BLOCK and NS-BLOCK ACK, or between an NS-UNBLOCK and NS-UNBLOCK ACK. The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification.
Mib	WirelessNssBssPcu
Values	Decimal (1..120)
Units	seconds
Default	3

ATTRIBUTE Pcusn Gtl nsBlockRetries (nBlk)

Access	Read: All Write: All
Description	This attribute specifies the number of times the NS-BLOCK message can be retried if NS-BLOCK ACK is not received before the *nsBlockTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (0..10)
Default	3

ATTRIBUTE Pcusn Gtl nsUnBlockRetries (nUnBlk)

Access	Read: All Write: All
Description	This attribute specifies the number of times the NS-UNBLOCK message can be retried if NS-UNBLOCK ACK is not received before the *nsBlockTimer* expires. The default value is the value provided in the GPRS specification.

Copyright © 2006, Nortel Nortel Confidential

Mib	WirelessNssBssPcu
Values	Decimal (3..15)
Default	3

ATTRIBUTE Pcusn Gtl nsResetTimer (tnsReset)

Access	Read: All Write: All
Description	This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) RESET procedure. This is the time interval between an NS-RESET and NS-RESET ACK. The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification.
Mib	WirelessNssBssPcu
Values	Decimal (1..120)
Units	seconds
Default	3

ATTRIBUTE Pcusn Gtl nsResetRetries (nReset)

Access	Read: All Write: All
Description	This attribute specifies the times the NS-RESET message can be retried if NS-RESET ACK is not received before the *nsResetTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (3..10)
Default	5

ATTRIBUTE Pcusn Gtl nsTestTimer (tnsTest)

Access	Read: All Write: All
Description	This attribute specifies the periodicity of the Network Service Virtual Connection (NS-VC) TEST procedure which is the initiation of the NS-ALIVE Protocol Data Unit (PDU). The range is the value provided in the GPRS specification.
Mib	WirelessNssBssPcu
Values	Decimal (1..60)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	30

ATTRIBUTE Pcusn Gtl nsAliveTimer (tnsAlive)

Access	Read: All Write: All
Description	This attribute specifies the timer to guard the Network Service Virtual Connection (NS-VC) ALIVE procedure. This is the time interval between an NS-ALIVE and NS-ALIVE ACK. The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU). The default value is the value provided in the GPRS specification.
Mib	WirelessNssBssPcu
Values	Decimal (1..10)
Units	seconds
Default	3

ATTRIBUTE Pcusn Gtl nsAliveRetries (nAlive)

Access	Read: All Write: All
Description	This attribute specifies the number of times the NS-ALIVE message can be retried if NS-ALIVE ACK is not received before the *nsAliveTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (3..10)
Default	10

COMPONENT Pcusn NetworkServiceEntity (Nse)

Instance	Decimal (0..65535)
Groups	GROUP Pcusn Nse Provisioned (Prov)
Scope	Application
Description	*Pcusn NetworkServiceEntity/<nsei>* This component represents a Network Service Entity (NSE). Each NSE is associated with a single Packet Control Unit (PCU) and is identified by means of a Network Service Entity Identifier (NSEI). The same NSE can

Copyright © 2006, Nortel Nortel Confidential

be provisioned in multiple PcGtl instances to enable load sharing.

GROUP Pcusn Nse Provisioned (Prov)

Properties Provisioned

Description This group contains provisionable attributes for the BSS GPRS Protocol (BSSGP) layer of GPRS.

Mib WirelessNssBssPcu

ATTRIBUTE Pcusn Nse linkToPcuConn (lToPcu)

Access Read: All
Write: All

Description This attribute specifies a *Pcusa Connection* component that this NSE associates with. The purpose is to associate an NSE (Gb interface) with a *Connection* which groups the PCM links to a BSC (a GPRS interface). The operator will provision this link when setting up the conections through the PCUSN for the BSC to SGSN.

Mib WirelessNssBssPcu

Values Link (Service, linkToNse)

Default No default

ATTRIBUTE Pcusn Nse bvcBlockUnblockTimer (tBlkUnblk)

Access Read: All
Write: All

Description This attribute specifies the timer to guard the blocking and unblocking procedures. The Packet Control Unit (PCU) sends a BVC-BLOCK (UNBLOCK) Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *bvcBlockUnblockTimer*. The PCU stops the timer upon reception of a BVC-BLOCK (UNBLOCK)-ACK PDU from the SGSN. If the timer expires, the PCU retries the BVC-BLOCK(UNBLOCK) procedure.

The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).

Mib WirelessNssBssPcu

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..30)
Units	seconds
Default	15

ATTRIBUTE Pcusn Nse bvcBlockRetries (nBvcBlk)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of times the Packet Control Unit (PCU) can send the BVC-BLOCK Protocol Data Unit (PDU) in case a BVC-BLOCK ACK is not received before the *bvcBlockUnblockTimer* expiry (defined in *Pcusn Nse* component).
Mib	WirelessNssBssPcu
Values	Decimal (0..6)
Default	3

ATTRIBUTE Pcusn Nse bvcUnblockRetries (nBvcUnblk)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the BVC-UNBLOCK Protocol Data Unit (PDU) in case a BVC-UNBLOCK ACK is not received before the *bvcBlockUnblockTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (0..6)
Default	3

ATTRIBUTE Pcusn Nse bvcResetReqTimer (tReset)

Access	Read: All Write: All
Description	This attribute specifies the timer to guard the BVC-RESET procedure. The Packet Control Unit (PCU) sends a BVC-RESET Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *bvcResetReqTimer* for a BVC. The PCU stops the timer upon reception of a BVC-RESET-ACK PDU from the SGSN. If the timer expires, the PCU retries the BVC-RESET procedure. The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).
Mib	WirelessNssBssPcu
Values	Decimal (1..120)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	60

ATTRIBUTE Pcusn Nse bvcResetReqRetries (nBvcRst)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the BVC-RESET Protocol Data Unit (PDU) in case a BVC-RESET ACK is not received before the *bvcResetReqTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (0..6)
Default	3

ATTRIBUTE Pcusn Nse suspendTimer (tSuspend)

Access	Read: All Write: All
Description	This attribute specifies the timer to guard the SUSPEND procedure. The Packet Control Unit (PCU) sends a SUSPEND Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *suspendTimer*. The PCU stops the timer upon reception of a SUSPEND-ACK (NACK) PDU from the SGSN. If the timer expires, the PCU retries the SUSPEND procedure. The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).
Mib	WirelessNssBssPcu
Values	Decimal (1..10)
Units	seconds
Default	5

ATTRIBUTE Pcusn Nse suspendRetries (nSuspend)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the SUSPEND Protocol Data Unit (PDU) in case a SUSPEND ACK is not received before the *suspendTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (0..6)

Copyright © 2006, Nortel Nortel Confidential

Default	3

ATTRIBUTE Pcusn Nse resumeTimer (tResume)

Access	Read: All Write: All
Description	This attribute specifies the timer to guard the RESUME procedure. The Packet Control Unit (PCU) sends a RESUME Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) and starts the *resumeTimer*. The PCU stops the timer upon reception of a RESUME-ACK (NACK) PDU from the SGSN. If the timer expires, the PCU retries the RESUME procedure. The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).
Mib	WirelessNssBssPcu
Values	Decimal (1..10)
Units	seconds
Default	5

ATTRIBUTE Pcusn Nse resumeRetries (nResume)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the RESUME PDU in case a RESUME ACK is not received before the *resumeTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (0..6)
Default	3

ATTRIBUTE Pcusn Nse raCapabilityUpTimer (tRaUp)

Access	Read: All Write: All
Description	This attribute specifies the timer to guard the RA-CAPABILITY-UPDATE procedure. When the Packet Control Unit (PCU) sends a RA-CAPABILITY-UPDATE Protocol Data Unit (PDU) to the Serving GPRS Support Node (SGSN) it starts the *raCapabilityUpTimer*. The PCU stops the timer upon reception of a RA-CAPABILITY-UPDATE-ACK PDU from the SGSN. If the timer expires, the PCU retries the RA-CAPABILITY-UPDATE procedure. The timer must be provisioned to a value that is greater than the maximum expected round trip delay of a Protocol Data Unit (PDU).
Mib	WirelessNssBssPcu

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..30)
Units	seconds
Default	15

ATTRIBUTE Pcusn Nse raCapabiltyUpRetries (nRaUp)

Access	Read: All Write: All
Description	This attribute specifies the maximum number of times the Packet Control Unit (PCU) can resend the RA-CAPABILITY-UPDATE PDU in case a RA-CAPABILITY-UPDATE ACK is not received before the *raCapabilityUpTimer* expires.
Mib	WirelessNssBssPcu
Values	Decimal (0..6)
Default	3

ATTRIBUTE Pcusn Nse flowControlMaxRate (flCntlMaxRt)

Access	Read: All Write: All
Description	This attribute specifies the minimum interval between sending consequent Flow Control Protocol Data Unit (PDU) for a given BSS GPRS Virtual Connection (BVC) or for a Mobile Station (MS). Changing the value can affect the flow control function at the Packet Control Unit (PCU) level, with the Logical Link Control (LLC) frames discarded due to overflow of the MS or the BVC buckets.
Mib	WirelessNssBssPcu
Values	Decimal (1001..9999)
Units	msec
Default	2000

ATTRIBUTE Pcusn Nse tsFlowCntlBucketSize (tsBmax)

Access	Read: All Write: All
Description	This attribute specifies the maximum bucket size (Bmax) for a BSS GPRS Virtual Connection (BVC) Flow Control procedure. The value is the BVC Max Bucket size for a BVC with 1 time slot. The Packet Control Unit (PCU) calculates the actual BVC Max Bucket size for the configuration, by multiplying this provisioned value by the number of time slots in the cell, dynamically given by the Base Station Control (BSC). The default value has been estimated based on the *msFlowCntlBucketSize* default value, with 8 Mobiles in downlink transfer. The unit is 100 bytes.
Mib	WirelessNssBssPcu

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)
Default	5760

ATTRIBUTE Pcusn Nse tsLeakRate (tsLeakRt)

Access	Read: All Write: All
Description	This attribute specifies the leak rate parameter for a BSS GPRS Virtual Connection (BVC) with 1 time slot. The Packet Control Unit (PCU) calculates the actual BVC leak rate for the configuration, by multiplying this provisioned value by the number of time slots in the cell, dynamically given by the Base Station Control (BSC). The default value assumes a CS1 Mobile Station (MS), with a throughput of 10000 bit/s, with assumption that the flow is statistically regular in the cell. The unit is 100 bit/s.
Mib	WirelessNssBssPcu
Values	Decimal (0..65535)
Default	125

ATTRIBUTE Pcusn Nse msFlowCntlBucketSize (msBmax)

Access	Read: All Write: All
Description	This attribute specifies the Mobile Station (MS) maximum bucket size. The default value assumes 6 Logical Link Control (LLC) frames in the bucket. The unit is 100 bytes.
Mib	WirelessNssBssPcu
Values	Decimal (241..65535)
Default	720

ATTRIBUTE Pcusn Nse msLeakRate (msLeakRt)

Access	Read: All Write: All
Description	This attribute specifies the Mobile Station (MS) leak rate parameter. The default value is based on the fact that the MS Bucket has a null throughput during the radio datapath establishment with the MS. The unit is 100 bit/s.
Mib	WirelessNssBssPcu
Values	Decimal (0..65535)
Default	50

ATTRIBUTE Pcusn Nse flowControlMaxDelay (flCntMaxDelay)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum interval between two consecutive MS-Flow-Control messages sent to the SGSN. It must be smaller than the Th timer defined in the SGSN (from GSM8.18). It must be greater than *flowControlMaxRate* + 3 seconds. The value of 3 seconds is considered as the maximum tranmission delay between a PCUSN and a SGSN.
Mib	WirelessNssBssPcu
Values	Decimal (5..6000)
Units	seconds
Default	300

ATTRIBUTE Pcusn Nse linkToSlaveNse (lTonse)

Access	Read: All Write: All
Description	This attribute specifies the corresponding *PcGtl Nse* component instances provisioned on the FPs. The purpose is to provide common parameters to all instances of this NSE on the FPs and also to associate the *Pcusa Connection* component with this NSE.
Mib	WirelessNssBssPcu

GROUP Piwf CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	PppIwf

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE Piwf customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	PppIwf
Values	Decimal (0; 1..8191)
Default	0

GROUP Piwf IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	PppIwf

ATTRIBUTE Piwf ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	PppIwf
Values	up down testing
Default	up

ATTRIBUTE Piwf ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	PppIwf
Values	Decimal (1..65535)
Default	No default

GROUP Piwf OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	PppIwf

ATTRIBUTE Piwf adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	PppIwf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Piwf operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: PppIwf

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Piwf usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: PppIwf

Values: idle
active (activ)
busy

Default: idle

GROUP Piwf OperationalStatus (OperStatus)

Properties: Operational

Description: This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Mib: PppIwf

ATTRIBUTE Piwf snmpOperStatus

Access: Read only

Description: The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

	change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).
Mib	PppIwf
Values	disabled enabled
Default	enabled

ATTRIBUTE Piwf Lnk restartTimer (rtimer)

Access	Read and write
Description	This is the time, in milliseconds, that *Ppp* will wait for a response to a configure request or a terminate request before retrying.
Mib	PppIwf
Values	Decimal (1000..10000)
Units	msec
Default	3000

ATTRIBUTE Piwf Lnk continuityMonitor (cntmon)

Access	Read and write
Description	This attribute turns on/off (***enabled/disabled***) the Link Continuity Monitor. If set to ***enabled***, periodic keep alive echo packet will be sent over the *Ppp* link. If set to ***disabled***, no keep alive packets will be sent. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).
Mib	PppIwf
Values	enabled disabled
Default	disabled

ATTRIBUTE Piwf Lnk negativeAckTries (naks)

Access	Read and write
Description	This attribute specifies the maximum negative acknowledgments sent to the remote *Ppp* entity during negotiation before defaulting its configuration parameters.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	10

ATTRIBUTE Piwf Lnk qualityThreshold (quality)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the minimum allowed line quality before the line is considered too poor to continue operation. The value for this attribute is a percentage measure of the line quality given in integers (10 to 99). The higher the value, the more stringent the line requirements.
Mib	PppIwf
Values	Decimal (10..99)
Units	%
Default	90

ATTRIBUTE Piwf Lnk qualityWindow (qwindow)

Access	Read and write
Description	This attribute specifies the number of seconds used for sampling line quality. If line quality drops below the level set with the *qualityThreshold* attribute during this window, this instance of *Ppp* will be marked down until line quality recovers.
Mib	PppIwf
Values	Decimal (10..400)
Units	seconds
Default	30

ATTRIBUTE Piwf Lnk terminateRequestTries (term)

Access	Read and write
Description	This attribute specifies the maximum terminate requests to be sent, when closing the connection, and not answered before this instance of *Ppp* enters a closing state.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	10

ATTRIBUTE Piwf Lnk configureRequestTries (try)

Access	Read and write
Description	This attribute specifies the number of configuration requests that will be sent out and not answered before this instance of *Ppp* enters a listening state. If both sides enter the listening state then the link will not come up. To eliminate this possibility, this attribute should be set to 1000000000. This will ensure that this end of the *Ppp* link will continue to try until the link is good.
Mib	PppIwf
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	1000000000

GROUP Piwf Lnk Operational (Oper)

Properties	Operational
Description	This group contains the *Ppp* Link Operational attributes.
Mib	PppIwf

ATTRIBUTE Piwf Lnk operState (state)

Access	Read only
Description	This is the operational state of the Link Control Protocol. For more information as to the definition of each state see RFC1331 section 5.3.
Mib	PppIwf
Values	initial starting closed stopped closing stopping reqsent ackrcvd acksent opened
Default	initial

ATTRIBUTE Piwf Lnk lineCondition (lcond)

Access	Read only
Description	This attribute describes the condition of the physical line that *Ppp* is running over. ***ok***: The condition of the line is good. ***looped***: The line is looped back on itself, probably at the remote end. ***noClock***: There is a hardware problem with the line. The cable may not be plugged in correctly. ***badLineCondition***: The quality of the line is below the *qualityThreshold*.
Mib	PppIwf
Values	ok looped noClock badLineCondition
Default	ok

ATTRIBUTE Piwf Lnk badAddresses (ba)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of packets received with an incorrect Address Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Lnk badControls (bc)

Access	Read only
Description	This attribute counts the number of packets received on this link with an incorrect Control Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Lnk packetTooLongs (ptl)

Access	Read only
Description	This attribute counts the number of packets received that have been discarded because their length exceeded the Maximum Receive Unit (Mru). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Lnk badFcss (bfcs)

Access	Read only
Description	This attribute counts the number of packets received that have been discarded due to having an incorrect Frame Check Sequence (Fcs). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Piwf Lnk localMru (lmru)

Access	Read only
Description	This is the current value of the Maximum Receive Unit (Mru) for the local *Ppp* Entity. This value is the Mru that the remote entity is using when sending packets to the local *Ppp* entity.
Mib	PppIwf
Values	Decimal (1..2147483648)
Units	octets
Default	1

ATTRIBUTE Piwf Lnk remoteMru (rmru)

Access	Read only
Description	This is the current value of the Maximum Receive Unit (Mru) for the remote *Ppp* entity. This value is the Mru that the local entity is using when sending packets to the remote *Ppp* entity.
Mib	PppIwf
Values	Decimal (1..2147483648)
Units	octets
Default	No default

ATTRIBUTE Piwf Lnk transmitFcsSize (tfcs)

Access	Read only
Description	This is the size of the Frame Check Sequence (Fcs) in bits that the local node will generate when sending packets to the remote node.
Mib	PppIwf
Values	Decimal (0..128)
Units	bits
Default	0

ATTRIBUTE Piwf Lnk receiveFcsSize (rfcs)

Access	Read only
Description	This is the size of the Frame Check Sequence (Fcs) in bits that the remote node will generate when sending packets to the local node.
Mib	PppIwf
Values	Decimal (0..128)
Units	bits

GROUP Piwf Framer DiscardStatistics (Disc)

COLLECTED STATS PppIwf Framer

Scope — Application

Description

Ppp/n Framer
PppIwf/n Framer

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer* that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute that binds the application component to a specific hardware

Copyright © 2006, Nortel
Nortel Confidential

component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

ATTRIBUTE Piwf Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	PppIwf
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Piwf Framer usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	PppIwf
Values	idle active (activ) busy
Default	idle

GROUP Piwf Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a *Framer, MlpppFramer or MlpppLink* component.
Mib	PppIwf

ATTRIBUTE Piwf Framer aborts

Access	Read only
Description	This attribute counts the total number of aborts received. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Framer crcErrors

Access	Read only
Description	This attribute counts the total number of frames with CRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Piwf Framer **lrcErrors**

Access	Read only
Description	This attribute counts the total number of frames with LRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Framer **nonOctetErrors**

Access	Read only
Description	This attribute counts the total number of frames that were non octet aligned. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Framer **overruns**

Access	Read only
Description	This attribute counts the total number of frames received from the interface for which overruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Framer **underruns**

Access	Read only
Description	This attribute counts the total number of frames transmitted to the interface for which underruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Piwf Framer **largeFrmErrors**

Access	Read only
Description	This attribute counts the total number of frames received that were too large. The frame exeeceded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwf
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf Framer **octetToIf**

Access	Read only
Description	This attribute indicates the number of octets transmitted by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppIwf
Values	Long Integer
Default	No default

ATTRIBUTE Piwf Framer **octetFromIf**

Access	Read only
Description	This attribute indicates the number of octets received by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets received by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets received by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppIwf
Values	Long Integer

ATTRIBUTE Piwf Framer **frmFromIf**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of LCP, NCP and Data frames received by the *Framer.* This attribute indicates the number of NCP and Data frames received by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments received by the *MlpppLink.*
Mib	PppIwf
Values	Long Integer
Default	No default

ATTRIBUTE Piwf Framer frmToIf

Access	Read only
Description	This attribute indicates the number of LCP, NCP and Data frames transmitted by the *Framer.* This attribute indicates the number of NCP and Data frames transmitted by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments transmitted by the *MlpppLink.*
Mib	PppIwf
Values	Long Integer
Default	No default

GROUP Piwf Framer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	PppIwf

ATTRIBUTE Piwf Framer normPrioLinkUtilToIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data sent to the interface as a percentage of the available bandwidth of the link (*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	PppIwf

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..100)
Units	%
Default	0

ATTRIBUTE Piwf Framer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data received from the interface as a percentage of the available bandwidth on the link(*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	PppIwf
Values	Decimal (0..100)
Units	%
Default	0

GROUP Piwf Framer DiscardStatistics (Disc)

Properties	Operational
Description	This group contains the operational discards statistics for the *Framer/ MlpppFramer* component.
Mib	PppIwf

ATTRIBUTE Piwf Framer discCongFrmToIfEp0 (disc0)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 0 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.

COLLECTED STATS PppIwf Framer

Description	The statistics record generated by the PppIwf Framer component.

ATTRIBUTE Piwf Framer rxBytes

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Piwf Framer rxFrames

Description	This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Piwf Framer txBytes

Description	This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE Piwf Framer txFrames

Description	This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE Piwf Framer rxTotalLinkUtil

Description	This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.
Values	Decimal (0..100)

COMPONENT Piwf AtmAdaptionPoint (AtmAp)

Groups	GROUP Piwf AtmAp Provisioned (AtmApProv) GROUP Piwf AtmAp OsiState (State) GROUP Piwf AtmAp Operational (AapOper)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*Piwf/n AtmAdaptionPoint* This component represents a SoftPVC between Point-to-Point Protocol and remote ATM Interface. Multiprotocol Encapsulation as specified in RFC1483 is used to transfer higher-layer protocol (IP) data across a virtual channel in an ATM network.
Mib	PppIwf
Subcomponents	COMPONENT Piwf AtmAp TrafficManagement (Tm)
Dyn. Subcomp.	COMPONENT Piwf AtmAp AtmConnection (AtmCon)
Common Verbs	Help List Display Add DELete

VERB Restart Piwf AtmAp

Impact	Service
Description	This command is used to restart the automatic connections procedure. The operational attributes *retryTimerValue* and *retryFailures* will also be reset. This command may be used after the connection procedure has been abandoned due to reaching the maximum number of retries allowed, as specified by *retryLimit*, or before the limit has been reached. This command may also be used when a connection has been established, in which case the connection will first be released. This command will fail if the *channel* associated with the *Framer* component is disabled, or if *spvcStatus* has the value ***initialising***. If *spvcStatus* has the value ***failed***, this command may fail.

GROUP Piwf AtmAp Provisioned (AtmApProv)

Properties	Provisioned
Description	This group contains the previsional attribute for *AtmAdaptionPoint* component.
Mib	PppIwf

ATTRIBUTE Piwf AtmAp maxTransmissionUnit (mtu)

Access	Read and write
Criticality	Process
Description	This attribute specifies the size of the largest datagram which can be sent

Copyright © 2006, Nortel Nortel Confidential

on the SoftPVC. This includes the size of the Logical Link Control header (if applicable) as well as the protocol data unit.

Mib	PppIwf
Values	Decimal (256..9188)
Units	octets
Default	9188

ATTRIBUTE Piwf AtmAp encapType (etype)

Access	Read and write
Criticality	Process
Description	This attribute specifies the RFC1483 encapsulation type to be used for the *AtmConnections* under this *PppAtmIwf*. Specifying ***llcEncap*** allows multiplexing of multiple protocols over the VCCs. The protocol of the carried PDU will be identified by an IEEE 802.2 Logical Link Control header. If Bridging or Inverse ARP is to be carried over a VCC, ***llcEncap*** must be used. Specifying ***ipVcEncap*** indicates that the VCC (e.g. *AtmConnection*) under an *AtmAdaptionPoint* component will use VC based multiplexing and will carry IP PDUs only.
Mib	PppIwf
Values	llcEncap ipVcEncap
Default	ipVcEncap

ATTRIBUTE Piwf AtmAp localAddress (localAddr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the local NSAP address. If the switch prefix (the *nodePrefix* attribute of the *ModuleData* component) has been provisioned, a default value for *localAddress* based on *nodePrefix* will be provided. If *ModuleData nodePrefix* is empty and one or more alternate switch prefixes (the *alternatePorsPrefixes* attribute of the *ModuleData* component) have been provisioned, a default value for *localAddress* based on the first provisioned *alternatePorsPrefix* value will be provided. If switch prefixes are empty, *localAddress* will default to an empty string. To obtain a valid default *localAddress* in this case, either or both of the *ModuleData nodePrefix* and *ModuleData alternatePorsPrefixes* attributes

Copyright © 2006, Nortel Nortel Confidential

must be provisioned, and this end point component must then be deleted and re-added.

Mib	PppIwf
Values	String (40, AESANsapAddress)
Default	No default

ATTRIBUTE Piwf AtmAp calledVpiVci (vc)

Access	Read and write
Criticality	Process
Description	*calledVpiVci* specifies the identity of the PVC at the remote ATM node on which the SoftPVC connection terminates.
Mib	PppIwf
Values	Integer Sequence (0..4095; 1..65535)
Default	No default

ATTRIBUTE Piwf AtmAp addressToCall (addrToCall)

Access	Read and write
Criticality	Process
Description	This attribute specifies the remote NSAP address which this *AtmAdaptionPoint* will call.
Mib	PppIwf
Values	String (40, AESANsapAddress)
Default	No default

ATTRIBUTE Piwf AtmAp firstRetryInterval (int)

Access	Read and write
Criticality	Process
Description	This attribute specifies the time to wait, in seconds, before attempting to establish the connection after the first failed attempt. The time to wait between subsequent call attempts will generally differ due to a backoff scheme.
Mib	PppIwf
Values	Decimal (1..3600)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	10

ATTRIBUTE Piwf AtmAp retryLimit (limit)

Access	Read and write
Criticality	Process
Description	*retryLimit* specifies the maximum number of consecutive unsuccessful connection setup attempts that may be made before further attempts are abandoned. If this limit is reached, the *Restart* verb may be used to restart connection attempts. If *retryLimit* is ***0***, there is no limit; attempts will continue indefinitely until a successful connection is established.
Mib	PppIwf
Values	Decimal (0..65535)
Default	0

GROUP Piwf AtmAp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	PppIwf

ATTRIBUTE Piwf AtmAp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	PppIwf
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Piwf AtmAp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	PppIwf
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Piwf AtmAp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	PppIwf
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP Piwf AtmAp Operational (AapOper)

Properties	Operational
Description	This group contains operational attributes for *AtmAdaptionPoint* component.
Mib	PppIwf

ATTRIBUTE Piwf AtmAp spvcStatus (status)

Access	Read only
Description	*spvcStatus* indicates the status of the incoming and outgoing connections. When this attribute has the value ***initialising***, it indicates that the component is initialising when first created; a connection has not been established, and no incoming setup requests will be processed. When this attribute has the value ***connecting***, it indicates that a connection has not yet been established, but that incoming setup requests will be sent. When this attribute has the value ***connected***, it indicates that a connection has been established. When this attribute has the value ***idle***, it indicates that a connection has not been established, and the component is waiting to restart. When this attribute has the value ***retriesExhausted***, it indicates that *retryLimit* consecutive connection setup attempts have failed, and the connection procedure has been aborted. When this attribute has the value ***failed***, it indicates that the ATM Networking resources are not available to setup the connection.
Mib	PppIwf
Values	initialising connecting connected idle retriesExhausted failed
Default	No default

ATTRIBUTE Piwf AtmAp retryTimeRemaining (timer)

Access	Read only
Description	*retryTimerValue* is the current value of the retry timer for this connection; it

Copyright © 2006, Nortel Nortel Confidential

indicates the number of seconds before the next connection attempt will be made. *retryTimerValue* is initialized when a connection attempt fails.

When *retryTimerValue* reaches ***0***, an attempt will be made to establish the connection.

When the timer is not running, for example when the connection has been established, *retryTimerValue* will be ***0***.

Mib PppIwf

Values Decimal (0..86400)

Units seconds

Default No default

ATTRIBUTE Piwf AtmAp retryFailures (failures)

Access Read only

Description

retryFailures counts the number of consecutive failed connection attempts.

retryFailures is reset to ***0*** whenever a connection is successfully established, or the connection is restarted using the *Restart* verb. The counter wraps when the maximum value is exceeded.

Mib PppIwf

Values Decimal (0..2147483647)

Default No default

ATTRIBUTE Piwf AtmAp lastSetupFailureCause (failCause)

Access Read only

Description

lastSetupFailureCause indicates the cause of the last connection setup failure.

The values are as defined in the ATM Forum ATM User-Network Interface (UNI) Specification.

DELete

GROUP Piwf MlFramer Provisioned (Prov)

Properties: Provisioned

Description:

This group contains the provisioning data for the *MlpppFramer* component.

Mib: PppIwfMlFramer

ATTRIBUTE Piwf MlFramer fragmentSize (fragSize)

Access: Read and write

Description:

This attribute specifies the maximum fragment size in octets for the payload. The fragment size does not include the 8 octets of MLPPP Header, or the 4 octets for FCS.

When the value of this attribute is set to ***no***, NCP and Data frames transmitted to the interface will not be fragmented.

When the value of this attribute is not equal to ***no***, all NCP and Data frames transmitted to the interface will be divided in data fragments which are sent over different links in a bundle. During LCP configuration if the *remoteMru* is less than the provisioned *fragmentSize*, LCP will send a Configure-Nak for the MRU with a value of 1500 bytes.

Copyright © 2006, Nortel
Nortel Confidential

	The fragment size is configured for the local bundle. The fragment size of the remote bundle does not need be the same.
Mib	PppIwfMlFramer
Values	Decimal (48; 96; 144; 192; 240; 288; 336; 384; 432; 480) no
Units	octets
Default	no

ATTRIBUTE Piwf MlFramer ep0Treatment

Access	Read and write
Criticality	Process
Description	This attribute specifies the handling of egress frames sent at Emission Priority (EP) 0. If a value of ***normal*** is specified then frames sent on EP0 will be fragmentented according to the fragmentSize attribute. If a value of ***doNotFragment*** is specified then frames sent on EPO will not be fragmented but the MLPPP Header will still be prepended to the frame. If the value of ***noMlpppHeader*** is specified then the frames sent to EP0 will not be fragmented and the MLPPP Header will not be prepended to the frame. When this value is used misordering can occur.
Mib	PppIwfMlFramer
Values	normal doNotFragment noMlpppHeader
Default	normal

ATTRIBUTE Piwf MlFramer configMrru (cmrru)

Access	Read and write
Criticality	Process
Description	This attribute specifies the Maximum Receive Reconstructed Unit (MRRU) that the local MLPPP bundle will advertise to the remote entity. This value includes 8 bytes for the MLPPP header, and an additional 2 bytes for the protocol field of the payload.
Mib	PppIwfMlFramer
Values	Decimal (68..9204)

Copyright © 2006, Nortel Nortel Confidential

Units	octets
Default	1524

ATTRIBUTE Piwf MlFramer endpointDiscriminator (epd)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the endpoint discriminator is used during the configuration phase of a link. If the value of ***noEndpointDisc*** is specified the endpoint discriminator is not included during Link Control Protocol(LCP) negotiation. If the value ***local*** is specified the endpoint discriminator option is included during LCP negotiation. The value consists of the system's node name appended with the *Ppp/Piwf* interface component name and instance number.
Mib	PppIwfMlFramer
Values	noEndpointDisc local
Default	local

GROUP Piwf MlFramer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — PppIwfMlFramer

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Piwf MlFramer operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — PppIwfMlFramer

ATTRIBUTE Piwf MlFramer aborts

Access	Read only
Description	This attribute counts the total number of aborts received. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer crcErrors

Access	Read only
Description	This attribute counts the total number of frames with CRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer lrcErrors

Access	Read only
Description	This attribute counts the total number of frames with LRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer nonOctetErrors

Access	Read only
Description	This attribute counts the total number of frames that were non octet aligned.

Copyright © 2006, Nortel Nortel Confidential

	For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer overruns

Access	Read only
Description	This attribute counts the total number of frames received from the interface for which overruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer underruns

Access	Read only
Description	This attribute counts the total number of frames transmitted to the interface for which underruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer largeFrmErrors

Access	Read only
Description	This attribute counts the total number of frames received that were too large. The frame exeeceded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer octetToIf

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of octets transmitted by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer octetFromIf

Access	Read only
Description	This attribute indicates the number of octets received by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets received by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets received by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer frmFromIf

Access	Read only
Description	This attribute indicates the number of LCP, NCP and Data frames received by the *Framer.* This attribute indicates the number of NCP and Data frames received by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments received by the *MlpppLink.*
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer frmToIf

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of LCP, NCP and Data frames transmitted by the *Framer.* This attribute indicates the number of NCP and Data frames transmitted by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments transmitted by the *MlpppLink.*
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

GROUP Piwf MlFramer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer normPrioLinkUtilToIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data sent to the interface as a percentage of the available bandwidth of the link (*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	PppIwfMlFramer
Values	Decimal (0..100)
Units	%
Default	0

ATTRIBUTE Piwf MlFramer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data received from the interface as a percentage of the available bandwidth on the link(*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	PppIwfMlFramer

GROUP Piwf MlFramer DiscardStatistics (Disc)

Properties	Operational
Description	This group contains the operational discards statistics for the *Framer/MlpppFramer* component.
Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer discCongFrmToIfEp0 (disc0)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 0 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	PppIwfMlFramer
Vector of	Decimal (0..4294967295)
Index	lowPrecedence highPrecedence
Default	No default

ATTRIBUTE Piwf MlFramer discCongFrmToIfEp1 (disc1)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 1 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	PppIwfMlFramer

Default	No default

ATTRIBUTE Piwf MlFramer discCongFrmToIfEp2 (disc2)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 2 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	PppIwfMlFramer
Vector of	Decimal (0..4294967295)
Index	lowPrecedence highPrecedence
Default	No default

ATTRIBUTE Piwf MlFramer discCongFrmToIfEp3 (disc3)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 3 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	PppIwfMlFramer
Vector of	Decimal (0..4294967295)
Index	lowPrecedence highPrecedence
Default	No default

GROUP Piwf MlFramer MlpppFramerOper (Oper)

Properties	Operational
Description	This group contains the operational data for the *MlpppFramer* component.
Mib	PppIwfMlFramer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Piwf MlFramer **localMrru (lmrru)**

Access	Read only
Description	This attribute indicates the negotiated value of the Maximum Receive Reconstructed Unit (MRRU) for the local MLPPP bundle. This value is the MRRU that the remote entity is using when sending packets to the local MLPPP Bundle. This value includes 8 bytes for the MLPPP header, and an additional 2 bytes for the protocol field of the payload.
Mib	PppIwfMlFramer
Values	Decimal (1..18000)
Units	octets
Default	No default

ATTRIBUTE Piwf MlFramer **remoteMrru (rmrru)**

Access	Read only
Description	This attribute indicates the current Maximum Receive Reconstructed Unit (MRRU) for the remote MLPPP bundle. This value is the MTU that the local entity is using when sending packets to the remote MLPPP Bundle. This value includes 8 bytes for the MLPPP header, and an additional 2 bytes for the protocol field of the payload.
Mib	PppIwfMlFramer
Values	Decimal (1..18000)
Units	octets
Default	No default

ATTRIBUTE Piwf MlFramer **localEndpointDiscriminator (lepd)**

Access	Read only
Description	This attribute indicates the end point disciminator of the local bundle.
Mib	PppIwfMlFramer
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Piwf MlFramer **remoteEndpointDiscriminator (repd)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the end point disciminator of the remote bundle, as it was received from the first successfully negotiated link.
Mib	PppIwfMlFramer
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Piwf MlFramer expectedSequenceNumber (esn)

Access	Read only
Description	This attribute indicates the expected sequence number of the next MLPPP frsme received from the link. The attribute is set to the sequence number of the last fragment received plus one.
Mib	PppIwfMlFramer
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Piwf MlFramer sentSequenceNumber (ssn)

Access	Read only
Description	This attribute indicates the sequence number of the next MLPPP frame to be sent to the link.
Mib	PppIwfMlFramer
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Piwf MlFramer bundleSpeed

Access	Read only
Description	This attribute indicates the aggregate speed of all enabled *MlpppLinks* under the *MlpppFramer*.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

GROUP Piwf MlFramer MlpppFramerStatistics (MlStats)

Properties	Operational
Description	This group contains the statistical attributes of the *MlpppFramer* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer discardedFrmFromIf

Access	Read only
Description	This attribute indicates the number of frames that have been received by a *MlpppLink* but are discarded by the MLPPP Bundle. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer sequencingErrors

Access	Read only
Description	This attribute indicates the number of sequencing errors detected on a MLPPP Bundle. A sequencing error occurs when one or more MLPPP frames are determined to be lost. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer mrruExceededErrors

Access	Read only
Description	This attribute indicates the number of times a reassembled packet exceeded the *localMrru* value of an MLPPP Bundle. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

COLLECTED STATS PppIwf MlpppFramer

Description	The statistics record generated by the PppIwf MlpppFramer component.

ATTRIBUTE Piwf MlFramer rxBytes

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Copyright © 2006, Nortel Nortel Confidential

Values Long Integer

ATTRIBUTE Piwf MlFramer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE Piwf MlFramer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE Piwf MlFramer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE Piwf MlFramer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

GROUP Piwf MlFramer Lk Provisioned (Prov)

Properties Provisioned

Description
This group contains the provisioning data for the *MlpppLink* component.

Mib PppIwfMlFramer

ATTRIBUTE Piwf MlFramer Lk interfaceName

Access Read and write

Criticality Component

Description
This attribute specifies a hardware component name.

The attribute associates the application with a specific link. This defines the logical processor on which *MlpppLink* component (as well as *MlpppFramer* itself) will run.

Mib PppIwfMlFramer

Values Link (Hardware, applicationFramerName)

Default No default

GROUP Piwf MlFramer Lk OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib PppIwfMlFramer

ATTRIBUTE Piwf MlFramer Lk adminState (osiAdmin)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	PppIwfMlFramer
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Piwf MlFramer Lk operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	PppIwfMlFramer
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Piwf MlFramer Lk usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

	The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	PppIwfMlFramer
Values	idle active (activ) busy
Default	idle

GROUP Piwf MlFramer Lk Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a *Framer, MlpppFramer or MlpppLink* component.
Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer Lk aborts

Access	Read only
Description	This attribute counts the total number of aborts received. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk crcErrors

Access	Read only
Description	This attribute counts the total number of frames with CRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk lrcErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of frames with LRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk nonOctetErrors

Access	Read only
Description	This attribute counts the total number of frames that were non octet aligned. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk overruns

Access	Read only
Description	This attribute counts the total number of frames received from the interface for which overruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk underruns

Access	Read only
Description	This attribute counts the total number of frames transmitted to the interface for which underruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk largeFrmErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of frames received that were too large. The frame exeeceded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk octetToIf

Access	Read only
Description	This attribute indicates the number of octets transmitted by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer Lk octetFromIf

Access	Read only
Description	This attribute indicates the number of octets received by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets received by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets received by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer Lk frmFromIf

Access	Read only
Description	This attribute indicates the number of LCP, NCP and Data frames received by the *Framer.*

Copyright © 2006, Nortel Nortel Confidential

This attribute indicates the number of NCP and Data frames received by the *MlpppFramer.*

This attribute indicates the number of LCP frames, and NCP and Data frames or frragments received by the *MlpppLink.*

Mib PppIwfMlFramer

Values Long Integer

Default No default

ATTRIBUTE Piwf MlFramer Lk frmToIf

Access Read only

Description This attribute indicates the number of LCP, NCP and Data frames transmitted by the *Framer.*

This attribute indicates the number of NCP and Data frames transmitted by the *MlpppFramer.*

This attribute indicates the number of LCP frames, and NCP and Data frames or frragments transmitted by the *MlpppLink.*

Mib PppIwfMlFramer

Values Long Integer

GROUP Piwf MlFramer Lk LinkOperational (Lnk)

Properties Operational

Description This group contains the Link Control Protocol operational attributes for the *MlpppLink/n*.

Mib PppIwfMlFramer

ATTRIBUTE Piwf MlFramer Lk lcpState (state)

Access Read only

Description This attribute indicates the operational state of the Link Control Protocol.

The ***initial*** state, the link is unavailable (disabled), and no Open has occurred.

The ***starting*** state LCP is has been initialized, but the link is unavailable (disabled).

In the ***closed*** state, the link is available (enabled), but no Open has occurred.

In the ***stopped*** state LCP is waiting for a Down event after the This-Layer-

Copyright © 2006, Nortel Nortel Confidential

Finished action, or after sending a Terminate-Ack.

In the ***closing*** state, an attempt is made to terminate the connection. A Terminate-Request has been sent a but a Terminate-Ack has not been received.

In the ***stopping*** state a Terminate-Request has been sent and the Restart timer is running, but a Terminate-Ack has not yet been received.

In the request sent (***reqsent***) state an attempt is made to configure the connection. A Configure-Request has been sent and the Restart timer is running, but a Configure-Ack has not yet been received nor has one been sent.

In the ack received (***ackrcvd***) state, a Configure-Request has been sent and a Configure-Ack has been received.

In the ack sent (***acksent***) state, a Configure-Request and a Configure-Ack have both been sent, but a Configure-Ack has not yet been received. The Restart timer is running, since a Configure-Ack has not yet been received.

In the ***opened*** state, a Configure-Ack has been both sent and received.

For more information as to the definition of each state see RFC1331 section 5.3.

ATTRIBUTE Piwf MlFramer Lk lineCondition (lcond)

Access — Read only

Description — This attribute indicates the condition of the physical line that the Link Control Protocol is running over.

ok: The condition of the line is good.
looped: The line is looped back on itself, probably at the remote end.
misconfigured: The value of the remote MRRU or Endpoint Discriminator in the LCP configuration request does not match the operational value of the *MlpppFramer remoteMrru* or *remoteEndpointDiscriminator* attibutes.

Copyright © 2006, Nortel Nortel Confidential

noClock: There is a hardware problem with the line. The cable may not be plugged in correctly.
badLineCondition: The quality of the line is below the *Ppp/n Lnk qualityThreshold*.

Mib	PppIwfMlFramer
Values	ok looped misconfigured noClock badLineCondition
Default	ok

ATTRIBUTE Piwf MlFramer Lk badAddress (ba)

Access	Read only
Description	This attribute indicates the number of packets received with an incorrect Address Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than PPP. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk badControl (bc)

Access	Read only
Description	This attribute indicates the number of packets received on this link with an incorrect Control Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than PPP. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk packetTooLong (ptl)

Access	Read only
Description	This attribute indicates the number of packets received that have been discarded because their length exceeded the Maximum Receive Unit

Copyright © 2006, Nortel Nortel Confidential

	(MRU). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk badFcs (bfcs)

Access	Read only
Description	This attribute indicates the number of packets received that have been discarded due to having an incorrect Frame Check Sequence (FCS). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk localMru (lmru)

Access	Read only
Description	This attribute indicates the current value of the Maximum Receive Unit (MRU) for the local *MlpppLink* Entity. This value is the MRU that the remote entity is using when sending packets to the local *MlpppLink* entity.
Mib	PppIwfMlFramer
Values	Decimal (1..18000)
Units	octets
Default	1

ATTRIBUTE Piwf MlFramer Lk remoteMru (rmru)

Access	Read only
Description	This attribute indicates the current value of the Maximum Receive Unit (MRU) for the remote *MlpppLink* entity. This value is the MRU that the local entity is using when sending packets to the remote *MlpppLink* entity.
Mib	PppIwfMlFramer
Values	Decimal (1..18000)
Units	octets
Default	No default

ATTRIBUTE Piwf MlFramer Lk transmitFcsSize (tfcs)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the size of the Frame Check Sequence (Fcs) in bits that the local node will generate when sending packets to the remote node.
Mib	PppIwfMlFramer
Values	Decimal (0..128)
Units	bits
Default	0

ATTRIBUTE Piwf MlFramer Lk receiveFcsSize (rfcs)

Access	Read only
Description	This attribute indicates the size of the Frame Check Sequence (FCS) in bits that the remote node will generate when sending packets to the local node.
Mib	PppIwfMlFramer
Values	Decimal (0..128)
Units	bits
Default	0

GROUP Piwf MlFramer Lk LqmOperational (Lqm)

Properties	Operational
Description	This group contains the Link Quality Monitor operational attributes for the *MlpppLink*.
Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer Lk quality (qual)

Access	Read only
Description	This attribute indicates the current quality of the link. A value of ***good*** indicates that *Ppp/n LinkQualityMonitor configStatus* is ***enabled*** and link quality is above *Ppp/n Lnk linkQuality Threshold*. A value of ***bad*** indicates that *Ppp/n LinkQualityMonitor configStatus* is ***enabled*** and and link quality is not above *Ppp/n Lnk linkQuality Threshold*. A value of ***notDetermined*** indicates that either the *Ppp/n LinkQualityMonitor configStatus* is ***enabled*** and the quality of the link has not been calculated yet, or the *Ppp/n LinkQualityMonitor configStatus* is ***disabled***.
Mib	PppIwfMlFramer

Copyright © 2006, Nortel Nortel Confidential

Values	good bad notDetermined
Default	notDetermined

ATTRIBUTE Piwf MlFramer Lk inGoodOctets (ingo)

Access	Read only
Description	This attribute indicates the number of good octets received. This counter wraps around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Piwf MlFramer Lk localPeriod (localp)

Access	Read only
Description	This attribute indicates the *Ppp/n Lqm* reporting period, in hundredths of a second that is in effect for the local link.
Mib	PppIwfMlFramer
Values	Decimal (1..4294967295)
Units	centiseconds
Default	1

ATTRIBUTE Piwf MlFramer Lk remotePeriod (remotep)

Access	Read only
Description	This attribute indicates the *Ppp/n Lqm* reporting period, in hundredths of a second, that is in effect for the remote link.
Mib	PppIwfMlFramer
Values	Decimal (1..4294967295)
Units	centiseconds
Default	1

ATTRIBUTE Piwf MlFramer Lk outLqrs (outr)

Access	Read only
Description	This attribute indicates the number of link quality reports sent out. This counter wraps around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Piwf MlFramer Lk inLqrs (inr)

Access	Read only
Description	This attribute indicates the number of link quality reports received. This counter wraps around to 0 when it exceeds its maximum count.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967295)
Default	0

COMPONENT Piwf MlFramer Lk Override (Ov)

Groups	GROUP Piwf MlFramer Lk Ov LinkControlProtocol (Lcp) GROUP Piwf MlFramer Lk Ov LinkQualityMonitor (Lqm)
Scope	Application
Description	*Ppp/n MlFramer Lk/n Override* *Piwf/n MlFramer Lk/n Override* This component contains all the attributes related to the *MlpppLink Override* component. When added the provisioned values for the Link Control Protocol (*Ppp/Piwf Lnk)*, and the Link Quality Monitor (*Ppp/Piwf Lqm*) will be overriden for this particular *MlpppLink* instance. This is an optional subcomponent of *MlpppLink*.
Mib	PppIwfMlFramer
Common Verbs	Help List Display Add DELete

GROUP Piwf MlFramer Lk Ov LinkControlProtocol (Lcp)

Properties	Provisioned
Description	This group contains the override attributes for the Link Control Protocol. These attributes will override the value provisioned under the *Ppp Link* or *Piwf Link* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer Lk Ov **configInitialMru (cimru)**

Access	Read and write
Description	This is the initial Maximum Receive Unit (Mru) that the local *MlpppLink* entity will advertise to the remote entity. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used. A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).
Mib	PppIwfMlFramer
Values	Decimal (68..18000) sameAsLnk
Units	octets
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **configMagicNumber (cmn)**

Access	Read and write
Description	If ***enabled*** the local node will attempt to perform Magic Number negotiation with the remote node. If ***disabled*** this negotiation is not performed. In any event, the local node will comply with any magic number negotiations attempted by the remote node, per the Ppp specification. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used. A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).
Mib	PppIwfMlFramer
Values	disabled enabled sameAsLnk
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **restartTimer (rtimer)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This is the time, in milliseconds, that *MlpppLink* will wait for a response to a configure request or a terminate request before retrying.
Mib	PppIwfMlFramer
Values	Decimal (1000..10000) sameAsLnk
Units	msec
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **continuityMonitor (cntmon)**

Access	Read and write
Description	This attribute turns on/off (***enabled/disabled***) the Link Continuity Monitor. If set to ***enabled***, periodic keep alive echo packet will be sent over the *MlpppLink*. If set to ***disabled***, no keep alive packets will be sent. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used. A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).
Mib	PppIwfMlFramer
Values	enabled disabled sameAsLnk
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **negativeAckTries (naks)**

Access	Read and write
Description	This attribute specifies the maximum negative acknowledgments sent to the remote *MlpppLink* entity during negotiation before defaulting its configuration parameters. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967294) sameAsLnk
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **qualityThreshold (quality)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the minimum allowed line quality before the line is considered too poor to continue operation. The value for this attribute is a percentage measure of the line quality given in integers (10 to 99). The higher the value, the more stringent the line requirements. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppIwfMlFramer
Values	Decimal (10..99) sameAsLnk
Units	%
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **qualityWindow (qwindow)**

Access	Read and write
Description	This attribute specifies the number of seconds used for sampling line quality. If line quality drops below the level set with the *Ppp Lnk qualityThreshold* attribute during this window, this instance of *MlpppLink* will be marked down until line quality recovers. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppIwfMlFramer
Values	Decimal (10..400) sameAsLnk
Units	seconds
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **terminateRequestTries (term)**

Access	Read and write
Description	This attribute specifies the maximum terminate requests to be sent, when closing the connection, and not answered before this instance of *MlpppLink* enters a closing state. When set to ***sameAsLnk***, this attribute is not override and the value provisioned under *Ppp/Piwf Lnk* component will be used.

Copyright © 2006, Nortel Nortel Confidential

Mib	PppIwfMlFramer
Values	Decimal (0..4294967294) sameAsLnk
Default	sameAsLnk

ATTRIBUTE Piwf MlFramer Lk Ov **configureRequestTries (try)**

Access	Read and write
Description	This attribute specifies the number of configuration requests that will be sent out and not answered before this instance of *MlpppLink* enters a listening state. If both sides enter the listening state then the link will not come up. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppIwfMlFramer
Values	Decimal (0..4294967294) sameAsLnk
Default	sameAsLnk

GROUP Piwf MlFramer Lk Ov **LinkQualityMonitor (Lqm)**

Properties	Provisioned
Description	This group contains the override attributes for the Link Quality Monitor. These attributes will override the value provisioned under the *Ppp Lqm* or *Piwf Lqm* component.
Mib	PppIwfMlFramer

ATTRIBUTE Piwf MlFramer Lk Ov **configPeriod (cfgper)**

Access	Read and write
Description	This attribute specifies the Link Quality Monitor's reporting period that the local *MlpppLink* entity will attempt to negotiate with the remote entity, in units of hundredths of a second. A value of "0" allows the remote *Mlppp* entity to determine the reporting period. A value greater than 180,000 (1/2 hour) allows the period to be determined dynamically as a function of the transmit data rate. A value from 1-9 is rounded up to 10 during negotiation. When set to ***sameAsLqm*** the value provisioned under *Ppp/Piwf Lnk* component will be used.

Copyright © 2006, Nortel Nortel Confidential

	A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).
Mib	PppIwfMlFramer
Values	Decimal (0..2147483647) sameAsLqm
Units	centiseconds
Default	sameAsLqm

ATTRIBUTE Piwf MlFramer Lk Ov configStatus (cfgstat)

Access	Read and write
Description	If this attribute is ***enabled***, the local node will attempt to perform *Lqm* negotiation with the remote node. If it is ***disabled*** this negotiation is not performed. When set to ***sameAsLqm*** the value provisioned under *Ppp/Piwf Lnk* component will be used. A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).
Mib	PppIwfMlFramer
Values	disabled enabled sameAsLqm
Default	sameAsLqm

GROUP Ppp CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel

Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Ppp

ATTRIBUTE Ppp customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Ppp
Values	Decimal (0; 1..8191)
Default	0

GROUP Ppp IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	Ppp

ATTRIBUTE Ppp ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ppp
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	Ppp
Values	Decimal (1..65535)
Default	No default

GROUP Ppp MediaProv (Mp)

Properties	Provisioned
Description	This group contains the base provisioning data for the Media Application component.
Mib	Ppp

ATTRIBUTE Ppp linkToProtocolPort (pp)

Access	Read and write
Criticality	Component
Description	This attribute contains a protocol port component name. The attribute associates the application with a protocol port.
Mib	Ppp
Values	Link (Service, linkToMedia)
Default	No default

GROUP Ppp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ppp

ATTRIBUTE Ppp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Ppp

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Ppp operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Ppp

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Ppp usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

	The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ppp
Values	idle active (activ) busy
Default	idle

GROUP Ppp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ppp

ATTRIBUTE Ppp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ppp
Values	up down testing
Default	up

GROUP Ppp PppProv (Ppp)

Properties	Provisioned
Description	This group contains the provisioning data for the *Ppp* link level protocol component.
Mib	Ppp

ATTRIBUTE Ppp linkToApplication

Access	Read and write
Criticality	Component
Description	This attribute contains a *PppApplication* component name. The attribute associates the *Ppp* link level protocol component with a *PppApplication* component.
Mib	Ppp

Copyright © 2006, Nortel Nortel Confidential

Values	Link (Service, linkToMedia)
Default	No default

COMPONENT Ppp ConnectionAdministrator (Ca)

Groups	GROUP Ppp Ca Provisioned (Prov) GROUP Ppp Ca Operational (Oper)
Scope	Application
Description	*Ppp/n ConnectionAdministrator* This component manages the link bandwidth, and reports the information about the link usage. This component can only be provisioned if the *MplsPort* component is provisioned.
Mib	Ppp
Common Verbs	Help List Display Add DELete

GROUP Ppp Ca Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Ca* component.
Mib	Ppp

ATTRIBUTE Ppp Ca percentBandwidthManaged (pBwManaged)

Access	Read and write
Description	This attribute specifies the percentage of link capacity used for transmitting the network clients' MPLS traffic and managed by the bandwidth manager. If this percent is selected to be less than 100% then an explicit amount of bandwidth is reserved for other traffic that is not managed by the bandwidth manager such as IP native traffic or IP control traffic. It should be noted that this attribute is used for bandwidth reservation for Connection Admission Control purpose and does not control the actual transmission of traffic which is controlled by the scheduler configuration. The total bandwidth for transmitting the network clients' MPLS traffic (*managedBandwidthTotal*) can be obtained as the multiplication of this attribute and the link transmitting capacity.
Mib	Ppp

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..100)
Units	%
Default	100

GROUP Ppp Ca Operational (Oper)

Properties	Operational
Description	This group contains operational attributes of the *Ca* component.
Mib	Ppp

ATTRIBUTE Ppp Ca managedBandwidthTotal (bwTotal)

Access	Read only
Description	This attribute indicates the total bandwidth for transmitting the network clients' traffic. Its value is equal to the multiplication of link capacity and the provisioned value of *percentBandwidthManaged*.
Mib	Ppp
Values	Decimal (0..4294967295)
Units	kbit/s
Default	No default

ATTRIBUTE Ppp Ca maxBandwidthPool (maxBwPool)

Access	Read only
Description	This attribute indicates the maximum amount of bandwidth allowed for each pool. The value of each pool is equal to the multiplication of *managedBandwidthTotal* and the provisioned value of *percentMaxBandwidthPool*.
Mib	Ppp
Vector of	Decimal (0..4294967295)
Units	kbit/s
Index	Decimal (0..3)
Default	No default

ATTRIBUTE Ppp Ca guaranteedBandwidthPool (gBwPool)

Access	Read only
Description	This attribute indicates the amount of bandwidth guaranteed for each pool. This value is equal to the multiplication of *managedBandwidthTotal* and the provisioned value of *percentGuaranteeBandwidthPool*.

Copyright © 2006, Nortel Nortel Confidential

This is a mandatory subcomponent of *Ppp* and does not need to be added.

Mib	Ppp
Common Verbs	Help List Display

GROUP Ppp Lnk Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *Ppp* Link component.
Mib	Ppp

ATTRIBUTE Ppp Lnk configInitialMru (cimru)

Access	Read and write
Description	This is the initial Maximum Receive Unit (Mru) that the local *Ppp* entity will advertise to the remote entity. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).
Mib	Ppp
Values	Decimal (68..18000)
Units	octets
Default	18000

ATTRIBUTE Ppp Lnk configMagicNumber (cmn)

Access	Read and write
Description	If ***enabled*** the local node will attempt to perform Magic Number negotiation with the remote node. If ***disabled*** this negotiation is not performed. In any event, the local node will comply with any magic number negotiations attempted by the remote node, per the *Ppp* specification. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).
Mib	Ppp
Values	disabled enabled
Default	enabled

ATTRIBUTE Ppp Lnk restartTimer (rtimer)

Access	Read and write
Description	This is the time, in milliseconds, that *Ppp* will wait for a response to a configure request or a terminate request before retrying.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ppp
Values	Decimal (1000..10000)
Units	msec
Default	3000

ATTRIBUTE Ppp Lnk continuityMonitor (cntmon)

Access	Read and write
Description	This attribute turns on/off (***enabled/disabled***) the Link Continuity Monitor. If set to ***enabled***, periodic keep alive echo packet will be sent over the *Ppp* link. If set to ***disabled***, no keep alive packets will be sent. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).
Mib	Ppp
Values	enabled disabled
Default	disabled

ATTRIBUTE Ppp Lnk negativeAckTries (naks)

Access	Read and write
Description	This attribute specifies the maximum negative acknowledgments sent to the remote *Ppp* entity during negotiation before defaulting its configuration parameters.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	10

ATTRIBUTE Ppp Lnk qualityThreshold (quality)

Access	Read and write
Description	This attribute specifies the minimum allowed line quality before the line is considered too poor to continue operation. The value for this attribute is a percentage measure of the line quality given in integers (10 to 99). The higher the value, the more stringent the line requirements.
Mib	Ppp
Values	Decimal (10..99)
Units	%
Default	90

ATTRIBUTE Ppp Lnk qualityWindow (qwindow)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the number of seconds used for sampling line quality. If line quality drops below the level set with the *qualityThreshold* attribute during this window, this instance of *Ppp* will be marked down until line quality recovers.
Mib	Ppp
Values	Decimal (10..400)
Units	seconds
Default	30

ATTRIBUTE Ppp Lnk terminateRequestTries (term)

Access	Read and write
Description	This attribute specifies the maximum terminate requests to be sent, when closing the connection, and not answered before this instance of *Ppp* enters a closing state.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	10

ATTRIBUTE Ppp Lnk configureRequestTries (try)

Access	Read and write
Description	This attribute specifies the number of configuration requests that will be sent out and not answered before this instance of *Ppp* enters a listening state. If both sides enter the listening state then the link will not come up. To eliminate this possibility, this attribute should be set to 1000000000. This will ensure that this end of the *Ppp* link will continue to try until the link is good.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	1000000000

GROUP Ppp Lnk Operational (Oper)

Properties	Operational
Description	This group contains the *Ppp* Link Operational attributes.
Mib	Ppp

ATTRIBUTE Ppp Lnk operState (state)

Access	Read only
Description	This is the operational state of the Link Control Protocol. For more information as to the definition of each state see RFC1331 section 5.3.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ppp
Values	initial starting closed stopped closing stopping reqsent ackrcvd acksent opened
Default	initial

ATTRIBUTE Ppp Lnk lineCondition (lcond)

Access	Read only
Description	This attribute describes the condition of the physical line that *Ppp* is running over. ***ok***: The condition of the line is good. ***looped***: The line is looped back on itself, probably at the remote end. ***noClock***: There is a hardware problem with the line. The cable may not be plugged in correctly. ***badLineCondition***: The quality of the line is below the *qualityThreshold*.
Mib	Ppp
Values	ok looped noClock badLineCondition
Default	ok

ATTRIBUTE Ppp Lnk badAddresses (ba)

Access	Read only
Description	This attribute counts the number of packets received with an incorrect Address Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Lnk badControls (bc)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of packets received on this link with an incorrect Control Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Lnk packetTooLongs (ptl)

Access	Read only
Description	This attribute counts the number of packets received that have been discarded because their length exceeded the Maximum Receive Unit (Mru). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Lnk badFcss (bfcs)

Access	Read only
Description	This attribute counts the number of packets received that have been discarded due to having an incorrect Frame Check Sequence (Fcs). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Lnk localMru (lmru)

Access	Read only
Description	This is the current value of the Maximum Receive Unit (Mru) for the local *Ppp* Entity. This value is the Mru that the remote entity is using when sending packets to the local *Ppp* entity.
Mib	Ppp
Values	Decimal (1..2147483648)
Units	octets
Default	1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp Lnk remoteMru (rmru)

Access	Read only
Description	This is the current value of the Maximum Receive Unit (Mru) for the remote *Ppp* entity. This value is the Mru that the local entity is using when sending packets to the remote *Ppp* entity.
Mib	Ppp
Values	Decimal (1..2147483648)
Units	octets
Default	No default

ATTRIBUTE Ppp Lnk transmitFcsSize (tfcs)

Access	Read only
Description	This is the size of the Frame Check Sequence (Fcs) in bits that the local node will generate when sending packets to the remote node.
Mib	Ppp
Values	Decimal (0..128)
Units	bits
Default	0

ATTRIBUTE Ppp Lnk receiveFcsSize (rfcs)

Access	Read only
Description	This is the size of the Frame Check Sequence (Fcs) in bits that the remote node will generate when sending packets to the local node.
Mib	Ppp
Values	Decimal (0..128)
Units	bits
Default	0

GROUP Ppp Lqm Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *Ppp* Link Quality Monitor component.
Mib	Ppp

ATTRIBUTE Ppp Lqm configPeriod (cfgper)

Access	Read and write
Description	This is the *Lqm* reporting period that the local *Ppp* entity will attempt to negotiate with the remote entity, in units of hundredths of a second. A value of “0” allows the remote *Ppp* entity to determine the reporting period. A value greater than 180,000 (1/2 hour) allows the period to be determined dynamically as a function of the transmit data rate. A value from 1-9 is rounded up to 10 during negotiation. A change to this attribute does not take effect until *Ppp* is restarted (lock/unlock).
Mib	Ppp
Values	Decimal (0..2147483647)
Units	centiseconds
Default	0

ATTRIBUTE Ppp Lqm configStatus (cfgstat)

Access	Read and write
Criticality	Process
Description	If this attribute is ***enabled***, the local node will attempt to perform *Lqm* negotiation with the remote node. If it is ***disabled*** this negotiation is not performed. A change to this attribute will not take effect until *Ppp* is restarted (lock/unlock).
Mib	Ppp
Values	disabled enabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

GROUP Ppp Lqm Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Ppp* Link Quality Monitor component.
Mib	Ppp

ATTRIBUTE Ppp Lqm quality (qual)

Access	Read only
Description	This is the current quality of the link as declared by the local *Ppp* entity's LinkQuality Management modules. A value of ***good*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and *Link quality* is above *LinkQuality Threshold*. A value of ***bad*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and *Link quality* is not above *Link qualityThreshold*. A value of ***notDetermined*** indicates that *LinkQualityMonitor configStatus* is ***enabled*** and the quality of the link has not been calculated yet or *LinkQualityMonitor configStatus* is ***disabled***.
Mib	Ppp
Values	good bad notDetermined
Default	notDetermined

ATTRIBUTE Ppp Lqm inGoodOctets (ingo)

Access	Read only
Description	This attribute counts the number of good octets received. This counter wraps around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Lqm localPeriod (localp)

Access	Read only
Description	This is the *Lqm* reporting period, in hundredths of a second that is in effect for the local *Ppp* entity.
Mib	Ppp
Values	Decimal (1..4294967295)
Units	centiseconds
Default	1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp Lqm remotePeriod (remotep)

Access	Read only
Description	This is the *Lqm* reporting period, in hundredths of a second, that is in effect for the remote *Ppp* entity.
Mib	Ppp
Values	Decimal (1..4294967295)
Units	centiseconds
Default	1

ATTRIBUTE Ppp Lqm outLqrs (outr)

Access	Read only
Description	This attribute counts the number of link quality reports sent out. This counter wraps around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Lqm inLqrs (inr)

Access	Read only
Description	This attribute counts the number of link quality reports received. This counter wraps around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

COMPONENT Ppp NetworkControlProtocol (Ncp)

Groups	GROUP Ppp Ncp IpOperational (IpOper) GROUP Ppp Ncp MplsOperational (MplsOper)
Scope	Application
Description	*Ppp/n NetworkControlProtocol* This component is used to contain all the operational attributes for the *Ppp* Network Control Protocols (*Ncp*). This is a mandatory subcomponent of *Ppp* and does not need to be manually added.
Mib	Ppp
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP Ppp Ncp IpOperational (IpOper)

Properties	Operational
Description	This group contains the Ip Network Control Protocol operational attributes.
Mib	Ppp

ATTRIBUTE Ppp Ncp ipOperState (ipostate)

Access	Read only
Description	This is the operational state of the Ip network protocol. For more information as to the definition of each state see RFC1331 section 5.3.
Mib	Ppp
Values	initial starting closed stopped closing stopping reqsent ackrcvd acksent opened
Default	initial

GROUP Ppp Ncp MplsOperational (MplsOper)

Properties	Operational
Description	This group contains the MPLS Network Control Protocol operational attribute.
Mib	Ppp

ATTRIBUTE Ppp Ncp mplsOperState (mplsostate)

Access	Read only
Description	This attribute indicates the operational states of the MPLS Network Control Protocol. In the initial state the lower layer (LCP in this case) is in a Down state The lower layer is also Down in the starting state where in contrast an administrative Open has been received. When the lower Layer is Up a req-sent is sent to the peer awaiting an ackrcvd. An ack-sent is reached when an ack is sent in reply to the peer ack-req request. An open state is reached when both peers have sent ack-req and received ack-rcvd. Closing is before closed state when waiting for a terminate-ack after sending a terminate-req. The same for stopping and stopped states with the difference that the The Stopping state provides a well defined opportunity to terminate the link before allowing new traffic. (for more information as to the definition of each state see RFC 1331 section 5.3).

Copyright © 2006, Nortel Nortel Confidential

Mib	Ppp
Values	initial starting closed stopped closing stopping reqsent ackrcvd acksent opened
Default	initial

COMPONENT Ppp Framer

Groups	GROUP Ppp Framer Provisioned (Prov) GROUP Ppp Framer OsiState (State) GROUP Ppp Framer Statistics (Stats) GROUP Ppp Framer LinkUtilization (Util) GROUP Ppp Framer DiscardStatistics (Disc)

COLLECTED STATS PointToPointProtocol Framer

Scope	Application
Description	*Ppp/n Framer* *PppIwf/n Framer* The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer* that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute that binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface

Copyright © 2006, Nortel Nortel Confidential

datapath statistics (such as frame counts and aborts).

Mib	Ppp
Common Verbs	Help List Display Add DELete

GROUP Ppp Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	Ppp

ATTRIBUTE Ppp Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the logical processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	Ppp
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP Ppp Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ppp

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ppp
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ppp Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ppp
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Ppp Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib Ppp

Values idle
active (activ)
busy

Default idle

GROUP Ppp Framer Statistics (Stats)

Properties Operational

Description

This group contains the operational statistics data for a *Framer, MlpppFramer or MlpppLink* component.

Mib Ppp

ATTRIBUTE Ppp Framer aborts

Access Read only

Description This attribute counts the total number of aborts received.

For a *MlpppFramer*this will be the sum for all links in the bundle.

Mib Ppp

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Ppp Framer crcErrors

Access Read only

Description This attribute counts the total number of frames with CRC errors.

For a *MlpppFramer*this will be the sum for all links in the bundle.

Mib Ppp

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Ppp Framer lrcErrors

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of frames with LRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Framer nonOctetErrors

Access	Read only
Description	This attribute counts the total number of frames that were non octet aligned. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Framer overruns

Access	Read only
Description	This attribute counts the total number of frames received from the interface for which overruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Framer underruns

Access	Read only
Description	This attribute counts the total number of frames transmitted to the interface for which underruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Framer largeFrmErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of frames received that were too large. The frame exeeceded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Framer octetToIf

Access	Read only
Description	This attribute indicates the number of octets transmitted by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	Ppp
Values	Long Integer
Default	No default

ATTRIBUTE Ppp Framer octetFromIf

Access	Read only
Description	This attribute indicates the number of octets received by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets received by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets received by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	Ppp
Values	Long Integer
Default	No default

ATTRIBUTE Ppp Framer frmFromIf

Access	Read only
Description	This attribute indicates the number of LCP, NCP and Data frames received by the *Framer.*

Copyright © 2006, Nortel Nortel Confidential

	This attribute indicates the number of NCP and Data frames received by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments received by the *MlpppLink.*
Mib	Ppp
Values	Long Integer
Default	No default

ATTRIBUTE Ppp Framer frmToIf

Access	Read only
Description	This attribute indicates the number of LCP, NCP and Data frames transmitted by the *Framer.* This attribute indicates the number of NCP and Data frames transmitted by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments transmitted by the *MlpppLink.*
Mib	Ppp
Values	Long Integer
Default	No default

GROUP Ppp Framer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	Ppp

ATTRIBUTE Ppp Framer normPrioLinkUtilToIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data sent to the interface as a percentage of the available bandwidth of the link (*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	Ppp
Values	Decimal (0..100)
Units	%

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Ppp Framer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data received from the interface as a percentage of the available bandwidth on the link(*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	Ppp
Values	Decimal (0..100)
Units	%
Default	0

GROUP Ppp Framer DiscardStatistics (Disc)

Properties	Operational
Description	This group contains the operational discards statistics for the *Framer/ MlpppFramer* component.
Mib	Ppp

ATTRIBUTE Ppp Framer discCongFrmTolfEp0 (disc0)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 0 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	Ppp
Vector of	Decimal (0..4294967295)
Index	lowPrecedence highPrecedence
Default	No default

ATTRIBUTE Ppp Framer discCongFrmTolfEp1 (disc1)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 1 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	Ppp
Vector of	Decimal (0..4294967295)
Index	lowPrecedence highPrecedence
Default	No default

ATTRIBUTE Ppp Framer discCongFrmTolfEp2 (disc2)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 2 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs. Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	Ppp
Vector of	Decimal (0..4294967295)
Index	lowPrecedence highPrecedence

COLLECTED STATS PointToPointProtocol Framer

Description	The statistics record generated by the PointToPointProtocol Framer component.

ATTRIBUTE Ppp Framer rxBytes

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Ppp Framer rxFrames

Description	This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE Ppp Framer txBytes

Description	This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE Ppp Framer txFrames

Description	This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE Ppp Framer rxTotalLinkUtil

Description	This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.
Values	Decimal (0..100)

COMPONENT Ppp LinkEmissionQueue (Leq)

Groups	GROUP Ppp Leq Provisioned (Prov) GROUP Ppp Leq Statistics (Stats) GROUP Ppp Leq TotalStatistics (TStats) GROUP Ppp Leq CurrentStatistics (CStats) GROUP Ppp Leq ThresholdStatistics (ThrStats)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	*Ppp/n LinkEmissionQueue* This component provides a means of statistics gathering and packet discard.
Mib	Ppp
Common Verbs	Help List Display Add DELete

GROUP Ppp Leq Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *LinkEmissionQueue* component.
Mib	Ppp

ATTRIBUTE Ppp Leq maxPackets (maxP)

Access	Read and write
Description	This attribute specifies the maximum number of packets allowed in the *Leq* before being discarded. If this attribute is set to zero then the maximum number of packets is calculated from the transmit data rate. This calculated value is placed in *queuePktThreshold*.
Mib	Ppp
Values	Decimal (0..2048)
Default	0

ATTRIBUTE Ppp Leq maxMsecData (maxData)

Access	Read and write
Description	This attribute specifies the maximum number of “Milliseconds worth of data” allowed in the *Leq* before packets are discarded. The *queueByteThreshold* will be calculated from this attribute, based on the transmit data rate.
Mib	Ppp
Values	Decimal (100..60000)
Default	10000

ATTRIBUTE Ppp Leq maxPercentMulticast (mpm)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum percentage of multicast packets allowed in the *Leq,* based on *queuePktThreshold*, before being discarded. The calculated value will be placed in *queueMulticastThreshold*.
Mib	Ppp
Values	Decimal (1..100)
Default	50

ATTRIBUTE Ppp Leq timeToLive (ttl)

Access	Read and write
Description	This attribute specifies the “Milliseconds Time To Live” of packets in the *Leq*. If the *timeToLive* of a packet expires, it will be discarded.
Mib	Ppp
Values	Decimal (100..60000)
Units	msec
Default	10000

GROUP Ppp Leq Statistics (Stats)

Properties	Operational
Description	This group contains Link Emission Queue general statistics.
Mib	Ppp

ATTRIBUTE Ppp Leq timedOutPkt (topkt)

Access	Read only
Description	This attribute counts the number of packets that have been discarded due to exceeding the *timeToLive*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq hardwareForcedPkt (hfpkt)

Access	Read only
Description	This attribute counts the number of hardware forced packets on this instance of *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Ppp Leq forcedPktDiscards (fpktd)

Access	Read only
Description	This attribute counts the total number of hardware forced packets that had to be discarded due to link failure. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq queuePurgeDiscards (qpd)

Access	Read only
Description	This attribute counts the total number of packets discarded by a queue purge (i.e. a discarding of all packets on the queue). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

GROUP Ppp Leq TotalStatistics (TStats)

Properties	Operational
Description	This group contains Link Emission Queue total statistics.
Mib	Ppp

ATTRIBUTE Ppp Leq totalPktHandled (tpkthand)

Access	Read only
Description	This attribute counts the total number of packets handled by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq totalPktForwarded (tpktfor)

Access	Read only
Description	This attribute counts the total number of packets forwarded by the *Leq*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq totalPktQueued (tpktq)

Access	Read only
Description	This attribute counts the total number of packets that required queuing by the *Leq* due to transmit congestion. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq totalMulticastPkt (tmulp)

Access	Read only
Description	This attribute counts the total number of multicast packets handled by this instance of *Ppp*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq totalPktDiscards (tpktdis)

Access	Read only
Description	This attribute counts the total number of packets that were discarded for this instance of *Ppp*. This is the sum of *timedOutPkt*, *forcedPktDiscards*, *queuePurgeDiscards*, *pktThresholdExceeded*, *byteThresholdExceeded*, *mulThresholdExceeded,* and *memThresholdExceeded*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

GROUP Ppp Leq CurrentStatistics (CStats)

Properties	Operational
Description	This group contains Link Emission Queue current statistics.
Mib	Ppp

ATTRIBUTE Ppp Leq currentPktQueued (cpktq)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the current number of packets queued.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq currentBytesQueued (cbytesq)

Access	Read only
Description	This attribute counts the current number of bytes queued.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq currentMulticastQueued (cmulq)

Access	Read only
Description	This attribute counts the current number of multicast packets in the queue.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

GROUP Ppp Leq ThresholdStatistics (ThrStats)

Properties	Operational
Description	This group contains Link Emission Queue threshold statistics.
Mib	Ppp

ATTRIBUTE Ppp Leq queuePktThreshold (qpthr)

Access	Read only
Description	This attribute is the maximum number of packets that can be contained in the queue before being discarded. If *maxPackets* was set to 0 then this attribute will contain the value that has been calculated based on the transmit data rate. If *maxPackets* was set to one or more than this attribute will contain that number.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq pktThresholdExceeded (pthrx)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of packets discarded due to the *queuePktThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq queueByteThreshold (qbytethr)

Access	Read only
Description	This attribute is the maximum number of bytes allowed in the queue based on *maxMsecData* and the transmit data rate.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq byteThresholdExceeded (bthrx)

Access	Read only
Description	This attribute counts the number of packets discarded due to the *queueByteThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq queueMulticastThreshold (qmolthr)

Access	Read only
Description	This attribute is the number of multicast packets allowed in the queue based on *maxPercentMulticast* and *maxPackets*.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq mulThresholdExceeded (multhrx)

Access	Read only
Description	This attribute counts the number of packets discarded due to the *queueMulticastThreshold* being exceeded. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp Leq memThresholdExceeded (memthrx)

Access	Read only
Description	This attribute counts the number of packets discarded due to exceeding the memory usage threshold for *Leq*. The memory usage threshold is determined by the *Leq* software, guaranteeing that the *Leq* does not consume all of the memory. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	Ppp
Values	Decimal (0..4294967295)
Default	0

COMPONENT Ppp MlpppFramer (MlFramer)

Groups	GROUP Ppp MlFramer Provisioned (Prov) GROUP Ppp MlFramer OsiState (State) GROUP Ppp MlFramer Statistics (Stats) GROUP Ppp MlFramer LinkUtilization (Util) GROUP Ppp MlFramer DiscardStatistics (Disc) GROUP Ppp MlFramer MlpppFramerOper (Oper) GROUP Ppp MlFramer MlpppFramerStatistics (MlStats)

COLLECTED STATS PointToPointProtocol MlpppFramer

Scope	Application
Description	*Ppp/n MlpppFramer* *PppIwf/n MlpppFramer* The *MlpppFramer* component contains a group of links representing a Multilink Point To Point Protocol (MLPPP) Bundle, as describe in RFC 1990. This component contains provisionable and operational atributes that represent the MLPPP Bundle.

Opt. Subcomp.	COMPONENT Ppp MlFramer MlpppLink (Lk)
Common Verbs	Help List Display Add DELete

Copyright © 2006, Nortel Nortel Confidential

GROUP Ppp MlFramer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *MlpppFramer* component.
Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer fragmentSize (fragSize)

Access	Read and write
Description	This attribute specifies the maximum fragment size in octets for the payload. The fragment size does not include the 8 octets of MLPPP Header, or the 4 octets for FCS. When the value of this attribute is set to ***no***, NCP and Data frames transmitted to the interface will not be fragmented. When the value of this attribute is not equal to ***no***, all NCP and Data frames transmitted to the interface will be divided in data fragments which are sent over different links in a bundle. During LCP configuration if the *remoteMru* is less than the provisioned *fragmentSize*, LCP will send a Configure-Nak for the MRU with a value of 1500 bytes. The fragment size is configured for the local bundle. The fragment size of the remote bundle does not need be the same.
Mib	PppMlFramer
Values	Decimal (48; 96; 144; 192; 240; 288; 336; 384; 432; 480) no
Units	octets
Default	no

ATTRIBUTE Ppp MlFramer ep0Treatment

Access	Read and write
Criticality	Process
Description	This attribute specifies the handling of egress frames sent at Emission Priority (EP) 0. If a value of ***normal*** is specified then frames sent on EP0 will be fragmentented according to the fragmentSize attribute. If a value of ***doNotFragment*** is specified then frames sent on EPO will not be fragmented but the MLPPP Header will still be prepended to the frame.

Copyright © 2006, Nortel Nortel Confidential

If the value of ***noMlpppHeader*** is specified then the frames sent to EP0 will not be fragmented and the MLPPP Header will not be prepended to the frame. When this value is used misordering can occur.

Mib	PppMlFramer
Values	normal doNotFragment noMlpppHeader
Default	normal

ATTRIBUTE Ppp MlFramer configMrru (cmrru)

Access	Read and write
Criticality	Process
Description	This attribute specifies the Maximum Receive Reconstructed Unit (MRRU) that the local MLPPP bundle will advertise to the remote entity. This value includes 8 bytes for the MLPPP header, and an additional 2 bytes for the protocol field of the payload.
Mib	PppMlFramer
Values	Decimal (68..9204)
Units	octets
Default	1524

ATTRIBUTE Ppp MlFramer endpointDiscriminator (epd)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the endpoint discriminator is used during the configuration phase of a link. If the value of ***noEndpointDisc*** is specified the endpoint discriminator is not included during Link Control Protocol(LCP) negotiation. If the value ***local*** is specified the endpoint discriminator option is included during LCP negotiation. The value consists of the system's node name appended with the *Ppp/Piwf* interface component name and instance number.
Mib	PppMlFramer
Values	noEndpointDisc local
Default	local

GROUP Ppp MlFramer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	PppMlFramer
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ppp MlFramer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	PppMlFramer
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Ppp MlFramer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	PppMlFramer
Values	idle active (activ) busy
Default	idle

GROUP Ppp MlFramer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a *Framer, MlpppFramer or MlpppLink* component.
Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer aborts

Access	Read only
Description	This attribute counts the total number of aborts received. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer crcErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of frames with CRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer lrcErrors

Access	Read only
Description	This attribute counts the total number of frames with LRC errors. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer nonOctetErrors

Access	Read only
Description	This attribute counts the total number of frames that were non octet aligned. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer overruns

Access	Read only
Description	This attribute counts the total number of frames received from the interface for which overruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer underruns

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of frames transmitted to the interface for which underruns occurred. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer largeFrmErrors

Access	Read only
Description	This attribute counts the total number of frames received that were too large. The frame exeeceded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit. For a *MlpppFramer*this will be the sum for all links in the bundle.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer octetToIf

Access	Read only
Description	This attribute indicates the number of octets transmitted by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppFramer* for only NCP and Data frames. This attribute indicates the number of octets transmitted by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Ppp MlFramer octetFromIf

Access	Read only
Description	This attribute indicates the number of octets received by the *Framer* for LCP, NCP and Data frames. This attribute indicates the number of octets received by the *MlpppFramer* for only NCP and Data frames.

Copyright © 2006, Nortel Nortel Confidential

	This attribute indicates the number of octets received by the *MlpppLink* for LCP frames, and NCP and Data frames or fragments.
Mib	PppMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Ppp MlFramer frmFromIf

Access	Read only
Description	This attribute indicates the number of LCP, NCP and Data frames received by the *Framer.* This attribute indicates the number of NCP and Data frames received by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments received by the *MlpppLink.*
Mib	PppMlFramer
Values	Long Integer

ATTRIBUTE Ppp MlFramer frmToIf

Access	Read only
Description	This attribute indicates the number of LCP, NCP and Data frames transmitted by the *Framer.* This attribute indicates the number of NCP and Data frames transmitted by the *MlpppFramer.* This attribute indicates the number of LCP frames, and NCP and Data frames or frragments transmitted by the *MlpppLink.*
Mib	PppMlFramer
Values	Long Integer
Default	No default

GROUP Ppp MlFramer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	PppMlFramer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp MlFramer normPrioLinkUtilToIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data sent to the interface as a percentage of the available bandwidth of the link (*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	PppMlFramer
Values	Decimal (0..100)
Units	%
Default	0

ATTRIBUTE Ppp MlFramer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute indicates the utilization of the normal priority data received from the interface as a percentage of the available bandwidth on the link(*Framer*) or the MLPPP Bundle (*MlpppFramer*). The utilization is the average for the last minute.
Mib	PppMlFramer
Values	Decimal (0..100)
Units	%
Default	0

GROUP Ppp MlFramer DiscardStatistics (Disc)

Properties	Operational
Description	This group contains the operational discards statistics for the *Framer/ MlpppFramer* component.
Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer discCongFrmToIfEp0 (disc0)

Access	Read only
Description	This attribute indicates the number of egress frames discarded due to congestion for emission priority queue 0 and each discard priority. Frames with a lowPrecedence (low drop precedence) are least likely to be be discarded when congestion occurs.

Copyright © 2006, Nortel Nortel Confidential

	Frames with a highPrecedence (high drop precedence) are most likely to be be discarded when congestion occurs.
Mib	PppMlFramer
Vector of	Decimal (0..4294967295)

Default	No default

GROUP Ppp MlFramer MlpppFramerOper (Oper)

Properties	Operational
Description	This group contains the operational data for the *MlpppFramer* component.
Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer localMrru (lmrru)

Access	Read only
Description	This attribute indicates the negotiated value of the Maximum Receive Reconstructed Unit (MRRU) for the local MLPPP bundle. This value is the MRRU that the remote entity is using when sending packets to the local MLPPP Bundle. This value includes 8 bytes for the MLPPP header, and an additional 2 bytes for the protocol field of the payload.
Mib	PppMlFramer
Values	Decimal (1..18000)
Units	octets
Default	No default

ATTRIBUTE Ppp MlFramer remoteMrru (rmrru)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current Maximum Receive Reconstructed Unit (MRRU) for the remote MLPPP bundle. This value is the MTU that the local entity is using when sending packets to the remote MLPPP Bundle. This value includes 8 bytes for the MLPPP header, and an additional 2 bytes for the protocol field of the payload.
Mib	PppMlFramer
Values	Decimal (1..18000)
Units	octets
Default	No default

ATTRIBUTE Ppp MlFramer localEndpointDiscriminator (lepd)

Access	Read only
Description	This attribute indicates the end point disciminator of the local bundle.
Mib	PppMlFramer
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Ppp MlFramer remoteEndpointDiscriminator (repd)

Access	Read only
Description	This attribute indicates the end point disciminator of the remote bundle, as it was received from the first successfully negotiated link.
Mib	PppMlFramer
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Ppp MlFramer expectedSequenceNumber (esn)

Access	Read only
Description	This attribute indicates the expected sequence number of the next MLPPP frsme received from the link. The attribute is set to the sequence number of the last fragment received plus one.
Mib	PppMlFramer
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Ppp MlFramer sentSequenceNumber (ssn)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the sequence number of the next MLPPP frame to be sent to the link.
Mib	PppMlFramer
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Ppp MlFramer bundleSpeed

Access	Read only
Description	This attribute indicates the aggregate speed of all enabled *MlpppLinks* under the *MlpppFramer*.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

GROUP Ppp MlFramer MlpppFramerStatistics (MlStats)

Properties	Operational
Description	This group contains the statistical attributes of the *MlpppFramer* component.
Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer discardedFrmFromIf

Access	Read only
Description	This attribute indicates the number of frames that have been received by a *MlpppLink* but are discarded by the MLPPP Bundle. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Ppp MlFramer sequencingErrors

Access	Read only
Description	This attribute indicates the number of sequencing errors detected on a MLPPP Bundle. A sequencing error occurs when one or more MLPPP frames are determined to be lost.

Copyright © 2006, Nortel Nortel Confidential

This counter will wrap around to 0 when it exceeds its maximum count.

Mib PppMlFramer

Values Long Integer

Default No default

ATTRIBUTE Ppp MlFramer mrruExceededErrors

Access Read only

Description This attribute indicates the number of times a reassembled packet exceeded the *localMrru* value of an MLPPP Bundle.

This counter will wrap around to 0 when it exceeds its maximum count.

Mib PppMlFramer

Values Long Integer

Default No default

COLLECTED STATS PointToPointProtocol MlpppFramer

Description The statistics record generated by the PointToPointProtocol MlpppFramer component.

ATTRIBUTE Ppp MlFramer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE Ppp MlFramer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE Ppp MlFramer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE Ppp MlFramer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp MlFramer rxTotalLinkUtil

Description	This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.
Values	Decimal (0..100)

GROUP Ppp MlFramer Lk OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer Lk adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	PppMlFramer
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Ppp MlFramer Lk operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: PppMlFramer

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Ppp MlFramer Lk usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: PppMlFramer

Values: idle
active (activ)
busy

Default: idle

GROUP Ppp MlFramer Lk Statistics (Stats)

Properties: Operational

Description

This group contains the operational statistics data for a *Framer, MlpppFramer or MlpppLink* component.

Mib: PppMlFramer

ATTRIBUTE Ppp MlFramer Lk aborts

Access: Read only

Description: This attribute counts the total number of aborts received.

For a *MlpppFramer*this will be the sum for all links in the bundle.

Mib: PppMlFramer

GROUP Ppp MlFramer Lk LinkOperational (Lnk)

Properties	Operational
Description	This group contains the Link Control Protocol operational attributes for the *MlpppLink/n*.

Copyright © 2006, Nortel Nortel Confidential

Mib	PppMlFramer

ATTRIBUTE Ppp MlFramer Lk **lcpState (state)**

Access	Read only
Description	This attribute indicates the operational state of the Link Control Protocol. The ***initial*** state, the link is unavailable (disabled), and no Open has occurred. The ***starting*** state LCP is has been initialized, but the link is unavailable (disabled). In the ***closed*** state, the link is available (enabled), but no Open has occurred. In the ***stopped*** state LCP is waiting for a Down event after the This-Layer-Finished action, or after sending a Terminate-Ack. In the ***closing*** state, an attempt is made to terminate the connection. A Terminate-Request has been sent a but a Terminate-Ack has not been received. In the ***stopping*** state a Terminate-Request has been sent and the Restart timer is running, but a Terminate-Ack has not yet been received. In the request sent (***reqsent***) state an attempt is made to configure the connection. A Configure-Request has been sent and the Restart timer is running, but a Configure-Ack has not yet been received nor has one been sent. In the ack received (***ackrcvd***) state, a Configure-Request has been sent and a Configure-Ack has been received. In the ack sent (***acksent***) state, a Configure-Request and a Configure-Ack have both been sent, but a Configure-Ack has not yet been received. The Restart timer is running, since a Configure-Ack has not yet been received. In the ***opened*** state, a Configure-Ack has been both sent and received. For more information as to the definition of each state see RFC1331 section 5.3.

ATTRIBUTE Ppp MlFramer Lk lineCondition (lcond)

Access	Read only
Description	This attribute indicates the condition of the physical line that the Link Control Protocol is running over. ***ok***: The condition of the line is good. ***looped***: The line is looped back on itself, probably at the remote end. ***misconfigured***: The value of the remote MRRU or Endpoint Discriminator in the LCP configuration request does not match the operational value of the *MlpppFramer remoteMrru* or *remoteEndpointDiscriminator* attibutes. ***noClock***: There is a hardware problem with the line. The cable may not be plugged in correctly. ***badLineCondition***: The quality of the line is below the *Ppp/n Lnk qualityThreshold*.
Mib	PppMlFramer
Values	ok looped misconfigured noClock badLineCondition
Default	ok

ATTRIBUTE Ppp MlFramer Lk badAddress (ba)

Access	Read only
Description	This attribute indicates the number of packets received with an incorrect Address Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than PPP. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer Lk badControl (bc)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of packets received on this link with an incorrect Control Field. If this count is going up quickly, it could indicate that there is a line quality problem or that the remote end is transmitting a protocol other than PPP. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer Lk packetTooLong (ptl)

Access	Read only
Description	This attribute indicates the number of packets received that have been discarded because their length exceeded the Maximum Receive Unit (MRU). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer Lk badFcs (bfcs)

Access	Read only
Description	This attribute indicates the number of packets received that have been discarded due to having an incorrect Frame Check Sequence (FCS). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	PppMlFramer
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Ppp MlFramer Lk localMru (lmru)

Access	Read only
Description	This attribute indicates the current value of the Maximum Receive Unit (MRU) for the local *MlpppLink* Entity. This value is the MRU that the remote entity is using when sending packets to the local *MlpppLink* entity.
Mib	PppMlFramer
Values	Decimal (1..18000)
Units	octets

Copyright © 2006, Nortel Nortel Confidential

Default	1

ATTRIBUTE Ppp MlFramer Lk remoteMru (rmru)

Access	Read only
Description	This attribute indicates the current value of the Maximum Receive Unit (MRU) for the remote *MlpppLink* entity. This value is the MRU that the local entity is using when sending packets to the remote *MlpppLink* entity.
Mib	PppMlFramer
Values	Decimal (1..18000)
Units	octets
Default	No default

ATTRIBUTE Ppp MlFramer Lk transmitFcsSize (tfcs)

Access	Read only
Description	This attribute indicates the size of the Frame Check Sequence (Fcs) in bits that the local node will generate when sending packets to the remote node.
Mib	PppMlFramer
Values	Decimal (0..128)
Units	bits
Default	0

ATTRIBUTE Ppp MlFramer Lk receiveFcsSize (rfcs)

Access	Read only
Description	This attribute indicates the size of the Frame Check Sequence (FCS) in bits that the remote node will generate when sending packets to the local node.
Mib	PppMlFramer
Values	Decimal (0..128)
Units	bits
Default	0

GROUP Ppp MlFramer Lk LqmOperational (Lqm)

Properties	Operational
Description	This group contains the Link Quality Monitor operational attributes for the *MlpppLink*.
Mib	PppMlFramer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp MlFramer Lk **quality (qual)**

Access	Read only
Description	This attribute indicates the current quality of the link. A value of ***good*** indicates that *Ppp/n LinkQualityMonitor configStatus* is ***enabled*** and link quality is above *Ppp/n Lnk linkQuality Threshold*. A value of ***bad*** indicates that *Ppp/n LinkQualityMonitor configStatus* is ***enabled*** and and link quality is not above *Ppp/n Lnk linkQuality Threshold*. A value of ***notDetermined*** indicates that either the *Ppp/n LinkQualityMonitor configStatus* is ***enabled*** and the quality of the link has not been calculated yet, or the *Ppp/n LinkQualityMonitor configStatus* is ***disabled***.
Mib	PppMlFramer
Values	good bad notDetermined
Default	notDetermined

ATTRIBUTE Ppp MlFramer Lk **inGoodOctets (ingo)**

Access	Read only
Description	This attribute indicates the number of good octets received. This counter wraps around to 0 when it exceeds its maximum count.
Mib	PppMlFramer
Values	Long Integer
Default	No default

ATTRIBUTE Ppp MlFramer Lk **localPeriod (localp)**

Access	Read only
Description	This attribute indicates the *Ppp/n Lqm* reporting period, in hundredths of a second that is in effect for the local link.
Mib	PppMlFramer
Values	Decimal (1..4294967295)
Units	centiseconds
Default	1

COMPONENT Ppp MlFramer Lk Override (Ov)

Groups	GROUP Ppp MlFramer Lk Ov LinkControlProtocol (Lcp) GROUP Ppp MlFramer Lk Ov LinkQualityMonitor (Lqm)
Scope	Application
Description	*Ppp/n MlFramer Lk/n Override* *Piwf/n MlFramer Lk/n Override* This component contains all the attributes related to the *MlpppLink Override* component. When added the provisioned values for the Link Control Protocol (*Ppp/Piwf Lnk)*, and the Link Quality Monitor (*Ppp/Piwf Lqm*) will be overriden for this particular *MlpppLink* instance.

Copyright © 2006, Nortel Nortel Confidential

This is an optional subcomponent of *MlpppLink*.

Mib: PppMlFramer

Common Verbs: Help, List, Display, Add, DELete

GROUP Ppp MlFramer Lk Ov LinkControlProtocol (Lcp)

Properties: Provisioned

Description: This group contains the override attributes for the Link Control Protocol.

These attributes will override the value provisioned under the *Ppp Link* or *Piwf Link* component.

Mib: PppMlFramer

ATTRIBUTE Ppp MlFramer Lk Ov configInitialMru (cimru)

Access: Read and write

Description: This is the initial Maximum Receive Unit (Mru) that the local *MlpppLink* entity will advertise to the remote entity.

When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.

A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).

Mib: PppMlFramer

Values: Decimal (68..18000)
sameAsLnk

Units: octets

Default: sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov configMagicNumber (cmn)

Access: Read and write

Description: If ***enabled*** the local node will attempt to perform Magic Number negotiation with the remote node.

If ***disabled*** this negotiation is not performed.

In any event, the local node will comply with any magic number

Copyright © 2006, Nortel Nortel Confidential

negotiations attempted by the remote node, per the Ppp specification.

When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.

A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).

Mib: PppMlFramer

Values:
disabled
enabled
sameAsLnk

Default: sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov restartTimer (rtimer)

Access: Read and write

Description: This is the time, in milliseconds, that *MlpppLink* will wait for a response to a configure request or a terminate request before retrying.

Mib: PppMlFramer

Values:
Decimal (1000..10000)
sameAsLnk

Units: msec

Default: sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov continuityMonitor (cntmon)

Access: Read and write

Description: This attribute turns on/off (***enabled/disabled***) the Link Continuity Monitor.

If set to ***enabled***, periodic keep alive echo packet will be sent over the *MlpppLink*.

If set to ***disabled***, no keep alive packets will be sent.

When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.

A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).

Mib: PppMlFramer

Values:
enabled
disabled
sameAsLnk

Default	sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov **negativeAckTries (naks)**

Access	Read and write
Description	This attribute specifies the maximum negative acknowledgments sent to the remote *MlpppLink* entity during negotiation before defaulting its configuration parameters. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppMlFramer
Values	Decimal (0..4294967294) sameAsLnk
Default	sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov **qualityThreshold (quality)**

Access	Read and write
Description	This attribute specifies the minimum allowed line quality before the line is considered too poor to continue operation. The value for this attribute is a percentage measure of the line quality given in integers (10 to 99). The higher the value, the more stringent the line requirements. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppMlFramer
Values	Decimal (10..99) sameAsLnk
Units	%
Default	sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov **qualityWindow (qwindow)**

Access	Read and write
Description	This attribute specifies the number of seconds used for sampling line quality. If line quality drops below the level set with the *Ppp Lnk qualityThreshold* attribute during this window, this instance of *MlpppLink* will be marked down until line quality recovers. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.

Copyright © 2006, Nortel Nortel Confidential

Mib	PppMlFramer
Values	Decimal (10..400) sameAsLnk
Units	seconds
Default	sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov terminateRequestTries (term)

Access	Read and write
Description	This attribute specifies the maximum terminate requests to be sent, when closing the connection, and not answered before this instance of *MlpppLink* enters a closing state. When set to ***sameAsLnk***, this attribute is not override and the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppMlFramer
Values	Decimal (0..4294967294) sameAsLnk
Default	sameAsLnk

ATTRIBUTE Ppp MlFramer Lk Ov configureRequestTries (try)

Access	Read and write
Description	This attribute specifies the number of configuration requests that will be sent out and not answered before this instance of *MlpppLink* enters a listening state. If both sides enter the listening state then the link will not come up. When set to ***sameAsLnk*** the value provisioned under *Ppp/Piwf Lnk* component will be used.
Mib	PppMlFramer
Values	Decimal (0..4294967294) sameAsLnk
Default	sameAsLnk

GROUP Ppp MlFramer Lk Ov LinkQualityMonitor (Lqm)

Properties	Provisioned
Description	This group contains the override attributes for the Link Quality Monitor. These attributes will override the value provisioned under the *Ppp Lqm* or *Piwf Lqm* component.
Mib	PppMlFramer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Ppp MlFramer Lk Ov configPeriod (cfgper)

Access	Read and write
Description	This attribute specifies the Link Quality Monitor's reporting period that the local *MlpppLink* entity will attempt to negotiate with the remote entity, in units of hundredths of a second. A value of "0" allows the remote *Mlppp* entity to determine the reporting period. A value greater than 180,000 (1/2 hour) allows the period to be determined dynamically as a function of the transmit data rate. A value from 1-9 is rounded up to 10 during negotiation. When set to ***sameAsLqm*** the value provisioned under *Ppp/Piwf Lnk* component will be used. A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).
Mib	PppMlFramer
Values	Decimal (0..2147483647) sameAsLqm
Units	centiseconds
Default	sameAsLqm

ATTRIBUTE Ppp MlFramer Lk Ov configStatus (cfgstat)

Access	Read and write
Description	If this attribute is ***enabled***, the local node will attempt to perform *Lqm* negotiation with the remote node. If it is ***disabled*** this negotiation is not performed. When set to ***sameAsLqm*** the value provisioned under *Ppp/Piwf Lnk* component will be used. A change to this attribute will not take effect until the physical port specified by the *MlpppLink interfaceName* attribute becomes ***disabled*** (*lock/unlock*).
Mib	PppMlFramer

VERB ACTivate Prov

Impact: Service

Description:

Activate [-file(<file name>)] [-force] [-noPause] Prov
This verb is used to activate (or bring into service) the provisioning data changes in the edit view or from a specified provisioning data file.

After activation completes, the operator must issue a *Confirm* command in order to prevent automatic re-activation of the committed view. Note that the committed view is not necessarily the same as the view which was in effect prior to the activation.

Options:
-file (<file name>)
specifies the name of a file containing provisioning data to be loaded, checked and activated. Note that only this form of the activate verb is allowed outside of provisioning mode.

The *file name* argument has the form
name[.type[.number]]
where *name* is the name of the file; *type* must be ***full***; and *number* is the unique sequence number of the file.

The *name* part of the argument must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores. Note that file names are case-sensitive. If *number* is omitted, the most recent file beginning with *name.type* will be used; if both *type* and *number* are omitted, the most recent (complete) file beginning with *name.**full*** will be used.

-force
When a complete provisioning view is activated, the provisioning system checks to make sure that all the software necessary to activate the components contained in the view is currently running on the module. If any necessary software is missing, the *Activate* command fails and a list of missing software is displayed. The *-force* option overrides the checks for required software, and causes the file to be loaded and activated by reloading the module with this provisioning data file.

When an unchecked provisioning view is being activated, the provisioning system runs a semantic *check* to issue errors and warnings. Some warnings are considered critical. For example, a service may have to be restarted in order to activate the specified provisioning data change, or a complete system restart may be required. If a semantic check error or critical warning occurs, the *activate* command is aborted. The *-force* option overrides the critical warnings, and activates the changes regardless. Note that semantic check errors can not be overridden.

In addition, if the journaled current view can be restored, then the *Activate Prov* command may cause the journaled current view to be purged, and a

Copyright © 2006, Nortel Nortel Confidential

restore to be no longer possible. In this case, the -*force* option is required for the activation to proceed. Note that a restore is only possible if the attribute *restorePossible* is set to ***yes***.

-noPause
A staged software migration may enter a paused state if certain events occur. These events include software and hardware alarms on the migration shelf, provisioning data that is nacked, and the failure of an application to indicate that it is ready for the migration switchover. Once a software migration is paused, the user must issue the *Continue* command to unpause it.

The -noPause option indicates that the migration is never paused, even if a pausable event occurs.

-pause
A staged software migration is going to enter a paused state. Once a software migration is paused, the user must issue the *Continue* command to unpause it.

The -noPause and -pause Options are mutually exclusive.

VERB Check Prov

Impact: Configuration

Description: *Check [-stopOnError][-component (<name>) [-nonrecursive]] [-changed] Prov*

This verb checks the provisioning data in the edit view to ensure it is semantically correct. A view cannot be activated until this check has been successfully completed.

If the semantic check fails, all errors must be corrected before an activation attempt will succeed.

Options:
-stopOnError
This option specifies that the check should be aborted immediately upon finding the first error. If this option is not specified, the system will abort after five (or more) errors have been detected.

-component(<name>)
This option specifies that the named component and all its

Copyright © 2006, Nortel Nortel Confidential

subcomponents (recursively) are to be checked for semantic correctness. That is, the entire subtree, rooted at the named component will be checked. If this option is not specified, the entire edit view is checked.

-nonrecursive
This option specifies that only the named component (that is, none of its subcomponents) is to be checked for semantic correctness.

-changed
This option specifies that checks will only be run on added or changed components. Note that this may mean that not all required checks will run. This option is not valid when the -*component* option is used.

VERB CLEAR Prov

Impact: System_admin

Description:

Clear [-removedFeature] Prov
This verb, when used with no options, will remove all deletable components (and their subcomponents) from the edit view. Components which cannot be deleted (and their subcomponents) are not affected.

Options:
-removedFeature
This option is typically used in conjunction with previously having removed one or more features from one or more LPTs. This option specifies that all components, both deletable and non-deletable, which will have their associated software unloaded from the switch, are to be removed from the edit view by the provisioning system.

VERB COMMIT Prov

Impact: Service

Description:

Commit [-file(<file name>)] [-force] Prov
Commit makes the current view of the provisioning data the “committed” view. The committed view is the configuration that the module will activate following a Control Processor reset.

If the command specifies a filename, *Commit* will save the data for the current view in that file. If the current view has not been saved, the filename must be specified.

Note: in a system having two disks, the disks must be synchronized before the *commit* command will be accepted.

Options:
-file(<file name>)
specifies the name of the output file (actually the prefix for the output file name, as explained below) to be used for saving the current view data. If this option is not specified, the data for the current view must have already been saved, otherwise an error response will be generated.

Copyright © 2006, Nortel Nortel Confidential

The *file name* argument must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores. File names are case-sensitive.

The actual file name used for the saved data has the form *name*.full.*number*
where *name* is the name specified in the *-file* option; and *number* is a unique sequence number for the file generated by the provisioning system.

-force
If the journaled current view can be restored, then the *Commit Prov* command will cause the journaled current view to be purged, and a restore will no longer be possible. In this case, the *-force* option is required for the *commit prov* command to proceed. Note that a restore is only possible if the attribute *restorePossible* is set to ***yes***.

VERB Confirm Prov

Impact: Service

Description:

Confirm Prov
A *Confirm* command must be issued following each *Activate* command. This ensures that management connectivity has not been lost when a new provisioning view is brought into service.

If a *Confirm* is not entered within a reasonable time following an *Activate*, a system restart will occur and the committed view will be re-activated by the system. Service will be disrupted while the restart is in progress.

VERB Copy Prov

Impact: Configuration

Description:

Copy [-source(<component name>) [-current] [-nonrecursive] [-destination(<component name>)]]Prov
This verb is used to copy all or part of a view into the edit view.

If no options are provided, the entire current view is copied into the edit view, replacing whatever was in the edit view previously, so that the two views are identical afterward.

Options:
-source(<component name>)
specifies that only the named component and its subcomponents are to be copied. If any of these components already exist in the edit view, the copy fails and the edit view is unchanged. When *-source* is the only option specified, the system automatically copies the component and its subcomponents, if any, from the current view into the edit view.

-current
specifies that components are to be copied from the current view to the edit view, rather than being copied from the edit view.

Copyright © 2006, Nortel Nortel Confidential

-nonrecursive
This option is valid only if the *-source* option is also present. It specifies that the named *source* component (but not its subcomponents) should be copied. If, however, the copied component has “required” subcomponents, the default instances of these “required” subcomponents are always created. (This is similar to the behavior of the *Add* command.)

-destination(<component name>)
specifies the name to be given to the copy of the *source* component when it is put into the edit view. Any copied subcomponents of the *source* component will be likewise renamed in the edit view. If any renamed component already exists in the edit view, the copy fails and the edit view is unchanged.

VERB End Prov

Impact: Configuration

Description:

End Prov
This verb is used to leave provisioning mode.

The edit view is unchanged by this command. The edit view is not automatically saved on disk; it will be presented to the next provisioning operator as it was when the *End* command was executed.

VERB Load Prov

Impact: Configuration

Description:

Load [-force] -file(<file name>) Prov
This verb is used to load a specified file of provisioning data from the disk into the edit view.

Options:
-file (<file name>)
specifies the name of the file containing the provisioning data to be loaded.The *file name* argument has the form
name[.type[.number]]
where *name* is the name of the file; *type* is either ***full*** if the file contains a complete view, or ***part*** if the file contains only a particular component (and its subcomponents); and *number* is the unique sequence number of the file.

The *name* part of the argument must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores. Note that file names are case-sensitive. If *number* is omitted, the most recent file beginning with *name.type* will be used; if both *type* and *number* are omitted, the most recent (complete) file beginning with *name.**full*** will be used.

-force
Normally, when a complete provisioning view is loaded, the provisioning system checks to make sure that all the software necessary to activate the

Copyright © 2006, Nortel Nortel Confidential

components contained in the view is currently running on the module. If any necessary software is missing, the *Load* command fails and a list of missing software is displayed.

The *-force* option overrides the checks for required software; that is, it causes the file to be loaded regardless of what software is currently running. When this option is used, error messages and software alarms may appear during loading of the file, and some components which are present in the file may be missing from the edit view when loading is complete.

The *-force* option also ensures the system processes the entire provisioning file rather than stopping after 5 errors.

VERB Save Prov

Impact — Configuration

Description

Save [-current] [-file(<file name>)]
[-component(<component name>)]
[-ascii] [-portable] Prov
This verb is used to save all or part of a provisioning view on the disk.

If no options are provided, the entire edit view is saved, using a default file name (see the description of the *-file* option below).

Options:
-current
specifies that the provisioning data of the current view is to be saved. If this option is not specified, the data of the edit view is saved.

-file(<file name>)
This option specifies the name of the output file (actually the prefix for the output file name, as explained below). The name must be between 1 and 31 characters in length, and may contain only alphanumeric characters and underscores.

The actual file name used for the saved data has the form
name.type.number
where *name* is the name specified in the *-file* option; *type* is automatically set to ***full*** if the file contains a complete view, or ***part*** otherwise; and *number* will be a unique sequence number for the file, generated by the provisioning system.

If the *-file* option is not specified, the *name* used in the most recent *Save*, *Load* or *Commit* command involving a complete view is used to construct the output file name as described above.

-component(<component name>)
This option specifies a particular component to be saved; the named component must be provisionable. Only this component and its subcomponents will appear in the saved provisioning data.

Copyright © 2006, Nortel Nortel Confidential

When this option is used, the *-file* option must also be specified; the name of the saved file will always have the form *name.**part**.number*

-ascii
This option is used to force the system to write a file in ASCII format. This format is not required by the switch itself, but a file in this format may be used by external tools.

-portable
This option forces the system to write a complete file to disk. The ***portable*** format may at times be automatically generated when needed and the user would not normally be required to use this option. One reason to use this option is that the ***portable*** format is one complete unit (not dependent on any other view) and may be backed up, while the ***delta*** format has dependencies on the current view when saved.

If the *-ascii*, *-component* and *-portable* options are not specified, the system will save the differences between the edit and current views in the ***delta*** format.

VERB Start (St) **Prov**

Impact: Configuration

Description:

Start [-force] Prov
This verb is used to enter the provisioning mode. Only one operator session can be in provisioning mode at a given time. Therefore a *Start* command is normally rejected if another session is in provisioning mode.

Options:
-force
This option allows an operator with at least ***systemAdministration*** impact to enter provisioning mode even when another operator's session is already in provisioning mode. A user with configuration impact uses the force option to take over a provisioning session he/she has opened in another NMIS session.

The other operator's session is forced out of provisioning mode, after completing any commands in progress. A message alarm is generated to indicate that the other session is no longer in provisioning mode. The contents of the edit view created by the other operator are unaffected by the change of ownership of the provisioning session; therefore on entering provisioning mode the new provisioning operator may see a partially provisioned edit view created by the previous provisioning operator. Note that this view might not have been saved on disk by the previous operator.

Copyright © 2006, Nortel Nortel Confidential

VERB Tidy Prov

Impact: Configuration

Description:

Tidy[-all]
[-keep(<file> ...)]
[-remove(<file> ...)]
[-fromDate(<date>) -toDate(<date>)]

This verb causes the system to remove old provisioning views and/or software from the disk. Note that at least one option must be included in the command.

The following views and files are never removed by the *Tidy* command, regardless of the options specified in the command:
- the committed view
- the most recent complete view used by an *Activate, Load, Save* or *Commit* command
- the current view, if it exists as a saved view
- any view that is a base view for another kept view
- all protected views
- views that are currently opened for reading or writing
- non-provisioning files

The sequence of tidying events is as follows:
- prepare a list of candidate files for deletion (using the *-all*, *-remove* options)
- remove files from the list if they must be kept (using the *-keep*, *-fromDate*, *-toDate* option)
- remove the files on the list

This means that if the options specify a particular file (either explicitly or by wild-carding) both for removal and keeping, then the file will be kept.

Options:

-all
specifies that all views except the special views mentioned above are to be removed. This option can not be combined with the -remove, -fromDate, or -toDate options.

-keep(<view> <view> ...)
specifies that all views except the given list of views and the special views mentioned above are to be removed. Combining the -all option with this option is redundant.

-remove(<view> <view>...)
specifies that the given list of views are to be removed.

-fromDate(<date>)
specifies the start date (which has a format of yyyy-mm-dd) of the period for which views are to be removed. The period specification is inclusive,

Copyright © 2006, Nortel Nortel Confidential

that is, views created or modified on this date will be removed. If this option is specified, the -toDate option must also be specified in the command. Also, the time specified by *toDate* must not be earlier than *fromDate*.

-toDate(<date>)
specifies the end date (which has a format of yyyy-mm-dd) of the period for which views are to be removed. The period specification is inclusive, that is, views created or modified on this date will be removed. If this option is specified, the -fromDate option must also be specified in the command. Also, the time specified by *toDate* must not be earlier than *fromDate*.

VERB STOP Prov

Impact	Configuration
Description	*Stop Prov* This verb causes certain potentially long-running *ProvisioningSystem* commands to be aborted. Only the *Apply*, *Check*, *Load*, *Save, and Activate* commands can be stopped in this manner and they can only be stopped by a user in provisioning mode. If *provisioningActivity* has the value "***semantic checking***", "***saving***" or "***loading or applying***", the *ProvisioningSystem* attempts to abort the activity at the earliest possible time. This may not happen immediately as the command must finish the phase it is in before aborting. If provisioningActivity has the value "***activating***" and this is a software upgrade and only the sw component was changed, then ProvisioningSystem attempts to abort the command. The *activityProgress* indicates the status of the abort until it has occurred. Note that the *Stop* command itself completes immediately (indicating success) even if the long-running command does not (the long-running command will indicate that it has been cancelled when it actually stops). If *provisioningActivity* has any other value, or is not applicable to the activation, the user is notified that the *Stop* command is not supported for the current activity.

Copyright © 2006, Nortel Nortel Confidential

VERB APPly Prov

Impact	Configuration
Description	*Apply [-force] -file(<file name>) Prov* This verb is used to apply a previously stored set of changes (saved in ***delta*** format) to the edit view. **Options:** *-file (<file name>)* specifies the file, saved with a ***delta*** format, containing the changes to be applied.The *file name* argument has the form *name[*.full*[.number]]* where *name* is the name of the file; and *number* is the unique sequence number of the file. The *name* must refer to a file saved with a ***delta*** format, that is, created by the *Save Prov* command without the *-ascii* or *-portable* options. Note that file names are case-sensitive. If *number* is omitted, the most recent file beginning with *name.**full*** will be used; if only name is specified, the most recent (complete) file beginning with *name.**full*** will be used. *-force* Normally, when a complete provisioning view is applied, the provisioning system checks to make sure that all the software necessary to activate the components contained in the view is currently running on the module. If any necessary software is missing, the *Apply* command fails and a list of missing software is displayed. The *-force* option overrides the checks for required software; that is, it causes the file to be loaded regardless of what software is currently running. When this option is used, error messages and software alarms may appear during processing of the file, and some components which are present in the file may be missing from the edit view when the apply completes. The *-force* option also ensures the system processes the entire provisioning file rather than stopping after 5 errors.

Copyright © 2006, Nortel Nortel Confidential

VERB Continue Prov

Impact	Service
Description	Continue [-force] Prov This verb causes a software migration activation to be continued if it has been paused. Only an *Activate* command where the *provisioningActivity* has the value "***software migration paused, manual intervention required***" can be continued. If provisioningActivity has any other value, the user is notified that this command is not supported for the current activity. *-force* The *-force* option is going to continue software migration regardless of the pause cause. Pause cause can be that operator used *Activate* command with *-pause* option, or some pausable event occurred. These events include software and hardware alarms on the migration shelf, provisioning data that is nacked, and the failure of an application to indicate that it is ready for the migration switchover.

VERB REStore Prov

Impact	Service
Description	*Restore Prov* This verb causes the provisioning system to re-activate the journaled current view if a switch resets to the committed view. The attribute *restorePossible* is set to ***yes*** in the case where the *Restore Prov* command can be issued to restore the journaled current view.

GROUP Prov OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Provisioning

ATTRIBUTE Prov adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Provisioning

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Prov operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Provisioning

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Prov usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: Provisioning

Values	idle active (activ) busy
Default	idle

GROUP Prov Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *ProvisioningSystem* component.
Mib	Provisioning

ATTRIBUTE Prov provisioningActivity

Access	Read only
Description	This attribute describes the type of provisioning activity that the *ProvisioningSystem* component is performing.
Mib	Provisioning
Values	initial loading none activation initial activation rolling back saving loading or applying semantic checking waiting for confirm clearing copying committing deleting confirming adding restoring
Default	No default

ATTRIBUTE Prov activityProgress

Access	Read only
Description	This attribute indicates the status relating to a long-running command handled by the *ProvisioningSystem*. It is usually expressed as a percentage of the number of elements (for example, components) processed with respect to the total set of elements that need to be processed for that activity. Note that, one cannot assume that the percentage implies how much time the task may still take. The time to complete the activity is dependent on many things which are beyond the control of the *ProvisioningSystem* itself.

Copyright © 2006, Nortel Nortel Confidential

Mib	Provisioning
Values	String (1..255, ASCII)
Default	No default

ATTRIBUTE Prov committedFileName

Access	Read only
Description	This attribute contains the name of the committed file. This is the file that will be used to obtain the provisioning data if the module restarts. Immediately after system power-up, this attribute contains the name of the file used during initial loading.
Mib	Provisioning
Values	String (1..40, ASCII)
Default	No default

ATTRIBUTE Prov currentViewFileName

Access	Read only
Description	This attribute contains the name of the provisioning file that contains the current view provisioning data. After system power-up, this attribute contains the name of the file used during initial loading. If the current view data has not been saved, this attribute is empty.
Mib	Provisioning
Values	String (1..40, ASCII)
Default	No default

ATTRIBUTE Prov lastUsedFileName

Access	Read only
Description	This attribute contains the last saved, loaded or committed file name. If a *Load*, *Save* or *Commit* command returns an error, this attribute remains unchanged. Immediately after system power-up, this attribute contains the name of the file used during initial loading.
Mib	Provisioning
Values	String (1..40, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Prov provisioningSession (session)

Access	Read only
Description	This attribute contains the component name of the operator session which is currently in provisioning mode. For example, ***NMIS Telnet Session/2*** If no session is in provisioning mode, this attribute will be empty.
Mib	Provisioning
Values	The name of the component
Default	No default

ATTRIBUTE Prov provisioningUser (user)

Access	Read only
Description	This attribute contains the *userid* of the operator who is currently provisioning the module. If no session is in provisioning mode, this attribute will be empty.
Mib	Provisioning
Values	String (1..8, ASCII)
Default	No default

ATTRIBUTE Prov checkRequired

Access	Read only
Description	This attribute indicates whether semantic checking is required before activating the edit view.
Mib	Provisioning
Values	yes no
Default	No default

ATTRIBUTE Prov confirmRequired

Access	Read only
Description	This attribute indicates whether the operator must enter a *Confirm Prov* command in order to keep a newly activated or restored current view in effect. If an activation or restore is not confirmed within 20 minutes of its completion, the module will restart using the committed provisioning data.
Mib	Provisioning
Values	yes no

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Prov editViewName (evName)

Access	Read only
Description	This attribute indicates the name of the provisioning view that represents the edit view provisioning data. If the edit view data has not been saved, this attribute is empty.
Mib	Provisioning
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Prov editViewAddedComponents (evAdded)

Access	Read only
Description	This attribute indicates the number of provisioning components that have been added to the edit view with respect to the current view.
Mib	Provisioning
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Prov editViewDeletedComponents (evDeleted)

Access	Read only
Description	This attribute indicates the number of provisioned components that have been deleted from the edit view with respect to the current view.
Mib	Provisioning
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Prov editViewChangedComponents (evChanged)

Access	Read only
Description	This attribute indicates the number of provisioned components whose attributes differ between the edit and current views.
Mib	Provisioning
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Prov standbyCpActivity

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current activity being performed by the provisioning system on the standby CP. This attribute may take the following values: ***none*** - When no provisioning activity is in progress. ***loading provisioning data*** - When a committed file is being loaded. ***saving commit-format provisioning data*** - When provisioning data is being saved with commit formats in preparation for a software migration. ***delivering provisioning data on migrating cards*** - When the standby CP is being activated as the migration active card for a software migration. ***synchronizing provisioning data***- When a journal log file is being loaded on the standby CP in order to synchronize the standby CP configuration database with the active CP configuration database. This occurs after a manual activation has been confirmed when CP equipment protection is provisioned. ***loading new software on CP*** - When the standby CP is coming up and is being loaded with software.
Mib	Provisioning
Values	none loading provisioning data saving commit-format provisioning data delivering provisioning data on migrating cards synchronizing provisioning data loading new software on CP
Default	No default

ATTRIBUTE Prov standbyCpActivityProgress

Access	Read only
Description	This attribute indicates the status of the provisioning activity which the *ProvisioningSystem* is performing on the standby CP.
Mib	Provisioning
Values	String (1..255, ASCII)
Default	No default

ATTRIBUTE Prov journalDisabledReason

Access	Read only
Description	This attribute indicates the reason (if any) that journal log file saving is disabled. This attribute may take the following values: ***"not disabled"*** - If journal log file saving is operationally enabled. ***"not configured"*** - If journal log file saving is provisioned to be disabled. ***"file system error***" - If journal log file saving is operationally disabled due to a file system problem, such as disk full or file system locked. ***"threshold exceeded"*** - If journal log file saving is operationally disabled because the maximum number of journal log files has already been reached. ***"reload activation***" - If journal log file saving is operationally disabled

Copyright © 2006, Nortel Nortel Confidential

	because the last activation was a reload activation. ***"initial commit required"*** - If journaling has just been enabled by provisioning but a *Commit Prov* has not been issued. "***restore failed***" - If journal log saving is operationally disabled because the *restore prov* command failed to restore all the journal logs. After the error condition is corrected, a *Commit Prov* command causes journaling to become enabled once again.
Mib	Provisioning
Values	not disabled not configured file system error threshold exceeded reload activation initial commit required restore failed
Default	No default

ATTRIBUTE Prov restorePossible

Access	Read only
Description	This attribute indicates whether or not it is possible to use the *Restore Prov* command to restore to the last known current view after a switch reset. If a switch comes up and a *Restore Prov* command is possible, a warning alarm with index 7000 0038 will be raised against the *Prov* component. This alarm will be cleared when the *Restore Prov* command is issued by the operator. It will also be cleared if the operator does not perform a *Restore Prov* command, but performs an *Activate Prov* or a *Commit Prov*. Note that an activation or commit before a *Restore Prov* command results in the removal of all the existing journal log files, so that a *Restore Prov* command will no longer be possible. This situation is indicated to the operator by a semantic check warning.
Mib	Provisioning
Values	yes no
Default	No default

ATTRIBUTE Prov currentJournal (currentJn)

Access	Read only
Description	This attribute indicates the number of journal logs files that have been saved since the last *Commit Prov* command. When the value of the *currentJournal* attribute approaches the provisioned maximum allowed number of journal log files (a value represented by the *maxNumberJournalFiles* attribute), an alarm with index 7000 0036 is

Copyright © 2006, Nortel Nortel Confidential

raised against the *Prov* component. The severity of the alarm depends on the percentage of the maximum allowed number of journal log files that have been saved since the last *Commit Prov* command:

75% - Warning
85% - Minor
95% - Major

If the user does not perform a *Commit Prov* command and allows the value of the *currentJournal* attribute to equal the *maxNumberJournalFiles* attribute, journal log file saving becomes operationally disabled. In this case, a critical alarm with index 7000 0037 is raised against the *Prov* component. The resulting impact is that CP equipment protection is disabled, and a CP switchover attempt would result in a shelf reset instead.

When the user enters a *Commit Prov* command, all previous journal logs are removed and the *currentJournal* attribute is reset to zero. If an alarm was raised because journal log saving was disabled, it is cleared. If an alarm was raised due to the number of journal log files before the commit prov, it is cleared. If CP equipment protection and journal log saving were disabled before the *Commit Prov* command because of the number of journal log files, they become enabled after the *Commit Prov* command.

Mib	Provisioning
Values	Decimal (0..2000)
Default	No default

GROUP Prov Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *ProvisioningSystem* component.
Mib	Provisioning

ATTRIBUTE Prov maxNumberJournalFiles (maxJn)

Access	Read and write
Description	This attribute specifies the maximum number of journal files that can be saved. A value of ***none*** specifies that journaling is disabled, while any other value specifies that journaling is enabled. The *Shelf cpEquipmentProtection* attribute must be set to ***cold*** when the *maxNumberJournalFiles* attribute is set to ***none***. The value of the *maxNumberJournalFiles* attribute must be greater than the value of the *Prov currentJournal* operational attribute. If it is not, the resulting impact is that journal log file saving becomes operationally disabled. A critical alarm with index 7000 0037 is also raised against the *Prov* component. A *Commit Prov* command would need to be entered to re-enable journaling.

Copyright © 2006, Nortel Nortel Confidential

The operator may want to set the *maxNumberJournalFiles* attribute to be less than the default value of ***2000*** in order to force a *Commit Prov* command to be entered more frequently. If a switch reset to the committed view occurs, the *Restore Prov* command may take less time to complete in this case, since there are fewer journal log files to load and activate.

Mib	Provisioning
Values	Decimal (100..2000) none
Default	2000

ATTRIBUTE Prov autoConfirm

Access	Read and write
Description	This attribute specifies whether the auto-confirmation functionality is turned on or off. When the attribute is turned ***on***, the operator need not issue a *Confirm Prov* command following an activation. When the attribute is turned ***off***, any activation should be confirmed through the *Confirm Prov* command. With this attribute turned ***on***, if an activation inadvertently impacts management connectivity to the shelf, then the shelf would remain isolated from management perspective. Hence,it is strongly recommended to have serial port access to the switch for troubleshooting and recovery.
Mib	Provisioning
Values	off on
Default	off

COMPONENT Prov View

Instance	String (1..40, ASCII)
Groups	GROUP Prov View Operational (Oper)
Scope	Application
Description	*Prov View/<string>* This component represents information about provisioning views. Most of these views have been saved and can be activated or loaded. In this case, the format for <string> is <name>.<type>.<number> where <name> is the view's name; <type> is either ***full*** or ***part***, <number> is a unique sequence number generated by the system.

Copyright © 2006, Nortel Nortel Confidential

The ***current*** and ***edit*** views are not necessarily saved.

Mib	Provisioning
Common Verbs	Help List Display

GROUP Prov View Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *View* component.
Mib	Provisioning

ATTRIBUTE Prov View user

Access	Read only
Description	This attribute indicates the *userid* of the operator who first saved this view. It may be empty if unknown or if the view has not been saved.
Mib	Provisioning
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Prov View checkState

Access	Read only
Description	This attribute indicates the semantic check state of the view when it was saved. The values are described in worst to best order. The ***failed*** state indicates that the view has failed a semantic check and cannot be activated. The ***unknown*** state indicates that semantic checks have not been run and the view cannot be activated. The ***partial*** state indicates that the view has passed incomplete checks, that is *Check -changed Prov* has succeeded. This is also the best state value for a partial view. Thew view cannot be activated until it has been fully checked. The ***softwareChanged*** state indicates that the view has passed complete checks, but by software other than that to be activated, that is, either the application versions have changed, or features have been added. After activation, the new software may detect semantic errors. After correcting these errors, if any, the view will need to be re-saved or re-committed as appropriate.

Copyright © 2006, Nortel Nortel Confidential

The ***full*** state indicates that the view has passed complete checks, that is, it has been fully verified. It can be activated.

Mib	Provisioning
Values	failed (fail) unknown (unk) partial (part) softwareChanged (sw) full
Default	No default

ATTRIBUTE Prov View components (comps)

Access	Read only
Description	This attributes indicates the number of provisioned components that have been (or could be) saved.
Mib	Provisioning
Values	Decimal (0..999999)
Default	No default

ATTRIBUTE Prov View formats

Access	Read only
Description	This attribute indicates the formats of the saved information. Each serves a different purpose. The ***ascii*** format is readable by operators and can be easily parsed and generated by scripts. MDM makes use of this format. Note that the syntax is subject to change without notice. This format is generated via *Save -ascii Prov*. A view with an ascii format can be loaded and activated. The ***commit*** format is generated via *Commit Prov* and allows for fast activation, that is, a shorter service outage time. The system will never leave a view with only this format, as it cannot be loaded. The ***delta*** format contains the changes made between the current view and the edit view. It is, therefore, much smaller and faster to *Load* or *Save* than the other formats. A view containing this format can be loaded or have the changes applied to the edit view. This provides a mechanism to propagate a set of changes from one view to another. A view containing only this format can be activated if this would not require a system reload. To generate this format, issue *Save Prov* without the *-ascii* or *-portable* options. The ***part*** format is generated via *Save -component() Prov*. The part format can be loaded. The syntax of this format is subject to change without notice.

Copyright © 2006, Nortel Nortel Confidential

	The ***portable*** format is a compact representation that can be quickly loaded. It can be transported from one node to another, or to an MDM. It is generated via *Save -portable Prov.* The portable format can be loaded and activated.
Mib	Provisioning
Set of	ascii commit delta part portable (port)
Default	No default

ATTRIBUTE Prov View baseView (base)

Access	Read only
Description	This attribute indicates the name of the view upon which this view's changes are based (even if the ***delta*** format does not exists). In other words, it indicates the name of the current view that existed at the time that this view was saved. This may not be the name of the current view that is running now. This attribute is empty when the view is unsaved or if the current view was saved.
Mib	Provisioning

GROUP Prov CAA OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	ProvAm

ATTRIBUTE Prov CAA adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	ProvAm
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Prov CAA operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	ProvAm
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Prov CAA usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	ProvAm
Values	idle active (activ) busy
Default	idle

GROUP Prov CAA Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Prov CtricalAttributeActivation* component.

COMPONENT RoutingGateway (RGty)

Instance	Decimal (0..4294967295)
Groups	GROUP RGty OsiState (State) GROUP RGty Prov (Prov) GROUP RGty Oper (Oper) GROUP RGty CustomerIdentifierData (CidData)
Scope	Network
Description	*RoutingGateway/n* This component must be provisioned on nodes where calls cross boundaries between topology regions. It must also be provisioned on nodes where calls cross boundaries between cluster and non-cluster nodes. A *RGty* is responsible for bridging calls across these boundaries. A *RGty* upon the receipt of a call setup message terminates the existing segment of the call coming from the direction of its source and originates a new path segment of the call towards its destination. This means that each call handled by the *RGty* consists of two segments: one leading to the source of the call and the other leading to the destination of the call. The *RGty* may be provisioned on one or more logical processors (*Lp*s). If an *RGty* is provisioned on a single *Lp*, all calls bridged across the above mentioned boundaries through this node will have their path segments terminated and originated on this *Lp*. If a single *Lp* does not have sufficient capacity to bridge all of the calls then multiple *RGty*s may be provisioned on multiple *Lp*s and the calls will be equally shared among all the *RGty*s. For more information as to which *Lp* to choose for the *RGty,* or for

Copyright © 2006, Nortel

Nortel Confidential

information as to how many *RGty*s should be provisioned on a node please refer to the Engineering Guidelines.

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE RGty operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	RoutingGateway
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE RGty usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	RoutingGateway
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE RGty availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE RGty proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE RGty controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	RoutingGateway
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE RGty alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	RoutingGateway
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE RGty standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE RGty unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	RoutingGateway
Values	false true
Default	false

GROUP RGty Prov (Prov)

Properties	Provisioned
Description	This group contains all the provisionable attributes of the *RGty*.
Mib	RoutingGateway

ATTRIBUTE RGty logicalProcessor (lp)

Access	Read and write
Criticality	Process
Description	This attribute specifies a logical processor (*Lp*) on which the *RGty* resides. The *RGty* may reside on any *Lp* simply by pointing this attribute to the *Lp/n* component. Only one *RGty* may reside on an *Lp*. For more information as to which *Lp* to choose for the *RGty,* or for information as to how many *RGty*s should be provisioned on a node please refer to the Engineering Guidelines.
Mib	RoutingGateway
Values	Link (Hardware, linkToApplications)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE RGty maxCalls (maxc)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of calls that the *RGty* can handle, thus the attribute is used to limit resource (CPU and memory) usage by the *RGty*. The attribute is also used to control the spreading of calls among multiple *RGty*s. When a call needs to cross a topology region or cluster boundary, the *RGty* selected to handle the call is the one which has the smallest ratio of *currentCalls* to *maxCalls*. For example, assume there are two *RGty*s, first with *currentCalls* = 1 and *maxCalls* = 10, second with *currentCalls* = 1 and *maxCalls* = 100. New calls will go to the second *RGty* until it has *currentCalls* = 11 at which time the first *RGty* will take one call giving it the ratio of 2 *currentCalls* to 10 *maxCalls*. Then, 10 more calls will go to the second *RGty* and the next call to the first *RGty*, and so on. Note that the spreading algorithm is approximate and does not yield exact results due to latency in the delivery and caching of the required distributed data. It is important to note that this attribute does not guarantee enough resources are available to handle the maximum number of calls. It simply guarantees that no more than the maximum number of calls will be handled by the *RGty*.
Mib	RoutingGateway
Values	Decimal (0..1000)
Default	100

GROUP RGty Oper (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *RGty*.
Mib	RoutingGateway

ATTRIBUTE RGty currentCalls (curc)

Access	Read only
Description	This attribute indicates the number of calls that the *RGty* is currently handling. Note that *currentCalls* may exceed *maxCalls* when *maxCalls* was decreased at the time when the *RGty* had *currentCalls* greater than the new *maxCalls*. For example, if the *RGty* has *currentCalls* = 70 and *maxCalls* = 100 when *maxCalls* is decreased to 50 then until 20 calls are cleared *currentCalls* will be greater than *maxCalls*.
Mib	RoutingGateway

ATTRIBUTE RGty rerouteFromGateway (rrfg)

Access	Read only
Description	This attribute counts the Nortel Networks proprietary reroute messages that the *RGty* has received across the topology region or cluster boundary. This reflects the number of times a call handled by the *RGty* has been moved from one boundary (inter-region or cluster) link to another. The call is moved as a result of a successful reroute due to link failure, or as a result of call balancing or optimization occurring on the local node or node across the boundary.
Mib	RoutingGateway
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE RGty rerouteToGateway (rrtg)

Access	Read only
Description	This attribute counts the Nortel Networks proprietary reroute messages that the *RGty* has sent across the topology region or cluster boundary. This reflects the number of times a call handled by the *RGty* has been moved from one path to another within the *RGty*'s topology region or cluster. The call is moved as a result of a successful reroute due to a link failure within the *RGty*'s topology region or cluster, or as a result of call balancing or optimization occurring within this region or cluster.
Mib	RoutingGateway
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE RGty failedCallAttempts (fc)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the calls handled by the *RGty* that have failed during their establishment phase (setup and connect).
Mib	RoutingGateway
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE RGty localResourceExhaustionReleases (lr)

Access	Read only
Description	This attribute counts the call release messages that the *RGty* has generated due to a lack of resources required to process a call setup or connect message.
Mib	RoutingGateway
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE RGty lastFailedAttemptCalledAddress (fcda)

Access	Read only
Description	This attribute indicates the final destination NSAP address of the last call handled by the *RGty* which failed in its establishment phase. An empty string implies that there has been no call establishment failure so far.
Mib	RoutingGateway
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE RGty lastFailedAttemptCallingAddress (fcca)

Access	Read only
Description	This attribute indicates the initial source NSAP address of the last call handled by the *RGty* which failed in its establishment phase. An empty string implies that there has been no call establishment failure so far.
Mib	RoutingGateway
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE RGty lastFailedAttemptReleaseCause (fcrc)

Access	Read only
Description	This attribute indicates the Q.2931 release cause for the last call handled by the *RGty* which failed in its establishment phase. A value of 0 implies that there has been no call establishment failure so far. The most common release causes are as follows:

Copyright © 2006, Nortel Nortel Confidential

3 = No Route To Destination, (routing system cannot get there)
17 = User Busy, (called party already has a call up)
18 = No User Response, (called party not responding)
21 = Call Rejected, (called party not accepting call)
37 = Cell Rate Unavailable (network congestion upstream)
41 = Temporary Failure (upstream card failure, etc.)
45 = No VPI VCI Available (got route but no B/W or VCC upstream)
47 = Resource Unavailable (got route but no resources upstream)
88 = Incompatible destination (called party not compatible)
102 = Timer Recovery (control or data congestion upstream)

Mib	RoutingGateway
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE RGty lastFailedAttemptReleaseDiag (fcrd)

Access	Read only
Description	This attribute indicates the Q.2931 release diagnostic for the last call handled by the *RGty* which failed in its establishment phase. An empty string implies that there has been no call establishment failure so far.
Mib	RoutingGateway
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE RGty lastFailedAttemptTime (fct)

Access	Read only
Description	This attribute indicates the time at which the *RGty* processed the last call that failed in its establishment phase. If no call establishment failures have occurred then it gives the time the *RGty* was created.
Mib	RoutingGateway
Values	Time (DHMS)
Default	No default

GROUP RGty CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	RoutingGateway

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE RGty customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	RoutingGateway
Values	Decimal (0; 1..8191)
Default	0

COMPONENT RGty Call (Call)

Instance	Decimal (0..65534)
Groups	GROUP RGty Call Oper (Oper)
Scope	Network
Description	*RGty/n Call/n* This component represents a call from source to destination that is handled by the *RGty*. The *RGty* upon the receipt of a call setup message terminates the existing path segment of the call coming from the direction of its source and originates a new path segment of the call towards the destination. This means that each *RGtyCall* consists of two path segments: one leading to the source of the call and the other leading to the destination of the call.

VERB REROute RGty Call Seg LCo

Impact	Service
Description	REROute ..Lc This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *REROute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified. This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively. When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path. If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP RGty Call Seg LCo **PathData**

Properties	Operational
Description	This group contains all operational attributes for the path oriented LCo.
Mib	RoutingGateway

ATTRIBUTE RGty Call Seg LCo **state**

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.
Mib	RoutingGateway
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE RGty Call Seg LCo **overrideRemoteName (orn)**

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	RoutingGateway
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE RGty Call Seg LCo **end**

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	RoutingGateway
Values	calling called
Default	No default

ATTRIBUTE RGty Call Seg LCo **costMetric (cost)**

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	RoutingGateway
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE RGty Call Seg LCo **delayMetric (delay)**

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0.

Copyright © 2006, Nortel Nortel Confidential

Mib	RoutingGateway
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE RGty Call Seg LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	RoutingGateway
Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE RGty Call Seg LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.
Mib	RoutingGateway
Values	Decimal (0..4)
Default	No default

ATTRIBUTE RGty Call Seg LCo holdingPriority (hpri)

Access	Read only
Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.

Copyright © 2006, Nortel Nortel Confidential

Mib	RoutingGateway
Values	Decimal (0..4)
Default	No default

ATTRIBUTE RGty Call Seg LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	RoutingGateway
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE RGty Call Seg LCo requiredRxBandwidth (rbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value
Mib	RoutingGateway
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE RGty Call Seg LCo requiredTrafficType (rttyp)

Access	Read only
Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.
Mib	RoutingGateway

Copyright © 2006, Nortel Nortel Confidential

Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE RGty Call Seg LCo **permittedTrunkTypes (pttyp)**

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	RoutingGateway
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE RGty Call Seg LCo **requiredSecurity (rsec)**

Access	Read only
Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	RoutingGateway
Values	Decimal (0..7)
Default	No default

ATTRIBUTE RGty Call Seg LCo **requiredCustomerParameter (rcparm)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	RoutingGateway
Values	Decimal (0..7)
Default	No default

ATTRIBUTE RGty Call Seg LCo **emissionPriority (epri)**

Access	Read only
Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority*. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	RoutingGateway
Values	Decimal (0..2)
Default	No default

ATTRIBUTE RGty Call Seg LCo **discardPriority (dpri)**

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority*. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).
Mib	RoutingGateway
Values	Decimal (1..3)
Default	No default

ATTRIBUTE RGty Call Seg LCo **pathType (pType)**

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected

Copyright © 2006, Nortel Nortel Confidential

automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs).

The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.

Mib — RoutingGateway

Values
normal
manual
forced

Default — No default

ATTRIBUTE RGty Call Seg LCo **retryCount (rcount)**

Access — Read only

Description — This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology.
This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.

Mib — RoutingGateway

Values — Decimal (0..255)

Default — No default

ATTRIBUTE RGty Call Seg LCo **pathFailureCount (pfcount)**

Access — Read only

Description — This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.

Mib — RoutingGateway

Values	Decimal (0..65535)
Default	No default

ATTRIBUTE RGty Call Seg LCo **reasonForNoRoute (rnr)**

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.
Mib	RoutingGateway
Values	none destinationNameTooLong destinationNotSpecified unknownDestinationName incorrectDestination incorrectDestinationEndPoint unknownSource unknownDestination sameNode routeCostTooMuch routesDelayTooLong attributesNotMet anError attributeProfileProblem manualPathIndexProblem
Default	none

ATTRIBUTE RGty Call Seg LCo **lastTearDownReason**

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons: ***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up. ***normalShutDown*** - This path has gone down due to normal call termination. ***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.

Copyright © 2006, Nortel Nortel Confidential

insufficientRxLcOrBandwidth - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
trunkFailure- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
trunkCardFailure- A trunk FP card has failed along the path.
accessCardFailure- The FP on which the peer access service was running has failed.
operatorForced- The path has terminated due to the operator locking a trunk along the path.
lostLcnClash- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
networkCongestion - The path has failed due to control information being lost and not recoverable.
trunkNotFound - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
farEndNotFound - The far end is not provisioned or is not up. Check remote Name.
wrongModuleReached - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
farEndBusy - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
callLoopedBack - This LCo is provisioned to call itself. Re-provision since this is invalid.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
remoteNameMismatch - The remote end has alarmed and rejected this setup due to remoteName provisioning.
serviceTypeMismatch - The remote Service Type does not match this service type. Check provisioning.
reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component

Copyright © 2006, Nortel Nortel Confidential

did not specify the same mode.

Default	none

ATTRIBUTE RGty Call Seg LCo **pathFailureAction**

Access	Read only
Description	This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure. With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect. All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Copyright © 2006, Nortel Nortel Confidential

Values	reRoutePath disconnectConnection
Default	No default

ATTRIBUTE RGty Call Seg LCo **bumpPreference (bpref)**

Access	Read only
Description	This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.
Mib	RoutingGateway
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE RGty Call Seg LCo **optimization (opt)**

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

COMPONENT RncInterfaceNode (RncIn)

Groups	GROUP RncIn Provisioned (Prov) GROUP RncIn OsiState (State)
Scope	Network
Description	*RncInterfaceNode* This component represents system level information related to a passport configured either as a classic I-Node in an RNC or as a RNC Compact.
Mib	no_mib
Common Verbs	Help List Display

GROUP RncIn Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes of the *RncInterfaceNode* component.
Mib	no_mib

ATTRIBUTE RncIn primaryOmuIpAddress (priOmuAddr)

Access	Read: All Write: All
Description	This attribute specifies the IP address of the primary Omu in the Control Node. This IP address is used to establish a link between the I-Node and the C-Node in the RNC. This address must be the same as the C-Node primary OmuIP address configured in the CT-2000. If the value of this attribute is changed, the Master and Standby APs must be reset after the *Activate Prov* command has completed.
Mib	no_mib
Values	IP address
Default	No default

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE RncIn secondaryOmuIpAddress (secOmuAddr)

Access	Read: All Write: All
Description	This attribute specifies the Ip Address of the secondary Omu in the Control Node. This attribute is used to establish a link between the I-Node and the C-Node in the case where the primary Omu is not active. This address must be the same as the secondary OMU IP address configured in the CT-2000. If the value of this attribute is changed, the Master and Standby APs must be reset after the *Activate Prov* command has completed.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE RncIn protocolConverterResources (pcRes)

Access	Read: All Write: All
Description	This value represents the percentage of processing resources for Protocol Converters (PC). When this value increases, more resources will be devoted to Protocol converters. When this value decreases, more resources will be devoted to Radio Access Bearer services. If you change this value, the new value takes effect as new processing resources come into service. To force the new percentage to be effective immediately, either reset the whole shelf or enough processing resources. The processing resources for protocol converters will be allocated based on the nearest percentage possible to the specified one.
Mib	no_mib
Values	Decimal (0..100)
Units	%
Default	17

ATTRIBUTE RncIn mode (mode)

Access	Read: All Write: All
Criticality	Module
Description	This attribute specifies the mode of RNC configuration. A value of *InodeClassic* indicates a normal Classic configuration. A value of *RncCompact* indicates a complete RNC Compact configuration.
Mib	no_mib
Values	inodeClassic rncCompact

Copyright © 2006, Nortel Nortel Confidential

Default	inodeClassic

GROUP RncIn OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE RncIn adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE RncIn operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE RncIn usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Rsa operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	ServerAccessRsa
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rsa usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	ServerAccessRsa
Values	idle active (activ) busy
Default	idle

GROUP Rsa Operational

Properties	Operational
Description	The *Operational* group defines operational attributes associated with the *Rsa* component.
Mib	ServerAccessRsa

ATTRIBUTE Rsa maxRsiConnections

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the maximum number of RSI connections which can be supported by this *Rsa*.
Mib	ServerAccessRsa
Values	Decimal (1000)
Default	No default

ATTRIBUTE Rsa rsiConnections

Access	Read only
Description	This attribute specifies the number of active RSI connections currently supported by the *Rsa* component.
Mib	ServerAccessRsa
Values	Decimal (0..1000)
Default	No default

COMPONENT Rsa DataNetworkAddress (Dna)

Groups	GROUP Rsa Dna Address GROUP Rsa Dna OutgoingOptions GROUP Rsa Dna IncomingOptions
Scope	Network
Description	*Rsa/n DataNetworkAddress* This is the description of the Remote Server Agent *Dna* component. It includes the attributes which apply to a VC between the RSI and RSA.
Mib	ServerAccessRsa
Opt. Subcomp.	COMPONENT Rsa Dna ClosedUserGroup (Cug)
Common Verbs	Help List Display

GROUP Rsa Dna Address

Properties	Provisioned
Description	The *Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. The string of address digits is complemented by the type of address or Npi. These attributes are used to interpret the format of the address digits.
Mib	ServerAccessRsa

ATTRIBUTE Rsa Dna numberingPlanIndicator (npi)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. An address may belong to the X.121 or E.164 numbering plans. X.121 is used in packet switched data networks.
Mib	ServerAccessRsa
Values	x121 e164
Default	x121

ATTRIBUTE Rsa Dna dataNetworkAddress (dna)

Access	Read and write
Description	The *Dna* attribute contains digits which form a unique identifier of the customer interface. It can be compared (approximation only) to a telephone number where each phone number identifies a unique telephone set. *Dna* digits are selected and assigned by network operators.
Mib	ServerAccessRsa
Values	BCD (1..15)
Default	No default

GROUP Rsa Dna OutgoingOptions

Properties	Provisioned
Description	The *OutgoingOptions* group defines call options of a *Dna* for calls which are made out of the interface represented by the *Dna*. These options are not used for calls arriving to the interface represented by the *Dna*.
Mib	ServerAccessRsa

ATTRIBUTE Rsa Dna outCalls (ouc)

Access	Read only
Description	This attribute, if set to a value of ***allowed*** indicates that outgoing calls (from the DTE to the network) can be made using this particular *D*na. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for *Dnas* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.
Mib	ServerAccessRsa
Values	disallowed allowed
Default	disallowed

Copyright © 2006, Nortel Nortel Confidential

GROUP Rsa Dna IncomingOptions

Properties	Provisioned
Description	*IncomingOptions* defines the set of options for incoming calls. These options are used for calls arriving to the interface represented by the *Dna*. For calls originated from the interface, *IncomingOptions* attributes are not used.
Mib	ServerAccessRsa

ATTRIBUTE Rsa Dna incCalls (inc)

Access	Read only
Description	This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) can be made to this *Dna*. If set to a value of ***disallowed***, then incoming calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for DNAs in that incoming calls are barred if this attribute is set to a value of ***disallowed***. Either *outCalls*, or *incCalls* (or both) must be set to a value of ***allowed*** for this *Dna* to be usable.
Mib	ServerAccessRsa
Values	disallowed allowed
Default	allowed

ATTRIBUTE Rsa Dna incAccess (ina)

Access	Read and write
Description	This attribute is an extension of the Closed User Group (CUG) facility, as follows: This attribute, if set to a value of ***allowed*** indicates that incoming calls (from the network to the DTE) from the open (non-CUG) part of the network are permitted. It also permits incoming calls from DTEs that have Outgoing Access capabilities. If set to a value of ***disallowed***, then such calls cannot be made to this *Dna* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Closed User Group with Incoming Access' feature for *Dnas* in that incoming access is granted if this attribute is set to a value of ***allowed***.
Mib	ServerAccessRsa
Values	disallowed allowed
Default	disallowed

Copyright © 2006, Nortel Nortel Confidential

COMPONENT Rsa Dna ClosedUserGroup (Cug)

Instance	Decimal (0..255)
Groups	GROUP Rsa Dna Cug CugOptions
Scope	Network
Description	*Rsa/n Dna ClosedUserGroup* *ClosedUserGroup* defines options associated with a national or international CUG identifier. Other *Dna*s in the network can have *Cug*s defined which group these *Dna*s by *Cug interlockCode*. If *Dna*s are defined with *Cugs*, calls from *Dna*s which do not have the same *interlockCode* defined are refused. Attributes *incAccess* and *outAccess* can override this rule.
Mib	ServerAccessRsa
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Rsa Dna Cug CugOptions

Properties	Provisioned
Description	Attributes in this group define *ClosedUserGroup* options associated with this particular *interlockCode*. *Dna's* with the same *Cug* (*interlockCode*) can make calls within this group. Various combinations which permit or prevent calls in the same *Cug* group are defined here.
Mib	ServerAccessRsa

ATTRIBUTE Rsa Dna Cug type

Access	Read and write
Description	This attribute specifies the CUG type - the CUG is either a national CUG, or an international CUG. International closed user groups are usually established between DTEs for which there is an X.75 Gateway between; whereas national closed user groups are usually established between DTEs for which there is no X.75 Gateway between. (National CUGs cannot normally traverse an X.75 Gateway). If this attribute is set to ***national***, then the CUG is a national CUG, in which case, the *dnic* should be left at its default value since it is not part of a national CUG. If this attribute is set to ***international***, then the CUG is an international CUG, in which case, the *dnic* should be set appropriately as part of the *Cug interlockCode*.
Mib	ServerAccessRsa

Copyright © 2006, Nortel Nortel Confidential

Values	national international
Default	national

ATTRIBUTE Rsa Dna Cug dnic

Access	Read and write
Description	This attribute specifies the DNIC (Data Network ID Code) of the CUG by which packet networks are identified. This attribute is not applicable if the CUG is a national CUG, as specified by the Cug *type* attribute. There are usually one or two DNICs assigned per country, for public networks. The U.S. is an exception where each BOC has a DNIC. Also, a group of private networks can have its own DNIC. The DNIC is assigned by international agreement and controlled by ITU-T.
Mib	ServerAccessRsa
Values	BCD (4)
Default	0000

ATTRIBUTE Rsa Dna Cug interlockCode (ilc)

Access	Read and write
Description	This attribute specifies the *Cug* identifier of a national or international *Cug* call. It is an arbitrary number and it also can be called Cug in some descriptions. Interfaces (DNAs) defined with this number can make calls to DNAs with the same *interlockCode*.
Mib	ServerAccessRsa
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rsa Dna Cug preferential (pre)

Access	Read only
Description	This attribute, if set to ***yes*** indicates that this *Cug* is the preferential *Cug*, in which case it will be used during the call establishment phase if the DTE has not explicitly specified a *Cug* index in the call request packet. If set to ***no***, then this *Cug* is not the preferential *Cug*. Only one of the *Cugs* associated with a particular *Dna* can be the preferential *Cug* - only one *Cug* can have this attribute set to ***yes***.
Mib	ServerAccessRsa
Values	no yes
Default	no

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rsa Dna Cug outCalls (ouc)

Access	Read only
Description	This attribute, if set to ***allowed*** indicates that outgoing calls (from the DTE into the network) can be made using this particular *Cug*. If set to a value of ***disallowed***, then outgoing calls cannot be made using this *Cug* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Outgoing Calls Barred' feature for *Cugs* in that outgoing calls are barred if this attribute is set to a value of ***disallowed***.
Mib	ServerAccessRsa
Values	disallowed allowed
Default	disallowed

ATTRIBUTE Rsa Dna Cug incCalls (inc)

Access	Read only
Description	This attribute, if set to ***allowed*** indicates that incoming calls (from the network to the DTE) can be made using this particular *Cug*. If set to ***disallowed***, then incoming calls cannot be made using this *Cug* - such calls will be cleared by the local DCE. This attribute corresponds to the ITU-T 'Incoming Calls Barred' feature for *Cugs* in that incoming calls are barred if this attribute is set to a value of ***disallowed***.
Mib	ServerAccessRsa
Values	disallowed allowed
Default	allowed

ATTRIBUTE Rsa Dna Cug privileged (pri)

Access	Read only
Description	This attribute, if set to ***yes*** indicates that this *Cug* is a privileged *Cug*. In DPN, at least one side of a call setup within a *Cug* must have the *Cug* as a privileged *Cug*. If set to ***no***, then the *Cug* is not privileged. If both the local DTE and the remote DTE subscribe to the *Cug*, but it is not privileged, then the call will be cleared. This attribute is typically used for a host DTE which must accept calls from many other DTEs in which case the other DTEs cannot call one another, but can call the host. In this example, the host would have the privileged *Cug*, and the other DTEs would belong to the same *Cug*, but it would not be privileged.
Mib	ServerAccessRsa
Values	no yes

Copyright © 2006, Nortel Nortel Confidential

Default	yes

COMPONENT Rsa VncsAccess

Groups	GROUP Rsa VncsAccess Provisioned GROUP Rsa VncsAccess OsiState (State) GROUP Rsa VncsAccess Operational
Scope	Network
Description	*Rsa/<string> VncsAccess* The *VncsAccess* component provides access to the Nortel Networks Multiservice Switch Voice Networking Call Server.

GROUP Rsa VncsAccess Provisioned

Properties	Provisioned
Description	The *Provisioned* group defines provisioned attributes associated with the *VncsAccess* component.
Mib	ServerAccessRsa

ATTRIBUTE Rsa VncsAccess timeToLive

Access	Read and write
Description	This attribute specifies the length of time VNCS requests are allowed to remain queued for transmission before they are considered too old and are discarded. This attribute should be set in consideration with the voice application time-out interval.
Mib	ServerAccessRsa
Values	Decimal (1..5)
Units	seconds
Default	2

GROUP Rsa VncsAccess OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For

Copyright © 2006, Nortel Nortel Confidential

component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — ServerAccessRsa

ATTRIBUTE Rsa VncsAccess adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — ServerAccessRsa

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Rsa VncsAccess operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — ServerAccessRsa

Values — enabled (ena)
disabled (dis)

Default — disabled

GROUP Rsa Connection **LapfStatistics (LapfStats)**

Properties	Operational
Description	This group contains the LAPF statistics.
Mib	ServerAccessRsa

ATTRIBUTE Rsa Connection **lapfStateChanges**

Access	Read only
Description	This attribute counts the number of times the LAPF interface has changed state. While the LAPF interface is in ***informationTransfer*** state, this counter will increment on each expiry of *idleProbeTimer* as its state goes from ***informationTransfer*** to ***waitingAck*** and back. When this count reaches maximum, it wraps to zero.
Mib	ServerAccessRsa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rsa Connection **lapfRemoteBusy**

Access	Read only
Description	This attribute counts the number of times transmission of an I-frame was unsuccessful due to a perceived remote busy condition (window closed or remote busy). When this count reaches maximum, it wraps to zero.
Mib	ServerAccessRsa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rsa Connection **lapfAckTimeouts**

Access	Read only
Description	This attribute counts the number of times the *ackTimer* has expired. Frequent increments of this counter indicate improper values have been chosen for *ackTimer* and *ackDelayTimer* between the local and remote ends. When this count reaches maximum, it wraps to zero.
Mib	ServerAccessRsa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rsa Connection **lapfRejectFramesRx**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of REJ frames received. When this count reaches maximum, it wraps to zero.
Mib	ServerAccessRsa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rsa Connection lapfIFramesTx

Access	Read only
Description	This attribute counts the number of I-frames transmitted. An I-frame may be counted more than once if there are retransmissions. When this count reaches maximum, it wraps to zero.
Mib	ServerAccessRsa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rsa Connection lapfIFramesTxDiscarded

Access	Read only
Description	This attribute counts the number of transmit I-frames that have been discarded. Discard reasons may be one of the following: 1.The frame length is beyond allowed limit. 2.The LAPF interface is in ***disconnected*** state. 3.The transmit queue has been purged because the queue length has reached the reset threshold. When this count reaches maximum, it wraps to zero.
Mib	ServerAccessRsa
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rsa Connection lapfIFramesRx

Access	Read only
Description	This attribute counts the number of I-frames received. When this count reaches maximum, it wraps to zero.

Common Verbs	Help List Display

VERB Ping Rsa Connection Vc

Impact	Passive
Description	Ping *[-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)]* FrUni/*<n>* Dlci/*<n>* Vc Ping causes a query packet to be sent to the destination module where the Frame Relay DLCI VC terminates. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the ping query packet will be the same as that of the Frame Relay data except at the source and destination module. The ping packets originate from the CP rather than the Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the Frame Relay FP. Note that this command does not provide any information regarding the

Copyright © 2006, Nortel Nortel Confidential

status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The ping command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the roundTripDelay option is specified, the command reports the time taken to reach the destination and back. For the roundTripDelay option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the ping packets are generated and bounced back by the CP rather than the Frame Relay DLCI's FP.

The ping command supports the following options:

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the sendPktSize and returnPktSize options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control

Copyright © 2006, Nortel Nortel Confidential

information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the -rtd option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

GROUP Rsa Connection Vc **CallData (Cad)**

Properties	Operational
Description	This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application.
Mib	ServerAccessRsa

ATTRIBUTE Rsa Connection Vc **type**

Access	Read only
Description	This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***.
Mib	ServerAccessRsa
Values	pvc svc spvc frf10spvc
Default	No default

ATTRIBUTE Rsa Connection Vc **state**

Access	Read only
Description	This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***.
Mib	ServerAccessRsa

Values	normal high interrupting
Default	No default

ATTRIBUTE Rsa Connection Vc dataPath (dapa)

Access	Read only
Description	This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed

Copyright © 2006, Nortel Nortel Confidential

value of this attribute can be different from the provisioned value.

If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system)

If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed.

If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.

Mib	ServerAccessRsa
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Rsa Connection Vc **dprsMcsEndPoint (dmep)**

Access	Read only
Description	This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components. If the connection is using ***dprsOnly*** data path, this attribute is empty. If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.
Mib	ServerAccessRsa
List of	The name of the component
Default	No default

GROUP Rsa Connection Vc **IntervalData (Intd)**

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.
Mib	ServerAccessRsa

ATTRIBUTE Rsa Connection Vc **elapsedTimeTillNow**

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	ServerAccessRsa
Values	Decimal (0..16777215)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rsa Connection Vc **segmentsRx**

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.
Mib	ServerAccessRsa
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Rsa Connection Vc **segmentsSent**

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.
Mib	ServerAccessRsa
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Rsa Connection Vc **startTime**

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	ServerAccessRsa
Values	Time (DHMS)
Default	No default

ATTRIBUTE Rsa Connection Vc **callReferenceNumber**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	ServerAccessRsa
Values	Decimal (0..4294967295)
Default	No default

GROUP Rsa Connection Vc **FrameRelayData (Frd)**

Properties	Operational
Description	This group defines Frame Relay attributes collected by Frame Relay *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*. Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers
Mib	ServerAccessRsa

ATTRIBUTE Rsa Connection Vc **frmCongestedToSubnet**

Access	Read only
Description	This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc **cannotForwardToSubnet**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc notDataXferToSubnet

Access	Read only
Description	This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc outOfRangeFrmFromSubnet

Access	Read only
Description	This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late.
Mib	ServerAccessRsa
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Rsa Connection Vc combErrorsFromSubnet

Access	Read only
Description	This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc*
Mib	ServerAccessRsa
Values	Decimal (0..5000)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rsa Connection Vc **duplicatesFromSubnet**

Access	Read only
Description	This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc **notDataXferFromSubnet**

Access	Read only
Description	This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc **frmLossTimeouts**

Access	Read only
Description	This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc **ooSeqByteCntExceeded**

Access	Read only
Description	This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.

Copyright © 2006, Nortel Nortel Confidential

Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc peakOoSeqPktCount

Access	Read only
Description	This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc peakOoSeqFrmForwarded

Access	Read only
Description	This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current implementation also uses this statistics to set a maximum size for the out-of-sequenced queue.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc sendSequenceNumber

Access	Read only
Description	This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame.
Mib	ServerAccessRsa
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE Rsa Connection Vc pktRetryTimeouts

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc **peakRetryQueueSize**

Access	Read only
Description	This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc **subnetRecoveries**

Access	Read only
Description	This attribute displays the number of successful *Vc* recovery attempts.
Mib	ServerAccessRsa
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Rsa Connection Vc **ooSeqPktCntExceeded**

Access	Read only
Description	This attribute displays the number times that the out of sequence packet threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.

ATTRIBUTE Rtg tandemTraffic

Access	Read and write
Description	This attribute specifies whether tandem traffic is permitted through the node. Tandem traffic is traffic that arrives at the node on a trunk and leaves the node on another trunk. The default value of this attribute is ***allowed***, which permits tandem traffic to pass through the node. When this attribute is set to ***denied***, DPRS and

Copyright © 2006, Nortel

Nortel Confidential

PORS traffic is not permitted to tandem through the node in most circumstances.

However, there are some exceptions on DPRS gateway nodes, backbone border nodes, and cluster border nodes. For DPRS, traffic is allowed to tandem through these nodes with this attribute set to ***denied*** in the following situations:

1) On a DPRS gateway node, DPRS traffic that flows out of the subnet or enters the subnet is allowed to tandem through the node, even if this attribute is set to ***denied***. Traffic that is from one node and destined to another node in the same subnet is not allowed to tandem through the gateway node when this attribute is set to ***denied***. DPRS gateway nodes include RID gateway nodes (the nodes that are connected to another RID subnet or to DPN-100 RMs) and MID gateway nodes (the nodes that are connected to DPN-100 AM clusters).

2) On a backbone border node, DPRS traffic that is destined to either leave the backbone (to a cluster) or enter the backbone (from a cluster) is allowed to tandem through the node, even if this attribute is set to ***denied***. Traffic that is from one backbone node and destined to another backbone node in the same RID subnet is not allowed to tandem through the backbone border node when this attribute is set to ***denied***.

3) On a cluster border node, DPRS traffic that is destined to either leave the cluster (to the backbone or to another cluster) or enter the cluster is allowed to tandem through the node, even if this attribute is set to ***denied***. Intra-cluster DPRS traffic is generally not allowed to tandem through any cluster border node which has this attribute set to ***denied***. However, setting the attribute to ***denied*** on a cluster border node could cause that some nodes in the cluster become unreachable, from the source cluster node, through all paths inside the cluster. In this case, intra-cluster DPRS traffic between these nodes would be attempted to route through the default route. A cluster border node that is on the default route of a cluster node allows intra-cluster DPRS traffic to tandem through it, even if this attribute is set to ***denied***.

Changing this attribute has no effect on PORS calls that were set up before the change. These calls can be manually forced to reroute using the new setting by clearing the calls or locking the trunks on which they are routed.

Mib	BaseRouting
Values	allowed denied
Default	allowed

ATTRIBUTE Rtg clusterNode

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute identifies whether a node is a cluster node in a network. The default value of ***no*** indicates that this node is not a cluster node. When this attribute is provisioned to ***yes***, this node becomes a cluster node. One or more cluster nodes interconnected with each other forms a cluster. Deploying clusters in a Topology Region reduces the memory, CPU and control traffic bandwidth required to maintain the topology database in the Topology Region and thus improves network scaling. This is because only minimum routing information is exchanged between a cluster and other non-cluster nodes in a topology region. Cluster nodes are typically used to support access services. A cluster must be connected to other nodes located in the backbone of the network within the same RID subnet. It cannot be connected to nodes with different region identifiers (provisioned in the *regionId* attribute under the *ModuleData* component).
Mib	BaseRouting
Values	no yes
Default	no

ATTRIBUTE Rtg fullTopExchgOnClusterLinks (fullTopExchg)

Access	Read and write
Description	This attribute specifies whether this node wishes to exchange full topological information across its cluster-backbone links. A cluster-backbone link is a link between a cluster node and a backbone node. A cluster node has its *rtg clusterNode* attribute set to the value of ***yes***. A backbone node is a non-cluster node. If this attribute is set to the value of ***disabled*** on at least one node connected with cluster-backbone links, then only summarized topological information is propagated across those links. If this attribute is set to the value of ***enabled*** on two nodes connected with cluster-backbone links, then summarized and full topological information is propagated across those links. This attribute should only be set to the value of ***enabled*** during a clusters migration. During normal operation, this attribute should be set to the value of ***disabled*** in order to avoid accidental exchange of full topological information across the cluster-backbone boundary.
Mib	BaseRouting
Values	disabled enabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtg splittingRegionIds

Access	Read and write
Description	This attribute specifies which connected neighbor nodes, in different topology regions, are allowed to exchange topological information with this node. It should be used only when splitting or merging existing topology regions. This node only exchanges topological information with a connected node under either of the following conditions: (i) this node and the neighbor node are in the same topology region. That is, this node's *regionId* attribute and the neighbor's *regionId* attribute (under *Mod* component) are provisioned with the same value, or (ii) this node and the neighbor node are in different topology regions, and this node's *splittingRegionIds* attribute is provisioned to contain the neighbor's *regionId*, and the neighbor's *splittingRegionIds* attribute is provisioned to contain this node's *regionId*. When this attribute is used during migration of topology regions, values provisioned for the attribute are normally the old and new *regionIds* of the node. Use of this attribute makes it possible to migrate existing topology regions in the following cases: (i) splitting a topology region into two without isolating a node, and (ii) merging two different topology regions into one without introducing an extra topological barrier. The attribute should be cleared when all migration activities are complete. At this point, the region boundary takes effect.

COMPONENT Rtg RouteSelector (Rs)

Groups	GROUP Rtg Rs SelectedRoute GROUP Rtg Rs RouteSelectorControls (Controls) GROUP Rtg Rs PathAttributes GROUP Rtg Rs Statistics (Stats)
Scope	Application
Description	*Routing RouteSelector* This component sits directly under the *Routing* component. It is dynamically created by Routing System and thus is always present when PORS software is loaded on a node. *RouteSelector* is used by PORS services for the following purposes: - Selecting a route to a destination through the current topology region. The route may be directly to the destination node or to a gateway node through which the destination can be reached. - Returning a manual route stored as part of manual path profile. *RouteSelector* is invoked with a route request data containing one of the following:

Copyright © 2006, Nortel Nortel Confidential

- Parameters which must be met by the selected route.
- Parameter profile reference where parameters which must be met by the selected route are stored.
- Manual path profile reference.

When the route request data contains a manual path profile reference then *RouteSelector* returns the manual path route associated with that reference. The manual path route is returned in the selected route description data. *RouteSelector* does not verify the manual path route.

When the route request data contains parameter profile reference then *RouteSelector* obtains route request data parameters associated with that reference and then proceeds as though the parameters were contained in the route request data.

Using the route request data parameters, *RouteSelector* uses a route selection algorithm, based on Dijkstra's Shortest-Path-First algorithm, to select the best route to the destination. That route may be directly to the destination node or to a gateway node through which the destination can be reached. The selected route must satisfy all the route request data parameters. The route selection is done against the current view of the topological database maintained by Routing Topology System of the current topology region. Once the route is selected, selected route description data is returned by *RouteSelector*.

RouteSelector can be used in two modes: automatic and manual.

In the automatic mode, a route request message containing the route request data is originated by a PORS VC and sent to *RouteSelector*. *RouteSelector* then selects a route or gets a manual route and returns its description in the selected route description data in the selected route message back to the PORS VC.

In the manual mode, *RouteSelector* allows the operator to modify the parameters in the route request data (except for the manual path profile reference), and to initiate route selection using that data. When *RouteSelector* selects the route it displays its description to the operator.

GROUP Rtg Rs SelectedRoute

Properties Operational

Description This group contains operational attributes describing the last selected or manual route returned by *RouteSelector*. These attributes form selected route description data.

Copyright © 2006, Nortel Nortel Confidential

Mib	PorsVc

ATTRIBUTE Rtg Rs routeCostMetric (rcm)

Access	Read only
Description	This attribute indicates the sum of cost metrics of trunks that make up the selected route returned by *RouteSelector*. If the cost metrics at both ends of a trunk differ, the larger metric is used for that trunk. If a route could not be selected for whatever reason then the *routeCostMetric* is set to a value 999999 intended to symbolize unknown cost. For manual routes the value of *routeCostMetric* is also 999999. This is because *RouteSelector* does not verify manual routes thus *routeCostMetric* is unknown.
Mib	PorsVc
Values	Decimal (0..999999)
Default	999999

ATTRIBUTE Rtg Rs routeDelayMetric (rdm)

Access	Read only
Description	This attribute indicates the sum of delay metrics of trunks that make up the selected route returned by *RouteSelector*. The delay metric of a trunk is equal to half the *measuredRoundTripDelay* operational attribute of the trunk. If the delay metrics at both ends of a trunk differ, the larger metric is used for that trunk. If a route could not be selected for whatever reason then the *routeDelayMetric* is set to a value 999999 intended to symbolize unknown delay. For manual routes the value of *routeDelayMetric* is also 999999. This is because *RouteSelector* does not verify manual routes, thus *routeDelayMetric* is unknown.
Mib	PorsVc
Values	Decimal (0..999999)
Units	msec
Default	999999

ATTRIBUTE Rtg Rs routeBumpingPriority (rbp)

Access	Read only
Description	This attribute indicates the priority at which a route has been selected, or a value of 4 for manual routes since no route selection was made. Since *RouteSelector* does not verify manual routes the value of 4 for *routeBumpingPriority* symbolizes an unknown value for manual routes. The remainder of the description is not applicable to manual routes. The bumping priority of a route specifies a priority at which a path along that route can be established. The lowest bumping priority is 4, the highest bumping priority is equal to a setup priority contained in the route request data. If a route is selected at bumping priority 4, then no paths will be

Copyright © 2006, Nortel Nortel Confidential

bumped since there appears to be enough free bandwidth on selected trunks, and also since this bumping priority is not better than the lowest holding priority (4) of any path.

If a route cannot be selected at bumping priority 4 and a setup priority is 3 or better, then a route may be selected at bumping priority 3. This means that paths at holding priority 4 may be bumped if currently there is not enough free bandwidth on selected trunks to establish the new path with setup priority 3.

If a route cannot be selected at bumping priority 3 and a setup priority is 2 or better, then a route may be selected at bumping priority 2. In this case paths with holding priority 4 and 3 may be bumped if there is not enough free bandwidth on selected trunks to establish the new path with setup priority 2.

If a route cannot be selected at bumping priority 2 and a setup priority is 1 or better, then a route may be selected at bumping priority 1. In this case paths with holding priority 4, 3, and 2 may be bumped if there is not enough free bandwidth on selected trunks to establish the new path with setup priority 1.

If a route cannot be selected at bumping priority 1 and a setup priority is 0, then a route may be selected at bumping priority 0. In this case paths with holding priority 4, 3, 2, and 1 may be bumped if there is not enough free bandwidth on selected trunks to establish the new path with setup priority 0.

Mib	PorsVc
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Rtg Rs reasonForNoRoute (rnr)

Access	Read only
Description	This attribute indicates the reason for which a route was not selected by *RouteSelector*.

If the route was selected then *reasonForNoRoute* has a value of ***none***.

If the destination in the form of ASCII name was specified (see *destination*) and the name of node is too long (more than 12 characters) then *reasonForNoRoute* has a value of ***destinationNameTooLong***. Check and correct node name in the *destination* attribute.

If the destination was not specified, that is *destination* is blank, then *reasonForNoRoute* has a value of ***destinationNotSpecified***. *Destination* attribute should not be blank.

If the destination in the form of ASCII name was specified (see

Copyright © 2006, Nortel Nortel Confidential

destination) and the name of node cannot be found in topological database then *reasonForNoRoute* has a value of ***unknownDestinationName***. Check and correct node name in the *destination* attribute. If it is correct then this node does not appear in local topological database as this node may lie across the topology region or cluster boundary.

If the destination cannot be found in the topological database or cannot be reached through any gateway node then *reasonForNoRoute* has a value of ***unknownDestination***. Ensure the destination specified in *destination* attribute resides in the topology region, or can be reached through a Routing Gateway. That is, at least one reachable address provisioned under a *Trunk Address* component representing a gateway link can reach the destination NSAP address.

If the destination was specified using an incorrect format (see *destination*) then *reasonForNoRoute* has a value of ***incorrectDestination***. Use the correct format for *destination* attribute.

If there is no physical connectivity to the destination or gateway node, or number of hops to such node exceeds a limit of 20 hops, or a route to such node cannot satisfy all the parameters in the route request data then *reasonForNoRoute* has a value of ***attributeNotMet***. Set *operationMode* to ***manual*** and issue *d rtg rs* command and inspect *attributeNotMet* to determine which attribute could not be satisfied.

If the route to the destination could not be selected for some internal reason then *reasonForNoRoute* has a value of ***internalReason***. A Software Alarm generated in association with this situation should be reported to Nortel Networks technical support.

If the route to the destination could not be selected because of profile reference problem then *reasonForNoRoute* has a value of ***attributeProfileProblem***.

If the route to the destination could not be selected because of manual path reference problem then *reasonForNoRoute* has a value of ***manualPathIndexProblem***.

The following values of *reasonForNoRoute* are no longer generated: ***routeCostTooMuch***, ***routeDelayTooMuch***, ***incorrectDestinationEndPoint***, and ***sameNode***.

ATTRIBUTE Rtg Rs attributeNotMet (anm)

Access: Read only

Description: This attribute indicates the name of a possible route request data parameter which prevents *RouteSelector* from selecting the route. This attribute always has a value of ***allAttributesMet*** for manual routes since *RouteSelector* does not verify manual routes. This attribute has a meaningful value if *reasonForNoRoute* attribute has a value of ***attributesNotMet***. The value of *attributeNotMet* is only computed when *RouteSelector* operates in manual mode. That is, when route selection has been initiated by the operator in which case *operationMode* has a value of ***manual***.

RouteSelector determines which of the attributes: *requiredRxBandwidth*, *requiredTxBandwidth*, *requiredTrunkModes*, *maximumAcceptableCost*, *maximumAcceptableDelay*, *maximumAcceptableGatewaCost*, *requiredTrafficType*, *permittedTrunkTypes*, *requiredSecurity*, *requiredCustomerParameter*, and *maximumTransmissionUnit* prevents successful route selection by dropping the constraints associated with that attribute and re-selecting the route. If that route can be successfully selected then the attribute for which the constraints were dropped is the attribute preventing successful route selection.

For example, *RouteSelector* drops bandwidth constraints by selecting a route with *requiredRxBandwidth* or *requiredTxBandwidth* of 0. If the route can be selected then bandwidth is preventing successful route selection.

A value of ***unknownAttributeNotMet*** indicates that *RouteSelector* cannot determine why route cannot be selected. Constraints for all attributes are dropped yet successful route cannot be computed. This usually indicates a lack physical connectivity to the destination or gateway node. Alternatively, this may indicate that destination or gateway node is more than 20 hops away where 20 hops is the maximum number of hops in the route.

ATTRIBUTE Rtg Rs routeGatewayCostMetric (rgcm)

Access Read only

Description This attribute indicates the cost metric associated with reaching the destination indirectly through a gateway node or gateway link that is part of the selected route If the selected route leads directly to the destination node then the *routeGatewayCostMetric* is set to a value 0. If a route could not be selected for whatever reason then the *routeGatewayCostMetric* is set to a value 999999 intended to symbolize unknown cost. For manual routes the value of *routeGatewayCostMetric* is also 999999. This is because *RouteSelector* does not verify manual routes thus *routeGatewayCostMetric* is unknown.

Mib PorsVc

Values Decimal (0..999999)

Default 0

ATTRIBUTE Rtg Rs routeType (rtyp)

Access Read only

Description This attribute indicates the type of route that was selected by *RouteSelector.*

If no route was selected then *routeType* has a value of ***noRoute***.

If the destination resides on the current node then *routeType* has a value of ***sameNode***.

If the destination resides on a different node and can be reached directly as opposed to indirectly through a gateway node then *routeType* has a value of ***destinationNode*** or ***destinationNodeLegacy*** with the latter only possible when legacy gateway selection algorithm was used (see *gatewaySelectionAlgorithm*).

If the destination can be reached indirectly through a gateway node with the gateway node being different from the current node then *routeType* has a value of ***gatewayNode*** or ***gatewayLink*** depending on whether or

Copyright © 2006, Nortel Nortel Confidential

not the route consists of a single gateway link. A route consists of a single gateway link only when the route requestor (see *routeRequestor*) is a Routing Gateway (in inbound or outbound direction) and the route leads immediately across topology region or cluster boundary.

If the destination can be reached indirectly through a gateway node with the gateway node being the current node and the route requestor (see *routeRequestor*) is an application service as opposed to a Routing Gateway then *routeType* has a value of ***routingGateway***.

If selected route is a manual route then *routeType* has a value of ***manual***.

Note that the type of route, except for manual route, depends on who is the route requestor (application service, Routing Gateway serving as inbound or outbound gateway), where it resides (gateway or non-gateway node), how the destination can be reached (directly or indirectly through a gateway node), and what is the gateway selection algorithm (cost-based, random or legacy).

manual

Default — noRoute

ATTRIBUTE Rtg Rs routeDescription (rd)

Access — Read only

Description — This attribute indicates a vector of strings describing the selected or manual route returned by *RouteSelector*. Each entry in the vector describes one hop of the route. The hops are identified using a node name and either
- a TRM allocated trunk identification or exit number (TRM uses a component ‘link’, or ‘Lk’ in short form, to refer to trunks), or
- a trunk name,
which is local to that node. TRM allocated exit number is used for routes selected by *RouteSelector*. Trunk name is used for manual routes.

For example, a hop out of node StarBase using exit number 99 is described as “EM/STARBASE Trm Lk/99” for the selected route. A hop out of node StarBase using trunk name 123 is described as “EM/STARBASE TRK/123” for the manual route. A command *display Trm Lk/99* on node StarBase can be used to find out the trunk name corresponding to exit number 99.

GROUP Rtg Rs RouteSelectorControls (Controls)

Properties	Operational
Description	This group contains attributes used to control *RouteSelector*.
Mib	PorsVc

ATTRIBUTE Rtg Rs operationMode (om)

Access	Read and write
Description	This attribute indicates the mode in which the *RouteSelector* is currently operating. The two possible modes are automatic and manual. In the automatic mode, a route request message containing the route request data is originated by a PORS VC and sent to the *RouteSelector*. *RouteSelector* then selects a route or gets a manual route and returns its description in the selected route description data in the selected route message back to the PORS VC. In the manual mode, the *RouteSelector* allows the operator to modify the parameters in the route request data (except for the manual path profile reference), and to initiate route selection using that data. When *RouteSelector* selects the route it displays its description to the operator. Note that even when *operationMode* is set to ***manual***, *RouteSelector* handles route request messages originated by services' VCs in the same way as it does when *operationMode* is set to ***automatic***.
Mib	PorsVc

Default	automatic

ATTRIBUTE Rtg Rs lastRouteSelectionTime (lrst)

Access	Read only
Description	This attribute indicates the time when *RouteSelector* last handled a route request message.
Mib	PorsVc
Values	Time (DHMS)
Default	No default

GROUP Rtg Rs PathAttributes

Properties	Operational
Description	This group contains parameters in route request data that govern the route selection. Values of these parameters are obtained either from an operator or from the last route request message from a PORS VC that contained such parameters or a reference to such parameters (parameter profile reference) as part of the route request data. Route request messages from a PORS VC that ask for a manual route do not contain such parameters or reference to such parameters. All other route request messages either explicitly contain route request data parameters or a reference to a profile containing such parameters. This group of attributes is therefore not applicable to manual routes.
Mib	PorsVc

ATTRIBUTE Rtg Rs sourceNodeId (snid)

Access	Read and write
Description	This attribute indicates the node ID of the source node from which a route to the destination is to be found. It is typically the current node. The term ‘source’ is used in relation to the route selection process and not the node where *RouteSelector* resides, that is the current node. That is, the source node need not be the current node although the selected route will be based on the topological database of the current node.
Mib	PorsVc
Values	Decimal (1..16777215)
Default	1

ATTRIBUTE Rtg Rs setupPriority (sp)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the required priority for path establishment along the selected. Zero is the highest priority and four is the lowest. This attribute is closely related to *bumpingPriority* attribute.
Mib	PorsVc
Values	Decimal (0..4)
Default	2

ATTRIBUTE Rtg Rs requiredTxBandwidth (tbw)

Access	Read and write
Description	This attribute indicates the required transmit bandwidth in bits per second to send data to the destination.
Mib	PorsVc
Values	Decimal (0..4294967295)
Units	bit/s
Default	64000

ATTRIBUTE Rtg Rs requiredRxBandwidth (rbw)

Access	Read and write
Description	This attribute indicates the required receive bandwidth in bits per second to receive data from the destination.
Mib	PorsVc
Values	Decimal (0..4294967295)
Units	bit/s
Default	64000

ATTRIBUTE Rtg Rs maximumTransmissionUnit (maxtu)

Access	Read and write
Description	This attribute indicates the size of the largest packet that can be transported along the selected route. It is used by *RouteSelector* to select a route which avoids trunks whose maximum transmission unit is less than *maximumTransmissionUnit* and as a result would be unable to transport packets of this size. The default value of 0 permits all trunks to be eligible with respect to this attribute.
Mib	PorsVc
Values	Decimal (0..8192)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtg Rs requiredSecurity (rsec)

Access	Read and write
Description	This attribute indicates the required minimum level of security of the trunks along the selected route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the *Trunk PathAdministrator (Trk Pa)* component. *RouteSelector* ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	PorsVc
Values	Decimal (0..7)
Default	4

ATTRIBUTE Rtg Rs requiredTrafficType (rttyp)

Access	Read and write
Description	This attribute indicates the required type of traffic that can be transported along the selected route. There are eight possible traffic types, and only one type can be transported. The ***voice***, ***data,*** and ***video*** traffic types are already defined, and five other traffic types can be defined by the network administrator. The *supportedTrafficType* attribute of the *Trunk PathAdministrator (Trk Pa)* component lists all the types of traffic allowed on the trunk. When selecting a route, *RouteSelector* only chooses trunks whose *supportedTrafficType* contains the *requiredTrafficType*.
Mib	PorsVc
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	voice

ATTRIBUTE Rtg Rs permittedTrunkTypes (pttyp)

Access	Read and write
Description	This attribute indicates a maximum of eight types of trunks that can be part of the selected route. The ***terrestrial*** and ***satellite*** trunk types have been defined already, leaving six remaining types that can be defined by the network administrator. The *trunkType* attribute of the *Trunk PathAdministrator (Trk Pa)* component specifies the type of the trunk. When selecting a route, *RouteSelector* only chooses trunks whose *trunkType* is one of the *permittedTrunkTypes*.

Copyright © 2006, Nortel Nortel Confidential

Mib	PorsVc
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	(terrestrial, satellite, trunkType1, trunkType2, trunkType3)

ATTRIBUTE Rtg Rs requiredCustomerParm (rcpar)

Access	Read and write
Description	This attribute indicates the mechanism to customize the usage of trunks. Any trunk, whose *customerParameter* attribute under the *Trunk PathAdministrator (Trk Pa)* component is larger than the *requiredCustomerParameter* is not eligible to become part of the selected route.
Mib	PorsVc
Values	Decimal (0..7)
Default	4

ATTRIBUTE Rtg Rs pathAttributeToMinimize (pamin)

Access	Read and write
Description	This attribute indicates whether a route should be selected on the basis of minimizing the route cost or the route delay. Each trunk has a cost and a delay metric associated with it. The cost of a route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a route is the sum of the trunk delay metrics for all trunks included in the route. The delay metric of a trunk is equal to half the *measuredRoundTripDelay* operational attribute of the trunk.
Mib	PorsVc
Values	cost delay
Default	cost

ATTRIBUTE Rtg Rs maximumAcceptableCost (maxCost)

Access	Read and write
Description	This attribute indicates the upper bound on the cost metric of the selected route, which is the sum of the cost metrics of all trunks on the route. *RouteSelector* ensures the cost metric of the selected route does not exceed the *maximumAcceptableCost*.

Copyright © 2006, Nortel Nortel Confidential

Mib	PorsVc
Values	Decimal (0..65535)
Default	1280

ATTRIBUTE Rtg Rs maximumAcceptableDelay (maxDelay)

Access	Read and write
Description	This attribute indicates the upper bound on the delay metric of the selected route, which is the sum of the delay metrics of all trunks on the route. *RouteSelector* ensures the delay metric of the selected route does not exceed the *maximumAcceptableDelay*. The delay metric of a trunk is equal to half the *measuredRoundTripDelay* operational attribute of the trunk.
Mib	PorsVc
Values	Decimal (0..100000)
Units	msec
Default	100000

ATTRIBUTE Rtg Rs bumpPreference (bprf)

Access	Read and write
Description	This attribute indicates whether bumping may be considered when selecting a route. By default, bumping may be considered only when it is necessary. That is, only when no other route to the destination or gateway node can be found An indication to always bump in order to find the best route may be set. In this case an absolutely best route to the destination or gateway node is found even if other paths along that route would need bumping.
Mib	PorsVc
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	bumpWhenNecessary

ATTRIBUTE Rtg Rs requiredTrunkModes (rtmod)

Access	Read and write
Description	This attribute indicates which trunk modes to consider during route selection. The operational *mode* attribute of the *Trunk PathAdministrator (Trk Pa)* component specifies the mode of the trunk. When selecting a route, *RouteSelector* can either consider trunks with any mode, or only trunks with *mode* set to ***mapping***. That is, the selected route may contain trunks with any mode, or all trunks with *mode* set to ***mapping***.
Mib	PorsVc

Copyright © 2006, Nortel Nortel Confidential

Values	any mapping
Default	any

ATTRIBUTE Rtg Rs maximumAcceptableGatewayCost (maxGCost)

Access	Read and write
Description	This attribute indicates the upper bound on the cost metric associated with reaching the destination along the selected route and through a gateway node. Such cost metrics are provisioned under *Trunk Address* component on a gateway node specifying costs of reaching an address through the gateway node and more accurately through the gateway link represented by the *Trunk* component.
Mib	PorsVc
Values	Decimal (0..65535)
Default	2048

ATTRIBUTE Rtg Rs routeRequestor (rreq)

Access	Read and write
Description	This attribute indicates the type of entity that makes a request for a route (route requestor). Three types of entities can make route requests: application service, Routing Gateway serving as inbound gateway at a gateway node, or Routing Gateway serving as outbound gateway at a gateway node.
Mib	PorsVc
Values	applicationService inboundRGty outboundRGty
Default	applicationService

ATTRIBUTE Rtg Rs gatewaySelectionAlg (gsalg)

Access	Read and write
Description	This attribute indicates the type of algorithm to use when a route to the destination has to be selected indirectly through a gateway node. The following types of algorithms are available: cost based, random, and legacy. For cost based algorithm, *RouteSelector* selects gateway node that advertised it can reach the destination at the smallest cost. For random algorithm, *RouteSelector* selects randomly any gateway node that advertised it can reach the destination. For legacy algorithm, *RouteSelector* selects a complete route to the

Copyright © 2006, Nortel Nortel Confidential

destination without attempting to route through gateway nodes. This is only possible during single to multi topology region migration, or cluster migration but before such migration is complete. During such migrations routing to the destination is initially attempted through gateway nodes, but if such routing fails then legacy routing is attempted.

Mib	PorsVc
Values	costBased random legacy
Default	costBased

ATTRIBUTE Rtg Rs destination (dest)

Access	Read and write
Description	This attribute indicates either the ASCII name, node ID, or NSAP address of the destination node to which a route needs to be found. The format for *destination* is either 1. “EM/nodeName serviceName/instance”, for ASCII name, for example “EM/MoonBase VS/3”, or 2. “NID/nodeId”, for node ID, for example “NID/1226”, or 3. “NSAP/nsapAddress”, for NSAP address, for example “NSAP/12234001”. For NSAP address formats a full ATM End System Address, node summary, or reachable address can be specified, as well as a node prefix.
Mib	PorsVc
Values	String (0..45, ASCII)
Default	No default

GROUP Rtg Rs Statistics (Stats)

Properties	Operational
Description	This group contains statistics gathered by *RouteSelector* and relating to route selections.
Mib	PorsVc

ATTRIBUTE Rtg Rs routeStatistics

Access	Read only
Description	This attribute indicates a table (or an array) of the number of route requests and the number of routes selected. There are six rows and five columns in the table. The first row contains a number of route requests in a column. Each column corresponds to a value of *setupPriority* (= 0,1,2,3,4). An element in the first row gives a number of route request per given *setupPriority*. The five subsequent rows provide numbers of routes selected at *bumpingPriority* 0,1,2,3,4. The second row provides numbers

Copyright © 2006, Nortel Nortel Confidential

of route selections at *bumpingPriority* 0. Only route requests of *setupPriority* 0 could be given routes of the *bumpingPriority* 0. By virtue of the property of *bumpingPriority* that it cannot be better than the *setupPriority* the rows two to six form a lower triangular matrix. Route selections performed upon operator request (manual route requests) are not counted.

COMPONENT Rtg DpnAddressPlan (Dpn)

Groups	GROUP Rtg Dpn Provisioned (Prov) GROUP Rtg Dpn Operational (Oper) GROUP Rtg Dpn ControlStatistics (ConStats) GROUP Rtg Dpn ForwardingStatistics (FwdStats)
Scope	Network
Description	*Routing DpnAddressPlan* This component is a subcomponent of *Routing*. It resides on all nodes that carry DPN traffic and is responsible for maintaining the routing information required to route this traffic. It is required on nodes that (i) support gateways to RMs and/or AMs, (ii) nodes that source and/or sink DPN traffic (for example, nodes which

Copyright © 2006, Nortel Nortel Confidential

support VC end points), and (iii) intermediary nodes that simply carry DPN traffic.

Common Verbs	Help List Display

GROUP Rtg Dpn Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *DpnAddressPlan*. Attributes in this group must be set to allow the *DpnAddressPlan* component to function properly.
Mib	DpnRouting

ATTRIBUTE Rtg Dpn logicalNetworkNumber (lnn)

Access	Read only
Criticality	Module
Description	This attribute specifies the Logical Network Number for the *DpnAddressPlan*. Since only one instance of this component can exist, this value is always set to one. It is provided here to be consistent with other address plans and so that it can be queried.
Mib	DpnRouting
Values	Decimal (1..1)
Default	1

ATTRIBUTE Rtg Dpn routingId

Access	Read and write
Criticality	Module
Description	This attribute specifies the Routing Identifier (RID) associated with this node.

Copyright © 2006, Nortel Nortel Confidential

The RID is used to identify a group of one or more interconnected nodes (called a RID subnet) supporting the transport of DPN traffic. Its value must be the same as that of the other nodes in this RID subnet and different from that of all RMs and other RID subnets in the network.

The *routingId* must be set when a *DpnAddressPlan* component is configured on an node.

Changing the value of the *routingId* causes the node to restart.

Mib	DpnRouting
Values	Decimal (1..126)
Default	No default

ATTRIBUTE Rtg Dpn moduleId

Access	Read and write
Criticality	Module
Description	This attribute specifies the Module Identifier (MID) associated with this node. The MID is used to identify a node supporting the transport of DPN traffic. Its value must be different from that of all MIDs assigned to nodes in this RID subnet (interconnected nodes sharing a RID) and AMs in clusters supported by this subnet. If routing zones are used, it must also be unique from all other MIDs in this zone. The *moduleId* must be set when a *DpnAddressPlan* component is configured on a node. Changing the value of the *moduleId* will cause the node to restart.
Mib	DpnRouting
Values	Decimal (1..1909)
Default	No default

ATTRIBUTE Rtg Dpn delayMetricCutOff (delayC)

Access	Read and write
Description	This attribute specifies the delay metric value beyond which a destination RID should be considered unreachable. That is, if a delay metric to a RID is equal to or greater than this value then the RID is considered to be unreachable in the delay class of service. Lowering this value has the effect of speeding up the detection of the loss of reachability to a RID. It also reduces the amount of Routing Table Update (RTU) traffic generated in this scenario. Care must be taken to

Copyright © 2006, Nortel Nortel Confidential

ensure that the value chosen is big enough for the longest delay path in the network.

This attribute is optional; a default of 128 is used when it is not set. It is recommended that all nodes in the network be provisioned with the same cut off value.

Mib	DpnRouting
Values	Decimal (64..250)
Default	128

ATTRIBUTE Rtg Dpn throughputMetricCutOff (tputC)

Access	Read and write
Description	This attribute specifies the throughput metric value beyond which a destination RID should be considered unreachable. That is, if a throughput metric to a RID is equal to or greater than this value then the RID will be considered to be unreachable in the throughput class of service. Lowering this value has the effect of speeding up the detection of the loss of reachability to a RID. It also reduces the amount of Routing Table Update (RTU) traffic generated in this scenario.Care must be taken to ensure that the value chosen is big enough for the longest throughput path in the network. This attribute is optional; a default of 245 is used when it is not set. It is recommended that all nodes in the network be provisioned with the same cut off value.
Mib	DpnRouting
Values	Decimal (128..245)
Default	245

ATTRIBUTE Rtg Dpn forwardingPolicy

Access	Read and write
Description	This attribute specifies the forwarding policy used by packet forwarding to handle DPN traffic on a node. When this attribute is set to ***loadshare***, DPN traffic is shared among preferred links in a link group in proportion to the available bandwidth on each link; the traffic is not forwarded in an order-preserved manner and needs resequencing at the destination, but the available bandwidth in a link group is utilized efficiently. When this attribute is set to ***loadspread***, DPN traffic is forwarded in an order-preserved manner along a randomly selected route; the traffic sticks to a particular link in a link group, and will not spill over to other links in the link group unless there is congestion on the selected link.

Copyright © 2006, Nortel Nortel Confidential

When this attribute is set to ***loadspreadFast***, DPN traffic is forwarded in an order-preserved manner along a randomly selected route; the traffic sticks to a particular link in a link group, and will not spill over to other links in the link group. Choosing this value may improve throughput but traffic may be discarded in the presence of congestion.

It is recommended that all nodes in the network be provisioned with the same forwarding policy.

Note that though ***loadshare***, ***loadspread*** and ***loadspreadFast*** are all supported on the Nortel Networks Multiservice Switch 7400, ***loadspreadFast*** is the only forwarding policy that is supported on the Nortel Networks Multiservice Switch 15000 and the Nortel Networks Multiservice Switch 20000. On these switches, if the *forwardingPolicy* attribute is set to either ***loadshare*** or ***loadspread***, the underlying forwarding policy defaults to the value of ***loadspreadFast***.

A change in this attribute does not take effect on any already established Frame Relay (FR) connection. The existing FR connections should be restarted to adopt the new forwarding policy.

Mib	DpnRouting
Values	loadspread (spread) loadshare (share) loadspreadFast (spFast)
Default	loadspread

ATTRIBUTE Rtg Dpn delayMetricRangeBoundary (delayR)

Access	Read and write
Description	This attribute specifies the total path delay metric below which the *variance* value specified for delay COS and a low metric range is used, and at or above which the *variance* value specified for delay COS and a high metric range is used. This attribute defaults to 0, so that the *variance* value specified for delay COS and a high metric range is used for all delay paths. If this attribute is set to 2147483647, the *variance* value specified for delay COS and a low metric range is used for all delay paths.
Mib	DpnRouting
Values	Decimal (0..2147483647)
Default	0

ATTRIBUTE Rtg Dpn tputMetricRangeBoundary (tputR)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the total path throughput metric below which the *variance* value specified for throughput COS and a low metric range is used, and at or above which the *variance* value specified for throughput COS and a high metric range is used. This attribute defaults to 0, so that the *variance* value specified for throughput COS and a high metric range is used for all delay paths. If this attribute is set to 2147483647, the *variance* value specified for throughput COS and a low metric range is used for all throughput paths.
Mib	DpnRouting
Values	Decimal (0..2147483647)
Default	0

ATTRIBUTE Rtg Dpn variance

Access	Read and write
Description	This attribute specifies the variance values for high and low metric ranges, for each class of service (COS). A variance value is the maximum allowed difference in metric between the best path and the second path, as a percentage of the best path metric. High and low metric ranges are defined for each COS by the *delayMetricRangeBoundary* and *tputMetricRangeBoundary* attributes, and refer to total path metrics. When a variance value for a certain COS and metric range is set to the default value of 0, only equal metric paths can be used under that COS when the best path metric is in that range. When it is set to a value greater than 0, an alternate path which is safe (that is, non-looping) and which has a metric within this percentage of the best path metric can be used as a multipath. The special value of 9999 signifies an infinite variance, so that any safe alternate path may be used in addition to the single best path, regardless of its metric.
Mib	DpnRouting
Array of	Decimal (0..500; 9999)
Units	%
Row	cos [delay throughput]
Column	metricRange [low high]
Default	([2 * 2] 0)

ATTRIBUTE Rtg Dpn csrmRoute

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the loadsharing mechanism for CSRM routing. When this attribute is set to ***share***, all call request packets that originate from or transit through the node will be forwarded to the two active CSRMs on a round-robin basis. When this attribute is set to ***closest***, all the call request packets will be forwarded to the closest CSRM. The default behavior is set to forward the calls to the closest CSRM.
Mib	DpnRouting
Values	closest (cl) shared (sh)
Default	closest

GROUP Rtg Dpn Operational (Oper)

Properties	Operational
Description	This group of attributes provides information about the functioning of the *DpnAddressPlan* component.
Mib	DpnRouting

ATTRIBUTE Rtg Dpn callServerModuleRids

Access	Read only
Description	This attribute indicates the RIDs of the Call Server Resource Modules (CSRMs) currently in use to support Call Server functions, such as SCR and DCR, for the RID subnet. Up to two CSRMs can be in use to support such Call Server functions. Note that packets destined to Call Server functions are routed to the closest CSRM supporting the required server functionality.
Mib	DpnRouting
List of	Decimal (1..126)
Default	No default

GROUP Rtg Dpn ControlStatistics (ConStats)

Properties	Operational
Description	This group of attributes provides statistics about the behavior of the *DpnAddressPlan* component. The statistics concern the distribution of routing information, required to support the routing of DPN traffic, to all nodes in the RID subnet.
Mib	DpnRouting

ATTRIBUTE Rtg Dpn controlPktTx

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the internal control packets, originating from this node, sent to other nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The packets received from a neighbor node and forwarded to other neighbors are not counted. The counter wraps around to zero when the maximum value is reached.
Mib	DpnRouting
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtg Dpn controlPktRx

Access	Read only
Description	This attribute counts the internal control packets received from other nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The counter wraps around to zero when the maximum value is reached.
Mib	DpnRouting
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtg Dpn controlBytesTx

Access	Read only
Description	This attribute counts the internal control packet bytes, originating from the node, sent to other nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. Packet bytes received from a neighbor node and forwarded to other neighbors are not counted. The counter wraps around to zero when the maximum value is reached.
Mib	DpnRouting
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtg Dpn controlBytesRx

Access	Read only
Description	This attribute counts the internal control packet bytes received from other nodes in the RID subnet. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The counter wraps around to zero when the maximum value is reached.
Mib	DpnRouting

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtg Dpn outOfSequencePkt

Access	Read only
Description	This attribute counts the internal control packets received and rejected. These packets contained old sequence numbers. The packets contain DPN routing information required by the *DpnAddressPlan* component to support the transport of DPN traffic. The counter wraps around to zero when the maximum value is reached.
Mib	DpnRouting
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtg Dpn ForwardingStatistics (FwdStats)

Properties	Operational
Description	This group of attributes provides statistics for the traffic handled by DPN packet forwarding on this module. The statistics can be used to monitor the connectionless traffic profile on this module.
Mib	DpnRouting

ATTRIBUTE Rtg Dpn totalPackets

Access	Read only
Description	This attribute counts the delay and throughput packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast.*** It is the aggregate of *totalPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.
Mib	DpnRouting
Values	Long Integer
Default	No default

ATTRIBUTE Rtg Dpn throughputPackets

Access	Read only
Description	This attribute counts the throughput packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *throughputPackets* attribute of all *LpStatistics* components on the module. Note that DPRS

Copyright © 2006, Nortel Nortel Confidential

packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.

Mib	DpnRouting
Values	Long Integer
Default	No default

ATTRIBUTE Rtg Dpn delayPackets

Access	Read only
Description	This attribute counts the delay packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *delayPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.
Mib	DpnRouting
Values	Long Integer
Default	No default

ATTRIBUTE Rtg Dpn normalReliabilityPackets

Access	Read only
Description	This attribute counts the normal reliability packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *normalReliabilityPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.
Mib	DpnRouting
Values	Long Integer
Default	No default

ATTRIBUTE Rtg Dpn highReliabilityPackets

Access	Read only
Description	This attribute counts the high reliability packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *highReliabilityPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are

Copyright © 2006, Nortel Nortel Confidential

not counted. The counter wraps to zero when the maximum value is exceeded.

Mib	DpnRouting
Values	Long Integer
Default	No default

ATTRIBUTE Rtg Dpn discardNoRoute

Access	Read only
Description	This attribute counts the packets that have been discarded by packet forwarding due to failure to find a route to forward the packets on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *discardNoRoute* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.
Mib	DpnRouting
Values	Long Integer
Default	No default

ATTRIBUTE Rtg Dpn interruptingPackets

Access	Read only
Description	This attribute counts the multimedia packets handled by DPN packet forwarding on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. It is the aggregate of *interruptingPackets* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.
Mib	DpnRouting
Values	Long Integer
Default	No default

ATTRIBUTE Rtg Dpn discardLpCongested

Access	Read only
Description	This attribute counts the packets that have been discarded by packet forwarding due to LP congestion on this module when the *forwardingPolicy* attribute of the *Routing DpnAddressPlan* component is set to a value of ***loadshare***, ***loadspread*** or ***loadspreadFast***. A packet encounters LP congestion when there is insufficient shared memory. This attribute is the aggregate of *discardLpCongested* attribute of all *LpStatistics* components on the module. Note that DPRS packets leaving

Copyright © 2006, Nortel Nortel Confidential

	the network at this module are not counted. The counter wraps to zero when the maximum value is exceeded.
Mib	DpnRouting
Values	Long Integer
Default	No default

COMPONENT Rtg Dpn ReachableRidInfo (Rid)

Instance	Decimal (0..127)
Groups	GROUP Rtg Dpn Rid Operational (Oper)
Scope	Network
Description	*Routing Dpn ReachableRidInfo/<rid>* This component is a dynamic subcomponent of the *DpnAddressPlan*. It provides information about the paths to RIDs in the network that are reachable. There is one instance per reachable RID.
Mib	DpnRouting
Dyn. Subcomp.	COMPONENT Rtg Dpn Rid Mid
Common Verbs	Help List Display

VERB Ping Rtg Dpn Rid

Impact	Passive
Description	*Ping [-sensitivity(throughput/delay|multimedia)] [-reliability(high/normal)] [-priority(normal/high)] [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] [-allPaths] Routing Dpn Rid/<rid>* *Ping* causes a query packet to be sent to the RID destination. It can be used to either find a path to a destination or to measure the round trip delay to reach the destination. The ping command can also be used to ensure that the destination is reachable. If the destination is unreachable or the network is congested, the operator will be notified. The ping command can be issued with or without options. If no options are specified, the command reports the path used to reach the destination. When ping is used to find a path, it displays the RID and MID of each module that the query packet passes through on its way to the destination.

Copyright © 2006, Nortel Nortel Confidential

The *ping* command supports the following options:

-sensitivity: This option specifies the sensitivity for the route to be taken by the ping packet. If ***delay*** sensitivity is specified, the packet is routed on the minimum delay path. If ***throughput*** sensitivity is specified, the packet is routed on the highest bandwidth route. If **multimedia** sensitivity is specified, the
packet is routed on the minimum delay path using the highest emission priority link transmit queue available. If this option is not selected, ***throughput*** sensitivity is used.

-reliability: This option specifies the reliability for the route to be taken by the ping packet. If ***high*** reliability is specified, the packet is routed on an overflow path if the primary path is congested. If ***normal*** reliability is specified, the ping packet is discarded if the primary path is congested. If this option is not selected, ***high*** reliability is used.

-priority: This option influences the priority of the *ping* packet. If ***high*** priority is specified, the packet is less likely to be discarded in the network. If this option is not selected, ***normal*** priority is used.

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the sendPktSize and returnPktSize options. The minimum, maximum and average time taken by the returned packets are reported. This option is ignored if the *allPaths* option is selected. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. This option is ignored if the -rtd option is not specified.

The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response.

If this option is not selected the default value is 64 octets if **multimedia** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. This option is ignored if the -rtd option is not specified.

The rtd acknowledge packet consists of the Nortel Netwroks proprietary

Copyright © 2006, Nortel Nortel Confidential

common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response.

If this option is not selected the default value is 64 octets if **multimedia** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-allPaths (-all): If this option is selected, 16 query packets will be sent to the destination, and all possible paths (up to 16) to reach the destination will be reported. Since there are 16 path selection values used in the DPRS packet forwarding system, 16 query packets that each carry a different path selector will collect path information for all possible paths. All query packets which return to the source node within the timeout period are included in the response. The response indicates how many query packets were sent, how many were returned, and how many unique paths were taken.

GROUP Rtg Dpn Rid **Operational (Oper)**

Properties	Operational
Description	This group of attributes is maintained by the *DpnAddressPlan* component to provide information about the RIDs reachable in the network.
Mib	DpnRouting

ATTRIBUTE Rtg Dpn Rid **dpnDelayMetric**

Access	Read only
Description	This attribute indicates the minimum DPN delay metric to the destination RID. The delay metric associated with a path is computed by the routing system by translating the smallest *delayMetric* calculated for the destination. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities. The metric displayed is that of the best path to the destination. This metric is advertised to neighbor RMs and Nortel Networks Multiservice Switches in a different RID subnet. A metric value of 255 means the RID is unreachable in the delay class of service. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID. A metric value of 252 indicates that the destination RID is that of a Network Module (NM).
Mib	DpnRouting
Values	Decimal (0..255)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rtg Dpn Rid dpnTputMetric

Access	Read only
Description	This attribute indicates the minimum DPN throughput metric to the destination RID. The throughput metric associated with a path is computed by the routing system by translating the smallest *tputMetric* calculated for the destination. A path with a lower metric value is preferable to one with a higher value as it is associated with higher bandwidth facilities. The metric displayed is that of the best path to the destination. This metric is advertised to neighbor RMs and Nortel Networks Multiservice Switches in a different RID subnet. A metric value of 255 means the RID is unreachable in the throughput class of service. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID.
Mib	DpnRouting
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Rtg Dpn Rid routeType

Access	Read only
Description	This attribute indicates whether the paths in use to reach the destination RID are learned or default routes. When the paths in use are learned paths, the attribute value is ***learned***. When the paths are default routes, the attribute value is ***default***. The paths in use are always learned when this node is not a cluster node. There are up to two paths to reach a destination RID for each delay and throughput class of service. The paths displayed are the best and next best paths among all available paths to the destination. The paths in use are default routes only when this node is a cluster node. A cluster node has no knowledge about RID subnets other than its own. All packets destined to unknown RIDs, i.e. RIDs other than its own RID, will first be sent out of the cluster in which this node is located, and further forwarded by the nodes outside of the cluster to reach the destination. Therefore, the delay and throughput paths in use to reach a RID other than the cluster node's own RID are the two best and next best delay or throughput paths to get out of the cluster, and are called the default routes.
Mib	DpnRouting
Values	learned default
Default	learned

ATTRIBUTE Rtg Dpn Rid delayNextHopLinkGroups

Access	Read only
Description	This attribute indicates the delay link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination RID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest delay metrics to the destination. The link group can be that of either a Nortel Networks Multiservice Switch interconnection or a gateway to an RM. If no link groups are listed then the destination is not reachable in the delay class of service (except in the case of the local node's RID). Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.
Mib	DpnRouting
Values	The name of the component
Replication	Decimal (0..1)
Default	No default

ATTRIBUTE Rtg Dpn Rid tputNextHopLinkGroups

Access	Read only
Description	This attribute indicates the throughput link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination RID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest throughput metrics to the destination. The link group can be that of either a Nortel Networks Multiservice Switch interconnection or a gateway to an RM. If no link groups are listed then the destination is not reachable in the throughput class of service (except in the case of the local node's RID). ATTRIBUTE Rtg Dpn Rid delayPathTrafficProportions

Access	Read only
Description	This attribute indicates the target percentages of the total delay traffic flows to the destination which are sent over each delay path. These percentages are achieved when there is a large number of virtual circuits (VCs).
Mib	DpnRouting
Values	Decimal (0..100)
Units	%
Replication	Decimal (0..1)
Default	No default

ATTRIBUTE Rtg Dpn Rid tputPathTrafficProportions

Access	Read only
Description	This attribute indicates the target percentages of the total throughput traffic flows to the destination which are sent over each throughput path. These percentages are achieved when there is a large number of virtual circuits (VCs).
Mib	DpnRouting
Values	Decimal (0..100)
Units	%
Replication	Decimal (0..1)
Default	No default

ATTRIBUTE Rtg Dpn Rid delayMetric

Access	Read only
Description	This attribute indicates the delay metrics of up to two paths to the destination RID. The delay metric associated with a path is computed by the routing system based on the sum of the delays associated with the links in the path to the destination. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities. The metrics displayed are those of the paths being used to reach the destination. Metric values of 2147483647 for both paths means the RID is unreachable in the delay class of service. A metric value of 2147483647 for the second path only means that there is only one viable delay path to the destination. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID. Metric values of 2147483646 indicate that the destination RID is that of a Network Module (NM).

The throughput metric associated with a path is computed by the routing system based on the sum of the bandwidth associated with the links in the path to the destination. A path with a lower metric value is preferable to one with a higher value as it is associated with higher bandwidth facilities. The metrics displayed are those of the paths being used to reach the destination. Metric values of 2147483647 for both paths means the RID is unreachable in the throughput class of service. A metric value of 2147483647 for the second path only means that there is only one viable throughput path to the destination. A value of 0 indicates that no cost is associated with the path to the destination. This would be the case for the local node's RID.

VERB Ping **Rtg Dpn Rid Mid**

Impact	Passive
Description	*Ping [-sensitivity(throughput/delay|multimedia)] [-reliability(high/normal)] [-priority(normal/high)] [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] [-allPaths] Routing Dpn Rid/<rid> Mid/<mid>* *Ping* causes a query packet to be sent to the RID MID destination. It can be used to either find a path to a destination or to measure the round trip delay to reach the destination. The ping command can also be used to ensure that the destination is reachable. If the destination is unreachable or the network is congested, the operator will be notified. The ping command can be issued with or without options. If no options are specified, the command reports the path used to reach the destination. When ping is used to find a path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. The *ping* command supports the following options: *-sensitivity:* This option specifies the sensitivity for the route to be taken by the ping packet. If ***delay*** sensitivity is specified, the packet is routed on the minimum delay path. If ***throughput*** sensitivity is specified, the packet is routed on the highest bandwidth route. If ***multimedia*** sensitivity is specified***,*** the packet is routed on the minimum delay path using the highest emission priority link transmit queue available. If this option is not selected, ***throughput*** sensitivity is used. *-reliability:* This option specifies the reliability for the route to be taken by the ping packet. If ***high*** reliability is specified, the packet is routed on an overflow path if the primary path is congested. If ***normal*** reliability is specified, the ping packet is discarded if the primary path is congested. If this option is not selected, ***high*** reliability is used. *-priority:* This option influences the priority of the *ping* packet. If ***high*** priority is specified, the packet is less likely to be discarded in the network. If this option is not selected, ***normal*** priority is used. -sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. This option is ignored if the -rtd option is not specified. The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12

Copyright © 2006, Nortel Nortel Confidential

octets are sent to the destination. The actual number of data octets sent is displayed in the ping response.

If this option is not selected the default value is 64 octets if **multimedia** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. This option is ignored if the -rtd option is not specified.

The rtd acknowledge packet consists of the Nortel networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response.

If this option is not selected the default value is 64 octets if **multimedia** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-allPaths (-all): If this option is selected, 16 query packets will be sent to the destination, and all possible paths (up to 16) to reach the destination will be reported. Since there are 16 path selection values used in the DPRS packet forwarding system, 16 query packets that each carry a different path selector will collect path information for all possible paths. All query packets which return to the source node within the timeout period are included in the response. The response indicates how many query packets were sent, how many were returned, and how many unique paths were taken.

COMPONENT Rtg Dpn ReachableMidInfo (Mid)

Instance	Decimal (0..2046)
Groups	GROUP Rtg Dpn Mid Operational (Oper)
Scope	Network
Description	*Routing Dpn ReachableMidInfo/<mid>* This component is a dynamic subcomponent of the *DpnAddressPlan*. It provides information about the MIDs supported by the local RID subnet that are, or were once, reachable. If the node is not a cluster node, an instance of this component represents the MID of any one of the nodes supported in the RID subnet. These includes nodes located inside or outside a cluster, DPN-100 AMs sub-tended off a cluster, and DPN-100 AMs connected to a node outside of a

cluster.

If the node is a cluster node, an instance of this component represents the MID of any one of the nodes supported by the local cluster in the subnet. These include only Nortel Networks Multiservice Switches in the local cluster and DPN-100 AMs sub-tended off the cluster. In other words, MIDs located outside of the cluster are not shown.

Note that the node is in a cluster and is a cluster node when the *clusterNode* attribute under the *Routing* component is provisioned as ***yes***.

Mib — DpnRouting

Common Verbs — Help, List, Display

VERB Ping **Rtg Dpn Mid**

Impact — Passive

Description — *Ping [-sensitivity(throughput/delay/multimedia)] [-reliability(high/normal)] [-priority(normal/high)] [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] [-allPaths] Routing Dpn Mid/<mid>*

Ping causes a query packet to be sent to the MID destination. It can be used to either find a path to a destination or to measure the round trip delay to reach the destination.

The ping command can also be used to ensure that the destination is reachable. If the destination is unreachable or the network is congested, the operator will be notified.

The ping command can be issued with or without options. If no options are specified, the command reports the path used to reach the destination. When ping is used to find a path, it displays the RID and MID of each module that the query packet passes through on its way to the destination.

The *ping* command supports the following options:

-sensitivity: This option specifies the sensitivity for the route to be taken by the ping packet. If ***delay*** sensitivity is specified, the packet is routed on the minimum delay path. If ***throughput*** sensitivity is specified, the packet is routed on the highest bandwidth route. If ***multimedia*** sensitivity is specified***,*** the packet is routed on the minimum delay path using the highest
emission priority link transmit queue available. If this option is not selected, ***throughput*** sensitivity is used.

-reliability: This option specifies the reliability for the route to be taken by

Copyright © 2006, Nortel Nortel Confidential

the ping packet. If ***high*** reliability is specified, the packet is routed on an overflow path if the primary path is congested. If ***normal*** reliability is specified, the ping packet is discarded if the primary path is congested. If this option is not selected, ***high*** reliability is used.

-priority: This option influences the priority of the *ping* packet. If ***high*** priority is specified, the packet is less likely to be discarded in the network. If this option is not selected, ***normal*** priority is used.

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the sendPktSize and returnPktSize options. The minimum, maximum and average time taken by the returned packets are reported. This option is ignored if the *allPaths* option is selected. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. This option is ignored if the -rtd option is not specified.

The rtd query packet consists of the Nortel Netwroks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response.

If this option is not selected the default value is 64 octets if **multimedia** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the timeout response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. This option is ignored if the -rtd option is not specified.

The rtd acknowledge packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response.

If this option is not selected the default value is 64 octets if **multimedia** sensitivity has been specified, and 128 octets otherwise. If the specified packet data size exceeds the capability of some facilities on the path, the

Copyright © 2006, Nortel Nortel Confidential

packet will be discarded and the operator will get the timeout response.

-allPaths (-all): If this option is selected, 16 query packets will be sent to the destination, and all possible paths (up to 16) to reach the destination will be reported. Since there are 16 path selection values used in the DPRS packet forwarding system, 16 query packets that each carry a different path selector will collect path information for all possible paths. All query packets which return to the source node within the timeout period are included in the response. The response indicates how many query packets were sent, how many were returned, and how many unique paths were taken.

GROUP Rtg Dpn Mid Operational (Oper)

Properties	Operational
Description	This group of attributes is maintained by *DpnAddressPlan* component to provide information about the MIDs reachable, or once reachable, through the local RID subnet.
Mib	DpnRouting

ATTRIBUTE Rtg Dpn Mid routeType

Access	Read only
Description	This attribute indicates whether the paths in use to reach the destination MID is learned or default routes. When the paths in use are learned paths, the attribute value is ***learned***. When the paths are default routes, the attribute value is ***default***. The paths in use are always learned when this node is not a cluster node. There are up to two paths to reach a destination MID for each delay and throughput class of service. The paths displayed are the best and next best paths among all available paths to the destination. The paths in use can be learned or default routes when this node is a cluster node. The paths are learned when the destination MID and this node are located in the same cluster. When the destination MID is located outside of the cluster, all packets destined to that MID will first be sent out of the cluster, and further forwarded by the nodes outside of the cluster to reach the destination. Therefore, the delay and throughput paths in use to send packets to all MIDs located outside of the cluster are the two best and next best delay or throughput paths to get out of the cluster, and are called the default routes.
Mib	DpnRouting
Values	learned default
Default	learned

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtg Dpn Mid **midType**

Access	Read only
Description	This attribute indicates the type of the MID for the module in the subnet. ***em*** - for a backbone (that is, non-cluster) Nortel Networks Multiservice Switch. ***am*** - for a DPN-100 node. ***cluster*** - for a Nortel Networks Multiservice Switch inside a cluster. ***unknown*** - for a node that is unknown to the cluster node.
Mib	DpnRouting
Values	em am cluster unknown
Default	No default

ATTRIBUTE Rtg Dpn Mid **substituteRid**

Access	Read only
Description	This attribute indicates the substitute RID in use for the MID. This RID will be substituted for the RID in DPN packets destined to the local node's RID and the MID in question when the MID is unreachable (when, for example, all links to an AM from the RID subnet are down). It will also be used in the case where the path through the substitute RID is better than that available through the subnet's connection to the cluster containing the AM MID. Substitute RIDs are learned from AM clusters that are supported by two RIDs (the subnet's RID and another one). The operator can check this value to determine if a possible back up route to an AM exists. When there are no *delayNextHopLinkGroups* or *tputNextHopLinkGroups* shown to reach the MID, the substitute RID will be used. A value of 128 indicates that no substitute RID is known.
Mib	DpnRouting
Values	Decimal (1..128)
Default	128

ATTRIBUTE Rtg Dpn Mid **delayNextHopLinkGroups**

Access	Read only
Description	This attribute indicates the delay link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination MID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest delay metrics to the destination.

Copyright © 2006, Nortel Nortel Confidential

The link group can be that of either a Nortel Networks Multiservice Switch interconnection or a gateway to an AM.

If no link groups are listed then the destination is not reachable in the delay class of service (except in the case of the local node's MID, or when a substitute RID path is available).

Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.

Mib	DpnRouting
Values	The name of the component
Replication	Decimal (0..1)
Default	No default

ATTRIBUTE Rtg Dpn Mid tputNextHopLinkGroups

Access	Read only
Description	This attribute indicates the throughput link group, or groups, that are being used to reach a neighbor which is the next hop in the path to the destination MID. DPN traffic will be spread across the links, in up to two link groups, when available. The link groups selected are those associated with the two loop-free paths with the lowest throughput metrics to the destination. The link group can be that of either a Nortel Networks Multiservice Switch interconnection or a gateway to an AM. If no link groups are listed then the destination is not reachable in the throughput class of service (except in the case of the local node's MID, or when a substitute RID path is available). Link group instances are managed by the *TransportResource* component. Further information about the links in the group can be obtained from it.
Mib	DpnRouting

Description	This group of attributes specifies the criteria for filtering Routing Table Updates (RTUs) sent to and received from a neighboring RID.
Mib	DpnRouting

ATTRIBUTE Rtg Dpn RidFilter importRidList

Access	Read and write
Description	This attribute specifies the list of RIDs whose reachability information will be accepted from the instance RID. Information about RIDs which do not appear in this list will be ignored and this node considers those RIDs to be unreachable from the instance RID. Note that this also applies to the instance RID itself, that is, if the instance RID does not appear in the import list, this node considers the instance RID to be unreachable from the instance RID. By default this list contains all valid RIDs, meaning that information about

Copyright © 2006, Nortel Nortel Confidential

all RIDs will be accepted from the instance RID.

When this list is empty, no RID information is accepted from the instance RID, therefore, no RID traffic will be routed to it. A warning is generated when an empty import list is detected.

RID 127 is the Network Services Sharing (NSS) RID, used to identify DPN-100 nodes running call servers which can be used for remote call processing. This RID can be filtered like any other using the import RID list.

Mib	DpnRouting
List of	Decimal (1..127)

Replication	Decimal (0..1)
Default	No default

ATTRIBUTE Rtg Dpn DefRoute delayMetric

Access	Read only
Description	This attribute indicates the delay metrics of up to two paths in use at a cluster node for forwarding packets to any unknown RID, MID, or Call server. The paths in use are the paths towards the backbone of the network. Packets destined to any unknown RID, MID, or Call Server are forwarded to a non-cluster node outside of the cluster and further handled by the node outside of the cluster to reach their destinations. Paths from the local cluster node to all connected non-cluster nodes in the RID subnet are found by the Routing System. The delay metric displayed is computed based on the sum of the delays associated with the links in a path from the local node to one of those non-cluster nodes. A path with a lower metric value is preferable to one with a higher value as it is associated with lower delay facilities. Metric values of 2147483647 for both paths means no default paths are in use and thus all unknown RIDs, MIDs, and Call Servers are unreachable in the delay class of service. A metric value of 2147483647 for the second path only means that there is only one viable delay path to get off the cluster.
Mib	DpnRouting
Values	Decimal (0..2147483647)
Replication	Decimal (0..1)
Default	No default

ATTRIBUTE Rtg Dpn DefRoute tputMetric

Access	Read only
Description	This attribute indicates the throughput metrics of up to two paths in use at a cluster node for forwarding packets to any unknown RID, MID, or Call server. The paths in use are the paths towards the backbone of the network. Packets destined to any unknown RID, MID, or Call Server are forwarded to a non-cluster node outside of the cluster and further handled by the node outside of the cluster to reach their destinations. Paths from the local cluster node to all connected non-cluster nodes in the RID subnet are found by the Routing System. The throughput metric displayed is computed based on the sum of the throughputs associated with the links in a path from the local node to one of those non-cluster

COMPONENT Rtg Dpn AutomaticRouteTester (Art)

Groups	GROUP Rtg Dpn Art Provisioned (Prov) GROUP Rtg Dpn Art Operational (Oper)
Scope	Network
Description	*Rtg Dpn AutomaticRouteTester* This component is a subcomponent of *DpnAddressPlan*. It provides the DPN automatic route testing capability by periodically sending DPN Ping packets to each reachable RID and MID destination in the DPN routing table. It monitors if these Ping packets are returned in a reasonable period of time (about 15 seconds), and analyzes the route information collected in these packets. An alarm will be raised if one or more of the following problems are detected to at least one of the destinations in the DPN routing table: (1) “Timeout” After sending three Ping packets (one round-trip-delay Ping packet and two path Ping packets) to a destination, none of them return back in a reasonable period of time. This is referred to as a “timeout” problem to this destination. (2) “Routing Loop” After analyzing the route information collected in the path Ping packets that have returned in time (a path Ping packet logs the route information (forward direction only) of all the tandem nodes this Ping packet has traversed before it reached the destination), a routing loop is detected if a specific node appears more than once on the route. This is referred to as a "routing loop" (sometimes simply “loop”) problem to this destination. Information about each error destination is accessible via a dynamic sub-component under this component. If the destination is a RID destination, it will be *ErrorRid/x* (where x is the RID value of the RID destination). For MID destination, it will be *ErrorMid/y* (where y is the MID value of the MID destination). The maximum number of error destinations (counting both the RID and the MID destinations) that can be simultaneously tracked (and

Copyright © 2006, Nortel Nortel Confidential

thus appear here) is 10.

Please note that *ErrorRid/x* or *ErrorMid/y only* exist as long as there is a problem to this destination. If the problem no longer exist or this error destination becomes unreachable, the component (*ErrorRid/x* or *ErrorMid/y)* that keeps track of this error destination will be automatically removed.

GROUP Rtg Dpn Art Provisioned (Prov)

Properties Provisioned

Description This group of attributes provides information about the option(s) and parameter(s) that the operator can set to control the behavior of automatic route tester.

Mib DpnRouting

ATTRIBUTE Rtg Dpn Art cosUnderTest

Access Read and write

Description This attribute specifies the COS type(s) (delay, throughput, delay and throughput) for which the automatic route testing is conducted.

A description of possible values for this attribute follows:
none: Do not conduct route testing for any COS type (essentially the automatic route tester is turned off).
delayCosOnly: Conduct route testing to each reachable RID and MID destination for delay COS only.
tputCosOnly: Conduct route testing to each reachable RID and MID destination for throughput COS only.
delayAndTputCos: Conduct route testing to each reachable RID and MID destination for delay and throughput COSs.

Setting this attribute to "***none***" allows the operator to turn off the automatic route tester. Using value "***delayCosOnly***" or "***tputCosOnly***" tells the automated route tester to only work on one COS of the operator's choice. Choosing value "***delayAndTputCos***" when both the delay and throughput COSs are to be tested.

The network resources consumption (such as CPU, memory, link bandwidth) of the automatic route tester working on two COSs will roughly be two times as much as working on only one COS. The time to complete

Copyright © 2006, Nortel Nortel Confidential

a full cycle of route testing to every reachable destination is also expected to be twice as long when working on two COSs.

Mib: DpnRouting

Values:
none
delayCosOnly
tputCosOnly
delayAndTputCos

Default: none

ATTRIBUTE Rtg Dpn Art testInterval (interval)

Access: Read and write

Description: This attribute specifies the time interval between the successive tests on different destinations. The automatic route tester periodically tries to test the route to a different reachable destination (RID or MID). In order not to put too heavy a load on the network, it will wait for a period of time equal to this interval before it will start working on another destination.

The smaller the value of this attribute, the more frequently the automatic route tester gets invoked to work on route testing. On one hand, doing so will reduce the amount of time needed to complete a fully cycle of route testing to every reachable destination. One the other hand, this will increase the resource consumption of the automatic route tester accordingly.

During each testInterval, the automatic route tester will first retry the routes to each error destination, if any, to see if they have recovered. After the retries of all these error destinations, another RID/MID destination from the DPN routing table (not in the error destination list) will be chosen to conduct route testing only if the current number of error destinations is less than 10. If the number of error destinations has reached 10, no other destinations will be chosen and the automatic route tester will focus on retrying only these error destinations at each testInterval. However, if the routes to at least one error destination has recovered or has become unreachable, the number of error destinations will fall below 10, and the selection and conducting of route testing on another destination from the DPN routing table will resume.

COMPONENT Rtg Dpn **PerformanceStatistics (PerfStats)**

Scope	Network
Description	*Rtg Dpn PerfStats* This component is a subcomponent of *Rtg Dpn* component. It is responsible for monitoring the performance of *Dpn* component by recording statistics. Statistics maintained by this component include (1) number of routing control packets and bytes that are transmitted and received by the *Dpn* component, and (2) RID subnet statistics (such as

Copyright © 2006, Nortel Nortel Confidential

number of MIDs, number of gateway nodes etc.) that are stored in the database and maintained by the *Dpn* component.

Routing control packets (also known as routing protocol packets), which are sent and received by the *Dpn* component, can be categorized into two types: intra-subnet protocol packets and inter subnet protocol packets. Intra-subnet protocol packets are also called broadcast packets, and are used to advertise reachable RID, MID, Call Server functions, Call Server Resource Module (CSRM) RID, and substitute RID information in a subnet. Inter subnet protocol packets are used to convey routing information between RID subnets and to inter-network with DPN-100 networks. The packet statistics provided by this component include only broadcast packets that are transmitted to and received from other nodes in the subnet in which this node resides.

The subnet statistics (*DpnRidSubnetStatistics*), maintained by this component, provide subnet characteristics from this node's view. When there are no clusters being deployed in a RID subnet, the *PerfStats DpnRidSubnetStatistics* provided by each node in the subnet should be identical. If there exist clusters in a RID subnet, the subnet statistics provided by subnet backbone nodes and cluster nodes would be different. However, the *PerfStats DpnRidSubnetStatistics* provided by each subnet backbone node should be identical; the *PerfStats DpnRidSubnetStatistics* provided by each cluster node in the same cluster should be identical.

Mib	DpnRouting
Dyn. Subcomp.	COMPONENT Rtg Dpn PerfStats LinkGroupStatistics (LgStats)
Common Verbs	Help List Display

COMPONENT Rtg Dpn PerfStats LinkGroupStatistics (LgStats)

Instance	String (1..12, ASCII)
Scope	Network
Description	*Rtg Dpn PerfStats LgStats/<aNeighborNodeName>* This component is a dynamic subcomponent of *Rtg Dpn PerfStats* component. It provides statistics of broadcast packets that are transmitted to and received from the neighbor node identified by the *LgStats* component. Note that there is one *LgStats* instance per spanning tree link group (also known as spanning tree neighbor), and that not all physical link groups staged on this node are present as *LgStats* instances. This is because a spanning tree forwarding algorithm is used by the *Dpn* component to perform broadcasting (that is, broadcast packets are forwarded only along the spanning tree branches, not forwarded on every physical link groups staged on a node) in order to achieve broadcast efficiency and lower

Copyright © 2006, Nortel Nortel Confidential

broadcast traffic. The spanning tree is computed by the *Rtg Top* component, and is computed on a per RID subnet basis upon topology change. Even though the spanning tree spans and covers every node, including cluster nodes, in the subnet, the *Dpn* component is informed only the local link groups that are on the spanning tree, as only these spanning tree link groups are needed to perform the broadcasting. Therefore, for each local spanning tree link group inside the subnet in which this node locates, there is an *LgStats* instance added to record the statistics of broadcast packet that are transmitted to and received from the spanning tree neighbor.

Note also that some *Dpn* broadcasts in a subnet do go across backbone and cluster border. Therefore, on a backbone or cluster border node, a spanning tree link group, identified by an *LgStats* instance, may be a backbone cluster border link group.

An *LgStats* instance also represents a broadcast neighbor. When the link group to a broadcast neighbor goes down and then comes back, statistics maintained by the *LgStats* instance will be reset and restart from zero.

COMPONENT Rtg Topology (Top)

Groups: GROUP Rtg Top Statistics (Stats)

Scope: Network

Description:

Rtg Topology
This component is a subcomponent of *Routing*. It resides on all Nortel Networks Multiservice Switches and is responsible for maintaining a topological database describing the network topology in terms of nodes and connectivity between them in a topology region. Note that a topology region is an autonomous groups of nodes, in which each of the nodes has its *regionId* (attribute of *ModuleData* component) set to the same value. A node only exchanges topology information with connected nodes in the same region.

This component also computes the reachability costs to each node within

Copyright © 2006, Nortel
Nortel Confidential

	the topology region for multiple address plans taking into account the underlying transport attributes of interest to them.

COMPONENT Rtg Top Node

Instance	String (1..12, ASCII)
Groups	GROUP Rtg Top Node Operational (Oper)
Scope	Network
Description	*Rtg Top Node/<neighborNodeName>* This component is a dynamic subcomponent of *Topology*. It describes the existence of a node whose *clusterNode* (attribute under the *Routing* component) is provisioned the same value as that of this node, and indicates this node's view of interconnections to the node. If this node is a cluster node, that is the attribute *clusterNode* for this node is provisioned with the value ***yes***, then this component provides reachability information for each node supported in the cluster in which this node is located. Note that a cluster, consisting of one or more interconnected cluster nodes, is typically deployed at the edge of a topology region to provide access services. Therefore, in other words, if this node is in a cluster of a topology region, there is one instance of this component for each node in the cluster topology. Similarly, if this node is a non-cluster node, that is the attribute *clusterNode* for this node is provisioned with the value ***no***, then this component provides reachability information for each node supported in the topology region but excluding all cluster nodes. Note that, in contrast, a non-cluster node typically provides transportation for traffic flows originating or terminating on cluster nodes. A group of interconnected non-cluster nodes is typically located in the center of a topology region to connect clusters. To simplify the description of all subcomponents of *Node* component as well as their attributes in the following text, this group of interconnected non-cluster nodes in a topology region is referred as the backbone or a topology region's backbone, and a non-cluster node in the backbone is referred as a backbone node. Therefore, if this node is in the

Copyright © 2006, Nortel Nortel Confidential

backbone of a topology region, there is one instance of this component for each node located in the backbone.

COMPONENT Rtg Top Node LinkGroup (Lg)

Instance	String (1..12, ASCII)
Groups	GROUP Rtg Top Node Lg Operational (Oper)
Scope	Network
Description	*Rtg Top Node/<neighborNodeName> LinkGroup/ <neighborNodeName>* This component is a dynamic subcomponent of the *Node* component. It describes the link group that connects two nodes with the same *clusterNode* value, more precisely, from a cluster node to a cluster node or from a non cluster node to a non cluster node (referred to as backbone

Copyright © 2006, Nortel Nortel Confidential

node). This type of link group is also known as the normal link group.

This component provides information, in this node's view, about normal link groups supported on each node in either the backbone or a cluster depending on the location of this node.

If this node is in a cluster, there is one instance of this component for each link group (excluding cluster border link group) supported by each node in the cluster.

Similarly, if this node is a non-cluster node, i.e. it is located in the backbone of a topology region, there is one instance of this component for each link group (excluding cluster border link groups) supported by each node in the backbone.

COMPONENT Rtg Top Node **ClusterNode**

Instance	String (1..12, ASCII)
Groups	GROUP Rtg Top Node ClusterNode Operational (Oper)
Scope	Network
Description	*Rtg Top Node/<backboneBorderNodeName> ClusterNode/ <clusterNodeName>* *Rtg Top BorderLinkGroup/<neighborNodeName> ClusterNode/ <clusterNodeName>* This component is a dynamic subcomponent of both the *Node* and *BorderLinkGroup* components. It exists only on a non cluster node (also referred as a backbone node), that is, this component is present under *Node* and/or *BorderLinkGroup* only if the attribute *clusterNode* for this node is provisioned with ***no***. This component does not exist on any cluster node. If this node is a backbone node, this component, under *Node*, describes the reachability from a border node in the backbone to a cluster node. Note that a border node refers to the node that is connected by cluster border link groups. Therefore, this component provides information, in this backbone node's view, about all cluster nodes (which might be located in multiple clusters) reachable through all border nodes in the backbone. There is one instance of this component for each cluster node reachable through a border node. If this node is also a border node in the backbone, that is, this node is a backbone node and has at least one cluster border link group staged on it. Then, this component, under the *BorderLinkGroup*, describes the reachability to a cluster node through a local cluster border link group. There is one instance of this component for each cluster node in a cluster that can be reached through a cluster border link group. Note that this information (reachable cluster nodes through a cluster border link group) is

Copyright © 2006, Nortel Nortel Confidential

only known to the local node, and is not shared with the other nodes in the backbone.

COMPONENT Rtg Top Node **NodeAddress (Addr)**

Instance String (1..40, ASCII)

Scope Network

Description *Rtg Top Node/<nodeName> NodeAddress/<nodeAddress>*
This component represents an NSAP address (or prefix) which can be reached from the node identified by the instance of the *Node* component. Each instance of this component actually represents a *nodePrefix* or an *alternatePorsPrefixes* provisioned under the *Mod* component on the node identified by the instance of the *Node* component.

Instances of this component associated with a remote node are learned from the topology information broadcast sent by the remote node. Topology information is exchanged only between nodes within the same topology region's backbone or cluster. Instances of this component under all *Node* components represent the set of all node addresses stored in the topology database maintained by the local node.

COMPONENT Rtg Top Node ReachableAddr (RAddr)

Instance	address [String (1..40, ASCII)] linkId [Decimal (0..9999)]
Groups	GROUP Rtg Top Node RAddr Operational (Oper)
Scope	Network
Description	*Rtg Top Node/<nodeName> ReachableAddr/<reachableAddr>,<linkId>* This component represents an NSAP address (or prefix) as well as the associated link ID which can be reached from the node identified by the instance of the *Node* component. Actually, an instance of this component really represents either an *Address* component provisioned under a *Trunk* component or a *SummaryAddress* component provisioned under the *Routing* component on the node identified by the instance of the *Node* component. Instances of this component associated with a remote node are learned from the topology information broadcast sent by the remote node. Topology information is exchanged only between nodes within the same topology region's backbone or cluster. Instances of this component under all *Node* components represent the set of all reachable addresses stored in the topology database maintained by the local node. If a *SummaryAddress* component, provisioned under the *Routing* component, is the prefix of an *Address* component provisioned under a *Trunk* component on the same node, the *Address* component will be removed from the list of *ReachableAddr* instances associated with and broadcast by that node. This behavior is also referred as reachable addresses summarization. That is, if an *Address* component is summarized by a *SummaryAddress* component provisioned on the same node, the *Address* component will not be broadcast by that node, therefore, it will not be displayed through a *ReachableAddr* component instance associated with that node.

ATTRIBUTE Rtg Top BLg TrkObj **supportedTrafficTypes (sttyp)**

Access	Read only
Description	This attribute indicates the type of traffic that can be transmitted on the trunk. There are eight possible traffic types and the trunk can transmit all of them if desired. The voice, data and video traffic types are defined, and five other traffic types can be defined in using *supportedTrafficTypes* under the trunk path administrator. This attribute is used in the route selection process to limit the route to trunks that support the traffic to be carried by the path.
Mib	BaseRouting
Set of	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtg Top BLg TrkObj **trunkType (typ)**

Access	Read only
Description	This attribute lists the type of the trunk. There can be up to eight types of trunks. The terrestrial and satellite trunk types have been defined, leaving six remaining types that can be defined by the network administration. The set of allowed trunk types for a path is indicated in the *permittedTrunkTypes* attribute of the *PLC*. When selecting a route, PORS only chooses trunks whose *Pa trunkType* is in the *permittedTrunkTypes* set of the path.
Mib	BaseRouting
Values	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE Rtg Top BLg TrkObj **customerParameter (cpar)**

Access	Read only
Description	This attribute indicates the customer defined parameter for the trunk. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary *PLC* attribute, *requiredCustomerParam*, also has a value from zero to seven. The Route Selector does not consider trunks whose *Pa customerParameter* is greater than the *requiredCustomerParam* of the path.
Mib	BaseRouting
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Rtg Top BLg TrkObj **farEndTrmLkInstance (far)**

Access	Read only
Description	This attribute indicates identification of the corresponding trunk providing the reverse direction of transmission.
Mib	BaseRouting
Values	Decimal (1..1023)
Default	No default

ATTRIBUTE Rtg Top BLg TrkObj **mapMode**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates if the trunk is in Map Mode or not. A value of ***yes*** indicates that the trunk is in Map mode and ***no*** if it is not.
Mib	BaseRouting
Values	no yes
Default	No default

ATTRIBUTE Rtg Top BLg TrkObj **unreservedBwOut (unres)**

Access	Read only
Description	This attribute displays a table. In the first row there are setup priorities. In the second row there are numerators of parts of unreserved bandwidth corresponding to setup priority 0 (first column) through 4 (fifth column). The denominator is 255.

Default	No default

COMPONENT Rtg Top BLg **ClusterNode**

Instance	String (1..12, ASCII)
Groups	GROUP Rtg Top BLg ClusterNode Operational (Oper)
Scope	Network
Description	*Rtg Top Node/<backboneBorderNodeName> ClusterNode/ <clusterNodeName>* *Rtg Top BorderLinkGroup/<neighborNodeName> ClusterNode/ <clusterNodeName>* This component is a dynamic subcomponent of both the *Node* and *BorderLinkGroup* components. It exists only on a non cluster node (also referred as a backbone node), that is, this component is present under *Node* and/or *BorderLinkGroup* only if the attribute *clusterNode* for this node is provisioned with ***no***. This component does not exist on any cluster node. If this node is a backbone node, this component, under *Node*, describes the reachability from a border node in the backbone to a cluster node. Note that a border node refers to the node that is connected by cluster border link groups. Therefore, this component provides information, in this backbone node's view, about all cluster nodes (which might be located in

Copyright © 2006, Nortel Nortel Confidential

multiple clusters) reachable through all border nodes in the backbone. There is one instance of this component for each cluster node reachable through a border node.

If this node is also a border node in the backbone, that is, this node is a backbone node and has at least one cluster border link group staged on it. Then, this component, under the *BorderLinkGroup*, describes the reachability to a cluster node through a local cluster border link group. There is one instance of this component for each cluster node in a cluster that can be reached through a cluster border link group. Note that this information (reachable cluster nodes through a cluster border link group) is only known to the local node, and is not shared with the other nodes in the backbone.

GROUP Rtg Top BLg ClusterNode Operational (Oper)

Properties: Operational

Description: *Rtg Top Node/<backboneBorderNodeName> ClusterNode/ <clusterNodeName> Operational*

Rtg Top BorderLinkGroup/<neighborNodeName> ClusterNode/ <clusterNodeName> Operational

Rtg Top Node/<clusterBorderNodeName> PeerBorderNode/ <backboneBorderNodeName> Operational

This group contains the operational data stored and maintained by the *ClusterNode* component on a backbone node and/or the *PeerBorderNode* component on a cluster node.

Mib: BaseRouting

ATTRIBUTE Rtg Top BLg ClusterNode nodeId

Access: Read only

Description: This attribute is a number that uniquely identifies the *ClusterNode* and/or the *PeerBorderNode* instance in topology region. It is the identifier used in the routing control packets sent by this node to other nodes in the same topology region.

The *nodeId* for each node in a topology region is learned from the routing protocol packets.

Mib: BaseRouting

Values: Decimal (1..4095)

Default	No default

ATTRIBUTE Rtg Top BLg ClusterNode **delayMetric**

Access	Read only
Description	This attribute indicates the outbound cost for the delay class of service to reach the destination (a cluster node or a peer border node in the backbone). It is the sum of delay metrics of multiple hops from the border node to reach the destination. A low outbound cost is preferable to a higher value as it is associated with higher speed facilities. A metric value of 2147483647 means that the destination is unreachable for the delay class of service.
Mib	BaseRouting
Values	Decimal (1..2147483647)
Default	No default

ATTRIBUTE Rtg Top BLg ClusterNode **tputMetric**

Access	Read only
Description	This attribute indicates the outbound cost for the throughput class of service to reach the destination (a cluster node or a peer border node in the backbone). It is the sum of throughput metrics of multiple hops from the border node to reach the destination. A low outbound cost is preferable to a higher value as it is associated with higher speed facilities. A metric value of 2147483647 means that the destination is unreachable for the throughput class of service.
Mib	BaseRouting
Values	Decimal (1..2147483647)
Default	No default

COMPONENT Rtg Top **PerformanceStatistics (PerfStats)**

Scope	Network
Description	*Rtg Top PerfStats* This component is a subcomponent of *Rtg Top* component. It is responsible for monitoring the performance of *Top* component by recording statistics. Statistics maintained by this component include the number of (1) routing control packets and (2) various information fragments (also known as database entries) that are stored and maintained in the topology database by the *Top* component. Routing control packets (also known as routing protocol packets), sent and received by the *Top* component, can be categorized into two types: topology protocol packets and cluster protocol packets. Topology protocol packets are used to advertise topology information and are exchanged

Copyright © 2006, Nortel Nortel Confidential

only between nodes in the same flat topology region, region's backbone, or cluster. Therefore, the topology database, maintained by the *Top* component, contains only information of nodes in the same flat topology region, region's backbone, or cluster. Cluster protocol packets are used to convey routing information across the backbone-cluster boundary and are exchanged only between backbone and cluster border nodes.

If clusters are not deployed, the packet statistics provided by this component include only topology protocol packets that are transmitted to and received from other nodes in the same topology region. The database statistics maintained by this component provides information of the topology database that contains all nodes in the same topology region in which this node resides.

If clusters are deployed in the topology region, on a backbone node, the packet statistics provided by this component include only topology protocol packets that are transmitted to and received from other nodes in the backbone. On a backbone border node, the packet statistics provided by this component also include the cluster protocol packets that are sent to and received from the connected cluster border nodes. Since the topology database, maintained by a *Top* component, is the same on either a backbone node or a backbone border node, the database statistics provided by this component should be identical on all nodes in the backbone.

Similarly, on a cluster node, the packet statistics provided by this component include only topology protocol packets that are transmitted to and received from other node in the cluster. On a cluster border node, the packet statistics provided by this component also include the cluster protocol packets that are sent to and received from the connected backbone border nodes. Since the topology database, maintained by a *Top* component, is the same on either a cluster node or a cluster border node, the database statistics provided by this component should be identical on all nodes in the same cluster.

Mib	BaseRouting
Dyn. Subcomp.	COMPONENT Rtg Top PerfStats LinkGroupStatistics (LgStats)
Common Verbs	Help List Display

COMPONENT Rtg Top PerfStats LinkGroupStatistics (LgStats)

Instance	String (1..12, ASCII)
Scope	Network
Description	*Rtg Top PerfStats LgStats/<aNeighborNodeName>* This component is a dynamic subcomponent of *Rtg Top PerfStats* component. It provides statistics of topology protocol packets that are

Copyright © 2006, Nortel Nortel Confidential

transmitted to and received from the neighbor node identified by the *LgStats* component.

Note that there is one *LgStats* instance per locally staged *Lg* on this node. Topology protocol packets are exchanged only between neighbor nodes that are in the same flat topology region, region's backbone, or cluster, they are not sent across a topology region border nor a backbone-cluster border. Therefore, for each locally staged *Lg* that is in the same flat topology region, region's backbone, or cluster in which this node resides, there is one *LgStats* instance added to record the statistic of topology protocol packets that are transmitted to and received from the neighbor node.

Statistics maintained by an *LgStats* instance only exist for the duration of the *Lg* component. When the *Lg* to a neighbor goes down and then comes back, statistics maintained by the corresponding *LgStats* instance will be reset and restart from zero.

VERB Optimize (Opt) Rtg Pors

Impact	Service
Description	Optimize [-segmented] Rtg Pors If this module is not optimizing, this command forces an optimization process to begin immediately. Optimization is carried out on each active connection, on the module, at a rate of one per second. If no option is specified, all unsegmented PORS connections sourced on the module that allow optimization will attempt to optimize. If the -segmented option is specified, disruptive optimization will be triggered for segmented calls. Calls sourced on the module that are specified in the *optimizationScope* attribute and that allow optimization will be selected. Simultaneous optimization of segmented and unsegmented call types is not permitted. This command may be used regardless of whether periodic optimization has been disabled by setting the *optimizationInterval* to zero.

GROUP Rtg Pors Provisioned (Prov)

Properties	Provisioned
Description	This group contains all provisionable attributes for the *Routing PathOrientedRoutingSystem* component.
Mib	PorsVc

ATTRIBUTE Rtg Pors optimizationInterval

Access	Read and write
Description	This attribute specifies the interval at which periodic optimization occurs. The time defined is from the end of one optimization pass until the start of another pass. Periodic optimization has no effect on segmented calls. If an interval of zero is specified periodic optimization is disabled on this module.
Mib	PorsVc
Values	Decimal (0; 1..1440)
Units	minutes
Default	30

ATTRIBUTE Rtg Pors optimizationScope (opts)

Access	Read and write
Description	This attribute specifies the type of routing point that is considered for segmented optimization. Note that only routing points that are sourcing

Copyright © 2006, Nortel Nortel Confidential

call segments can be considered. Segmented optimization occurs when the destination node of the call segment is switched, or when an alternate path to the existing call segment destination node has at least a 10% improvement in path cost over the current path. Segmented optimization is disruptive to the call or calls being optimized. Three types of routing points can be selected as candidates for segmented optimization.

applicationService:
The source application. Enabling this routing point selects all calls sourced on the node. Call disruption will affect all call segments.

outboundRGty:
The outbound gateway that is leaving the region or cluster. Enabling this routing point selects all calls leaving the region or cluster from this node. Call disruption is from the outbound link to the destination node.

inboundRGty:
The inbound gateway that is entering a new region or cluster. Enabling this routing point will select all calls that enter the region or cluster through this node. Call disruption is from the current node to the destination node.

Mib	PorsVc

GROUP Rtg Pors Information (Info)

Properties	Operational
Description	This group contains operational information for the *PathOrientedRoutingSystem* component.
Mib	PorsVc

ATTRIBUTE Rtg Pors activeConnections

Access	Read only
Description	This attribute is the current number of active PORS connections on this module. Active connections are connections that are in the Logical Connection component ***pathUp*** *state*. This value is updated when requested and represents the current number of active PORS connections. During *Pors* optimization this number represents all the connections that receive optimization requests.
Mib	PorsVc
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rtg Pors optimizationState

Access	Read only
Description	This attribute is the current state of the *Pors* optimization. The ***disabled*** state means that the *optimizationInterval* has been set to zero. The ***scheduled*** state means that the optimization will be started at the *nextOptimizationTime.* The optimizing state means that *Pors* is currently attempting to optimize all connections on the module.
Mib	PorsVc
Values	disabled scheduled optimizing
Default	No default

ATTRIBUTE Rtg Pors lastOptimizationTime

Access	Read only
Description	This attribute specifies the time that the last optimization started.
Mib	PorsVc
Values	Time (DHMS)
Default	No default

ATTRIBUTE Rtg Pors nextOptimizationTime

Access	Read only
Description	This attribute specifies the time the next optimization process will begin. In the event that *optimizationInterval* is set to zero this value is also set to 0.
Mib	PorsVc
Values	Time (DHMS)
Default	No default

ATTRIBUTE Rtg Pors optimizationPasses

Access	Read only
Description	This is the number of optimization passes for the PORS connection manager. An optimization pass consists of a notification to each active PORS connection to attempt to optimize. All types of optimization passes are included in this statistic.
Mib	PorsVc

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtg Pors optimizationProgress

Access	Read only
Description	This attribute is the percentage of active connections that have been sent an optimization request. A message is sent to each *Pors* component LC requesting it to optimize its route. This value is cleared at the beginning of each optimization pass.
Mib	PorsVc
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Rtg Pors pathsOptimized

Access	Read only
Description	This attribute is the number of successfully optimized paths for the latest optimization pass. Successfully optimized paths are paths that switched to a better route. This value is cleared at the beginning of each optimization pass.
Mib	PorsVc
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Rtg Pors totalPathsOptimized

Access	Read only
Description	This attribute is the number of successfully optimized paths on this module since the CP became active.
Mib	PorsVc
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtg Pors Profile (Prof)

Instance	Decimal (1..255)
Groups	GROUP Rtg Pors Prof Provisioned (Prov)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*Rtg Pors Prof/n* This component includes all attributes which may generically apply to a set of *LogicalConnections*. It is basically identical to the *PermanentLogicalConnection* except it does not include a *remoteName* or *manualPath* attribute. The specification of emission and discard priority is also a bit different in that they may be left unspecified in which case the emission and discard priority of the connection will be selected by the application.
Mib	PorsVc
Common Verbs	Help List Display Add DELete

GROUP Rtg Pors Prof Provisioned (Prov)

Properties	Provisioned
Description	This group contains all provisionable attributes for a PORS profile..
Mib	PorsVc

ATTRIBUTE Rtg Pors Prof setupPriority (spri)

Access	Read and write
Description	This attribute specifies the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, specifies the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	PorsVc
Values	Decimal (0..4)
Default	2

ATTRIBUTE Rtg Pors Prof holdingPriority (hpri)

Access	Read and write
Description	This attribute specifies the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines this path's likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.

Mib	PorsVc
Values	Decimal (0..4)
Default	2

ATTRIBUTE Rtg Pors Prof requiredTxBandwidth (tbw)

Access	Read and write
Description	This attribute specifies the bandwidth (in bits per second) reserved by a path on each of the trunks of its route.This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced but is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value. A value of 0 (the default) means that the bandwidth will be the Peak Cell Rate for CLP0+1 as chosen by the user. A non zero value overrides this reservation.
Mib	PorsVc
Values	Decimal (0..155520000)
Units	bit/s
Default	0

ATTRIBUTE Rtg Pors Prof requiredRxBandwidth (rbw)

Access	Read and write
Description	This attribute specifies the bandwidth (in bits per second) reserved by a path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced but is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value. A value of 0 (the default) means that the bandwidth will be the Peak Cell Rate for CLP0+1 as chosen by the user. A non zero value overrides this reservation.
Mib	PorsVc
Values	Decimal (0..155520000)
Units	bit/s
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtg Pors Prof requiredTrafficType (rttyp)

Access	Read and write
Description	This attribute specifies the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection.
Mib	PorsVc
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	data

ATTRIBUTE Rtg Pors Prof permittedTrunkTypes (pttyp)

Access	Read and write
Description	This attribute specifies up to eight types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the *Trunk* component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	PorsVc
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	(terrestrial, satellite, trunkType1, trunkType2, trunkType3)

ATTRIBUTE Rtg Pors Prof requiredSecurity (rsec)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the required minimum level of security of the trunks on the route. A value of zero represents the most secure while seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the *Trunk* component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	PorsVc
Values	Decimal (0..7)
Default	4

ATTRIBUTE Rtg Pors Prof requiredCustomerParm (rcparm)

Access	Read and write
Description	This attribute specifies the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	PorsVc
Values	Decimal (0..7)
Default	4

ATTRIBUTE Rtg Pors Prof pathAttributeToMinimize (pamin)

Access	Read and write
Description	This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route.
Mib	PorsVc
Values	cost delay
Default	cost

ATTRIBUTE Rtg Pors Prof maximumAcceptableCost (maxCost)

Access	Read and write
Description	This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the

Copyright © 2006, Nortel Nortel Confidential

trunkCost is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done regardless of the value of *pathAttributeToMinimize*. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.

Mib	PorsVc
Values	Decimal (0..65535)
Default	1280

ATTRIBUTE Rtg Pors Prof maximumAcceptableDelay (maxDelay)

Access	Read and write
Description	This attribute specifies an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512 byte packet. Remember, that during its staging, the trunk measures a *measuredRoundTripDelay*. This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement. If for any trunk, half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay*.
Mib	PorsVc
Values	Decimal (0..100000)
Units	msec
Default	100000

ATTRIBUTE Rtg Pors Prof emissionPriority (epri)

Access	Read and write
Description	This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. An *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher). The default value for this attribute *(sameAsApplication)* will cause the connection's emissionPriority to be inherited from the user of the profile. In other words, setting this attribute to

Copyright © 2006, Nortel Nortel Confidential

	anything other than the default acts as an override to the priority normally used by the application linked to this profile.
Mib	PorsVc
Values	sameAsApplication ep0 ep1 ep2
Default	sameAsApplication

ATTRIBUTE Rtg Pors Prof discardPriority (dpri)

Access	Read and write
Description	This attribute specifies the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority* (numerically lower) are discarded after packets with a higher *discardPriority* (numerically higher). The default value for this attribute *(sameAsApplication)* will cause the connection's discardPriority to be inherited from the user of the profile. In other words, setting this attribute to anything other than the default acts as an override to the priority normally used by the application linked to this profile.
Mib	PorsVc
Values	sameAsApplication dp1 dp2 dp3
Default	sameAsApplication

ATTRIBUTE Rtg Pors Prof pathFailureAction (pfa)

Access	Read and write
Description	This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure. With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.
Mib	PorsVc
Values	reRoutePath disconnectConnection

Copyright © 2006, Nortel Nortel Confidential

Default	reRoutePath

ATTRIBUTE Rtg Pors Prof bumpPreference (bpref)

Access	Read and write
Description	This attribute specifies when bumping may be triggered as a result of this call being routed/rerouted or optimized. There are two possibilities: ***bumpWhenNecessary***: means that this call will only trigger the bumping of another call (subject to setup/holding priority restrictions) when there is no other way to establish a route for this call. ***bumpToObtainBestRoute***: means that this call may trigger the bumping of other calls (subject to setup/holding priority restrictions) if doing so would result in this call obtaining a better (lower cost/delay) route. Since bumping to obtain the best route can be somewhat intrusive the default is only to bump when there is no other way to route the call.
Mib	PorsVc
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	bumpWhenNecessary

ATTRIBUTE Rtg Pors Prof optimization (opt)

Access	Read and write
Description	If this attribute is ***enabled***, this connection will be optimized periodically as specified by the *Rtg Pors* attribute *optimizationInterval*. If this attribute is ***disabled***, the connection will use the route it was given for the life of the connection or until a failure or *lock* results in the call being rerouted.
Mib	PorsVc
Values	disabled enabled
Default	enabled

ATTRIBUTE Rtg Pors Prof users (usr)

Access	Read only
Description	This attribute specifies all of the components which are associated with this *Profile*. Users of this profile will select and instantiate routes based on the attributes of this profile when PORS is used to choose and instantiate the route. If IISP or PNNI are used to choose and instantiate the route these attributes are ignored since they have no counterparts in IISP or PNNI routing.

ATTRIBUTE Rtg Pors Mpath route

Access	Read and write
Description	This attribute specifies the sequence of trunks used as the route for a path. If any trunk in the sequence does not meet the requirements (bandwidth, permittedTrunkType, security, customerParm, etc.) for a component listed in *users*, path validation fails and no path is instantiated for that user. Changing this attribute will cause active connections of users of this *ManualPath* to move to the new route only if the users have *optimization* ***enabled*** and *Rtg Pors optimizationInterval* > 0. Otherwise, changing this attribute will cause the users' current connections to stay on the old *route* with all new calls instantiating their paths with the new *route*. Optimization can be disabled by having the application use a *Rtg Pors Prof/n* component with *optimization* ***disabled*** or by setting *Rtg Pors optimizationInterval* ***0***. As an example, the trunk component name for the trunk instance 10 on node MoonBase is *EM/MoonBase Trk/10*. These strings are case

Copyright © 2006, Nortel Nortel Confidential

	insensitive but the complete component name must be input. Note 1: the trunk designation must be in the 3-letter form 'trk'. Note 2: only the outbound trunk component names are used to provision the *route*.
Mib	PorsVc
Vector of	String (0..40, ASCII)
Index	Decimal (0..19)
Default	([20] "")

ATTRIBUTE Rtg Pors Mpath **users (usr)**

Access	Read only
Description	This attribute specifies all of the components that will use this *ManualPath* to instantiate a path. Users of this component have paths that follow the sequence of *Trunks* specified in the *route* attribute of this component when PORS is used to choose and instantiate the route.
Mib	PorsVc
List of	Link (Service, porsManualPath)
List Size	30
Default	No default

GROUP Rtg Pors Mpath **Operational (Oper)**

Properties	Operational
Description	This group contains operational information for the *Rtg Pors ManualPath/n* component.
Mib	PorsVc

ATTRIBUTE Rtg Pors Mpath **lastSetupFailureReason (lfr)**

Access	Read only
Description	This attribute indicates the reason for the most recent failure for an attempted connection using this *ManualPath*'s *route*. The following is a brief description of the reasons: ***none*** - This path has no information for the teardown. ***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the *Trunks* for this path in the transmit direction. If a trunk in the *route* attribute was previously locked, or has a *Trk PA* subcomponent that is not in the ***up*** *state* , that *Trunk* is considered as having no available bandwidth. If the *Trunk PA* is in ***mapped*** *mode*, the inability to allocate an *Atmif Vcc* also results in this failure reason. ***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the *Trunks* for this path in the receive direction. If a trunk in the *route* attribute

Copyright © 2006, Nortel Nortel Confidential

was previously locked, or has a *Trk PA* subcomponent that is not in the ***up*** *state* , that *Trunk* is considered as having no available bandwidth.
trunkFailure- A *Trunk* on the path has failed or has gone down, due to a provisioning change of a critical attribute, as the path was being established.
trunkCardFailure- A *Trunk* FP card has failed along the path as the path was being established.
accessCardFailure- The FP on which the peer access service was running has failed as the path was being established.
operatorForced- The path has terminated due to the operator locking a *Trunk* along the path as the path was being established.
lostLcnClash- The path has terminated because the *Trk PA*'s at both ends of an intermediate trunk have allocated the same *Trk LC* to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different *Trk LC*'s). It is normal to get the odd clash especially when the *Trk PA usedLC* is approaching the *Trk PA maxLC*. An LCN clash results in the path failing to instantiate only if the application disabled rerouting. By default rerouting is enabled for all applications. Applications can disable rerouting by using a *Rtg Pors Prof/n* component with *pathFailureAction* set to ***disconnectConnection***.
networkCongestion - The path has failed to establish due to control information being lost and not being recoverable.
trunkNotFound - Check for *Trunks* not up or names provisioned incorrectly in *route* attribute .
farEndNotFound - The far end is not provisioned or is not up. The called NSAP address cannot be reached through the last node in the *Rtg Pors ManualPath path*.
farEndBusy - The far end has been reached but it is busy. Check remote end provisioning.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
serviceTypeMismatch - The remote service type does not match this service type. Check provisioning.
bumped - Another call bumped this path, as it was being established, from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path. A manual path that is bumped fails to instantiate if it cannot bump another path along the same *route*, or if it has *pathFailureAction* set to ***disconnectConnection***.
trunkOrFarEndDidNotSupportMode - This call was unable to complete because a *mode* required by the service was not supported by one of the *Trunks* the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on *Trk Pa Atm* component.

Values The name of the component

Default No default

COMPONENT Rtg SummaryAddress (SumAddr)

Instance String (0..40, ASCII)

Groups GROUP Rtg SumAddr Prov

Scope Application

Description *Rtg SummaryAddress/<sumAddr>*
This is an optional subcomponent of the *Routing* component. It is used to summarize a set of addresses provisioned as the *Trunk/<n> Address/ <addr>* components. When one or more of those addresses have a prefix

Copyright © 2006, Nortel Nortel Confidential

in common, an instance of this component can be added using the common prefix as the instance value.

If this node is not a cluster node, the summary address identified by this component will be distributed to all nodes but not to any cluster node in the Topology region.

If this is a cluster node, this summary address will be distributed to all cluster nodes located in the local cluster only. That is, the address will not be distributed outside of this cluster.

COMPONENT Router (Rtr)

Instance	String (1..16, ASCII)
Groups	GROUP Rtr Provisioned GROUP Rtr CustomerIdentifierData (CidData) GROUP Rtr RouterProvisioned (RtrProv) GROUP Rtr OsiState (State) GROUP Rtr IfNumberOper GROUP Rtr Statistics (Stats)
Scope	Application
Description	*Router/<string>* The *Router* component represents an instance of a Routing Component on the platform. The purpose of the *Router* component is to provide IP routing and forwarding services as well as MPLS signalling and forwarding services. At any time, the number of Routing Components (*Router, VpnRouteForwarder* and *VirtualRouter)* existing in the current view plus the number of newly created Routing Components in the edit view must be less than the maximum allowed number of Routing Components. This is regardless of how many *VirtualRouter, VpnRouteForwarder* or *Router* components may have been deleted in the edit view. Any Routing Component which, when created in the edit view, results in a total count greater than the maximum allowed, is labelled as invalid and must be deleted. It is recommended that the deletion of any *VirtualRouter, VpnRouteForwarder* or *Router* components existing in the current view

VERB TELNET Rtr

Impact: Passive

Description: *Telnet -ipAddress(<IP address>) Rtr/<string>*

This command allows access to the Telnet client, attempting to set up a connection from this node to the specified IP address within the specified Router address space.

Options:
ipAddress - This mandatory option specifies the IP address of the remote node to which the user wants to Telnet within this Router's address space.

GROUP Rtr Provisioned

Properties: Provisioned

Copyright © 2006, Nortel
Nortel Confidential

Description	This group contains the router attributes common to the *Router* and *Router VpnRouteForwarder* components.
Mib	no_mib

ATTRIBUTE Rtr sourceRoute

Access	Read and write
Description	This attribute specifies whether or not this *Router* or *VpnRouteForwarder* allows processing of datagrams which have a source route IP option.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr cacheTableSize (cts)

Access	Read and write
Description	This attribute specifies the maximum number of entries that can exist in the local cache table on each *Lp* for this *Router* or *VpnRouteForwarder*. This attribute provides a way to control the resources allocated to the IP cache tables. The default cache table size is *300* for an FP and *100* for a CP. The attribute value must be a multiple of 100.
Mib	no_mib
Vector of	Decimal (100..8000)
Index	Decimal (0..15)
Default	([1] 100, [15] 300)

GROUP Rtr CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	no_mib

ATTRIBUTE Rtr customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Copyright © 2006, Nortel Nortel Confidential

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib	no_mib
Values	Decimal (0; 1..8191)
Default	0

GROUP Rtr RouterProvisioned (RtrProv)

Properties	Provisioned
Description	This group contains provisioned attributes specific to the *Router* component.
Mib	no_mib

ATTRIBUTE Rtr virtualRouterProcessor (vrp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the *LogicalProcessor* on which this *Router* resides. The following card types may support a *Router* component: ***CP*** ***CPeD*** ***CPeE*** ***VpnXc*** WARNING: When changing this attribute the *operationalState* of the *LogicalProcessor* originally associated with this *Router* must be ***enabled*** when the provisioning is activated. This is required for the IP control path to be updated correctly on all media logical processors. If the original *LogicalProcessor* is not ***enabled*** when the provisioning is activated then the IP control path for all medias under this *Router* will be disabled. The only method to recover the IP control path is to reset the LogicalProcessor for each of the associated medias.
Mib	no_mib
Values	Link (Hardware, linkToApplications)
Default	No default

GROUP Rtr OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr IfNumberOper

Properties	Operational
Description	This group contains the ifNumber attribute.
Mib	no_mib

ATTRIBUTE Rtr ifNumber (ifN)

Access	Read only
Description	This attribute defines the number of *IfEntries* in the *IfTable*.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

GROUP Rtr Statistics (Stats)

Properties	Operational
Description	This is the GROUP holding the struct which contains statistical attributes for IP.
Mib	no_mib

ATTRIBUTE Rtr inReceives

Access	Read only
Description	This is the number of input datagrams received from the interfaces, including those received in error. *inReceives* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr inHdrErrors

Access	Read only
Description	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc. *inHdrErrors* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr inAddrErrors

Access	Read only
Description	The number of input datagrams discarded due to errors such as invalid address, unsupported address class. *inAddrErrors* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr forwDatagrams

Access	Read only
Description	The number of input datagrams for which this router was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. *forwDatagrams* wraps to zero if reaches it's maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr inUnknownProtos

Access	Read only
Description	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol *inUnknownProtos* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr inDiscards

Access	Read only
Description	The number of input datagrams for which no problems were encountered to prevent their continued processing, but which were discarded due to the lack of buffers. This does not include any datagram discarded while awaiting for re-assembly. *inDiscards* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr inDelivers

Access	Read only
Description	The number of input datagrams successfully delivered to IP user-protocols (including ICMP). *inDelivers* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr outRequests

Access	Read only
Description	The number of datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. This sum does not include datagrams counted in *ForwDatagrams*. *outRequests* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr outDiscards

Access	Read only
Description	The number of outbound datagrams that were discarded due to the lack of buffers. This sum also includes datagrams counted in *forwDatagrams* if any such packets met the discard criterion. *outDiscards* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr outNoRoutes

Access	Read only
Description	The number of outbound datagrams discarded because no route could be found to transmit them to their destination. This counter includes any datagrams counted in *forwDatagrams*. *outNoRoutes* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr reasmTimeOut

Access	Read only
Description	The maximum number of seconds, which received fragments are held while they are awaiting reassembly at this gateway.
Mib	no_mib
Values	Decimal (0..5)
Units	seconds
Default	5

ATTRIBUTE Rtr reasmReqds

Access	Read only
Description	The number of the IP fragments received by this gateway which needed to be reassembled. *reasmReqds* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr reasmOks

Access	Read only
Description	The number of IP fragments successfully reassembled by this gateway. *reasmOks* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr reasmFails

Access	Read only
Description	The number of times this gateway is unabled to assemble IP-fragments for whatever reasons. *reasmFails* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr fragOks

Access	Read only
Description	The number of IP datagrams that have been successfully fragmented by this gateway. *fragOks* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr fragFails

Access	Read only
Description	The number of IP-fragments that have been discarded because they needed to be fragmented but could not be. For example, their Don't Fragment flag was set. *fragFails* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr fragCreates

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This number of IP fragments that have been generated as a result of fragmentation by this gateway. *fragCreates* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr routingDiscards

Access	Read only
Description	The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free -up buffer space for other routing entries. In this implementation, this number is always zero because IP never deletes a valid routing entry.
Mib	no_mib
Values	Decimal (0..0)
Default	0

ATTRIBUTE Rtr inSrcRouteDiscards

Access	Read only
Description	The number of input datagrams which had a source route IP option and were discarded because this functionality is not allowed for this Routing Component. *srcRouteDiscards* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

COMPONENT Rtr Arp

Groups	GROUP Rtr Arp Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Arp* *Rtr/<string> Arp*

Copyright © 2006, Nortel Nortel Confidential

Rtr/<string> Vrf/<string> Arp
The component specifies the Address Resolution Protocol.

Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Arp HostEntry (Host)
Dyn. Subcomp.	COMPONENT Rtr Arp DynHostEntry (DynHost)
Common Verbs	Help List Display

VERB Clear **Rtr Arp**

Impact	Passive
Description	*Clear [-logicalIf(Ip Address)] [-includeInverse] Vr/<string> Ip Arp* *Clear [-logicalIf(Ip Address)] [-includeInverse] Rtr/<string> Arp* The *Clear* verb is intended for manually flushing dynamically learned ARP entries. Without any options, *Clear* will flush all non-inverse dynamic ARP entries. The *Clear* verb does not affect static ARP host entries, that is, entries which correspond to *HostEntry* subcomponents of this component. These entries can be removed by deleting the corresponding provisioned *HostEntry* component. The *-logicalIf* or *-interface* option is used to flush dynamic ARP entries which were learned on a particular *IpPort LogicalInterface* or *Interface*. The option must specify the IP address of an existing *IpPort LogicalInterface* (which may be under any *ProtocolPort) or Interface*. The *-includeInverse* option is used to force the deletion of inverse ARP entries. Inverse ARP entries which are learned through inverse ARP (*FrDte*) and inverse ATM ARP (*AtmMpe*) are important and should not be cleared by the users accidentally. If the option is not present, inverse ARP entries are not cleared.

GROUP **Rtr Arp** **Provisioned (Prov)**

Properties	Provisioned
Description	The ARP refresh feature allows the router to periodically verify ARP table entries. Whenever the router updates an ARP entry, or creates a new entry, a timeout value is assigned to the entry. When the timeout for an entry expires, the router will send a unicast ARP request to the currently-known physical address. If an ARP response comes back, the entry will be assigned a new timeout. If, however, the host has gone away or been assigned a new physical address, the host will not respond to the unicast ARP, and the entry will be removed from the ARP table. The new physical address will be discovered through the normal ARP mechanism when the next communication is attempted to the host.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Arp autoRefresh

Access	Read and write
Description	This attribute is used to enable or disable the ARP refresh feature.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Arp autoRefreshTimeout

Access	Read and write
Description	This attribute defines the timeout value, in minutes, which is assigned to updated ARP entries, or newly created ARP entries. The range for the timeout is 1 minute to 1440 minutes (24 hours).
Mib	no_mib
Values	Decimal (1..1440)
Units	minutes
Default	5

ATTRIBUTE Rtr Arp retryTimes

Access	Read and write
Description	This attribute defines the number of times that an ARP request will be sent to a remote host if there is no reply received. This value is assigned when ARP entries are updated or created. The range of the value can be from 0 to 127.
Mib	no_mib
Values	Decimal (0..127)
Units	times
Default	127

COMPONENT Rtr Arp DynHostEntry (DynHost)

Instance	hostAddress (addr) [IP address] cos [0 1 2 3 notApplicable (na)]
Groups	GROUP Rtr Arp DynHost Operational (Oper)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	*Vr/<string> Ip Arp DynHostEntry/<Ip Address>* *Router/<string> Arp DynHostEntry/<Ip Address>* *Router/<string> Vrf/<string> DynHostEntry/<Ip Address>* This component is a table that contains all Arp host entries (both static and dynamic). Each IP ARP entry in the table is uniquely defined by its IP address and connection class (cos) value. For *Vr*, when associated *mediaType* under *IpPort* is ***frameRelay***, ***atmMpeLlcEncap,*** and ***atmMpeVcEncap***, the connection class value of the arp entry is ***0, 1, 2,*** or ***3*** . For all other media, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis). For *Router* or *Vrf*, when the media associated with the interface is *atmMpe* or *IpoDlci*, the connection class value of the arp entry is ***0, 1, 2,*** or ***3***. For all other media, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis). An IP packet that has been assigned a particular connection class value will be forwarded using the arp entry which corresponds to the next hop gateway IP address and matching connection class value where the next hop gateway IP address is determined via a forwarding table look up on the packet's destination IP address. When there are arp entries that match the next hop gateway IP address, but not the packet's connection class, then the packet will be forwarded using the arp entry that has the next lowest connection class value; failing this, the packet will be forwarded using the arp entry that has the next highest connection class value.
Mib	no_mib
Common Verbs	Help List Display

VERB Clear Rtr Arp DynHost

Impact	Passive
Description	*Clear [-inverse] Vr/<string> Ip Arp DynHostEntry/<Ip Address>* *Clear [-inverse] Router/<string> Arp DynHostEntry/<Ip Address>* *Clear [-inverse] Router/<string> Vrf/<string> Arp DynHostEntry/<Ip Address>* The *Clear* verb is used to delete the single dynamically learned ARP entry that is represented by this component. The *Clear* command does not affect static ARP host entries, that is, entries whose *type* attribute has the value ***static***. These entries can be removed by deleting the corresponding provisioned *HostEntry* component under *Arp*. The *-inverse* option deletes the ARP entry even if it was an inverse ARP entry. Inverse ARP entries are learned through inverse ARP (*FrDte* or *IpoDlci*) and inverse ATM ARP (*AtmMpe*), and should not be removed by the users accidentally. If the option is not present, an inverse ARP entry is not cleared.

GROUP Rtr Arp DynHost Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *DynHostEntry* component.
Mib	no_mib

ATTRIBUTE Rtr Arp DynHost physAddress

Access	Read only
Description	This attribute indicates the physical address of the host in canonical form.
Mib	no_mib
Values	String (0..8, Dashed Hex)
Default	No default

ATTRIBUTE Rtr Arp DynHost maxTxUnit (mtu)

Access	Read only
Description	This attribute indicates the maximum MTU size that can be accepted by the host.
Mib	no_mib
Values	Decimal (0..0; 80..18944)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Arp DynHost **encapsulationType (encap)**

Access	Read only
Description	This attribute indicates the encapsulation type of the host.
Mib	no_mib
Values	ieee8023 ethernet notApplicable
Default	No default

ATTRIBUTE Rtr Arp DynHost **permanentVirtualCircuitNumber (pvcNo)**

Access	Read only
Description	This attribute indicates the permanent virtual circuit number to the remote host.
Mib	no_mib
Values	Decimal (0..4095)
Default	No default

ATTRIBUTE Rtr Arp DynHost **ifIndex**

Access	Read only
Description	This attribute indicates the *ifIndex* of the protocol port that is associated with this entry.
Mib	no_mib
Values	Decimal (1..65535)
Default	1

ATTRIBUTE Rtr Arp DynHost **type**

Access	Read only
Description	This attribute indicates how this entry was learned.
Mib	no_mib
Values	pending invalid dynamic static
Default	No default

ATTRIBUTE Rtr Arp DynHost **ncPhysAddress**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the physical address of the host in non-canonical form. This attribute is not displayed for hosts on non-LAN media.
Mib	no_mib
Values	String (0..8, Dashed Hex)
Default	No default

ATTRIBUTE Rtr Arp DynHost tunnelDestinationAddress (tda)

Access	Read only
Description	This attribute indicates the IP address of a remote IP tunnel endpoint in the shared domain. A value of 0.0.0.0 is used when the entry is not referring to an IP tunnel.
Mib	no_mib
Values	IP address
Default	0.0.0.0

COMPONENT Rtr Arp HostEntry (Host)

Instance	hostAddress (addr) [IP address] cos [0 1 2 3 notApplicable (na)]
Groups	GROUP Rtr Arp Host Provisioned (Prov) GROUP Rtr Arp Host Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Arp HostEntry/<Ip Address>,<cos>* *Rtr/<string> Arp HostEntry/<Ip Address>,<cos>* *Rtr/<string> Vrf/<string> Arp HostEntry/<Ip Address>,<cos>* This component defines a static host entry in the ARP table. For *Vr*, a connection class (cos) value of ***0, 1, 2,*** or ***3*** is used when the associated *mediaType* under *IpPort* is ***frameRelay***, ***atmMpeLlcEncap***, or ***atmMpeVcEncap***. For other media types, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis). For *Router* and *Vrf*, a connection class (cos) value of ***0, 1, 2,*** or ***3*** is used when the media associated with the interface is *AtmMpe* or *IpoDlci*. For

Copyright © 2006, Nortel Nortel Confidential

other media, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis).

Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr Arp Host **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes of the *HostEntry* component.
Mib	no_mib

ATTRIBUTE Rtr Arp Host **physAddress**

Access	Read and write
Description	This attribute identifies the physical address of the host being defined. The value for this attribute should only be specified for media types supporting physical addresses (e.g. ethernet, fddi, tokenRing etc.)
Mib	no_mib
Values	String (0..8, Dashed Hex)
Default	00-00-00-00-00-00

ATTRIBUTE Rtr Arp Host **maxTxUnit (mtu)**

Access	Read and write
Description	Specify the maximum transmit unit (MTU) size that can be accepted by the host. If this value is not specified, the value for the media interface is used. The specified MTU must be less than or equal to the interface's MTU size.
Mib	no_mib
Values	Decimal (0..0; 80..18944)
Default	0

ATTRIBUTE Rtr Arp Host **permanentVirtualCircuitNumber (pvcNo)**

Access	Read and write
Description	This attribute specifies the number of the PVC for the static host entry. It is the instance number of the X.25 media, Frame Relay media, and of the *AtmConnection* component on the ATM MPE interface..
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4095)
Default	0

ATTRIBUTE Rtr Arp Host tunnelDestinationAddress (tda)

Access	Read and write
Description	This attribute specifies the IP address of a remote IP tunnel endpoint in the shared domain. A value of 0.0.0.0 is used when the entry is not referring to an IP tunnel.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Arp Host encap

Access	Read and write
Description	This attribute specifies the encapsulation type for the host. The value for this attribute should only be specified for the hosts on the ethernet media. If a value of ***auto*** is specified, the application based on the media will determine the proper applicable encapsulation type.
Mib	no_mib
Values	ieee8023 ethernet auto
Default	auto

GROUP Rtr Arp Host Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *HostEntry* component.
Mib	no_mib

ATTRIBUTE Rtr Arp Host operMaxTxUnit (operMtu)

Access	Read only
Description	This attribute indicates the operational value of the maximum transmission unit.
Mib	no_mib
Values	Decimal (0..0; 80..18944)
Default	No default

ATTRIBUTE Rtr Arp Host operEncap

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the operational encapsulation type. if the value of the attribute *encap* is set to ***auto***, then the application will determine the encapsulation type based on the media being used and assigns the appropriate value.
Mib	no_mib
Values	ieee8023 ethernet notApplicable
Default	No default

COMPONENT Rtr BootpRelayAgent (Bootp)

Groups	GROUP Rtr Bootp AdministrativeControl (AdminControl) GROUP Rtr Bootp Provisioned (Prov) GROUP Rtr Bootp OsiState (State) GROUP Rtr Bootp OperationalStatus (OperStatus)
Scope	Application
Description	*Vr/<string> Ip BootpRelayAgent* *Rtr/<string> BootpRelayAgent* *Rtr/<string> Vrf<string> BootpRelayAgent* The *BootpRelayAgent* component contains all the necessary attributes and components to provision a BOOTP relay agent. The BOOTP relay agent functionality conforms to that described in RFCs 951 and 1542. The purpose of the BOOTP relay agent is to forward BOOTP request packets from a client to a server, and also to deliver server BOOTP replies back to the client. When a BOOTP request is received on a port, the request will be sent to a provisioned list of IP addresses for that port. In addition, the request will be broadcast out all other BOOTP ports which allow it.

Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	no_mib

ATTRIBUTE Rtr Bootp snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Bootp Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *BootpRelayAgent* component.
Mib	no_mib

ATTRIBUTE Rtr Bootp hopDiscardThreshold (hops)

Access	Read and write
Description	BOOTP packets contain a ‘hops’ field which is used to limit the number of relay agents that can process the packet (each relay agent increments the ‘hops’ field by one). This attribute is used by the relay agent to determine when to discard a BOOTP packet. If the ‘hops’ field exceeds the *hopDiscardThreshold* the BOOTP packet will be discarded.
Mib	no_mib
Values	Decimal (2..16)
Default	4

GROUP Rtr Bootp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Bootp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Bootp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Bootp usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Bootp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Bootp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

	The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Cache Operational (Oper)

Properties	Operational
Description	This group houses all the operational attributes of an *Ip* cache table.
Mib	no_mib

ATTRIBUTE Rtr Cache entriesFree (ef)

Access	Read only
Description	This attribute is indicative of the number of free *Ip* cache table entries. A consistently high value for this attribute indicates that there is a resource surplus of the memory requirements for cache table. This surplus could be utilized elsewhere if needed by adjusting the appropriate *cacheTableMaxEntries* attribute. For *Vr*, *cacheTableMaxEntries* is under the *Ip* component; for *Rtr* and *Vrf*, it is under the respective components.
Mib	no_mib
Values	Decimal (0..8000)
Default	No default

ATTRIBUTE Rtr Cache totalLookups (tl)

Access	Read only
Description	This attribute indicates the total number of local cache lookups. It wraps around to zero when it exceeds its maximum value of 4294967295.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Cache lookupMisses (lm)

Access	Read only
Description	This attribute indicates the total number of local cache lookup misses. It wraps around to zero when it exceeds its maximum value of 4294967295.
Mib	no_mib

GROUP Rtr Bgp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Bgp* component.
Mib	no_mib

ATTRIBUTE Rtr Bgp bgpIdentifier

Access	Read and write
Criticality	Component
Description	This attribute specifies the *Bgp* Identifier of this *Bgp* component instance. It is picked from the IP address space, and should follow the same rule as choosing an unique IP address for *IpPort* or *Interface*.
Mib	no_mib
Values	IP address
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Bgp localAs

Access	Read and write
Criticality	Component
Description	This attribute specifies the autonomous system identifier for this *Bgp* component instance.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Rtr Bgp defaultLocalPreference (locPrf)

Access	Read and write
Criticality	Component
Description	This attribute specifies this *Bgp* component instance's default degree of preference for routes. It can be overridden by the *localPreference* provisioned in *ImportPolicy*. A higher value indicates a more preferred route.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	144

ATTRIBUTE Rtr Bgp defaultMultiExitDisc (med)

Access	Read and write
Criticality	Component
Description	This attribute specifies this *Bgp* component instance's default metric to discriminate between multiple exit points to the same adjacent autonomous system. It can be overridden by the s*endMultiExitDiscToEbgp* provisioned in *ExportPolicy*. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	4294967294

ATTRIBUTE Rtr Bgp routeThrottleLimit (rtl)

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of routes in the IP forwarding table this *Bgp* component instance will process at one time to decide if a route in the IP forwarding table should be exported to a peer. This limit is

Copyright © 2006, Nortel Nortel Confidential

	used because the throttling requirements are different under different network configurations.
Mib	no_mib
Values	Decimal (1..1000)
Default	250

ATTRIBUTE Rtr Bgp routeThrottleInter (rti)

Access	Read and write
Criticality	Component
Description	This attribute specifies the interval between the processing of the routes in the IP forwarding table to decide if a route in the IP forwarding table should be exported to a peer. This interval is used because the throttling requirements is different under different network configurations.
Mib	no_mib
Values	Decimal (1..30)
Units	seconds
Default	5

ATTRIBUTE Rtr Bgp routeReflector (rr)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this *Bgp* instance is a Route Reflector. If the value of this attribute is ***true***, *Bgp* redistributes routes it learns from an IBGP speaker to other IBGP speakers in the AS. The rule of redistribution depends on the peer type: 1) When a route is learned from a non-client peer, it is redistributed to all the client peers within the cluster. 2) When a route is learned from a client peer, it is redistributed to all the non-client peers and also to the client peers. If the value of this attribute is ***false***, *Bgp* does not redistribute routes it learns from one IBGP speaker to other IBGP speakers in the AS.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Bgp routeReflectorCluster (rrCluster)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute identifies the cluster consisting of the Route Reflector and its peer clients. When *routeReflector* of *Bgp* is ***true***, value of 0.0.0.0 or 255.255.255.255 is invalid; the default value of this attribute is same as *bgpIdentifier*. For redundancy, a cluster may have more than one Route Reflector; in this case, the value of this attribute of all the Route Reflectors in the same cluster should be same. The value of this attribute is ignored when *routeReflector* of *Bgp* is ***false***
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Bgp redistributeIgpToIbgp (rigp)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this *Bgp* instance allows exporting of IGP routes to internal Bgp peers. IGP routes include the routes learned from OSPF, RIP, local routes and static routes. If the value of this attribute is ***true***, and if *ExportPolicy* is specified to distribute, then *Bgp* allows IGP route to be distributed to internal Bgp peers. If the value of this attribute is ***false***, *Bgp* does not allow IGP routes to be distributed to internal *Bgp* peer, even if *ExportPolicy* is specified to distribute. This attribute is set to true if and only this Bgp is part of the Carrier Manage Service, otherwise, a routing loop may result.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Bgp defaultIbgpRtePreference (ibgpPref)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's default routing preference for IBGP routes. It can be overridden by the *IbgpRtePreference* provisioned in *ImportPolicy*. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..253)
Default	122

ATTRIBUTE Rtr Bgp defaultEbgpRtePreference (ebgpPrf)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies this *Bgp* component instance's default routing preference for EBGP routes. It can be overridden by the *ebgpRtePreference* provisioned in *ImportPolicy*. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..253)
Default	70

ATTRIBUTE Rtr Bgp vpnPeeringTopology (topology)

Access	Read and write
Description	Under the *Vr* component, this attribute specifies the peering mode that determines if a dynamic IBGP peer is to be instantiated between this *BGP* instance and a discovered IP Tunnel endpoint on the remote customer VR. This mode controls the distribution of IP routing information among VPN sites through dynamic BGP sessions after auto-discovery has taken place. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute. Under the *Rtr* or *Rtr Vrf* component, this attribute is not used.
Mib	no_mib
Values	none hub spoke
Default	No default

ATTRIBUTE Rtr Bgp alarmGeneration (alarms)

Access	Read and write
Description	This attribute specifies the level of alarm generation for this *Bgp* instance. A value of ***all*** specifies that all BGP alarms are made visible. A value of ***normal*** specifies that all BGP alarms are made visible, except for the following: - *Bgp Peer* listening failure alarms, - *Bgp Peer* connect failure alarms, and - *Bgp* notification alarms.

Copyright © 2006, Nortel Nortel Confidential

Any listening failure or connect failure alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

A value of ***none*** specifies that no BGP alarms are made visible. Any listening failure, connect failure, or “no auto discovery” alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

Note that, because the listening failure, connect failure, and “no auto discovery” alarms are triggered by state changes in the *Peer* component, they are not automatically regenerated when previously disabled alarm generation is enabled. For example, consider the following:
- If the *Bgp alarmGeneration* attribute is set to ***all*** and a *Peer* enters a listening failure state, a listening failure alarm is set against that *Peer* subcomponent.
- If the *Bgp alarmGeneration* attribute is then set to ***normal*** or ***none***, the above listening failure alarm is cleared.
- If the *Bgp alarmGeneration* attribute is then set back to ***all***, no alarm is generated because the *Peer* subcomponent has not changed state.
- If the *Peer* then exits the listening failure state, a listening failure alarm clear is generated for the *Peer*, even though there is no alarm set for that component.

When the scope of alarm generation has been increased for a *Bgp* instance, previously existing alarms which had been suppressed can be regenerated by locking and unlocking the *Bgp Peer* subcomponents.

For a *VirtualRouter* with *vpnMode* attribute be set to ***carrier***, it is recommended that the *alarmGeneration* attribute be set to ***all***. For a *VirtualRouter* with the *vpnMode* attribute set to ***customer***, it is recommended that the *alarmGeneration* attribute be set to either ***normal*** or ***none***, for scalability reasons.

Similarly, for a *Router* component, it is recommended that the *alarmGeneration* attribute be set to ***all***. For a *Router Vrf* component, it is recommended that the *alarmGeneration* attribute be set to either ***normal*** or ***none***, for scalability reasons.

Mib	no_mib
Values	none normal all
Default	all

ATTRIBUTE Rtr Bgp keyTransitionDelay (keyDelay)

Access	Read and write
Description	This attribute specifies a default delay period associated with a change of *md5Key* value event for the *Bgp* component. The *md5Key* is set under the *Bgp Peer Descriptor* component.

Copyright © 2006, Nortel Nortel Confidential

This is the time that can elapse before the local router transitions to using the new key for transmission for all the Bgp Peer sessions' under this *Bgp* component. This time is not used to control when to accept the new key for reception, and the new key is immediately accepted for reception.

This delay equates to the amount of time the operator has to provision both the local and remote ends with the new key, without losing service.

This can be overridden by the *keyTransitionDelay* provisioned under the *Bgp Peer Descriptor* component.

Mib	no_mib
Values	Decimal (1..20160)
Units	minutes
Default	10

ATTRIBUTE Rtr Bgp bgpImportRouteLimit (birl)

Access	Read and write
Criticality	Component
Description	This attribute specifies a limit to control the maximum number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated. The default value of zero implies no protection. This limit is set based on the requirements of the network configuration and is critical to BGP.
Mib	no_mib
Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Rtr Bgp bgpImportRouteDiscardLimit (bird)

Access	Read and write
Criticality	Component
Description	This attribute specifies a limit to control the number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated and subsequent routes are discarded. The default value of zero signifies no protection. This limit is set based on the requirements of the network configuration and is critical to BGP.
Mib	no_mib
Values	Decimal (0..4000000000)
Default	0

GROUP Rtr Bgp Operational (Oper)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the operational attributes for the *Bgp* component.
Mib	no_mib

ATTRIBUTE Rtr Bgp tableVersion

Access	Read only
Description	This attribute indicates the version of the BGP routing table. It is incremented every time the BGP routing table changes. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp inMsgs

Access	Read only
Description	This attribute counts the total number of BGP messages received without error. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp inErrors

Access	Read only
Description	This attribute counts the total number of BGP messages received from all peers that proved to be in error. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp inErrorMsgs

Access	Read only
Description	This attribute counts the total number of BGP NOTIFICATION messages from all the peers. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Bgp outMsgs

Access	Read only
Description	This attribute counts the total number of BGP messages sent to peers. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp outDiscards

Access	Read only
Description	This attribute counts the number of BGP messages that were locally generated but were not sent out due to resource limitations within a *Bgp* instance. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp outErrorMsgs

Access	Read only
Description	This attribute counts the BGP NOTIFICATION messages sent to the peers. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp indbSize

Access	Read only
Description	This attribute indicates the number of *Bgp* indb entries under this *Bgp* component instance.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

GROUP Rtr Bgp OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Bgp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Bgp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Rtr Bgp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Bgp AdministrativeControl (AdminControl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	no_mib

ATTRIBUTE Rtr Bgp snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Bgp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Bgp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

COMPONENT Rtr Bgp Peer

Instance	IP address
Groups	GROUP Rtr Bgp Peer OsiState (State) GROUP Rtr Bgp Peer Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Bgp Peer/<Ip Address>* *Rtr/<string> Bgp Peer/<Ip Address>* *Rtr/<string> Vrf/<string> Bgp Peer/<Ip Address>* This component identifies the properties of a BGP peer. The index value of this entry identifies the IP address of that peer. This component is required for BGP to set up a peer session with a remote peer. Peers with discovered IP address are dynamic peers, where the provisioned ones are static peers.

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Bgp Peer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Bgp Peer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

ATTRIBUTE Rtr Bgp Peer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Bgp Peer Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Peer* component.
Mib	no_mib

ATTRIBUTE Rtr Bgp Peer connectionState

Access	Read only
Description	This attribute indicates the current state of this BGP peer connection. The meaning of each state is as follows: ***idle*** - it is the initial state of the BGP peer connection. Error events will also cause BGP peer connection to transit to the idle state. ***connect*** - BGP has initiated a TCP connection request to this peer, and waiting for reply from that peer. ***active*** - BGP is not initiating a TCP connection request to this peer, because TCP connection failed and is waiting for connection retry time-out. ***openSent*** - a TCP connection to this peer has been established, but the OPEN message has not been successfully exchanged. ***openConfirm*** - OPEN message has been successfully exchanged with this peer, but the first KEEPALIVE message has not been received from that peer. ***established -*** the first KEEPALIVE message has been received from this peer, which means this BGP peer connection has been established. See RFC 1771 for a detailed description of BGP state transitions.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	idle connect active openSent openConfirm established
Default	idle

ATTRIBUTE Rtr Bgp Peer bgpIdentifier (bgpId)

Access	Read only
Description	This attribute indicates the BGP Identifier of this *Bgp Peer* component. It is learned from the peer through the OPEN message.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Bgp Peer versionNegotiated (vn)

Access	Read only
Description	This attribute indicates the BGP version number negotiated with this peer through the OPEN message. Currently, only BGP version 4 is supported. BGP will reject the peer connection if our peer proposes a BGP version other than 4.
Mib	no_mib
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Rtr Bgp Peer holdTimeNegotiated (htn)

Access	Read only
Description	This attribute indicates the maximum time in seconds, that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. This is the negotiated value with peer through the OPEN message. The hold time must be either zero or at least three seconds. If the negotiated hold time is zero, then periodic KEEPALIVE messages are not expected from the peer.
Mib	no_mib
Values	Decimal (0; 3..65535)
Units	seconds
Default	No default

ATTRIBUTE Rtr Bgp Peer keepAliveNegotiated (kan)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the interval in seconds, between BGP KEEPALIVE message retransmissions. This keepalive interval will have the same ratio to the hold time negotiated with the peer as that of the locally configured keepalive and hold time. This attribute will be zero if the *holdTimeNegotiated* attribute is zero, which means periodic KEEPALIVE messages will not be sent.
Mib	no_mib
Values	Decimal (0..21845)
Units	seconds
Default	No default

ATTRIBUTE Rtr Bgp Peer localAddressUsed (lau)

Access	Read only
Description	This attribute indicates the local IP address used for this BGP peer connection. If the *localAddressConfigured* attribute is non-zero, its value will be used. Otherwise, the local address will be assigned by TCP based on the remote IP address of this peer connection and the IP forwarding table.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Bgp Peer localPort

Access	Read only
Description	This attribute indicates the local TCP port for the connection between the BGP peers.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Rtr Bgp Peer remotePort

Access	Read only
Description	This attribute indicates the remote TCP port for the connection between the BGP peers.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Bgp Peer lastError

Access	Read only
Description	This attribute indicates the last error code and subcode seen by this *Bgp* component instance on this peer connection. The first byte of this two byte OCTET STRING contains the error code, and the second byte contains the subcode. A value of zero means that no error has occurred. Check RFC 1771 for mappings of error codes and error subcodes.
Mib	no_mib
Values	String (2, Hex)
Default	No default

ATTRIBUTE Rtr Bgp Peer connectionEstablishedTime (ceTime)

Access	Read only
Description	This attribute indicates how long since this *Peer* component's last transition to or from the ***established*** state. It is set to zero when the *Peer* component is activated.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	seconds
Default	0

ATTRIBUTE Rtr Bgp Peer connectionEstablishedTransitions (ceTrans)

Access	Read only
Description	This attribute counts the total number of times the BGP connection state transitioned into the ***established*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer inUpdateElapsedTime (iuet)

Access	Read only
Description	This attribute indicates the elapsed time in seconds since the last BGP UPDATE message was received from the peer. Each time *inUpdates* attribute is incremented, the value of this attribute is set to zero.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rtr Bgp Peer inMsgs

Access	Read only
Description	This attribute counts the number of BGP messages received without error from the BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer inUpdates

Access	Read only
Description	This attribute counts the number of BGP UPDATE messages received on this peer connection. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer inErrors

Access	Read only
Description	This attribute counts the number of messages received from this BGP peer that proved to be in error. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer inErrorMsgs

Access	Read only
Description	This attribute counts the number of BGP NOTIFICATION messages received from this BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer outMsgs

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of locally generated BGP messages sent to this BGP peer. It does not include discarded messages. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer outUpdates

Access	Read only
Description	This attribute counts the number of BGP UPDATE messages sent to this peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer outDiscards

Access	Read only
Description	This attribute counts the number of locally generated BGP messages not sent to this BGP peer due to resource limitations within a BGP entity. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer outErrorMsgs

Access	Read only
Description	This attribute counts the number of BGP NOTIFICATION messages sent to this BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer inRoutes

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of routes received from this BGP peer.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Peer peerType

Access	Read only
Description	This attribute indicates the way this peer is created. Peer is **static,** if created through provisioning or **dynamic,** if created through IP VPN auto discovery. For *Router* and *Vrf*, all peers are statically created. So, this value will always be ***static***.
Mib	no_mib
Values	static dynamic
Default	No default

ATTRIBUTE Rtr Bgp Peer authenticationType

Access	Read only
Description	This attribute indicates the authentication type of this BGP peer. If the *md5Key* attribute under the *Bgp Peer Desc* component is set to a null string, this peer's authentication type is ***none***; otherwise, if the *md5Key* attribute is set to a valid non-null string, this peer's authentication type is ***md5***. If this BGP peer's *peerType* is ***dynamic***, its authentication type is always ***none***.
Mib	no_mib
Values	none md5
Default	No default

ATTRIBUTE Rtr Bgp Peer noAuthenticationPkts

Access	Read only
Description	This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which do not contain the MD5 authentication information, but MD5 authentication is provisioned on the local BGP peer. This type of authentication failure occurs when the *md5Key* attribute under the local *Bgp Peer Desc* component is set to a valid non-null string, but the remote BGP peer does not use MD5

Copyright © 2006, Nortel Nortel Confidential

	authentication, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Bgp Peer badAuthenticationPkts

Access	Read only
Description	This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which fail the MD5 authentication. This type of authentication failure occurs when the *md5Key* attribute set under the local *Bgp Peer Desc* component does not match the MD5 key used by the remote BGP peer, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Bgp Peer unexpectedAuthenticationPkts

Access	Read only
Description	This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which contain the MD5 authentication information, but MD5 authentication is not provisioned on the local BGP peer. This type of authentication failure occurs when the *md5Key* attribute under the local *Bgp Peer Desc* component is set to a null string, but the remote BGP peer uses MD5 authentication, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Bgp Peer addressFamilyNegotiated (afn)

Access	Read only
Description	The attribute indicates the list of multi-protocol extensions negotiated on this peer session. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.

Copyright © 2006, Nortel Nortel Confidential

To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.

To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extensions, the value of ***ipv4MplsVpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances.

To distribute IPv4 Unicast routes with labels, using multi-protocol BGP extensions, the value of ***ipv4Label*** must be in the *addressFamilyNegotated* list of the peer instance.

ipv4Unicast represents AFI = 1 and SAFI = 1
ipv4Vpn represents AFI = 1 and SAFI = 140 (not for RFC 2547)
mbgpVpn represents AFI = 1 and SAFI = 141 (not for RFC 2547)
ipv4MplsVpn represents AFI = 1 and SAFI = 128
ipv4Label represents AFI = 1 and SAFI = 4

Mib	no_mib

GROUP Rtr Bgp Peer Desc Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisional attributes for this BGP *Peer* component

Mib: no_mib

ATTRIBUTE Rtr Bgp Peer Desc peerAs

Access: Read and write

Description: This attribute specifies the autonomous system identifier of this BGP *Peer* component. It is used to verify the autonomous system identifier learned from the peer through the OPEN message. The peer connection is rejected and a NOTIFICATION message is sent to the peer if these two numbers don't match.

Mib: no_mib

Values: Decimal (0..65535)

Default: 0

ATTRIBUTE Rtr Bgp Peer Desc localAddressConfigured (lac)

Access: Read and write

Description: This attribute specifies the local IP address configured for this *Bgp Peer* connection. If this attribute is 0.0.0.0, TCP chooses a local IP interface based on the remote IP address of this peer connection and the IP forwarding table. The value chosen is stored in the *localAddressUsed* attribute under the same *Peer* component.

Mib: no_mib

Values: IP address

Default: 0.0.0.0

ATTRIBUTE Rtr Bgp Peer Desc keepAliveConfigured (kac)

Access: Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the configured interval between BGP KEEPALIVE message retransmissions. It is used to establish the ratio between keepalive interval and hold time. If this attribute is zero, then the *holdTimeConfigured* attribute must be zero, which means that periodic KEEPALIVE messages will not be sent.
Mib	no_mib
Values	Decimal (0..21845)
Units	seconds
Default	30

ATTRIBUTE Rtr Bgp Peer Desc **holdTimeConfigured (htc)**

Access	Read and write
Description	This attribute specifies the maximum time that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. The hold time must be either zero or at least three seconds. If this attribute is zero, then the *keepAliveConfigured* attribute should also be zero, which means that periodic KEEPALIVE messages will not be sent.
Mib	no_mib
Values	Decimal (0; 3..65535)
Units	seconds
Default	90

ATTRIBUTE Rtr Bgp Peer Desc **connectRetryTime (connectRetry)**

Access	Read and write
Description	This attribute specifies the time interval for the ConnectRetry timer. It is the minimum amount of time that must elapse between successive TCP connection retries for establishing BGP peer connection.
Mib	no_mib
Values	Decimal (1..65535)
Units	seconds
Default	120

ATTRIBUTE Rtr Bgp Peer Desc **minAsOrigTime (minAsOrig)**

Access	Read and write
Description	This attribute specifies the time interval for the MinAsOriginationInterval timer. It is the minimum amount of time that must elapse between updates that advertise a change to a route within the local autonomous system to neighboring autonomous systems.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)
Units	seconds
Default	15

ATTRIBUTE Rtr Bgp Peer Desc minRouteAdvTime (minRouteAdv)

Access	Read and write
Description	This attribute specifies the time interval for the MinRouteAdvertisementInterval timer. Feasible routes received from peers in other autonomous systems may only be re-advertised to peers in other autonomous systems at a rate no greater than MinRouteAdvertisementInterval.
Mib	no_mib
Values	Decimal (1..65535)
Units	seconds
Default	30

ATTRIBUTE Rtr Bgp Peer Desc defaultInAggMed (diaMed)

Access	Read and write
Description	This attribute specifies this *Bgp Peer* component instance's metric for generating a dynamic default route whenever this external BGP peer got established. It is used to prioritize between the dynamic default routes generated by BGP speakers. If this attribute is not set, BGP does not generate a dynamic default route. When this attribute is set, BGP automatically generates a dynamic default route when the connection established.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Rtr Bgp Peer Desc isRouteReflectorClient (isRrClient)

Access	Read and write
Description	This attribute specifies whether the peer is a client peer or non-client peer of this *Bgp* instance. The attribute is ignored unless the value of the '*routeReflector'* attribute of the '*Bgp'* component is set to ***true***.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Bgp Peer Desc removePrivateAs (remPrivate)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the treatment of the AS_PATH path attribute in routes sent to the peer. If this attribute is enabled, then BGP will remove private AS numbers from the AS_PATH. This attribute is meaningful only for external peers.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Bgp Peer Desc **nextHopSelf (nhs)**

Access	Read and write
Description	This attribute controls the setting of the NEXT_HOP path attribute in routes advertised to the peer. If this attribute is enabled, BGP will advertise itself as the NEXT_HOP. This is useful when routes are propagated from an EBGP peer to an IBGP peer: the IBGP peer does not need to have a route to the EBGP peer.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Bgp Peer Desc **md5Key**

Access	Write only
Description	This attribute specifies this *Bgp Peer* component instance's MD5 key value that is used by the MD5 authentication on this BGP Peer session's underlying TCP connection. A null string indicates that the MD5 authentication is not to be used on the TCP connection to this Bgp Peer session.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Bgp Peer Desc **keyTransitionDelay (keyDelay)**

Access	Read and write
Description	This attribute specifies a delay period associated with a change of *md5Key* value event of the *Peer* component. This is the time that can elapse before the local router transitions to using the new key for transmission for this Bgp Peer session.This time is not used to control when to accept the new key for reception, and the new key

Copyright © 2006, Nortel Nortel Confidential

is immediately accepted for reception.

This delay equates to the amount of time the operator has to provision both the local and remote ends with the new key, without losing service.

If ***sameAsBgp*** is specified, the value of *keyTransitionDelay* set under the parent *Bgp* component is used. Otherwise the value of this attribute will be used**.** The default is to use ***sameAsBgp***.

Mib no_mib

Values Decimal (1..20160)
sameAsBgp

Units minutes

Default sameAsBgp

ATTRIBUTE Rtr Bgp Peer Desc multiHopEbgp (mhEbgp)

Access Read and write

Description This attribute specifies whether MultiHop EBGP (External BGP) route distribution is supported on this EBGP peer. MultiHop EBGP allows routes to be distributed between EBGP peers that are not directly connected and can span multiple hops

Mib no_mib

Values enabled
disabled

Default disabled

ATTRIBUTE Rtr Bgp Peer Desc asPathCheck

Access Read and write

Description This attribute specifies the treatment of the AS_PATH loop detection mechanism in routes received from the peer.

If this attribute is set to ***disabled***, AS_PATH loop is not detected. If this attribute is set to ***enabled***, AS_PATH loop is detected.

Mib no_mib

Values enabled
disabled

Default enabled

ATTRIBUTE Rtr Bgp Peer Desc attachSiteOfOrigin (attachSoo)

Access Read and write

Description This attribute specifies the site of origin identifier to attach for this BGP Peer connection.

Copyright © 2006, Nortel Nortel Confidential

	If this attribute is set, a site of origin extended community path attribute is attached to the routes received from this peer unless the site of origin extended community path attribute is already included in the routes.
Mib	no_mib
Values	String (0..21, RFC2547RdRtSyntax)
Default	No default

ATTRIBUTE Rtr Bgp Peer Desc **checkSiteOfOrigin (checkSoo)**

Access	Read and write
Description	This attribute specifies the site of origin identifiers to check for this BGP Peer connection. If this attribute is set, a check is done when routes are received from this peer or advertised to this peer. If the site of origin extended community path attribute presents in received routes and matches any Site Of Origin in this attribute, the routes are not accepted. If the site of origin extended community path attribute presents in the advertised routes and matches any SOO in this attribute, the routes are not advertised to this peer. If this attribute is not set, no check and filtering is done.
Mib	no_mib
List of	String (3..21, RFC2547RdRtSyntax)
List Size	256
Default	No default

ATTRIBUTE Rtr Bgp Peer Desc **bgpPeerRouteLimit (bprl)**

Access	Read and write
Criticality	Component
Description	This attribute specifies a limit to control the maximum number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated. The default value of zero implies no protection. This limit is set based on the requirements of the network configuration and is optional but critical under the peer.
Mib	no_mib
Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Rtr Bgp Peer Desc **bgpPeerRouteDiscard (bprd)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a limit to control the number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated and subsequent routes are discarded. The default value of zero signifies no protection. This limit is set based on the requirements of the network configuration and is optional but critical under the peer.
Mib	no_mib
Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Rtr Bgp Peer Desc **asOverride (asOr)**

Access	Read and write
Description	This attribute specifies the treatment of the AS_PATH path attribute in routes sent to the peer. If this attribute is ***enabled,*** then BGP will override all the AS numbers in the AS_PATH list, that match the AS number of the peer that we are sending to, with the local AS number. This attribute is meaningful only for external peers. This attribute is available for the *Bgp Peer Desc* component under the *Vr Ip*, *Vrf* and *Rtr* components. However, if it is set to ***enabled*** under the *Rtr Bgp Peer Desc* component, it has no impact. The behaviour is ***disabled*** regardless of the provisioned value in this case.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Bgp Peer Desc **addressFamily**

Access	Read and write
Description	The attribute specifies the supported network layer protocols being carried in any BGP-4 UPDATE messages over this Peer session. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be added to this attribute on all VCGs' peer instances. To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamily* list of all the VCGs' Peer instances. To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extensions, the value of ***ipv4MplsVpn*** must be in the *addressFamily* list of all the VCGs' peer instances. To distribute IPv4 Unicast routes with labels, using multi-protocol BGP

Copyright © 2006, Nortel Nortel Confidential

extensions, the value of ***ipv4Label*** must be in the *addressFamily* list of the peer instance.

ipv4Unicast represents AFI = 1 and SAFI = 1
ipv4Vpn represents AFI = 1 and SAFI = 140 (not for RFC 2547)
mbgpVpn represents AFI = 1 and SAFI = 141 (not for RFC 2547)
ipv4MplsVpn represents AFI = 1 and SAFI = 128
ipv4Label represents AFI=1 and SAFI=4

GROUP Rtr Bgp Peer Vpn Ipv4 **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes of the *Ipv4* component.
Mib	no_mib

ATTRIBUTE Rtr Bgp Peer Vpn Ipv4 **publicIpAddress**

Access	Read only
Description	This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Bgp Peer Vpn Ipv4 **asPath**

Access	Read only
Description	This attribute indicates the sequence of AS path segments through which the IP VPN information arrives. The AS Path lists the ASs in reverse traversal order from the point of origin. This attribute is not applicable and is not displayed for locally -learned IP VPN information.
Mib	no_mib
Values	String (2..255, ASCII)
Default	No default

ATTRIBUTE Rtr Bgp Peer Vpn Ipv4 **vpnPeeringTopology**

Access	Read only
Description	This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	none hub spoke
Default	No default

ATTRIBUTE Rtr Bgp Peer Vpn Ipv4 **asOriginatorId**

Access	Read only
Description	This attribute is associated with the Route Reflector. It indicates the router-id of the originator of this IP VPN information in the local AS. When the Route Reflector in the backbone distributes a discovered VPN information to other IBGP speakers, the value of this attribute in the discovered VPN information is used if one is present; otherwise, the Route Reflector's router-id is used. A value of 0.0.0.0 indicates this *Bgp* instance is not a Route Reflector. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Bgp Peer Vpn Ipv4 **redundant**

Access	Read only
Description	This attribute indicates that the IP VPN information entry learned from more than one BGP peers in the carrier backbone. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	no_mib
Values	no yes
Default	No default

ATTRIBUTE Rtr Bgp Peer Vpn Ipv4 **rrClusterList**

Access	Read only
Description	This attribute is associated with the Route Reflector. It indicates the sequence of cluster-ids that this discovered IP VPN information has traversed. When the Route Reflector in the backbone reflects a discovered VPN information to other non-client IBGP peers, the cluster ID of the Route Reflector is added to the cluster list of the received VPN information. A blank list indicates this attribute is not present in the received VPN information or if this *Bgp* instance is not a Route Reflector.

COMPONENT Rtr Bgp ImportPolicy (Import)

Instance	Decimal (0..65535)
Groups	GROUP Rtr Bgp Import Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Import/n* *Rtr/<string> Bgp Import/n* *Rtr/<string> Vrf/<string> Bgp Import/n* Each instance of this component describes a BGP import policy. A BGP import policy is used to decide if certain routing information learned from its peer is to be ignored or used. If no import policy is provisioned, BGP will accept all routes received from its IBGP peers, but will not use any routing information received from its EBGP peers. If multiple import policies are provisioned, the one with the most specific match will apply. The keys are matched in the following order from the least specified to the most specified: *Network*, *peerAs*, *peerIpAddress*, *originAs*, *originProtocol*, *matchAsPath,* *matchCommunity.* Example1: There are 2 import policies defined: vr/0 ip bgp import/1, originProtocol = ***any***, originAs = ***20***, usageFlag = ***use*** vr/0 ip bgp import/2, originProtocol = ***igp***, usageFlag = ***ignore*** If a BGP NLRI contains a route originally learned from an igp with origin AS 20, it will be used. Example2: There are 2 import policies defined: vr/0 ip bgp import/1, originProtocol = ***any***, matchAsPath = ***“1 2 3”***, usageFlag = ***ignore*** vr/0 ip bgp import/2, originProtocol = ***any***, usageFlag = use If a BGP NLRI contains a route originally learned from an igp with the AsPath “1 2 3 4”, it will be ignored.

Copyright © 2006, Nortel Nortel Confidential

For Router and Vrf, the example is similar with ‘Vr/0 Ip’ replaced with ‘Router/0’ and ‘Router/0 Vrf/1’ respectively.

GROUP Rtr Bgp Import Provisioned (Prov)

Properties Provisioned

Description This group contains all the provisionable attributes for the *Import* component.

Mib no_mib

ATTRIBUTE Rtr Bgp Import peerAs

Access Read and write

Description This key attribute specifies the autonomous system number of the peer from which the routes are learned. A value of 0 for this attribute means that peer AS number will match any AS number.

Mib no_mib

Values Decimal (0..65535)

Default 0

ATTRIBUTE Rtr Bgp Import peerIpAddress

Access Read and write

Description This key attribute specifies the IP address of the peer from which the routes are learned. A value of 0.0.0.0 for this attribute means that peer IP address will match any IP address.

Mib no_mib

Values IP address

Default 0.0.0.0

ATTRIBUTE Rtr Bgp Import originAs

Access Read and write

Description This key attribute specifies the autonomous system number where the routes were originated. A value of 0 for this attribute means origin AS number will match any AS number.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Bgp Import originProtocol

Access	Read and write
Description	This key attribute specifies the protocols that originated the routes. A value of ***incomplete*** for this attribute means this information is not available.
Mib	no_mib
Values	any igp egp incomplete
Default	any

ATTRIBUTE Rtr Bgp Import usageFlag (usage)

Access	Read and write
Description	This attribute specifies whether BGP will use or ignore information in received update if it meets criteria specified by the key attributes of this component.
Mib	no_mib
Values	use ignore
Default	use

ATTRIBUTE Rtr Bgp Import localPreference (locPrf)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's degree of preference for those routes that match the criteria of this import policy. A higher value indicates a more preferred route. A value of 0 for this attribute means that the default local preference value provisioned under the *Bgp* component should be used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Import asPathExpression (asExpr)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the received update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path. The following characters has the special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1... n2]' - Matches any AS number that appeared in the set n1... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a AS set, range or number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x. 'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y. 'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y. For example: The AS path "5 4 3 2 1", where 1 is the origin AS, would be match by any one of the following regular expressions: ***1$,*** ***^5,*** ***4 3,*** ***5 3 - 4*,*** ***5 [4 3 2] not10 2 1,*** ***not (6 7 8 9 10) and 5 4.* 1*** Empty regular expression implies a match on all AS path.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Bgp Import **communityExpression (comExpr)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of Community number separated by a space which making up a Community attribute. The following characters have a special meaning: '[n1... n2]' - Matches any Community number that appeared in the set n1...n2. 'n1 - n2' - Matches any Community number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the Community attribute that is not matched by x. 'AND'- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y. 'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y. For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression: ***1,*** ***5,*** ***4 3,*** ***2 3 - 4*,*** ***1 [3 4 2]+,*** ***not (6 7 8 9 10) and 1 2*** Empty regular expression implies a match on all Community path.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Bgp Import **expressPreference (exprPref)**

Access	Read and write
Description	This attribute specifies the relative preference of the policy which use the keys *expressAsPath* and *expressCommunity*. This attribute is ignored if attributes *expressAsPath* and *expressCommunity* are both empty. This

Copyright © 2006, Nortel Nortel Confidential

attribute is used to break the tie when two import policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy.

Mib	no_mib
Values	Decimal (0..255)
Default	128

ATTRIBUTE Rtr Bgp Import **appendCommunity (appCom)**

Access	Read and write
Description	This attribute indicates which community number this import policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is appended to the Community attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Import **ibgpRtePreference (ibgpPref)**

Access	Read and write
Description	This attribute specifies the routing preference of IBGP routes matching this import policy. A lower value means the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultIbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.
Mib	no_mib
Values	Decimal (1..253) sameAsBgp
Default	sameAsBgp

ATTRIBUTE Rtr Bgp Import **ebgpRtePreference (ebgpPref)**

Access	Read and write
Description	This attribute specifies the routing preference of EBGP routes matching this import policy. A lower value specifies the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultEbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.

COMPONENT Rtr Bgp ExportPolicy (Export)

Instance	Decimal (0..65535)
Groups	GROUP Rtr Bgp Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Export/n* *Rtr/<string> Bgp Export/n* *Rtr/<string> Vrf/<string> Bgp Export/n*

Copyright © 2006, Nortel Nortel Confidential

Each instance of this component describes a BGP export policy. A BGP export policy is used to decide if certain routing information should be blocked or advertised to its peers.
If no export policy is provisioned, BGP will advertise all external BGP learned routes to its internal peers, but not advertise any routing information to its external peers.
If multiple export policies are provisioned, the one with the most specific match will apply.
The keys are matched in the following order from the least specified to the most specified:
peerAs,
peerIpAddress,
protocol,
ripInterface (if applicable),
egpAs, bgpAs, ripNeighbour, or *ospfTag* (whichever is applicable),
Network,
matchAsPath,
matchCommunity.

Example1: (for Router and Vrf, the examples are similar by replacing ‘vr/0 ip’ with ‘Router/a’ and ‘Router/a Vrf/b’ respectively)
There are 2 export policies defined:
vr/0 ip bgp export/1, protocol = ***all***, advertiseStatus = ***send***
vr/0 ip bgp export/2, protocol = ***rip***, advertiseStatus = ***block***
BGP will generate BGP updates for all routes except the routes learned from RIP.
Example2:
There are 2 export policies defined:
vr/0 ip bgp export/1, protocol = all, matchCommunity = ***303***, advertiseStatus = ***send***
vr/0 ip bgp export/2, protocol = ***all***, advertiseStatus = ***block***
BGP will generate BGP updates for all routes that belongs to Community 303.

GROUP Rtr Bgp Export Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisioned attributes for the *Export* component.

Mib: no_mib

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Bgp Export **peerAs**

Access	Read and write
Description	This key attribute specifies the autonomous system number of the peer where the routes are advertised to. A value of 0 for this attribute means this export policy applies to all peer ASes.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Bgp Export **peerIpAddress**

Access	Read and write
Description	This key attribute specifies the IP address of the peer where the routes are advertised to. A value of 0.0.0.0 for this attribute means this export policy applies to all peers. This key attribute is used in export policies for AFI/SAFI = 1/128 only if the *addressFamily* attribute is set to ***ipv4MplsVpn***.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Bgp Export **protocol**

Access	Read and write
Description	This key attribute specifies which protocol the export policy applies to. If it is set to ***all***, that means this export policy will apply all routes in the IP routing table. Example: vr/1 ip ospf export/1 with advertise Status = block protocol = bgpExternal bgpAsId = 3 peerAs = 5 This policy specifies that all routes learned from EBGP Peers that are originated from AS 3 should not be advertised to AS 5.
Mib	no_mib
Values	all egp rip ospfInternal ospfExternal staticLocal staticRemote bgpInternal bgpExternal

Copyright © 2006, Nortel Nortel Confidential

	bgpAggregate mbgp bgpMplsInternal
Default	all

ATTRIBUTE Rtr Bgp Export egpAsId (egpAs)

Access	Read and write
Description	This key attribute specifies the EGP autonomous system number that this export policy will apply to. When this value is non-zero, the *protocol* attribute must be set to ***egp***.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Bgp Export bgpAsId (bgpAs)

Access	Read and write
Description	This key attribute specifies the BGP autonomous system number that this export policy will apply to. When this value is non-zero, the *protocol* attribute must be set to either ***bgpInternal*** or ***bgpExternal***.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Bgp Export ospfTag

Access	Read and write
Description	This key attribute specifies the OSPF tag when the *protocol* attribute is set to either ***ospfInternal*** or ***ospfExternal***. The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag not specified.
Mib	no_mib
Values	Hex (H.0..H.ffffffff)
Default	H.ffffffff

ATTRIBUTE Rtr Bgp Export ripInterface (ripIf)

Access	Read and write
Description	This key attribute specifies the local RIP interface where the routes are learned from. The *ripInterface* attribute when non-zero should be equal to one of the IP addresses provisioned as a *logicalIf* component under *IpPort*, or the IP address of an *Interface* component. Otherwise, this policy will be ignored.

Copyright © 2006, Nortel Nortel Confidential

	The value of the *protocol* attribute must be set to ***rip*** if a value for the *ripInterface* attribute is non-zero.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Bgp Export ripNeighbor (ripNbr)

Access	Read and write
Description	This key attribute specifies the RIP neighbor where the routes were learned from. The value of the *protocol* attribute must be set to ***rip*** if the *ripNeighbor* attribute is non-zero.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Bgp Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies whether data will be exported if it meets criteria specified by the other key attributes of this component.
Mib	no_mib
Values	send block
Default	send

ATTRIBUTE Rtr Bgp Export multiExitDisc (med)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's metric to discriminate between multiple exit points to an adjacent autonomous system if the route meets the criteria specified by the key attributes of this component. A lower value indicates a more preferred route. A value of 0 for this attribute means the default MED value provisioned under the *Bgp* component should be used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Export sendMultiExitDiscToEbgp (sendMed)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies whether the Multi Exit Discriminator (MED) attribute should be included in an update message sent to an EBGP peer.
Mib	no_mib
Values	false true
Default	false

ATTRIBUTE Rtr Bgp Export asPathExpression (asExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the export update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path. The following characters have a special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1... n2]' - Matches any AS number that appeared in the set n1... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x. 'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y. 'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y. For example: The AS path "5 4 3 2 1", where 1 is the origin AS, would be match by any one of the following regular expressions:

Copyright © 2006, Nortel Nortel Confidential

1$,
^5,
4 3,
5 3 - 4*,
5 [4 3 2] not10 2 1,
not (6 7 8 9 10) and 5 4.* 1
Empty regular expression implies a match on all AS path.

Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Bgp Export communityExpression (comExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of Community number separated by a space which making up a Community attribute. The following characters have a special meaning: '[n1... n2]' - Matches any Community number that appeared in the set n1...n2. 'n1 - n2' - Matches any Community number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the Community attribute that is not matched by x. 'AND'- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y. 'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y. For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression: ***1,*** ***5,*** ***4 3,*** ***2 3 - 4*,*** ***1 [3 4 2]+,*** ***not (6 7 8 9 10) and 1 2*** Empty regular expression implies a match on all Community path.

Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Bgp Export expressPreference (exprPref)

Access	Read and write
Description	This attribute specifies the relative preference of the policy which use the keys *expressAsPath* and *expressCommunity*. This attribute is ignored if attributes *expressAsPath* and *expressCommunity* are both empty. This attribute is used to break the tie when two export policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy.
Mib	no_mib
Values	Decimal (0..255)
Default	128

ATTRIBUTE Rtr Bgp Export sendCommunity (sendCom)

Access	Read and write
Description	This attribute indicates which community number this export policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is added to the Community attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Export localPreference (locPrf)

Access	Read and write
Description	This attribute specifies the value of the LOCAL_PREFERENCE path attribute in routes sent to internal peers. A value of 0 means that the value specified in the import policy (if any) or the default local preference value should be used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Bgp Export virtualPrivateNetworkIdentifier (vpnId)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the Virtual Private Network (VPN) identifier of the routes this export policy should apply to. This attribute is only used if *addressFamily* has included ***mbgpVpn***. The value “00-00-00-00-00-00-00” identifies an unspecified VPN ID, meaning the VPN ID will not be used as a matching criteria in this export policy.
Mib	no_mib
Values	String (7, Dashed Hex)
Default	00-00-00-00-00-00-00

ATTRIBUTE Rtr Bgp Export addressFamily (af)

Access	Read and write
Description	This attribute specifies the Address Family of the routes this export policy should apply to. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). An export policy is applied for AFI/SAFI = 1/128 only when this attribute is set to ***ipv4MplsVpn***. In this case only *peerIpAddress*, *routeTarget*, and *advertiseStatus* attributes and *Network* component and its related attributes are used for export policies. It can contain one of the following: ***ipv4Unicast*** represents AFI = 1 and SAFI = 1 ***mbgpVpn*** represents AFI = 1 and SAFI = 141 ***ipv4MplsVpn*** represents AFI = 1 and SAFI = 128 ***all***
Mib	no_mib
Values	all ipv4Unicast mbgpVpn ipv4MplsVpn
Default	all

ATTRIBUTE Rtr Bgp Export description (desc)

Access	Read and write
Description	This attribute describes the policy. For example, ‘to export BGP routes to MCI’.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Bgp Export insertDummyAs (insertAs)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the AS number(s) to be inserted into the AS Path Attribute. The value is a sequence of AS number separated by period(.). For example, if the value is ***20.20.30***, the AS numbers 20, 20 and 30 would be inserted at the end of the AS Path Attribute just before the local AS number.
Mib	no_mib
Values	Integer Sequence
Default	No default

ATTRIBUTE Rtr Bgp Export routeTarget (rt)

Access	Read and write
Description	This attribute specifies the Route Target of the routes this export policy should apply to.
Mib	no_mib
List of	String (3..21, RFC2547RdRtSyntax)
List Size	256
Default	No default

COMPONENT Rtr Bgp Export Network (Net)

Instance	Decimal (0..65535)
Groups	GROUP Rtr Bgp Export Net Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Export/n Network/n* *Rtr/<string> Bgp Export/n Network/n* *Rtr/<string> Vrf/<string> Export/n Network/n* This is an optional subcomponent of the *Export* component and identifies a destination network that this BGP export policy will apply to. This component is used as a key for the export policy. If no network list is provisioned, the export policy applies to all networks. This component and its associated attributes are applied in an export policy for AFI/SAFI = 1/128 only if *addressFamily* attribute is set to ***ipv4MplsVpn***.
Mib	no_mib

Description	This group contains the attributes associated to each autonomous system for this *Bgp* component instance.
Mib	no_mib

ATTRIBUTE Rtr Bgp As weight

Access	Read and write
Description	This attribute specifies the weight for an autonomous system. It allows users to prefer some ASes over others. It is used in route selection. Lowest weight is preferred. Setting the weight of an AS to 255 will make any route that traverses through that AS unpreferred.
Mib	no_mib
Values	Decimal (0..255)
Default	128

COMPONENT Rtr Bgp AggregatePolicy (Aggregate)

Instance	prefix [IP address] length [Decimal (0..32)]
Scope	Application
Description	*Vr/<string> Ip Bgp AggregatePolicy/<Ip Address>,<Decimal>* *Rtr/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>* *Rtr/<string> Vrf/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>* This component is used to perform aggregation of BGP routes for exporting. Aggregation is the process of combining the characteristics of several different routes in such a way that a single route can be advertised. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Refer to RFC1771 for the set of rules regarding which routes can be aggregated. A ***network*** subcomponent is automatically added with the same network range as the aggregation policy key and its action is set to ***aggregate***. So by default all subnets under the aggregation key range will be aggregated. Examples (For *Router* and *Vrf*, the examples are similar by replacing 'vr/0 ip' with 'Router/a' and 'Router/a Vrf/b' respectively): Example #1: aggregate all the networks covered by A.0.0.0/8 add vr/0 ip bgp aggregate/A.0.0.0,8 (Note: the following subcomponent vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action aggregate will be automatically added) Example #2: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks add vr/0 ip bgp aggregate/A.0.0.0,8 set vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.B.0.0, length 16, action aggregate (Note: this set command will overwrite the default network subcomponent vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action

Copyright © 2006, Nortel Nortel Confidential

aggregate)
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate

Example #3: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks; also advertise A.B.C.0/24
add vr/0 ip bgp aggregate/A.0.0.0,8
set vr/0 ip bgp aggregate/A.0.0.0,8 networkl/0 prefix A.B.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/2
set vr/0 ip bgp aggregate/A.0.0.0,8 network/2 prefix A.B.C.0, length 24, action advertise

Example #4: aggregate all networks under A.0.0.0/8, meanwhile advertise A.B.0.0/16
add vr/0 ip bgp aggregate/A.0.0.0,8
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.B.0.0, length 16, action advertise

Default	No default

ATTRIBUTE Rtr Bgp Outdb asOriginatorId

Access	Read only
Description	This attribute is associated with the Route Reflector. It indicates the router-id of the originator of a route in the local AS. When the Route Reflector distributes a learned IBGP route to other IBGP speakers, the value of this attribute in the learned route is used if one is present; otherwise, the Route Reflector's router-id is used. A value of 0.0.0.0 indicates this *Bgp* instance is not a Route Reflector.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Bgp Outdb rrClusterList

Access	Read only
Description	This attribute indicates a sequence of cluster-ids that the route has traversed. When the Route Reflector redistributes a learned IBGP to other IBGP speakers, the cluster id of this Route Reflector is appended to the cluster list of the learned IBGP route. If this *Bgp* instance is not a Route Reflector, this attribute is blank.

Description	This group contains the operational attributes of the *Ipv4* component.
Mib	no_mib

ATTRIBUTE Rtr Bgp LocalVpn Ipv4 publicIpAddress

Access	Read only
Description	This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Bgp LocalVpn Ipv4 vpnPeeringTopology

Access	Read only
Description	This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no

Copyright © 2006, Nortel Nortel Confidential

dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.

COMPONENT Rtr Bgp MBgpRibEntry (MBgpRib)

Instance:
vpnId [String (7, Dashed Hex)]
prefix [IP address]
length [Decimal (0..32)]
peer [IP address]

Groups: GROUP Rtr Bgp MBgpRib Operational (Oper)

Scope: Application

Description:
Vr/<string> Ip Bgp MBgpRibEntry/ <vpnid>,<prefix>,<length>,<peer_ip_address>
This component represents a single MBGP routing database entry received from one of the BGP peers of this virtual router.

The instance values of this component have the following meanings:
- *vpnId:* the virtual private network identifier associated with the MBGP route.
- *prefix*: the destination IP address prefix of the MBGP route.
- *length:* the length of the IP address prefix of the MBGP route.
- *peer_ip_address:* the IP address prefix of the BGP peer that the MBGP route has been learned from. A value of 0.0.0.0 indicates that the MBGP route is learned from a locally attaching customer VR.

This component only appears under a *VirtualRouter* component whose *vpnMode* attribute is set to ***carrier***.

COMPONENT Rtr Bgp MplsVpnRibEntry (MvRib)

Instance	routeDistinguisher [String (3..21, RFC2547RdRtSyntax)] prefix [IP address] length [Decimal (0..32)] peer [IP address]
Groups	GROUP Rtr Bgp MvRib Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr> *Rtr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr> The *MplsVpnRibEntry* component represents a single entry in the MPLS VPN routing information database.This component is used to maintain the MPLS VPN routes learned both locally and from the BGP peers. The instance values of this component have the following meaning: - *routeDistinguisher:* a string associated with the MPLS VPN route. The string is in the form of (1) AS:nn or (2) IPAddr:mm. where

Copyright © 2006, Nortel Nortel Confidential

AS represents an autonomous system number,
nn represents an index value,
IPAddr represents an IP address,
mm represents an index value

- *prefix*: the destination IP address prefix of the MPLS VPN route. This is an IP address prefix as specified in the Network Layer Reachability Information field of the MP_REACH_NLRI path attribute.

- *length:* the length of the IP address prefix of the MPLS VPN route. This is the IP address prefix length as specified in the Network Layer Reachability Information field.

- peerIpAddr: the IP address prefix of the BGP peer that the MPLS VPN route has been learned from.

This component is only applicable to the *Router* component or a virtual router whose *vpnMode* attribute is set to ***carrier***.

Mib: Bgp

ATTRIBUTE Rtr Bgp MvRib serviceLabel (sl)

Access: Read only

Description: This attribute indicates the service label (the inner label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node and distributed together with the routing information toward the remote end PE. The service label is then used by the remote PE node to encapsulate traffic of the same VPN to the local PE node. When the local PE node processes a received packet which has the service label at the top of the stack, the PE pops the stack, and sends the packet to the Customer Edge (CE) node from which the route leads. (See also transportLabel attribute description.)

Mib: Bgp

Values: Decimal (0..1048575)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rtr Bgp MvRib **transportLabel (tl)**

Access	Read only
Description	This attribute indicates the transport label (the outer label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node. The transport label identifies the MPLS tunnel (Labeled Switched Path) used to transport the service label encapsulated VPN traffic, between two PE nodes, through the backbone. The transport label is applied on top of the service label at the source PE node, and used to direct the VPN traffic (travelling through the network core) to the destination PE. At the destination PE node the transport label is stripped, leaving the service label encapsulated packet to be processed and forwarded to a CE node based on the service label. A value of ***awaitingLabel*** indicates the MPLS tunnel is currently not available and waiting to be established. A value of ***notApplicable*** indicates this is a local route and hence doesn't have a transport label.
Mib	Bgp
Values	Decimal (0..1048575) awaitingLabel notApplicable

[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-cos(0..3)][-dscp(0..63)][-tos(0..FF)][-stop] Vr/<string> Ip Icmp

Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)]
[-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)]
[-traceRoute] [-continuous] [-dontFragment] [-noOp]
[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-dscp(0..63)][-tos(0..FF)][-stop] Rtr/<string> Icmp

Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)]
[-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)]
[-traceRoute] [-continuous] [-dontFragment] [-noOp]
[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-dscp(0..63)][-tos(0..FF)][-stop] Rtr/<string> Vrf/<string> Icmp

The *Ping* verb is intended for testing network connections at the IP level. The verb invokes ICMP to issue an echo request to the host specified by the *ipAddr* option and waits for its echo response.

If the *Ping* is successful, it outputs the following information:
- number of bytes received
- IP address of the responding host
- ICMP sequence number of the received packet
- elaspsed time from sending of the *Ping* to receiving of the response

The following options are supported:

-srcAddr is used to define the source IP address of the IP ICMP echo request packet. When not specified or specified as 0.0.0.0, the outgoing IP *Interface* or *LogicalIf* address is used as the source address.

-netmask when specified is used to define a range of IP host addresses to

Copyright © 2006, Nortel Nortel Confidential

which echo requests are sent to (ping sweep). The netmask given must be contiguous. The *-retry* option is ignored if used together with this option. By default, the value is set to 255.255.255.255.

-*size* is used to define the size of the IP packet to be echoed including the IP and ICMP header. The default is 64 bytes. The maximum size is 4096.

-*retry* is used to define the number of times an echo request is resent if no echo reply is received. Default is 0.

-*traceRoute* is used to find the route the node would use to reach a particular destination IP address at the moment when the *Ping* command is executed with this option. The *-netmask*, *-size, -retry* and *-continuous* option are ignored if used together with this option. By default, the *traceRoute* option is not used.

-continuous causes ICMP to issue echo requests once per second to the host or hosts specified by the *-ipAddr* and the *-netmask* option. For every echo response ICMP receives, one line of output is printed. No output is produced if there is no response. The -*stop* option is used to stop ICMP from sending the echo requests. By default, the *-continuous* option is not used.

-dontFragment causes ICMP to set the Don't Fragment flag of the IP packet that carries the echo request. This is useful in determining path MTU. By default, the *dontFragment* option is not used.

-noOp causes a No Operation option to be inserted into the IP header of the packet that carries the echo request. By default, the *noOp* option is not used.

-recordRoute causes the route of the IP packet that carries the echo request to be recorded in the IP header. Up to 9 routes can be recorded. If the number of routes to record is not specified, 5 routes are recorded by default.

-timeStamp sets the Time Stamp option in the IP header of the packet that carries the echo request. The format used for the time stamps consists of both an IP Adress and a time field. The default number of time stamps is 3. A maximum of 4 time stamps can be recorded.

-looseSrcRoute is used to specify a loose set of routes for the packet carrying the echo request to go through along the path to the destination. Up to 9 routes can be specified.

-strictSrcRoute is used to specify a strict set of routes for the packet carrying the echo request to go through to get to the destination. Up to 9 routes can be specified.

-cos causes the echo request packet to be forwarded with the given Class Of Service. Default is 0. This option is not supported on a Router

Copyright © 2006, Nortel Nortel Confidential

component, a VpnRouteForwarder component, nor on a VirtualRouter component that has a DifferentiatedServicesDomain subcomponent.

-dscp causes the six most significant bits of Type Of Service (TOS) byte of the echo request packet to be set to the given value. These six bits are know as the Differentiated Services Code Point (DSCP). Default is 0. This option cannot be used together with the *-tos* option.

-tos causes the Type Of Service (TOS) byte of the echo request packet to be set to the given value. Default is 0. This option cannot be used together with the *-dscp* option.

-stop is used to stop ICMP from sending echo requests due to a previously issued *Ping* command with the *-continuous* and/or *-netmask* option. Under any other situation, the *Ping* command with the *-stop* option has no effect.

Note: Only one *Ping* command per *VirtualRouter* or *Router* or *Router Vrf* is allowed to be in progress at any one time. Any in progress *Ping* command must be stopped before a new *Ping* command can be issued.

GROUP Rtr Icmp Statistics (Stats)

Properties	Operational
Description	This group holds statistics for ICMP.
Mib	no_mib

ATTRIBUTE Rtr Icmp inMsgs

Access	Read only
Description	This attribute counts the ICMP messages received by this gateway. This number includes *inErrors*. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inErrors

Access	Read only
Description	This attribute counts the ICMP messages received by this gateway but determined as having ICMP specific errors such as bad ICMP checksum or bad length. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Rtr Icmp inDestUnreachs

Access	Read only
Description	This attribute counts the ICMP destination unreachable messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inTimeExcds

Access	Read only
Description	This attribute counts the ICMP time exceeded messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inParmProbs

Access	Read only
Description	This attribute counts the ICMP parameter problem messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inSrcQuenchs

Access	Read only
Description	This attribute counts the ICMP source quench messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Icmp inRedirects

Access	Read only
Description	This attribute counts the ICMP redirect messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inEchos

Access	Read only
Description	This attribute counts the ICMP echo request messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inEchoReps

Access	Read only
Description	This attribute counts the ICMP echo reply messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inTimestamps

Access	Read only
Description	This attribute counts the ICMP timestamp request messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inTimestampReps

Access	Read only
Description	This attribute counts the ICMP timestamp reply messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inAddrMasks

Access	Read only
Description	This attribute counts the ICMP address mask request messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp inAddrMaskReps

Access	Read only
Description	This attribute counts the ICMP address mask reply messages received by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Icmp outMsgs

Access	Read only
Description	This attribute counts the ICMP messages that this gateway attempted to send. This number includes *outErrors*.

Copyright © 2006, Nortel Nortel Confidential

The counter wraps to zero when it exceeds its maximum value.

Mib no_mib

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Rtr Icmp outErrors

Access Read only

Description This attribute counts the ICMP messages that this gateway did not send due to problems discovered within ICMP such as a lack of buffers. *outErrors* does not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram.

The counter wraps to zero when it exceeds its maximum value.

Mib no_mib

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Rtr Icmp outDestUnreachs

Access Read only

Description This attribute counts the ICMP destination unreachable messages sent by this gateway.

The counter wraps to zero when it exceeds its maximum value.

Mib no_mib

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Rtr Icmp outTimeExcds

Access Read only

Description This attribute counts the ICMP time exceeded messages sent by this gateway.

The counter wraps to zero when it exceeds its maximum value.

Mib no_mib

Values Decimal (0..4294967295)

Default 0

Common Verbs	Help List Display Add DELete LOCK Unlock

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Ospf Provisioned (Prov)

Properties	Provisioned
Description	This group of attributes are used to configure the OSPF component.
Mib	no_mib

ATTRIBUTE Rtr Ospf routerId (id)

Access	Read and write
Description	This attribute is an Ip Address that uniquely identifies the router in the autonomous system.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Ospf snmpAdminStatus

Access	Read and write
Description	The administrative status of the OSPF Component in this routing component (*Vr*, *Rtr* or *Vrf*).
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr Ospf asBdrRtrStatus (asBr)

Access	Read and write
Description	This attribute is a flag to note whether this router is an autonomous system border router. If this router is configured to export any routes learned from other than OSPF-internal protocol, this attribute should be configured as autonomous system border router.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Ospf tosSupport

Access	Read and write
Description	The router's support for type-of-service routing. Only one value will be allowed. This is a deviation from supporting the MIB.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	false
Default	false

ATTRIBUTE Rtr Ospf multicastForward

Access	Read and write
Description	A bit mask indicating the limits on Network Layer Multicast (class D) forwarding. It is represented as a sum of the following: if intra-Area forwarding is permitted, 1; else 0 if inter-Area forwarding is permitted 2; else 0 if inter-AS forwarding is permitted, 4; else 0 Only the value of 0 is being supported and this is a MIB deviation.
Mib	no_mib
Values	Decimal (0..0)
Default	0

ATTRIBUTE Rtr Ospf migrateRip

Access	Read and write
Description	This Attribute sets the preference level of OSPF-internal routes to be less preferred than RIP. This attribute should only be used when starting a migration of a network from RIP to OSPF. When ready to cut over to OSPF, set this attribute to a value of ***disabled*** and run under normal preferences. All OSPF routers in the Autonomous System should be running with the *migrateRip* attribute set to a value of ***enabled*** or with *migrateRip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Ospf generateDefaultRouteMetric (genDefaultMetric)

Access	Read and write
Description	If this router is configured as an autonomous system border router, then this attribute causes the default route to be generated with a metric value equal to *generateDefaultRouteMetric* value. This route is put in the OSPF update along with the normal update routes when updates are sent to the neighbors. No default route will be generated if the value is 0.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Signed (-1..65535)
Default	0

ATTRIBUTE Rtr Ospf redistributeIbgp (ribgp)

Access	Read and write
Description	This attribute specifies whether the export policies of this *Ospf* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all***. If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching routes. If *redistributeIbgp* is ***false***, routes learned from IBGP peers are excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Ospf estimatedNumberOfInternalOSPFRoutes

Access	Read and write
Description	This attribute specifies the average estimated number of routes in the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory.
Mib	no_mib
Values	Decimal (0..65535)
Default	500

ATTRIBUTE Rtr Ospf estimatedNumberOfExternalOSPFRoutes

Access	Read and write
Description	This attribute specifies the average estimated number of routes external to the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory.
Mib	no_mib
Values	Decimal (0..65535)
Default	500

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Ospf estimatedNumberOfAreas

Access	Read and write
Description	This attribute specifies the average estimated number of areas in the autonomous system that this OSPF instance will have to keep track of.
Mib	no_mib
Values	Decimal (0..65535)
Default	2

ATTRIBUTE Rtr Ospf estimatedNumberOfInterfacesPerArea

Access	Read and write
Description	This attribute specifies the average estimated number of interfaces in a given area that this OSPF instance will have to keep track of.
Mib	no_mib
Values	Decimal (0..65535)
Default	10

ATTRIBUTE Rtr Ospf estimatedNumberOfNeighborsPerInterface

Access	Read and write
Description	This attribute specifies the average estimated number of neighbors that a given interface will have on it in this OSPF interface.
Mib	no_mib
Values	Decimal (0..65535)
Default	3

ATTRIBUTE Rtr Ospf defaultOspfIntRtePreference (ospfIntPref)

Access	Read and write
Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF internal routes. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..254)
Default	30

ATTRIBUTE Rtr Ospf defaultOspfExt1RtePreference (ospfExt1Pref)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 1 routes. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..254)
Default	80

ATTRIBUTE Rtr Ospf defaultOspfExt2RtePreference (ospfExt2Pref)

Access	Read and write
Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 2 routes. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..254)
Default	120

ATTRIBUTE Rtr Ospf opaqueCapability (opcap)

Access	Read and write
Description	This attribute specifies whether the OSPF instance is allowed to participate in flooding Opaque LSAs. Such LSAs are also stored in the InwOspfLsdbEntry. Applications, such as MPLS Traffic Engineering, use this mechanism to flood their information throughout a network. Of the three Opaque LSA types (9,10,11), only type 10 LSAs (area scope) are supported.The OSPF instance remains fully inter-operable with non-opaque-capable neighbors. Opaque capability is not fully supported. When the ***mplsTeEmulation*** feature is provisioned, setting this attribute to ***true*** activates hooks to emulate TE capability by flooding hard-coded type 10 TE LSAs to opaque-capable neighbors. This emulated TE functionality is not standards compliant and is strictly provided for MPLS RSVP-TE inter-operability with vendors that are dependent on MPLS TE to establish LSPs.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Ospf spareInstance (spInst)

Access	Read and write
Description	This attribute specifies whether to maintain a copy of the link state database on the standby card. When this attribute is set to ***disable***, OSPF does not maintain a copy of the link state database.

Copyright © 2006, Nortel Nortel Confidential

If the *virtualRouterProcessor* attribute of this *VirtualRouter* is set to ***Lp/0***, then the following conditions must both be true for a copy of the link-state database to be maintained on the standby CP:

- This attribute must be set to ***enable***, and

- The *Shelf cpEquipmentProtection* attribute must be set to ***hot***.

Mib: no_mib

Values: enable
disable

Default: disable

ATTRIBUTE Rtr Ospf spfHoldTime (spfTime)

Access: Read and write

Description: This attribute specifies the minimum time interval between SPF calculations. If a link state change in the autonomous system is detected and the time since the last SPF calculation is greater than *spfHoldTime*, then the SPF calculation starts immediately. Otherwise, the SPF calculation waits until a time of at least *spfHoldTime* has elapsed since the previous SPF calculation.

Setting this attribute to a lower value decreases convergence time in the OSPF autonomous system, but uses more CPU resource more frequently. Setting this attribute to a higher value increases convergence time but provides for a more scalable node configuration, especially if there are many *Ospf* components configured on the node.

Mib: no_mib

Values: Decimal (1..60)

Units: seconds

Default: 1

ATTRIBUTE Rtr Ospf alarmGeneration (alarms)

Access: Read and write

Description: This attribute specifies the level of alarm generation for this *Ospf* instance.

A value of ***all*** specifies that all OSPF alarms are made visible.

A value of ***normal*** specifies that all existing OSPF alarms are made visible, except *Ospf NeighborEntry* state change alarms.

A value of ***none*** specifies that no OSPF alarms are made visible.

It is recommended that *VirtualRouter* components with the *vpnMode* attribute set to ***carrier*** should have the *alarmGeneration* attribute set to

Copyright © 2006, Nortel
Nortel Confidential

all. *VirtualRouter* components with the *vpnMode* attribute set to ***customer*** should have the *alarmGeneration* attribute set to either ***normal*** or ***none***, for scalability reasons. Similarly, the *alarmGeneration* attribute should be set to ***all*** for *Router*. The *alarmGeneration* attribute should be set to either ***normal*** or ***none*** for *Vrf* for scalability reasons.

Mib	no_mib
Values	none normal all
Default	all

ATTRIBUTE Rtr Ospf ecmpStatus

Access	Read and write
Description	This attribute specifies whether the Equal Cost Multi-Path (ECMP) functionality is enabled or not in the network meaning that the number of next hops for one route learned through OSPF depend on the value of *ecmpStatus*. If *ecmpStatus* is ***enabled,*** a maximum of three next hops are kept for one route. If it is ***disabled***, one next hop is kept for that route.
Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr Ospf attachAsTag (asTag)

Access	Read and write
Description	This attribute specifies the treatment of the OSPF tag when routes are redistributed between BGP and OSPF. If this attribute is set to ***enabled***, an AS number is encoded as OSPF tag when routes are redistributed from BGP into OSPF. When routes are redistributed from OSPF into BGP, the OSPF tag is checked against the AS number to avoid routing loops. If this attribute is set to ***disabled***, an AS number is not encoded as OSPF tag when routes are redistributed from BGP into OSPF. When routes are redistributed from OSPF into BGP, the OSPF tag is not checked against the AS number.
Mib	no_mib
Values	disabled enabled
Default	enabled

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Ospf Operational (Oper)

Properties	Operational
Description	These group of attributes identifies the operational attributes for this OSPF Component.
Mib	no_mib

ATTRIBUTE Rtr Ospf versionNumber (ver)

Access	Read only
Description	The Current Version number of the OSPF Protocol. (2).
Mib	no_mib
Values	Decimal (2..2)
Default	2

ATTRIBUTE Rtr Ospf areaBdrRtrStatus

Access	Read only
Description	This attribute is used to specify whether this router is configured as an area border router.
Mib	no_mib
Values	true false
Default	No default

ATTRIBUTE Rtr Ospf externLsaCount

Access	Read only
Description	The number of external (LS type 5) link-state advertisements in the link-state database.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Ospf externLsaChecksumSum

Access	Read only
Description	The 32-bit unsigned sum of the LS checksums of the external link-state database. This sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Ospf originateNewLsas

Access	Read only
Description	The number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Ospf rxNewLsas

Access	Read only
Description	The number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtr Ospf OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Ospf adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Rtr Ospf operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Rtr Ospf usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Values:
idle
active (activ)
busy

Copyright © 2006, Nortel Nortel Confidential

Default	idle

GROUP Rtr Ospf OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Ospf snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

COMPONENT Rtr Ospf AreaEntry (Area)

Instance	IP address
Groups	GROUP Rtr Ospf Area Provisioned (Prov) GROUP Rtr Ospf Area Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Ospf AreaEntry/<Ip Address>* *Rtr/<string> Ospf AreaEntry/<Ip Address>* *Rtr/<string> Vrf/<string> Ospf AreaEntry/<Ip Address>* This component contains the information about various areas that the router is connected to.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr Ospf Area Provisioned (Prov)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group describes the set of provisionable attributes for the AreaEntry Component.
Mib	no_mib

ATTRIBUTE Rtr Ospf Area authType

Access	Read and write
Description	The authentication type specified for this area.
Mib	no_mib
Values	none simplePassword md5
Default	none

ATTRIBUTE Rtr Ospf Area importAsExtern

Access	Read and write
Description	The area's support for importing AS external link-state advertisements. For backbone area (that is, areaId 0.0.0.0), this attribute must be set to ***importExternal***.
Mib	no_mib
Values	importExternal (external) importNoExternal (noExternal) importNssa (nssa)
Default	importExternal

ATTRIBUTE Rtr Ospf Area areaSummary

Access	Read and write
Description	This variable controls the import of summary LSAs into stub areas. If it is ***noAreaSummary***, the router will neither originate nor propagate summary LSAs into the stub areas. It will rely entirely on its default route. If it is ***sendAreaSummary***, the router will both summarize and propagate summary LSAs.
Mib	no_mib
Values	noAreaSummary sendAreaSummary
Default	noAreaSummary

GROUP Rtr Ospf Area Operational (Oper)

Properties	Operational
Description	This group of attributes describes the Operational set of attributes for the AreaEntry component.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Ospf Area spfRuns

Access	Read only
Description	The number of times that the intra-area route table has been calculated using this area's link-state database since the protocol became operational.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Ospf Area areaBdrRtrCount

Access	Read only
Description	The total number of area border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Ospf Area asBdrRtrCount

Access	Read only
Description	The total number of Autonomous System border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Ospf Area lsaCount

Access	Read only
Description	The total number of link-state advertisements in this area's link-state database, excluding AS External LSAs.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Ospf Area areaLsaCksumSum

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The 32-bit unsigned sum of the link-state advertisement's LS checksums contained in this area's link-state database. This sum excludes external (LS type 5) link-state advertisements. The sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Ospf StubAreaEntry (Stub)

Instance	areaId [IP address] tos [Decimal (0..0)]
Groups	GROUP Rtr Ospf Stub Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Ospf StubAreaEntry/<Ip Address>,<Decimal>* *Rtr/<string> Ospf StubAreaEntry/<Ip Address>,<Decimal>* *Rtr/<string> Vrf/<string> Ospf StubAreaEntry/<Ip Address>,<Decimal>* This component describes metrics that a default area border router will advertise into a stub area.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr Ospf Stub Provisioned (Prov)

Properties	Provisioned
Description	These set of attributes explain the provisionable group for the *StubAreaEntry*.
Mib	no_mib

ATTRIBUTE Rtr Ospf Stub metric (metric)

Access	Read and write
Description	The metric value applied at the indicated type of service.
Mib	no_mib
Values	Decimal (1..4294967295)
Default	1

ATTRIBUTE Rtr Ospf Stub metricType

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This type of the metric advertised as a default route.
Mib	no_mib
Values	ospfMetric comparableCost nonComparable
Default	ospfMetric

ATTRIBUTE Rtr Ospf Stub advertiseDefault

Access	Read and write
Description	This attribute determines whether or not the default routing information will be advertised, depending on other criterion. Setting this value to ***no*** can prevent advertising default routing information. If the value of the attribute is set to ***yes***, then the value of the attribute *importAsExtern* for that particular *AreaEntry* should be set to ***importNssa***.
Mib	no_mib
Values	yes no
Default	yes

COMPONENT Rtr Ospf AreaAggregateEntry (Aggregate)

Instance	areaId [IP address] lsdbType [summaryLink nssaExternalLink] aggregateNet [IP address] aggregateMask [IP address]
Groups	GROUP Rtr Ospf Aggregate Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Ospf AreaAggregateEntry/<Ip Address>,<enum>, <Ip Address>,<Ip Address>* *Rtr/<string> Ospf AreaAggregateEntry/<Ip Address>,<enum>, <Ip Address>,<Ip Address>* *Rtr/<string> Vrf/<string> Ospf AreaAggregateEntry/<Ip Address>,<enum>,<Ip Address>,<Ip Address>*

This table entry replaces the Area Summary table from RFC1253 and is used as an extension for CIDR support.

Mib: no_mib

Common Verbs: Help, List, Display, Add, DELete

GROUP Rtr Ospf Aggregate Provisioned (Prov)

Properties: Provisioned

Description: Identifies a group of provisionable attributes.

Mib: no_mib

ATTRIBUTE Rtr Ospf Aggregate effect

Access: Read and write

Description: This attribute determines whether or not the routing information will be advertised, depending on other criterion. Setting this value to ***doNotAdvertiseMatching*** can prevent advertising routing information for the address and mask values specified as the indices for this entry.

Mib: no_mib

Values: advertiseMatching, doNotAdvertiseMatching, invalid

Default: advertiseMatching

COMPONENT Rtr Ospf HostEntry (Host)

Instance: address [IP address]
tos [Decimal (0..0)]

Groups: GROUP Rtr Ospf Host Provisioned (Prov)

Scope: Application

Description: *Vr/<string> Ip Ospf HostEntry/<Ip Address>,<Decimal>*
Rtr/<string> Ospf HostEntry/<Ip Address>,<Decimal>
Rtr/<string> Vrf/<string> Ospf HostEntry/<Ip Address>,<Decimal>
This component indicates what hosts are directly attached to the router,

GROUP Rtr Ospf VirtIf Provisioned (Prov)

Properties Provisioned

Description This group of attributes provide provisioning data for the *VirtIfEntry*.

Mib no_mib

ATTRIBUTE Rtr Ospf VirtIf transitDelay (transDelay)

Access Read and write

Description The estimated number of seconds it takes to transmit a link-state update packet over this interface.

Mib no_mib

Values Decimal (1..3600)

Units seconds

Default 1

ATTRIBUTE Rtr Ospf VirtIf retransInterval (retransInt)

Access Read and write

Description The number of seconds between link-state advertisement retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description
and link-state request packets. This value would be well over the expected round-trip time.

Mib no_mib

Values Decimal (1..3600)

Units seconds

Default 5

ATTRIBUTE Rtr Ospf VirtIf helloInterval (helloInt)

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for the virtual neighbor.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	10

ATTRIBUTE Rtr Ospf VirtIf rtrDeadInterval (rtrDeadInt)

Access	Read and write
Description	The number of seconds that a router's Hello packets have not been seen before its neighbors declare the router down. This should be some multiple of the Hello interval. This value must be the same for the virtual neighbor.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	60

ATTRIBUTE Rtr Ospf VirtIf authKey

Access	Write only
Description	If authentication type is simple password, the password for this virtual circuit. If the value of the attribute is not set, then this attribute is ignored by the application. If the value of this attribute is set, then the value of the attribute *authType* under this particular *Area* should be set to ***simplePassword***, otherwise the application will ignore this authentication key.
Mib	no_mib
Values	String (1..8, Hex)
Default	0000000000000000

ATTRIBUTE Rtr Ospf VirtIf authType

Access	Read and write
Description	The authentication type specified for this *VirtIf*.
Mib	no_mib
Values	none simplePassword md5 SameAsArea

Copyright © 2006, Nortel Nortel Confidential

Default	SameAsArea

GROUP Rtr Ospf VirtIf **Operational (Oper)**

Properties	Operational
Description	Represents a group of operational attributes for the *VirtIfEntry* component.
Mib	no_mib

ATTRIBUTE Rtr Ospf VirtIf **state (state)**

Access	Read only
Description	The state of the OSPF virtual interface.
Mib	no_mib
Values	down pointToPoint
Default	No default

ATTRIBUTE Rtr Ospf VirtIf **events (events)**

Access	Read only
Description	The number of state changes or error events on the virtual link.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Ospf VirtIf **Md5KeyId (KeyId)**

Properties	Provisioned
Description	This group describes the set of provisional attributes for the *KeyId* component.
Mib	no_mib

ATTRIBUTE Rtr Ospf VirtIf KeyId md5Key (Key)

Access	Write only
Description	The MD5 authentication key for the *KeyId* component.
Mib	no_mib
Values	String (0..16, ASCII)
Default	""

GROUP Rtr Ospf VirtIf KeyId Operational (Oper)

Properties	Operational
Description	This group describes the set of operational attributes for the *KeyId* component.
Mib	no_mib

ATTRIBUTE Rtr Ospf VirtIf KeyId inUseForGeneration (inUse)

Access	Read only
Description	This attribute indicates whether the *Key* is currently in use or not. If this attribute is equal to ***true***, it indicates the *Key* is active.
Mib	no_mib
Values	true false
Default	false

COMPONENT Rtr Ospf Export

Instance	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Rtr Ospf Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Ospf Export/n* *Rtr/<string> Ospf Export/n* *Rtr/<string> Vrf/<string> Ospf Export/n* Each instance of this component specifies an OSPF export policy. An OSPF export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as OSPF external routes onto attached OSPF areas of the routing component (*Vr*, *Rtr* or *Vrf*). The *Ospf* component by default advertises all OSPF external routes based on the metric and tag in the IP forwarding table.
Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Ospf Export NetworkList (NetList)
Common Verbs	Help List Display Add DELete

GROUP Rtr Ospf Export Provisioned (Prov)

Properties	Provisioned
Description	This Group contains all the Provisioned attributes for the Export Component.
Mib	no_mib

ATTRIBUTE Rtr Ospf Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***).
Mib	no_mib
Values	send block
Default	send

ATTRIBUTE Rtr Ospf Export metric (metric)

Access	Read and write
Description	This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *metric* is ignored. The *metric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes.

Copyright © 2006, Nortel Nortel Confidential

	A value of -1 indicates that the metric associated with the route in the forwarding table is used.
Mib	no_mib
Values	Signed (-1..16777215)
Default	-1

ATTRIBUTE Rtr Ospf Export protocol

Access	Read and write
Description	This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Ospf* component's *reDistributeIBGP* attribute has the value ***false***.
Mib	no_mib
Values	all egp rip staticLocal staticRemote bgpInternal bgpExternal mbgp bgpMplsInternal
Default	all

ATTRIBUTE Rtr Ospf Export ripInterface (ripIf)

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of an *Interface* or a *LogicalIf* that has a *RipIf* on the same routing component.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Ospf Export ripNeighbor (ripNbr)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP neighbor of which the routes are learned from. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP neighbor.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Ospf Export **egpAsId (egpAs)**

Access	Read and write
Description	This attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from. This attribute can only be non zero when *protocol* is set to ***egp***. The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Ospf Export **tag**

Access	Read and write
Description	This attribute specifies the OSPF tag to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *tag* is ignored. The *tag* value is not used to select which routes to block or send, but rather the tag value advertised for the routes. A value of 4294967295 indicates that the tag associated with the route in the forwarding table is used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Rtr Ospf Export **extLsaMetricType**

Access	Read and write
Description	This attribute specifies the metric type in the OSPF external link state advertisement of the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *extLsaMetricType* is ignored. The *extLsaMetricType* value is not used to select which routes to block or send, but rather the metric value advertised

Copyright © 2006, Nortel Nortel Confidential

	for the routes. The value ***useProtocolDefault*** indicates the metric type is automatically chosen based on the routing protocol which the route was learned from.
Mib	no_mib
Values	useProtocolDefault type1 type2
Default	useProtocolDefault

ATTRIBUTE Rtr Ospf Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This attribute specifies the BGP AS from which a BGP route is learned from. This key is used only if the *protocol* is ***bgpExternal***. *bgpAsId* of value ***0*** matches all ASs.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Ospf Export **bgpPeerIp (peerIp)**

Access	Read and write
Description	This attribute specifies the BGP peer where the routes were learned from. *bgpPeerIp* of ***0*** matches all BGP peers. This attribute is used as a key when *protocol* is set to ***bgpInternal*** or ***bgpExternal***.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Ospf Export **description (desc)**

Access	Read and write
Description	This attribute describes the policy. For example, ‘to export OSPF routes to MCI’.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

COMPONENT Rtr Ospf Export **NetworkList (NetList)**

Instance	Decimal (0..65535)

Mib	no_mib

ATTRIBUTE Rtr Isis snmpAdminStatus (admin)

Access	Read: All Write: All
Description	This attribute specifies the administrative status of the *Isis* component in this *Router*.
Mib	no_mib
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Isis intermediateSystemType (isType)

Access	Read: All Write: All
Description	This attribute specifies the ISIS level functionality of this *Router* as defined in ISO specification 10589. In this release only level1 ISIS support exists and therefore the value ***level1*** is the only value supported by this attribute.
Mib	no_mib
Values	level1
Default	level1

ATTRIBUTE Rtr Isis overloadBitControl

Access	Read: All Write: All
Description	This attribute specifies how the value of the overload bit in the *Router's* Link State PDU (LSP) should be derived. A value of ***on*** specifies that the overload bit is forced on in the LSP. A value of ***auto*** specifies that the overload bit value is fully controlled by system software. This means that system software, based on current operating conditions, may choose to set the overload bit as appropriate. Any other value specifies, in seconds, the time period after a software restart that the overload bit will be forced on.
Mib	no_mib
Values	Decimal (60..1800) on auto
Default	auto

ATTRIBUTE Rtr Isis ignoreLspErrors

Access	Read: All Write: All
Description	This attribute specifies how the system behaves on receipt of a corrupted Link State PDU (LSP). If the attribute value is ***ignore***, the system will discard a corrupted LSP. If the attribute value is ***purge***, the system will purge the LSP.
Mib	no_mib
Values	purge ignore

Copyright © 2006, Nortel Nortel Confidential

Default	purge

ATTRIBUTE Rtr Isis lspMaxLifetime

Access	Read: All Write: All
Description	This attribute specifies the time, in seconds, that an LSP generated by this *Router* may exist before being considered to be stale and therefore should be purged by other nodes in the network. A *Check Prov* error occurs if this attribute specifies a value less than or equeal to the value specified for the *lspRefreshInterval* attribute. A *Check Prov* warning is produced if the value of this attribute is not at least 300 seconds greater than the value of the *lspRefreshInterval* attribute.
Mib	no_mib
Values	Decimal (350..65535)
Units	seconds
Default	1200

ATTRIBUTE Rtr Isis lspRefreshInterval

Access	Read: All Write: All
Description	This attribute specifies the time, in seconds, between successive retransmissions of this *Router's* LSP. A *Check Prov* error occurs if this attribute specifies a value greater than the value specified for the *lspMaxLifetime* attribute. A *Check Prov* warning is produced if the value of this attribute is not at least 300 seconds less than the value of the *lspMaxLifetime* attribute.
Mib	no_mib
Values	Decimal (1..65535)
Units	seconds
Default	900

ATTRIBUTE Rtr Isis spfDelay

Access	Read: All Write: All
Description	This attribute specifies, in milliseconds, the delay between the detection of a network topology change and the execution of the ISIS Shortest Path First (SPF) route calculation algorithm.
Mib	no_mib
Values	Decimal (1..10000)

Copyright © 2006, Nortel Nortel Confidential

Units	msec
Default	2000

ATTRIBUTE Rtr Isis alarmGeneration

Access	Read and write
Description	This attribute specifies the level of alarm generation for this *Isis* instance. A value of ***all*** specifies that all ISIS alarms are made visible. A value of ***none*** specifies that no ISIS alarms are made visible.
Mib	no_mib
Values	none all
Default	all

GROUP Rtr Isis OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Isis adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Isis operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Isis usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Isis ErrorStatistics (Errors)

Properties	Operational
Description	The attributes in this group are essentially statistics or counters. Each attribute counts each particular, abnormal event that has occurred since the *Isis* component was last enabled or unlocked.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Isis rxCorruptedLsps

Access	Read: All Write: Illegal
Description	This attribute indicates the number of corrupted LSPs received on all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Isis lsdbOverloads

Access	Read: All Write: Illegal
Description	This attribute indicates the number of occurrences of link state database overloads for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Isis attemptsToExceedMaxSeqNum

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that the maximum LSP sequence number has be reached for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Isis seqNumSkips

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that LSPs have been received where sequence numbers are nonsequential with respect to the previously received LSP. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Isis ownLspPurges

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that this *Router* has purged its own LSP. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Isis idFieldLenMismatches

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that this *Router* has received PDUs with ID Field lengths that do not match those used by this *Router*. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Isis maxAreaAddrMismatches

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that this *Router* has received a PDU with the “maximum number of supported area addresses” field set to a value greater than the maximum number of area addresses supported by this *Router*. This attribute counts this event for all ports for all levels since the last time the *Isis* component became enabled and/or was unlocked.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtr Isis OperationalStatus (OperStatus)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Isis snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

COMPONENT Rtr Isis NetworkEntityTitle (Net)

Instance	String (1..46, ASCII)
Scope	Application
Description	*Rtr/id Isis NetworkEntityTitle/<net>* This component represents the *Router's* Network Entity Title (NET). A NET is an ISO address that uniquely identifies an ISIS router. The NET format is specified in ISO 8348. The *Net* instance ID must be formatted as follows: AA.aaaa.SSSS.SSSS.SSSS.NN where; "AA" represents the ISIS area number and is a two hex digit string. "aaaa" represents the ISIS area number and is a string of 0 to 24 hex digits and there must be an even number of digits in this field. "SSSS.SSSS.SSSS" represents this *Router's* ISIS system ID. The system ID is made up of 12 hex digits, grouped in 3 groups of 4 hex digits, separated by the "." character. Note that when more than one *Net* component is provisioned, all *Net* components must have the same system ID portion of the *Net* instance ID. "NN" represents the NSEL portion of the *Net* instance ID. This must always be "00" (zero zero).

Copyright © 2006, Nortel Nortel Confidential

The sections of the *Net* instance ID are separated by the "." character.

Mib: no_mib

Common Verbs: Help, List, Display, Add, DELete

COMPONENT Rtr Isis IsisLevel (Level)

Instance: Decimal (1..1)

Groups: GROUP Rtr Isis Level Provisioned (Prov)

Scope: Application

Description: *Rtr/<s> Isis IsisLevel/<1..2>*
The ISIS routing protocol supports a two-level routing hierarchy. This component represents those ISIS routing aspects that are specific to each level. In this release, only *Level/1* is supported.

Mib: no_mib

Dyn. Subcomp.: COMPONENT Rtr Isis Level LsDbEntry (Lsdb)

Common Verbs: Help, List, Display, Add, DELete

GROUP Rtr Isis Level Provisioned (Prov)

Properties: Provisioned

Description: This group of attributes is used to configure each ISIS routing level.

Mib: no_mib

ATTRIBUTE Rtr Isis Level preference

Access: Read: All
Write: All

Description: This attribute specifies the routing preference assigned to ISIS routes for this level. A lower value indicates a "more preferred" route.

Mib: no_mib

Values: Decimal (1..255)

Default: 32

Copyright © 2006, Nortel Nortel Confidential

COMPONENT Rtr Isis Level LsDbEntry (Lsdb)

Instance	sysId [String (1..14, ASCII)] psnid [Decimal (0..65536)] fragid [Decimal (0..65535)]
Groups	GROUP Rtr Isis Level Lsdb Operational
Scope	Application
Description	Rtr/<id> Isis Level/n LsDbEntry/SysId,PSNId,FragId This component describes an entry in the ISIS LSP Database.
Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Isis Level Lsdb Operational

Properties	Operational
Description	This group contains the set of operational attributes of the *LsDbEntry* component.
Mib	no_mib

ATTRIBUTE Rtr Isis Level Lsdb seqNumber

Access	Read: All Write: Illegal
Description	This attribute indicates the sequence number of the LSP.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Isis Level Lsdb remainingLifetime

Access	Read: All Write: Illegal
Description	This attribute indicates, in seconds, the remaining lifetime of the LSP.
Mib	no_mib
Values	Decimal (0..65535)
Units	seconds
Default	No default

ATTRIBUTE Rtr Isis Level Lsdb attachment (att)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates whether the default attachment bit is set in this LSP.
Mib	no_mib
Values	notAttached attached
Default	No default

ATTRIBUTE Rtr Isis Level Lsdb partitionRepair

Access	Read: All Write: Illegal
Description	This attribute indicates whether the partition repair bit is set in this LSP.
Mib	no_mib
Values	off on
Default	No default

ATTRIBUTE Rtr Isis Level Lsdb overloadBit

Access	Read: All Write: Illegal
Description	This attribute indicates whether the overload bit is set in this LSP.
Mib	no_mib
Values	off on
Default	No default

ATTRIBUTE Rtr Isis Level Lsdb isType

Access	Read: All Write: Illegal
Description	This attribute indicates which system type bits are set in this LSP.
Mib	no_mib
Values	none level1 level2 both
Default	No default

ATTRIBUTE Rtr Isis Level Lsdb lspBody

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the content of this LSP's body.
Mib	no_mib
Values	String (1..1500, Hex)
Default	No default

COMPONENT Rtr Isis NeighborEntry (Nbr)

Instance	sysId [String (1..14, ASCII)] level [Decimal (1..2)]
Groups	GROUP Rtr Isis Nbr Operational (Oper)
Scope	Application
Description	*Rtr/<id> Isis Nbr/SysId,Level* This component represents the list of ISIS adjacencies formed with the specified ISIS router at the specified level.
Mib	no_mib
Dyn. Subcomp.	COMPONENT Rtr Isis Nbr Adjacency (Adj)
Common Verbs	Help List Display

GROUP Rtr Isis Nbr Operational (Oper)

Properties	Operational
Description	This group contains only one operational attribute, which represents the number of adjacencies formed with the router identified by the instance ID of the parent *NeighborEntry* component. This instance ID specifies the System ID of the neighbor router.
Mib	no_mib

ATTRIBUTE Rtr Isis Nbr adjacencies

Access	Read: All Write: Illegal
Description	This attribute indicates the number of adjacencies between this *Router* and the specified neighbor router at the specified ISIS level. The neighbor's system ID and the level at which the adjacency was formed is specified by the instance ID of the *NeighborEntry* component.
Mib	no_mib
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

COMPONENT Rtr Isis Nbr Adjacency (Adj)

Instance	Decimal (1..65535)
Groups	GROUP Rtr Isis Nbr Adj Operational (Oper)
Scope	Application
Description	*Rtr/<id> Isis Nbr/SysId,Level Adjacency/n* This component represents the collection information available regarding an adjacency formed with another ISIS router.
Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Isis Nbr Adj Operational (Oper)

Properties	Operational
Description	This group contains a set of attributes that indicate the characteristics of the adjacency.
Mib	no_mib

ATTRIBUTE Rtr Isis Nbr Adj neighborLinkLayerAddress (nbrLLAddr)

Access	Read: All Write: Illegal
Description	This attribute indicates the neighbor's link layer address for the link on which the adjacency was formed. In ISO ISIS terminology, this is referred to as the subnetwork point of attachment (SNPA).
Mib	no_mib
Values	String (0..11, ASCII)
Default	No default

ATTRIBUTE Rtr Isis Nbr Adj interface

Access	Read: All Write: Illegal
Description	This attribute indicates the *Interface* component on which this adjacency was formed. The format will be: *Rtr/<s> Interface/<IP Address>*
Mib	no_mib
Values	The name of the component

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rtr Isis Nbr Adj **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the operating state of the *adjacency*.
Mib	no_mib
Values	null initializing up fail
Default	No default

ATTRIBUTE Rtr Isis Nbr Adj **holdTime**

Access	Read: All Write: Illegal
Description	This attribute indicates, in seconds, the maximum time that may elapse without receiving a hello message before the adjacency is considered down.
Mib	no_mib
Values	Decimal (1..600)
Units	seconds
Default	No default

ATTRIBUTE Rtr Isis Nbr Adj **priority**

Access	Read: All Write: Illegal
Description	This attribute indicates the DIS priority of the neighbor associated with this *adjacency*.
Mib	no_mib
Values	Decimal (0..127)
Default	No default

ATTRIBUTE Rtr Isis Nbr Adj **protocols**

Access	Read: All Write: Illegal
Description	This attribute indicates the list of protocols supported by the neighbor on this *adjacency*.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	none osi_only ip_only osi_and_ip
Default	No default

ATTRIBUTE Rtr Isis Nbr Adj areaAddresses

Access	Read: All Write: Illegal
Description	This attribute indicates the list of area addresses used by the neighbor associated with this *adjacency*.
Mib	no_mib
Values	String (0..85, ASCII)
Default	No default

ATTRIBUTE Rtr Isis Nbr Adj age

Access	Read: All Write: Illegal
Description	This attribute indicates the elapsed time, in seconds, since this *adjacency* was established.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

COMPONENT Rtr RelayBC

Groups	GROUP Rtr RelayBC Provisioned (Prov) GROUP Rtr RelayBC Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip RelayBC* *Rtr/<string> RelayBC* *Rtr/<string> Vrf/<string> RelayBC* The *InwRelayBroadcast* component controls the dissemination of IP broadcast packets received as Link-Layer broadcast.
Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr RelayBC PortEntry (Port)
Common Verbs	Help List Display

GROUP Rtr RelayBC Provisioned (Prov)

Properties	Provisioned
Description	This group contains global configuration attributes for the Relay Broadcast component.
Mib	no_mib

ATTRIBUTE Rtr RelayBC relayStatus

Access	Read and write
Description	Specifies whether or not IP will forward IP broadcast packets that were received as Link-Layer broadcasts.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr RelayBC relayNdStatus

Access	Read and write
Description	Specifies whether or not IP will forward broadcast packets whose protocol is Sun ND.
Mib	no_mib
Values	enabled disabled
Default	disabled

GROUP Rtr RelayBC Operational (Oper)

Properties	Operational
Description	This group contains RelayBroadcast component statistics.
Mib	no_mib

ATTRIBUTE Rtr RelayBC relayNdCount

Access	Read only
Description	Indicates the number of Sun ND packets received by this router which were forwarded. *relayNdCount* wraps to zero if reached its maximum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

COMPONENT Rtr RelayBC PortEntry (Port)

Instance	Decimal (0..4294967295)
Groups	GROUP Rtr RelayBC Port Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip RelayBC PortEntry/<Decimal>* *Rtr/<string> RelayBC PortEntry/<Decimal>* This component is a table of destination UDP port numbers. In order for a packet to be forwarded by Relay Broadcast, the packet's destination UDP port number must be listed in this table.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr RelayBC Port Operational (Oper)

Properties	Operational
Description	This group contains statistics related to *InwPortEntry*.
Mib	no_mib

ATTRIBUTE Rtr RelayBC Port relayBcUdpCount

Access	Read only
Description	Indicates the number of forwarded packets with this destination UDP port number. *relayBcUdpCount* wraps to zero if reached its maximum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

COMPONENT Rtr RoutingInformationProtocol (Rip)

Groups	GROUP Rtr Rip Provisioned (Prov) GROUP Rtr Rip OsiState (State) GROUP Rtr Rip AdministrativeControl (AdminControl) GROUP Rtr Rip OperationalStatus (OperStatus) GROUP Rtr Rip Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Rip* *Rtr/<string> Rip* *Rtr/<string> Vrf/<string> Rip*

Copyright © 2006, Nortel Nortel Confidential

This component represents the Routing Information Protocol for the IP. There should be at least one *RipInterface* provisioned below an *Interface* or below a *LogicalIf* under an *IpPort*.

Mib: no_mib

Opt. Subcomp.: COMPONENT Rtr Rip Import (Import)
COMPONENT Rtr Rip Export

Common Verbs: Help, List, Display, Add, DELete, LOCK, Unlock

GROUP Rtr Rip Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisionable attributes for the RIP component

Mib: no_mib

ATTRIBUTE Rtr Rip migrateRip

Access: Read and write

Description: This attribute sets the preference level of OSPF-internal routes to be less preferred than RIP.
Note:
This parameter should only be used when starting migration of network from RIP to OSPF. When ready to cut over to OSPF, set this attribute value to ***disabled*** and run under normal preferences. All OSPF routers in the Autonomous System should be running with *migrateRip* ***enabled*** or with *migrateRip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.

Mib: no_mib

Values: enabled
disabled

Default: disabled

ATTRIBUTE Rtr Rip rfc1058MetricUsage (rfc1058)

Access: Read and write

Description: This attribute determines the metric usage for this RIP instance.

This flag is used to determine the way metrics are incremented.

Copyright © 2006, Nortel Nortel Confidential

RFC 1058 way:
Sending Update: This is to use the metric for the route from the routing table as the advertised metric to be sent for that route. Nothing is ever added to this value from the sending side. The only special case handling is that if the route being advertised is the network route of a directly connected network, the metric in the routing table will be zero. Then the RipIf interface metric for the interface being advertised is used as the advertise metric. If the interface being advertised is not a Rip interface, then metric value of 1 is used.
Receiving Update: Add receiving interface's RIP metric to the metric for the route in the received advertisement and install the result in the receiver's routing table as the metric for that route.
Older way:
Sending Updates: Add the out going interfaces rip metric to the metric for a route in the routing table to form the metric to be advertised for that route.
Receiving Updates: The metric received in the advertisement for a route is put directly in the routing table as the metric for that route.

Note: It is recommended that, all the routers in this autonomous system should be following the rfc1058 metric system.
Setting this flag to ***disabled*** will have the effect of running the RIP with old metric incrementing system.

Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr Rip generateDiscardRoute (discard)

Access	Read and write
Description	This attribute specifies whether network discard routes should be added to the routing and forwarding table for the subnetted interfaces that are running RIP.
Mib	no_mib
Values	yes no
Default	yes

ATTRIBUTE Rtr Rip redistributeIbgp (ribgp)

Access	Read and write
Description	This attribute specifies whether the export policies of this *Rip* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all.*** If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching

Copyright © 2006, Nortel Nortel Confidential

routes. If *redistributeIbgp* is ***false,*** routes learned from IBGP peers are excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***.

Mib no_mib

Values true
false

Default false

ATTRIBUTE Rtr Rip defaultRipRtePreference (ripPref)

Access Read and write

Description This attribute specifies this RIP component instance's default routing preference assigned to the RIP routes. A lower value indicates a more preferred route.

Mib no_mib

Values Decimal (1..254)

Default 82

GROUP Rtr Rip OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib no_mib

ATTRIBUTE Rtr Rip adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Rip operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Rip usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Rip AdministrativeControl (AdminControl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	no_mib

ATTRIBUTE Rtr Rip snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Rip OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Rip snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Rip Operational (Oper)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group defines a set of operational attributes belonging to the *RIP* component. It corresponds to the rip2Globals table in the RIP-2 standard MIB.
Mib	no_mib

ATTRIBUTE Rtr Rip routeChangesMade

Access	Read only
Description	This attribute counts the route changes made to the IP Route Database by Rip. This does not include the refresh of the route's age.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Rip queryResponses

Access	Read only
Description	This attribute counts the responses sent to RIP queries from other systems.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

COMPONENT Rtr Rip Import (Import)

Instance	Decimal (0..65535)
Groups	GROUP Rtr Rip Import Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Import/<Decimal>* *Rtr/<string> Rip Import/<Decimal>* *Rtr/<string> Vrf/<string> Rip Import/<Decimal>* This component controls the functionality of Route Leaking. In other words, this component will determine what routes are used by RIP.

Description	This is the group of provisionable attributes for the *Import* Subcomponent.
Mib	no_mib

ATTRIBUTE Rtr Rip Import **usageFlag (usage)**

Access	Read and write
Description	This flag when set to ***ignore*** indicates the routes that are not used and if set to ***use***, indicates the routes which are used.
Mib	no_mib
Values	use ignore
Default	use

ATTRIBUTE Rtr Rip Import **importMetric (metric)**

Access	Read and write
Description	This attribute is used to override the default import metric for the RIP protocol. This value is not used to select which routes to use or ignore, rather it is the metric to be used in the routing table for the routes imported for this import policy. A value of zero indicates that the metric received in the update will be used.
Mib	no_mib
Values	Decimal (0..16)
Default	0

ATTRIBUTE Rtr Rip Import **neighbor (nbr)**

Access	Read and write
Description	This attribute indicates the IP Address of the neighbor this policy will apply to.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Rip Import **interface (if)**

Access	Read and write
Description	This attribute specifies the RIP interface to which this import policy applies. The value of 0.0.0.0 implies any RIP interface on the routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the

Copyright © 2006, Nortel Nortel Confidential

	interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Rip Import description (desc)

Access	Read and write
Description	This attribute describes the policy. For example, 'to import RIP routes from MCI'.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

COMPONENT Rtr Rip Import Network (Net)

Instance	Decimal (0..65535)
Groups	GROUP Rtr Rip Import Net Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Import/<Decimal> NetworkList/<Decimal>* *Rtr/<string> Rip Import/<Decimal> NetworkList/<Decimal>* *Rtr/<string> Vrf/<string> Rip Import/<Decimal> NetworkList/<Decimal>* This component identifies a set of networks that this Import policy will apply to.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr Rip Import Net Provisioned (Prov)

Properties	Provisioned
Description	This group contains attributes for the *Import NetworkList* component for the Import Policy to be applied to.
Mib	no_mib

ATTRIBUTE Rtr Rip Import Net ipAddress (addr)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the IP address that needs to be matched against in this network list for the Import Policy to be applied to.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Rip Import Net ipMask (mask)

Access	Read and write
Description	This attribute specifies the IP mask for the attribute *ipAddress*.
Mib	no_mib
Values	IP address
Default	No default

COMPONENT Rtr Rip Export

Instance	Decimal (0..65535)
Groups	GROUP Rtr Rip Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Export/<Decimal>* *Rtr/<string> Rip Export/<Decimal>* *Rtr/<string> Vrf/<string> Rip Export/<Decimal>* Each instance of this component specifies a RIP export policy. A RIP export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as a RIP route on one or all RIP interfaces of the routing component (*Vr*, *Rtr* or *Vrf*). The *Rip* component by default advertises all local routes and all RIP learned routes to all RIP interfaces based on the metric in the IP forwarding table.
Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Rip Export Network (Net)
Common Verbs	Help List Display Add DELete

GROUP Rtr Rip Export Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisioned attributes for the *Export* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Rip Export **advertiseStatus (advertise)**

Access	Read and write
Description	This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***).
Mib	no_mib
Values	send block
Default	send

ATTRIBUTE Rtr Rip Export **exportMetric (metric)**

Access	Read and write
Description	This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *exportMetric* is ignored. The *exportMetric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes. A value of 0 indicates that the exported routes will be advertised with their original metric. When exporting routes from other protocols into RIP, an *exportMetric* value of 0 will distribute these routes with the metric of the original protocol. If the metric of the original protocol exceeds 15, the exported routes will be considered as unreachable by RIP. If an *exportMetric* value of 16 is specified, the exported routes will be advertised into RIP as unreachable.
Mib	no_mib
Values	Decimal (0..16)
Default	0

ATTRIBUTE Rtr Rip Export **protocol**

Access	Read and write
Description	This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Rip* component's *reDistributeIBGP* attribute has the value ***false***.
Mib	no_mib
Values	all egp rip

bgpInternal
bgpExternal
mbgp
bgpMplsInternal

Default: all

ATTRIBUTE Rtr Rip Export ripInterface (ripIf)

Access: Read and write

Description: This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.

Mib: no_mib

Values: IP address

Default: 0.0.0.0

ATTRIBUTE Rtr Rip Export egpAsId (egpAs)

Access: Read and write

Description: Under the *Rtr* and *Rtr Vrf*, this attribute has no effect.

Under the *Vr*, this attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from.
This attribute can only be non zero when *protocol* is set to ***egp***. The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.

Mib: no_mib

Values: Decimal (0..65536)

Default: 0

ATTRIBUTE Rtr Rip Export ospfTag (tag)

Access: Read and write

Description: This attribute specifies the OSPF learned external routes to which this export policy applies, based on the learned OSPF tag of the routes.

Copyright © 2006, Nortel Nortel Confidential

	This attribute can only be set to a non default value when *protocol* is set to ***ospfExternal***. The default value of 4294967295 implies any tag.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Rtr Rip Export **outInterface (outIf)**

Access	Read and write
Description	This attribute specifies the RIP interface on the virtual router which routes are exported onto as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *outInterface* is ignored. The *outInterface* value is not used to select which routes to block or send, but rather where to export the routes. A value of 0.0.0.0 indicates that the routes are exported to all RIP interfaces on the routing component (*Vr*, *Rtr* or *Vrf*). Otherwise, the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Rip Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This key attribute specifies the BGP AS from which the routes are learned. This key will be used only when the *protocol* is set to ***bgpExternal***. *bgpAsId* of ***0*** matches all BGP ASs.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Rip Export **description (desc)**

Access	Read and write
Description	The attribute describes the policy. For example, ‘to export RIP routes to AS 1’.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

The value of *gateway* for the localInterface routes will be the same value as the *destAddress*.
Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Rdb Operational (Oper)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	Identifies a group of operational attributes associated with each entry in the routing database.
Mib	no_mib

ATTRIBUTE Rtr Rdb metric

Access	Read only
Description	This attribute specifies the primary routing metric for this route. The semantics of this metric are determined by the routing protocol specified by the value of the index to this entry *protocol*. If this metric is not used, its value should be set to -1.
Mib	no_mib
Values	Signed (-1..65535)
Default	-1

ATTRIBUTE Rtr Rdb preference (pref)

Access	Read only
Description	This attribute specifies the the preference value of this particular entry. The value of this attribute affects the way the routeEntries in this database are selected for installing it in the *ForwardTable*. The lower the preference value of this entry, the higher are the chances that this entry will be selected to install in the *ForwardTable*.
Mib	no_mib
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Rtr Rdb age

Access	Read only
Description	This attribute specifies the number of seconds since this route was last updated or otherwise determined to be correct.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Static

Groups	GROUP Rtr Static OsiState (State) GROUP Rtr Static Provisioned (Prov)

GROUP Rtr Static OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: no_mib

ATTRIBUTE Rtr Static adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Copyright © 2006, Nortel
Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Static **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Static **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Static **Provisioned (Prov)**

Properties	Provisioned
Description	This group of attributes are used to configure the Static component.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Static defaultStaticRemoteRtePreference (pref)

Access	Read and write
Description	This attribute specifies this *Static* component instance's default routing preference assigned to the remote routes. A lower value indicates a more preferred route. Assigning a non-zero value to the *staticRemoteRtePreference* attribute in *RouteEntry* will override this default.
Mib	no_mib
Values	Decimal (1..253)
Default	72

ATTRIBUTE Rtr Static defaultStaticDiscardRtePreference (discpref)

Access	Read and write
Description	This attribute specifies this *Static* component instance's default routing preference assigned to the discard routes. A lower value indicates a more preferred route. Assigning a non-zero value to the *staticDiscardRtePreference* attribute in *DiscardRouteEntry* will override this default.
Mib	no_mib
Values	Decimal (0..253)
Default	0

ATTRIBUTE Rtr Static maxEcmpNextHops

Access	Read and write
Description	This attribute specifies the maximum number of Equal Cost Multi-Path (ECMP) *NextHop*s that are supported for *Static RouteEntry*s. If *maxEcmpNextHops* is ***1*** then only a single available *NextHop* is used, even if multiple *NextHops* are provisioned with the same *metric* value under a given *Static RouteEntry*. In other words ECMP is disabled for static routes. If *maxEcmpNextHops* is ***3*** the traffic will be loadshared over the available *NextHops* that have the same value set for the *metric* attribute under a given *Static RouteEntry*. When *protected Static RouteEntry*s are provisioned, *maxEcmpNextHops* must be ***1***.
Mib	no_mib
Values	1 3
Default	3

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Static heartbeatDeadInterval (hbDeadInt)

Access	Read and write
Description	This attribute specifies the L3 *Static* heartbeat dead router interval for the *NextHop* Routers of *Static Route*s which have *heartbeat* ***enabled***. If no heartbeat polling responses have been received in the last *heartbeatDeadInterval* seconds, then the *heartbeatState* of this *NextHop* is ***down***. If *heartbeatDeadInterval* is ***disabled***, L3 heartbeat monitoring will not occur for any *Static Route NextHop*s and the *heartbeatState* of all *NextHop*s will be ***disabled***.
Mib	no_mib
Values	Decimal (4..60) disabled
Default	disabled

COMPONENT Rtr Static RouteEntry (Route)

Instance	destAddress (addr) [IP address] destMask (mask) [IP address] typeOfService (tos) [Decimal (0..0)]
Groups	GROUP Rtr Static Route Provisioned (Prov) GROUP Rtr Static Route Operational (Oper) GROUP Rtr Static Route OsiState (State)
Scope	Application
Description	*Vr/<string> Ip Static RouteEntry/*<Ip Address>, <Ip Address>, <Decimal> *Rtr/<string> Static RouteEntry/*<Ip Address>, <Ip Address>, <Decimal> *Rtr/<string> Vrf/<string> Static RouteEntry/*<Ip Address>, <Ip Address>, <Decimal> This component describes the IP static routes. For a *RouteEntry* to be valid, there should be at least one *NextHop* provisioned. Up to three *NextHops* can be provisioned for each instance of a *RouteEntry*. The value of index *destMask* should be contiguous.

Copyright © 2006, Nortel Nortel Confidential

	Only the value zero is supported. Zero will be substituted for any value that is entered.
Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Static Route NextHop (Nh)
Common Verbs	Help List Display Add DELete

GROUP Rtr Static Route **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains a provisionable set of attributes for the static route entry component.
Mib	no_mib

ATTRIBUTE Rtr Static Route **staticRemoteRtePreference (pref)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the route preference of the static remote route. A lower preference value means the route is more preferred. If ***sameAsStatic*** is specified, the value of *defaultStaticRemoteRtePreference* in the *Static* component is used.
Mib	no_mib
Values	Decimal (1..253) sameAsStatic
Default	sameAsStatic

ATTRIBUTE Rtr Static Route **protected**

Access	Read and write
Description	This attribute specifies whether this route is protected or not. Note that *Vr Ip Static maxEcmpNextHops* must be ***1*** and *Vr Ip Ospf ecmpStatus* must be ***disabled*** when there is a *protected* static route under the *Vr*.
Mib	no_mib
Values	yes no
Default	no

ATTRIBUTE Rtr Static Route **protectedFailureBehavior (protFlrB)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the behavior when all *NextHops* of a *protected* static route fail. If ***discard*** is specified, the static route will not be removed, it will continue to be used to discard traffic.
Mib	no_mib
Values	discard
Default	discard

ATTRIBUTE Rtr Static Route heartbeat

Access	Read and write
Description	This attribute specifies whether or not *heartbeat* is ***enabled*** for this route. In order for this attribute to have any effect, heartbeat must first be permitted at the *Static* component level by configuring the *heartbeatDeadInterval* to a value different than ***disabled***. If ***enabled*** is specified for *heartbeat*, an IP heartbeat is maintained for each of the *NextHops*. ICMP echo requests are sent every 1second and if an ICMP echo resply is received, the *heartbeatState* of the *NextHop* is declared ***up***. If at any point no ICMP response has been received for *heartbeatDeadInterval* seconds, the *heartbeatState* of the *NextHop* will be ***down***. If ***disabled*** is specified, the *heartbeatState* of each *NextHop* under this *Static Route* will be ***disabled***.
Mib	no_mib
Values	enabled disabled
Default	disabled

GROUP Rtr Static Route Operational (Oper)

Properties	Operational
Description	This group contains a set of operational attributes for the static route entry component.
Mib	no_mib

ATTRIBUTE Rtr Static Route protectionLevel (protL)

Access	Read only
Description	This attribute indicates the current protection level for a *Static RouteEntry*. A value of ***portProtected*** indicates that the only alternative enabled *NextHop*(s) for this protected route are on the same card as the active *NextHop*. When the value is ***cardProtected***, one or more alternative enabled ***NextHop***s exist on a different card than the active ***NextHop***. If the value is ***unprotected***, no alternative enabled *NextHop*s exist or this is an

Copyright © 2006, Nortel Nortel Confidential

unprotected static route (that is, *protected* = ***no*** for this *Static RouteEntry*).

Mib	no_mib
Values	portProtected cardProtected unprotected notApplicable
Default	No default

GROUP Rtr Static Route **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Static Route **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Static Route **operationalState (osiOper)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Static Route **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

COMPONENT Rtr Static Route **NextHop (Nh)**

Instance	IP address

This component provides the destination Ip address of the *NextHop* (some times referred to as the Gateway).

For a *RouteEntry* to be valid, there should be at least one *NextHop* provisioned. Up to three *NextHops* can be provisioned for each instance of a *RouteEntry*.

Each provisioned *NextHop* address should belong to a valid subnet. A valid subnet for this IP entity can be provisioned as a *logicalIf* Entry under an *IpPort.*

Properties	Operational
Description	This group holds statictics for UDP.
Mib	no_mib

ATTRIBUTE Rtr Udp inDatagrams

Access	Read only
Description	The number of UDP datagrams delivered to UDP users. *inDatagrams* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Udp noPorts

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The number of UDP datagrams received for which there was no application at the destination port. *noPorts* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Udp inErrors

Access	Read only
Description	The number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port. *inErrors* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Udp outDatagrams

Access	Read only
Description	The number of UDP datagrams sent from this gateway. *outDatagrams* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Udp ListenEntry

Instance	localAddress [IP address] localPort [Decimal (0..65535)]
Scope	Application
Description	The table contains UDP listener information.
Mib	no_mib
Common Verbs	Help List Display LOCK Unlock

COMPONENT Rtr Tcp

Groups	GROUP Rtr Tcp Statistics (Stats)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	The *Tcp* component contains all attributes related to TCP.
Mib	no_mib
Dyn. Subcomp.	COMPONENT Rtr Tcp TcpEntry (TcpEntry)
Common Verbs	Help List Display

GROUP Rtr Tcp Statistics (Stats)

Properties	Operational
Description	This group contains statistics for TCP.
Mib	no_mib

ATTRIBUTE Rtr Tcp rToAlgorithm

Access	Read only
Description	Indicate which algorithm was used to calculate the timeout value used for retransmitting unackowledged octet.
Mib	no_mib
Values	other constant rsre vanJacobson
Default	No default

ATTRIBUTE Rtr Tcp rToMin

Access	Read only
Description	Indicate the minimum value, measured in milliseconds, allowed for retransmission timeout.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	msec
Default	0

ATTRIBUTE Rtr Tcp rToMax

Access	Read only
Description	Indicates the maximun value, measured in milliseconds, allowed for retransmission timeout.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Rtr Tcp maxConn

Access	Read only
Description	Limit on number of connections the TCP can support. The value is always -1 which indicates that the number of connections supported is dynamic (limited by memory in the system).
Mib	no_mib
Values	Signed (-1)
Default	-1

ATTRIBUTE Rtr Tcp activeOpens

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***synSent*** state from the ***closed*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp passiveOpens

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***synRcvd*** state from the ***listen*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp attemptFails

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***synSent*** state or the ***synRcvd*** state, plus the number of times TCP connections have made a direct transition to the ***listen*** state from the ***synRcvd*** state.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp estabResets

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***established*** state or the ***closedWait*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp currEstab

Access	Read only
Description	The number of TCP connections for which the current state is either ***established*** or ***closedWait***.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp inSegs

Access	Read only
Description	The number of segments received, including those received in error. This count includes segments received on currently established connections.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp outSegs

Access	Read only
Description	The number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp retransSegs

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The number of segments retransmitted that is, the number of TCP segments transmitted containing one or more previously transmitted octets.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp inErrs

Access	Read only
Description	Total number of segments received in error, for example bad TCP checksum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Tcp outRsts

Access	Read only
Description	Number of TCP segments sent containing the RST flag.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Tcp TcpEntry (TcpEntry)

Instance	localAddress [IP address] localPort [Decimal (0..65535)] remoteAddress [IP address] remotePort [Decimal (0..65535)]
Groups	GROUP Rtr Tcp TcpEntry Operational (Oper)
Scope	Application
Description	The component defines an entry in the TCP connection table. Each entry corresponds to TCP end-point identified by 4-tuples, *LocalAddress*, *LocalPort*, *RemoteAddress*, and *RemotePort*.
Mib	no_mib
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Tcp TcpEntry **Operational (Oper)**

Properties	Operational
Description	This group contains columnar entries for each end-point on the TCP.
Mib	no_mib

ATTRIBUTE Rtr Tcp TcpEntry **state**

Access	Read and write
Description	This attribute reflects the current state of this Tcp connection.
Mib	no_mib
Values	closed listen synSent synReceived established closeWait finWait1 closing lastAck finWait2 timeWait delete
Default	No default

COMPONENT Rtr **VpnRouteForwarder (Vrf)**

Instance	String (1..16, ASCII)
Groups	GROUP Rtr Vrf Provisioned GROUP Rtr Vrf CustomerIdentifierData (CidData) GROUP Rtr Vrf OperationalStatus (OperStatus) GROUP Rtr Vrf OsiState (State) GROUP Rtr Vrf IfNumberOper GROUP Rtr Vrf Statistics (Stats) GROUP Rtr Vrf VrfProvisioned GROUP Rtr Vrf VpnIdentifier GROUP Rtr Vrf VrfOperational (VrfOper)
Scope	Application
Description	Rtr/<string> VpnRouteForwarder/<string> The *VpnRouteForwarder (Vrf)* component represents an instance of a Routing Component on the platform. The *VpnRouteForwarder* component acts as an Edge Router connecting to a customer edge router providing the customer site with a VPN connection.

Copyright © 2006, Nortel Nortel Confidential

At any time, the number of Routing Components (*Router*, *VpnRouteForwarder* and *VirtualRouter*) existing in the current view plus the number of newly created Routing Components in the edit view must be less than the maximum allowed number of virtual routers. This is regardless of how many *VirtualRouter*, *VpnRouteForwarder* or *Router* components may have been deleted in the edit view. Any Routing Component which, when created in the edit view, results in a total count greater than the maximum allowed, is labelled as invalid and must be deleted.

It is recommended that the deletion of any *VirtualRouter*, *VpnRouteForwarder*, or *Router* components existing in the current view should be activated using the *Activate Prov* command before creating any new *VirtualRouter*, *VpnRouteForwarder*, or *Router* components.

VERB TELNET Rtr Vrf

Impact	Passive
Description	*Telnet -ipAddress(<IP address>) Rtr/<string> Vrf/<string>* This command allows access to the Telnet client, attempting to set up a connection from this node to the specified IP address within the specified Vrf address space. Options: *ipAddress* - This mandatory option specifies the IP address of the remote node to which the user wants to Telnet within this VR's address space.

GROUP Rtr Vrf **Provisioned**

Properties	Provisioned
Description	This group contains the router attributes common to the *Router* and *Router VpnRouteForwarder* components.
Mib	no_mib

ATTRIBUTE Rtr Vrf **sourceRoute**

Access	Read and write
Description	This attribute specifies whether or not this *Router* or *VpnRouteForwarder* allows processing of datagrams which have a source route IP option.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf **cacheTableSize (cts)**

Access	Read and write
Description	This attribute specifies the maximum number of entries that can exist in the local cache table on each *Lp* for this *Router* or *VpnRouteForwarder*. This attribute provides a way to control the resources allocated to the IP cache tables. The default cache table size is *300* for an FP and *100* for a CP. The attribute value must be a multiple of 100.
Mib	no_mib
Vector of	Decimal (100..8000)
Index	Decimal (0..15)
Default	([1] 100, [15] 300)

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Vrf CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	no_mib

ATTRIBUTE Rtr Vrf customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	no_mib
Values	Decimal (0; 1..8191)
Default	0

GROUP Rtr Vrf OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	up down testing
Default	up

GROUP Rtr Vrf OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Vrf operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

	The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Vrf usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Vrf IfNumberOper

Properties	Operational
Description	This group contains the ifNumber attribute.
Mib	no_mib

ATTRIBUTE Rtr Vrf ifNumber (ifN)

Access	Read only
Description	This attribute defines the number of *IfEntries* in the *IfTable*.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

GROUP Rtr Vrf Statistics (Stats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This is the GROUP holding the struct which contains statistical attributes for IP.
Mib	no_mib

ATTRIBUTE Rtr Vrf inReceives

Access	Read only
Description	This is the number of input datagrams received from the interfaces, including those received in error. *inReceives* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf inHdrErrors

Access	Read only
Description	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc. *inHdrErrors* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf inAddrErrors

Access	Read only
Description	The number of input datagrams discarded due to errors such as invalid address, unsupported address class. *inAddrErrors* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf forwDatagrams

Access	Read only
Description	The number of input datagrams for which this router was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. *forwDatagrams* wraps to zero if reaches it's maximum defined value.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf inUnknownProtos

Access	Read only
Description	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol *inUnknownProtos* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf inDiscards

Access	Read only
Description	The number of input datagrams for which no problems were encountered to prevent their continued processing, but which were discarded due to the lack of buffers. This does not include any datagram discarded while awaiting for re-assembly. *inDiscards* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf inDelivers

Access	Read only
Description	The number of input datagrams successfully delivered to IP user-protocols (including ICMP). *inDelivers* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf outRequests

Access	Read only
Description	The number of datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. This sum does not include datagrams counted in *ForwDatagrams*. *outRequests* wraps to zero if reaches its maximum defined value.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf outDiscards

Access	Read only
Description	The number of outbound datagrams that were discarded due to the lack of buffers. This sum also includes datagrams counted in *forwDatagrams* if any such packets met the discard criterion. *outDiscards* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf outNoRoutes

Access	Read only
Description	The number of outbound datagrams discarded because no route could be found to transmit them to their destination. This counter includes any datagrams counted in *forwDatagrams*. *outNoRoutes* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf reasmTimeOut

Access	Read only
Description	The maximum number of seconds, which received fragments are held while they are awaiting reassembly at this gateway.
Mib	no_mib
Values	Decimal (0..5)
Units	seconds
Default	5

ATTRIBUTE Rtr Vrf reasmReqds

Access	Read only
Description	The number of the IP fragments received by this gateway which needed to be reassembled. *reasmReqds* wraps to zero if reaches its maximum defined value.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf reasmOks

Access	Read only
Description	The number of IP fragments successfully reassembled by this gateway. *reasmOks* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf reasmFails

Access	Read only
Description	The number of times this gateway is unabled to assemble IP-fragments for whatever reasons. *reasmFails* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf fragOks

Access	Read only
Description	The number of IP datagrams that have been successfully fragmented by this gateway. *fragOks* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf fragFails

Access	Read only
Description	The number of IP-fragments that have been discarded because they needed to be fragmented but could not be. For example, their Don't Fragment flag was set. *fragFails* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Rtr Vrf fragCreates

Access	Read only
Description	This number of IP fragments that have been generated as a result of fragmentation by this gateway. *fragCreates* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf routingDiscards

Access	Read only
Description	The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free -up buffer space for other routing entries. In this implementation, this number is always zero because IP never deletes a valid routing entry.
Mib	no_mib
Values	Decimal (0..0)
Default	0

ATTRIBUTE Rtr Vrf inSrcRouteDiscards

Access	Read only
Description	The number of input datagrams which had a source route IP option and were discarded because this functionality is not allowed for this Routing Component. *srcRouteDiscards* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

GROUP Rtr Vrf VrfProvisioned

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Router Vrf* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf snmpAdminStatus

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the desired SNMP state of the VRF. The ***up*** state indicates that the VRF is operational and packet forwarding is allowed. The ***down*** state indicates that the VRF is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr Vrf mode

Access	Read and write
Criticality	Process
Description	This attribute specifies the mode of operation of the *VRF* component. A value of ***rfc2547*** specifies that the *VRF* is provisioned as an access node for the BGP/MPLS VPN network. A value of ***ipRouter*** specifies that the *VRF* is used for direct IP connectivity.
Mib	no_mib
Values	rfc2547 ipRouter
Default	rfc2547

ATTRIBUTE Rtr Vrf importRoutesAlarmLimit (importal)

Access	Read and write
Description	This attribute specifies the alarm threshold of number of 2547 VPN routes to be imported to this *Vrf*'s routing table from the *Router* component. When the number of routes imported to this *Vrf* reaches this limit, an alarm is generated and *Vrf* will continue importing routes. The current number of imported routes is available in the *routeImports* operational attribute of this *Vrf*. This attribute does not apply if the *mode* attribute of this *Vrf* is set to ***ipRouter***. The value of the *importRoutesAlarmLimit* attribute must be less than the value of the *importRoutesDiscardLimit* attribute.
Mib	no_mib
Values	Decimal (1..65535)
Default	2400

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf importRoutesDiscardLimit (importdl)

Access	Read and write
Description	This attribute specifies the maximum number of 2547 VPN routes to be imported to this *Vrf*'s routing table from the *Router* component. When the number of routes imported to this *Vrf* reaches this limit, an alarm is generated and *Vrf* will stop importing routes. The current number of imported routes is available in the *routeImports* operational attribute of this *Vrf*. This attribute does not apply if the *mode* attribute of this *Vrf* is set to ***ipRouter***. The value of the *importRoutesDiscardLimit* attribute must be greater than the value of the *importRoutesAlarmLimit* attribute.
Mib	no_mib
Values	Decimal (1..65535)
Default	3000

ATTRIBUTE Rtr Vrf exportRoutesAlarmLimit (exportal)

Access	Read and write
Description	This attribute specifies the alarm threshold of number of routes to be exported from this *Vrf*'s routing table to the 2547 VPN routing database of the *Router* component. When the number of routes exported from this *Vrf* reaches this limit, an alarm is generated and *Vrf* will continue exporting routes. The current number of exported routes is available in the *routeExports* operational attribute of this *Vrf*. This attribute does not apply if the *mode* attribute of this *Vrf* is set to ***ipRouter***. The value of the *exportRoutesAlarmLimit* attribute must be less than the value of the *exportRoutesDiscardLimit* attribute.
Mib	no_mib
Values	Decimal (1..65535)
Default	400

ATTRIBUTE Rtr Vrf exportRoutesDiscardLimit (exportdl)

Access	Read and write
Description	This attribute specifies the maximum number of routes to be exported from this *Vrf*'s routing table to the 2547 VPN routing database of the *Router* component. When the number of routes exported from this *Vrf* reaches this limit, an alarm is generated and *Vrf* will stop exporting routes. The current number of exported routes is available in the *routeExports* operational attribute of this *Vrf*. This attribute does not apply if the *mode* attribute of this *Vrf* is set to ***ipRouter***. The value of the *exportRoutesDiscardLimit* attribute must be greater than the value of the *exportRoutesAlarmLimit* attribute.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..65535)
Default	500

ATTRIBUTE Rtr Vrf defaultLocalBgpMplsIRtePref (localPref)

Access	Read and write
Description	This attribute specifies the default bgpMplsInternal route preference for routes learned from *Vrfs* on the local PE node. A lower value indicates a greater preference.
Mib	no_mib
Values	Decimal (1..253)
Default	125

ATTRIBUTE Rtr Vrf defaultRemoteBgpMplsIRtePref (remotePref)

Access	Read and write
Description	This attribute specifies the default bgpMplsInternal route preference for routes learned from *Vrf*s on the remote PE node. A lower value indicates a greater preference.
Mib	no_mib
Values	Decimal (1..253)
Default	127

GROUP Rtr Vrf VpnIdentifier

Properties	Provisioned
Description	This group contains provisioned attributes to specify the Virtual Private Network (VPN) associated with this *Vrf* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf vpnId

Access	Read and write
Description	This attribute specifies the Virtual Private Network (VPN) associated with this *Vrf* component. This is a globally unique identifier composed of a three-octet long Organizationally Unique Identifier (OUI) followed by a four-octet long VPN index. It can be used by MDM to identify configured VPNs in the network. Provisioning the same VPN ID on a set of VRFs indicates that they belong to the same VPN. This attribute does not affect the distribution of routing information in the

Copyright © 2006, Nortel Nortel Confidential

	VPN. The value "***00-00-00-00-00-00-00-00***" identifies an unspecified VPN ID.
Mib	no_mib
Values	String (7, Dashed Hex)
Default	00-00-00-00-00-00-00

ATTRIBUTE Rtr Vrf vpnName

Access	Read and write
Description	This attribute specifies an identifier for grouping *Vrf* into VPNs. It can be used by MDM to identify configured VPNs in the network. Provisioning the same *vpnName* on a set of *Vrf* indicates that they belong to the same VPN. This attribute does not affect the distribution of routing information in the VPN. If no value is provisioned, it implies that no *vpnName* has been specified.
Mib	no_mib
Values	String (0..255, ASCII)
Default	" "

GROUP Rtr Vrf VrfOperational (VrfOper)

Properties	Operational
Description	This group contains the operational attributes of the *Vrf* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf routeImports

Access	Read only
Description	This attribute indicates the current number of routes imported to this *Vrf* from *Router* BgpMpls database. The maximum value of this attribute is provisioned in attribute *importRoutesDiscardLimit*.
Mib	no_mib
Values	Decimal (1..65535)
Default	No default

ATTRIBUTE Rtr Vrf routeExports

Access	Read only
Description	This attribute indicates the current number of routes exported from this *Vrf* to Router BgpMpls database.

Copyright © 2006, Nortel Nortel Confidential

The maximum value of this attribute is provisioned in attribute *exportRoutesDiscardLimit*.

Mib: no_mib

Values: Decimal (1..65535)

VERB Clear Rtr Vrf Arp

Impact: Passive

Description:
Clear [-logicalIf(Ip Address)] [-includeInverse] Vr/<string> Ip Arp
Clear [-logicalIf(Ip Address)] [-includeInverse] Rtr/<string> Arp

The *Clear* verb is intended for manually flushing dynamically learned ARP entries. Without any options, *Clear* will flush all non-inverse dynamic ARP entries. The *Clear* verb does not affect static ARP host entries, that is, entries which correspond to *HostEntry* subcomponents of this component. These entries can be removed by deleting the corresponding provisioned *HostEntry* component.

The *-logicalIf* or *-interface* option is used to flush dynamic ARP entries which were learned on a particular *IpPort LogicalInterface* or *Interface*. The option must specify the IP address of an existing *IpPort LogicalInterface* (which may be under any *ProtocolPort) or Interface*.

The *-includeInverse* option is used to force the deletion of inverse ARP entries. Inverse ARP entries which are learned through inverse ARP (*FrDte*) and inverse ATM ARP (*AtmMpe*) are important and should not be cleared by the users accidentally. If the option is not present, inverse ARP entries are not cleared.

GROUP Rtr Vrf Arp Provisioned (Prov)

Properties	Provisioned
Description	The ARP refresh feature allows the router to periodically verify ARP table entries. Whenever the router updates an ARP entry, or creates a new entry, a timeout value is assigned to the entry. When the timeout for an entry expires, the router will send a unicast ARP request to the currently-known physical address. If an ARP response comes back, the entry will be assigned a new timeout. If, however, the host has gone away or been assigned a new physical address, the host will not respond to the unicast ARP, and the entry will be removed from the ARP table. The new physical address will be discovered through the normal ARP mechanism when the next communication is attempted to the host.
Mib	no_mib

ATTRIBUTE Rtr Vrf Arp autoRefresh

Access	Read and write
Description	This attribute is used to enable or disable the ARP refresh feature.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf Arp autoRefreshTimeout

Access	Read and write
Description	This attribute defines the timeout value, in minutes, which is assigned to updated ARP entries, or newly created ARP entries. The range for the timeout is 1 minute to 1440 minutes (24 hours).
Mib	no_mib
Values	Decimal (1..1440)
Units	minutes
Default	5

ATTRIBUTE Rtr Vrf Arp retryTimes

Access	Read and write
Description	This attribute defines the number of times that an ARP request will be sent to a remote host if there is no reply received. This value is assigned when ARP entries are updated or created. The range of the value can be from 0 to 127.
Mib	no_mib
Values	Decimal (0..127)

Units	times
Default	127

COMPONENT Rtr Vrf Arp DynHostEntry (DynHost)

Instance	hostAddress (addr) [IP address] cos [0 1 2 3 notApplicable (na)]
Groups	GROUP Rtr Vrf Arp DynHost Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Arp DynHostEntry/<Ip Address>* *Router/<string> Arp DynHostEntry/<Ip Address>* *Router/<string> Vrf/<string> DynHostEntry/<Ip Address>* This component is a table that contains all Arp host entries (both static and dynamic). Each IP ARP entry in the table is uniquely defined by its IP address and connection class (cos) value. For *Vr*, when associated *mediaType* under *IpPort* is ***frameRelay***, ***atmMpeLlcEncap,*** and ***atmMpeVcEncap***, the connection class value of the arp entry is ***0, 1, 2,*** or ***3*** . For all other media, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis). For *Router* or *Vrf*, when the media associated with the interface is *atmMpe* or *IpoDlci*, the connection class value of the arp entry is ***0, 1, 2,*** or ***3***. For all other media, the connection class value is ***notApplicable*** (not specified on a per virtual circuit basis). An IP packet that has been assigned a particular connection class value will be forwarded using the arp entry which corresponds to the next hop gateway IP address and matching connection class value where the next hop gateway IP address is determined via a forwarding table look up on the packet's destination IP address. When there are arp entries that match the next hop gateway IP address, but not the packet's connection class, then the packet will be forwarded using the arp entry that has the next lowest connection class value; failing this, the packet will be forwarded using the arp entry that has the next highest connection class value.

VERB Clear Rtr Vrf Arp DynHost

Impact	Passive
Description	*Clear [-inverse] Vr/<string> Ip Arp DynHostEntry/<Ip Address>* *Clear [-inverse] Router/<string> Arp DynHostEntry/<Ip Address>* *Clear [-inverse] Router/<string> Vrf/<string> Arp DynHostEntry/<Ip Address>* The *Clear* verb is used to delete the single dynamically learned ARP entry that is represented by this component. The *Clear* command does not affect static ARP host entries, that is, entries whose *type* attribute has the value ***static***. These entries can be removed by deleting the corresponding provisioned *HostEntry* component under *Arp*. The *-inverse* option deletes the ARP entry even if it was an inverse ARP entry. Inverse ARP entries are learned through inverse ARP (*FrDte* or *IpoDlci*) and inverse ATM ARP (*AtmMpe*), and should not be removed by the users accidentally. If the option is not present, an inverse ARP entry is not cleared.

GROUP Rtr Vrf Arp DynHost **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes of the *DynHostEntry* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Arp DynHost **physAddress**

Access	Read only
Description	This attribute indicates the physical address of the host in canonical form.
Mib	no_mib
Values	String (0..8, Dashed Hex)
Default	No default

ATTRIBUTE Rtr Vrf Arp DynHost **maxTxUnit (mtu)**

Access	Read only
Description	This attribute indicates the maximum MTU size that can be accepted by the host.

Values	ieee8023 ethernet notApplicable
Default	No default

COMPONENT Rtr Vrf BootpRelayAgent (Bootp)

Groups	GROUP Rtr Vrf Bootp AdministrativeControl (AdminControl) GROUP Rtr Vrf Bootp Provisioned (Prov) GROUP Rtr Vrf Bootp OsiState (State) GROUP Rtr Vrf Bootp OperationalStatus (OperStatus)
Scope	Application
Description	*Vr/<string> Ip BootpRelayAgent* *Rtr/<string> BootpRelayAgent* *Rtr/<string> Vrf<string> BootpRelayAgent* The *BootpRelayAgent* component contains all the necessary attributes and components to provision a BOOTP relay agent. The BOOTP relay agent functionality conforms to that described in RFCs 951 and 1542. The purpose of the BOOTP relay agent is to forward BOOTP request packets from a client to a server, and also to deliver server BOOTP replies back to the client. When a BOOTP request is received on a port, the request will be sent to a provisioned list of IP addresses for that port. In addition, the request will be broadcast out all other BOOTP ports which allow it.

Default	up

GROUP Rtr Vrf Bootp Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *BootpRelayAgent* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bootp hopDiscardThreshold (hops)

Access	Read and write
Description	BOOTP packets contain a ‘hops’ field which is used to limit the number of relay agents that can process the packet (each relay agent increments the ‘hops’ field by one). This attribute is used by the relay agent to determine when to discard a BOOTP packet. If the ‘hops’ field exceeds the *hopDiscardThreshold* the BOOTP packet will be discarded.
Mib	no_mib
Values	Decimal (2..16)
Default	4

GROUP Rtr Vrf Bootp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bootp adminState (osiAdmin)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Vrf Bootp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Vrf Bootp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

GROUP Rtr Vrf Bgp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Bgp* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp bgpIdentifier

Access	Read and write
Criticality	Component
Description	This attribute specifies the *Bgp* Identifier of this *Bgp* component instance. It is picked from the IP address space, and should follow the same rule as choosing an unique IP address for *IpPort* or *Interface*.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp localAs

Access	Read and write
Criticality	Component
Description	This attribute specifies the autonomous system identifier for this *Bgp* component instance.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Rtr Vrf Bgp defaultLocalPreference (locPrf)

Access	Read and write
Criticality	Component
Description	This attribute specifies this *Bgp* component instance's default degree of preference for routes. It can be overridden by the *localPreference* provisioned in *ImportPolicy*. A higher value indicates a more preferred route.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	144

ATTRIBUTE Rtr Vrf Bgp defaultMultiExitDisc (med)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies this *Bgp* component instance's default metric to discriminate between multiple exit points to the same adjacent autonomous system. It can be overridden by the s*endMultiExitDiscToEbgp* provisioned in *ExportPolicy*. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	4294967294

ATTRIBUTE Rtr Vrf Bgp routeThrottleLimit (rtl)

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of routes in the IP forwarding table this *Bgp* component instance will process at one time to decide if a route in the IP forwarding table should be exported to a peer. This limit is used because the throttling requirements are different under different network configurations.
Mib	no_mib
Values	Decimal (1..1000)
Default	250

ATTRIBUTE Rtr Vrf Bgp routeThrottleInter (rti)

Access	Read and write
Criticality	Component
Description	This attribute specifies the interval between the processing of the routes in the IP forwarding table to decide if a route in the IP forwarding table should be exported to a peer. This interval is used because the throttling requirements is different under different network configurations.
Mib	no_mib
Values	Decimal (1..30)

Default	5

ATTRIBUTE Rtr Vrf Bgp routeReflector (rr)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether this *Bgp* instance is a Route Reflector. If the value of this attribute is ***true***, *Bgp* redistributes routes it learns from an IBGP speaker to other IBGP speakers in the AS. The rule of redistribution depends on the peer type: 1) When a route is learned from a non-client peer, it is redistributed to all the client peers within the cluster. 2) When a route is learned from a client peer, it is redistributed to all the non-client peers and also to the client peers. If the value of this attribute is ***false***, *Bgp* does not redistribute routes it learns from one IBGP speaker to other IBGP speakers in the AS.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Vrf Bgp **routeReflectorCluster (rrCluster)**

Access	Read and write
Criticality	Component
Description	This attribute identifies the cluster consisting of the Route Reflector and its peer clients. When *routeReflector* of *Bgp* is ***true***, value of 0.0.0.0 or 255.255.255.255 is invalid; the default value of this attribute is same as *bgpIdentifier*. For redundancy, a cluster may have more than one Route Reflector; in this case, the value of this attribute of all the Route Reflectors in the same cluster should be same. The value of this attribute is ignored when *routeReflector* of *Bgp* is ***false***
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp **redistributeIgpTolbgp (rigp)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this *Bgp* instance allows exporting of IGP routes to internal Bgp peers. IGP routes include the routes learned from OSPF, RIP, local routes and static routes. If the value of this attribute is ***true***, and if *ExportPolicy* is specified to distribute, then *Bgp* allows IGP route to be distributed to internal Bgp peers. If the value of this attribute is ***false***, *Bgp* does not allow IGP routes to be distributed to internal *Bgp* peer, even if *ExportPolicy* is specified to distribute. This attribute is set to true if and only this Bgp is part of the Carrier Manage Service, otherwise, a routing loop may result.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	true false
Default	false

ATTRIBUTE Rtr Vrf Bgp defaultIbgpRtePreference (ibgpPref)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's default routing preference for IBGP routes. It can be overridden by the *IbgpRtePreference* provisioned in *ImportPolicy*. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..253)
Default	122

ATTRIBUTE Rtr Vrf Bgp defaultEbgpRtePreference (ebgpPrf)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's default routing preference for EBGP routes. It can be overridden by the *ebgpRtePreference* provisioned in *ImportPolicy*. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..253)
Default	70

ATTRIBUTE Rtr Vrf Bgp vpnPeeringTopology (topology)

Access	Read and write
Description	Under the *Vr* component, this attribute specifies the peering mode that determines if a dynamic IBGP peer is to be instantiated between this *BGP* instance and a discovered IP Tunnel endpoint on the remote customer VR. This mode controls the distribution of IP routing information among VPN sites through dynamic BGP sessions after auto-discovery has taken place. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.

Copyright © 2006, Nortel Nortel Confidential

Under the *Rtr* or *Rtr Vrf* component, this attribute is not used.

Mib: no_mib

Values:
none
hub
spoke

Default: No default

ATTRIBUTE Rtr Vrf Bgp alarmGeneration (alarms)

Access: Read and write

Description: This attribute specifies the level of alarm generation for this *Bgp* instance.

A value of ***all*** specifies that all BGP alarms are made visible.

A value of ***normal*** specifies that all BGP alarms are made visible, except for the following:
- *Bgp Peer* listening failure alarms,
- *Bgp Peer* connect failure alarms, and
- *Bgp* notification alarms.

Any listening failure or connect failure alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

A value of ***none*** specifies that no BGP alarms are made visible. Any listening failure, connect failure, or “no auto discovery” alarms which were previously set for a *Peer* component under this *Bgp* instance are cleared.

Note that, because the listening failure, connect failure, and “no auto discovery” alarms are triggered by state changes in the *Peer* component, they are not automatically regenerated when previously disabled alarm generation is enabled. For example, consider the following:
- If the *Bgp alarmGeneration* attribute is set to ***all*** and a *Peer* enters a listening failure state, a listening failure alarm is set against that *Peer* subcomponent.
- If the *Bgp alarmGeneration* attribute is then set to ***normal*** or ***none***, the above listening failure alarm is cleared.
- If the *Bgp alarmGeneration* attribute is then set back to ***all***, no alarm is generated because the *Peer* subcomponent has not changed state.
- If the *Peer* then exits the listening failure state, a listening failure alarm clear is generated for the *Peer*, even though there is no alarm set for that component.

When the scope of alarm generation has been increased for a *Bgp* instance, previously existing alarms which had been suppressed can be regenerated by locking and unlocking the *Bgp Peer* subcomponents.

For a *VirtualRouter* with *vpnMode* attribute be set to ***carrier***, it is recommended that the *alarmGeneration* attribute be set to ***all***. For a *VirtualRouter* with the *vpnMode* attribute set to ***customer***, it is

Copyright © 2006, Nortel Nortel Confidential

recommended that the *alarmGeneration* attribute be set to either ***normal*** or ***none***, for scalability reasons.

Similarly, for a *Router* component, it is recommended that the *alarmGeneration* attribute be set to ***all***. For a *Router Vrf* component, it is recommended that the *alarmGeneration* attribute be set to either ***normal*** or ***none***, for scalability reasons.

Mib: no_mib

Values:
none
normal
all

Default: all

ATTRIBUTE Rtr Vrf Bgp keyTransitionDelay (keyDelay)

Access: Read and write

Description: This attribute specifies a default delay period associated with a change of *md5Key* value event for the *Bgp* component. The *md5Key* is set under the *Bgp Peer Descriptor* component.

This is the time that can elapse before the local router transitions to using the new key for transmission for all the Bgp Peer sessions' under this *Bgp* component. This time is not used to control when to accept the new key for reception, and the new key is immediately accepted for reception.

This delay equates to the amount of time the operator has to provision both the local and remote ends with the new key, without losing service.

This can be overridden by the *keyTransitionDelay* provisioned under the *Bgp Peer Descriptor* component.

Mib: no_mib

Values: Decimal (1..20160)

Units: minutes

Default: 10

ATTRIBUTE Rtr Vrf Bgp bgpImportRouteLimit (birl)

Access: Read and write

Criticality: Component

Description: This attribute specifies a limit to control the maximum number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated. The default value of zero implies no protection. This limit is set based on the requirements of the network configuration and is critical to BGP.

Mib: no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Rtr Vrf Bgp bgpImportRouteDiscardLimit (bird)

Access	Read and write
Criticality	Component
Description	This attribute specifies a limit to control the number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated and subsequent routes are discarded. The default value of zero signifies no protection. This limit is set based on the requirements of the network configuration and is critical to BGP.
Mib	no_mib

Default	0

GROUP Rtr Vrf Bgp Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Bgp* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp tableVersion

Access	Read only
Description	This attribute indicates the version of the BGP routing table. It is incremented every time the BGP routing table changes. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp inMsgs

Access	Read only
Description	This attribute counts the total number of BGP messages received without error. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp inErrors

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the total number of BGP messages received from all peers that proved to be in error. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp inErrorMsgs

Access	Read only
Description	This attribute counts the total number of BGP NOTIFICATION messages from all the peers. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp outMsgs

Access	Read only
Description	This attribute counts the total number of BGP messages sent to peers. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp outDiscards

Access	Read only
Description	This attribute counts the number of BGP messages that were locally generated but were not sent out due to resource limitations within a *Bgp* instance. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp outErrorMsgs

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the BGP NOTIFICATION messages sent to the peers. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp indbSize

Access	Read only
Description	This attribute indicates the number of *Bgp* indb entries under this *Bgp* component instance.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

GROUP Rtr Vrf Bgp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Vrf Bgp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Vrf Bgp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Vrf Bgp AdministrativeControl (AdminControl)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf Bgp OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf Bgp Peer **Operational (Oper)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the operational attributes for the *Peer* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp Peer connectionState

Access	Read only
Description	This attribute indicates the current state of this BGP peer connection. The meaning of each state is as follows: ***idle*** - it is the initial state of the BGP peer connection. Error events will also cause BGP peer connection to transit to the idle state. ***connect*** - BGP has initiated a TCP connection request to this peer, and waiting for reply from that peer. ***active*** - BGP is not initiating a TCP connection request to this peer, because TCP connection failed and is waiting for connection retry time-out. ***openSent*** - a TCP connection to this peer has been established, but the OPEN message has not been successfully exchanged. ***openConfirm*** - OPEN message has been successfully exchanged with this peer, but the first KEEPALIVE message has not been received from that peer. ***established -*** the first KEEPALIVE message has been received from this peer, which means this BGP peer connection has been established. See RFC 1771 for a detailed description of BGP state transitions.
Mib	no_mib
Values	idle connect active openSent openConfirm established
Default	idle

ATTRIBUTE Rtr Vrf Bgp Peer bgpIdentifier (bgpId)

Access	Read only
Description	This attribute indicates the BGP Identifier of this *Bgp Peer* component. It is learned from the peer through the OPEN message.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer versionNegotiated (vn)

Access	Read only
Description	This attribute indicates the BGP version number negotiated with this peer through the OPEN message. Currently, only BGP version 4 is supported.

Copyright © 2006, Nortel Nortel Confidential

	BGP will reject the peer connection if our peer proposes a BGP version other than 4.
Mib	no_mib
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer holdTimeNegotiated (htn)

Access	Read only
Description	This attribute indicates the maximum time in seconds, that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. This is the negotiated value with peer through the OPEN message. The hold time must be either zero or at least three seconds. If the negotiated hold time is zero, then periodic KEEPALIVE messages are not expected from the peer.
Mib	no_mib
Values	Decimal (0; 3..65535)
Units	seconds
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer keepAliveNegotiated (kan)

Access	Read only
Description	This attribute indicates the interval in seconds, between BGP KEEPALIVE message retransmissions. This keepalive interval will have the same ratio to the hold time negotiated with the peer as that of the locally configured keepalive and hold time. This attribute will be zero if the *holdTimeNegotiated* attribute is zero, which means periodic KEEPALIVE messages will not be sent.
Mib	no_mib
Values	Decimal (0..21845)
Units	seconds
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer localAddressUsed (lau)

Access	Read only
Description	This attribute indicates the local IP address used for this BGP peer connection. If the *localAddressConfigured* attribute is non-zero, its value will be used. Otherwise, the local address will be assigned by TCP based on the remote IP address of this peer connection and the IP forwarding table.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer localPort

Access	Read only
Description	This attribute indicates the local TCP port for the connection between the BGP peers.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer remotePort

Access	Read only
Description	This attribute indicates the remote TCP port for the connection between the BGP peers.
Mib	no_mib
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer lastError

Access	Read only
Description	This attribute indicates the last error code and subcode seen by this *Bgp* component instance on this peer connection. The first byte of this two byte OCTET STRING contains the error code, and the second byte contains the subcode. A value of zero means that no error has occurred. Check RFC 1771 for mappings of error codes and error subcodes.
Mib	no_mib
Values	String (2, Hex)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer connectionEstablishedTime (ceTime)

Access	Read only
Description	This attribute indicates how long since this *Peer* component's last transition to or from the ***established*** state. It is set to zero when the *Peer* component is activated.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **connectionEstablishedTransitions (ceTrans)**

Access	Read only
Description	This attribute counts the total number of times the BGP connection state transitioned into the ***established*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **inUpdateElapsedTime (iuet)**

Access	Read only
Description	This attribute indicates the elapsed time in seconds since the last BGP UPDATE message was received from the peer. Each time *inUpdates* attribute is incremented, the value of this attribute is set to zero.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer **inMsgs**

Access	Read only
Description	This attribute counts the number of BGP messages received without error from the BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **inUpdates**

Access	Read only
Description	This attribute counts the number of BGP UPDATE messages received on this peer connection. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **inErrors**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of messages received from this BGP peer that proved to be in error. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **inErrorMsgs**

Access	Read only
Description	This attribute counts the number of BGP NOTIFICATION messages received from this BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **outMsgs**

Access	Read only
Description	This attribute counts the number of locally generated BGP messages sent to this BGP peer. It does not include discarded messages. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **outUpdates**

Access	Read only
Description	This attribute counts the number of BGP UPDATE messages sent to this peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **outDiscards**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of locally generated BGP messages not sent to this BGP peer due to resource limitations within a BGP entity. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **outErrorMsgs**

Access	Read only
Description	This attribute counts the number of BGP NOTIFICATION messages sent to this BGP peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **inRoutes**

Access	Read only
Description	This attribute indicates the number of routes received from this BGP peer.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer **peerType**

Access	Read only
Description	This attribute indicates the way this peer is created. Peer is **static,** if created through provisioning or **dynamic,** if created through IP VPN auto discovery. For *Router* and *Vrf*, all peers are statically created. So, this value will always be ***static***.
Mib	no_mib
Values	static dynamic
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer **authenticationType**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the authentication type of this BGP peer. If the *md5Key* attribute under the *Bgp Peer Desc* component is set to a null string, this peer's authentication type is ***none***; otherwise, if the *md5Key* attribute is set to a valid non-null string, this peer's authentication type is ***md5***. If this BGP peer's *peerType* is ***dynamic***, its authentication type is always ***none***.
Mib	no_mib
Values	none md5
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer **noAuthenticationPkts**

Access	Read only
Description	This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which do not contain the MD5 authentication information, but MD5 authentication is provisioned on the local BGP peer. This type of authentication failure occurs when the *md5Key* attribute under the local *Bgp Peer Desc* component is set to a valid non-null string, but the remote BGP peer does not use MD5 authentication, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer **badAuthenticationPkts**

Access	Read only
Description	This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which fail the MD5 authentication. This type of authentication failure occurs when the *md5Key* attribute set under the local *Bgp Peer Desc* component does not match the MD5 key used by the remote BGP peer, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer **unexpectedAuthenticationPkts**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of packets received on this BGP peer session's underlying TCP connection, which contain the MD5 authentication information, but MD5 authentication is not provisioned on the local BGP peer. This type of authentication failure occurs when the *md5Key* attribute under the local *Bgp Peer Desc* component is set to a null string, but the remote BGP peer uses MD5 authentication, or when a hacker is spoofing packets from a legitimate peer. This counter will wrap to zero once the value exceeds the maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer addressFamilyNegotiated (afn)

Access	Read only
Description	The attribute indicates the list of multi-protocol extensions negotiated on this peer session. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances. To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances. To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extensions, the value of ***ipv4MplsVpn*** must be in the *addressFamilyNegotiated* list of all the VCGs' peer instances. To distribute IPv4 Unicast routes with labels, using multi-protocol BGP extensions, the value of ***ipv4Label*** must be in the *addressFamilyNegotated* list of the peer instance. ***ipv4Unicast*** represents AFI = 1 and SAFI = 1 ***ipv4Vpn*** represents AFI = 1 and SAFI = 140 (not for RFC 2547) ***mbgpVpn*** represents AFI = 1 and SAFI = 141 (not for RFC 2547) ***ipv4MplsVpn*** represents AFI = 1 and SAFI = 128 ***ipv4Label*** represents AFI = 1 and SAFI = 4

COMPONENT Rtr Vrf Bgp Peer Descriptor (Desc)

Groups	GROUP Rtr Vrf Bgp Peer Desc Provisioned (Prov)
Scope	Network
Description	*Vr/<string> Ip Bgp Peer/<Ip Address> Desc* *Rtr/<string> Bgp Peer/<Ip Address> Desc* *Rtr/<string> Vrf/<string> Bgp Peer/<Ip Address> Desc* This component contains provisioned attributes for BGP peers. Provisioned attributes are only used when the peer is a statically provisioned peer.
Mib	no_mib
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Rtr Vrf Bgp Peer Desc Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisional attributes for this BGP *Peer* component
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp Peer Desc peerAs

Access	Read and write
Description	This attribute specifies the autonomous system identifier of this BGP *Peer* component. It is used to verify the autonomous system identifier learned from the peer through the OPEN message. The peer connection is rejected and a NOTIFICATION message is sent to the peer if these two numbers don't match.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer Desc **localAddressConfigured (lac)**

Access	Read and write
Description	This attribute specifies the local IP address configured for this *Bgp Peer* connection. If this attribute is 0.0.0.0, TCP chooses a local IP interface based on the remote IP address of this peer connection and the IP forwarding table. The value chosen is stored in the *localAddressUsed* attribute under the same *Peer* component.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Bgp Peer Desc **keepAliveConfigured (kac)**

Access	Read and write
Description	This attribute specifies the configured interval between BGP KEEPALIVE message retransmissions. It is used to establish the ratio between keepalive interval and hold time. If this attribute is zero, then the *holdTimeConfigured* attribute must be zero, which means that periodic KEEPALIVE messages will not be sent.
Mib	no_mib
Values	Decimal (0..21845)
Units	seconds
Default	30

ATTRIBUTE Rtr Vrf Bgp Peer Desc **holdTimeConfigured (htc)**

Access	Read and write
Description	This attribute specifies the maximum time that may elapse without receiving a KEEPALIVE or UPDATE message before the connection is considered down. The hold time must be either zero or at least three seconds. If this attribute is zero, then the *keepAliveConfigured* attribute should also be zero, which means that periodic KEEPALIVE messages will not be sent.
Mib	no_mib
Values	Decimal (0; 3..65535)
Units	seconds
Default	90

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Bgp Peer Desc **connectRetryTime (connectRetry)**

Access	Read and write
Description	This attribute specifies the time interval for the ConnectRetry timer. It is the minimum amount of time that must elapse between successive TCP connection retries for establishing BGP peer connection.
Mib	no_mib
Values	Decimal (1..65535)
Units	seconds
Default	120

ATTRIBUTE Rtr Vrf Bgp Peer Desc **minAsOrigTime (minAsOrig)**

Access	Read and write
Description	This attribute specifies the time interval for the MinAsOriginationInterval timer. It is the minimum amount of time that must elapse between updates that advertise a change to a route within the local autonomous system to neighboring autonomous systems.
Mib	no_mib
Values	Decimal (1..65535)
Units	seconds
Default	15

ATTRIBUTE Rtr Vrf Bgp Peer Desc **minRouteAdvTime (minRouteAdv)**

Access	Read and write
Description	This attribute specifies the time interval for the MinRouteAdvertisementInterval timer. Feasible routes received from peers in other autonomous systems may only be re-advertised to peers in other autonomous systems at a rate no greater than MinRouteAdvertisementInterval.
Mib	no_mib
Values	Decimal (1..65535)
Units	seconds
Default	30

ATTRIBUTE Rtr Vrf Bgp Peer Desc **defaultInAggMed (diaMed)**

Access	Read and write
Description	This attribute specifies this *Bgp Peer* component instance's metric for generating a dynamic default route whenever this external BGP peer got established. It is used to prioritize between the dynamic default routes generated by BGP speakers. If this attribute is not set, BGP does not generate a dynamic default route. When this attribute is set, BGP

Copyright © 2006, Nortel Nortel Confidential

automatically generates a dynamic default route when the connection established.

Mib no_mib

Values Decimal (0..4294967295)

Default 4294967295

ATTRIBUTE Rtr Vrf Bgp Peer Desc **isRouteReflectorClient (isRrClient)**

Access Read and write

Description This attribute specifies whether the peer is a client peer or non-client peer of this *Bgp* instance. The attribute is ignored unless the value of the '*routeReflector'* attribute of the '*Bgp'* component is set to ***true***.

Mib no_mib

Values true
false

Default false

ATTRIBUTE Rtr Vrf Bgp Peer Desc **removePrivateAs (remPrivate)**

Access Read and write

Description This attribute specifies the treatment of the AS_PATH path attribute in routes sent to the peer. If this attribute is enabled, then BGP will remove private AS numbers from the AS_PATH. This attribute is meaningful only for external peers.

Mib no_mib

Values enabled
disabled

Default disabled

ATTRIBUTE Rtr Vrf Bgp Peer Desc **nextHopSelf (nhs)**

Access Read and write

Description This attribute controls the setting of the NEXT_HOP path attribute in routes advertised to the peer. If this attribute is enabled, BGP will advertise itself as the NEXT_HOP. This is useful when routes are propagated from an EBGP peer to an IBGP peer: the IBGP peer does not need to have a route to the EBGP peer.

Mib no_mib

Values enabled
disabled

Default disabled

ATTRIBUTE Rtr Vrf Bgp Peer Desc **md5Key**

Access Write only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies this *Bgp Peer* component instance's MD5 key value that is used by the MD5 authentication on this BGP Peer session's underlying TCP connection. A null string indicates that the MD5 authentication is not to be used on the TCP connection to this Bgp Peer session.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Desc **keyTransitionDelay (keyDelay)**

Access	Read and write
Description	This attribute specifies a delay period associated with a change of *md5Key* value event of the *Peer* component. This is the time that can elapse before the local router transitions to using the new key for transmission for this Bgp Peer session.This time is not used to control when to accept the new key for reception, and the new key is immediately accepted for reception. This delay equates to the amount of time the operator has to provision both the local and remote ends with the new key, without losing service. If ***sameAsBgp*** is specified, the value of *keyTransitionDelay* set under the parent *Bgp* component is used. Otherwise the value of this attribute will be used**.** The default is to use ***sameAsBgp***.
Mib	no_mib
Values	Decimal (1..20160) sameAsBgp
Units	minutes
Default	sameAsBgp

ATTRIBUTE Rtr Vrf Bgp Peer Desc **multiHopEbgp (mhEbgp)**

Access	Read and write
Description	This attribute specifies whether MultiHop EBGP (External BGP) route distribution is supported on this EBGP peer. MultiHop EBGP allows routes to be distributed between EBGP peers that are not directly connected and can span multiple hops
Mib	no_mib
Values	enabled disabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Bgp Peer Desc **asPathCheck**

Access	Read and write
Description	This attribute specifies the treatment of the AS_PATH loop detection mechanism in routes received from the peer. If this attribute is set to ***disabled***, AS_PATH loop is not detected. If this attribute is set to ***enabled***, AS_PATH loop is detected.
Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr Vrf Bgp Peer Desc **attachSiteOfOrigin (attachSoo)**

Access	Read and write
Description	This attribute specifies the site of origin identifier to attach for this BGP Peer connection. If this attribute is set, a site of origin extended community path attribute is attached to the routes received from this peer unless the site of origin extended community path attribute is already included in the routes.
Mib	no_mib
Values	String (0..21, RFC2547RdRtSyntax)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Desc **checkSiteOfOrigin (checkSoo)**

Access	Read and write
Description	This attribute specifies the site of origin identifiers to check for this BGP Peer connection. If this attribute is set, a check is done when routes are received from this peer or advertised to this peer. If the site of origin extended community path attribute presents in received routes and matches any Site Of Origin in this attribute, the routes are not accepted. If the site of origin extended community path attribute presents in the advertised routes and matches any SOO in this attribute, the routes are not advertised to this peer. If this attribute is not set, no check and filtering is done.
Mib	no_mib
List of	String (3..21, RFC2547RdRtSyntax)
List Size	256
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Desc **bgpPeerRouteLimit (bprl)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies a limit to control the maximum number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated. The default value of zero implies no protection. This limit is set based on the requirements of the network configuration and is optional but critical under the peer.
Mib	no_mib
Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer Desc **bgpPeerRouteDiscard (bprd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies a limit to control the number of BGP Ipv4 Unicast routes that will be processed until an alarm is generated and subsequent routes are discarded. The default value of zero signifies no protection. This limit is set based on the requirements of the network configuration and is optional but critical under the peer.
Mib	no_mib
Values	Decimal (0..4000000000)
Default	0

ATTRIBUTE Rtr Vrf Bgp Peer Desc **asOverride (asOr)**

Access	Read and write
Description	This attribute specifies the treatment of the AS_PATH path attribute in routes sent to the peer. If this attribute is ***enabled,*** then BGP will override all the AS numbers in the AS_PATH list, that match the AS number of the peer that we are sending to, with the local AS number. This attribute is meaningful only for external peers. This attribute is available for the *Bgp Peer Desc* component under the *Vr Ip*, *Vrf* and *Rtr* components. However, if it is set to ***enabled*** under the *Rtr Bgp Peer Desc* component, it has no impact. The behaviour is ***disabled*** regardless of the provisioned value in this case.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf Bgp Peer Desc **addressFamily**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	The attribute specifies the supported network layer protocols being carried in any BGP-4 UPDATE messages over this Peer session. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). To perform IP VPN auto discovery in a VPN, the value of ***ipv4Vpn*** must be added to this attribute on all VCGs' peer instances. To perform IP VPN multi-protocol BGP route distribution in a VPN, the value of ***mbgpVpn*** and ***ipv4Vpn*** must be in the *addressFamily* list of all the VCGs' Peer instances. To perform RFC 2547 VPN route distribution in a VPN using multi-protocol BGP extensions, the value of ***ipv4MplsVpn*** must be in the *addressFamily* list of all the VCGs' peer instances. To distribute IPv4 Unicast routes with labels, using multi-protocol BGP extensions, the value of ***ipv4Label*** must be in the *addressFamily* list of the peer instance. ***ipv4Unicast*** represents AFI = 1 and SAFI = 1 ***ipv4Vpn*** represents AFI = 1 and SAFI = 140 (not for RFC 2547) ***mbgpVpn*** represents AFI = 1 and SAFI = 141 (not for RFC 2547) ***ipv4MplsVpn*** represents AFI = 1 and SAFI = 128 ***ipv4Label*** represents AFI=1 and SAFI=4
Mib	no_mib
List of	ipv4Unicast ipv4Vpn mbgpVpn ipv4MplsVpn ipv4Label
Default	(ipv4Unicast)

Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Vrf Bgp Peer Vpn Ipv4 Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Ipv4* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp Peer Vpn Ipv4 publicIpAddress

Access	Read only
Description	This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Vpn Ipv4 asPath

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the sequence of AS path segments through which the IP VPN information arrives. The AS Path lists the ASs in reverse traversal order from the point of origin. This attribute is not applicable and is not displayed for locally -learned IP VPN information.
Mib	no_mib
Values	String (2..255, ASCII)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Vpn Ipv4 **vpnPeeringTopology**

Access	Read only
Description	This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.
Mib	no_mib
Values	none hub spoke
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Vpn Ipv4 **asOriginatorId**

Access	Read only
Description	This attribute is associated with the Route Reflector. It indicates the router-id of the originator of this IP VPN information in the local AS. When the Route Reflector in the backbone distributes a discovered VPN information to other IBGP speakers, the value of this attribute in the discovered VPN information is used if one is present; otherwise, the Route Reflector's router-id is used. A value of 0.0.0.0 indicates this *Bgp* instance is not a Route Reflector. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Vpn Ipv4 **redundant**

Access	Read only
Description	This attribute indicates that the IP VPN information entry learned from more than one BGP peers in the carrier backbone. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	no_mib
Values	no yes
Default	No default

ATTRIBUTE Rtr Vrf Bgp Peer Vpn Ipv4 **rrClusterList**

Access	Read only
Description	This attribute is associated with the Route Reflector. It indicates the sequence of cluster-ids that this discovered IP VPN information has traversed. When the Route Reflector in the backbone reflects a discovered VPN information to other non-client IBGP peers, the cluster ID of the Route Reflector is added to the cluster list of the received VPN information. A blank list indicates this attribute is not present in the received VPN information or if this *Bgp* instance is not a Route Reflector. This attribute is not applicable and is not displayed for locally learned IP VPN information.
Mib	no_mib
List of	IP address
List Size	256
Default	No default

COMPONENT Rtr Vrf Bgp **ImportPolicy (Import)**

Instance	Decimal (0..65535)
Groups	GROUP Rtr Vrf Bgp Import Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Import/n* *Rtr/<string> Bgp Import/n* *Rtr/<string> Vrf/<string> Bgp Import/n* Each instance of this component describes a BGP import policy. A BGP import policy is used to decide if certain routing information learned from its peer is to be ignored or used.

Copyright © 2006, Nortel Nortel Confidential

If no import policy is provisioned, BGP will accept all routes received from its IBGP peers, but will not use any routing information received from its EBGP peers.
If multiple import policies are provisioned, the one with the most specific match will apply.
The keys are matched in the following order from the least specified to the most specified:
Network,
peerAs,
peerIpAddress,
originAs,
originProtocol,
matchAsPath,
matchCommunity.

Example1:
There are 2 import policies defined:
vr/0 ip bgp import/1, originProtocol = ***any***, originAs = ***20***, usageFlag = ***use***
vr/0 ip bgp import/2, originProtocol = ***igp***, usageFlag = ***ignore***
If a BGP NLRI contains a route originally learned from an igp with origin AS 20, it will be used.
Example2:
There are 2 import policies defined:
vr/0 ip bgp import/1, originProtocol = ***any***, matchAsPath = ***"1 2 3"***, usageFlag = ***ignore***
vr/0 ip bgp import/2, originProtocol = ***any***, usageFlag = use
If a BGP NLRI contains a route originally learned from an igp with the AsPath "1 2 3 4", it will be ignored.

For Router and Vrf, the example is similar with 'Vr/0 Ip' replaced with 'Router/0' and 'Router/0 Vrf/1' respectively.

Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Vrf Bgp Import Network (Net)
Common Verbs	Help List Display Add DELete

GROUP **Rtr Vrf Bgp Import** **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains all the provisionable attributes for the *Import* component.
Mib	no_mib

ATTRIBUTE **Rtr Vrf Bgp Import** **peerAs**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This key attribute specifies the autonomous system number of the peer from which the routes are learned. A value of 0 for this attribute means that peer AS number will match any AS number.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Bgp Import **peerIpAddress**

Access	Read and write
Description	This key attribute specifies the IP address of the peer from which the routes are learned. A value of 0.0.0.0 for this attribute means that peer IP address will match any IP address.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Bgp Import **originAs**

Access	Read and write
Description	This key attribute specifies the autonomous system number where the routes were originated. A value of 0 for this attribute means origin AS number will match any AS number.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Bgp Import **originProtocol**

Access	Read and write
Description	This key attribute specifies the protocols that originated the routes. A value of ***incomplete*** for this attribute means this information is not available.
Mib	no_mib
Values	any igp egp incomplete
Default	any

ATTRIBUTE Rtr Vrf Bgp Import **usageFlag (usage)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether BGP will use or ignore information in received update if it meets criteria specified by the key attributes of this component.
Mib	no_mib
Values	use ignore
Default	use

ATTRIBUTE Rtr Vrf Bgp Import localPreference (locPrf)

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's degree of preference for those routes that match the criteria of this import policy. A higher value indicates a more preferred route. A value of 0 for this attribute means that the default local preference value provisioned under the *Bgp* component should be used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Import asPathExpression (asExpr)

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the received update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path. The following characters has the special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1... n2]' - Matches any AS number that appeared in the set n1... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a AS

Copyright © 2006, Nortel Nortel Confidential

set, range or number.
The following logical operators are evaluated in descending order:
'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.
For example: The AS path "5 4 3 2 1", where 1 is the origin AS, would be match by any one of the following regular expressions:
1$,
^5,
4 3,
5 3 - 4*,
5 [4 3 2] not10 2 1,
not (6 7 8 9 10) and 5 4.* 1
Empty regular expression implies a match on all AS path.

Mib — no_mib

Values — String (0..255, ASCII)

Default — No default

ATTRIBUTE Rtr Vrf Bgp Import **communityExpression (comExpr)**

Access — Read and write

Description — This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280.

The basic syntax of a regular expression is a list of Community number separated by a space which making up a Community attribute.

The following characters have a special meaning:
'[n1... n2]' - Matches any Community number that appeared in the set n1...n2.
'n1 - n2' - Matches any Community number between the range of n1 and n2.
'()' - is supported to change the order of evaluation.
'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number.
'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number.
'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in descending order:
'NOT' - Given a regular expression x, NOT x matches the Community attribute that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y

Copyright © 2006, Nortel
Nortel Confidential

matches the intersection of the Community attribute that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y.
For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression:
1,
5,
4 3,
2 3 - 4*,
1 [3 4 2]+,
not (6 7 8 9 10) and 1 2
Empty regular expression implies a match on all Community path.

Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Import expressPreference (exprPref)

Access	Read and write
Description	This attribute specifies the relative preference of the policy which use the keys *expressAsPath* and *expressCommunity*. This attribute is ignored if attributes *expressAsPath* and *expressCommunity* are both empty. This attribute is used to break the tie when two import policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy.
Mib	no_mib
Values	Decimal (0..255)
Default	128

ATTRIBUTE Rtr Vrf Bgp Import appendCommunity (appCom)

Access	Read and write
Description	This attribute indicates which community number this import policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is appended to the Community attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Import ibgpRtePreference (ibgpPref)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the routing preference of IBGP routes matching this import policy. A lower value means the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultIbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.
Mib	no_mib
Values	Decimal (1..253) sameAsBgp
Default	sameAsBgp

ATTRIBUTE Rtr Vrf Bgp Import **ebgpRtePreference (ebgpPref)**

Access	Read and write
Description	This attribute specifies the routing preference of EBGP routes matching this import policy. A lower value specifies the route is more preferred. If ***sameAsBgp*** is specified, the value of *defaultEbgpRtePref* set under the *Bgp* component is used. Otherwise the value of this attribute will be used as the routing preference**.** The default is to use sameAsBgp.
Mib	no_mib
Values	Decimal (1..253) sameAsBgp
Default	sameAsBgp

ATTRIBUTE Rtr Vrf Bgp Import **addressFamily (af)**

Access	Read and write
Description	This attribute specifies the Address Family of the routes this import policy should apply to. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). It can contain one of the following: ***ipv4Unicast*** represents AFI = 1 and SAFI = 1 ***mbgpVpn*** represents AFI = 1 and SAFI = 141 (Not for RFC 2547) ***all***
Mib	no_mib
Values	all ipv4Unicast mbgpVpn ipv4Label
Default	all

ATTRIBUTE Rtr Vrf Bgp Import **description (desc)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the policy. For example, 'to import BGP routes from AS 1'.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

GROUP Rtr Vrf Bgp Import Net **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the set of provisionable attributes for the *Network* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp Import Net **prefix**

Access	Read and write
Description	This attribute specifies the network prefix whose length is determined by the *length* attribute under the same *Network* component.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp Import Net **length**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the length of the network prefix.
Mib	no_mib
Values	Decimal (1..32)
Units	bits
Default	No default

COMPONENT Rtr Vrf Bgp ExportPolicy (Export)

Instance	Decimal (0..65535)
Groups	GROUP Rtr Vrf Bgp Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Bgp Export/n* *Rtr/<string> Bgp Export/n* *Rtr/<string> Vrf/<string> Bgp Export/n* Each instance of this component describes a BGP export policy. A BGP export policy is used to decide if certain routing information should be blocked or advertised to its peers. If no export policy is provisioned, BGP will advertise all external BGP learned routes to its internal peers, but not advertise any routing information to its external peers. If multiple export policies are provisioned, the one with the most specific match will apply. The keys are matched in the following order from the least specified to the most specified: *peerAs*, *peerIpAddress*, *protocol,* *ripInterface* (if applicable), *egpAs, bgpAs, ripNeighbour*, or *ospfTag* (whichever is applicable), *Network,* *matchAsPath,* *matchCommunity.* Example1: (for Router and Vrf, the examples are similar by replacing 'vr/0 ip' with 'Router/a' and 'Router/a Vrf/b' respectively) There are 2 export policies defined: vr/0 ip bgp export/1, protocol = ***all***, advertiseStatus = ***send*** vr/0 ip bgp export/2, protocol = ***rip***, advertiseStatus = ***block*** BGP will generate BGP updates for all routes except the routes learned from RIP. Example2: There are 2 export policies defined: vr/0 ip bgp export/1, protocol = all, matchCommunity = ***303***, advertiseStatus = ***send*** vr/0 ip bgp export/2, protocol = ***all***, advertiseStatus = ***block***

Copyright © 2006, Nortel Nortel Confidential

BGP will generate BGP updates for all routes that belongs to Community 303.

GROUP Rtr Vrf Bgp Export Provisioned (Prov)

Properties: Provisioned

Description: This group contains all the provisioned attributes for the *Export* component.

Mib: no_mib

ATTRIBUTE Rtr Vrf Bgp Export peerAs

Access: Read and write

Description: This key attribute specifies the autonomous system number of the peer where the routes are advertised to. A value of 0 for this attribute means this export policy applies to all peer ASes.

Mib: no_mib

Values: Decimal (0..65535)

Default: 0

ATTRIBUTE Rtr Vrf Bgp Export peerIpAddress

Access: Read and write

Description: This key attribute specifies the IP address of the peer where the routes are advertised to. A value of 0.0.0.0 for this attribute means this export policy applies to all peers. This key attribute is used in export policies for AFI/SAFI = 1/128 only if the *addressFamily* attribute is set to ***ipv4MplsVpn***.

Mib: no_mib

Values: IP address

Default: 0.0.0.0

ATTRIBUTE Rtr Vrf Bgp Export protocol

Access: Read and write

Description: This key attribute specifies which protocol the export policy applies to. If it is set to ***all***, that means this export policy will apply all routes in the IP routing table.

Copyright © 2006, Nortel Nortel Confidential

	Example: vr/1 ip ospf export/1 with advertise Status = block protocol = bgpExternal bgpAsId = 3 peerAs = 5 This policy specifies that all routes learned from EBGP Peers that are originated from AS 3 should not be advertised to AS 5.
Mib	no_mib
Values	all egp rip ospfInternal ospfExternal staticLocal staticRemote bgpInternal bgpExternal bgpAggregate mbgp bgpMplsInternal
Default	all

ATTRIBUTE Rtr Vrf Bgp Export **egpAsId (egpAs)**

Access	Read and write
Description	This key attribute specifies the EGP autonomous system number that this export policy will apply to. When this value is non-zero, the *protocol* attribute must be set to ***egp***.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Bgp Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This key attribute specifies the BGP autonomous system number that this export policy will apply to. When this value is non-zero, the *protocol* attribute must be set to either ***bgpInternal*** or ***bgpExternal***.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Bgp Export **ospfTag**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This key attribute specifies the OSPF tag when the *protocol* attribute is set to either ***ospfInternal*** or ***ospfExternal***. The default tag value 4294967295 (FFFFFFFF in hex) indicates that the tag not specified.
Mib	no_mib
Values	Hex (H.0..H.ffffffff)
Default	H.ffffffff

ATTRIBUTE Rtr Vrf Bgp Export ripInterface (ripIf)

Access	Read and write
Description	This key attribute specifies the local RIP interface where the routes are learned from. The *ripInterface* attribute when non-zero should be equal to one of the IP addresses provisioned as a *logicalIf* component under *IpPort*, or the IP address of an *Interface* component. Otherwise, this policy will be ignored. The value of the *protocol* attribute must be set to ***rip*** if a value for the *ripInterface* attribute is non-zero.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Bgp Export ripNeighbor (ripNbr)

Access	Read and write
Description	This key attribute specifies the RIP neighbor where the routes were learned from. The value of the *protocol* attribute must be set to ***rip*** if the *ripNeighbor* attribute is non-zero.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Bgp Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies whether data will be exported if it meets criteria specified by the other key attributes of this component.
Mib	no_mib
Values	send block
Default	send

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Bgp Export **multiExitDisc (med)**

Access	Read and write
Description	This attribute specifies this *Bgp* component instance's metric to discriminate between multiple exit points to an adjacent autonomous system if the route meets the criteria specified by the key attributes of this component. A lower value indicates a more preferred route. A value of 0 for this attribute means the default MED value provisioned under the *Bgp* component should be used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Export **sendMultiExitDiscToEbgp (sendMed)**

Access	Read and write
Description	This attribute specifies whether the Multi Exit Discriminator (MED) attribute should be included in an update message sent to an EBGP peer.
Mib	no_mib
Values	false true
Default	false

ATTRIBUTE Rtr Vrf Bgp Export **asPathExpression (asExpr)**

Access	Read and write
Description	This key attribute allows the user to enter a regular expression to match the import AS Path Attribute of the export update message. Note: the AS Path Attribute lists the ASs in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS number separated by a space which making up a AS path. The following characters have a special meaning: '.' - Matches any AS number. '^n' - Matches the first AS item (n) in the AS Path Attribute, or in order words, matches the last AS (n) traversed in the AS path. 'n$' - Matches the last AS item (n) in the AS Path Attribute, or in order words, matches the first AS (n) traversed in the AS path. '[n1... n2]' - Matches any AS number that appeared in the set n1... n2. 'n1 - n2' - Matches any AS number between the range of n1 and n2. '()' - is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a

Copyright © 2006, Nortel Nortel Confidential

set, range or AS number.
'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number.
'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in descending order:
'NOT' - Given a regular expression x, NOT x matches the AS number pattern that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS path that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the AS path that are matched by x and those are matched by y.
For example: The AS path "5 4 3 2 1", where 1 is the origin AS, would be match by any one of the following regular expressions:
1$,
^5,
4 3,
5 3 - 4*,
5 [4 3 2] not10 2 1,
not (6 7 8 9 10) and 5 4.* 1
Empty regular expression implies a match on all AS path.

Mib — no_mib

Values — String (0..255, ASCII)

Default — No default

ATTRIBUTE Rtr Vrf Bgp Export **communityExpression (comExpr)**

Access — Read and write

Description — This key attribute allows the user to enter a regular expression to match the import Community Attribute of the received update message. The syntax of the regular expression is a subset of the RFC 2280.
The basic syntax of a regular expression is a list of Community number separated by a space which making up a Community attribute.
The following characters have a special meaning:
'[n1... n2]' - Matches any Community number that appeared in the set n1...n2.
'n1 - n2' - Matches any Community number between the range of n1 and n2.
'()' - is supported to change the order of evaluation.
'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number.
'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number.
'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or number.
The following logical operators are evaluated in descending order:
'NOT' - Given a regular expression x, NOT x matches the

Copyright © 2006, Nortel
Nortel Confidential

Community attribute that is not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the Community attribute that are matched by x and those are matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the Community attribute that are matched by x and those are matched by y.
For example: The Community path "1 2 3 4 5" would be match by any one of the following regular expression:
1,
5,
4 3,
2 3 - 4*,
1 [3 4 2]+,
not (6 7 8 9 10) and 1 2
Empty regular expression implies a match on all Community path.

Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Export expressPreference (exprPref)

Access	Read and write
Description	This attribute specifies the relative preference of the policy which use the keys *expressAsPath* and *expressCommunity*. This attribute is ignored if attributes *expressAsPath* and *expressCommunity* are both empty. This attribute is used to break the tie when two export policies' expression attributes match a specific AS Path or Community. A higher value indicates a more preferred policy.
Mib	no_mib
Values	Decimal (0..255)
Default	128

ATTRIBUTE Rtr Vrf Bgp Export sendCommunity (sendCom)

Access	Read and write
Description	This attribute indicates which community number this export policy will send along with the Path Attribute. Refer to RFC 1997 for the detailed description of how this attribute may be used to pass additional information to BGP peers. If the value is set to 0, no community is added to the Community attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Bgp Export **localPreference (locPrf)**

Access	Read and write
Description	This attribute specifies the value of the LOCAL_PREFERENCE path attribute in routes sent to internal peers. A value of 0 means that the value specified in the import policy (if any) or the default local preference value should be used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Bgp Export **virtualPrivateNetworkIdentifier (vpnId)**

Access	Read and write
Description	This attribute specifies the Virtual Private Network (VPN) identifier of the routes this export policy should apply to. This attribute is only used if *addressFamily* has included ***mbgpVpn***. The value “00-00-00-00-00-00-00” identifies an unspecified VPN ID, meaning the VPN ID will not be used as a matching criteria in this export policy.
Mib	no_mib
Values	String (7, Dashed Hex)
Default	00-00-00-00-00-00-00

ATTRIBUTE Rtr Vrf Bgp Export **addressFamily (af)**

Access	Read and write
Description	This attribute specifies the Address Family of the routes this export policy should apply to. It consists of both the Address Family Identifier (AFI) and the Subsequent Address Family Identifier (SAFI). An export policy is applied for AFI/SAFI = 1/128 only when this attribute is set to ***ipv4MplsVpn***. In this case only *peerIpAddress*, *routeTarget*, and *advertiseStatus* attributes and *Network* component and its related attributes are used for export policies. It can contain one of the following: ***ipv4Unicast*** represents AFI = 1 and SAFI = 1 ***mbgpVpn*** represents AFI = 1 and SAFI = 141 ***ipv4MplsVpn*** represents AFI = 1 and SAFI = 128 ***all***
Mib	no_mib
Values	all ipv4Unicast mbgpVpn ipv4MplsVpn

Copyright © 2006, Nortel Nortel Confidential

Default	all

ATTRIBUTE Rtr Vrf Bgp Export **description (desc)**

Access	Read and write
Description	This attribute describes the policy. For example, 'to export BGP routes to MCI'.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Vrf Bgp Export **insertDummyAs (insertAs)**

Access	Read and write
Description	This attribute specifies the AS number(s) to be inserted into the AS Path Attribute. The value is a sequence of AS number separated by period(.). For example, if the value is ***20.20.30***, the AS numbers 20, 20 and 30 would be inserted at the end of the AS Path Attribute just before the local AS number.
Mib	no_mib
Values	Integer Sequence
Default	No default

ATTRIBUTE Rtr Vrf Bgp Export **routeTarget (rt)**

Access	Read and write
Description	This attribute specifies the Route Target of the routes this export policy should apply to.
Mib	no_mib
List of	String (3..21, RFC2547RdRtSyntax)
List Size	256
Default	No default

COMPONENT Rtr Vrf Bgp Export **Network (Net)**

Mib no_mib

ATTRIBUTE Rtr Vrf Bgp As weight

Access Read and write

Description This attribute specifies the weight for an autonomous system. It allows users to prefer some ASes over others. It is used in route selection. Lowest weight is preferred. Setting the weight of an AS to 255 will make any route that traverses through that AS unpreferred.

Mib no_mib

Values Decimal (0..255)

Default 128

COMPONENT Rtr Vrf Bgp AggregatePolicy (Aggregate)

Instance prefix [IP address]
length [Decimal (0..32)]

Scope Application

Description *Vr/<string> Ip Bgp AggregatePolicy/<Ip Address>,<Decimal>*
Rtr/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>
Rtr/<string> Vrf/<string> Bgp AggregatePolicy/<Ip Address>,<Decimal>
This component is used to perform aggregation of BGP routes for exporting. Aggregation is the process of combining the characteristics of several different routes in such a way that a single route can be advertised. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Refer to RFC1771 for the set of rules regarding which routes can be aggregated. A ***network*** subcomponent is automatically added with the same network range as the aggregation policy key and its action is set to ***aggregate***. So by default all subnets under the aggregation key range will be aggregated. Examples (For *Router* and *Vrf*, the examples are similar by replacing ‘vr/0

Copyright © 2006, Nortel Nortel Confidential

ip' with 'Router/a' and 'Router/a Vrf/b' respectively):
Example #1: aggregate all the networks covered by A.0.0.0/8
add vr/0 ip bgp aggregate/A.0.0.0,8
(Note: the following subcomponent vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action aggregate will be automatically added)

Example #2: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks
add vr/0 ip bgp aggregate/A.0.0.0,8
set vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.B.0.0, length 16, action aggregate
(Note: this set command will overwrite the default network subcomponent vr/0 ip bgp aggregate/A.0.0.0,8 network/0 prefix A.0.0.0, length 8, action aggregate)
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate

Example #3: aggregate A.B.0.0/16 and A.C.0.0/16 as A.0.0.0/8 and advertise other networks; also advertise A.B.C.0/24
add vr/0 ip bgp aggregate/A.0.0.0,8
set vr/0 ip bgp aggregate/A.0.0.0,8 networkl/0 prefix A.B.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.C.0.0, length 16, action aggregate
add vr/0 ip bgp aggregate/A.0.0.0,8 network/2
set vr/0 ip bgp aggregate/A.0.0.0,8 network/2 prefix A.B.C.0, length 24, action advertise

Example #4: aggregate all networks under A.0.0.0/8, meanwhile advertise A.B.0.0/16
add vr/0 ip bgp aggregate/A.0.0.0,8
add vr/0 ip bgp aggregate/A.0.0.0,8 network/1
set vr/0 ip bgp aggregate/A.0.0.0,8 network/1 prefix A.B.0.0, length 16, action advertise

Mib	no_mib

ATTRIBUTE Rtr Vrf Bgp LocalVpn Ipv4 publicIpAddress

Access	Read only
Description	This attribute indicates the public IP Address for the remote IP VPN tunnel endpoint. It is used to encapsulate IP packets from the local IP VPN site to the remote site.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Bgp LocalVpn Ipv4 vpnPeeringTopology

Access	Read only
Description	This attribute indicates the peering mode of the remote customer BGP from which this VPN information is originated. This mode determines if a dynamic IBGP peer is instantiated between this *BGP* instance and the remote IP Tunnel endpoint on the remote customer VR. A ***none*** value specifies that BGP never instantiate dynamic IBGP peers. Dynamic IBGP peer is instantiated between two customer VR in the same VPN if and only if at least one end is configured with a ***hub*** value and the other is either configured with a ***hub*** or a ***spoke*** value. In any case; static BGP peers may be configured and overwrite the dynamic ones after auto-discovery has taken place. If auto-discovery is enabled when static peers already present between VPN sites, no

Copyright © 2006, Nortel Nortel Confidential

dynamic peers with the same provisioned peer instance will be instantiated regardless of the configured value of the attribute.

Instance:
vpnId [String (7, Dashed Hex)]
prefix [IP address]
length [Decimal (0..32)]
peer [IP address]

Groups: GROUP Rtr Vrf Bgp MBgpRib Operational (Oper)

Scope: Application

Description:
Vr/<string> Ip Bgp MBgpRibEntry/ <vpnid>,<prefix>,<length>,<peer_ip_address>
This component represents a single MBGP routing database entry received from one of the BGP peers of this virtual router.

The instance values of this component have the following meanings:
- *vpnId:* the virtual private network identifier associated with the MBGP route.
- *prefix*: the destination IP address prefix of the MBGP route.
- *length:* the length of the IP address prefix of the MBGP route.
- *peer_ip_address:* the IP address prefix of the BGP peer that the MBGP route has been learned from. A value of 0.0.0.0 indicates that the MBGP route is learned from a locally attaching customer VR.

This component only appears under a *VirtualRouter* component whose *vpnMode* attribute is set to ***carrier***.

COMPONENT Rtr Vrf Bgp **MplsVpnRibEntry (MvRib)**

Instance	routeDistinguisher [String (3..21, RFC2547RdRtSyntax)] prefix [IP address] length [Decimal (0..32)] peer [IP address]
Groups	GROUP Rtr Vrf Bgp MvRib Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr> *Rtr/<string> Ip Bgp MplsVpnRibEntry/* <routeDistinguisher>,<prefix>,<length>,<peerIpAddr> The *MplsVpnRibEntry* component represents a single entry in the MPLS VPN routing information database.This component is used to maintain the MPLS VPN routes learned both locally and from the BGP peers. The instance values of this component have the following meaning: - *routeDistinguisher:* a string associated with the MPLS VPN route. The string is in the form of (1) AS:nn or (2) IPAddr:mm. where AS represents an autonomous system number, nn represents an index value, IPAddr represents an IP address,

Copyright © 2006, Nortel Nortel Confidential

mm represents an index value

- *prefix*: the destination IP address prefix of the MPLS VPN route. This is an IP address prefix as specified in the Network Layer Reachability Information field of the MP_REACH_NLRI path attribute.

- *length:* the length of the IP address prefix of the MPLS VPN route. This is the IP address prefix length as specified in the Network Layer Reachability Information field.

- peerIpAddr: the IP address prefix of the BGP peer that the MPLS VPN route has been learned from.

This component is only applicable to the *Router* component or a virtual router whose *vpnMode* attribute is set to ***carrier***.

Properties: Operational

Description: This group contains the operational attributes of the *BgpMplsRibEntry* component.

Mib: Bgp

ATTRIBUTE Rtr Vrf Bgp MvRib **serviceLabel (sl)**

Access: Read only

Description: This attribute indicates the service label (the inner label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node and distributed together with the routing information toward the remote end PE. The service label is then used by the remote PE node to encapsulate traffic of the same VPN to the local PE node. When the local PE node processes a received packet which has the service label at the top of the stack, the PE pops the stack, and sends the packet to the Customer Edge (CE) node from which the route leads. (See also transportLabel attribute description.)

Mib: Bgp

Values: Decimal (0..1048575)

Default: No default

ATTRIBUTE Rtr Vrf Bgp MvRib **transportLabel (tl)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the transport label (the outer label in a two-level MPLS label stack) allocated by the Provider Edge (PE) node. The transport label identifies the MPLS tunnel (Labeled Switched Path) used to transport the service label encapsulated VPN traffic, between two PE nodes, through the backbone. The transport label is applied on top of the service label at the source PE node, and used to direct the VPN traffic (travelling through the network core) to the destination PE. At the destination PE node the transport label is stripped, leaving the service label encapsulated packet to be processed and forwarded to a CE node based on the service label. A value of ***awaitingLabel*** indicates the MPLS tunnel is currently not available and waiting to be established. A value of ***notApplicable*** indicates this is a local route and hence doesn't have a transport label.
Mib	Bgp
Values	Decimal (0..1048575) awaitingLabel notApplicable

COMPONENT Rtr Vrf **RouteDistinguisher (Rd)**

Instance	String (3..21, RFC2547RdRtSyntax)
Scope	Application
Description	*Rtr/<string> Vrf/<string> RouteDistinguisher/<admin>:n* The route distinguisher is used to create distinct routes to a common IPv4 address prefix. An IPv4 MPLS VPN (RFC2547) address consists of a route distinguisher and a IPv4 prefix. The route distinguisher value consists of an administrative part and an assigned number part. A route distinguisher can have two different formats as follows: **Type 0 format**: administrative field contains a 2 byte autonomous system number assigned by the operator and the assigned number field contains a 4 byte number also assigned by the operator. The two fields are separated by a colon. (e.g. as:number) **Type 1 format**: administrative field contains a 4 byte IPv4 address assigned by the operator and the assigned number field contains a 2 byte number also assigned by the operator. The two fields are separated by a colon. (e.g. IPAddr:number)

Copyright © 2006, Nortel Nortel Confidential

Refer to RFC 2547 for further details regarding the route distinguisher.

There must be one and only one route distinguisher defined for the Vrf.

COMPONENT Rtr Vrf RouteTarget (Rt)

Instance: String (3..21, RFC2547RdRtSyntax)

Groups: GROUP Rtr Vrf Rt Provisioned (Prov)

Scope: Application

Description: *Rtr/<string> Vrf/<string> RouteTarget/<admin>:n*
A route target is a form of policy which identifies a set of sites within a Virtual Private Network. They are used to control the distribution of IPv4 MPLS VPN (RFC2547) routes. Each instance of this component defines a VRF route target. 'Export' route targets are attached to a route received from a locally attached CE and advertised to other Provider Edge routers. 'Import' route targets are used by the Provider Edge router to determine whether a route received from another Provider Edge router could be installed in the VRF's routing table associated with the locally attached CE.

The route target value consists of an administrative part and an assigned number part. A route distinguisher can have two different formats as follows:
Type 0 format: administrative field contains a 2 byte autonomous system number assigned by the operator and the assigned number field contains a 4 byte number also assigned by the operator. The two fields are separated by a colon. (e.g. as:number)
Type 1 format: administrative field contains a 4 byte IPv4 address assigned by the operator and the assigned number field contains a 2 byte number also assigned by the operator. The two fields are separated by a colon. (e.g. IPAddr:number)

Refer to RFC 2547 for further details regarding route targets.

Copyright © 2006, Nortel Nortel Confidential

A Route Target can be defined as being either an import route target, and export route target, or both an import and an export route target.

Properties: Provisioned

Description: This group contains the provisionable attributes for the *RouteTarget* component.

Mib: no_mib

ATTRIBUTE Rtr Vrf Rt mode

Access: Read and write

Description: This attribute specifies the mode of the route target. If the value is ***both***, the route target becomes both the import and export route targets.

Mib: no_mib

Values:
both
import
export

Default: both

COMPONENT Rtr Vrf ExportPolicy (Export)

Instance: Decimal (0..65535)

Groups: GROUP Rtr Vrf Export Provisioned (Prov)

Scope: Application

Description: *Rtr/<string> Vrf/<string> ExportPolicy/n*
Each instance of this component defines a VRF export policy. A VRF export policy is used to decide whether locally learned routing information is to be sent or blocked.

If no export policy is provisioned, *Vrf* exports all routes into the IBGP routing database of the associated *Rtr*, except those learned from IBGP. If multiple export policies are provisioned, the policy with the most specific match to the route is applied.

Example 1:
Two export policies are defined:

Copyright © 2006, Nortel
Nortel Confidential

Rtr/0 vrf/0 export/1, *protocol* = ***all,*** *advertiseStatus* = ***send***
Rtr/0 vrf/0 export/2, *protocol* = ***rip***, *advertiseStatus* = ***block***
This example specifies that *Vrf* should export all routes in this *Vrf*'s routing table, except routes learned from RIP.

Example 2:
Two export policies are defined:
Rtr/0 vrf/0 export/2, *protocol* = ***all***, *advertiseStatus* = ***send***
Rtr/0 vrf/0 export/3, protocol = ***rip***, *advertiseStatus* = ***block***
Rtr/0 vrf/0 export/3 network/1, *prefix* = ***47.0.0.0***, *length* = ***8***
Vrf willl export all routes in this *Vrf*'s routing table except routes learned from RIP which match the network address prefix 47.0.0.0/8.

Description	This attribute specifies whether routing data which matches the criteria for this policy is exported.
Mib	no_mib
Values	send block
Default	send

ATTRIBUTE Rtr Vrf Export localPreference (locPrf)

Access	Read and write
Description	This attribute specifies the value of the LOCAL_PREFERENCE path attribute in routes advertised to the remote Provider Edge (PE) node. A value of ***0*** means that the default local preference value, taken from the *Router Bgp defaultLocalPreference*, is used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Export asPathExpression (asExpr)

Access	Read and write
Description	This attribute specifies a pattern of autonomous system (AS) numbers, as one of the matching criteria, that is used by this *ExportPolicy* to match a route's AS Path Attribute before the route is exported. Note that AS numbers listed in AS Path Attribute are in reverse traversal order. The syntax of the regular expression is a subset of the RFC 2280. The basic syntax of a regular expression is a list of AS numbers separated by a space which makes up an AS path. The following characters have a special meaning: '.' - Matches any AS number. '^n' - Matches the first AS number (n) in the AS path, or in other words, matches the last AS number (n) traversed in the AS path. 'n$' - Matches the last AS number (n) in the AS path, or in other words, matches the first AS number (n) traversed in the AS path. '[n1... n2]' - Matches any AS number that appears in the set of n1... n2. 'n1 - n2' - Matches any AS number that appears in the range of n1 to n2. '()' - Is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or AS number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or AS number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a

Copyright © 2006, Nortel Nortel Confidential

set, range or AS number.
The following logical operators are evaluated in descending order:
'NOT' - Given a regular expression x, NOT x matches the AS paths that are not matched by x.
'AND'- Given two regular expressions x and y, x AND y matches the intersection of the AS paths that are matched by x and matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the AS paths that are matched by x or matched by y.
For example: In the AS path "5 4 3 2 1", 1 is the origin AS number, and the AS path would be matched by any one of the following regular expressions:
1$,
^5,
4 3,
5 3 - 4*,
5 [4 3 2] not10 2 1,
not (6 7 8 9 10) and 5 4.* 1
Empty regular expressions imply a match to all AS paths.

Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Vrf Export communityExpression (comExpr)

Access	Read and write
Description	This attribute specifies a pattern of Community numbers, as one of the matching criteria, that is used by this *ExportPolicy* to match a route's Community Path Attribute before the route is exported. It uses a subset of regular expressions that are described in RFC 2280. The basic syntax of a regular expression is a list of Community numbers separated by a space which makes up a Community. The following characters have a special meaning: '[n1... n2]' - Matches any Community number that appears in the set of n1... n2. 'n1 - n2' - Matches any Community number that appears in the range of n1 to n2. '()' - Is supported to change the order of evaluation. 'n*' - Matches 0 or more occurrences of n, where n can be a set, range or Community number. 'n+' - Matches 1 or more occurrences of n, where n can be a set, range or Community number. 'n?' - Matches 0 or 1 occurrences of n, where n can be a set, range or Community number. The following logical operators are evaluated in descending order: 'NOT' - Given a regular expression x, NOT x matches the Communitys that are not matched by x. 'AND'- Given two regular expressions x and y, x AND y

Copyright © 2006, Nortel Nortel Confidential

matches the intersection of the Communitys that are matched by x and matched by y.
'OR' - Given two regular expressions x and y, x OR y matches the union of the Communitys that are matched by x or matched by y.
For example: In the Community "1 2 3 4 5", it would be matched by any one of the following regular expressions:
1,
5,
4 3,
2 3 - 4*,
1 [3 4 2]+,
not (6 7 8 9 10) and 1 2
Empty regular expressions imply a match to all Communitys.

Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)]
[-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)]
[-traceRoute] [-continuous] [-dontFragment] [-noOp]
[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-dscp(0..63)][-tos(0..FF)][-stop] Rtr/<string> Icmp

Ping -ipAddr(Ip Address) [-srcAddr(Ip Address)]
[-netmask(Ip Address)] [-size(30..20000)] [-retry(0..9)]
[-traceRoute] [-continuous] [-dontFragment] [-noOp]
[-recordRoute(1..9)] [-timeStamp(1..4)]
[-looseSrcRoute(Ip Address...)][-strictSrcRoute(Ip Address...)]
[-dscp(0..63)][-tos(0..FF)][-stop] Rtr/<string> Vrf/<string> Icmp

The *Ping* verb is intended for testing network connections at the IP level. The verb invokes ICMP to issue an echo request to the host specified by the *ipAddr* option and waits for its echo response.

If the *Ping* is successful, it outputs the following information:
- number of bytes received
- IP address of the responding host
- ICMP sequence number of the received packet
- elaspsed time from sending of the *Ping* to receiving of the response

The following options are supported:

-srcAddr is used to define the source IP address of the IP ICMP echo request packet. When not specified or specified as 0.0.0.0, the outgoing IP *Interface* or *LogicalIf* address is used as the source address.

-netmask when specified is used to define a range of IP host addresses to which echo requests are sent to (ping sweep). The netmask given must be contiguous. The *-retry* option is ignored if used together with this option. By default, the value is set to 255.255.255.255.

-*size* is used to define the size of the IP packet to be echoed including the IP and ICMP header. The default is 64 bytes. The maximum size is 4096.

-*retry* is used to define the number of times an echo request is resent if no echo reply is received. Default is 0.

Copyright © 2006, Nortel Nortel Confidential

-traceRoute is used to find the route the node would use to reach a particular destination IP address at the moment when the *Ping* command is executed with this option. The *-netmask*, *-size, -retry* and *-continuous* option are ignored if used together with this option. By default, the *traceRoute* option is not used.

-continuous causes ICMP to issue echo requests once per second to the host or hosts specified by the *-ipAddr* and the *-netmask* option. For every echo response ICMP receives, one line of output is printed. No output is produced if there is no response. The *-stop* option is used to stop ICMP from sending the echo requests. By default, the *-continuous* option is not used.

-dontFragment causes ICMP to set the Don't Fragment flag of the IP packet that carries the echo request. This is useful in determining path MTU. By default, the *dontFragment* option is not used.

-noOp causes a No Operation option to be inserted into the IP header of the packet that carries the echo request. By default, the *noOp* option is not used.

-recordRoute causes the route of the IP packet that carries the echo request to be recorded in the IP header. Up to 9 routes can be recorded. If the number of routes to record is not specified, 5 routes are recorded by default.

-timeStamp sets the Time Stamp option in the IP header of the packet that carries the echo request. The format used for the time stamps consists of both an IP Adress and a time field. The default number of time stamps is 3. A maximum of 4 time stamps can be recorded.

-looseSrcRoute is used to specify a loose set of routes for the packet carrying the echo request to go through along the path to the destination. Up to 9 routes can be specified.

-strictSrcRoute is used to specify a strict set of routes for the packet carrying the echo request to go through to get to the destination. Up to 9 routes can be specified.

-cos causes the echo request packet to be forwarded with the given Class Of Service. Default is 0. This option is not supported on a Router component, a VpnRouteForwarder component, nor on a VirtualRouter component that has a DifferentiatedServicesDomain subcomponent.

-dscp causes the six most significant bits of Type Of Service (TOS) byte of the echo request packet to be set to the given value. These six bits are know as the Differentiated Services Code Point (DSCP). Default is 0. This option cannot be used together with the *-tos* option.

Copyright © 2006, Nortel Nortel Confidential

-tos causes the Type Of Service (TOS) byte of the echo request packet to be set to the given value. Default is 0. This option cannot be used together with the *-dscp* option.

-stop is used to stop ICMP from sending echo requests due to a previously issued *Ping* command with the *-continuous* and/or *-netmask* option. Under any other situation, the *Ping* command with the *-stop* option has no effect.

Note: Only one *Ping* command per *VirtualRouter* or *Router* or *Router Vrf* is allowed to be in progress at any one time. Any in progress *Ping* command must be stopped before a new *Ping* command can be issued.

Description	This attribute counts the ICMP messages that this gateway did not send due to problems discovered within ICMP such as a lack of buffers. *outErrors* does not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Icmp outDestUnreachs

Access	Read only
Description	This attribute counts the ICMP destination unreachable messages sent by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Icmp outTimeExcds

Access	Read only
Description	This attribute counts the ICMP time exceeded messages sent by this gateway. The counter wraps to zero when it exceeds its maximum value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Icmp outParmProbs

Access	Read only
Description	This attribute counts the ICMP parameter problem messages sent by this gateway. The counter wraps to zero when it exceeds its maximum value.

GROUP Rtr Vrf Ospf Provisioned (Prov)

Properties Provisioned

Description This group of attributes are used to configure the OSPF component.

Mib no_mib

ATTRIBUTE Rtr Vrf Ospf routerId (id)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute is an Ip Address that uniquely identifies the router in the autonomous system.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Ospf snmpAdminStatus

Access	Read and write
Description	The administrative status of the OSPF Component in this routing component (*Vr*, *Rtr* or *Vrf*).
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr Vrf Ospf asBdrRtrStatus (asBr)

Access	Read and write
Description	This attribute is a flag to note whether this router is an autonomous system border router. If this router is configured to export any routes learned from other than OSPF-internal protocol, this attribute should be configured as autonomous system border router.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Vrf Ospf tosSupport

Access	Read and write
Description	The router's support for type-of-service routing. Only one value will be allowed. This is a deviation from supporting the MIB.
Mib	no_mib
Values	false
Default	false

ATTRIBUTE Rtr Vrf Ospf multicastForward

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	A bit mask indicating the limits on Network Layer Multicast (class D) forwarding. It is represented as a sum of the following: if intra-Area forwarding is permitted, 1; else 0 if inter-Area forwarding is permitted 2; else 0 if inter-AS forwarding is permitted, 4; else 0 Only the value of 0 is being supported and this is a MIB deviation.
Mib	no_mib
Values	Decimal (0..0)
Default	0

ATTRIBUTE Rtr Vrf Ospf migrateRip

Access	Read and write
Description	This Attribute sets the preference level of OSPF-internal routes to be less preferred than RIP. This attribute should only be used when starting a migration of a network from RIP to OSPF. When ready to cut over to OSPF, set this attribute to a value of ***disabled*** and run under normal preferences. All OSPF routers in the Autonomous System should be running with the *migrateRip* attribute set to a value of ***enabled*** or with *migrateRip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf Ospf generateDefaultRouteMetric (genDefaultMetric)

Access	Read and write
Description	If this router is configured as an autonomous system border router, then this attribute causes the default route to be generated with a metric value equal to *generateDefaultRouteMetric* value. This route is put in the OSPF update along with the normal update routes when updates are sent to the neighbors. No default route will be generated if the value is 0.
Mib	no_mib
Values	Signed (-1..65535)
Default	0

ATTRIBUTE Rtr Vrf Ospf redistributeIbgp (ribgp)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether the export policies of this *Ospf* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all***. If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching routes. If *redistributeIbgp* is ***false***, routes learned from IBGP peers are excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Vrf Ospf estimatedNumberOfInternalOSPFRoutes

Access	Read and write
Description	This attribute specifies the average estimated number of routes in the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory.
Mib	no_mib
Values	Decimal (0..65535)
Default	500

ATTRIBUTE Rtr Vrf Ospf estimatedNumberOfExternalOSPFRoutes

Access	Read and write
Description	This attribute specifies the average estimated number of routes external to the autonomous system that this OSPF instance will have to keep track of. If this value is provisioned too low it will cause increased CPU utilization due to dynamic memory allocation. If this value is provisioned too high the result is wasted memory.
Mib	no_mib
Values	Decimal (0..65535)
Default	500

ATTRIBUTE Rtr Vrf Ospf estimatedNumberOfAreas

Access	Read and write
Description	This attribute specifies the average estimated number of areas in the autonomous system that this OSPF instance will have to keep track of.
Mib	no_mib
Values	Decimal (0..65535)

Copyright © 2006, Nortel Nortel Confidential

Default	2

ATTRIBUTE Rtr Vrf Ospf **estimatedNumberOfInterfacesPerArea**

Access	Read and write
Description	This attribute specifies the average estimated number of interfaces in a given area that this OSPF instance will have to keep track of.
Mib	no_mib
Values	Decimal (0..65535)
Default	10

ATTRIBUTE Rtr Vrf Ospf **estimatedNumberOfNeighborsPerInterface**

Access	Read and write
Description	This attribute specifies the average estimated number of neighbors that a given interface will have on it in this OSPF interface.
Mib	no_mib
Values	Decimal (0..65535)
Default	3

ATTRIBUTE Rtr Vrf Ospf **defaultOspfIntRtePreference (ospfIntPref)**

Access	Read and write
Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF internal routes. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..254)
Default	30

ATTRIBUTE Rtr Vrf Ospf **defaultOspfExt1RtePreference (ospfExt1Pref)**

Access	Read and write
Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 1 routes. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..254)
Default	80

ATTRIBUTE Rtr Vrf Ospf **defaultOspfExt2RtePreference (ospfExt2Pref)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies this *OSPF* component instance's default routing preference assigned to the OSPF external type 2 routes. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..254)
Default	120

ATTRIBUTE Rtr Vrf Ospf **opaqueCapability (opcap)**

Access	Read and write
Description	This attribute specifies whether the OSPF instance is allowed to participate in flooding Opaque LSAs. Such LSAs are also stored in the InwOspfLsdbEntry. Applications, such as MPLS Traffic Engineering, use this mechanism to flood their information throughout a network. Of the three Opaque LSA types (9,10,11), only type 10 LSAs (area scope) are supported.The OSPF instance remains fully inter-operable with non-opaque-capable neighbors. Opaque capability is not fully supported. When the ***mplsTeEmulation*** feature is provisioned, setting this attribute to ***true*** activates hooks to emulate TE capability by flooding hard-coded type 10 TE LSAs to opaque-capable neighbors. This emulated TE functionality is not standards compliant and is strictly provided for MPLS RSVP-TE inter-operability with vendors that are dependent on MPLS TE to establish LSPs.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Vrf Ospf **spareInstance (spInst)**

Access	Read and write
Description	This attribute specifies whether to maintain a copy of the link state database on the standby card. When this attribute is set to ***disable***, OSPF does not maintain a copy of the link state database. If the *virtualRouterProcessor* attribute of this *VirtualRouter* is set to ***Lp/0***, then the following conditions must both be true for a copy of the link-state database to be maintained on the standby CP: - This attribute must be set to ***enable***, and - The *Shelf cpEquipmentProtection* attribute must be set to ***hot***.
Mib	no_mib
Values	enable disable

Copyright © 2006, Nortel Nortel Confidential

Default	disable

ATTRIBUTE Rtr Vrf Ospf spfHoldTime (spfTime)

Access	Read and write
Description	This attribute specifies the minimum time interval between SPF calculations. If a link state change in the autonomous system is detected and the time since the last SPF calculation is greater than *spfHoldTime*, then the SPF calculation starts immediately. Otherwise, the SPF calculation waits until a time of at least *spfHoldTime* has elapsed since the previous SPF calculation. Setting this attribute to a lower value decreases convergence time in the OSPF autonomous system, but uses more CPU resource more frequently. Setting this attribute to a higher value increases convergence time but provides for a more scalable node configuration, especially if there are many *Ospf* components configured on the node.
Mib	no_mib
Values	Decimal (1..60)
Units	seconds
Default	1

ATTRIBUTE Rtr Vrf Ospf alarmGeneration (alarms)

Access	Read and write
Description	This attribute specifies the level of alarm generation for this *Ospf* instance. A value of ***all*** specifies that all OSPF alarms are made visible. A value of ***normal*** specifies that all existing OSPF alarms are made visible, except *Ospf NeighborEntry* state change alarms. A value of ***none*** specifies that no OSPF alarms are made visible. It is recommended that *VirtualRouter* components with the *vpnMode* attribute set to ***carrier*** should have the *alarmGeneration* attribute set to ***all***. *VirtualRouter* components with the *vpnMode* attribute set to ***customer*** should have the *alarmGeneration* attribute set to either ***normal*** or ***none***, for scalability reasons. Similarly, the *alarmGeneration* attribute should be set to ***all*** for *Router*. The *alarmGeneration* attribute should be set to either ***normal*** or ***none*** for *Vrf* for scalability reasons.
Mib	no_mib
Values	none normal all
Default	all

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Ospf **ecmpStatus**

Access	Read and write
Description	This attribute specifies whether the Equal Cost Multi-Path (ECMP) functionality is enabled or not in the network meaning that the number of next hops for one route learned through OSPF depend on the value of *ecmpStatus*. If *ecmpStatus* is ***enabled,*** a maximum of three next hops are kept for one route. If it is ***disabled***, one next hop is kept for that route.
Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr Vrf Ospf **attachAsTag (asTag)**

Access	Read and write
Description	This attribute specifies the treatment of the OSPF tag when routes are redistributed between BGP and OSPF. If this attribute is set to ***enabled***, an AS number is encoded as OSPF tag when routes are redistributed from BGP into OSPF. When routes are redistributed from OSPF into BGP, the OSPF tag is checked against the AS number to avoid routing loops. If this attribute is set to ***disabled***, an AS number is not encoded as OSPF tag when routes are redistributed from BGP into OSPF. When routes are redistributed from OSPF into BGP, the OSPF tag is not checked against the AS number.
Mib	no_mib
Values	disabled enabled
Default	enabled

GROUP Rtr Vrf Ospf **Operational (Oper)**

Properties	Operational
Description	These group of attributes identifies the operational attributes for this OSPF Component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Ospf **versionNumber (ver)**

Access	Read only
Description	The Current Version number of the OSPF Protocol. (2).
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (2..2)
Default	2

ATTRIBUTE Rtr Vrf Ospf **areaBdrRtrStatus**

Access	Read only
Description	This attribute is used to specify whether this router is configured as an area border router.
Mib	no_mib
Values	true false
Default	No default

ATTRIBUTE Rtr Vrf Ospf **externLsaCount**

Access	Read only
Description	The number of external (LS type 5) link-state advertisements in the link-state database.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Ospf **externLsaChecksumSum**

Access	Read only
Description	The 32-bit unsigned sum of the LS checksums of the external link-state database. This sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Ospf **originateNewLsas**

Access	Read only
Description	The number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Ospf **rxNewLsas**

Access	Read only
Description	The number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtr Vrf Ospf **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf Ospf **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Vrf Ospf **operationalState (osiOper)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Vrf Ospf usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Vrf Ospf OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Ospf snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates

Copyright © 2006, Nortel Nortel Confidential

	the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

COMPONENT Rtr Vrf Ospf AreaEntry (Area)

Instance	IP address
Groups	GROUP Rtr Vrf Ospf Area Provisioned (Prov) GROUP Rtr Vrf Ospf Area Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Ospf AreaEntry/<Ip Address>* *Rtr/<string> Ospf AreaEntry/<Ip Address>* *Rtr/<string> Vrf/<string> Ospf AreaEntry/<Ip Address>* This component contains the information about various areas that the router is connected to.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf Ospf Area Provisioned (Prov)

Properties	Provisioned
Description	This group describes the set of provisionable attributes for the AreaEntry Component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Ospf Area authType

Access	Read and write
Description	The authentication type specified for this area.
Mib	no_mib
Values	none simplePassword md5
Default	none

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Ospf Area **importAsExtern**

Access	Read and write
Description	The area's support for importing AS external link-state advertisements. For backbone area (that is, areaId 0.0.0.0), this attribute must be set to ***importExternal***.
Mib	no_mib
Values	importExternal (external) importNoExternal (noExternal) importNssa (nssa)
Default	importExternal

ATTRIBUTE Rtr Vrf Ospf Area **areaSummary**

Access	Read and write
Description	This variable controls the import of summary LSAs into stub areas. If it is ***noAreaSummary***, the router will neither originate nor propagate summary LSAs into the stub areas. It will rely entirely on its default route. If it is ***sendAreaSummary***, the router will both summarize and propagate summary LSAs.
Mib	no_mib
Values	noAreaSummary sendAreaSummary
Default	noAreaSummary

GROUP Rtr Vrf Ospf Area **Operational (Oper)**

Properties	Operational
Description	This group of attributes describes the Operational set of attributes for the AreaEntry component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Ospf Area **spfRuns**

Access	Read only
Description	The number of times that the intra-area route table has been calculated using this area's link-state database since the protocol became operational.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Ospf Area **areaBdrRtrCount**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The total number of area border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Ospf Area **asBdrRtrCount**

Access	Read only
Description	The total number of Autonomous System border routers reachable within this area. This is initially zero, and is calculated in each Shortest Path First Pass.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Ospf Area **lsaCount**

Access	Read only
Description	The total number of link-state advertisements in this area's link-state database, excluding AS External LSAs.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Ospf Area **areaLsaCksumSum**

Access	Read only
Description	The 32-bit unsigned sum of the link-state advertisement's LS checksums contained in this area's link-state database. This sum excludes external (LS type 5) link-state advertisements. The sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf Ospf VirtIf **Provisioned (Prov)**

Properties	Provisioned
Description	This group of attributes provide provisioning data for the *VirtIfEntry*.
Mib	no_mib

ATTRIBUTE Rtr Vrf Ospf VirtIf **transitDelay (transDelay)**

Access	Read and write
Description	The estimated number of seconds it takes to transmit a link-state update packet over this interface.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	1

ATTRIBUTE Rtr Vrf Ospf VirtIf **retransInterval (retransInt)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	The number of seconds between link-state advertisement retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description and link-state request packets. This value would be well over the expected round-trip time.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	5

ATTRIBUTE Rtr Vrf Ospf VirtIf helloInterval (helloInt)

Access	Read and write
Description	The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for the virtual neighbor.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	10

ATTRIBUTE Rtr Vrf Ospf VirtIf rtrDeadInterval (rtrDeadInt)

Access	Read and write
Description	The number of seconds that a router's Hello packets have not been seen before its neighbors declare the router down. This should be some multiple of the Hello interval. This value must be the same for the virtual neighbor.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	60

ATTRIBUTE Rtr Vrf Ospf VirtIf authKey

Access	Write only
Description	If authentication type is simple password, the password for this virtual circuit. If the value of the attribute is not set, then this attribute is ignored by the application. If the value of this attribute is set, then the value of the attribute *authType* under this particular *Area* should be set to ***simplePassword***, otherwise the application will ignore this authentication key.

COMPONENT Rtr Vrf Ospf **Export**

Instance	Decimal (0..65535)
Groups	GROUP Rtr Vrf Ospf Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Ospf Export/n* *Rtr/<string> Ospf Export/n* *Rtr/<string> Vrf/<string> Ospf Export/n* Each instance of this component specifies an OSPF export policy. An OSPF export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as OSPF external routes onto attached OSPF areas of the routing component (*Vr*, *Rtr* or *Vrf*). The *Ospf* component by default advertises all OSPF external routes based on the metric and tag in the IP forwarding table.
Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Vrf Ospf Export NetworkList (NetList)
Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf Ospf Export **Provisioned (Prov)**

Properties	Provisioned
Description	This Group contains all the Provisioned attributes for the Export Component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Ospf Export **advertiseStatus (advertise)**

Access	Read and write
Description	This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***).
Mib	no_mib
Values	send block
Default	send

ATTRIBUTE Rtr Vrf Ospf Export **metric (metric)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *metric* is ignored. The *metric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes. A value of -1 indicates that the metric associated with the route in the forwarding table is used.
Mib	no_mib
Values	Signed (-1..16777215)
Default	-1

ATTRIBUTE Rtr Vrf Ospf Export **protocol**

Access	Read and write
Description	This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Ospf* component's *reDistributeIBGP* attribute has the value ***false***.
Mib	no_mib
Values	all egp rip staticLocal staticRemote bgpInternal bgpExternal mbgp bgpMplsInternal
Default	all

ATTRIBUTE Rtr Vrf Ospf Export **ripInterface (ripIf)**

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of an *Interface* or a *LogicalIf* that has a *RipIf* on the same routing component.
Mib	no_mib
Values	IP address

Copyright © 2006, Nortel Nortel Confidential

Default	0.0.0.0

ATTRIBUTE Rtr Vrf Ospf Export **ripNeighbor (ripNbr)**

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP neighbor of which the routes are learned from. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP neighbor.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Ospf Export **egpAsId (egpAs)**

Access	Read and write
Description	This attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from. This attribute can only be non zero when *protocol* is set to ***egp***. The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Ospf Export **tag**

Access	Read and write
Description	This attribute specifies the OSPF tag to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *tag* is ignored. The *tag* value is not used to select which routes to block or send, but rather the tag value advertised for the routes. A value of 4294967295 indicates that the tag associated with the route in the forwarding table is used.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Rtr Vrf Ospf Export **extLsaMetricType**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the metric type in the OSPF external link state advertisement of the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *extLsaMetricType* is ignored. The *extLsaMetricType* value is not used to select which routes to block or send, but rather the metric value advertised for the routes. The value ***useProtocolDefault*** indicates the metric type is automatically chosen based on the routing protocol which the route was learned from.
Mib	no_mib
Values	useProtocolDefault type1 type2
Default	useProtocolDefault

ATTRIBUTE Rtr Vrf Ospf Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This attribute specifies the BGP AS from which a BGP route is learned from. This key is used only if the *protocol* is ***bgpExternal***. *bgpAsId* of value ***0*** matches all ASs.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Ospf Export **bgpPeerIp (peerIp)**

Access	Read and write
Description	This attribute specifies the BGP peer where the routes were learned from. *bgpPeerIp* of ***0*** matches all BGP peers. This attribute is used as a key when *protocol* is set to ***bgpInternal*** or ***bgpExternal***.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Ospf Export **description (desc)**

Access	Read and write
Description	This attribute describes the policy. For example, ‘to export OSPF routes to MCI’.

COMPONENT Rtr Vrf PolicerProfile (Policer)

Instance	String (1..20, ASCII)
Groups	GROUP Rtr Vrf Policer Provisioned (Prov)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description

Vr/<string> Ip PolicerProfile/<string>
Rtr/<string> Vrf/<string> PolicerProfile/<string>

This component and its subcomponents represent traffic conditioning rules for metering and policing IP packets received or transmitted at an interface. The rules specify various conditioning actions to be applied to individual packets after they are determined to be in-profile or out-of-profile with respect to various traffic rates and burst sizes.

A *PolicerProfile* component is used to condition inbound or outbound IP traffiic at a *VirtualRouter IpPort* or *VpnRouteForwarder Interface* by setting the *linkToPolicerProfile* attribute of the *IngressServices* or *EgressServices* subcomponent, respectively.

At ingress interfaces the conditioning rules are applied to drop or re-mark the DSCP field of IP packets received at the interface after ingress classification and DSCP marking (if any), prior to VPN encapsulation (if any), and prior to selection of forwarding treatments.

At egress interfaces the conditioning rules are applied to drop or re-mark the DSCP field of IP packets transmitted at the interface, after VPN decapsulation (if any), and prior to the selection of forwarding treatments. Egress classification and DSCP marking with a *DiffServProfile* component is not allowed when a *PolicerProfile* component is used to condition outbound traffic.

See the description of the *DifferentiatedServicesDomain* component and its subcomponents for a explanation of how an IP packet is treated based on the value of the DSCP field in the IP packet header.

Each *PolicerProfile* component must have at least one *Meter* subcomponent.

The *Vr Ip* component cannot have a *PolicerProfile* subcomponent unless the *Vr* has a *DiffServDomain* subcomponent and the *Vr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the *LogicalProcessorType* linked to the *LogicalProcessor* includes ***ipPolicing***.

The *Vrf* component cannot have *PolicerProfile* subcomponents unless the *Rtr* or *Vrf* has a *DiffServDomain* subcomponent and the *Rtr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the

Units	bits
Default	64000

ATTRIBUTE Rtr Vrf Policer Meter **excessBurstSize (be)**

Access	Read and write
Description	This attribute specifies the excess burst size in bits. This is the amount of uncommitted data that the network will attempt to deliver over a specified time interval. The time interval is calculated internally based on the *commitedInformationRate(cir)* and *commitedBurstSize(bc)* attribute values (t=*bc/cir*); however, if the *commitedInformationRate(cir)* and *commitedBurstSize(bc)* attribute values are zero, then the time interval is specified by the *measurementInterval* (*t*) attribute. If the *be* attribute is set to ***0***, then packets that exceed the committed information rate are discarded.
Mib	no_mib
Values	Decimal (0..50000000)
Units	bits
Default	64000

ATTRIBUTE Rtr Vrf Policer Meter **measurementInterval (t)**

Access	Read and write
Description	This attribute specifies the time interval (in milliseconds) over which traffic rates and burst sizes are measured. This attribute value must be non-zero if *cir* and *bc* attribute values are zero. If the *cir* and *bc* attributes are non-zero then the *measurmentInterval* attribute is ignored.
Mib	no_mib
Values	Decimal (0..25500)
Units	msec
Default	0

Groups	GROUP Rtr Vrf Policer Meter Phb Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Policer/<string> Meter<string> PolicedPhb/<phb> Rtr/<string> Vrf<string> Policer/<string> Meter<string> PolicedPhb/<phb>* This component is used to identify the traffic that is conditioned by the *Meter*. An IP packet is assigned a PHB according to the value of DSCP field in the IP packet header and the set of existing *DiffServDomain PerHopBehavior* components. If the PHB assigned to the IP packet matches the *PolicedPhb* subcomponent instance, then the packet is conditioned by a policing mechanism that is established at the ingress or

Copyright © 2006, Nortel Nortel Confidential

egress interface according to the *Meter* component provisioning.

The instance of this component must match a *PerHopBehavior* subcomponent of the *DiffServDomain* component used by the *Vr* or *Vrf*.

Each *Meter* component must have at least one *PolicedPhb* subcomponent.

Two *Meter* subcomponents of one *PolicerProfile* component cannot have *PolicedPhb* subcomponents with equal component instance values.

GROUP Rtr Vrf Policer Meter Phb Provisioned (Prov)

Properties: Provisioned

Description: This group contains the provisioned attributes of the *PolicedPhb* component.

Mib: no_mib

ATTRIBUTE Rtr Vrf Policer Meter Phb initialBucket

Access: Read and write

Description: This attribute specifies whether or not traffic entering the *Meter* with this PHB contributes to the committed information rate.

If this attribute is set to ***committed*** then IP traffic entering the meter with this PHB is directed to the bucket tracking the committed information rate. The traffic is policed in a dual rate mode where both committed and excess information rates are enforced.

If this attribute is set to ***excess*** then IP traffic entering the meter with this PHB is directed to bucket the tracking the excess information rate. The traffic is policed in a single rate mode where only the excess information rate is enforced.

Mib: no_mib

Values:
committed
excess

Default: excess

ATTRIBUTE Rtr Vrf Policer Meter Phb outOfProfilePhb

Access: Read and write

Copyright © 2006, Nortel
Nortel Confidential

Description	This attribute specifies a new PHB that is assigned to any packet that has exceeded the committed information rate. This attribute will have effect only if the *initialBucket* attribute is set to ***committed***. The DSCP field of an IP packet that exceeds the committed information rate will be modifed to match this attribute value. The value of this attribute must match a *PerHopBehavior* subcomponent of the *DiffServDomain* component used by the *Vr* or *Vrf*. The default value of this attribute is equal to the *PolicedPhb* component instance for all PHBs except ***AF41***, ***AF42***, ***AF31***, ***AF32***, ***AF21***, ***AF22***, ***AF11***, ***AF12*** where the default value is ***AF42***, ***AF43***, ***AF32***, ***AF33***, ***AF22***, ***AF23***, ***AF12***, ***AF13***, respectively. The traffic class associated with the new PHB assigned to the packet must be equal to the traffic class associated with the original PHB assigned to the packet prior to policing. The traffic class associated with a PHB is identified by the *DiffServDomain PerHopBehavior trafficClass* attribute. Normally the drop precedence associated with the new PHB assigned to the packet is greater than the drop precedence associated with the original PHB assigned to the packet prior to policing. The drop precedence associated with a PHB is identified by the *DiffServDomain PerHopBehaviour dropPrecedence* attribute.

Values — low
medium
high

Default — high

COMPONENT Rtr Vrf **DiffServProfile (DiffServProf)**

Instance — String (1..20, ASCII)

Groups — GROUP Rtr Vrf DiffServProf Provisioned (Prov)

Scope — Application

Description — *Vr/<string> Ip DiffServProfile/<string>*
Rtr/<string> Vrf/<string> DiffServProfile/<string>

This component and its subcomponents represent mapping rules for classifying and marking IP packets received or transmitted at an interface.

At ingress interfaces the mapping rules are applied to mark the DSCP field of IP packets received at the interface, prior to policing (if any), prior to VPN encapsulation (if any), and prior to selection of forwarding treatments.

At egress interfaces the mapping rules are applied to mark the DSCP field of IP packets transmitted at the interface, after VPN decapsulation (if any) and after selection of forwarding treatments. Egress traffic conditioning with a *PolicerProfile* component is not allowed when a *DiffServProfile* component is used to classify and mark outbound traffic.

See the description of the *DifferentiatedServicesDomain* component and its subcomponents for a explanation of how an IP packet is treated based on the value of the DSCP field in the IP packet header.

Copyright © 2006, Nortel
Nortel Confidential

A *DiffServProfile* component is used to mark the DSCP field of inbound or outbound IP traffiic at a *VirtualRouter IpPort* or *VpnRouteForwarder Interface* by setting the *linkToDiffServProfile* attribute of the *IngressServices* or *EgressServices* subcomponent, respectively.

Each *DiffServProfile* component used at an ingress interface must have a *DscpMap* subcomponent, or a *LinkMap* subcomponent, or at least one *MfMap* subcomponent. The *LinkMap* subcomponent and *DscpMap* subcomponent are not allowed to co-exist. The *LinkMap* subcomponent and *MfMap* subcomponents are not allowed to co-exist.

Multifield classification at an ingress interface using *MfMap* subcomponents overrides DSCP classification using the *DscpMap* subcomponent. This means that DSCP classification, which is controlled by *the DscpMap* component, is performed only if the packet does not match any *MfMap IpAddrLayer4Flow* component. If *MfMap* subcomponents are used without the *DscpMap* subcomponent and the packet does not match any *MfMap IpAddrLayer4Flow* component, then the packet is marked with DSCP 0.

Each *DiffServProfile* component used at an egress interface must have a *DscpMap* subcomponent. It cannot have a *LinkMap* subcomponent nor a *MfMap* subcomponent.

The *Vr Ip* component cannot have *DiffServProfile* subcomponents if the *Vr vpnMode* attribute is set to ***carrier***.

The *Vr Ip* component cannot have *DiffServProfile* subcomponents if the *Vr* has does not have a *DiffServDomain* subcomponent.

The *Vr Ip* component cannot have *DiffServProfile* subcomponents unless the *Vr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the *LogicalProcessorType* linked to the *LogicalProcessor* includes ***ipDiffServ***.

The *Vrf* component cannot have *PolicerProfile* subcomponents if neither the *Rtr* nor *Vrf* has a *DiffServDomain* subcomponent.

The *Vrf* component cannot have *PolicerProfile* subcomponents if the *Rtr virtualRouterProcessor* attribute is set to *Lp/0* or to a *LogicalProcessor* component instance where the *featureList* attribute of the

Copyright © 2006, Nortel Nortel Confidential

LogicalProcessorType linked to the *LogicalProcessor* includes ***ipDiffServ***.

COMPONENT Rtr Vrf DiffServProf Mf **IpAddrLayer4Flow**

Instance Decimal (0..1023)

Groups GROUP Rtr Vrf DiffServProf Mf IpAddrLayer4Flow Provisioned (Prov)
GROUP Rtr Vrf DiffServProf Mf IpAddrLayer4Flow ProtoProvisioned
GROUP Rtr Vrf DiffServProf Mf IpAddrLayer4Flow Operational (Oper)

Scope Application

Description *Vr/<string> Ip DiffServProfile/<string> MultiFieldMap/<string> IpAddrLayer4Flow/<string>*

Rtr/<string> Vrf/<string> DiffServProfile/<string> MultiFieldMap/<string> IpAddrLayer4Flow/<string>

The *IpAddrLayer4Flow* component is used to specify multi-field (MF) Layer 3 and Layer 4 criteria.

The IP packet is checked to see if it matches the criteria specified by each *IpAddrLayer4Flow* component, if any, under the *DiffServProfile* component. The PHB assigned to the packet is the value of the *assignedPhb* attribute on the parent *MultiFieldMap* component of the *IpAddrLayer4Flow* whose criteria best match the packet. The DSCP field of the IP packet is marked accordingly.

For example, to assign PHB value ***AF41*** to FTP packets destined to subnet 123.123.123.0, an *IpAddrLayer4Flow* subcomponent is added to the *MultiFieldMap* component where the *assignedPhb* attribute is set to ***AF41***. The *prefix, prefixLength, protocol,* and *portNumberRange* attributes of the *IpAddrLayer4Flow* component are set to ***123.123.123.0***, ***24***, ***tcp***, and ***20***, ***21***, respectively. This criteria also applies to each FTP packet

Copyright © 2006, Nortel Nortel Confidential

that originates from subnet 123.123.123.0, but only if the source address and port number of the packet do not match any *IpAddrLayer4Flow* subcomponents of the *DiffServProfile.*

The packet matching algorithm for MF classification is explained in more detail as follows.

A match can be found only if the IP header protocol field is one of ICMP, TCP, or UDP. The *prefix*, *prefixLength*, and *portNumberRange* attributes are checked only if the protocol field in the header is TCP or UDP.

The destination IP address and destination port number information from the packet is first compared against the *prefix* attribute in conjunction with the *prefixLength* and *portNumberRange* attributes. If the *prefixLength* is ***0*** and the *prefix* is ***0.0.0.0***, then any value in the packet's IP destination address fields is a match. If *portNumberRange* is ***0***, then any value in the packet's destination port number fields is a match.

If more than one *IpAddrLayer4Flow* component matches a packet (for instance one component specifies a range of IP addresses and a second specifies a single IP address in the range), then the component with the more precise match is used (the one which specifies the single address in this case). Precedence is always given to the IP address over the port number. For example, if one *IpAddrLayer4Flow* component specifies an range of IP addresses that includes the IP address from the packet and any port number, while a second *IpAddrLayer4Flow* component specifies an exact port number but a wider range of addresses, the first *IpAddrLayer4Flow* component is used.

If no match is found using the packet's destination IP address and destination port number information, then a second search is performed using the packet's source IP address and source port number information. This means that an *IpAddrLayer4Flow* component where the *protocol* is ***udp*** or ***tcp***, the *prefixLength* is ***0*** and the *portNumberRange* is ***0***, always matches some destination address and port number. This prevents the source address and port number check from being performed.

An ICMP packet matches any *IpAddrLayer4Flow* component whose *protocol* attribute is set to ***icmp***.

No attempt is made to match any packets where the options or fragment bits are set.

The *DiffServProfile* is not allowed to have more than 100 *IpAddressLayer4Flow* subcomponents.

ATTRIBUTE Rtr Vrf Rip migrateRip

Access: Read and write

Description: This attribute sets the preference level of OSPF-internal routes to be less preferred than RIP.
Note:
This parameter should only be used when starting migration of network from RIP to OSPF. When ready to cut over to OSPF, set this attribute value to ***disabled*** and run under normal preferences. All OSPF routers in the Autonomous System should be running with *migrateRip* ***enabled*** or with *migrateRip* ***disabled*** to prevent routing loops. It is important that the changeover period from RIP to OSPF be performed quickly on all OSPF routers so that no routing loops are formed. These routing loops could be caused by conflicts in the internal RIP and OSPF databases.

Mib: no_mib

Values: enabled
disabled

Default: disabled

ATTRIBUTE Rtr Vrf Rip rfc1058MetricUsage (rfc1058)

Access: Read and write

Description: This attribute determines the metric usage for this RIP instance.

This flag is used to determine the way metrics are incremented.

Copyright © 2006, Nortel Nortel Confidential

RFC 1058 way:
Sending Update: This is to use the metric for the route from the routing table as the advertised metric to be sent for that route. Nothing is ever added to this value from the sending side. The only special case handling is that if the route being advertised is the network route of a directly connected network, the metric in the routing table will be zero. Then the RipIf interface metric for the interface being advertised is used as the advertise metric. If the interface being advertised is not a Rip interface, then metric value of 1 is used.
Receiving Update: Add receiving interface's RIP metric to the metric for the route in the received advertisement and install the result in the receiver's routing table as the metric for that route.
Older way:
Sending Updates: Add the out going interfaces rip metric to the metric for a route in the routing table to form the metric to be advertised for that route.
Receiving Updates: The metric received in the advertisement for a route is put directly in the routing table as the metric for that route.

Note: It is recommended that, all the routers in this autonomous system should be following the rfc1058 metric system.
Setting this flag to ***disabled*** will have the effect of running the RIP with old metric incrementing system.

Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr Vrf Rip **generateDiscardRoute (discard)**

Access	Read and write
Description	This attribute specifies whether network discard routes should be added to the routing and forwarding table for the subnetted interfaces that are running RIP.
Mib	no_mib
Values	yes no
Default	yes

ATTRIBUTE Rtr Vrf Rip **redistributeIbgp (ribgp)**

Access	Read and write
Description	This attribute specifies whether the export policies of this *Rip* instance can match routes learned from internal BGP (IBGP) peers when their *protocol* attribute value is ***all.*** If *redistributeIbgp* is ***true***, a *protocol* value of ***all*** allows routes learned from IBGP peers to be included in the matching routes. If *redistributeIbgp* is ***false,*** routes learned from IBGP peers are

Copyright © 2006, Nortel Nortel Confidential

	excluded when the *protocol* value is ***all***. To cause IBGP routes to be considered in this case, the *protocol* value must be set to ***bgpInternal***.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Vrf Rip defaultRipRtePreference (ripPref)

Access	Read and write
Description	This attribute specifies this RIP component instance's default routing preference assigned to the RIP routes. A lower value indicates a more preferred route.
Mib	no_mib
Values	Decimal (1..254)
Default	82

GROUP Rtr Vrf Rip OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf Rip adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Vrf Rip operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Vrf Rip usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Vrf Rip AdministrativeControl (AdminControl)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Rip snmpAdminStatus

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf Rip OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Rip snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf Rip Operational (Oper)

Properties	Operational
Description	This group defines a set of operational attributes belonging to the *RIP* component. It corresponds to the rip2Globals table in the RIP-2 standard MIB.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Rip routeChangesMade

Access	Read only
Description	This attribute counts the route changes made to the IP Route Database by Rip. This does not include the refresh of the route's age.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf Rip queryResponses

Access	Read only
Description	This attribute counts the responses sent to RIP queries from other systems.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

COMPONENT Rtr Vrf Rip Import (Import)

Instance	Decimal (0..65535)
Groups	GROUP Rtr Vrf Rip Import Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Import/<Decimal>* *Rtr/<string> Rip Import/<Decimal>* *Rtr/<string> Vrf/<string> Rip Import/<Decimal>* This component controls the functionality of Route Leaking. In other words, this component will determine what routes are used by RIP.
Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Vrf Rip Import Network (Net)
Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf Rip Import Provisioned (Prov)

Properties	Provisioned
Description	This is the group of provisionable attributes for the *Import* Subcomponent.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Rip Import **usageFlag (usage)**

Access	Read and write
Description	This flag when set to ***ignore*** indicates the routes that are not used and if set to ***use***, indicates the routes which are used.
Mib	no_mib
Values	use ignore
Default	use

ATTRIBUTE Rtr Vrf Rip Import **importMetric (metric)**

Access	Read and write
Description	This attribute is used to override the default import metric for the RIP protocol. This value is not used to select which routes to use or ignore, rather it is the metric to be used in the routing table for the routes imported for this import policy. A value of zero indicates that the metric received in the update will be used.
Mib	no_mib
Values	Decimal (0..16)
Default	0

ATTRIBUTE Rtr Vrf Rip Import **neighbor (nbr)**

Access	Read and write
Description	This attribute indicates the IP Address of the neighbor this policy will apply to.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Rip Import **interface (if)**

Access	Read and write
Description	This attribute specifies the RIP interface to which this import policy applies. The value of 0.0.0.0 implies any RIP interface on the routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	no_mib
Values	IP address
Default	0.0.0.0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Rip Import **description (desc)**

Access	Read and write
Description	This attribute describes the policy. For example, 'to import RIP routes from MCI'.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

COMPONENT Rtr Vrf Rip Import **Network (Net)**

Instance	Decimal (0..65535)
Groups	GROUP Rtr Vrf Rip Import Net Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Import/<Decimal> NetworkList/<Decimal>* *Rtr/<string> Rip Import/<Decimal> NetworkList/<Decimal>* *Rtr/<string> Vrf/<string> Rip Import/<Decimal> NetworkList/<Decimal>* This component identifies a set of networks that this Import policy will apply to.

Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf Rip Import Net **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains attributes for the *Import NetworkList* component for the Import Policy to be applied to.
Mib	no_mib

ATTRIBUTE Rtr Vrf Rip Import Net **ipAddress (addr)**

Access	Read and write
Description	This attribute specifies the IP address that needs to be matched against in this network list for the Import Policy to be applied to.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Vrf Rip Import Net **ipMask (mask)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the IP mask for the attribute *ipAddress*.
Mib	no_mib
Values	IP address
Default	No default

COMPONENT Rtr Vrf Rip Export

Instance	Decimal (0..65535)
Groups	GROUP Rtr Vrf Rip Export Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Rip Export/<Decimal>* *Rtr/<string> Rip Export/<Decimal>* *Rtr/<string> Vrf/<string> Rip Export/<Decimal>* Each instance of this component specifies a RIP export policy. A RIP export policy is used to decide if a route in the IP forwarding table should be blocked or advertised as a RIP route on one or all RIP interfaces of the routing component (*Vr*, *Rtr* or *Vrf*). The *Rip* component by default advertises all local routes and all RIP learned routes to all RIP interfaces based on the metric in the IP forwarding table.
Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Vrf Rip Export Network (Net)
Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf Rip Export Provisioned (Prov)

Properties	Provisioned
Description	This group contains all the provisioned attributes for the *Export* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Rip Export advertiseStatus (advertise)

Access	Read and write
Description	This attribute specifies if the routes that match this export policy are advertised (***send***) or not advertised (***block***).
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	send block
Default	send

ATTRIBUTE Rtr Vrf Rip Export exportMetric (metric)

Access	Read and write
Description	This attribute specifies the metric to be used on the routes being exported as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *exportMetric* is ignored. The *exportMetric* value is not used to select which routes to block or send, but rather the metric value advertised for the routes. A value of 0 indicates that the exported routes will be advertised with their original metric. When exporting routes from other protocols into RIP, an *exportMetric* value of 0 will distribute these routes with the metric of the original protocol. If the metric of the original protocol exceeds 15, the exported routes will be considered as unreachable by RIP. If an *exportMetric* value of 16 is specified, the exported routes will be advertised into RIP as unreachable.
Mib	no_mib
Values	Decimal (0..16)
Default	0

ATTRIBUTE Rtr Vrf Rip Export protocol

Access	Read and write
Description	This attribute specifies the routes to which this export policy applies based on the routing protocol of how the routes are learned. If the value is ***all***, the policy applies to all routes in the forwarding table, with the following exceptions: external BGP routes are always excluded and internal BGP routes are excluded if the parent *Rip* component's *reDistributeIBGP* attribute has the value ***false***.
Mib	no_mib
Values	all egp rip ospfInternal ospfExternal staticLocal staticRemote bgpInternal bgpExternal mbgp bgpMplsInternal
Default	all

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf Rip Export **ripInterface (ripIf)**

Access	Read and write
Description	This attribute specifies the RIP learned routes to which this export policy applies, based on the RIP interface from which the routes are learned. This attribute can only be non zero when the *protocol* is set to ***rip***. The value of 0.0.0.0 implies any RIP interface on the same routing component (*Vr*, *Rtr* or *Vrf*); otherwise the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Rip Export **egpAsId (egpAs)**

Access	Read and write
Description	Under the *Rtr* and *Rtr Vrf*, this attribute has no effect. Under the *Vr*, this attribute specifies the EGP learned routes to which this export policy applies, based on the EGP autonomous system identifier of which the routes are learned from. This attribute can only be non zero when *protocol* is set to ***egp***. The value of 0 implies any EGP autonomous system; otherwise the value of this attribute must match the *asId* of an EGP neighbor on the same virtual router.
Mib	no_mib
Values	Decimal (0..65536)
Default	0

ATTRIBUTE Rtr Vrf Rip Export **ospfTag (tag)**

Access	Read and write
Description	This attribute specifies the OSPF learned external routes to which this export policy applies, based on the learned OSPF tag of the routes. This attribute can only be set to a non default value when *protocol* is set to ***ospfExternal***. The default value of 4294967295 implies any tag.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	4294967295

ATTRIBUTE Rtr Vrf Rip Export **outInterface (outIf)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the RIP interface on the virtual router which routes are exported onto as a result of matching this export policy. If the attribute *advertiseStatus* is set to ***block***, then the value of *outInterface* is ignored. The *outInterface* value is not used to select which routes to block or send, but rather where to export the routes. A value of 0.0.0.0 indicates that the routes are exported to all RIP interfaces on the routing component (*Vr*, *Rtr* or *Vrf*). Otherwise, the value of this attribute must match the interface address of a *LogicalIf* or *Interface* that has a *RipIf* on the same routing component.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf Rip Export **bgpAsId (bgpAs)**

Access	Read and write
Description	This key attribute specifies the BGP AS from which the routes are learned. This key will be used only when the *protocol* is set to ***bgpExternal***. *bgpAsId* of ***0*** matches all BGP ASs.
Mib	no_mib
Values	Decimal (0..65535)
Default	0

ATTRIBUTE Rtr Vrf Rip Export **description (desc)**

Access	Read and write
Description	The attribute describes the policy. For example, 'to export RIP routes to AS 1'.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

COMPONENT Rtr Vrf Rip Export **Network (Net)**

Description	*Vr/<string> Ip RouteDataBaseEntry/ <destAddress>,<destMask>,<protocol>* *Rtr/<string> RouteDatabaseEntry/<destAddress>,<destMask>,<protocol>* *Rtr/<string> Vrf/<string> RouteDatabaseEntry/ <destAddress>,<destMask>,<protocol>* This component is used to display the information in the Ip routing database. *destAddress* and *destMask* indicates the address and mask of the route in the RoutingDatabase. *protocol* indicates the protocol this entry is learned from. *gateway* indicates the nextHop address for remote routes. The value of *gateway* for the localInterface routes will be the same value as the *destAddress*.
Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Vrf Rdb Operational (Oper)

Properties	Operational
Description	Identifies a group of operational attributes associated with each entry in the routing database.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Vrf Rdb metric

Access	Read only
Description	This attribute specifies the primary routing metric for this route. The semantics of this metric are determined by the routing protocol specified by the value of the index to this entry *protocol*. If this metric is not used, its value should be set to -1.
Mib	no_mib
Values	Signed (-1..65535)
Default	-1

ATTRIBUTE Rtr Vrf Rdb preference (pref)

Access	Read only
Description	This attribute specifies the the preference value of this particular entry. The value of this attribute affects the way the routeEntries in this database are selected for installing it in the *ForwardTable*. The lower the preference value of this entry, the higher are the chances that this entry will be selected to install in the *ForwardTable*.
Mib	no_mib
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Rtr Vrf Rdb age

Access	Read only
Description	This attribute specifies the number of seconds since this route was last updated or otherwise determined to be correct.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Vrf Static

Groups	GROUP Rtr Vrf Static OsiState (State) GROUP Rtr Vrf Static Provisioned (Prov)
Scope	Application
Description	*Vr/<string> Ip Static* *Rtr/<string> Static* *Rtr/<string> Vrf/<string> Static*

GROUP Rtr Vrf Static OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: no_mib

ATTRIBUTE Rtr Vrf Static adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values: locked (lck)
unlocked (unlck)
shuttingDown (shut)

Copyright © 2006, Nortel Nortel Confidential

Default	unlocked

ATTRIBUTE Rtr Vrf Static **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Vrf Static **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Vrf Static **Provisioned (Prov)**

Properties	Provisioned
Description	This group of attributes are used to configure the Static component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Static **defaultStaticRemoteRtePreference (pref)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies this *Static* component instance's default routing preference assigned to the remote routes. A lower value indicates a more preferred route. Assigning a non-zero value to the *staticRemoteRtePreference* attribute in *RouteEntry* will override this default.
Mib	no_mib
Values	Decimal (1..253)
Default	72

ATTRIBUTE Rtr Vrf Static **defaultStaticDiscardRtePreference (discpref)**

Access	Read and write
Description	This attribute specifies this *Static* component instance's default routing preference assigned to the discard routes. A lower value indicates a more preferred route. Assigning a non-zero value to the *staticDiscardRtePreference* attribute in *DiscardRouteEntry* will override this default.
Mib	no_mib
Values	Decimal (0..253)
Default	0

ATTRIBUTE Rtr Vrf Static **maxEcmpNextHops**

Access	Read and write
Description	This attribute specifies the maximum number of Equal Cost Multi-Path (ECMP) *NextHop*s that are supported for *Static RouteEntry*s. If *maxEcmpNextHops* is ***1*** then only a single available *NextHop* is used, even if multiple *NextHops* are provisioned with the same *metric* value under a given *Static RouteEntry*. In other words ECMP is disabled for static routes. If *maxEcmpNextHops* is ***3*** the traffic will be loadshared over the available *NextHops* that have the same value set for the *metric* attribute under a given *Static RouteEntry*. When *protected Static RouteEntry*s are provisioned, *maxEcmpNextHops* must be ***1***.
Mib	no_mib
Values	1 3
Default	3

ATTRIBUTE Rtr Vrf Static **heartbeatDeadInterval (hbDeadInt)**

Access	Read and write
Description	This attribute specifies the L3 *Static* heartbeat dead router interval for the *NextHop* Routers of *Static Route*s which have *heartbeat* ***enabled***. If no

Copyright © 2006, Nortel Nortel Confidential

heartbeat polling responses have been received in the last *heartbeatDeadInterval* seconds, then the *heartbeatState* of this *NextHop* is ***down***.
If *heartbeatDeadInterval* is ***disabled***, L3 heartbeat monitoring will not occur for any *Static Route NextHop*s and the *heartbeatState* of all *NextHop*s will be ***disabled***.

Mib: no_mib

Values: Decimal (4..60)
disabled

Default: disabled

COMPONENT Rtr Vrf Static RouteEntry (Route)

Instance: destAddress (addr) [IP address]
destMask (mask) [IP address]
typeOfService (tos) [Decimal (0..0)]

Groups: GROUP Rtr Vrf Static Route Provisioned (Prov)
GROUP Rtr Vrf Static Route Operational (Oper)
GROUP Rtr Vrf Static Route OsiState (State)

Scope: Application

Description: *Vr/<string> Ip Static RouteEntry/*<Ip Address>, <Ip Address>, <Decimal>
Rtr/<string> Static RouteEntry/<Ip Address>, <Ip Address>, <Decimal>
Rtr/<string> Vrf/<string> Static RouteEntry/<Ip Address>, <Ip Address>, <Decimal>
This component describes the IP static routes.

For a *RouteEntry* to be valid, there should be at least one *NextHop* provisioned. Up to three *NextHops* can be provisioned for each instance of a *RouteEntry*.

The value of index *destMask* should be contiguous.

Only the value zero is supported. Zero will be substituted for any value that is entered.

Mib: no_mib

Nortel Confidential

Description	This group contains a provisionable set of attributes for the static route entry component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Static Route **staticRemoteRtePreference (pref)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the route preference of the static remote route. A lower preference value means the route is more preferred. If ***sameAsStatic*** is specified, the value of *defaultStaticRemoteRtePreference* in the *Static* component is used.
Mib	no_mib
Values	Decimal (1..253) sameAsStatic
Default	sameAsStatic

ATTRIBUTE Rtr Vrf Static Route **protected**

Access	Read and write
Description	This attribute specifies whether this route is protected or not. Note that *Vr Ip Static maxEcmpNextHops* must be ***1*** and *Vr Ip Ospf ecmpStatus* must be ***disabled*** when there is a *protected* static route under the *Vr*.
Mib	no_mib
Values	yes no
Default	no

ATTRIBUTE Rtr Vrf Static Route **protectedFailureBehavior (protFlrB)**

Access	Read and write
Description	This attribute specifies the behavior when all *NextHops* of a *protected* static route fail. If ***discard*** is specified, the static route will not be removed, it will continue to be used to discard traffic.
Mib	no_mib
Values	discard
Default	discard

ATTRIBUTE Rtr Vrf Static Route **heartbeat**

Access	Read and write
Description	This attribute specifies whether or not *heartbeat* is ***enabled*** for this route. In order for this attribute to have any effect, heartbeat must first be

Copyright © 2006, Nortel Nortel Confidential

permitted at the *Static* component level by configuring the *heartbeatDeadInterval* to a value different than ***disabled***.
If ***enabled*** is specified for *heartbeat*, an IP heartbeat is maintained for each of the *NextHops*. ICMP echo requests are sent every 1second and if an ICMP echo resply is received, the *heartbeatState* of the *NextHop* is declared ***up***. If at any point no ICMP response has been received for *heartbeatDeadInterval* seconds, the *heartbeatState* of the *NextHop* will be ***down***.
If ***disabled*** is specified, the *heartbeatState* of each *NextHop* under this *Static Route* will be ***disabled***.

Mib: no_mib

Description: This group contains a set of operational attributes for the static route entry component.

Mib: no_mib

ATTRIBUTE Rtr Vrf Static Route **protectionLevel (protL)**

Access: Read only

Description: This attribute indicates the current protection level for a *Static RouteEntry*. A value of ***portProtected*** indicates that the only alternative enabled *NextHop*(s) for this protected route are on the same card as the active *NextHop*. When the value is ***cardProtected***, one or more alternative enabled ***NextHop***s exist on a different card than the active ***NextHop***. If the value is ***unprotected***, no alternative enabled *NextHop*s exist or this is an unprotected static route (that is, *protected* = ***no*** for this *Static RouteEntry*).

Mib: no_mib

Values:
portProtected
cardProtected
unprotected
notApplicable

Default: No default

GROUP Rtr Vrf Static Route **OsiState (State)**

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Copyright © 2006, Nortel Nortel Confidential

here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib no_mib

ATTRIBUTE Rtr Vrf Static Route **adminState (osiAdmin)**

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib no_mib

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Rtr Vrf Static Route **operationalState (osiOper)**

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib no_mib

Values enabled (ena)
disabled (dis)

Default disabled

ATTRIBUTE Rtr Vrf Static Route **usageState (osiUsage)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

COMPONENT **Rtr Vrf Static Route** **NextHop (Nh)**

Instance	IP address
Groups	GROUP Rtr Vrf Static Route Nh Provisioned (Prov) GROUP Rtr Vrf Static Route Nh OsiState (State) GROUP Rtr Vrf Static Route Nh Operational (Oper)
Scope	Application
Description	*Vr/<string> Ip Static Route/<Ip Address>,<Ip Address>,<Decimal> NextHop/<Ip Address>* *Rtr/<string> Static Route/<Ip Address>,<Ip Address>,<Decimal> NextHop/<Ip Address>* *Rtr/<string> Vrf/<string> Static Route/<Ip Address>,<Ip Address>,<Decimal> NextHop/<Ip Address>* This component provides the destination Ip address of the *NextHop* (some times referred to as the Gateway). For a *RouteEntry* to be valid, there should be at least one *NextHop* provisioned. Up to three *NextHops* can be provisioned for each instance of a *RouteEntry*. Each provisioned *NextHop* address should belong to a valid subnet.

Copyright © 2006, Nortel Nortel Confidential

A valid subnet for this IP entity can be provisioned as a *logicalIf* Entry under an *IpPort.*

GROUP Rtr Vrf Static Route Nh Provisioned (Prov)

Properties Provisioned

Description This group contains a provisionable set of attributes for the *Static RouteEntry NextHop* component.

Mib no_mib

ATTRIBUTE Rtr Vrf Static Route Nh metric (metric)

Access Read and write

Description This attribute specifies the primary routing metric for this *NextHop*.

Mib no_mib

Values Signed (-1..65535)

Default 1

GROUP Rtr Vrf Static Route Nh OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib no_mib

ATTRIBUTE Rtr Vrf Static Route Nh adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Rtr Vrf Static Route Nh **operationalState (osiOper)**

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Rtr Vrf Static Route Nh **usageState (osiUsage)**

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Values:
idle
active (activ)
busy

Default	idle

GROUP Rtr Vrf Static Route Nh **Operational (Oper)**

Properties	Operational
Description	
Mib	no_mib

ATTRIBUTE Rtr Vrf Static Route Nh **heartbeatState (hbS)**

Access	Read only
Description	This attribute indicates the state of the heartbeat mechanism with this *NextHop*'s next hop Router. The value will be ***disabled*** if the *heartbeatDeadInterval* is disabled for all *Static Route*s that share this *NextHop*. The value may be ***undetermined*** briefly upon initialization, before the heartbeat mechanism has completed an assessment. The value will be ***down*** if the *NextHop* Router has not responded to ICMP heartbeat requests nor ARP heartbeat requests. The value will be ***up*** if the *NextHop* Router has responded to ICMP heartbeat requests.
Mib	no_mib
Values	undetermined disabled down up
Default	No default

COMPONENT Rtr Vrf Static **DiscardRouteEntry (Discard)**

Instance	destAddress (addr) [IP address] destMask [IP address]
Scope	Application
Description	*Vr/<string> Ip Static DiscardRouteEntry/<Ip Address>,<Ip Address> Router/<string> Static DiscardRouteEntry/<Ip Address>,<Ip Address> Router/<string> Vrf/<string> Static DiscardRouteEntry/<Ip Address>,<Ip Address>* This table identifies invalid martian networks. Forwarding of packets to the network address indicated by this entry will be discarded.

GROUP Rtr Vrf Udp Statistics (Stats)

Properties	Operational
Description	This group holds statictics for UDP.
Mib	no_mib

ATTRIBUTE Rtr Vrf Udp inDatagrams

Access	Read only
Description	The number of UDP datagrams delivered to UDP users. *inDatagrams* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Udp noPorts

Access	Read only
Description	The number of UDP datagrams received for which there was no application at the destination port. *noPorts* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Udp inErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port. *inErrors* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Udp outDatagrams

Access	Read only
Description	The number of UDP datagrams sent from this gateway. *outDatagrams* wraps to zero if reaches its maximum defined value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Vrf Udp ListenEntry

Instance	localAddress [IP address] localPort [Decimal (0..65535)]
Scope	Application
Description	The table contains UDP listener information.
Mib	no_mib
Common Verbs	Help List Display LOCK Unlock

COMPONENT Rtr Vrf Tcp

Groups	GROUP Rtr Vrf Tcp Statistics (Stats)
Scope	Application
Description	The *Tcp* component contains all attributes related to TCP.
Mib	no_mib
Dyn. Subcomp.	COMPONENT Rtr Vrf Tcp TcpEntry (TcpEntry)
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Vrf Tcp Statistics (Stats)

Properties	Operational
Description	This group contains statistics for TCP.
Mib	no_mib

ATTRIBUTE Rtr Vrf Tcp rToAlgorithm

Access	Read only
Description	Indicate which algorithm was used to calculate the timeout value used for retransmitting unackowledged octet.
Mib	no_mib
Values	other constant rsre vanJacobson
Default	No default

ATTRIBUTE Rtr Vrf Tcp rToMin

Access	Read only
Description	Indicate the minimum value, measured in milliseconds, allowed for retransmission timeout.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	msec
Default	0

ATTRIBUTE Rtr Vrf Tcp rToMax

Access	Read only
Description	Indicates the maximun value, measured in milliseconds, allowed for retransmission timeout.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Rtr Vrf Tcp maxConn

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	Limit on number of connections the TCP can support. The value is always -1 which indicates that the number of connections supported is dynamic (limited by memory in the system).
Mib	no_mib
Values	Signed (-1)
Default	-1

ATTRIBUTE Rtr Vrf Tcp activeOpens

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***synSent*** state from the ***closed*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp passiveOpens

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***synRcvd*** state from the ***listen*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp attemptFails

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***synSent*** state or the ***synRcvd*** state, plus the number of times TCP connections have made a direct transition to the ***listen*** state from the ***synRcvd*** state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp estabResets

Access	Read only
Description	The number of times TCP connections have made a direct transition to the ***closed*** state from either the ***established*** state or the ***closedWait*** state.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp currEstab

Access	Read only
Description	The number of TCP connections for which the current state is either ***established*** or ***closedWait***.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp inSegs

Access	Read only
Description	The number of segments received, including those received in error. This count includes segments received on currently established connections.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp outSegs

Access	Read only
Description	The number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp retransSegs

Access	Read only
Description	The number of segments retransmitted that is, the number of TCP segments transmitted containing one or more previously transmitted octets.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp inErrs

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	Total number of segments received in error, for example bad TCP checksum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf Tcp outRsts

Access	Read only
Description	Number of TCP segments sent containing the RST flag.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Vrf Tcp TcpEntry (TcpEntry)

Instance	localAddress [IP address] localPort [Decimal (0..65535)] remoteAddress [IP address] remotePort [Decimal (0..65535)]
Groups	GROUP Rtr Vrf Tcp TcpEntry Operational (Oper)
Scope	Application
Description	The component defines an entry in the TCP connection table. Each entry corresponds to TCP end-point identified by 4-tuples, *LocalAddress*, *LocalPort*, *RemoteAddress*, and *RemotePort*.
Mib	no_mib
Common Verbs	Help List Display

GROUP Rtr Vrf Tcp TcpEntry Operational (Oper)

Properties	Operational
Description	This group contains columnar entries for each end-point on the TCP.
Mib	no_mib

ATTRIBUTE Rtr Vrf Tcp TcpEntry state

Access	Read and write
Description	This attribute reflects the current state of this Tcp connection.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	closed listen synSent synReceived established closeWait finWait1 closing lastAck finWait2 timeWait delete
Default	No default

COMPONENT Rtr Vrf Interface (If)

GROUP Rtr Vrf If AdministrativeControl (AdminControl)

Properties: Provisioned

Description: This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.

Mib: no_mib

ATTRIBUTE Rtr Vrf If snmpAdminStatus

Access: Read and write

Description: The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.

Mib: no_mib

Values:
up
down
testing

Copyright © 2006, Nortel
Nortel Confidential

Default	up

GROUP Rtr Vrf If Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for an Interface to the IP network.
Mib	no_mib

ATTRIBUTE Rtr Vrf If arpStatus

Access	Read and write
Description	This attribute specifies whether ARP is enabled or disabled on this *Interface*. If ***auto*** is specified, an appropriate value will be selected based on the *Interface* media type.
Mib	no_mib
Values	enabled disabled auto
Default	auto

ATTRIBUTE Rtr Vrf If proxyArpStatus

Access	Read and write
Description	This attribute specifies whether Proxy ARP is enabled or disabled for this *Interface*.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf If arpNoLearn

Access	Read and write
Description	This attribute specifies whether or not dynamic host entries will be installed in the ARP table when ARP packets are received on this *Interface*.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf If sendRedirect

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies whether or not ICMP host redirects will be sent out this *Interface*.
Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr Vrf If multicastStatus

Access	Read and write
Description	This attribute specifies whether or not IP multicast packets can be sent out this *Interface*. If ***auto*** is specified, an appropriate value will be selected based on the *Interface* media.
Mib	no_mib
Values	enabled disabled auto
Default	auto

ATTRIBUTE Rtr Vrf If relayAddress

Access	Read and write
Description	This attribute specifies a relay broadcast address for this *Interface*. Each packet, received on this *Interface*, meeting the relay broadcast criteria will be forwarded to the specified relay broadcast address. An relay address of all zero's indicates no relay broadcast address.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf If relayBroadcast

Access	Read and write
Description	This attribute specifies how packets, received on other *Interface*, meeting the relay broadcast criteria, will be forwarded out this *Interface*. The three options are described as follows: ***enabled***: packets will be forwarded out this *Interface*. ***disabled***: packets will not be forwarded out this *Interface*. ***auto***: packets will be forwarded out this *Interface* only when the bridge state is forwarding.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	enabled disabled auto
Default	disabled

ATTRIBUTE Rtr Vrf If linkDestinationAddress

Access	Read and write
Description	This attribute specifies the address for the link destination for this *Interface*. This attribute is required for PPP media when the netmask of the *Interface* is 32 bit.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf If lanModel

Access	Read and write
Criticality	Component
Description	This attribute specifies the lan model to use for this *Interface*.
Mib	no_mib
Values	localAreaNetwork (lan) nonBroadcastMultipleAccess (nbma)
Default	localAreaNetwork

ATTRIBUTE Rtr Vrf If interfaceType

Access	Read and write
Description	This attribute specifies whether the interface is an access or a core interface. For Router Interfaces, the default value is ***core***. For Vrf Interfaces, the default value is ***access***.
Mib	no_mib
Values	unspecified access core
Default	unspecified

ATTRIBUTE Rtr Vrf If icmpMaskReply

Access	Read and write
Description	This attribute specifies whether or not replies will be generated in response to ICMP Address Mask Requests received on this *Interface.*
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr Vrf If **directedBroadcast**

Access	Read and write
Description	This attribute specifies whether or not directed broadcast to physical broadcast translation is enabled for incoming traffic on this *Interface.* The IP router requirement (RFC1812) says this translation should be ***enabled***; however, in some network environments, setting this attribute to ***disabled*** may prevent operational problem such as broadcast storms. Note that in some configuration, setting this attribute to ***disabled*** may cause Bootp to fail.
Mib	no_mib
Values	enabled disabled
Default	enabled

GROUP Rtr Vrf If **NetMaskProv**

Properties	Provisioned
Description	This group contains attributes required to define a *netMask*.
Mib	no_mib

ATTRIBUTE Rtr Vrf If **netMask**

Access	Read and write
Description	This attribute specifies the subnet mask for this *Interface*. This attribute must be specified because the IP application will not automatically provide a default value. If the media is: 1) *Loopback* with *mode* ***primayLoopback***, then the value of the *netMask* attribute must be ***255.255.255.255***; 2) *Loopback* with *mode* ***alwaysUpInterface***, then the value of the *netMask* attribute can be any non-zero value; 3) *Ppp*, then the value of the *netMask* attribute can be any non-zero value; 3) another other media, then the value of the *netMask* attribute can be any non-zero value other than ***255.255.255.255***.
Mib	no_mib
Values	IP address
Default	0.0.0.0

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Vrf If OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf If OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf If adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Vrf If operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr Vrf If usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr Vrf If Operational (Oper)

Properties	Operational
Description	This group contains operational attributes for an *Interface*.
Mib	no_mib

ATTRIBUTE Rtr Vrf If operArpStatus

Access	Read only
Description	This attribute indicates the current operational ARP status. If the provisioned *arpStatus* is set to ***auto***, then the IP application automatically determines the *operArpStatus* based on the *Interface* media type.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf If operMulticastStatus

Access	Read only
Description	This attribute indicates the current operational Multicast status. If the provisioned *multicastStatus* is set to ***auto***, then the IP application automatically determines the *operMulticastStatus* based on the *Interface* media.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr Vrf If broadcastAddress

Access	Read only
Description	This attribute indicates the destination IP address to be used by any application which needs to broadcast on this *Interface*.
Mib	no_mib
Values	IP address
Default	No default

GROUP Rtr Vrf If RelayBcOperational (RelayBcOper)

Properties	Operational
Description	This group contains operational attributes for an *Interface*'s or *IpPort*'s RelayBc counters.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Vrf If relayAddressCount

Access	Read only
Description	This attribute indicates the number of frames received on this *Interface* or *IpPort* which were forwarded to the provisioned *relayAddress* for this port. This counter wraps to zero when it reaches it's maximum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf If relayBcCount

Access	Read only
Description	This attribute indicates the number of frames received on this port which were forwarded to the *broadcastAddress* on other *IpPorts* or *Interfaces*. This counter is incremented once for every frame received on this port regardless of how many other ports it was sent on. This counter wraps to zero when it reaches it's maximum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

GROUP Rtr Vrf If IfTable (Ift)

Properties	Operational
Description	This group represents the SNMP interface table entry.
Mib	no_mib

ATTRIBUTE Rtr Vrf If ifAdminStatus (admStatus)

Access	Read only
Description	This attribute provides the current administration status of the interface. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr Vrf If ifOperStatus (opStatus)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute provides the current operational status of the interface. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	down

ATTRIBUTE Rtr Vrf If ifLastChange (lastChange)

Access	Read only
Description	This attribute provides the value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re- initialization of the local network management subsystem, then this object contains a zero value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifInOctets (inOctets)

Access	Read only
Description	This attribute reports the total number of octets received on the interface, including framing characters. The 64-bit version may be available in the *ifHCInOctets* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifOutOctets (outOctets)

Access	Read only
Description	This attribute reports the total number of octets transmitted out of the interface, including framing characters. The 64-bit version may be available in the *ifHCOutOctets* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifInDiscards (inDiscard)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute reports the number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher layer protocol. One possible reason for discarding such a packet could be to free up buffer space.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifOutDiscards (outDiscard)

Access	Read only
Description	This attribute reports the number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifInErrors (inErr)

Access	Read only
Description	This attribute reports the number of inbound packets that contained errors preventing them from being deliverable to a higher layer protocol.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifOutErrors (outErr)

Access	Read only
Description	This attribute reports the number of outbound packets that could not be transmitted because of errors.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifInUcastPkts (inUcast)

Access	Read only
Description	This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast

Copyright © 2006, Nortel Nortel Confidential

	address at this sub-layer. The 64-bit version may be available in the *ifHCInUcastPkts* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifOutUcastPkts (outUcast)

Access	Read only
Description	This attribute reports the total number of packets that higher level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. The 64-bit version may be available in the *ifHCOutUcastPkts* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifInNuCastPkts (inNucast)

Access	Read only
Description	This attribute reports the number of non-unicast (i.e., subnetwork-broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol. The corresponding 64-bit versions may be available in the *ifInMulticastPkts* attribute and the *ifInBroadcastPkts* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifOutNuCastPkts (outNuCast)

Access	Read only
Description	This attribute reports the total number of packets that higher level protocols request be transmitted to a non-unicast address, including those that were discarded or not sent. The corresponding 64-bit versions may be available in the *ifOutMulticastPkts* and *ifOutBroadcastPkts* attributes.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifInUnknownProtos (inUknownProt)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute reports the number of packets received via the interface which were discarded because of an unknown or unsupported protocol.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifOutQlength (outQlen)

Access	Read only
Description	This attribute represents the length of the output packet queue (in packets).
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifDescription (desc)

Access	Read only
Description	This attribute provides a textual string containing information about the interface. This string includes the name of the manufacturer, the product name and the version of the hardware interface.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr Vrf If ifType (type)

Access	Read only
Description	This attribute describes the type of interface, distinguished according to the physical/link protocol(s) immediately below the network layer in the protocol stack
Mib	no_mib

ATTRIBUTE Rtr Vrf If ifMtu (mtu)

Access — Read only

Description — This attribute represents the size of the largest datagram which can be sent/received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface.

Mib — no_mib

Values — Decimal (0..4294967295)

Default — No default

ATTRIBUTE Rtr Vrf If ifSpeed (speed)

Access — Read only

Description — This attribute provides an estimate of the interface's current bandwidth in bits per second. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth.

Copyright © 2006, Nortel
Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If ifPhysicalAddress (phys)

Access	Read only
Description	This attribute represents the interface's address at the protocol layer immediately `below' the network layer in the protocol stack. For interfaces which do not have such an address (e.g., a serial line), this object should be an octet string of zero length.
Mib	no_mib
Values	String (0..17, ASCII)
Default	No default

GROUP Rtr Vrf If AdditionalInfo

Properties	Operational
Description	This group contains additional information associated with this ifEntry, including SNMP ifXTable entry information.
Mib	no_mib

ATTRIBUTE Rtr Vrf If ifHCInOctets (inHCOctets)

Access	Read only
Description	This attribute reports the total number of octets received on the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifInOctets* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr Vrf If ifHCInUcastPkts (inHCUcast)

Access	Read only
Description	This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer. This High Capacity counter is a 64-bit version of the *ifInUcastPkts* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf If ifHCOutOctets (outHCOctets)

Access	Read only
Description	This attribute reports the total number of octets transmitted out of the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifOutOctets* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr Vrf If ifHCOutUcastPkts (outHCUcast)

Access	Read only
Description	This attibutes reports the total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This High Capacity counter is a 64-bit version of the *ifOutUcastPkts* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

COMPONENT Rtr Vrf If AtmMultiprotocolEncapsulation (AtmMpe)

Groups	GROUP Rtr Vrf If AtmMpe CustomerIdentifierData (CidData) GROUP Rtr Vrf If AtmMpe IfEntryProv (IfEntry) GROUP Rtr Vrf If AtmMpe Provisioned (Prov) GROUP Rtr Vrf If AtmMpe OsiState (State) GROUP Rtr Vrf If AtmMpe OperationalStatus (OperStatus)
Scope	Application
Description	*Rtr/<string> If/<IP addr> AtmMpe* *Rtr/<string> Vrf/<string> If/<IP addr> AtmMpe* This subcomponent represents a logical interface between the Router and an ATM media (*AtmIf*). Multiprotocol Encapsulation as specified in RFC1483 is used to transfer higher-layer protocol data across virtual channels in an ATM network. *AtmMpe* provides a means to associate multiple ATM virtual channel connections with a single *Router Interface*.

Copyright © 2006, Nortel Nortel Confidential

The *AtmMpe* component is associated with virtual channel connections via a linkage attribute in each *AtmConnection* subcomponent.

GROUP Rtr Vrf If AtmMpe CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	no_mib
Values	Decimal (0; 1..8191)
Default	0

GROUP Rtr Vrf If AtmMpe IfEntryProv (IfEntry)

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr Vrf If AtmMpe ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	no_mib
Values	Decimal (1..65535)
Default	No default

GROUP Rtr Vrf If AtmMpe Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *AtmMpe* component under the Router Interface.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe maxTransmissionUnit (mtu)

Access	Read and write
Description	This attribute sets the size of the largest datagram which can be sent on the interface. This includes the size of the Logical Link Control header (if applicable) as well as the protocol data unit.
Mib	no_mib
Values	Decimal (256..9188)
Units	octets

Copyright © 2006, Nortel Nortel Confidential

Default	9188

ATTRIBUTE Rtr Vrf If AtmMpe **encapType (etype)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the RFC-1483 encapsulation type to be used for the *AtmConnections* under this *AtmMpe*. Specifying ***llcEncap*** allows multiplexing of multiple protocols over the *VCCs*. The protocol of the carried PDU will be identified by an IEEE 802.2 Logical Link Control header. If Inverse ARP is to be carried over a VCC, ***llcEncap*** must be used. If the *Stp* component exists under the *AtmMpe*, ***llcEncap*** must be used. Specifying ***ipVcEncap*** indicates that all the VCCs (that is, *AtmConnection*s) under an *AtmMpe* component will use VC-based multiplexing and will carry IP PDUs only. Specifying ***llcBridgeEncap*** indicates that the VCC (that is, the *AtmConnection*) under an *AtmMpe* component will use the bridged Ethernet encapsulation format specified in RFC-1483. Note that when setting the *encapType* attribute to ***llcBridgeEncap***, the *maxTransmissionUnit* must be set within the ***[256 .. 1524]*** range.
Mib	no_mib
Values	llcEncap ipVcEncap llcBridgeEncap
Default	llcEncap

GROUP Rtr Vrf If AtmMpe **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock*

Copyright © 2006, Nortel Nortel Confidential

command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Rtr Vrf If AtmMpe operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Rtr Vrf If AtmMpe usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Vrf If AtmMpe OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

COMPONENT Rtr Vrf If AtmMpe SpvcTerminationPoint (Stp)

Groups	GROUP Rtr Vrf If AtmMpe Stp Provisioned (Prov) GROUP Rtr Vrf If AtmMpe Stp Operational (Oper)
Scope	Application
Description	*AtmMpe/n Stp* *Rtr/<string> If/<IP addr> AtmMpe Stp* *Rtr/<string> Vrf/<string> If/<IP addr> AtmMpe Stp* This component specifies the SPVC related provisioning for the *AtmMpe* component. Its presence identifies an *AtmMpe* component that contains one or more SPVC connections.

GROUP Rtr Vrf If AtmMpe Stp **Provisioned (Prov)**

Properties	Provisioned
Description	This attribute group contains the provisionable attributes of the *SpvcTerminationPoint* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe Stp **localAddress (laddr)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the NSAP address of this *AtmMpe* component. The default is an empty string. If no NSAP address is provisioned, a default NSAP address is provided. To view the generated default address refer to the *opLocalAddress* attribute under this component after the *act prov* command is executed.
Mib	no_mib
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Rtr Vrf If AtmMpe Stp **softPvcRetryPeriod (retry)**

Access	Read: All Write: All
Description	This attribute specifies the interval at which an SPVC connection attempts establishment after a failed setup attempt occurs. The *softPvcRetryPeriod* attribute applies to all connections managed by the parent *AtmMpe* component.
Mib	no_mib
Values	Decimal (10..3600)
Units	seconds
Default	20

ATTRIBUTE Rtr Vrf If AtmMpe Stp **softPvcHoldOffTime (sHoldOffTime)**

Access	Read: All Write: All
Description	This attribute specifies how long to hold off before attempting to reestablish a connection after an established SPVC connection is cleared/released. The *softPvcHoldOffTime* attribute applies to all connections managed by the parent *AtmMpe* component.
Mib	no_mib
Values	Decimal (0; 50..3600000)

Copyright © 2006, Nortel Nortel Confidential

Units	msec
Default	20000

GROUP Rtr Vrf If AtmMpe Ac Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *AtmConnection* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe Ac atmConnection (link)

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM nailed up endpoint, *AtmIf/n Vcc/vpi.vci Nep,* that this connection is associated with. It must not be provisioned for an SPVC connection.
Mib	no_mib
Values	Link (Service, applicationName)
Default	No default

ATTRIBUTE Rtr Vrf If AtmMpe Ac ipCos

Access	Read and write
Criticality	Component
Description	This attribute specifies the connection class of the *AtmConnection.* This value is used to distinguish the connection from others for the purpose of IP and MPLS forwarding and accounting. Connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers. If a packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one *AtmConnection*, then one of the connections is selected for

Copyright © 2006, Nortel Nortel Confidential

transmitting the packet.

For IP packets the selection is based on either the Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet. For MPLS packets the selection is based on either the DSCP field of the IP packet or the EXP field of the MPLS packet.

DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component.
EXP based selection of the the outgoing connection is explained in the description of the *MplsServiceMap* component. Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the *AtmConnection*.

If the *AtmConnection* is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the *AtmConnection*. See the description of *Vr Ip CosPolicyGroup* for more information.

Mib	no_mib
Values	Decimal (0..3)
Default	0

ATTRIBUTE Rtr Vrf If AtmMpe Ac **mplsSignaling (mplsSig)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this AtmMpe Ac is dedicated for MPLS signaling (LDP or CR-LDP), or shared between MPLS and IP. If the value is ***dedicated***, the *Ac* is dedicated for MPLS signaling; the route is not found in IP ARP. If the value is ***shared***, the *Ac* is accessible by IP. The checking of this provisionable attribute is done through semantic checking. The attribute takes on the value ***shared*** by default, and can only be ***dedicated*** if there are more than one *Ac* under the *AtmMpe*.
Mib	no_mib
Values	shared dedicated
Default	shared

ATTRIBUTE Rtr Vrf If AtmMpe Ac **inErrors**

Access	Read only
Description	This attribute counts the total number of packets received on the connection which contained errors preventing them from being delivered to a higher-layer protocol (includes short frames). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtr Vrf If AtmMpe Ac **IpIfLink**

Properties	Provisioned
Description	This group contains the link between this component and an *IpLogicalInterface*.
Mib	no_mib

ATTRIBUTE Rtr Vrf If AtmMpe Ac **linkToIpLogicalInterface (ipIf)**

Access	Read and write
Description	This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with.

Copyright © 2006, Nortel Nortel Confidential

This attribute is not applicable and cannot be set when the *AtmConection* component is added under an *Rtr If AtmMpe* or an *Rtr Vrf If AtmMpe* component.

When set, the value of this attribute must be consistent with the *linkToPrototocolPort* attribute value of the parent *AtmMpe* component. That is, they must both point to the same *PrototocolPort* component.

Mib: no_mib

Values: Link (Service, linkToMediaConnection)

GROUP Rtr Vrf If BootpP Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *BootpPort* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If BootpP relayForwardStatus (status)

Access	Read and write
Description	This attribute controls how BOOTP request packets, received on another port, will be flooded out this port. If *relayForwardStatus* is ***enabled***, BOOTP requests received on another port will be broadcast out this port. When *relayForwardStatus* is ***disabled***, BOOTP requests will not be broadcast out this port. If ***auto*** is used, the bridge spanning tree database is used to determine if BOOTP requests should be broadcast out this port. Note that when using ***enabled***, it is possible to create misconfigurations which will result in broadcast storms. When using this feature with multiple routers, make sure there are no broadcast forwarding loops. Using ***auto***

Copyright © 2006, Nortel Nortel Confidential

with bridge spanning tree is safer to use if the network is running bridge spanning tree.

Note that for ***auto*** to have effect, bridge spanning tree must be running on the corresponding *VirtualRouter ProtocolPort* or *Rtr Interface* or *Rtr Vrf Interface*.

Mib	no_mib
Values	enabled disabled auto
Default	disabled

ATTRIBUTE Rtr Vrf If BootpP **bootpLogicalInterface (portIf)**

Access	Read and write
Description	This attribute identifies the logical interface whose address is to be the GIADDR of this BOOTP port. If not set, the address of the first logical port or Interface is chosen.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Vrf If BootpP **relayAddress (addr)**

Access	Read and write
Description	This attribute identifies a list of relay addresses. When a BOOTP request message is received on this port, the request will be forwarded to the IP addresses provisioned in *relayAddress*. Note that BOOTP requests are also broadcast out all other *BootpPort*'s according to the *relayForwardStatus* of the outgoing port.
Mib	no_mib
List of	IP address
List Size	3
Default	No default

GROUP Rtr Vrf If BootpP **AdministrativeControl (AdminControl)**

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If BootpP **snmpAdminStatus**

Access	Read and write

Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf If BootpP OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If BootpP snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf If BootpP OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf If BootpP adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Rtr Vrf If BootpP operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Rtr Vrf If BootpP usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

	The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr Vrf If BootpP **Statistics (Stats)**

Properties	Operational
Description	This group contains *BootpPortEntry* component statistics.
Mib	no_mib

ATTRIBUTE Rtr Vrf If BootpP **inRequests**

Access	Read only
Description	This attribute counts the total number of BOOTP Request messages received on this port.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf If BootpP **inReplies**

Access	Read only
Description	This attribute counts the total number of BOOTP Reply messages received on this port.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf If BootpP **outRequests**

Access	Read only
Description	This attribute counts total the number of BOOTP Request messages broadcast out on this port.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf If BootpP **outReplies**

Access	Read and write
Description	The administrative status of this Ospf interface.
Mib	no_mib
Values	up down
Default	up

ATTRIBUTE Rtr Vrf If OspfIf **rtrPriority (rtrPri)**

Access	Read and write
Description	The priority of this interface. Used in multi-access networks, this field is used in the designated router election algorithm. The value 0 signifies that the router is not eligible to become the designated router on this particular protocol port. In the event of a tie in this value, routers will use their *routerId* as a tie breaker.
Mib	no_mib
Values	Decimal (0..255)
Default	1

ATTRIBUTE Rtr Vrf If OspfIf **transitDelay**

Access	Read and write
Description	The estimated number of seconds it takes to transmit a link-state update packet over this interface.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	1

ATTRIBUTE Rtr Vrf If OspfIf **retransInterval (retransInt)**

Access	Read and write
Description	The number of seconds between link-state advertisements retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description and link-state request packets.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	5

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr Vrf If Ospflf **helloInterval (helloInt)**

Access	Read and write
Description	The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for all routers attached to a common network.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	10

ATTRIBUTE Rtr Vrf If Ospflf **rtrDeadInterval (rtrDeadInt)**

Access	Read and write
Description	The number of seconds that a router's hello packets have not been seen before it's neighbors declare the router down. This should be some multiple of the *helloIntereval*. This value must be the same for all routers attached to a common network.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	40

ATTRIBUTE Rtr Vrf If Ospflf **pollInterval (pollInt)**

Access	Read and write
Description	The largest time interval, in seconds, between the hello packets sent to an inactive non-broadcast multi-access neighbor.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	120

ATTRIBUTE Rtr Vrf If Ospflf **authKey**

Access	Write only
Description	The Authentication Key. If the value of the attribute *authType* of an *AreaEntry* is ***simplePassword***, and the *authKey* length is shorter than 8 octets, then the value of *authKey* will be left adjusted zero-filled to 8 octets.
Mib	no_mib
Values	String (1..8, Hex)

Copyright © 2006, Nortel Nortel Confidential

Default	0000000000000000

ATTRIBUTE Rtr Vrf If OspfIf **multicastForwarding (multicastFwd)**

Access	Read and write
Description	The way multicasts should be forwarded on this interface; non forwarded, forwarded as data-link multicasts, or forwarded as data-link unicasts. Data-link multicasting is not meaningful on point-to-point and NBMA(No Broadcast Multi Access) interfaces, and setting this attribute to blocked effectively disables all multicast forwarding.
Mib	no_mib
Values	blocked
Default	blocked

ATTRIBUTE Rtr Vrf If OspfIf **pointToMultiPointMode (ptmpmode)**

Access	Read and write
Description	This attribute specifies the Point-to-Multipoint mode to use when the *ifType* of this *OspfInterface* is ***pointToMultipoint***. A value of ***nonBroadcast*** restricts this interface to only send unicast packets, Hence, a *Neighbor* component must be configured. A value of ***broadcast*** enables sending multicast OSPF Hello packets to dynamically discover neighbors.
Mib	no_mib
Values	nonBroadcast (nbc) broadcast (bc)
Default	nonBroadcast

ATTRIBUTE Rtr Vrf If OspfIf **authType**

Access	Read and write
Description	The authentication type specified for this *Ospf* interface.
Mib	no_mib
Values	none simplePassword md5 SameAsArea
Default	SameAsArea

Default	No default

GROUP Rtr Vrf If Ospfif **Metric**

Properties	Operational
Description	This group contains the operational metric attribute of this interface.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr Vrf If OspfIf **metric**

Access	Read only
Description	This attribute indicates the metric being used by this *OspfIf*. The metric is derived in one of two ways: 1. If there is a *TypeOfService* component provisioned under this *OspfIf* component, then the value of the *metric* attribute is copied from the provisionable attribute *tosMetric*. 2. Otherwise, the metric is computed based on the interface speed. If the interface speed is greater than 100 Mbit/s, then the *metric* is 1. If the interface speed is less than 100 Mbit/s, then the metric is 100 Mbit/s divided by the interface speed. If the interface speed is unknown, then it is treated as 1.54 Mbit/s during the calculation. The value of interface speed is available by displaying the *ifSpeed* attribute of the corresponding *IfTableEntry* component.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

This component describes the metrics to be advertised for a specified interface at various types-of-service.

Mib: no_mib

Common Verbs: Help, List, Display, Add, DELete

GROUP Rtr Vrf If OspfIf TOS Provisioned (Prov)

Properties: Provisioned

Description: Identifies a provisionable set of attributes.

Mib: no_mib

ATTRIBUTE Rtr Vrf If OspfIf TOS tosMetric

Access: Read and write

Description: The metric using this typeOfService on this interface.

Mib: no_mib

Values: Decimal (0..65535)

Default: 1

COMPONENT Rtr Vrf If OspfIf Neighbor (Nbr)

Instance: IP address

Groups: GROUP Rtr Vrf If OspfIf Nbr Provisioned (Prov)
GROUP Rtr Vrf If OspfIf Nbr Operational (Oper)

Scope: Application

Description: *Vr/<string> Pp/<string> IpPort logicalIf/<Ip Address> ospfIf OspfIfNeighbor/<Ip Address>*
Rtr/<string> If/<Ip Address> ospfIf OspfIfNeighbor/<Ip Address>
Rtr/<string> Vrf/<string> If/<Ip Address> ospfIf OspfIfNeighbor/<Ip Address>
This component represents a neighbor on a multi-access non-broadcast *OspfInterface* configured with its *ifType* attribute set to one of the following:
- ***nbma*** and the *rtrPriority* attribute is set to non-zero or
- ***pointToMultiPoint*** and *pointToMultiPointMode* is set to ***nonBroadcast***.

The operational attributes for this component can also be viewed from: *Vr/<string> Ip Ospf NbrEntry/<Ip Address>,<Decimal>* or

Add
DELete

GROUP Rtr Vrf If Ospflf Nbr Provisioned (Prov)

Properties Provisioned

Description Identifies a group of Provisionable attributes.

Mib no_mib

ATTRIBUTE Rtr Vrf If Ospflf Nbr priority

Access Read and write

Description The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network. The higher the number, the better are the chances of being a designated router.

Mib no_mib

Values Decimal (0..255)

Default 1

GROUP Rtr Vrf If Ospflf Nbr Operational (Oper)

Properties Operational

Description Contains the Operational set of attributes for the Neighbor.

Mib no_mib

ATTRIBUTE Rtr Vrf If Ospflf Nbr rtrId

Access Read only

Description An Ip Address uniquely identifying the neighboring router in the Autonomous System.

Mib no_mib

Values IP address

Default No default

ATTRIBUTE Rtr Vrf If Ospflf Nbr options

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	A bit mask corresponding to the neighbor's options field. Bit 0, if set, indicates that the area accepts and operates on external information, if zero, it is a stub area. Bit 1, if set, indicates that the system will operate on Type of Service metrics other than TOS 0. If zero, the neighbor will ignore all metrics except the TOS 0 metric. Bit 2, if set, indicates that the system is Network Multicast capable; i.e., that it implements OSPF Multicast Routing.
Mib	no_mib
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Rtr Vrf If OspfIf Nbr **state**

Access	Read only
Description	The state of the relationship with this neighbor.
Mib	no_mib
Values	down attempt init twoWay exchangeStart exchange loading full
Default	No default

ATTRIBUTE Rtr Vrf If OspfIf Nbr **events**

Access	Read only
Description	The number of times this neighbor relationship has changed state, or an error has occurred.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If OspfIf Nbr **lsRetransQlen**

Access	Read only
Description	The current length of the Retransmission queue.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If OspfIf Nbr **exchangeStatus**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	Indicates the exchange status for a neighbor Entry.
Mib	no_mib
Values	master slave
Default	No default

ATTRIBUTE Rtr Vrf If OspfIf Nbr permanance

Access	Read only
Description	This attribute displays how the neighbor became an entry.
Mib	no_mib
Values	permanent dynamic
Default	permanent

COMPONENT Rtr Vrf If IsisInterface (IsisIf)

Groups	GROUP Rtr Vrf If IsisIf Provisioned (Prov) GROUP Rtr Vrf If IsisIf Operational (Oper) GROUP Rtr Vrf If IsisIf Statistics (Stats) GROUP Rtr Vrf If IsisIf ErrorStatistics (Errors)
Scope	Application
Description	*Rtr/<string> Interface/<Ip Address> IsisInterface* An *IsisIf* component can be created under each *Interface* component to run the ISIS protocol. This component requires an associated *Isis* component to be provisioned. This component requires at least one *Level* subcomponent to be provisioned. If the underlying media is ATM based, this component requires an *AtmConn* subcomponent to be provisioned.

Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf If IsisIf Provisioned (Prov)

Copyright © 2006, Nortel Nortel Confidential

Properties	Provisioned
Description	This group contains the set of attributes used to configure an ISIS Interface.
Mib	no_mib

ATTRIBUTE Rtr Vrf If IsisIf **snmpAdminStatus**

Access	Read: All Write: All
Description	This attribute specifies the administrative status of this *IsisInterface* component on this *Router*.
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr Vrf If IsisIf **passive**

Access	Read: All Write: All
Description	This attribute specifies whether the *IsisInterface* should be passive. A passive interface is one whose IP address is advertised in the LSP, but is not involved in ISIS protocol activities (for example, transmitting LSPs and establishing adjacencies).
Mib	no_mib
Values	no yes
Default	no

ATTRIBUTE Rtr Vrf If IsisIf **lspInterval**

Access	Read: All Write: All
Description	This attribute specifies, in milliseconds, the minimum time between transmission of successive LSPs on this interface. This minimum time applies to any LSP, whether it is the LSP of this *Router*, or another router's LSP that is being retransmitted.
Mib	no_mib
Values	Decimal (33..65535)
Units	msec
Default	100

ATTRIBUTE Rtr Vrf If IsisIf **lspRetransmitInterval**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies, in seconds, the minimum time to wait before retransmitting this *Router's* LSP on this interface. An LSP retransmission occurs if a previously transmitted LSP is not acknowledged. Retransmissions only occur on point-to-point links.
Mib	no_mib
Values	Decimal (1..300)
Units	seconds
Default	5

GROUP Rtr Vrf If IsisIf **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes associated with the ISIS protocol running on this interface.
Mib	no_mib

ATTRIBUTE Rtr Vrf If IsisIf **upTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the time, in seconds, that the ISIS protocol has been operational on this interface.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Rtr Vrf If IsisIf **adjacencyChanges (adjChanges)**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that an adjacency on this interface has changed state.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If IsisIf **operState (state)**

Access	Read: All Write: Illegal

Description	This attribute indicates the number of Partial Sequence Number PDUs (PSNPs) received on this interface since the last time this *IsisIf* component became enabled.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If IsisIf totalPacketsTxd

Access	Read: All Write: Illegal
Description	This attribute indicates the total number of packets transmitted on this interface since the last time this *IsisIf* component became enabled.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If IsisIf totalPacketsRxd

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the total number of packets received on this interface since the last time this *IsisIf* component became enabled.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtr Vrf If IsisIf **ErrorStatistics (Errors)**

Properties	Operational
Description	The attributes in this group are statistics associated with the operation of this *IsisInterface* component. Each attribute counts a specific abnormal event that has occurred since this component was last enabled.
Mib	no_mib

ATTRIBUTE Rtr Vrf If IsisIf **initFails**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that initialization of this ISIS interface has failed.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If IsisIf **adjRejects**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of times that an attempt to form an adjacency on this interface has failed.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Vrf If IsisIf **rxUnknownPacketTypes**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of packets of unknown type that were received on this interface since the last time this *IsisIf* component became enabled.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Rtr Vrf If IsisIf **IsisIfLevel (Level)**

Instance	Decimal (1..1)
Groups	GROUP Rtr Vrf If IsisIf Level Provisioned (Prov) GROUP Rtr Vrf If IsisIf Level Operational (Oper)
Scope	Application
Description	*Rtr/<string> Interface/<Ip Address> IsisIf Level/<1..2>* The ISIS routing protocol supports a two-level routing hierarchy. This component represents ISIS routing aspects that are specific to each routing level for this ISIS interface. In the current release, only *Level/1* is supported.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf If IsisIf Level **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the attributes used to independently configure each ISIS interface routing level.
Mib	no_mib

ATTRIBUTE Rtr Vrf If IsisIf Level **metric**

Access	Read: All Write: All
Description	This attribute specifies the cost of this interface, which is used by the SPF algorithm in this and other routers. This value is advertised in the LSP.
Mib	no_mib
Values	Decimal (0..63)
Default	10

ATTRIBUTE Rtr Vrf If IsisIf Level **helloInterval**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time, in seconds, between transmission of successive hello messages (IIH PDU).
Mib	no_mib
Values	Decimal (1..20000)
Units	seconds
Default	10

ATTRIBUTE Rtr Vrf If IsisIf Level helloMultiplier

Access	Read: All Write: All
Description	This attribute specifies the factor by which the *helloInterval* attribute is multiplied in order to create the hold time value transmitted in the hello packets (IIH PDU). The hold time value is used by the receiving router to determine how long it should maintain the adjacency if a subsequent hello packet is not received.
Mib	no_mib
Values	Decimal (2..100)
Default	3

ATTRIBUTE Rtr Vrf If IsisIf Level csnpInterval

Access	Read: All Write: All
Description	This attribute specifies the time interval, in seconds, between successive transmissions of the CSNP PDUs.
Mib	no_mib
Values	Decimal (1..600)
Units	seconds
Default	10

ATTRIBUTE Rtr Vrf If IsisIf Level priority

Access	Read: All Write: All
Description	This attribute specifies the DIS priority for this router. On a multi-access LAN, the router with the highest DIS priority is elected to represent the LAN. The elected router transmits an LSP for the pseudonode representing the LAN.
Mib	no_mib
Values	Decimal (0..127)
Default	64

Copyright © 2006, Nortel Nortel Confidential

Common Verbs	Help List Display Add DELete

GROUP Rtr Vrf If IS IngressServicesLinks (IsLinks)

Properties	Provisioned
Description	This group contains links to various components for traffic management services applied to IP traffic entering an interface.
Mib	no_mib

ATTRIBUTE Rtr Vrf If IS linkToDiffServProfile (dsLink)

Access	Read and write
Description	This attribute specifies the *DiffServProfile* component applied to IP traffic entering an interface.
Mib	no_mib
Values	Link (Service, linkToDiffServUsers)
Default	No default

ATTRIBUTE Rtr Vrf If IS linkToPolicerProfile (policerLink)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the *PolicerProfile* component applied to IP traffic entering an interface.
Mib	no_mib
Values	Link (Service, linkToPolicerUsers)
Default	No default

GROUP Rtr Vrf If IS ServiceSpecification (Sp)

Properties	Provisioned
Description	This group contains provisionable attributes of the *IngressServices* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If IS discardPriorityMode (dpMode)

Access	Read and write
Description	This attribute specifies how drop precedence is assigned to IP traffic entering an interface. If this attribute is set to ***mapPhbToDp*** then drop precedence is assigned to IP traffic entering the interface as explained in the description of the *DifferentiatedServicesDomain* component. If this attribute is set to ***mapLayer2ToDp*** then the drop precedence assigned to IP traffic entering the interface is determined by the ingress Layer 2 media. For an IP packet arriving on *AtmMpe* the cell loss priority (CLP) bit in the ingress cell header is mapped to drop precedence value according to ATM traffic management provisioning. For an IP packet arriving on *FrDte or IpDlciGroup* the discard eligible (DE) bit in the ingress frame header is mapped to drop precedence value according to Frame Relay traffic management provisioning. For IP traffic arriving on other media ***high*** drop precedence is assigned. The *Rtr Interface IngressServices dpMode* and *Rtr Vrf Interface IngressServices dpMode* attributes must be set to ***mapPhbToDp***. The *IpPort IngressServices dpMode* attribute must be set to ***mapPhbToDp*** if the *linkToPolicerProfile* attribute is set or if the *IpPort* is associated with IP tunnel media. The *IpPort IngressServices dpMode* attribute has no effect if either of the following two conditions is true: 1) the *VirtualRouter* component does not have *DifferentiatedServicesDomain* subcomponent (see the description of the *CosPolicyGroup* component for more information about drop precedence in this case); 2) the IP packet leaves an interface where the *IpPort EgressServices linkToPolicerProfile* attribute is set (see the description of the

Copyright © 2006, Nortel Nortel Confidential

PolicerProfile Meter PolicedPhb outOfProfile attribute for more information about drop precedence in this case).

Mib no_mib

Values mapPhbToDp
mapLayer2ToDp

Default mapPhbToDp

GROUP Rtr Vrf If IS Meter Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes of the *MeterStatistics* component.

Mib: no_mib

ATTRIBUTE Rtr Vrf If IS Meter committedInformationRate (cir)

Access: Read only

Description: This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions.

The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.

Mib: no_mib

Values: Decimal (0..600000000)

Units: bit/s

Default: No default

ATTRIBUTE Rtr Vrf If IS Meter excessInformationRate (eir)

Access: Read only

Description: This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information.

The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.

Mib: no_mib

Values: Decimal (0..50000000)

Copyright © 2006, Nortel Nortel Confidential

Units	bit/s
Default	No default

ATTRIBUTE Rtr Vrf If IS Meter **committedBurstSize (bc)**

Access	Read only
Description	This attribute indicates the committed burst size (bc) in bits for the *Meter*. The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Mib	no_mib
Values	Decimal (0..600000000)
Units	bits
Default	No default

ATTRIBUTE Rtr Vrf If IS Meter **excessBurstSize (be)**

Access	Read only
Description	This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Mib	no_mib
Values	Decimal (0..50000000)
Units	bits
Default	No default

ATTRIBUTE Rtr Vrf If IS Meter **measurmentInterval (t)**

Access	Read only
Description	This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*. The value of this attribute is derived from the provisioned *cir* and *bc* attributes values when both of those attributes are non-zero (t=*bc/cir*); otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Rtr Vrf If IS Meter **status**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates whether the meter is enabled or disabled at the interface where the policer is configured. The meter may be disabled if engineering limits for IP Policing on the FP are exceeded. Each policer assignment that involves a disabled meter should be removed.
Mib	no_mib
Values	disabled enabled
Default	No default

GROUP Rtr Vrf If IS Meter **Statistics (Stats)**

Properties	Operational
Description	This group contains the statistical attributes of the *MeterStatistics* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If IS Meter **packetsReceived**

Access	Read only
Description	This attribute counts the number of packets received by the traffic meter. It includes packets that are discarded due to excess. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr Vrf If IS Meter **octetsReceived**

Access	Read only
Description	This attribute counts the number of octets received by the traffic meter. It includes octets that are discarded due to excess. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr Vrf If IS Meter **eirPacketsReceived (excessPackets)**

Access	Read only
Description	This attribute counts the number of packets received by the traffic meter that contributed only to the excess information rate. When this count exceeds maximum value, it wraps to 0.

Default	COLLECTED STATS Router VpnRouteForwarder Interface IngressServices MeterStatistics
Description	The statistics record generated by the Router VpnRouteForwarder Interface IngressServices MeterStatistics component.

ATTRIBUTE Rtr Vrf If IS Meter **committedInformationRate (cir)**

Description	This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions. The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..600000000)

ATTRIBUTE Rtr Vrf If IS Meter **excessInformationRate (eir)**

Description	This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information. The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.
Values	Decimal (0..50000000)

ATTRIBUTE Rtr Vrf If IS Meter **committedBurstSize (bc)**

Description	This attribute indicates the committed burst size (bc) in bits for the *Meter*. The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..600000000)

ATTRIBUTE Rtr Vrf If IS Meter **excessBurstSize (be)**

Description	This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..50000000)

ATTRIBUTE Rtr Vrf If IS Meter **measurmentInterval (t)**

Description	This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*. The value of this attribute is derived from the provisioned *cir* and *bc* attributes values when both of those attributes are non-zero (t=*bc/cir*);

Copyright © 2006, Nortel Nortel Confidential

otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.

Values — Decimal (0..4294967295)

ATTRIBUTE Rtr Vrf If IS Meter packetsReceived

Description — This attribute indicates the number of packets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess.

Values — Long Integer

ATTRIBUTE Rtr Vrf If IS Meter octetsReceived

Description — This attribute indicates the number of octets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess

Values — Long Integer

ATTRIBUTE Rtr Vrf If IS Meter eirPacketsReceived (excessPackets)

Description — This attribute indicates the number of packets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Rtr Vrf If IS Meter eirOctetsReceived (excessOctets)

Description — This attribute indicates the number of octets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Rtr Vrf If IS Meter packetsRemarked

Description — This attribute indicates the number of packets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Rtr Vrf If IS Meter octetsRemarked

Description — This attribute indicates the number of octets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Rtr Vrf If IS Meter packetsDiscarded

Description — This attribute indicates the number of packets discarded by the traffic meter during the prior statistics collection interval.

Values — Long Integer

ATTRIBUTE Rtr Vrf If IS Meter octetsDiscarded

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the number of octets discarded by the traffic meter during the prior statistics collection interval. .

Access	Read and write
Description	Identifies the administrative status of this *RipInterface*. Setting this value to ***disabled*** will have the effect of rendering it inactive.
Mib	no_mib
Values	up down
Default	up

ATTRIBUTE Rtr Vrf If RipIf metric

Access	Read and write
Description	This attribute is the RIP metric for this logical interface.
Mib	no_mib
Values	Decimal (1..16)
Default	1

ATTRIBUTE Rtr Vrf If RipIf poisonReverseFlag (poison)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	If the value of this attribute is set to ***true***, then poison reverse algorithm is used when sending out the updates otherwise use split horizon only.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr Vrf If RipIf **flashUpdateFlag**

Access	Read and write
Description	This attribute when set to ***true*** will send updates when updates are received; otherwise RIP will wait till the next update period.
Mib	no_mib
Values	true false
Default	true

ATTRIBUTE Rtr Vrf If RipIf **networkRouteStatus**

Access	Read and write
Description	This attribute determines what type of network routes will be sent and whether a default route will be generated for this *RipInterface*. Generated default routes will not go into the routing table, but are sent in the updates going out on the interface. The possible values for this attribute are: ***naturalNetWithOutDefaultRoute*** - This value will cause normal RIP network routes to be put in the update. This means that the address of *logicalIf* or *Interface* pertaining to this *RipInterface* knowledge is taken into account in determining if the subnetted network or the natural network is sent for any route going into this update. ***naturalNetWithDefaultRoute*** - Selecting this value will cause a default route to be generated with the value of the metric selected for the attribute *defaultRouteMetric*. ***defaultRouteOnly*** - Selection of this value causes the default route to be generated with the value of the metric selected for the attribute *defaultRouteMetric*. NOTE: No other routes will go in the update. ***subnetsOnly*** - selection of this value will cause only subnet information to be put in the update. No default routes will be generated or passed on. Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be put in the update.

Copyright © 2006, Nortel Nortel Confidential

NOTE: this also effects receiving of updates on this interface. Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be accepted on a received RIP update on this *RipInterface*.

Mib: no_mib

Values:
naturalNetWithOutDefaultRoute (noDefault)
naturalNetWithDefaultRoute (withDefault)
defaultRouteOnly (defaultOnly)
subnetsOnly (subnets)

Default: naturalNetWithOutDefaultRoute

ATTRIBUTE Rtr Vrf If RipIf **defaultRouteMetric**

Access: Read and write

Description: This attribute identifies the metric value for the default route. This value is only used if the attribute *networkRouteStatus* is configured with a value of either ***naturalNetWithDefaultRoute*** or ***defaultRouteOnly***

Mib: no_mib

Values: Decimal (1..16)

Default: 1

ATTRIBUTE Rtr Vrf If RipIf **acceptDefault**

Access: Read and write

Description: If this attribute is set to true, then accept the default route from this interface.

Mib: no_mib

Values:
true
false

Default: true

ATTRIBUTE Rtr Vrf If RipIf **ifConfSend**

Access: Read and write

Description: This attribute identifies what the router sends on this *RipIf*. ***ripVersion1*** implies sending RIP updates compliant with RFC 1058. ***rip1Compatible*** implies broadcasting RIP-2 updates according to RFC 1058. ***ripVersion2*** implies multicasting RIP-2 updates.

Mib: no_mib

Values:
doNotSend (silent)
ripVersion1 (v1)
rip1Compatible (v2b)
ripVersion2 (v2)

Copyright © 2006, Nortel
Nortel Confidential

Default	rip1Compatible

ATTRIBUTE Rtr Vrf If RipIf **ifConfReceive**

Access	Read and write
Description	This attribute identifies which version of RIP updates are to be accepted on this *RipIf*. Note that ***rip2*** and ***rip1OrRip2*** implies reception of multicast packets.
Mib	no_mib
Values	rip1 (v1) rip2 (v2) rip1OrRip2 (both) doNotReceive (reject)
Default	rip1OrRip2

GROUP Rtr Vrf If RipIf **Operational (Stat)**

Properties	Operational
Description	This group contains operational attributes of the *RipIf* component. These attributes are statistical data corresponding to the RIP-2 standard MIB (rfc 1724) rip2Status table.
Mib	no_mib

ATTRIBUTE Rtr Vrf If RipIf **ifBadPacketRcv**

Access	Read only
Description	This attribute counts the number of RIP response packets recieved by the RIP process which were subsequently discarded for any reason.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr Vrf If RipIf **ifBadRouteRcv**

Access	Read only
Description	This attribute counts how many routes, in valid RIP packets, were ignored for any reason.
Mib	no_mib

Mib	no_mib
Values	Link (Service, listLinkToVrrp)
Default	No default

ATTRIBUTE Rtr Vrf If VrrpPort **holdDownTime (hdt)**

Access	Read and write
Description	This attribute specifies the length of time that a VrrpPort instance is prevented from participating in a VRRP Master virtual router election, if it has given up Mastership due to a failure, once the failure has been corrected. This allows the network routing protocol to re-establish a route to this VrrpPort instance when it becomes available. When the length of the holdDownTime is reached, a VRRP Master virtual router election occurs and the highest priority VrrpPort instance will become the VRRP Master virtual router. A holdDownTime attribute value of notApplicable disables the holdDownTime functionality. Any other value should be calculated based on an estimate of the time requiredfor the network routing protocol to establish a route to a VrrpPort instance, that has been disabled by a failure, once it has recovered. If the new VRRP Master virtual router fails within the holdDownTime interval and no other VRRP Backup virtual router is available, the holdDownTime functionality is canceled and the highest priority VrrpPort instance will become the VRRP Master virtual router. In a situation where both the VRRP Master and Backup virtual routers are on the same MSS, and both are affected by the same failure, the holdDownTime functionality doesn't add any value since the network routes to both VrrpPort instances are affected.
Mib	no_mib
Values	Decimal (1..3600) notApplicable (na)
Units	seconds
Default	notApplicable

ATTRIBUTE Rtr Vrf If VrrpPort **ipAddresses**

Access	Read and write
Description	This attribute specifies one or more IP addresses associated with this *VrrpPort* instance (VRID). All VRRP virtual routers with this VRID must have the same set of IP addresses configured. Each of the IP addresses

Copyright © 2006, Nortel Nortel Confidential

	in the list must be on the same subnet as an *IpLogicalInterface* for the *IpPort*. All the IP addresses in the list must be owned by this VRRP virtual router or by other VRRP virtual routers but not a combination.
Mib	no_mib
List of	IP address
Default	No default

Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf If VrrpPort **OperationalStatus (OperStatus)**

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If VrrpPort **snmpOperStatus**

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr Vrf If VrrpPort **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf If VrrpPort **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Rtr Vrf If VrrpPort usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Values:
idle
active (activ)
busy

Default: idle

COMPONENT Rtr Vrf If Loopback (Lb)

Groups:
GROUP Rtr Vrf If Lb IfEntryProv (IfEntry)
GROUP Rtr Vrf If Lb Provisioned (Prov)
GROUP Rtr Vrf If Lb OsiState (State)
GROUP Rtr Vrf If Lb OperationalStatus (OperStatus)

Scope: Application

Description:
Rtr/<string> Interface/<string> Loopback
Rtr/<string> Vrf/<string> Interface/<string> Loopback
The *Loopback* component represents an instance of a logical media. *Loopback* provides IP connectivity between routers on the same module, and supports an 'always-up IP interface' concept; i.e interface stays up unless it is administratively disabled or the hardware goes down.

Default	up

ATTRIBUTE Rtr Vrf If Lb **ifIndex (ifI)**

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	no_mib
Values	Decimal (1..65535)
Default	No default

GROUP Rtr Vrf If Lb **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Loopback* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf If Lb **mode**

Access	Read and write
Criticality	Component
Description	This attribute specifies the mode of operation of the *Loopback*. The following modes are supported: ***alwaysUpInterface***, and ***primaryLoopback***. ***alwaysUpInterface***: This mode limits the *Loopback* to provide the functionality of an 'always up interface' only. Inter router communication is not possible when this mode is selected. Memory consumption by the *Loopback If* is significantly less on the FP when this mode is selected. Hence this mode should be used when the sole purpose of the *Loopback If* is to provide an always up interface for an application like BGP4. ***primaryLoopback***: Only supported under *Router*; a router can have only one Interface which has a *Loopback* component with mode primaryLoopback.
Mib	no_mib
Values	alwaysUpInterface primaryLoopback
Default	alwaysUpInterface

GROUP Rtr Vrf If Lb **OsiState (State)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Vrf If Lb **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr Vrf If Lb **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. GROUP Rtr Vrf If RsvpTeIf **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains attributes for MPLS RSVP-TE configurable capability on a per interface basis.
Mib	no_mib

ATTRIBUTE Rtr Vrf If RsvpTeIf **adminStatus (status)**

Access	Read: All Write: All
Description	This attribute specifies the administrative status of this RSVP-TE interface. It is used to maintain the admin state over FP and nodal restarts.
Mib	no_mib
Values	null enabled disabled testing
Default	enabled

ATTRIBUTE Rtr Vrf If RsvpTeIf **reservableFactor (resFactor)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the percentage of media bandwidth available for LSP Tunnel reservations over this interface. A value of 0 prevents any bandwidth allocation for LSPs. A value of 100 allows RSVP-TE exclusive use of available bandwidth. Intermediate values allow distribution of bandwidth amongst RSVP-TE and other applications.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..100)
Units	%
Default	50

ATTRIBUTE Rtr Vrf If RsvpTelf overbookingFactor (overBook)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the percentage of the total bandwidth pool that is not sharable between LSP connections. The percentage ranges from 0% to 1000%. This allows for both under and over subscription of the bandwidth. A value of 100 results in absolute allocations--signaled bandwidth is exactly that allocated. A value < 100 allows under subscription of the link. A value > 100 allows over subscription of the link.
Mib	no_mib
Values	Decimal (0..1000)
Units	%
Default	100

ATTRIBUTE Rtr Vrf If RsvpTelf mediaCapacity (mediaCap)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the capacity in kbits/sec of the underlying media link for the interface. For GigE links, the default can be retained. For ATM links, this attribute should be set to the sum of the bandwidth provisioned for the underlying VCC(s) linked to the associated *Rtr/<s> Interface/<IP Address> AtmMpe*.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	kbit/s
Default	860000

ATTRIBUTE Rtr Vrf If RsvpTelf refreshInterval (rInt)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the interval between refresh messages sent by this LSR on this interface. This value is sent in the TIME_VALUES object of the PATH/RESV message to the next hop and is used in calculation of the lifetime of the PATH/RESV state block at the next hop. Setting this value will override the *refreshInterval* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (1..1800) sameAsRsvpTe
Units	seconds
Default	sameAsRsvpTe

ATTRIBUTE Rtr Vrf If RsvpTelf refreshKeepMultiplier (rKeep)

Access	Read: All Write: All
Description	This attribute specifies the default minimum number of refresh intervals that must pass before a PATH or a RESV state which is not being refreshed is aged out. This value is used in calculating the lifetime of the Path State Blocks (PSB) and Reservation State Blocks (RSB) for this interface; it prevents premature loss of these states. Setting this value will override the *refreshKeepMultiplier* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (1..50) sameAsRsvpTe
Default	sameAsRsvpTe

ATTRIBUTE Rtr Vrf If RsvpTelf slewMax (slew)

Access	Read: All Write: All
Description	This value specifies the rate at which an increase in the *refreshInterval* is introduced on the LSR. When a new *refreshInterval* value is provisioned to a higher value, the refresh interval is increased at *slewMax* percentage of the previous interval at each PATH/RESV cycle. In another words, the ratio of two successive refresh interval values do not exceed 1 + (Slew Max/100). Setting this value will override the *slewMax* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..200) sameAsRsvpTe
Units	%
Default	sameAsRsvpTe

ATTRIBUTE Rtr Vrf If RsvpTelf **helloInterval (hInt)**

Access	Read: All Write: All
Description	This attribute specifies the interval between HELLO messages sent by this LSR on this interface. A value of ***disabled*** indicates that the Hello mechanism is not enabled. Setting this value will override the *helloInterval* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (0.1..100.0) disabled sameAsRsvpTe
Units	seconds
Default	sameAsRsvpTe

ATTRIBUTE Rtr Vrf If RsvpTelf **helloMultiplier (hMult)**

Access	Read: All Write: All
Description	This attribute specifies the minimum number of HELLO intervals that must pass before the RSVP-TE connection is considered down. Setting this value will override the *helloMultiple* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (2.0; 2.5; 3.0; 3.5; 4.0; 4.5; 5.0; 5.5; 6.0; 6.5; 7.0; 7.5; 8.0; 8.5; 9.0; 9.5; 10.0) sameAsRsvpTe

GROUP Rtr Vrf If IpoDlci CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib no_mib

ATTRIBUTE Rtr Vrf If IpoDlci customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib no_mib

Values Decimal (0; 1..8191)

Default 0

GROUP Rtr Vrf If IpoDlci IfEntryProv (IfEntry)

Properties Provisioned

Mib	no_mib
Values	Link (Hardware, linkToIpDlciGrp)
Default	No default

ATTRIBUTE Rtr Vrf If IpoDlci Frc ipCos

Access	Read and write
Criticality	Component
Description	This attribute specifies the connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and accounting. Connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers. If an IP packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is based on either the

Copyright © 2006, Nortel Nortel Confidential

Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet.

DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component.
Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the *FrConnection*.

If the *FrConnection* is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.

Mib no_mib

Values Decimal (0..3)

Default 0

ATTRIBUTE Rtr Vrf If IpoDlci Frc **linkToIpLogicalInterface (ipIf)**

Access Read and write

Description This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with.

When set, the value of this attribute must be consistent with the *linkToProtocolPort* attribute value of the parent *IpDlciGroup* component. That is, they must both point to the same *ProtocolPort* component.

Mib no_mib

Groups	GROUP Rtr Vrf Cpp Provisioned (Prov) GROUP Rtr Vrf Cpp Operational (Oper) GROUP Rtr Vrf Cpp OsiState (State)

COLLECTED STATS Router VpnRouteForwarder ControlPlaneProtection

Scope	Application
Description	*Vr/<string> Ip ControlPlaneProtection* *Rtr/<string> ControlPlaneProtection* *Rtr/<string> Vrf/<string> ControlPlaneProtection* This component represents the IP Control Plane Protection mechanism. The *CPP* helps prevent control traffic from the current Virtural Router, Router, or vrForwarder (VR/VRF) receiving excessive traffic from adversely affecting the control processing of others. If the rate of packets received by the local-destined address is greater than the provisioned

Copyright © 2006, Nortel Nortel Confidential

value, CPP is notified.
This component does not protect locally destined IP traffic including IP options, IPv6, TTL of 0 or 1 which includes OSPF, and unsupported protocols (in hardware) such as ISIS.

Mib	no_mib
Dyn. Subcomp.	COMPONENT Rtr Vrf Cpp IsolatedDa
Common Verbs	Help List Display Add DELete LOCK Unlock

VERB Clear Rtr Vrf Cpp

Impact	Service
Description	clear Vr/<string> Ip Cpp clear Rtr/<string> Cpp clear Rtr/<string> Vrf/<string> Cpp This command is intended for manually clearing all isolated addresses from the current *Cpp* component, and resume traffic to the locally destined addresses on all the FPs.

GROUP Rtr Vrf Cpp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Cpp* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Cpp packetsPerSecond (pps)

Access	Read and write
Description	This attribute specifies the maximum number of packets per second a locally destined address on the VR/VRF can receive before being monitored by the *CPP* feature.
Mib	no_mib
Values	Decimal (100; 200; 300; 400; 500; 600; 700; 800; 900; 1000; 1100; 1200)
Default	1200

ATTRIBUTE Rtr Vrf Cpp isolationTime (isolation)

Access	Read and write
Description	This attribute specifies the amount of time a locally destined address will remain in isolation after exceeding the *packetsPerSecond* rate.

Copyright © 2006, Nortel Nortel Confidential

If *gracePeriod* is non-zero, isolation will not occur until the conclusion of the grace period.

A value of 0 indicates that a locally destined address which is isolated can only be cleared using the *CLEAR* command.

If the traffic to the address is still excessive after the isolationTime expires, this locally destined address will remain in isolation for *IsolationTime* * 2 period. If the traffic to the address is still excessive after 3 times of the above step, the address will be permanently isolated until it is cleared by the *CLEAR* verb.

The minimum value of *IsolationTime* other than zero is 30.

Mib	no_mib
Values	Decimal (0; 30..3600)
Units	seconds
Default	30

ATTRIBUTE Rtr Vrf Cpp **gracePeriod (grace)**

Access	Read and write
Description	This attribute specifies period of time used to sample the flow rate before the packets are discarded. The intent of the grace period is to measure the average flow rate during this period to ensure that the exceeded traffic flow rate was not due to bursty traffic. If *mode* is ***study***, a list of static record are generated every 15 minutes including a list of locally-destined addresses having excessive flow and its avarage flow rates during the gracePeriod. If *gracePeriod* is non-zero, isolation will not occur until the conclusion of the grace period. A value of 0 of this attribute when *mode* is ***protected*** indicates that no monitoring of the address will be performed after an excessive flow is detected and isolation occurs immediately. It is an error to have *mode* set to ***study*** and *gracePeriod* set to zero.
Mib	no_mib
Values	Decimal (0..300)
Units	seconds
Default	5

ATTRIBUTE Rtr Vrf Cpp **mode**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies whether we are simply monitoring excessive traffic (***study***), or will ***protect*** the VR by discarding traffic during excessive traffic flows, or the feature is ***disabled***. It is an error to have *mode* set to ***study*** and *gracePeriod* set to zero.
Mib	no_mib

Units	%
Default	No default

COMPONENT Rtr Vrf DifferentiatedServicesDomain (Dsd)

Instance	multiservice (ms) classSelector (cs) assuredForwarding (af) packetVoice (pv) wirelessUmts (umts) custom (cu)
Groups	GROUP Rtr Vrf Dsd LocalSourcePackets (Local)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum>* *Rtr/<string> DifferentiatedServicesDomain/<enum>* *Rtr/<string> Vrf/<string> DifferentiatedServicesDomain/<enum>* This component and its supcomponents represent a Differentiated Services administration domain for traffic management and congestion

Copyright © 2006, Nortel Nortel Confidential

control.

The *DifferentiatedServicesDomain* component instance identifies the domain type. The following domain types are available:

Multiservice (ms)
ClassSelector (cs)
AssuredForwarding (af)
PacketVoice (pv)
WirelessUmts (umts)
Custom (cu)

The *DifferentiatedServicesDomain* component is an optional subcomponent of the *Router*, *VpnRouteForwarder* and *VirtualRouter* components.

The *Router*, *VpnRouteForwarder*, and *VirtualRouter* components can have at most one *DifferentiatedServicesDomain* subcomponent.

If a *Router* component does not have a *DifferentiatedServicesDomain* subcomponent, then the *Router* operates as by default as follows. IP packets with Differentiated ServiceCode Point (DSCP) field value 48, and MPLS packets with Experimental Bits (EXP) field value 6, are treated with Per Hop Behavior (PHB) CS6; other IP and MPLS packets are treated with PHB DF for default forwarding. Locally generated routing control packets are treated with PHB CS6; other locally generated packets are treated with PHB DF. Per Hop Behaviors CS6 and DF are configured to provide the following values of scheduling class for 8, 4, 3, 2 queues, drop precedence, and EXP for MPLS encapsulation: (5, 2, 2, 0, low, 6) and (0, 0, 0, 0,, high, 0), respectively. This is equivalent to the default the configuration of the *DifferentiatedServicesDomain/custom* component instance.

If a *VpnRouteForwarder* component does not have a *DifferentiatedServicesDomain* subcomponent, then the *VpnRouteForwarder* component uses the *DifferentiatedServicesDomain* configuration of the *Router.*

ATTRIBUTE Rtr Vrf Dsd linkToVpnDscpMap (vpnMap)

Access	Read and write
Description	This attribute specifies a *VpnDscpMap* component instance that is used to translate the value of the DSCP field in an IP packet forwarded by a customer Virtual Router (cVr) to the value of the DSCP field in the IP header that encapsulates the packet when it is forwarded by a Virtual Connection Gateway (VCG).

Copyright © 2006, Nortel Nortel Confidential

If no *VpnDscpMap* component is specified, then the value of the DSCP field in the carrier IP header is set equal to the value of the DSCP field in the customer IP header.

This attribute is relevant only to a VR configured as a customer router in an IP VPN (RFC2764) network.

Mib: no_mib

Values: Link (Service, linkToVpnDscpMapUsers)

Default: No default

COMPONENT Rtr Vrf Dsd MplsServiceMap (MplsMap)

Instance: 0

Scope: Application

Description: *Vr/<string> Dsd/<enum> MplsServiceMap/<n>*
Rtr/<string> Dsd/<enum> MplsServiceMap/<n>

The subcomponents of the *MplsServiceMap* component specify mappings used to control how MPLS packets are forwarded over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

The *MpslServiceMap/0* subcomponent instance is added automatically to a *DifferentiatedServicesDomain* subcomponent being added to a *Router* component where the *Ldp* subcomponent is already activated.

The *MpslServiceMap/0* subcomponent instance is not allowed under a *DifferentiatedServicesDomain* component whose immediate parent is a *VirtualRouter* component or a *VirtualRouteForwarder* component.

Groups

GROUP Rtr Vrf Dsd MplsMap PhbMap Provisioned (Prov)
GROUP Rtr Vrf Dsd MplsMap PhbMap Operational (Oper)

Scope

Application

Description

Vr/<string> Dsd/<enum> MplsMap/<n> PerHopBehaviorMap/<phb>
Rtr/<string> Dsd/<enum> MplsMap/<n> PerHopBehaviorMap/<phb>

This component specifies a mapping from a *PerHopBehavior* component instance value to a three-bit Experimental (EXP) field value.

This mapping controls how the EXP field in an MPLS label is marked when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied.

Copyright © 2006, Nortel Nortel Confidential

The *DifferentiatedServicesDomain PerHopBehavior* component instance used to treat the packet prior to label encapsulation is used to select the EXP value for the label. If the *PerHopBehavior* component instance value used to treat the packet is not included among the existing *PerHopBehaviorMap* component instances, then the EXP value indicated by the *PerHopBehaviorMap* component whose instance is equal to 0 is used.

Each *PerHopBehaviorMap* component instance is equal to a decimal value in the range from 0 to 63. The following pairs of *PerHopBehaviorMap* component instances values are equal:
AF11 = 10,
AF12 =12,
AF13 =14,
AF31 = 26,
AF32 = 28,
AF33 = 30,
AF21 = 18,
AF22 = 20,
AF23 = 22,
AF41 = 34,
AF42 =36,
AF43 = 38
CS0 = 0,
CS1 = 8,
CS2 =16,
CS3 = 24,
CS4 =32 ,
CS5 = 40,
CS6 = 48,
CS7 = 56,
DF = 0,
EF = 46.

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services Code Point (DSCP) value.

Each *PerHopBehaviorMap* subcomponent of the *MplsServiceMap* must have a unique instance value. A *PerHopBehaviorMap* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehaviorMap* subcomponents with instance values equal to the *DifferentiatedServicesDomain PerHopBehavior* subcomponent instance values is added automatically when the *MplsServiceMap*

Description	This group contains the operational attributes of the *PerHopBehaviorMap* component.
Mib	no_mib

ATTRIBUTE Rtr Vrf Dsd MplsMap PhbMap **operExperimentalBits (operExp)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates a three-bit Experimental (EXP) field value in the range from ***0*** to ***7*** that is marked into the MPLS label when a packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) where the *MplsServiceMap* component is applied. The EXP value is selected according to the *PerHopBehaviorMap* component whose instance value is equal to the instance value of the *DifferentiatedServicesDomain PerHopBehavior* component used to treat the packet prior to label encapsulation. The value of this attribute is equal to the *experimentalBits* provisioned attribute.
Mib	no_mib
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Rtr Vrf Dsd MplsMap PhbMap **operExperimentalBitsAlternative (operExpAlt)**

Access	Read only
Description	This attribute is similar to the *operExperimentalBits* operational attribute, except that it used only on PQC-based access FPs with ASIC Version 2.0 when an IP packet is forwarded by a Label Edge Router (LER) over a Label Switched Path (LSP) via a PQC-based trunk FP. In such situations only, the value of this attribute, instead of the *operExperimentalBits* operational attribute value, is used to mark the Experimental (EXP) field of the MPLS label. If the *MplsServiceMap* does not have a *MarkingPerformance* subcomponent, then the value of this attribute is equal to the *experimentalBits* provisioned attribute; otherwise the value of this attribute is determined as explained in the next paragraph. If "***x***" is the *schedulingClass4Queues* operational attribute value of the *DifferentiatedServicesDomain PerHopBehavior* component whose instance value is equal to the *PerHopBehaviorMap* component instance value, then the *PerHopBehaviorMap experimentalBitsAlternative* operational attribute value is equal to the "***x***th" element of the *MarkingPerformance experimentalBitsAlternative* provisioned attribute.
Mib	no_mib
Values	Decimal (0..7)
Default	No default

COMPONENT Rtr Vrf Dsd MplsMap **MarkingPerformance**

Groups	GROUP Rtr Vrf Dsd MplsMap MarkingPerformance Provisioned (Prov)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	*Vr/<string> Dsd/<enum> MplsMap/<n> MarkingPerformance* *Rtr/<string> Dsd/<enum> MplsMap/<n> MarkingPerformance* This subcomponent is added to the *MplsServiceMap* component to enable high performance MPLS label encapsulation on some PQC-based ingress access FPs . IP packets that are forwarded from access FPs with PQC-ASIC Version 2.0 via PQC-based trunk FPs (any ASIC version) over an MPLS Label Switched Path (LSP) where the *MplsServiceMap* is applied are affected. Adding this component to the *MplsServiceMap* improves IP packet throughput on the affected access FPs but restricts how the three-bit Experimental (EXP) field of MPLS labels are marked, as explained in the description of the *operExperiementalBitsAlternative* operational attribute of the *MplsServiceMap PerHopBehaviorMap* component. Without the *MarkingPerformance* subcomponent, IP packets after being routed in hardware are encapsulated with MPLS labels by a software-assisted datapath that does not restrict how the EXP field of MPLS labels are marked. The *MarkingPerformance* subcomponent is added automatically to a *MpslServiceMap* subcomponent being added to a *DifferentiatedServicesDomain* component. This ensures that the high performance MPLS label encapsulation data path is used by default.

COMPONENT Rtr Vrf Dsd VpnDscpMap (VpnDscpMap)

Instance	String (1..20, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Rtr Vrf Dsd VpnDscpMap Provisioned (Prov)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum> VpnDscpMap/<string>*

This component provides a mapping of customer DSCP values to carrier DSCP values for IP tunnel encapsulation in an IP VPN (RFC2764) network.

When an IP packet is forwarded from a customer Virtual Router (cVr) to a Virtual Connection Gateway (VCG) the customer IP header is encapsulated with a carrier IP header for transmission through the carrier network.

If the customer virtual router (cVr) has a *DifferentiatedServicesDomain* subcomponent where the *linkToVpnDscpMap* attribute is set, then the value of DSCP field in the IP packet forwarded by the customer Virtual Router (cVr) is translated by the mapping specified by the *assignedPhb* attribute of the associated *VpnDscpMap* to a DSCP value that is marked in the carrier IP header. If the customer *DifferentiatedServicesDomain linkToVpnDscpMap* attribute is not set, then the value of the DSCP field in the carrier IP header is set equal to the value of the DSCP field in the customer IP header.

The encapsulated IP packet is treated by the Virtual Connection Gateway (VCG) as specified by the *DifferentiatedServicesDomain PerHopBehavior* component instance associated with the carrier header DSCP value. If the carrier header DSCP value does not correspond to a *PerHopBehavior* subcomponent of the VCG's *DifferentiatedServicesDomain* component, then the IP packet is treated as specified by the *PerHopBehavior* component instance associated with DSCP ***0***.

The *VpnDscpMap* component can be added only to the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***carrier***. It can be linked only to the *linkToVpnDscpMap* attribute of the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***customer***.

The component instance is an arbitrary text string to allow the operator to assign a meaningful name for easy reference.

The *DiffServDomain* component is not allowed to have more than eight *VpnDscpMap* subcomponents.

Copyright © 2006, Nortel Nortel Confidential

	No more than one *DiffServDomain* component instance is allowed to have *VpnDscpMap* subcomponents

COMPONENT Rtr Vrf Dsd VpnCosMap (VpnCosMap)

Groups	GROUP Rtr Vrf Dsd VpnCosMap Provisioned (Prov)
Scope	Application
Description	*Vr/<string> DifferentiatedServicesDomain/<enum> VpnCosMap* This component provides a mapping of customer CoS values to carrier DSCP values for IP tunnel encapsulation in an IP VPN (RFC2764) network. When an IP packet is forwarded from a customer Virtual Router (cVr) to a Virtual Connection Gateway (VCG) the customer IP header is encapsulated with a carrier IP header for transmission through the carrier network. If the customer virtual router (cVr) does not have a *DifferentiatedServicesDomain* subcomponent and the Virtual Connection Gateway (VCG) has a *DifferentiatedServicesDomain VpnCosMap* component, then the IP CoS value assigned to the packet by the customer virtual router is translated by the mapping specified by the *assignedPhb* attribute of the *VpnCosMap* to a DSCP value that is marked in the carrier

Copyright © 2006, Nortel Nortel Confidential

IP header. If the *DifferentiatedServicesDomain* of the Virtual Connection Gateway (VCG) does not have a *VpnCosMap* subcomponent, then the value of the DSCP field in the carrier IP header is set to ***0*** unless the customer header DSCP value is ***48*** (which corresponds to PHB CS6 for IP network control packets). In the latter case the carrier header DSCP value is set to ***48*** also.

The encapsulated IP packet is treated by the Virtual Connection Gateway (VCG) as specified by the *DifferentiatedServicesDomain PerHopBehavior* component instance associated with the carrier header DSCP value. If the carrier header DSCP value does not correspond to a *PerHopBehavior* subcomponent of the VCG's *DifferentiatedServicesDomain* component, then the IP packet is treated as specified by the *PerHopBehavior* component instance associated with DSCP ***0***.

The *VpnCosMap* component can be added only to the *DiffServDomain* subcomponent of a *VirtualRouter* component where the *vpnMode* attribute is set to ***carrier***.

The *VpnCosMap* component is used to assist the migration of an IP VPN network without *DifferentiatedServicesDomain* components to an IP VPN network where every customer Virtual Router (cVr) and Virtual Connection Gateway (VCG) has a *DifferentiatedServicesDomain* component. The *VpnCosMap* components can be removed once the CoS to DiffServ network migration is completed.
The VpnCosMap component controls how the DSCP field in the carrier IP header is marked when IP packets are forwarded by the Virtual Connection Gateway (VCG) only if the operational value of the Vr trafficManagementMode (tmMode) attribute for the customer VirtualRouter component is set to hybrid .

Scope

Application

Description

Vr/<string> Dsd/<enum> PerHopBehavior/<phb>
Rtr/<string> Dsd/<enum> PerHopBehavior/<phb>
Rtr/<string> Vrf/<string> Dsd/<enum> PerHopBehavior/<phb>

The attributes of the *PerHopBehavior* component specify per-packet traffic management parameters that control how individual packets are forwarded.

A packet is associated with a *PerHopBehavior* component instance by a packet classification mechanism. For IP packets, the associated *PerHopBehavior* component instance is equal to the value of the six-bit Differentiated Services Code Point (DSCP) field in the IP header. For MPLS packets forwarded by a Label Switched Router (LSR) over a Label Switched Path (LSP) where an *MplsServiceMap* component is applied, the associated *PerHopBehavior* component instance is equal to value of the *perHopBehavior* attribute of the *MplsServiceMap ExperimentalBitsMap* component whose instance is equal to the value of the three-bit Experimental (EXP) field of the MPLS label.

If the *PerHopBehavior* component instance associated with a packet is not included among the existing *PerHopBehavior* subcomponents of the *DifferentiatedServicesDomain*, then the packet is treated according to the *PerHopBehavior* component whose instance is equal to 0.

Each *PerHopBehavior* component instance is equal to a decimal value in

Copyright © 2006, Nortel
Nortel Confidential

the range from 0 to 63. The following pairs of *PerHopBehavior* component instances values are equal:
AF11 = 10,
AF12 =12,
AF13 =14,
AF31 = 26,
AF32 = 28,
AF33 = 30,
AF21 = 18,
AF22 = 20,
AF23 = 22,
AF41 = 34,
AF42 =36,
AF43 = 38
CS0 = 0,
CS1 = 8,
CS2 =16,
CS3 = 24,
CS4 =32,
CS5 = 40,
CS6 = 48,
CS7 = 56,
DF = 0,
EF = 46.

The first item in each pair above is a Per Hop Behavior designation identified in one of following IETF standards: RFC 2764 (“DiffServ Field Definition in IPv4 and IPv6 Headers”), RFC 2597 (“Assured Forwarding PHB Group”) or RFC 3246 (“An Expedited Forwarding PHB”). The the second item in each pair is the IETF recommended Differentiated Services Code Point (DSCP) value.

Each *PerHopBehavior* subcomponent of the *DifferentiatedServicesDomain* must have a unique instance value. A *PerHopBehavior* subcomponent whose instance value is equal to 0 must exist.

A set of *PerHopBehavior* subcomponents is added automatically when the *DifferentiatedServicesDomain* component is created. The members of this set is a function of the *DifferentiatedServicesDomain* component instance as indicated below.

GROUP Rtr Vrf Dsd Phb Provisioned (Prov)

Properties Provisioned

Description This group contains the provisioned attributes of the *PerHopBehavior* component.

Mib no_mib

ATTRIBUTE Rtr Vrf Dsd Phb trafficClass (tc)

Access Read and write

Description This attribute specifies the *TrafficClass* component instance associated with the *PerHopBehavior* component instance. This attribute allows *PerHopBehavior* component instances to be aggregated into groups that specify the same packet scheduling characteristics.

This attribute is set automatically to a default value according to a function of the *PerHopBehavior* component instance value when the *PerHopBehavior* component is created. The default values are listed below.

PeHopBehavior trafficClass
---*CS7 (56)*
critical
CS6 (48) ***network***

ATTRIBUTE Rtr Vrf Dsd Phb **dropPrecedence (dp)**

Access: Read and write

Description: This attribute specifies the drop precedence value given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a congestion threshold when the packet is placed on a queue that supports multiple congestion thresholds.

A drop precedence is assigned to a packet to control its loss sensitivity relative to other packets when the packets are placed into the same queue. Generally, the ***low*** value indicates the packet is less likely to be discarded when the queue is congested. This traffic has a higher probability of being forwarded. The ***high*** value indicates the packet is more likely to be discarded when the queue is congested. This traffic has a lower probability of being forwarded. The actual loss sensitivity of packets depends on the discarding mechanism at the queue.

Description	This attribute indicates the *TrafficClass* component instance associated with the *PerHopBehavior* component instance. This attribute allows *PerHopBehavior* component instances to be aggregated into groups that indicate the same packet scheduling characteristics. The value of this attribute is equal to value of the *trafficClass* provisioned attribute of the *PerHopBehavior* component.
Mib	no_mib
Values	critical network premium platinum gold silver bronze standard
Default	No default

ATTRIBUTE Rtr Vrf Dsd Phb **schedulingClass8Queues (sc8q)**

Access	Read only
Description	This attribute indicates a logical scheduling class value in the range from ***0*** to ***7*** given to a packet that uses the *PerHopBehavior* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports eight queues per connection. A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface. The value of this attribute is equal to value of the *schedulingClass8Queues* provisioned attribute of the *TrafficClass* component whose instance is equal to the *PerHopBehavior trafficClass* provisioned attribute value.

bronze	***1***
standard	***0***

Mib — no_mib

Values — Decimal (0..7)

Default — No default

ATTRIBUTE Rtr Vrf Dsd Tc schedulingClass4Queues (sc4q)

Access — Read and write

Description — This attribute specifies a logical scheduling class value in the range from ***0*** to ***3*** given to a packet that uses the *TrafficClass* component instance. This value is used to select a queue when the packet is transmitted at an interface that supports four queues per connection. It may also be used to select one of up to four link layer connections at interfaces where per-packet selection of egress connections is supported.

A scheduling class is assigned to a packet to control its scheduling behavior relative to other packets at the interface where the packets are transmitted. Generally, a numerically higher value indicates the packet is less likely to be delayed. This traffic is considered more urgent and less delay tolerant. A numerically lower value indicates the packet is more likely to be delayed. This traffic is considered less urgent and more delay tolerant. The actual scheduling behavior of packets depends on the scheduling mechanism at the interface.

This value is also used to select a one of up to four Layer 2 connections at the interface where the packet is transmitted. Per-packet selection of egress connections is supported only if these conditions are all true:

i) for the *Vr* component, the value of the associated *mediaType* attribute under the *IpPort* component is ***frameRelay***, ***atmMpeLlcEncap***, or ***atmMpeVcEncap***; for *Router* and *Vrf*, the media associated with the interface is *AtmMpe* or *IpoDlci*.
ii) more than one Layer 2 connection is configured to the next hop IP router, and
iii) each connection is configured with a different connection class value.

Copyright © 2006, Nortel Nortel Confidential

Normally the packet is transmitted on the connection whose connection class is equal to the *schedulingClass4Queues* value given to the packet. If that connection does not exist, then the connection having the next lower connection class is used. If that connection does not exist also, then the connection having the next higher connection class is used.

Locally generated IP multicast and IP broadcast packets are not eligible for per-packet selection of egress connections. Each of these packets is copied and transmitted individually on each of the available connections to the next hop IP router.

For *AtmMpe*, the connection class is specified by the *ipCos* attribute of the *AtmConnection* subcomponent. For *FrDte* the connection class is specified by the *ipCos* attribute of the *StaticDlci* and *DynamicDlciDef* subcomponents. For *IpDlciGroup* and *IpoDlci* the connection class is specified by the *ipCos* attribute of the *FrConnection* subcomponent.

If each Layer 2 connection is configured to provide different policing and scheduling characteristics, then the forwarding behaviors of IP and MPLS packets are differentiated as they transit through the Layer 2 network. In general, the scheduling characteristics of the connections should be configured to be better for numerically greater connection class values. For example, if four *AtmConnection* components are associated with *AtmIf* components configured for ATM service classes ***UBR***, ***nrtVBR***, ***rtVBR***, and ***CBR***, then the *ipCos* attributes of the *AtmConnection* components should be either ***0***,***1***,***2***, and ***3***, respectively, or ***0***,***1***,***3***, and ***2*** respectively.

The *schedulingClass4Queues* attribute is set automatically to a default value according to a function of the *TrafficClass*component instance value when the *TrafficClass* component is created. The default values are listed below. If the *TrafficClass* component instance is ***standard***, then this attribute must be set to ***0***.

Default values for all domains, except *assuredForwarding (af)*:

TrafficClass schedulingClass4Queues

Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Rtr If directedBroadcast

Access	Read and write
Description	This attribute specifies whether or not directed broadcast to physical broadcast translation is enabled for incoming traffic on this *Interface.* The IP router requirement (RFC1812) says this translation should be ***enabled***; however, in some network environments, setting this attribute to ***disabled*** may prevent operational problem such as broadcast storms. Note that in some configuration, setting this attribute to ***disabled*** may cause Bootp to fail.
Mib	no_mib
Values	enabled disabled
Default	enabled

GROUP Rtr If NetMaskProv

Properties	Provisioned
Description	This group contains attributes required to define a *netMask*.
Mib	no_mib

ATTRIBUTE Rtr If netMask

Access	Read and write
Description	This attribute specifies the subnet mask for this *Interface*. This attribute must be specified because the IP application will not automatically provide a default value. If the media is: 1) *Loopback* with *mode* ***primayLoopback***, then the value of the *netMask* attribute must be ***255.255.255.255***; 2) *Loopback* with *mode* ***alwaysUpInterface***, then the value of the *netMask* attribute can be any non-zero value; 3) *Ppp*, then the value of the *netMask* attribute can be any non-zero value; 3) another other media, then the value of the *netMask* attribute can be any non-zero value other than ***255.255.255.255***.
Mib	no_mib
Values	IP address
Default	0.0.0.0

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr If OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr If snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr If OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr If adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr If operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr If usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr If Operational (Oper)

Properties	Operational
Description	This group contains operational attributes for an *Interface*.
Mib	no_mib

ATTRIBUTE Rtr If operArpStatus

Access	Read only
Description	This attribute indicates the current operational ARP status. If the provisioned *arpStatus* is set to ***auto***, then the IP application automatically determines the *operArpStatus* based on the *Interface* media type.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr If operMulticastStatus

Access	Read only
Description	This attribute indicates the current operational Multicast status. If the provisioned *multicastStatus* is set to ***auto***, then the IP application automatically determines the *operMulticastStatus* based on the *Interface* media.
Mib	no_mib
Values	enabled disabled
Default	disabled

ATTRIBUTE Rtr If broadcastAddress

Access	Read only
Description	This attribute indicates the destination IP address to be used by any application which needs to broadcast on this *Interface*.
Mib	no_mib
Values	IP address
Default	No default

GROUP Rtr If RelayBcOperational (RelayBcOper)

Properties	Operational
Description	This group contains operational attributes for an *Interface*'s or *IpPort*'s RelayBc counters.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib

ATTRIBUTE Rtr If relayAddressCount

Access	Read only
Description	This attribute indicates the number of frames received on this *Interface* or *IpPort* which were forwarded to the provisioned *relayAddress* for this port. This counter wraps to zero when it reaches it's maximum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr If relayBcCount

Access	Read only
Description	This attribute indicates the number of frames received on this port which were forwarded to the *broadcastAddress* on other *IpPorts* or *Interfaces*. This counter is incremented once for every frame received on this port regardless of how many other ports it was sent on. This counter wraps to zero when it reaches it's maximum.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

GROUP Rtr If IfTable (Ift)

Properties	Operational
Description	This group represents the SNMP interface table entry.
Mib	no_mib

ATTRIBUTE Rtr If ifAdminStatus (admStatus)

Access	Read only
Description	This attribute provides the current administration status of the interface. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr If ifOperStatus (opStatus)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute provides the current operational status of the interface. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	down

ATTRIBUTE Rtr If ifLastChange (lastChange)

Access	Read only
Description	This attribute provides the value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re- initialization of the local network management subsystem, then this object contains a zero value.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifInOctets (inOctets)

Access	Read only
Description	This attribute reports the total number of octets received on the interface, including framing characters. The 64-bit version may be available in the *ifHCInOctets* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifOutOctets (outOctets)

Access	Read only
Description	This attribute reports the total number of octets transmitted out of the interface, including framing characters. The 64-bit version may be available in the *ifHCOutOctets* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifInDiscards (inDiscard)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute reports the number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher layer protocol. One possible reason for discarding such a packet could be to free up buffer space.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifOutDiscards (outDiscard)

Access	Read only
Description	This attribute reports the number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifInErrors (inErr)

Access	Read only
Description	This attribute reports the number of inbound packets that contained errors preventing them from being deliverable to a higher layer protocol.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifOutErrors (outErr)

Access	Read only
Description	This attribute reports the number of outbound packets that could not be transmitted because of errors.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifInUcastPkts (inUcast)

Access	Read only
Description	This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast

Copyright © 2006, Nortel Nortel Confidential

	address at this sub-layer. The 64-bit version may be available in the *ifHCInUcastPkts* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifOutUcastPkts (outUcast)

Access	Read only
Description	This attribute reports the total number of packets that higher level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. The 64-bit version may be available in the *ifHCOutUcastPkts* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifInNuCastPkts (inNucast)

Access	Read only
Description	This attribute reports the number of non-unicast (i.e., subnetwork-broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol. The corresponding 64-bit versions may be available in the *ifInMulticastPkts* attribute and the *ifInBroadcastPkts* attribute.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifOutNuCastPkts (outNuCast)

Access	Read only
Description	This attribute reports the total number of packets that higher level protocols request be transmitted to a non-unicast address, including those that were discarded or not sent. The corresponding 64-bit versions may be available in the *ifOutMulticastPkts* and *ifOutBroadcastPkts* attributes.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifInUnknownProtos (inUknownProt)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute reports the number of packets received via the interface which were discarded because of an unknown or unsupported protocol.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifOutQlength (outQlen)

Access	Read only
Description	This attribute represents the length of the output packet queue (in packets).
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifDescription (desc)

Access	Read only
Description	This attribute provides a textual string containing information about the interface. This string includes the name of the manufacturer, the product name and the version of the hardware interface.
Mib	no_mib
Values	String (0..255, ASCII)
Default	No default

ATTRIBUTE Rtr If ifType (type)

Access	Read only
Description	This attribute describes the type of interface, distinguished according to the physical/link protocol(s) immediately below the network layer in the protocol stack
Mib	no_mib
Values	other ddnX25 rfc877x25 ethernetCsmacd ethernet8023 tokenBus8024 tokenring8025 man802 starLan hyperChannel fddi

Default — No default

ATTRIBUTE Rtr If ifMtu (mtu)

Access — Read only

Description — This attribute represents the size of the largest datagram which can be sent/received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface.

Mib — no_mib

Values — Decimal (0..4294967295)

Default — No default

ATTRIBUTE Rtr If ifSpeed (speed)

Access — Read only

Description — This attribute provides an estimate of the interface's current bandwidth in bits per second. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth.

Copyright © 2006, Nortel
Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If ifPhysicalAddress (phys)

Access	Read only
Description	This attribute represents the interface's address at the protocol layer immediately `below' the network layer in the protocol stack. For interfaces which do not have such an address (e.g., a serial line), this object should be an octet string of zero length.
Mib	no_mib
Values	String (0..17, ASCII)
Default	No default

GROUP Rtr If AdditionalInfo

Properties	Operational
Description	This group contains additional information associated with this ifEntry, including SNMP ifXTable entry information.
Mib	no_mib

ATTRIBUTE Rtr If ifHCInOctets (inHCOctets)

Access	Read only
Description	This attribute reports the total number of octets received on the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifInOctets* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If ifHCInUcastPkts (inHCUcast)

Access	Read only
Description	This attribute reports the number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer. This High Capacity counter is a 64-bit version of the *ifInUcastPkts* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr If ifHCOutOctets (outHCOctets)

Access	Read only
Description	This attribute reports the total number of octets transmitted out of the interface, including framing characters. This High Capacity counter is a 64-bit version of the *ifOutOctets* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If ifHCOutUcastPkts (outHCUcast)

Access	Read only
Description	This attibutes reports the total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This High Capacity counter is a 64-bit version of the *ifOutUcastPkts* attribute.
Mib	no_mib
Values	Long Integer
Default	No default

COMPONENT Rtr If AtmMultiprotocolEncapsulation (AtmMpe)

Groups	GROUP Rtr If AtmMpe CustomerIdentifierData (CidData) GROUP Rtr If AtmMpe IfEntryProv (IfEntry) GROUP Rtr If AtmMpe Provisioned (Prov) GROUP Rtr If AtmMpe OsiState (State) GROUP Rtr If AtmMpe OperationalStatus (OperStatus)
Scope	Application
Description	*Rtr/<string> If/<IP addr> AtmMpe* *Rtr/<string> Vrf/<string> If/<IP addr> AtmMpe* This subcomponent represents a logical interface between the Router and an ATM media (*AtmIf*). Multiprotocol Encapsulation as specified in RFC1483 is used to transfer higher-layer protocol data across virtual channels in an ATM network. *AtmMpe* provides a means to associate multiple ATM virtual channel connections with a single *Router Interface*.

Copyright © 2006, Nortel Nortel Confidential

The *AtmMpe* component is associated with virtual channel connections via a linkage attribute in each *AtmConnection* subcomponent.

Mib	no_mib
Subcomponents	COMPONENT Rtr If AtmMpe AtmConnection (Ac)
Opt. Subcomp.	COMPONENT Rtr If AtmMpe SpvcTerminationPoint (Stp)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Rtr If AtmMpe CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	no_mib
Values	Decimal (0; 1..8191)
Default	0

Copyright © 2006, Nortel Nortel Confidential

GROUP Rtr If AtmMpe IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

ATTRIBUTE Rtr If AtmMpe ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	no_mib
Values	Decimal (1..65535)
Default	No default

GROUP Rtr If AtmMpe Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *AtmMpe* component under the Router Interface.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe maxTransmissionUnit (mtu)

Access	Read and write
Description	This attribute sets the size of the largest datagram which can be sent on the interface. This includes the size of the Logical Link Control header (if applicable) as well as the protocol data unit.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (256..9188)
Units	octets
Default	9188

ATTRIBUTE Rtr If AtmMpe encapType (etype)

Access	Read and write
Criticality	Component
Description	This attribute specifies the RFC-1483 encapsulation type to be used for the *AtmConnections* under this *AtmMpe*. Specifying ***llcEncap*** allows multiplexing of multiple protocols over the *VCCs*. The protocol of the carried PDU will be identified by an IEEE 802.2 Logical Link Control header. If Inverse ARP is to be carried over a VCC, ***llcEncap*** must be used. If the *Stp* component exists under the *AtmMpe*, ***llcEncap*** must be used. Specifying ***ipVcEncap*** indicates that all the VCCs (that is, *AtmConnection*s) under an *AtmMpe* component will use VC-based multiplexing and will carry IP PDUs only. Specifying ***llcBridgeEncap*** indicates that the VCC (that is, the *AtmConnection*) under an *AtmMpe* component will use the bridged Ethernet encapsulation format specified in RFC-1483. Note that when setting the *encapType* attribute to ***llcBridgeEncap***, the *maxTransmissionUnit* must be set within the ***[256 .. 1524]*** range.
Mib	no_mib
Values	llcEncap ipVcEncap llcBridgeEncap
Default	llcEncap

GROUP Rtr If AtmMpe OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr If AtmMpe operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr If AtmMpe usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Values:
idle
active (activ)
busy

Default: idle

GROUP Rtr If AtmMpe OperationalStatus (OperStatus)

Properties: Operational

Description: This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Mib: no_mib

ATTRIBUTE Rtr If AtmMpe snmpOperStatus

Access: Read only

Description: The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Mib: no_mib

Values:
up
down
testing

Default: up

COMPONENT Rtr If AtmMpe SpvcTerminationPoint (Stp)

Groups:
GROUP Rtr If AtmMpe Stp Provisioned (Prov)
GROUP Rtr If AtmMpe Stp Operational (Oper)

Scope: Application

Description:
AtmMpe/n Stp
Rtr/<string> If/<IP addr> AtmMpe Stp
Rtr/<string> Vrf/<string> If/<IP addr> AtmMpe Stp
This component specifies the SPVC related provisioning for the *AtmMpe*

component. Its presence identifies an *AtmMpe* component that contains one or more SPVC connections.

Mib: no_mib

Common Verbs: Help, List, Display, Add, DELete

GROUP Rtr If AtmMpe Stp Provisioned (Prov)

Properties: Provisioned

Description: This attribute group contains the provisionable attributes of the *SpvcTerminationPoint* component.

Mib: no_mib

ATTRIBUTE Rtr If AtmMpe Stp localAddress (laddr)

Access: Read: All
Write: All

Criticality: Component

Description: This attribute specifies the NSAP address of this *AtmMpe* component. The default is an empty string. If no NSAP address is provisioned, a default NSAP address is provided. To view the generated default address refer to the *opLocalAddress* attribute under this component after the *act prov* command is executed.

Mib: no_mib

Values: String (0..20, Hex)

Default: No default

ATTRIBUTE Rtr If AtmMpe Stp softPvcRetryPeriod (retry)

Access: Read: All
Write: All

Description: This attribute specifies the interval at which an SPVC connection attempts establishment after a failed setup attempt occurs. The *softPvcRetryPeriod* attribute applies to all connections managed by the parent *AtmMpe* component.

Mib: no_mib

Values: Decimal (10..3600)

Units: seconds

Default: 20

Copyright © 2006, Nortel
Nortel Confidential

ATTRIBUTE Rtr If AtmMpe Stp softPvcHoldOffTime (sHoldOffTime)

Access	Read: All Write: All
Description	This attribute specifies how long to hold off before attempting to reestablish a connection after an established SPVC connection is cleared/released. The *softPvcHoldOffTime* attribute applies to all connections managed by the parent *AtmMpe* component.
Mib	no_mib
Values	Decimal (0; 50..3600000)
Units	msec
Default	20000

GROUP Rtr If AtmMpe Stp Operational (Oper)

Properties	Operational
Description	This attribute group contains the operational attributes associated with the *SpvcTerminationPoint* component.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe Stp opLocalAddress (addr)

Access	Read: All Write: Illegal
Description	This attribute indicates the NSAP address of this *AtmMpe* component. The value is the same as the provisioned *laddr*. If the *laddr* is not provisioned, the value of *addr* is automatically generated by the software.
Mib	no_mib
Values	String (0..20, Hex)
Default	""

COMPONENT Rtr If AtmMpe AtmConnection (Ac)

Instance	Decimal (1..255)
Groups	GROUP Rtr If AtmMpe Ac Provisioned (Prov) GROUP Rtr If AtmMpe Ac OsiState (State) GROUP Rtr If AtmMpe Ac Operational (Oper) GROUP Rtr If AtmMpe Ac Statistics (Stats) GROUP Rtr If AtmMpe Ac IpIfLink
Scope	Application
Description	*AtmMpe/n AtmConnection/n* *Rtr/<string> If/<IP addr> AtmMpe AtmConnection/n* *Rtr/<string> Vrf/<string> If/<IP addr> AtmMpe AtmConnection/n* This component represents a virtual channel through which inter-

Copyright © 2006, Nortel Nortel Confidential

networking frames are transported using RFC 1483 encapsulation.

The *AtmConnection* component contains OSI state information, frame based statistics, and the linkage to an ATM virtual channel connection. This component's instance value is used by higher-layer protocols when referring to a specific ATM connection.

Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr If AtmMpe Ac SourcePvc (SrcPvc) COMPONENT Rtr If AtmMpe Ac DestinationPvc (DstPvc)
Dyn. Subcomp.	COMPONENT Rtr If AtmMpe Ac AtmConnection (AtmCon)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Rtr If AtmMpe Ac Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *AtmConnection* component.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe Ac atmConnection (link)

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM nailed up endpoint, *AtmIf/n Vcc/vpi.vci Nep,* that this connection is associated with. It must not be provisioned for an SPVC connection.
Mib	no_mib
Values	Link (Service, applicationName)
Default	No default

ATTRIBUTE Rtr If AtmMpe Ac ipCos

Access	Read and write
Criticality	Component
Description	This attribute specifies the connection class of the *AtmConnection.* This value is used to distinguish the connection from others for the purpose of IP and MPLS forwarding and accounting. Connection class values vary in

Copyright © 2006, Nortel Nortel Confidential

range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers.

If a packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one *AtmConnection*, then one of the connections is selected for transmitting the packet.

For IP packets the selection is based on either the Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet. For MPLS packets the selection is based on either the DSCP field of the IP packet or the EXP field of the MPLS packet.

DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component.
EXP based selection of the the outgoing connection is explained in the description of the *MplsServiceMap* component. Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the *AtmConnection*.

If the *AtmConnection* is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the *AtmConnection*. See the description of *Vr Ip CosPolicyGroup* for more information.

Mib	no_mib

Default	0

ATTRIBUTE Rtr If AtmMpe Ac **mplsSignaling (mplsSig)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this AtmMpe Ac is dedicated for MPLS signaling (LDP or CR-LDP), or shared between MPLS and IP. If the value is ***dedicated***, the *Ac* is dedicated for MPLS signaling; the route is not found in IP ARP. If the value is ***shared***, the *Ac* is accessible by IP. The checking of this provisionable attribute is done through semantic checking. The attribute takes on the value ***shared*** by default, and can only be ***dedicated*** if there are more than one *Ac* under the *AtmMpe*.
Mib	no_mib
Values	shared dedicated
Default	shared

GROUP Rtr If AtmMpe Ac **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe Ac **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr If AtmMpe Ac **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr If AtmMpe Ac usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr If AtmMpe Ac Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *AtmConnection* component.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe Ac speed

Access	Read only
Description	This attribute indicates the approximate bit rate for the connection. The bit rate is determined from the cell rate provisioned for the *Vcc* linked to this connection. The cell rate is multiplied by 53 bytes per cell and 8 bits per byte to obtain the bit rate. The *ifSpeed* of the entry in the ifTable corresponding to the *AtmMpe* component is the lowest speed of all the connections associated with the *AtmMpe* component. This attribute is always equal to 0 for an SPVC.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	bit/s

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP Rtr If AtmMpe Ac Statistics (Stats)

Properties	Operational
Description	This group contains the frame based statistics maintained for the *AtmConnection* component. For cell based statistics, see the *Vcc* component.
Mib	no_mib

ATTRIBUTE Rtr If AtmMpe Ac outPackets

Access	Read only
Description	This attribute counts the total number of packets sent on this connection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If AtmMpe Ac outOctets

Access	Read only
Description	This attribute counts the total number of octets sent on this connection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If AtmMpe Ac outDiscards

Access	Read only
Description	This attribute counts the total number of packets which were supposed to be sent on this connection but were discarded due to congestion or the connection being down. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If AtmMpe Ac inPackets

Access	Read only
Description	This attribute counts the total number of packets received on this connection. This counter will wrap around to 0 when it exceeds its maximum count.

Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If AtmMpe Ac **inOctets**

Access	Read only
Description	The attribute counts the total number of octets received on this connection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If AtmMpe Ac **inUnknownProtos**

Access	Read only
Description	This attribute counts the total number of packets received on this connection which were discarded because they contained an unknown or unsupported protocol (includes packets received for protocols not currently bound to the associated *ProtocolPort* component). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr If AtmMpe Ac **inErrors**

Access	Read only
Description	This attribute counts the total number of packets received on the connection which contained errors preventing them from being delivered to a higher-layer protocol (includes short frames). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtr If AtmMpe Ac **lpIfLink**

Properties	Provisioned
Description	This group contains the link between this component and an *IpLogicalInterface*.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr If AtmMpe Ac linkToIpLogicalInterface (ipIf)

Access	Read and write
Description	This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with. This attribute is not applicable and cannot be set when the *AtmConection* component is added under an *Rtr If AtmMpe* or an *Rtr Vrf If AtmMpe* component. When set, the value of this attribute must be consistent with the *linkToPrototocolPort* attribute value of the parent *AtmMpe* component. That is, they must both point to the same *PrototocolPort* component.
Mib	no_mib
Values	Link (Service, linkToMediaConnection)
Default	No default

GROUP Rtr If BootpP Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisionable attributes for the *BootpPort* component.

Mib: no_mib

ATTRIBUTE Rtr If BootpP relayForwardStatus (status)

Access: Read and write

Description: This attribute controls how BOOTP request packets, received on another port, will be flooded out this port. If *relayForwardStatus* is ***enabled***, BOOTP requests received on another port will be broadcast out this port. When *relayForwardStatus* is ***disabled***, BOOTP requests will not be broadcast out this port. If ***auto*** is used, the bridge spanning tree database is used to determine if BOOTP requests should be broadcast out this port.

Note that when using ***enabled***, it is possible to create misconfigurations which will result in broadcast storms. When using this feature with multiple routers, make sure there are no broadcast forwarding loops. Using ***auto*** with bridge spanning tree is safer to use if the network is running bridge spanning tree.

Note that for ***auto*** to have effect, bridge spanning tree must be running on the corresponding *VirtualRouter ProtocolPort* or *Rtr Interface* or *Rtr Vrf Interface*.

Mib: no_mib

Values:
enabled
disabled
auto

Default: disabled

ATTRIBUTE Rtr If BootpP bootpLogicalInterface (portIf)

Access: Read and write

Copyright © 2006, Nortel
Nortel Confidential

Description	This attribute identifies the logical interface whose address is to be the GIADDR of this BOOTP port. If not set, the address of the first logical port or Interface is chosen.
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr If BootpP relayAddress (addr)

Access	Read and write
Description	This attribute identifies a list of relay addresses. When a BOOTP request message is received on this port, the request will be forwarded to the IP addresses provisioned in *relayAddress*. Note that BOOTP requests are also broadcast out all other *BootpPort*'s according to the *relayForwardStatus* of the outgoing port.

Access	Read and write
Description	The estimated number of seconds it takes to transmit a link-state update packet over this interface.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	1

ATTRIBUTE Rtr If Ospfif retransInterval (retransInt)

Access	Read and write
Description	The number of seconds between link-state advertisements retransmissions, for adjacencies belonging to this interface. This value is also used when retransmitting database description and link-state request packets.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	5

ATTRIBUTE Rtr If Ospfif helloInterval (helloInt)

Access	Read and write
Description	The length of time, in seconds, between the Hello packets that the router sends on the interface. This value must be the same for all routers attached to a common network.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	10

ATTRIBUTE Rtr If Ospfif rtrDeadInterval (rtrDeadInt)

Access	Read and write
Description	The number of seconds that a router's hello packets have not been seen before it's neighbors declare the router down. This should be some

Copyright © 2006, Nortel Nortel Confidential

	multiple of the *helloIntereval*. This value must be the same for all routers attached to a common network.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	40

ATTRIBUTE Rtr If Ospfif pollInterval (pollInt)

Access	Read and write
Description	The largest time interval, in seconds, between the hello packets sent to an inactive non-broadcast multi-access neighbor.
Mib	no_mib
Values	Decimal (1..3600)
Units	seconds
Default	120

ATTRIBUTE Rtr If Ospfif authKey

Access	Write only
Description	The Authentication Key. If the value of the attribute *authType* of an *AreaEntry* is ***simplePassword***, and the *authKey* length is shorter than 8 octets, then the value of *authKey* will be left adjusted zero-filled to 8 octets.
Mib	no_mib
Values	String (1..8, Hex)
Default	0000000000000000

ATTRIBUTE Rtr If Ospfif multicastForwarding (multicastFwd)

Access	Read and write
Description	The way multicasts should be forwarded on this interface; non forwarded, forwarded as data-link multicasts, or forwarded as data-link unicasts. Data-link multicasting is not meaningful on point-to-point and NBMA(No Broadcast Multi Access) interfaces, and setting this attribute to blocked effectively disables all multicast forwarding.
Mib	no_mib
Values	blocked
Default	blocked

ATTRIBUTE Rtr If Ospfif pointToMultiPointMode (ptmpmode)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the Point-to-Multipoint mode to use when the *ifType* of this *OspfInterface* is ***pointToMultipoint***. A value of ***nonBroadcast*** restricts this interface to only send unicast packets, Hence, a *Neighbor* component must be configured. A value of ***broadcast*** enables sending multicast OSPF Hello packets to dynamically discover neighbors.
Mib	no_mib
Values	nonBroadcast (nbc) broadcast (bc)
Default	nonBroadcast

ATTRIBUTE Rtr If Ospfif **authType**

Access	Read and write
Description	The authentication type specified for this *Ospf* interface.
Mib	no_mib
Values	none simplePassword md5 SameAsArea
Default	SameAsArea

GROUP Rtr If Ospfif **Operational (Oper)**

Properties	Operational
Description	This group of attributes identifies operational state that this interface is performing.
Mib	no_mib

ATTRIBUTE Rtr If Ospfif **state**

Access	Read only
Description	The state of the OSPF interface.
Mib	no_mib
Values	down loopback waiting pointToPoint designatedRouter backupDesignatedRouter otherDesignatedRouter
Default	designatedRouter

ATTRIBUTE Rtr If Ospfif **designatedRouter**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The Ip address of the designated router.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr If OspfIf **backupDesignatedRouter**

Access	Read only
Description	The Ip address of the backup designated router
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr If OspfIf **events**

Access	Read only
Description	The number of times this OSPF interface has changed its state or an error has occurred.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

GROUP Rtr If OspfIf **Metric**

Properties	Operational
Description	This group contains the operational metric attribute of this interface.
Mib	no_mib

ATTRIBUTE Rtr If OspfIf **metric**

Access	Read only
Description	This attribute indicates the metric being used by this *OspfIf*. The metric is derived in one of two ways: 1. If there is a *TypeOfService* component provisioned under this *OspfIf* component, then the value of the *metric* attribute is copied from the provisionable attribute *tosMetric*. 2. Otherwise, the metric is computed based on the interface speed. If the interface speed is greater than 100 Mbit/s, then the *metric* is 1. If the interface speed is less than 100 Mbit/s, then the metric is 100 Mbit/s divided by the interface speed. If the interface speed is unknown, then it is treated as 1.54 Mbit/s during the calculation. The value of interface speed is available by displaying the *ifSpeed* attribute of the corresponding *IfTableEntry* component.

Properties	Provisioned
Description	This group contains the attributes used to independently configure each ISIS interface routing level.
Mib	no_mib

ATTRIBUTE Rtr If IsisIf Level metric

Access	Read: All Write: All
Description	This attribute specifies the cost of this interface, which is used by the SPF algorithm in this and other routers. This value is advertised in the LSP.
Mib	no_mib
Values	Decimal (0..63)
Default	10

ATTRIBUTE Rtr If IsisIf Level helloInterval

Access	Read: All Write: All
Description	This attribute specifies the time, in seconds, between transmission of successive hello messages (IIH PDU).
Mib	no_mib
Values	Decimal (1..20000)
Units	seconds
Default	10

ATTRIBUTE Rtr If IsisIf Level helloMultiplier

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the factor by which the *helloInterval* attribute is multiplied in order to create the hold time value transmitted in the hello packets (IIH PDU). The hold time value is used by the receiving router to determine how long it should maintain the adjacency if a subsequent hello packet is not received.
Mib	no_mib
Values	Decimal (2..100)
Default	3

ATTRIBUTE Rtr If IsisIf Level **csnpInterval**

Access	Read: All Write: All
Description	This attribute specifies the time interval, in seconds, between successive transmissions of the CSNP PDUs.
Mib	no_mib
Values	Decimal (1..600)
Units	seconds
Default	10

ATTRIBUTE Rtr If IsisIf Level **priority**

Access	Read: All Write: All
Description	This attribute specifies the DIS priority for this router. On a multi-access LAN, the router with the highest DIS priority is elected to represent the LAN. The elected router transmits an LSP for the pseudonode representing the LAN.
Mib	no_mib
Values	Decimal (0..127)
Default	64

GROUP Rtr If IsisIf Level **Operational (Oper)**

Scope	Application
Description	*Vr/<string> Pp/<string> Ip IngressServices* *Rtr/<string> Vrf/<string> If/<x.x.x.x> IngressServices* This component and its subcomponents represent various traffic management services applied to IP traffic entering an interface.
Mib	no_mib
Dyn. Subcomp.	COMPONENT Rtr If IS MeterStatistics (Meter)
Common Verbs	Help List Display Add DELete

GROUP Rtr If IS IngressServicesLinks (IsLinks)

Properties	Provisioned
Description	This group contains links to various components for traffic management services applied to IP traffic entering an interface.
Mib	no_mib

ATTRIBUTE Rtr If IS linkToDiffServProfile (dsLink)

Access	Read and write
Description	This attribute specifies the *DiffServProfile* component applied to IP traffic entering an interface.
Mib	no_mib
Values	Link (Service, linkToDiffServUsers)
Default	No default

ATTRIBUTE Rtr If IS linkToPolicerProfile (policerLink)

Access	Read and write
Description	This attribute specifies the *PolicerProfile* component applied to IP traffic entering an interface.
Mib	no_mib
Values	Link (Service, linkToPolicerUsers)
Default	No default

GROUP Rtr If IS ServiceSpecification (Sp)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains provisionable attributes of the *IngressServices* component.
Mib	no_mib

ATTRIBUTE Rtr If IS discardPriorityMode (dpMode)

Access	Read and write
Description	This attribute specifies how drop precedence is assigned to IP traffic entering an interface. If this attribute is set to ***mapPhbToDp*** then drop precedence is assigned to IP traffic entering the interface as explained in the description of the *DifferentiatedServicesDomain* component. If this attribute is set to ***mapLayer2ToDp*** then the drop precedence assigned to IP traffic entering the interface is determined by the ingress Layer 2 media. For an IP packet arriving on *AtmMpe* the cell loss priority (CLP) bit in the ingress cell header is mapped to drop precedence value according to ATM traffic management provisioning. For an IP packet arriving on *FrDte or IpDlciGroup* the discard eligible (DE) bit in the ingress frame header is mapped to drop precedence value according to Frame Relay traffic management provisioning. For IP traffic arriving on other media ***high*** drop precedence is assigned. The *Rtr Interface IngressServices dpMode* and *Rtr Vrf Interface IngressServices dpMode* attributes must be set to ***mapPhbToDp***. The *IpPort IngressServices dpMode* attribute must be set to ***mapPhbToDp*** if the *linkToPolicerProfile* attribute is set or if the *IpPort* is associated with IP tunnel media. The *IpPort IngressServices dpMode* attribute has no effect if either of the following two conditions is true: 1) the *VirtualRouter* component does not have *DifferentiatedServicesDomain* subcomponent (see the description of the *CosPolicyGroup* component for more information about drop precedence in this case); 2) the IP packet leaves an interface where the *IpPort EgressServices linkToPolicerProfile* attribute is set (see the description of the *PolicerProfile Meter PolicedPhb outOfProfile* attribute for more information about drop precedence in this case).
Mib	no_mib
Values	mapPhbToDp mapLayer2ToDp
Default	mapPhbToDp

GROUP Rtr If IS InterfaceServices (IntServ)

ATTRIBUTE Rtr If IS Meter excessBurstSize (be)

Access	Read only
Description	This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Mib	no_mib
Values	Decimal (0..50000000)
Units	bits
Default	No default

ATTRIBUTE Rtr If IS Meter measurmentInterval (t)

Access	Read only
Description	This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*. The value of this attribute is derived from the provisioned *cir* and *bc* attributes values when both of those attributes are non-zero (t=*bc/cir*); otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE Rtr If IS Meter status

Access	Read only
Description	This attribute indicates whether the meter is enabled or disabled at the interface where the policer is configured. The meter may be disabled if engineering limits for IP Policing on the FP are exceeded. Each policer assignment that involves a disabled meter should be removed.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	disabled enabled
Default	No default

GROUP Rtr If IS Meter Statistics (Stats)

Properties	Operational
Description	This group contains the statistical attributes of the *MeterStatistics* component.
Mib	no_mib

ATTRIBUTE Rtr If IS Meter packetsReceived

Access	Read only
Description	This attribute counts the number of packets received by the traffic meter. It includes packets that are discarded due to excess. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If IS Meter octetsReceived

Access	Read only
Description	This attribute counts the number of octets received by the traffic meter. It includes octets that are discarded due to excess. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If IS Meter eirPacketsReceived (excessPackets)

Access	Read only
Description	This attribute counts the number of packets received by the traffic meter that contributed only to the excess information rate. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If IS Meter eirOctetsReceived (excessOctets)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of octets received by the traffic meter that contributed only to the excess information rate. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If IS Meter **packetsRemarked**

Access	Read only
Description	This attribute counts the number of packets that contributed to and exceeded the commited information rate. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If IS Meter **octetsRemarked**

Access	Read only
Description	This attribute counts the number of octets that contributed to and exceeded the commited information rate. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If IS Meter **packetsDiscarded**

Access	Read only
Description	This attribute counts the number of packets discarded by the traffic meter. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib
Values	Long Integer
Default	No default

ATTRIBUTE Rtr If IS Meter **octetsDiscarded**

Access	Read only
Description	This attribute counts the number of octets discarded by the traffic meter. When this count exceeds maximum value, it wraps to 0.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default
Default	COLLECTED STATS Router Interface IngressServices MeterStatistics
Description	The statistics record generated by the Router Interface IngressServices MeterStatistics component.

ATTRIBUTE Rtr If IS Meter committedInformationRate (cir)

Description	This attribute indicates the committed information rate (cir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network agrees to transfer information under normal conditions. The provisioned *cir* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..600000000)

ATTRIBUTE Rtr If IS Meter excessInformationRate (eir)

Description	This attribute indicates the excess information rate (eir) in bits per second (bits/s) for the *Meter*. It represents the rate at which network will attempt to transfer information. The value of this attribute is derived from the *excessBurstSize* (*be*) and *measurmentInterval* (*t*) operational attribute values (eir = *be*/*t)*.
Values	Decimal (0..50000000)

ATTRIBUTE Rtr If IS Meter committedBurstSize (bc)

Description	This attribute indicates the committed burst size (bc) in bits for the *Meter*. The provisioned *bc* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..600000000)

ATTRIBUTE Rtr If IS Meter excessBurstSize (be)

Description	This attribute indicates the excess burst size (be) in bits for the *Meter*. The provisioned *be* attribute of the *Meter* component specifies the upper bound of this attribute value which might be adjusted in some cases.
Values	Decimal (0..50000000)

ATTRIBUTE Rtr If IS Meter measurmentInterval (t)

Description	This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured by the *Meter*. The value of this attribute is derived from the provisioned *cir* and *bc* attributes values when both of those attributes are non-zero (t=*bc/cir*); otherwise, it is equal to the provisioned *Meter measurmentInterval* attribute value.
Values	Decimal (0..4294967295)

ATTRIBUTE Rtr If IS Meter packetsReceived

Copyright © 2006, Nortel Nortel Confidential

Description This attribute indicates the number of packets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess.

Values Long Integer

ATTRIBUTE Rtr If IS Meter octetsReceived

Description This attribute indicates the number of octets received by the traffic meter during the prior statistics collection interval. It includes packets that are discarded due to excess

Values Long Integer

ATTRIBUTE Rtr If IS Meter eirPacketsReceived (excessPackets)

Description This attribute indicates the number of packets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr If IS Meter eirOctetsReceived (excessOctets)

Description This attribute indicates the number of octets received by the traffic meter that contributed only to the excess information rate during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr If IS Meter packetsRemarked

Description This attribute indicates the number of packets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr If IS Meter octetsRemarked

Description This attribute indicates the number of octets that contributed to and exceeded the committed information rate during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr If IS Meter packetsDiscarded

Description This attribute indicates the number of packets discarded by the traffic meter during the prior statistics collection interval.

Values Long Integer

ATTRIBUTE Rtr If IS Meter octetsDiscarded

Description This attribute indicates the number of octets discarded by the traffic meter during the prior statistics collection interval. .

Values Long Integer

Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr If RipIf Neighbor (Nbr)
Common Verbs	Help List Display Add DELete

GROUP Rtr If RipIf Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *RipIf* component.
Mib	no_mib

ATTRIBUTE Rtr If RipIf snmpAdminStatus

Access	Read and write
Description	Identifies the administrative status of this *RipInterface*. Setting this value to ***disabled*** will have the effect of rendering it inactive.
Mib	no_mib
Values	up down
Default	up

ATTRIBUTE Rtr If RipIf metric

Access	Read and write
Description	This attribute is the RIP metric for this logical interface.
Mib	no_mib
Values	Decimal (1..16)
Default	1

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Rtr If RipIf **poisonReverseFlag (poison)**

Access	Read and write
Description	If the value of this attribute is set to ***true***, then poison reverse algorithm is used when sending out the updates otherwise use split horizon only.
Mib	no_mib
Values	true false
Default	false

ATTRIBUTE Rtr If RipIf **flashUpdateFlag**

Access	Read and write
Description	This attribute when set to ***true*** will send updates when updates are received; otherwise RIP will wait till the next update period.
Mib	no_mib
Values	true false
Default	true

ATTRIBUTE Rtr If RipIf **networkRouteStatus**

Access	Read and write
Description	This attribute determines what type of network routes will be sent and whether a default route will be generated for this *RipInterface*. Generated default routes will not go into the routing table, but are sent in the updates going out on the interface. The possible values for this attribute are: ***naturalNetWithOutDefaultRoute*** - This value will cause normal RIP network routes to be put in the update. This means that the address of *logicalIf* or *Interface* pertaining to this *RipInterface* knowledge is taken into account in determining if the subnetted network or the natural network is sent for any route going into this update. ***naturalNetWithDefaultRoute*** - Selecting this value will cause a default route to be generated with the value of the metric selected for the attribute *defaultRouteMetric*. ***defaultRouteOnly*** - Selection of this value causes the default route to be generated with the value of the metric selected for the attribute *defaultRouteMetric*. NOTE: No other routes will go in the update. ***subnetsOnly*** - selection of this value will cause only subnet information to be put in the update. No default routes will be generated or passed on.

Copyright © 2006, Nortel Nortel Confidential

	Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be put in the update. NOTE: this also effects receiving of updates on this interface. Only subnetted routes that are part of the same subnetted network that this *logicalInterface* or *Interface* is on will be accepted on a received RIP update on this *RipInterface*.
Mib	no_mib
Values	naturalNetWithOutDefaultRoute (noDefault) naturalNetWithDefaultRoute (withDefault) defaultRouteOnly (defaultOnly) subnetsOnly (subnets)
Default	naturalNetWithOutDefaultRoute

ATTRIBUTE Rtr If RipIf defaultRouteMetric

Access	Read and write
Description	This attribute identifies the metric value for the default route. This value is only used if the attribute *networkRouteStatus* is configured with a value of either ***naturalNetWithDefaultRoute*** or ***defaultRouteOnly***
Mib	no_mib
Values	Decimal (1..16)
Default	1

ATTRIBUTE Rtr If RipIf acceptDefault

Access	Read and write
Description	If this attribute is set to true, then accept the default route from this interface.
Mib	no_mib
Values	true false
Default	true

ATTRIBUTE Rtr If RipIf ifConfSend

Access	Read and write
Description	This attribute identifies what the router sends on this *RipIf*. ***ripVersion1*** implies sending RIP updates compliant with RFC 1058. ***rip1Compatible*** implies broadcasting RIP-2 updates according to RFC 1058. ***ripVersion2*** implies multicasting RIP-2 updates.
Mib	no_mib
Values	doNotSend (silent) ripVersion1 (v1)

Copyright © 2006, Nortel Nortel Confidential

	rip1Compatible (v2b) ripVersion2 (v2)
Default	rip1Compatible

ATTRIBUTE Rtr If RipIf **ifConfReceive**

Access	Read and write
Description	This attribute identifies which version of RIP updates are to be accepted on this *RipIf*. Note that ***rip2*** and ***rip1OrRip2*** implies reception of multicast packets.
Mib	no_mib
Values	rip1 (v1) rip2 (v2) rip1OrRip2 (both) doNotReceive (reject)
Default	rip1OrRip2

GROUP Rtr If RipIf **Operational (Stat)**

Properties	Operational
Description	This group contains operational attributes of the *RipIf* component. These attributes are statistical data corresponding to the RIP-2 standard MIB (rfc 1724) rip2Status table.
Mib	no_mib

ATTRIBUTE Rtr If RipIf **ifBadPacketRcv**

Access	Read only
Description	This attribute counts the number of RIP response packets recieved by the RIP process which were subsequently discarded for any reason.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr If RipIf **ifBadRouteRcv**

Access	Read only
Description	This attribute counts how many routes, in valid RIP packets, were ignored for any reason.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr If RipIf **ifTriggeredUpdates**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the number of triggered updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

COMPONENT Rtr If RipIf Neighbor (Nbr)

Description	This group contains the provisionable attributes for the VrrpPort component.
Mib	no_mib

ATTRIBUTE Rtr If VrrpPort priority

Access	Read and write
Description	This attribute specifies the priority of *VrrpPort* during election of a master VRRP virtual router. A priority of 0 (zero) is reserved for the master to indicate it is releasing responsibility for the VRRP virtual router. A priority of 255 is reserved for the VRRP virtual router that owns (has as real interfaces) the IP addresses associated with this *VrrpPort*.
Mib	no_mib
Values	Decimal (1..255)
Default	100

ATTRIBUTE Rtr If VrrpPort advertisementInterval

Access	Read and write
Description	This attribute specifies the time interval between VRRP advertisements which will be sent by the master VRRP virtual router.
Mib	no_mib
Values	Decimal (1..255)
Units	seconds
Default	1

ATTRIBUTE Rtr If VrrpPort listLinkToCriticalIp (listLinkToCIp)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the *CriticalIp* instance to which the *VrrpPort* instance is linked. If the *IpPort* associated with this *CriticalIp* instance becomes disabled, the *VrrpPort* becomes disabled..
Mib	no_mib
Values	Link (Service, listLinkToVrrp)
Default	No default

ATTRIBUTE Rtr If VrrpPort **holdDownTime (hdt)**

Access	Read and write
Description	This attribute specifies the length of time that a VrrpPort instance is prevented from participating in a VRRP Master virtual router election, if it has given up Mastership due to a failure, once the failure has been corrected. This allows the network routing protocol to re-establish a route to this VrrpPort instance when it becomes available. When the length of the holdDownTime is reached, a VRRP Master virtual router election occurs and the highest priority VrrpPort instance will become the VRRP Master virtual router. A holdDownTime attribute value of notApplicable disables the holdDownTime functionality. Any other value should be calculated based on an estimate of the time requiredfor the network routing protocol to establish a route to a VrrpPort instance, that has been disabled by a failure, once it has recovered. If the new VRRP Master virtual router fails within the holdDownTime interval and no other VRRP Backup virtual router is available, the holdDownTime functionality is canceled and the highest priority VrrpPort instance will become the VRRP Master virtual router. In a situation where both the VRRP Master and Backup virtual routers are on the same MSS, and both are affected by the same failure, the holdDownTime functionality doesn't add any value since the network routes to both VrrpPort instances are affected.
Mib	no_mib
Values	Decimal (1..3600) notApplicable (na)
Units	seconds
Default	notApplicable

ATTRIBUTE Rtr If VrrpPort **ipAddresses**

Access	Read and write
Description	This attribute specifies one or more IP addresses associated with this *VrrpPort* instance (VRID). All VRRP virtual routers with this VRID must have the same set of IP addresses configured. Each of the IP addresses

Copyright © 2006, Nortel Nortel Confidential

	in the list must be on the same subnet as an *IpLogicalInterface* for the *IpPort*. All the IP addresses in the list must be owned by this VRRP virtual router or by other VRRP virtual routers but not a combination.
Mib	no_mib
List of	IP address
Default	No default

GROUP Rtr If VrrpPort Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *VrrpPort* component.
Mib	no_mib

ATTRIBUTE Rtr If VrrpPort virtualRouterState

Access	Read only
Description	This attribute indicates the state of this *VrrpPort* instance. It will be one of three states: initialize, backup and master.
Mib	no_mib
Values	initialize backup master
Default	initialize

ATTRIBUTE Rtr If VrrpPort virtualRouterPhysicalAddress

Access	Read only
Description	This attributes indicates the physcial address of the *VrrpPort*. The address is a virtual physical address of the form “00-00-5e-00-01-VRID” where the VRID is the instance value of the *VrrpPort*.
Mib	no_mib
Values	String (6, Dashed Hex)
Default	No default

GROUP Rtr If VrrpPort AdministrativeControl (AdminControl)

Properties	Provisioned
Description	This group includes the Administrative Control attribute. This attribute defines the current administrative state of this component.
Mib	no_mib

ATTRIBUTE Rtr If VrrpPort snmpAdminStatus

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	The desired state of the interface. The ***up*** state indicates the interface is operational and packet forwarding is allowed. The ***down*** state indicates the interface is not operational and packet forwarding is unavailable. The ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr If VrrpPort **OperationalStatus (OperStatus)**

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr If VrrpPort **snmpOperStatus**

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

GROUP Rtr If VrrpPort **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr If VrrpPort **adminState (osiAdmin)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr If VrrpPort **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr If VrrpPort **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib no_mib

Values
idle
active (activ)
busy

Default idle

COMPONENT Rtr If Loopback (Lb)

Groups
GROUP Rtr If Lb IfEntryProv (IfEntry)
GROUP Rtr If Lb Provisioned (Prov)
GROUP Rtr If Lb OsiState (State)
GROUP Rtr If Lb OperationalStatus (OperStatus)

Scope Application

Description
Rtr/<string> Interface/<string> Loopback
Rtr/<string> Vrf/<string> Interface/<string> Loopback
The *Loopback* component represents an instance of a logical media. *Loopback* provides IP connectivity between routers on the same module, and supports an 'always-up IP interface' concept; i.e interface stays up unless it is administratively disabled or the hardware goes down.

Values	up down testing
Default	up

ATTRIBUTE Rtr If Lb ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	no_mib
Values	Decimal (1..65535)
Default	No default

GROUP Rtr If Lb Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Loopback* component.
Mib	no_mib

ATTRIBUTE Rtr If Lb mode

Access	Read and write
Criticality	Component
Description	This attribute specifies the mode of operation of the *Loopback*. The following modes are supported: ***alwaysUpInterface***, and ***primaryLoopback***. ***alwaysUpInterface***: This mode limits the *Loopback* to provide the functionality of an 'always up interface' only. Inter router communication is not possible when this mode is selected. Memory consumption by the *Loopback If* is significantly less on the FP when this mode is selected. Hence this mode should be used when the sole purpose of the *Loopback If* is to provide an always up interface for an application like BGP4. ***primaryLoopback***: Only supported under *Router*; a router can have only one Interface which has a *Loopback* component with mode primaryLoopback.
Mib	no_mib
Values	alwaysUpInterface primaryLoopback

Copyright © 2006, Nortel Nortel Confidential

Default	alwaysUpInterface

GROUP Rtr If Lb OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr If Lb adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib

COMPONENT Rtr If RsvpTeIf

Groups	GROUP Rtr If RsvpTeIf Provisioned (Prov) GROUP Rtr If RsvpTeIf OsiState (State) GROUP Rtr If RsvpTeIf Operational (Op) GROUP Rtr If RsvpTeIf InboundStatistics (InStats) GROUP Rtr If RsvpTeIf OutboundStatistics (OutStats)
Scope	Application
Description	*Rtr/<s> Interface/<IP Address> RsvpTeIf* This component represents an instance of the RSVP-TE protocol running over the interface.
Mib	no_mib
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Rtr If RsvpTeIf Provisioned (Prov)

Properties	Provisioned
Description	This group contains attributes for MPLS RSVP-TE configurable capability on a per interface basis.
Mib	no_mib

ATTRIBUTE Rtr If RsvpTeIf adminStatus (status)

Access	Read: All Write: All
Description	This attribute specifies the administrative status of this RSVP-TE interface. It is used to maintain the admin state over FP and nodal restarts.
Mib	no_mib
Values	null enabled disabled testing
Default	enabled

ATTRIBUTE Rtr If RsvpTeIf reservableFactor (resFactor)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the percentage of media bandwidth available for LSP Tunnel reservations over this interface. A value of 0 prevents any bandwidth allocation for LSPs. A value of 100 allows RSVP-TE exclusive use of available bandwidth. Intermediate values allow distribution of bandwidth amongst RSVP-TE and other applications.
Mib	no_mib
Values	Decimal (0..100)
Units	%
Default	50

ATTRIBUTE Rtr If RsvpTelf overbookingFactor (overBook)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the percentage of the total bandwidth pool that is not sharable between LSP connections. The percentage ranges from 0% to 1000%. This allows for both under and over subscription of the bandwidth. A value of 100 results in absolute allocations--signaled bandwidth is exactly that allocated. A value < 100 allows under subscription of the link. A value > 100 allows over subscription of the link.
Mib	no_mib
Values	Decimal (0..1000)
Units	%
Default	100

ATTRIBUTE Rtr If RsvpTelf mediaCapacity (mediaCap)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the capacity in kbits/sec of the underlying media link for the interface. For GigE links, the default can be retained. For ATM links, this attribute should be set to the sum of the bandwidth provisioned for the underlying VCC(s) linked to the associated *Rtr/<s> Interface/<IP Address> AtmMpe*.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	Decimal (0..4294967295)
Units	kbit/s
Default	860000

ATTRIBUTE Rtr If RsvpTelf refreshInterval (rInt)

Access	Read: All Write: All
Description	This attribute specifies the interval between refresh messages sent by this LSR on this interface. This value is sent in the TIME_VALUES object of the PATH/RESV message to the next hop and is used in calculation of the lifetime of the PATH/RESV state block at the next hop. Setting this value will override the *refreshInterval* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (1..1800) sameAsRsvpTe
Units	seconds
Default	sameAsRsvpTe

ATTRIBUTE Rtr If RsvpTelf refreshKeepMultiplier (rKeep)

Access	Read: All Write: All
Description	This attribute specifies the default minimum number of refresh intervals that must pass before a PATH or a RESV state which is not being refreshed is aged out. This value is used in calculating the lifetime of the Path State Blocks (PSB) and Reservation State Blocks (RSB) for this interface; it prevents premature loss of these states. Setting this value will override the *refreshKeepMultiplier* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (1..50) sameAsRsvpTe
Default	sameAsRsvpTe

ATTRIBUTE Rtr If RsvpTelf slewMax (slew)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This value specifies the rate at which an increase in the *refreshInterval* is introduced on the LSR. When a new *refreshInterval* value is provisioned to a higher value, the refresh interval is increased at *slewMax* percentage of the previous interval at each PATH/RESV cycle. In another words, the ratio of two successive refresh interval values do not exceed 1 + (Slew Max/100). Setting this value will override the *slewMax* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (1..200) sameAsRsvpTe
Units	%
Default	sameAsRsvpTe

ATTRIBUTE Rtr If RsvpTeIf helloInterval (hInt)

Access	Read: All Write: All
Description	This attribute specifies the interval between HELLO messages sent by this LSR on this interface. A value of ***disabled*** indicates that the Hello mechanism is not enabled. Setting this value will override the *helloInterval* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (0.1..100.0) disabled sameAsRsvpTe
Units	seconds
Default	sameAsRsvpTe

ATTRIBUTE Rtr If RsvpTeIf helloMultiplier (hMult)

Access	Read: All Write: All
Description	This attribute specifies the minimum number of HELLO intervals that must pass before the RSVP-TE connection is considered down. Setting this value will override the *helloMultiple* attribute value under *Rtr/<s> RsvpTe*.
Mib	no_mib
Values	Decimal (2.0; 2.5; 3.0; 3.5; 4.0; 4.5; 5.0; 5.5; 6.0; 6.5; 7.0; 7.5; 8.0; 8.5; 9.0; 9.5; 10.0) sameAsRsvpTe
Default	sameAsRsvpTe

GROUP Rtr If IpoDlci CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib no_mib

ATTRIBUTE Rtr If IpoDlci customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib no_mib

Values Decimal (0; 1..8191)

Default 0

GROUP Rtr If IpoDlci **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr If IpoDlci **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr If IpoDlci **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr If IpoDlci usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	no_mib
Values	idle active (activ) busy
Default	idle

GROUP Rtr If IpoDlci OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	no_mib

ATTRIBUTE Rtr If IpoDlci snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	no_mib
Values	up down testing
Default	up

COMPONENT Rtr If IpoDlci FrConnection (Frc)

Instance	Decimal (1..255)
Groups	GROUP Rtr If IpoDlci Frc Provisioned (Prov) GROUP Rtr If IpoDlci Frc OsiState (State) GROUP Rtr If IpoDlci Frc Statistics (Stats)
Scope	Application
Description	*IpDlciGrp/n FrConnection/n* This component represents a virtual connection over which internetworking frames are relayed between IP and frame relay.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr If IpoDlci Frc Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *FrConnection* component.
Mib	no_mib

ATTRIBUTE Rtr If IpoDlci Frc linkToFrDlci (frDlci)

Access	Read and write
Criticality	Component
Description	This attribute specifies the frame relay *Dlci IpConn* component that this connection is associated with.
Mib	no_mib
Values	Link (Hardware, linkToIpDlciGrp)
Default	No default

ATTRIBUTE Rtr If IpoDlci Frc ipCos

Access	Read and write
Criticality	Component
Description	This attribute specifies the connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and accounting. Connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers.

Copyright © 2006, Nortel Nortel Confidential

If an IP packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is based on either the Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet.

DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component.
Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component.

Modifying this attribute will reset the *FrConnection*.

If the *FrConnection* is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.

Mib	no_mib
Values	Decimal (0..3)
Default	0

ATTRIBUTE Rtr If IpoDlci Frc **linkToIpLogicalInterface (ipIf)**

Access	Read and write
Description	This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ ipAddress*, that this connection is associated with. When set, the value of this attribute must be consistent with the *linkToProtocolPort* attribute value of the parent *IpDlciGroup* component. That is, they must both point to the same *ProtocolPort* component.
Mib	no_mib
Values	Link (Service, linkToMediaConnection)
Default	No default

Common Verbs	Help List Display Add DELete

COMPONENT Rtr Mpls Path Hop

Instance	Decimal (1..50)
Groups	GROUP Rtr Mpls Path Hop Provisioned (Prov)
Scope	Application
Description	*Rtr/<s> Mpls Path/m Hop/n* This component is used to define a specific hop in a *Path*. The order of these components within a Path component instance is the order which is used to set up the path. The *ipv4address* attribute of a *Hop* component must be a valid class A, B or C non-reserved address. The maximum number of hops per path is 20.
Mib	no_mib
Common Verbs	Help List Display Add DELete

GROUP Rtr Mpls Path Hop Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for *Rtr/<s> Mpls Path/m Hop/n* component. The *Hop* component can be provisioned as strict or loose. A Hop must be an Ipv4 address.
Mib	no_mib

ATTRIBUTE Rtr Mpls Path Hop ipv4Address (address)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the Ipv4 address of this *Hop* component. It must be a valid class A, B or C non-reserved address.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr Mpls Path Hop ipv4PrefixLen (prefix)

Access	Read and write
Description	This attribute specifies the prefix length of the Ipv4 address for this *Hop* component. If the length is 32, then the Ipv4 address is treated as a host address, otherwise it is treated as a network prefix.
Mib	no_mib
Values	Decimal (8..32)
Default	No default

ATTRIBUTE Rtr Mpls Path Hop hopMode (mode)

Access	Read and write
Description	This attribute specifies if the *Hop* component is treated as strict or loose. The value ***strict*** means that the address specified in the *Ipv4Address* attribute of this *Hop* component must be adjacent to the node on which Ipv4Address of the previous *Hop* component resides. For a single strict hop, the originating node must be adjacent to the Ipv4 address specified in the *Ipv4Address* attribute of the *Hop* component. The value ***loose*** means that *Ipv4Address* attribute of this hop is not necessarily adjacent to the previous hop. The LSR should determine a next hop which is in the same direction as the specified hop.
Mib	no_mib
Values	strict loose
Default	strict

COMPONENT Rtr Mpls LabelSwitchedPath (Lsp)

Instance	Decimal (1..65535)
Groups	GROUP Rtr Mpls Lsp Provisioned (Prov) GROUP Rtr Mpls Lsp OsiState (State) GROUP Rtr Mpls Lsp Operational (Oper)
Scope	Application
Description	*Rtr/<s> Mpls LabelSwitchedPath/n* This component represents a Label Switched Path (LSP) that originates

Copyright © 2006, Nortel Nortel Confidential

from this Label Switching Router (LSR).
When a *Rtr/<s> Mpls Lsp/n IpV4RA/<IP Address>,<IP Prefix Length>* component is provisioned under the LSP, it will act as the Forwarding Equivalency Class (FEC) and must be inherited by the standby LSPs from the primary LSP.

Mib	no_mib
Opt. Subcomp.	COMPONENT Rtr Mpls Lsp IpV4ReachableAddr (RAddr)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Rtr Mpls Lsp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the configurable parameters for the *LSP* component.
Mib	no_mib

ATTRIBUTE Rtr Mpls Lsp ipv4EndPointAddress (epa)

Access	Read and write
Criticality	Component
Description	This attribute specifies the Ipv4 End Point Address for the LSP. For standby LSPs, a value of ***0.0.0.0*** specifies that the value should inherit from the *ipv4EndPointAddress* attribute of the primary LSP. If the *addToIpRoutingDatabase* attribute is set to ***enabled***, then this endpoint address is installed into the IP routing table as a Forwarding Equivalency Class (FEC).
Mib	no_mib
Values	IP address
Default	0.0.0.0

ATTRIBUTE Rtr Mpls Lsp bandwidth (bw)

Access	Read and write
Criticality	Component
Description	This attribute specifies the requested bandwidth for the LSP. This attribute can have a numeric value between ***0*** and ***4294967293*** (2^32 - 2), ***nsNoBandwidth (nsNoBw)***, ***clsNoBandwidth (clsNoBw)*** or ***sameAsPrimaryLsp*** (***sameAsPLsp***).

Copyright © 2006, Nortel Nortel Confidential

If a numeric value is specified, then the value is signaled as the peak and sustained data rate in Kbit/sec as part of the label request and used in the bandwidth reservation.

If ***nsNoBandwidth*** is used, then the Integrated Services (IntServ) Null Service (NS) type is signaled for the LSP setup, and no bandwidth is reserved.

If ***clsNoBandwidth*** is used, then the IntServ Controlled Load Service (CLS) type is signaled for the LSP setup with the peak and sustained rate as 0 and no bandwidth is reserved.

If this LSP is configured to be the standby LSP, then the value ***sameAsPrimaryLsp*** specifies that this LSP will inherit the value of the *bandwidth* attribute from the primary LSP.

The value ***sameAsPrimaryLsp*** is not valid when this LSP is configured to be the primary LSP.

The default value is ***1***.

Mib	no_mib
Values	Decimal (1..4294967292) nsNoBandwidth (nsNoBw) clsNoBandwidth (clsNoBw) sameAsPrimaryLsp (sameAsPLsp)
Units	kbit/s

sameAsPrimaryLsp (sameAsPLsp)

Default: none

ATTRIBUTE Rtr Mpls Lsp addToIpRoutingDatabase (addToIpRdb)

Access: Read and write

Description: This attribute specifies whether or not this LSP should be installed into the IP Routing Database.

To carry native IP traffic over the LSP on establishment, this attribute must be set to ***true***.

Standby LSPs inherit the primary value and so this attribute must be set to ***sameAsPrimaryLsp***.

The default value is ***true***.

Mib: no_mib

Values:
false
true
sameAsPrimaryLsp (sameAsPLsp)

Default: true

ATTRIBUTE Rtr Mpls Lsp bestMatchOverride

Access: Read and write

Copyright © 2006, Nortel
Nortel Confidential

Description	This attribute specifies if an MPLS LSP should subsume more specific routes to carry IP traffic. What IP normally does when making next-hop route decision for incoming IP packets is to find the longest match on destination address in the routing table and use such a route. If multiple routes (from different protocols) are found to have same best destination address match, other criteria (such as route preference, metric) are used for further selection. The best-match on destination address is the most important factor in traditional IP route selection. On the Nortel Networks Multiservice Switch, the *bestMatchOverride* attribute allows network operators to override this IP tradition by enabling MPLS forced subsume functionality. In many situations, using subsume can help to achieve better traffic engineering goals. Setting this attribute to ***true*** instructs IP to select this MPLS LSP to forward IP packets that matches the FEC of the LSP, even though other routes have a better or longer destination address match for these IP packets. The value ***false*** is used when traditional IP route selection behavior (longest address match first) is chosen. For example, say OSPF has different routes to 2 sets of destinations (100.200.100.0/24 and 100.200.200.0/24). Then, an LSP is setup with FEC (reachable address) 100.200.0.0/16. If we set this attribute to ***false***, IP traffic for destination 100.200.100.xxx and 100.200.200.xxx will take the corresponding OSPF routes due to better address match than the MPLS LSP. However, if the value of this attribute is ***true***, all IP traffic for destination 100.200.xxx.xxx (including 100.200.100.xxx and 100.200.200.xxx) will take the MPLS LSP. In such a situation, the two OSPF routes have been subsumed by the more generic route - MPLS LSP and the IP best-match rule has been overridden. This attribute is only used when the *addToIPRoutingDatabase* attribute is set to ***true*** and the RA is used as the FEC Standby LSPs will inherit the value of the primary LSP and so this attribute must be set to sameAsPrimaryLsp. The default value is ***true***.
Mib	no_mib
Values	false true sameAsPrimaryLsp (sameAsPLsp)

GROUP Rtr Mpls Lsp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Rtr Mpls Lsp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Rtr Mpls Lsp operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Rtr Mpls Lsp usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

GROUP Rtr Mpls Lsp Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of this MPLS LSP.
Mib	no_mib

ATTRIBUTE Rtr Mpls Lsp status

Access	Read only
Description	This attribute indicates the status of an LSP. In the description that follows, "upstream" refers to a peer LSR from which an label request message is received and from which traffic is received. "Downstream" refers to a peer LSR to which traffic will be sent from this LSR. A value of ***idle*** indicates that the LSR has not set up the LSP. A value of ***responseAwaited*** indicates that the LSR has received and processed a label request message from an upstream LSR or it has received an internal setup request. It has sent a new label request message towards a downstream LSR. The LSR is waiting for the label mapping message from the downstream LSR. A value of ***established*** indicates that the LSR has received the label mapping message from the downstream LSR and the LSP is up and operational.
Mib	no_mib
Values	idle responseAwaited established
Default	No default

ATTRIBUTE Rtr Mpls Lsp retryCount (rCount)

Access	Read only
Description	This attribute counts the attempts to set up this LSP. This counter wraps around to zero when the maximum value is exceeded.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Mpls Lsp failureCount (fCount)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the times this LSP fails to establish. This counter wraps around to zero when the maximum value is exceeded.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Rtr Mpls Lsp lastTearDownReason (tearDown)

Access	Read only
Description	This attribute indicates why this LSP was torn down.
Mib	no_mib
Values	notApplicable rsvpRoutingProblem rsvpPathSetupTimeout rsvpLocked rsvpLostPeer rsvpLostLabel rsvpResourceUnavailable rsvpSystemError rsvpAdminCtrl rsvpRcvResvTear rsvpRcvUnsupportedStyle rsvpRcvConflictingStyle rsvpRcvErrNotify rsvpRcvErrRsvpSystem rsvpRcvErrTrafficCtrl rsvpRcvErrTrafficCtrlSys rsvpRcvErrUnknownObjClass rsvpRcvErrUnknownObjCType rsvpRcvErrAdminCtrl rsvpRcvErrPolicyCtrl rsvpRcvErrDestPortConflict rsvpRcvErrSendPortConflict rsvpRcvErrApi rsvpRcvErrRoutingProblem
Default	No default

ATTRIBUTE Rtr Mpls Lsp establishedTimeStamp (estTS)

Access	Read only
Description	This attribute indicates the time when this LSP was established.
Mib	no_mib
Values	Time (DHMS)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Rtr Mpls Lsp maxTransmissionUnit (mtu)

Access	Read only
Description	This attribute indicates the actual maximum transmission unit (MTU) supported on this LSP Tunnel. This is the smallest common denominator MTU of all MPLS capable interfaces on the route of the LSP tunnel. The value of this attribute is expressed in octets.
Mib	no_mib
Values	Decimal (1..4294967295)
Units	octets
Default	No default

ATTRIBUTE Rtr Mpls Lsp tunnelComponentName

Access	Read only
Description	This attribute specifies the corresponding *Rtr/<s> RsvpTe Tunnel/<Src Lsp Tunnel Address>,<Dest Lsp Tunnel Address>,<tunnel ID>,<Lsp ID>* that is associated with this LSP.
Mib	no_mib
Values	The name of the component
Default	No default

COMPONENT Rtr Mpls Lsp IpV4ReachableAddr (RAddr)

Instance	ipV4Element (ipv4Elem) [IP address] ipV4Prefix (ipv4Pref) [Decimal (1..32)]
Scope	Application
Description	*Rtr/<s> Mpls Lsp/n Ipv4ReachableAddr/<IP address>,<IP address length>* The *Ipv4ReachableAddr* component represents a destination IP address that acts as the FEC for the LSPs. Only the *Lsp* that has been provisioned to be the primary LSP can have *IpV4RA* subcomponents. There may be multiple instances of the *Ipv4ReachableAddr* component for each primary LSP. The addresses provisioned must be unique across all LSPs on this router. 1) The <IP address> index indicates the destination address. It is a host address if the second index <IP address length> has the value 32; otherwise it is a network address.

Copyright © 2006, Nortel Nortel Confidential

2) The <IP address length> index represents the length of the IP address given in the first index <IP address>.

COMPONENT Rtr RsvpTe

Groups:
GROUP Rtr RsvpTe OsiState (State)
GROUP Rtr RsvpTe Provisioned (Prov)
GROUP Rtr RsvpTe Statistics (Stats)

Scope: Application

Description:
Rtr/<s> RsvpTe
This component represents the MPLS ReSerVation Protocol (RSVP-TE) for Label Switched Path (LSP) tunnels. RSVP-TE is a signaling protocol used by Label Switched Routers (LSRs) to establish LSPs through a network by mapping network-layer routing information directly to data-link layer switched paths. There is only one instance of RSVP-TE per Nortel Networks Multiservice Switch.

ATTRIBUTE Rtr RsvpTe adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	no_mib
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Rtr RsvpTe operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	no_mib
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Rtr RsvpTe usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Values:
idle
active (activ)
busy

Default: idle

GROUP Rtr RsvpTe Provisioned (Prov)

Properties: Provisioned

Description

This group of attributes configures the RSVP-TE capabilities for this LSR. These attributes are shelf-wide attributes that apply to all *Rtr/<s> Interface/<IP Address> RsvpTeIf* components. Any of the *RsvpTeIf* components can override any of these shelf-wide attributes.

Mib: no_mib

ATTRIBUTE Rtr RsvpTe refreshInterval (rInt)

Access:
Read: All
Write: All

Description

This attribute specifies the interval between refresh messages sent by this LSR.
This value is sent to the next hop in the TIME_VALUES object of the PATH/RESV message and is used in calculation of the lifetime of the PATH/RESV state block at the next hop.

Mib: no_mib

Values: Decimal (1..1800)

Units: seconds

Default: 30

ATTRIBUTE Rtr RsvpTe refreshKeepMultiplier (rKeep)

Access:
Read: All
Write: All

Description: This attribute specifies the default minimum number of refresh intervals that must pass before a PATH or a RESV state which is not being refreshed will be aged out.

Copyright © 2006, Nortel Nortel Confidential

This value is used in calculating the lifetime of Path State Block (PSB) and Reservation State Block (RSB) for this interface; it prevents the premature loss of these states.

Mib	no_mib
Values	Decimal (1..50)
Default	3

ATTRIBUTE Rtr RsvpTe slewMax (slew)

Access	Read: All Write: All
Description	This attribute specifies the default rate on how fast the *refreshInterval* can increase on the LSR. When a new *refreshInterval* value is provisioned to a higher value, the refresh interval will be increased at *slewMax* percentage of the previous interval at each PATH/RESV cycle. In another words, the ratio of two successive refresh interval values will not exceed 1 + (Slew Max/100).
Mib	no_mib
Values	Decimal (1..200)
Units	%
Default	30

ATTRIBUTE Rtr RsvpTe helloInterval (hInt)

Access	Read: All Write: All
Description	This attribute specifies the default interval between HELLO messages sent by this LSR. A value of ***disabled*** indicates that the Hello mechanism is not enabled.
Mib	no_mib
Values	Decimal (0.1..100.0) disabled
Units	seconds
Default	0.5

ATTRIBUTE Rtr RsvpTe helloMultiplier (hMult)

Access	Read: All Write: All
Description	This attribute specifies the default minimum number of hello intervals that must pass before the RSVP-TE connection is considered down.
Mib	no_mib

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (2.0; 2.5; 3.0; 3.5; 4.0; 4.5; 5.0; 5.5; 6.0; 6.5; 7.0; 7.5; 8.0; 8.5; 9.0; 9.5; 10.0)
Default	3.5

GROUP Rtr RsvpTe Statistics (Stats)

Properties	Operational
Description	This group contains the attributes that indicate the aggregation of the control statistics from all of the *Rtr/<s> RsvpTe InterfaceStatistics/<IP Address>* and from any RSVP-TE control messages that were collected from any interfaces that were not configured with an *RsvpTeIf*. All of these attributes represent messages sent and received from this LSR. For those attributes within this group that count the number of messages sent and received, these attributes will rollover to 0 when the maximum value is exceeded.
Mib	no_mib

ATTRIBUTE Rtr RsvpTe pathMessages (path)

Access	Read: All Write: Illegal
Description	This attribute counts the number of PATH messages sent and received. This value is a snapshot of the FP-based real time counter and therefore may be up to 30 seconds out of date.
Mib	no_mib
Vector of	Decimal (0..4294967295)

Default	No default

GROUP Rtr RsvpTe Tunnel **TunnelDescription**

Properties	Operational
Description	This group contains the signaled attributes which describe the LSP Tunnel.
Mib	no_mib

ATTRIBUTE Rtr RsvpTe Tunnel **bandwidth (bw)**

Access	Read: All Write: Illegal
Description	This attribute indicates the bandwidth reserved by this LSP tunnel.
Mib	no_mib
Values	Decimal (0..4294967295)
Units	kbit/s
Default	No default

ATTRIBUTE Rtr RsvpTe Tunnel **extendedTeTunnelId (extId)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the extended tunnel identifier of this LSP tunnel. In most cases, it is the originating nodes IP address, but it may be zero.
Mib	no_mib
Values	IP address
Default	No default

ATTRIBUTE Rtr RsvpTe Tunnel teTunnelResvStyle (style)

Access	Read: All Write: Illegal
Description	This attribute indicates the RESV style used by this LSP tunnel. There are two styles that are supported: Fixed Filter (ff) and Shared Explicit (se).
Mib	no_mib
Values	fixedFilter (ff) sharedExplicit (se)
Default	No default

ATTRIBUTE Rtr RsvpTe Tunnel pathRecordRouteObject (pathRro)

Access	Read: All Write: Illegal
Description	This attribute indicates the Record Route Object (RRO) if provided in the PATH message. It is a vector of strings where each string specifies a hop address and optionally, the label that was used at that hop. The Nortel Networks Multiservice Switch does not include the label in the PATH RRO for its hops.
Mib	no_mib
Vector of	String (11..28, ASCII)
Index	Decimal (0..19)
Default	No default

ATTRIBUTE Rtr RsvpTe Tunnel resvRecordRouteObject (resvRro)

Access	Read: All Write: Illegal
Description	This attribute indicates the Record Route Object (RRO) if provided in the RESV message. It is a vector of strings where each string specifies a hop address and optionally the label used at that hop. When the signaled session attribute indicates that labels can be included, the Nortel Networks Multiservice Switch will encode the label for its hops in the RESV RRO.

Properties	Operational
Description	This group contains statistics attributes of the *VoFr* component.
Mib	no_mib

ATTRIBUTE Rtr RsvpTe IfStats fragmentedHighestPriorityFrames

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts egress frames with the highest priority, which had to be fragmented because they were larger than *maximumFrameSize*. This could happen when a data call is setup to use the highest emission priority, or MPA is provisioned with too low maximum frame size. When the maximum is reached the count wraps to zero.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr RsvpTe IfStats lostFragmentsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts lost VoFr fragments from the interface. Presence of lost fragments indicates a link problem. Note that lost whole frames cannot be detected. When the maximum is reached the count wraps to zero.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Rtr RsvpTe IfStats protocolViolationsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts VoFr protocol violations detected in the data from the interface. When the maximum is reached the count wraps to zero.
Mib	no_mib
Values	Decimal (0..4294967295)
Default	0

COMPONENT Rtr Ldp (Ldp)

Groups	GROUP Rtr Ldp LdpPolicy (Policy) GROUP Rtr Ldp Loop (Loop)
Scope	Application
Description	*Rtr/<s> Ldp* This component represents the Label Distribution Protocol (LDP). LDP is a signaling protocol used by Label Switched Routers (LSRs) to establish Label Switched Paths (LSPs) through a network by mapping network-layer routing information directly to data-link layer switched paths.

GROUP Rtr Ldp LdpPolicy (Policy)

Properties	Provisioned
Description	This group contains the attributes which describe the characteristics of remote LSRs that are allowed to establish LDP peers with this LSR.
Mib	no_mib

ATTRIBUTE Rtr Ldp keepAliveHoldTimer (kaTimer)

Access	Read: All Write: All
Description	This attribute specifies the interval for keep alive hold timer in seconds for a session.
Mib	no_mib
Values	Decimal (1..600)
Units	seconds
Default	30

ATTRIBUTE Rtr Ldp helloTimer (helloTimer)

Access	Read: All Write: All
Description	This attribute specifies the interval for hello timer in seconds for a given LDP adjacency.
Mib	no_mib
Values	Decimal (1..600)
Units	seconds
Default	15

ATTRIBUTE Rtr Ldp failedInitThreshold

Access	Read: All Write: All
Description	This attribute specifies that the *failedInitSessionThresholdExceeded* notification is generated whenever the value is exceeded.
Mib	no_mib
Values	Decimal (1..20)
Default	10

ATTRIBUTE Rtr Ldp signaledPenultimateHopPop (php)

Access	Read: All Write: All
Description	This attribute specifies whether Penultimate Hop Pop is signaled out from this node. When the attribute value is ***on***, this LSR will assign and distribute “Implicit Null Label (3)” for its own loopback address to all neighboring LSRs. When the attribute value is ***off***, this LSR will distribute label values outside the reserved label values. Default is ***on***.
Mib	no_mib
Values	on off
Default	on

ATTRIBUTE Rtr Ldp acceptNonProvisionedNeighbor (aNpNbr)

Access	Read: All Write: All
Description	This attribute specifies if non provisioned Ldp session can be established.
Mib	no_mib
Values	disabled enabled
Default	enabled
