ATTRIBUTE Lp E3 G832 timingMarker

Access: Read only

Copyright © 2006, Nortel Nortel Confidential

Description

Indicates whether or not the timing source at the far-end node is traceable to a Primary Reference Clock.
The *timingMarker* indication is controlled by the timing marker bit in the G832 MA byte. If the received timing marker bit is 1 for five consecutive frames, and five consecutive 0s are not received for two seconds, the *timingMarker* indication will be set to ***not traceable***. If the received timing marker bit is 0 for five consecutive frames and five consecutive 1s are not received for two seconds, the *timingMarker* indication will be set to ***traceable***.

Mib — LogicalProcessor

Values — not traceable
traceable

Default — No default

ATTRIBUTE Lp E3 G832 trailTraceReceived

Access — Read only

Description

This attribute indicates the 15 byte E.164 address which is currently being received in the trail trace (TR) field of the E3 G832 frame. If this attribute differs from the provisioned trailTraceTransmitted string a trail trace mismatch (TTM) defect is reported, possibly resulting in a TTM alarm, as described for operational attribute *trailTraceMismatch*.

Mib — LogicalProcessor

Values — String (0..15, ASCII)

Default — No default

GROUP Lp E3 G832 Statistics (Stats)

Properties — Operational

Description

This group contains the statistical data for the G832 component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib — LogicalProcessor

ATTRIBUTE Lp E3 G832 farEndErrorFreeSec (feefs)

Access — Read only

Description

This attribute indicates the number of seconds that the E3 line has not suffered any G832 errors.

Mib — LogicalProcessor

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 G832 farEndCodeViolations (fecv)

Access	Read only
Description	A count of E3 frames containing a Far-End Block Error (FEBE). A FEBE is reported over the FEBE bit each time the far-end terminal detects a BIP-8 error in a received E3 frame. For second intervals where Far End Unavailable Seconds (FEUAS) or Far End Severely Errored Seconds (FESES) are counted, counting of FECVs is inhibited. This attribute is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 G832 farEndErroredSec (fees)

Access	Read only
Description	This attribute indicates the total number of Far-End Errored Seconds (FEES). A FEES is declared for second intervals containing with one or more Far-End Coding Violations (FECV) or one or more Far-End Receive Failure (FERF) defects. A FERF defect occurs when the FERF bit in the received frame is set to one. For second intervals where Far End Unavailable Seconds (FEUAS) are counted, counting of FEESs is inhibited.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E3 G832 farEndSevErroredSec (feses)

Access	Read only
Description	This attribute indicates the total number of Far-End Severely Errored Seconds (FESESs). A FESES is declared for second intervals containing more than 34 Far-End Coding Violations (FECV) or one or more Far-End Receive Failure (FERF) defects. For second intervals where a Far-End Severely Errored Seconds (FESES) is counted, counting of FECVs is inhibited. For second intervals where Far End Unavailable Seconds (FEUAS) are counted, counting of FESESs is inhibited.

Description

This group contains the operational data for the *PLCP* component.

Mib LogicalProcessor

ATTRIBUTE Lp E3 Plcp lofAlarm (lof)

Access Read only

Description

This attribute displays whether a PLCP Loss Of Frame (LOF) failure alarm state has been entered. An LOF failure is declared when a PLCP LOF defect persists for 2.5 s +/- 0.5 s. An LOF defect occurs when an OOF (Out of Frame) state persists for more than 1 ms. If the OOF events are intermittent, the LOF defect counter is decremented at a rate of 1/12 (for DS3 PLCP) or 1/9 (for G.751 E3 PLCP) of the incrementing rate, with all measurements based on a 200 ms polling cycle. An OOF event (also known as a PLCP SEF event) is declared when an error is detected in both the A1 and A2 octets, or when two consecutive POHIDs are found in error.
OOF is removed when two valid sets of framing octets and two valid and sequential POHID octets have been found. The LOF defect is removed when the defect counter reaches zero, i.e. when OOF events are absent for more than 12 ms (DS3 PLCP) or 9 ms (G.751 E3 PLCP). LOF failure alarm is cleared when LOF defect is absent for 10.0 s +/- 0.5 s
The *DS3* or *E3* component goes into an operational state of *disabled* until the LOF failure alarm is cleared. The terminal declaring the LOF failure alarm will transmit a PLCP RAI signal to the far-end for the duration of the alarm.
The *lofAlarm* attribute is always set to *off* when the *DS3* or *E3* component has been *locked* and left *offline*.

Common Verbs	Help List Display Add DELete

GROUP Lp E3 Cell Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes for the *AtmCell* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E3 Cell alarmActDelay (act)

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	LogicalProcessor
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Lp E3 Cell scrambleCellPayload (scramble)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Mib: LogicalProcessor

Values:
off
on

Default: No default

ATTRIBUTE Lp E3 Cell correctSingleBitHeaderErrors

Access: Read and write

Description

This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib: LogicalProcessor

Values:
off
on

Default: off

ATTRIBUTE Lp E3 Cell clearDelay (clear)

Access: Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: LogicalProcessor

Values: Decimal (0..60)

Copyright © 2006, Nortel Nortel Confidential

Units	minutes
Default	0

ATTRIBUTE Lp E3 Cell hecSampleInterval (hSample)

Access	Read and write
Description	This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (0..25)
Units	seconds
Default	0

ATTRIBUTE Lp E3 Cell hecErrorLimit (hLimit)

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp E3 Cell lcdStateDelay (delay)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp E3 Cell hecErrorIntervalLimit (hIntLimit)

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..25)
Default	1

GROUP Lp E3 Cell Operational (Oper)

Properties	Operational
Description	This group contains the common operational attributes for the *AtmCell* component.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp E3 Cell lcdAlarm (lcd)

Access	Read only
Description	This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute. In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected. For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect. If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds. The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.
Mib	LogicalProcessor
Values	on off
Default	off

GROUP Lp E3 Cell Statistics (Stats)

Properties	Operational
Description	This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

ATTRIBUTE Lp E3 Cell sevErroredSec (ses)

Access Read only

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Description	This group contains all of the provisioning data for a DS1 component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 lineType (lineType)

Access	Read and write
Description	This attribute defines the framing of the DS1 line. ***d4*** defines a framing pattern of 12 frames per multiframe. ***esf*** defines a framing pattern of 24 frames per multiframe. ***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling. ***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling. ***unframed*** defines an unknown framing pattern for clear channels.

Copyright © 2006, Nortel Nortel Confidential

For cell-based cards only the default option ***esf*** is permitted.

Mib: LogicalProcessor

Values:
d4
esf
d4Cas
esfCas
unframed

Default: esf

ATTRIBUTE Lp DS1 zeroCoding (zeroCoding)

Access: Read and write

Criticality: Component

Description

This attribute defines the zero encoding on the DS1 line.
bit7Stuffing sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8.
b8zs substitutes a pattern of bipolar violations if more than 7 zeros in a row are to be transported.
ami specifies Alternate Mark Inversion, in which successive marks (ones) alternate between positive and negative polarity voltage signals, and spaces (zeros) are sent as a zero amplitude signal.
When *zeroCoding* is set to ***ami*** and l*ineType* is set to ***d4***, it is recommended that *raiAlarmType* be set to ***SBit*** in order to avoid possible mimic RAI alarm.

For cell-based cards, only the default value ***b8zs*** is permitted.

The value *ami* should be used with caution. If the ones density of the traffic is not sufficiently high, the DS1 will lose clock synchronization.

Mib: LogicalProcessor

Values:
bit7Stuffing
b8zs
ami

Default: b8zs

ATTRIBUTE Lp DS1 clockingSource (clockingSource)

Access: Read and write

Description

This attribute defines the source of the transmit clock for the DS1 line.

When ***local*** is selected, the crystal on the port generates the clocking for the line.

Copyright © 2006, Nortel Nortel Confidential

When ***line*** is selected, the port synchronizes to the clock from the facility.

When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP.

When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***.

When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network.

When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network.

A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured***

If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pDS1Atm*** card, which it defaults to ***local***.

On a ***3pDS1Atm*** card all ports must have the same value, and be either ***local*** or ***module***.

otherPort is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards.
On ***4DS1Aal1*** cards either:

all four ports' *clockingSource* values must be ***local*** OR
all four ports' *clockingSource* values must be ***module*** OR
one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. A port can only have ***srtsMode*** selected if the other ports are ***module*** or ***srtsMode***.

adaptiveMode

Default — No default

ATTRIBUTE Lp DS1 raiAlarmType (raiType)

Access — Read and write

Description

This attribute defines the method of sending a RAI (Remote Alarm

Copyright © 2006, Nortel Nortel Confidential

Indication) alarm on a DS1 line.
When ***SBit*** is selected, RAI alarm is sent by setting the S bit in frame 12.
When ***Bit2*** is selected, RAI alarm is sent by setting bit 2 in all timeslots to 0.
When ***fdl*** is selected, RAI alarm is sent by a repeating pattern of 00 hex and FF hex on the FDL link.
Note that for *lineType* of ***d4***, only the SBit and the Bit2 methods are applicable. Whereas for *lineType* of ***esf***, only the Bit2 and the ***fdl*** methods are applicable.
SBit method is recommended if *lineType* is set to ***d4*** and *zeroCoding* is set to ***ami***. This will help to avoid potential mimic RAI alarm when 1's density is too low in the data transmitted.
For cell-based cards, only the default value ***fdl*** is permitted.

Mib: LogicalProcessor

Values:
sBit
bit2
fdl

Default: fdl

ATTRIBUTE Lp DS1 lineLength (lineLength)

Access: Read and write

Description:
This attribute defines the line length (in feet) for equalization calculations for the DS1 line. The value ranges between 0-655. For ***8pDS1Atm*** cards the actual value used for equalization is rounded up to the nearest 110 feet; for all other card types the actual value used is rounded to the nearest 50 feet.

Mib: LogicalProcessor

Values: Decimal (0..655)

Default: 0

GROUP Lp DS1 CustomerIdentifierData (CidData)

Properties: Provisioned

Description: This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib: LogicalProcessor

ATTRIBUTE Lp DS1 customerIdentifier (cid)

Access: Read and write

Description: This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the

Copyright © 2006, Nortel Nortel Confidential

component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp DS1 AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp DS1 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp DS1 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp DS1 OperationalStatus (OperStatus)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp DS1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Lp DS1 operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp DS1 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp DS1 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default: No default

ATTRIBUTE Lp DS1 proceduralStatus (osiProc)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp DS1 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Properties	Operational
Description	This group contains the common operational data for a component in a digital hierarchy interface.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 losAlarm (losAlarm)

Access	Read only
Description	This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the

Copyright © 2006, Nortel Nortel Confidential

duration of the LOS alarm state.
The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.

Mib LogicalProcessor

ATTRIBUTE Lp DS1 rxAisAlarm (rxAisAlarm)

Access Read only

Description

This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms £ T £ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Mib LogicalProcessor

Values on
off

Default off

ATTRIBUTE Lp DS1 lofAlarm (lofAlarm)

Access Read only

Description

This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the

Copyright © 2006, Nortel Nortel Confidential

duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Mib LogicalProcessor

Values on
off

Default off

ATTRIBUTE Lp DS1 rxRaiAlarm (rxRaiAlarm)

Access Read only

Description

This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).
The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

ATTRIBUTE Lp DS1 Chan timeslots (ts)

Access	Read and write
Criticality	Component
Description	This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component. For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.
Mib	LogicalProcessor
Set of	none 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
Default	No default

ATTRIBUTE Lp DS1 Chan timeslotDataRate (dataRate)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute. When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s. When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s. On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card. On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***. One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.
Mib	LogicalProcessor
Values	56k doNotOverride
Default	doNotOverride

ATTRIBUTE Lp DS1 Chan applicationFramerName

Values	Link (Service, interfaceName)
Default	No default

GROUP Lp DS1 Chan CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp DS1 Chan IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp DS1 Chan ifIndex (ifI)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp DS1 Chan OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp DS1 Chan OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS1 Chan operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp DS1 Chan usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp DS1 Chan availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp DS1 Chan proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — LogicalProcessor

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Lp DS1 Chan controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib	LogicalProcessor
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp DS1 Chan alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp DS1 Chan standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — LogicalProcessor

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default — notSet

ATTRIBUTE Lp DS1 Chan unknownStatus (osiUnknw)

Access — Read only

Description — This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib — LogicalProcessor

Values
false
true

Default — false

GROUP Lp DS1 Chan Operational (Oper)

Properties — Operational

Description

This group contains all of the operational data for a *Channel* component.

Mib — LogicalProcessor

comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.

Mib	LogicalProcessor
Values	no yes
Default	no

COMPONENT Lp DS1 Chan Test (Test)

Groups	GROUP Lp DS1 Chan Test OsiState (State) GROUP Lp DS1 Chan Test Setup (Setup) GROUP Lp DS1 Chan Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	LogicalProcessor
Common Verbs	Help List Display

VERB START Lp DS1 Chan Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp DS1 Chan Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp DS1 Chan Test OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan Test adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS1 Chan Test operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp DS1 Chan Test usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

GROUP Lp DS1 Chan Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp DS1 Chan Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test.

Copyright © 2006, Nortel Nortel Confidential

externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Lp DS1 Chan Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: LogicalProcessor

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Lp DS1 Chan Test frmPatternType (fpt)

Copyright © 2006, Nortel
Nortel Confidential

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	LogicalProcessor
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp DS1 Chan Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp DS1 Chan Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp DS1 Chan Test displayInterval (di)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp DS1 Chan Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp DS1 Chan Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time

Copyright © 2006, Nortel Nortel Confidential

specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib: LogicalProcessor

Values:
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default: neverStarted

ATTRIBUTE Lp DS1 Chan Test bitsTx

Access: Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Chan Test bytesTx

Access	Read only
Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Chan Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Chan Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Chan Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Chan Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Chan Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Chan Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the

Copyright © 2006, Nortel Nortel Confidential

exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp DS1 Chan Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp DS1 Chan Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp DS1 Chan AtmCell (Cell)

Groups	GROUP Lp DS1 Chan Cell Provisioned (Prov) GROUP Lp DS1 Chan Cell Operational (Oper) GROUP Lp DS1 Chan Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM

Copyright © 2006, Nortel Nortel Confidential

cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

List
Display
Add
DELete

GROUP Lp DS1 Chan Cell Provisioned (Prov)

Properties Provisioned

Description
This group contains the provisioning attributes for the *AtmCell* component.

Mib LogicalProcessor

ATTRIBUTE Lp DS1 Chan Cell alarmActDelay (act)

Access Read and write

Description
This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib LogicalProcessor

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Lp DS1 Chan Cell scrambleCellPayload (scramble)

Access Read and write

Description
Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	off on
Default	No default

ATTRIBUTE Lp DS1 Chan Cell correctSingleBitHeaderErrors

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	LogicalProcessor
Values	off on
Default	off

ATTRIBUTE Lp DS1 Chan Cell clearDelay (clear)

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Lp DS1 Chan Cell hecSampleInterval (hSample)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (0..25)
Units	seconds
Default	0

ATTRIBUTE Lp DS1 Chan Cell hecErrorLimit (hLimit)

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp DS1 Chan Cell lcdStateDelay (delay)

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The

Copyright © 2006, Nortel Nortel Confidential

valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	LogicalProcessor
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp DS1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access	Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	LogicalProcessor
Values	Decimal (1..25)
Default	1

GROUP Lp DS1 Chan Cell **Operational (Oper)**

Properties	Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Chan Cell **lcdAlarm (lcd)**

Access	Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects

Copyright © 2006, Nortel Nortel Confidential

have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Default — off

GROUP Lp DS1 Chan Cell Statistics (Stats)

Properties — Operational

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib — LogicalProcessor

ATTRIBUTE Lp DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access — Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS1 Chan Cell sevErroredSec (ses)

Access	Read only
Description	This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted. In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects. Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp DS1 Chan Cell receiveCellUtilization (rxutil)

Access	Read only
Description	This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute. This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.
Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%

COMPONENT Lp DS1 Chan TrunkConditioning (Tc)

Groups	GROUP Lp DS1 Chan Tc Provisioned (Prov) GROUP Lp DS1 Chan Tc Operational (Op)
Scope	Device
Description	*Lp/n Ds1/n Chan/n Tc* *Lp/n E1/n Chan/n Tc* *Lp/n Ds3/n Ds1/n Chan/n Tc* *Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc* *Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc* *Laps/n* Vc4/n Vc12/k,l,m E1 Chan/n T*c* *Laps/n* Sts/n Vt1dot5/l,m Ds1 Chan/n T*c* The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service. Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk

Copyright © 2006, Nortel Nortel Confidential

conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

GROUP Lp DS1 Chan Tc Provisioned (Prov)

Properties — Provisioned

Description — This group contains all specific provisioning data for a *Tc* component.

Mib — LogicalProcessor

ATTRIBUTE Lp DS1 Chan Tc replacementData (data)

Access — Read and write

Description — This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.

The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:
DS1 MUX Out Of Service Code = 0x1A
E1 MUX Out Of Service Code = 0xFF

Copyright © 2006, Nortel
Nortel Confidential

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.

On the ***4pOC3ChSmIr***, ***2pOC3ChSmIrVsp3*** and *2pVS* cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.

Mib	LogicalProcessor
Values	Hex (H.0..H.ff)
Units	Hex
Default	No default

ATTRIBUTE Lp DS1 Chan Tc signalOneDuration (duration)

Access	Read and write
Description	This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits. If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions. The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds.
Mib	LogicalProcessor
Values	Decimal (0..60)
Units	seconds
Default	0

ATTRIBUTE Lp DS1 Chan Tc noServiceResponse (resp)

Access	Read and write
Description	This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available: ***autoConfigure*** - automatically configure the channels response. ***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction. ***ais*** - transmit AIS in the egress direction. ***noResponse*** - no response is sent in the egress direction. A value of ***autoConfigure*** will result in TC being transmitted for all card types.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	autoConfigure tc ais noResponse
Default	autoConfigure

ATTRIBUTE Lp DS1 Chan Tc signalOne (sigOne)

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.
Mib	LogicalProcessor
Vector of	Decimal (0..1)
Index	D C B A
Default	(1, 1, 1, 1)

ATTRIBUTE Lp DS1 Chan Tc signalTwo (sigTwo)

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.
Mib	LogicalProcessor
Vector of	Decimal (0..1)
Index	D C B A
Default	(1, 1, 1, 1)

Groups	GROUP Lp DS1 Test OsiState (State) GROUP Lp DS1 Test Setup (Setup) GROUP Lp DS1 Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	LogicalProcessor
Common Verbs	Help List Display

VERB START Lp DS1 Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp DS1 Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp DS1 Test OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Test adminState (osiAdmin)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp DS1 Test operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp DS1 Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: LogicalProcessor

Values: String (0..40, ASCII)

Default: No default

ATTRIBUTE Lp DS1 Test type (type)

Access: Read and write

Description:
This attribute is the type of test to be run. The available test types include the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end,

Copyright © 2006, Nortel Nortel Confidential

using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

ATTRIBUTE Lp DS1 Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: LogicalProcessor

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Lp DS1 Test frmPatternType (fpt)

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The

Copyright © 2006, Nortel
Nortel Confidential

following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib	LogicalProcessor
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp DS1 Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp DS1 Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp DS1 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test

Copyright © 2006, Nortel Nortel Confidential

	results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp DS1 Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp DS1 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp DS1 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

Copyright © 2006, Nortel Nortel Confidential

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp DS1 Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.

Copyright © 2006, Nortel Nortel Confidential

Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp DS1 Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp DS1 Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp DS1 Dsp

Scope	Device
Description	*LogicalProcessor/n Ds1/0 Dsp* The *Dsp* component presents the status of the Digital Signal Processors (DSPs) present on a voice card. A voice card's *Dsp* component is created automatically whenever the parent DS1 component becomes active, and remains in existence as long

Copyright © 2006, Nortel Nortel Confidential

as the card remains operational. *Dsp* components cannot be added or deleted.

Scope Device

Description
Lp/n E1/n
Lp/n Sdh/i Vc4/j Vc12/k,l,m E1
The *E1* component controls and monitors an E1 port or tributary on a Function Processor. The number of ports supported depends on the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pE1Aal1: 4 port. The lowest instance value is usually ***0***, except for the ***32pE1Aal*** card when it is ***1***.
No instance value is used when the E1 is a STM tributary.
Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an "ATM UNI port". (An E1 "ATM

Copyright © 2006, Nortel Nortel Confidential

UNI port" is an *E1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)
The instance number of an *E1* "ATM UNI port" must not be the same as the instance number of an *IMA* group under the same *Lp*.

Dyn. Subcomp.	COMPONENT Lp E1 Test (Test) COMPONENT Lp E1 Dsp COMPONENT Lp E1 Audio
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Lp E1 Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisioning data for an E1 component.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 lineType (lineType)

Access	Read and write
Description	This attribute specifies the framing of the E1 line. When ***cas*** (channel associated signalling) is selected, timeslot 16 is reserved for multiframe signalling and only 30 timeslots are available for data. The signalling bits are not interpreted. When ***ccs*** (common channel signalling) is selected, timeslot 16 is not reserved for multiframe signalling and 31 timeslots are available for data. The signalling bits are not interpreted. When ***unframed*** is selected, a clear channel is defined whereby data from all timeslots including the framing data (in timeslot 0) and timeslot 16 are passed transparently. This value is valid only for AAL1 cards. For cell-based cards the ATM Forum specifies that timeslot 16 be reserved, leaving 30 timeslots available for data. The ***8pE1Atm*** and ***1pStm1ChSmIr*** cards support the ***ccs*** value only. The ***4pOC3ChSmIr*** card only supports the ***ccs*** and ***unframed*** values. For both these cards, the default value is ***ccs***. For all other cards, the default value is ***cas***.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	ccs cas unframed
Default	No default

ATTRIBUTE Lp E1 clockingSource (clockingSource)

Access	Read and write
Description	This attribute defines the source of the transmit clock for the E1 line. When ***local*** is selected, the crystal on the port generates the clocking for the line. When ***line*** is selected, the port synchronizes to the clock from the facility. When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP. When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***. When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network. When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network. A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured*** If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pE1Atm*** card, which it defaults to ***local***. On a ***3pE1Atm*** card all ports must have the same value, and be either ***local*** or ***module***. ***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards. On ***4E1Aal1*** cards either: all four ports' *clockingSource* values must be ***local*** OR all four ports' *clockingSource* values must be ***module*** OR one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. The ***srtsMode*** clocking source is not supported for this card type.
Mib	LogicalProcessor

Values	local line module otherPort srtsMode adaptiveMode
Default	No default

ATTRIBUTE Lp E1 crc4Mode

Access	Read and write
Description	This attribute defines whether the CRC-4 checking and generation on the E1 line is enabled or disabled. The default CRC-4 mode is ***off*** except for the cell-based cards which default to ***on*** as per the ATM Forum.
Mib	LogicalProcessor
Values	on off
Default	No default

ATTRIBUTE Lp E1 sendRaiOnAis

Access	Read and write
Description	This attribute defines whether the Remote Alarm Indicator (RAI) will be sent when receiving an AIS alarm. The value is ***yes*** by default; it can be changed to ***no*** only for ports on J2MV cards.
Mib	LogicalProcessor
Values	no yes
Default	yes

ATTRIBUTE Lp E1 raiDeclareAlarmTime

Access	Read and write
Description	This attribute specifies the period of time that a Remote Alarm Indicator (RAI) must be present before declaring an RAI alarm. The value of ***auto*** sets the RAI declare time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiClearAlarmTime* attribute is ignored and ***auto*** is used. This attribute is

Copyright © 2006, Nortel Nortel Confidential

for E1 and E1C card types only. For all other card types, the default value must be used.

Mib	LogicalProcessor
Values	Decimal (1..20000) auto
Units	msec
Default	100

ATTRIBUTE Lp E1 raiClearAlarmTime

Access	Read and write
Description	This attribute specifies the period of time that a Remote Alarm Indicator (RAI) has been absent before clearing an RAI alarm. The value of ***auto*** sets the RAI clear time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiDeclareAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used.
Mib	LogicalProcessor
Values	Decimal (1..20000) auto
Units	msec
Default	100

ATTRIBUTE Lp E1 ssmE1SaNumber

Access	Read and write
Description	This attribute specifies which of the five available Sa bits (Sa4 to Sa8) recommended in ITU G.704 is to be used for Synchronization Status Messages (SSM). If set to ***none***, the transmission of SSM is disabled on this port.
Mib	LogicalProcessor
Values	Decimal (4..8) none
Default	none

GROUP Lp E1 CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp E1 AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp E1 commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LogicalProcessor
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp E1 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp E1 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp E1 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp E1 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp E1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp E1 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp E1 usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp E1 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp E1 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — LogicalProcessor

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Lp E1 controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib	LogicalProcessor
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp E1 alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp E1 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: LogicalProcessor

Values:
hotStandby (hot)
coldStandby (cold)

ATTRIBUTE Lp E1 unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: LogicalProcessor

Values:
false
true

Default: false

GROUP Lp E1 Operational (Oper)

Properties: Operational

Description

This group contains the common operational data for a component in a digital hierarchy interface.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp E1 losAlarm (losAlarm)

Access	Read only
Description	This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOS alarm state. The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp E1 rxAisAlarm (rxAisAlarm)

Access	Read only
Description	This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms £ T £ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	on off
Default	off

ATTRIBUTE Lp E1 lofAlarm (lofAlarm)

Access	Read only
Description	This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp E1 rxRaiAlarm (rxRaiAlarm)

Access	Read only
Description	This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time). The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp E1 txAisAlarm (txAisAlarm)

Access	Read only
Description	This attribute displays whether an AIS (Alarm Indication Signal) alarm is being transmitted on the line. An AIS alarm is transmitted when the port is in a locked state.
Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp E1 txRaiAlarm (txRaiAlarm)

Access	Read only
Description	This attribute displays whether a RAI signal is being sent on the outgoing line. The RAI signal is transmitted when the port detects a LOF alarm condition (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: RAI is transmitted when the port detects a LOS, LOF, or AIS condition).
Mib	LogicalProcessor
Values	on off
Default	off

GROUP Lp E1 E1Operational (E1Oper)

Properties	Operational
Description	This group contains all of the operational data for a E1 component that are not defined in the DSCommonOp group.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 multifrmLofAlarm (multiLofAlarm)

Access	Read only
Description	This attribute indicates whether a multiframe LOF (loss of frame) alarm state is entered. A multiframe LOF alarm state is entered when a multiframe LOF defect (2 consecutive errors in the multiframe alignment

Copyright © 2006, Nortel Nortel Confidential

signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe LOF defects are intermittently occurring, the multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds. When the multiframe LOF alarm is on, a multiframe RAI alarm indicator is transmitted on the line.

The ***8pE1Atm*** card does not support the multiframe LOF alarm.

Mib: LogicalProcessor

off

Default: off

ATTRIBUTE Lp E1 rxMultifrmRaiAlarm (rxMultiRaiAlarm)

Access: Read only

Description

This attribute displays whether a multiframe RAI (remote alarm indicator) alarm state has been entered. A multiframe RAI alarm state is entered when a multiframe RAI alarm indicator (bit 6 of timeslot 16 in frame 0 is set to a one) is observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe RAI indicator is intermittently received, the multiframe RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The multiframe RAI alarm condition is cleared when the multiframe RAI alarm indication is not received for 10 seconds +/- 0.5 seconds. The multiframe RAI alarm is usually an indication that the far end facility is unable to gain multiframe synchronization.

The ***8pE1Atm*** card does not support the multiframe RAI alarm.

Mib: LogicalProcessor

Values:
on
off

Default: off

ATTRIBUTE Lp E1 txMultifrmRaiAlarm (txMultiRaiAlarm)

Access: Read only

Description

This attribute displays whether a multiframe RAI (remote alarm indicator) alarm is being sent on the E1 line. This is transmitted when the E1 port detects a multiframe LOF condition.

The ***8pE1Atm*** card does not generate the multiframe RAI alarm.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	on off
Default	off

ATTRIBUTE Lp E1 ssmE1Tx

Access	Read only
Description	This attribute indicates the current Synchronization Status Message (SSM) transmitted on the E1 port within the Sa byte defined in ITU G.704. This attribute is filtered when *ssmE1SaNumber* is set to ***none***.
Mib	LogicalProcessor
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Lp E1 multifrmCRC4LofAlarm (multiCRC4LofAlarm)

Access	Read only
Description	This attribute indicates whether E1 CRC-4 multiframe LOF (loss of frame) alarm state is entered. A CRC-4 multiframe LOF alarm state is entered when a CRC-4 multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the CRC-4 multiframe LOF defects are intermittently occurring, the CRC-4 multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds. The *multifrmCRC4LofAlarm* is not implemented for the ***E1***, ***1pE1V***, ***1pE1Mvp***, ***1pE1Mvpe***, ***4pE1Mvpe***, ***8pE1Atm***, ***E1C*** and ***4pE1Aal1*** cards.
Mib	LogicalProcessor
Values	on off
Default	off

GROUP Lp E1 Statistics (Stats)

Properties	Operational
Description	This group contains the common statistical data for a component in a digital hierarchy interface.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp E1 runningTime (runningTime)

Access	Read only
Description	The number of seconds since the port component was activated.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 errorFreeSec (efs)

Access	Read only
Description	The number of seconds that the port has been in an error free state.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 erroredSec (es)

Access	Read only
Description	An errored second is declared when a second with one or more Code Violation Error events, or one or more Out Of Frame events occurs. A code violation error may be a CRC error or a BPV error. An Out Of Frame event occurs when 2 out of 5 framing bits are in error.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 sevErroredSec (ses)

Access	Read only
Description	A severely errored second occurs when a second with 320 or more Code Violation Error events or one or more Out Of Frame events occurs.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 sevErroredFrmSec (sefs)

Access	Read only

Description	A severely errored framing second occurs when a second with one or more Out Of Frame events occurs.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 unavailSec

Access	Read only
Description	The total number of seconds that the interface is in an unavailable signal state. An unavailable signal state occurs at the onset of 10 consecutive Severely Errored Seconds. The state is cleared at the onset of 10 seconds with no Severely Errored Seconds.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 bpvErrors (bpvErrors)

Access	Read only
Description	The current count of Bipolar Violations. A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 crcErrors (crcErrors)

Access	Read only
Description	If the interface is a DS1 line, it is the current count of CRC-6 errors. These will only be counted when the lineType is ESF. If the interface is an E1 line, it is the total number of CRC-4 errors. These will only be counted when crc4Mode is on.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp E1 frmErrors (frmErrors)

Access	Read only
Description	The current count of frame errors. A frame error is an error in the framing bits
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 losStateChanges (losChanges)

Access	Read only
Description	The total number of times that the line lost signal.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp E1 slipErrors (slipErrors)

Access	Read only
Description	The total number of times that the line experienced a controlled frame slip. This attribute is incremented for ports on the voice cards (for example the 1pDS1V and the 1pE1V function processors) only.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Lp E1 Chan Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisional data for a *Channel* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Chan timeslots (ts)

Access	Read and write
Criticality	Component
Description	This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component. For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Set of	none 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
Default	No default

ATTRIBUTE Lp E1 Chan timeslotDataRate (dataRate)

Access	Read and write
Criticality	Component
Description	This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute. When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

Copyright © 2006, Nortel Nortel Confidential

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Mib	LogicalProcessor
Values	56k doNotOverride
Default	doNotOverride

ATTRIBUTE Lp E1 Chan applicationFramerName

Access	Read and write
Description	This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.
Mib	LogicalProcessor
Values	Link (Service, interfaceName)
Default	No default

GROUP Lp E1 Chan CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Chan customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a

Copyright © 2006, Nortel Nortel Confidential

CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp E1 Chan IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Chan ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp E1 Chan ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.

GROUP Lp E1 Chan OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Chan snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp E1 Chan OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Chan adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Lp E1 Chan operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp E1 Chan usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp E1 Chan availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The

Copyright © 2006, Nortel Nortel Confidential

operationalState is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp E1 Chan proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase.

Copyright © 2006, Nortel Nortel Confidential

	If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	LogicalProcessor
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp E1 Chan controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	LogicalProcessor
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp E1 Chan alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — LogicalProcessor

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Lp E1 Chan standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

	The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	LogicalProcessor
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp E1 Chan unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	LogicalProcessor
Values	false true
Default	false

ATTRIBUTE Lp E1 Chan Test frmSize (size)

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	LogicalProcessor
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp E1 Chan Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	LogicalProcessor
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern

Copyright © 2006, Nortel Nortel Confidential

Default	ccitt32kBitPattern

ATTRIBUTE Lp E1 Chan Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp E1 Chan Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp E1 Chan Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp E1 Chan Test duration

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp E1 Chan Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Chan Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib — LogicalProcessor

ATTRIBUTE Lp E1 Chan Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Chan Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Chan Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp E1 Chan Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an

Copyright © 2006, Nortel Nortel Confidential

externalLoop test. For a data test, it indicates time since test data was first transmitted.

Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp E1 Chan Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp E1 Chan AtmCell (Cell)

Groups	GROUP Lp E1 Chan Cell Provisioned (Prov) GROUP Lp E1 Chan Cell Operational (Oper) GROUP Lp E1 Chan Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

GROUP Lp E1 Chan Cell Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes for the *AtmCell* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp E1 Chan Cell alarmActDelay (act)

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	LogicalProcessor
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Lp E1 Chan Cell scrambleCellPayload (scramble)

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	LogicalProcessor
Values	off on
Default	No default

ATTRIBUTE Lp E1 Chan Cell correctSingleBitHeaderErrors

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Copyright © 2006, Nortel Nortel Confidential

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib: LogicalProcessor

Values: off
on

Default: off

ATTRIBUTE Lp E1 Chan Cell clearDelay (clear)

Access: Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: LogicalProcessor

Values: Decimal (0..60)

Units: minutes

Default: 0

ATTRIBUTE Lp E1 Chan Cell hecSampleInterval (hSample)

Access: Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: LogicalProcessor

Values: Decimal (0..25)

Units: seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp E1 Chan Cell hecErrorLimit (hLimit)

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp E1 Chan Cell lcdStateDelay (delay)

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp E1 Chan Cell hecErrorIntervalLimit (hIntLimit)

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before

Copyright © 2006, Nortel Nortel Confidential

an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

GROUP Lp E1 Chan Cell Operational (Oper)

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib LogicalProcessor

ATTRIBUTE Lp E1 Chan Cell lcdAlarm (lcd)

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell*

Copyright © 2006, Nortel Nortel Confidential

component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib LogicalProcessor

ATTRIBUTE Lp E1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp E1 Chan Cell sevErroredSec (ses)

Access Read only

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where

Copyright © 2006, Nortel Nortel Confidential

the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Laps/n Vc4/n Vc12/k,l,m E1 Chan/n T*c*
Laps/n Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:

Copyright © 2006, Nortel Nortel Confidential

bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

ATTRIBUTE Lp E1 Chan Flm flmStatus (status)

Access	Read only
Description	This attribute indicates the status of a Frame Relay channel on an E1 line. By combining the E1 channel-associated-signalling (CAS) A-bits status, and HDLC defect, a single value indicates the likely cause of the failure. This mechanism assumes that the far end equipment loops back signaling A-bits for some or all of the timeslots in a channel. The A-bits in channel are transmitted as '0'. If they are all received as '0', it is assumed that the E1 link is up in both directions. The presence of HDLC frames indicates that the service is connected. When A-bits and HDLC frames are correctly received, ***frameLinkUp*** is indicated. When neither are received, ***frameLinkDown*** is indicated. When HDLC frames are not receive but A-bits are not at fault, ***lossOfHdlc*** is indicated. When HDLC frames are received, but there is a fault in any of timeslot's A-bits on a channel ***lossOfAbit*** is indicated.
Mib	LogicalProcessor
Values	notMonitoring frameLinkUp frameLinkDown lossOfHdlc lossOfAbit
Default	No default

COMPONENT Lp E1 Test (Test)

Groups	GROUP Lp E1 Test OsiState (State) GROUP Lp E1 Test Setup (Setup) GROUP Lp E1 Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	LogicalProcessor
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

VERB START Lp E1 Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp E1 Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp E1 Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)

Copyright © 2006, Nortel Nortel Confidential

Default	unlocked

ATTRIBUTE Lp E1 Test operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp E1 Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

GROUP Lp E1 Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Test purpose (purpose)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Mib LogicalProcessor

Values String (0..40, ASCII)

Default No default

ATTRIBUTE Lp E1 Test type (type)

Access Read and write

Description

This attribute is the type of test to be run. The available test types include the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

pathBIP2Error

Default card

ATTRIBUTE Lp E1 Test frmSize (size)

Access Read and write

Description

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib LogicalProcessor

Values Decimal (4..4096)

Units bytes

Default 1024

ATTRIBUTE Lp E1 Test frmPatternType (fpt)

Access Read and write

Description

This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib LogicalProcessor

Values ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default ccitt32kBitPattern

ATTRIBUTE Lp E1 Test customizedPattern (cp)

Access Read and write

Description

This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Mib LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp E1 Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp E1 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp E1 Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes

Copyright © 2006, Nortel Nortel Confidential

Default	1.00

GROUP Lp E1 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp E1 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima*

Copyright © 2006, Nortel Nortel Confidential

component on an MSA card will never terminate the test under the conditions described by these values.

Mib	LogicalProcessor
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning hardwareReconfigured loopCodeSyncFailed patternSyncFailed patternSyncLost
Default	neverStarted

ATTRIBUTE Lp E1 Test bitsTx

Access	Read only
Description	This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Test bytesTx

Access	Read only
Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp E1 Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.

Copyright © 2006, Nortel Nortel Confidential

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp E1 Test bitErrorRate

Access Read only

Description

This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib LogicalProcessor

Values String (5, ASCII)

Default No default

ATTRIBUTE Lp E1 Test elapsedTime

Access Read only

Description

This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Mib LogicalProcessor

Values Decimal (0.00..30240.00)

Units minutes

Default 0.00

ATTRIBUTE Lp E1 Test timeRemaining

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp E1 Dsp

Scope	Device
Description	*LogicalProcessor/n E1/0 Dsp* The *Dsp* component presents the status of the Digital Signal Processors (DSPs) present on a voice card. A voice card's *Dsp* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Dsp* components cannot be added or deleted.
Mib	LogicalProcessor
Common Verbs	Help List Display

COMPONENT Lp E1 Audio

Scope	Device
Description	*LogicalProcessor/n E1/0 Audio* The *Audio* component presents the audio status of the channels on a voice card. A voice card's *Audio* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Audio* components cannot be added or deleted.

GROUP Lp V35 Provisioned (Prov)

Properties	Provisioned
Description	This group contains all specific provisioning data for a *V35* component.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 linkMode (mode)

Access	Read and write
Description	This attribute defines the intended gender of the V.35 interface. The actual gender of the interface is determined by the physical connection to the patch panel. If the hardware setup does not match this attribute, an alarm will be generated. In ***dte*** mode, the RTS line signal is driven as specified by the attribute *readyLineState* when the interface passes its initial diagnostics. Then, the RTS line signal will be driven as specified in the attribute *dataTransferLineState* when the application is ready to transfer data. On the other hand, the input line signals (RFS, DSR, and DCD) are compared against those specified in the attributes *readyLineState* and *dataTransferLineState*. The application will be notified when the specified input line states are observed.

Copyright © 2006, Nortel Nortel Confidential

In ***dce*** mode, the *V35* component behaves similarly as when it is in ***dte*** mode. However, it will be driving the DCE line signals (RFS, DSR, and DCD) and monitoring the DTE line signal (RTS) as specified by the attributes *readyLineState* and *dataTransferLineState*.

Mib	LogicalProcessor
Values	dte dce
Default	dte

ATTRIBUTE Lp V35 readyLineState (rls)

Access	Read and write
Description	This attribute specifies the line signals originating from the V.35 interface that will always be turned on, provided the interface passes its diagnostics. This set of signals is generally required for maintaining the connection. Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*. See also *linkMode*.
Mib	LogicalProcessor
Set of	rfs dsr dcd rts
Default	(rfs, dsr, dcd, rts)

ATTRIBUTE Lp V35 dataTransferLineState (dtls)

Access	Read and write
Description	This attribute specifies the line signals required to indicate that the external equipment is in a good state (that is, data transfer can proceed). Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*. The value of this attribute must be a superset of that of the *readyLineState* attribute. See also *linkMode*.
Mib	LogicalProcessor
Set of	rfs dsr dcd rts
Default	(rfs, dsr, dcd, rts)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp V35 lineStatusTimeOut (lsto)

Access	Read and write
Description	This attribute specifies the time that the line state must be stable (good or bad) before a line state change is declared.
Mib	LogicalProcessor
Values	Decimal (10..20000)
Units	msec
Default	1000

ATTRIBUTE Lp V35 lineSpeed (speed)

Access	Read and write
Description	This attribute specifies the speed of the line for source clocking. This attribute is ignored if the interface is not providing a clock. The clock rate is rounded up to the nearest available value. Note that the actual clock rates are available in the operational attributes *actualTxLineSpeed* and *actualRxLineSpeed*. The values allowed on a V.35 DCE interface are: 3840000, 2560000, 2048000, 1920000, 1536000, 1344000, 1280000, 1024000, 960000, 768000, 672000, 640000, 512000, 448000, 384000, 336000, 320000, 256000, 224000, 192000, 168000, 128000, 112000, 64000, 56000, 48000, 32000, 19200, 9600. Note that line speeds of 1024000 and 2048000 cannot be provisioned on cards that have ports provisioned at 3840000, 2560000, 1920000, 1280000, 960000, 640000 or 320000.
Mib	LogicalProcessor
Values	Decimal (9600..3840000)
Units	bit/s
Default	192000

ATTRIBUTE Lp V35 clockingSource (clockingSource)

Access	Read and write
Description	This attribute specifies the source of synchronization of the outgoing clocks. This attribute is only used when the *actualLinkMode* is ***dce***. If the value of the attribute is ***local***, the outgoing clocks are synchronized to a local oscillator on the FP. If the value of the attribute is ***module***, the outgoing clocks are synchronized to the oscillator on the active CP.
Mib	LogicalProcessor
Values	local module

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp V35 dteDataClockSource (rxClk)

Access	Read and write
Description	This attribute is only used when the *actualLinkMode* is ***dce***. It is specifies the clock to be used to recover the receive data. A DTE interface uses TSET(DCE) and RSET(DCE) for timing. If the value of the attribute is ***fromDce***, the DCE uses the internally generated transmit clock to supply both TSET(DCE) and RSET(DCE). If the value of the attribute is ***fromDte***, the DCE still uses the internally generated transmit clock to supply TSET(DCE), but the receive timing is derived from TSET(DTE) on the link. The ***fromDte*** mode is recommended when the DTE is far away from the DCE interface. Note that TSET(DTE) is CCITT V.24 circuit 113; TSET(DCE) is CCITT V.24 circuit 114; and RSET(DCE) is CCITT V.24 circuit 115.
Mib	LogicalProcessor
Values	fromDce fromDte
Default	fromDce

ATTRIBUTE Lp V35 applicationFramerName (framer)

Access	Read and write
Description	This attribute specifies the component name of a *Framer* which is associated with the *V35* component.
Mib	LogicalProcessor
Values	Link (Service, interfaceName)
Default	No default

ATTRIBUTE Lp V35 enableDynamicSpeed (dynamic)

Access	Read and write
Description	When set to ***yes***, this attribute specifies that the transmit link speed should be set to the calculated receiver link speed. This attribute can be set to ***yes*** only if the *linkMode* is ***dce*** and the *dteDataClockSource* is ***fromDte***.
Mib	LogicalProcessor
Values	yes no
Default	no

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp V35 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp V35 AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp V35 commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LogicalProcessor
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp V35 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp V35 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp V35 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp V35 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp V35 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp V35 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp V35 usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp V35 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp V35 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — LogicalProcessor

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Lp V35 controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp V35 alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	LogicalProcessor

Default	No default

ATTRIBUTE Lp V35 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — LogicalProcessor

Values
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default — notSet

ATTRIBUTE Lp V35 unknownStatus (osiUnknw)

Access — Read only

Description — This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib — LogicalProcessor

Values
false
true

Default — false

GROUP Lp V35 Operational (Oper)

Properties — Operational

Description

This group contains all specific operational data for a *V35* component.

Mib — LogicalProcessor

ATTRIBUTE Lp V35 actualLinkMode

Access	Read only
Description	This attribute indicates the actual link mode defined by the hardware. Note that the hardware overrides the provisionable data. The interface behaves as a DCE or DTE according to the *actualLinkMode*.
Mib	LogicalProcessor
Values	dte dce
Default	No default

ATTRIBUTE Lp V35 lineState

Access	Read only
Description	This attribute indicates the current state of the interface signals.
Mib	LogicalProcessor
Set of	rfs dsr dcd rts
Default	No default

ATTRIBUTE Lp V35 actualTxLineSpeed

Access	Read only
Description	This attribute indicates the measured speed of the transmit clock.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Lp V35 actualRxLineSpeed

Access	Read only
Description	This attribute indicates the measured speed of the receive clock.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp V35 dataXferStateChanges

Access	Read only
Description	This attribute counts the line transitions from and to data transfer state.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

COMPONENT Lp V35 Test (Test)

Groups	GROUP Lp V35 Test OsiState (State) GROUP Lp V35 Test Setup (Setup) GROUP Lp V35 Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	LogicalProcessor
Common Verbs	Help List Display

VERB START Lp V35 Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp V35 Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp V35 Test OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For

Copyright © 2006, Nortel Nortel Confidential

component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib LogicalProcessor

ATTRIBUTE Lp V35 Test adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib LogicalProcessor

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Lp V35 Test operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib LogicalProcessor

Values enabled (ena)
disabled (dis)

Default disabled

ATTRIBUTE Lp V35 Test usageState (osiUsage)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

GROUP Lp V35 Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp V35 Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test.

Copyright © 2006, Nortel Nortel Confidential

remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Default: card

ATTRIBUTE Lp V35 Test frmSize (size)

Access: Read and write

Description:

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: LogicalProcessor

Values: Decimal (4..4096)

Units: bytes

Default: 1024

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp V35 Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	LogicalProcessor
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp V35 Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp V35 Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp V35 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp V35 Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp V35 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp V35 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started.

Copyright © 2006, Nortel Nortel Confidential

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib	LogicalProcessor
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning hardwareReconfigured loopCodeSyncFailed patternSyncFailed patternSyncLost
Default	neverStarted

ATTRIBUTE Lp V35 Test bitsTx

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp V35 Test bytesTx

Access	Read only
Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp V35 Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp V35 Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp V35 Test bytesRx

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp V35 Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp V35 Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp V35 Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the

Copyright © 2006, Nortel Nortel Confidential

	link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp V35 Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp V35 Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

GROUP Lp X21 Provisioned (Prov)

Properties: Provisioned

Description:

This group contains all specific provisioning data for an *X21* component.

Mib: LogicalProcessor

ATTRIBUTE Lp X21 linkMode (mode)

Access: Read and write

Description:

This attribute specifies the intended gender of the *X21* component (V.11 interface). The actual gender of the interface is determined by the physical connection to the patch panel. If the hardware setup does not match this attribute, an alarm will be generated.

In ***dte*** mode, the ***control*** line signal is driven as specified by the attribute *readyLineState* when the interface passes its initial diagnostics. Then, the ***control*** line signal will be driven as specified in the attribute *dataTransferLineState* when the application is ready to transfer data. On the other hand, the input line signal (***indication***) is compared against those specified in the attributes *readyLineState* and *dataTransferLineState*. The application will be notified when the specified line states are observed.

In ***dce*** mode, the *X21* component behaves similarly as when it is in ***dte*** mode. However, it will be driving the DCE line signal (***indication***) and

Copyright © 2006, Nortel Nortel Confidential

	monitoring the DTE line signal (***control***) as specified by the attributes *readyLineState* and *dataTransferLineState*.
Mib	LogicalProcessor
Values	dte dce
Default	dte

ATTRIBUTE Lp X21 readyLineState (rls)

Access	Read and write
Description	This attribute specifies the line signals originating from the V.11 interface that will always be turned on, provided the interface passes its diagnostics. This set of signals is generally required to maintain the connection. Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*. See also *linkMode*.
Mib	LogicalProcessor
Set of	indication control
Default	(indication, control)

ATTRIBUTE Lp X21 dataTransferLineState (dtls)

Access	Read and write
Description	This attribute specifies the state of the line signals required to indicate that the external equipment is in a good state (that is, data transfer can proceed). Note that both DTE and DCE signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the *actualLinkMode*. The value of this attribute must be a superset of that of the *readyLineState* attribute . See also *linkMode*.
Mib	LogicalProcessor
Set of	indication control
Default	(indication, control)

ATTRIBUTE Lp X21 lineStatusTimeOut (lsto)

Access	Read and write
Description	This attribute specifies the duration for the line state to be stable (good or bad) before a state change is declared.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Decimal (10..20000)
Units	msec
Default	1000

ATTRIBUTE Lp X21 lineSpeed (speed)

Access	Read and write
Description	This attribute specifies the speed of the line for source clocking. This attribute is ignored if the interface is not providing a clock. The clock rate is rounded up to the nearest available value. Note that the actual clock rates are available in the operational attributes *actualTxLineSpeed* and *actualRxLineSpeed*. The allowed values on a V.11 DCE interface are: 7680000, 3840000, 2560000, 2048000, 1920000, 1536000, 1344000, 1280000, 1024000, 960000, 768000, 672000, 640000, 512000, 448000, 384000, 336000, 320000, 256000, 224000, 192000, 168000, 128000, 112000, 64000, 56000, 48000, 32000, 19200, 9600. Note that line speeds of 1024000 and 2048000 cannot be provisioned on cards that have ports provisioned at 3840000, 2560000, 1920000, 1280000, 960000, 640000 or 320000.
Mib	LogicalProcessor
Values	Decimal (9600..7680000)
Units	bit/s
Default	192000

ATTRIBUTE Lp X21 clockingSource (clockingSource)

Access	Read and write
Description	This attribute specifies the source of synchronization of the outgoing clocks. This attribute is only used when the *actualLinkMode* is ***dce***. If the value of the attribute is *local*, the outgoing clocks are synchronized to a local oscillator on the FP. If the value of the attribute is *module*, the outgoing clocks are synchronized to the oscillator on the active CP.
Mib	LogicalProcessor
Values	local module
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp X21 dteDataClockSource (rxClk)

Access	Read and write
Description	This attribute is only used when the *actualLinkMode* is ***dce***. It specifies the clock to be used to recover the receive data. Note that a V.11 DTE interface uses the S clock (see X.21 standard) for both receive data and transmit data timing. The DTE interface always loops the received S clock back to the DCE as the X clock (see X.21 standard). If the value of the attribute is ***fromDce***, the DCE V.11 interface uses the internally generated transmit clock as the S clock and for both receive and transmit data timing. The X clock is ignored. If the value of the attribute is ***fromDte***, the DCE still uses the internally generated transmit clock as the S clock and for transmit data timing, but the receive data timing is derived from the X clock. The ***fromDte*** mode is recommended when the DTE is far away from the DCE interface.
Mib	LogicalProcessor
Values	fromDce fromDte
Default	fromDce

ATTRIBUTE Lp X21 lineTerminationRequired (ltr)

Access	Read and write
Description	This attribute specifies whether termination is required for this interface. If the hardware setup does not match this attribute, an alarm is generated.
Mib	LogicalProcessor
Values	yes no
Default	yes

ATTRIBUTE Lp X21 applicationFramerName (framer)

Access	Read and write
Description	This attribute specifies the component name of a *Framer* which is associated with the *X21* component.
Mib	LogicalProcessor
Values	Link (Service, interfaceName)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp X21 enableDynamicSpeed (dynamic)

Access	Read and write
Description	When set to ***yes***, this attribute specifies that the transmit link speed should be set to the calculated receiver link speed. This attribute can be set to ***yes*** only if the *linkMode* is ***dce*** and the *dteDataClockSource* is ***fromDte***.
Mib	LogicalProcessor
Values	yes no
Default	no

GROUP Lp X21 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp X21 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp X21 AdminInfo (AdminInfo)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LogicalProcessor

ATTRIBUTE Lp x21 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp x21 commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LogicalProcessor
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp x21 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp x21 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp X21 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp X21 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp X21 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp X21 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp x21 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp x21 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp x21 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp X21 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Lp X21 availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

Copyright © 2006, Nortel Nortel Confidential

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp X21 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	LogicalProcessor
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp X21 controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — LogicalProcessor

Set of — subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Lp X21 alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp x21 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	LogicalProcessor
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp x21 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

Copyright © 2006, Nortel Nortel Confidential

	The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	LogicalProcessor
Values	false true
Default	false

GROUP Lp X21 Operational (Oper)

Properties	Operational
Description	This group contains all specific operational data for an *X21* component.
Mib	LogicalProcessor

ATTRIBUTE Lp X21 actualLinkMode

Access	Read only
Description	This attribute indicates the actual link mode defined by the hardware. Note that the hardware overrides the provisionable data. The interface behaves as a DCE or DTE according to the *actualLinkMode*.
Mib	LogicalProcessor
Values	dte dce
Default	No default

ATTRIBUTE Lp X21 lineState

VERB START Lp X21 Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

Copyright © 2006, Nortel Nortel Confidential

VERB STOP Lp X21 Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp X21 Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp X21 Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp X21 Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp X21 Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

GROUP Lp X21 Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp X21 Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp X21 Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). Note that not all test types are not supported by all function processors.
Mib	LogicalProcessor
Values	card manual localLoop remoteLoop externalLoop payloadLoop remoteLoopThisTrib v54RemoteLoop pn127RemoteLoop lineBIP8Error sectionBIP8Error pathBIP8Error pathBIP2Error
Default	card

ATTRIBUTE Lp X21 Test frmSize (size)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	LogicalProcessor
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp X21 Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	LogicalProcessor
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp X21 Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp X21 Test dataStartDelay (dsd)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp X21 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp X21 Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp X21 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp X21 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

ATTRIBUTE Lp X21 Test bitsTx

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp X21 Test bytesTx

Access Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp X21 Test frmTx

Access Read only

Description

This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp X21 Test bitsRx

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp X21 Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp X21 Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp X21 Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp X21 Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp X21 Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp X21 Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.

GROUP Lp Tr CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LanDrivers

ATTRIBUTE Lp Tr customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the

Copyright © 2006, Nortel Nortel Confidential

component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Default	No default

GROUP Lp Tr Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the Token Ring port.
Mib	LanDrivers

ATTRIBUTE Lp Tr ringSpeed (rspd)

Access	Read and write
Criticality	Process
Description	This attribute indicates the ring speed at the next insertion into the ring. Note that all the interfaces on a ring must operate at the same speed.
Mib	LanDrivers
Values	fourMegabit sixteenMegabit
Default	sixteenMegabit

ATTRIBUTE Lp Tr monitorParticipate (mntr)

Access	Read and write
Criticality	Process
Description	This attribute determines whether the interface will participate in the active monitor selection process.
Mib	LanDrivers
Values	true false
Default	false

ATTRIBUTE Lp Tr functionalAddress

Access	Read and write
Criticality	Process
Description	This attribute contains a bit mask of all token ring functional addresses for which this interface will accept frames. The address is displayed in canonical form.
Mib	LanDrivers
Values	String (6, Dashed Hex)

Copyright © 2006, Nortel Nortel Confidential

Default	03-00-fe-ff-8f-01

ATTRIBUTE Lp Tr nodeAddress (nAddr)

Access	Read and write
Criticality	Process
Description	This attribute identifies the primary, node specific address recognized by this interface. If an operator does not provision a MAC address, the interface will use a predefined, permanentlyassigned address. A valid node address must not be any of the following: a broadcast address, a group address, a functional address or a null address. A node address should be entered in the canonical form.
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	00-00-00-00-00-00

ATTRIBUTE Lp Tr groupAddress (gAddr)

Access	Read and write
Criticality	Process
Description	This attribute identifies the group address for which this interface will accept frames. The address is displayed in canonical form. For a valid group address, the least significant bit of the first octet should be set to 1. Currently, only one group address can be provisioned for one interface.
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	03-00-01-00-00-00

ATTRIBUTE Lp Tr productId

Access	Read and write
Criticality	Process
Description	This attribute is used to identify the host system attached to this interface. This information is transmitted in response to Request Station Attachment MAC frames.
Mib	LanDrivers
Values	String (0..18, ASCII)
Default	"LAN Token Ring"

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Tr applicationFramerName (framer)

Access	Read and write
Criticality	Process
Description	This attribute contains the component name of a Framer which is associated with the *Tr* component.
Mib	LanDrivers
Values	Link (Service, interfaceName)
Default	No default

GROUP Lp Tr AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LanDrivers

ATTRIBUTE Lp Tr vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LanDrivers
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp Tr commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LanDrivers
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp Tr includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the

Copyright © 2006, Nortel Nortel Confidential

comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.

Mib	LanDrivers
Values	no yes
Default	no

GROUP Lp Tr OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LanDrivers

ATTRIBUTE Lp Tr adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LanDrivers
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Tr operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LanDrivers
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Tr usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LanDrivers
Values	idle active (activ) busy
Default	idle

GROUP Lp Tr OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LanDrivers

ATTRIBUTE Lp Tr snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Copyright © 2006, Nortel Nortel Confidential

Mib	LanDrivers
Values	up down testing
Default	up

GROUP Lp Tr Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the Token Ring component.
Mib	LanDrivers

ATTRIBUTE Lp Tr macAddress

Access	Read only
Description	This attribute contains the actual MAC address. The value is assigned by the system if *nodeAddress* is not provisioned. This address is displayed in canonical form. The non-canonical version of this address is indicated in *ncMacAddress*.
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	00-00-00-00-00-00

ATTRIBUTE Lp Tr ringState

Access	Read only
Description	This attribute contains the value of the current interface state with respect to entering or leaving the ring.
Mib	LanDrivers
Values	opened closed opening closing openFailure ringFailure
Default	ringFailure

ATTRIBUTE Lp Tr ringStatus

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute contains the value of the current interface status after the station has entered the ring. The value is a sum of values, one for each currently applicable condition. Before the station attempts an open this attribute has the value of ***noStatus***.
noProblems = 0,
ringRecovery = 32,
singleStation = 64,
removeReceived = 256,
reserved = 512,
autoRemovalError = 1024,
lobeWireFault = 2048,
transmitBeacon = 4096,
softError = 8192,
hardError = 16384,
signalLoss = 32768,
noStatus = 131072

duplicateMac

Copyright © 2006, Nortel Nortel Confidential

	requestFailed removeReceived open
Default	noOpen

ATTRIBUTE Lp Tr upStream

Access	Read only
Description	This attribute is the MAC address of the station's up-stream neighbor. This address is displayed in canonical form. The non-canonical version of this address is indicated in *ncUpStream.*
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	00-00-00-00-00-00

ATTRIBUTE Lp Tr chipSet

Access	Read only
Description	This attribute identifies the hardware chip set in use by an interface.
Mib	LanDrivers
Values	ibm16 titms380 titms380c16 titms380c26
Default	titms380c16

ATTRIBUTE Lp Tr lastTimeBeaconSent

Access	Read only
Description	This attribute indicates the time at which a Beacon frame was last transmitted on this interface.
Mib	LanDrivers
Values	Time (DHMS)
Default	No default

GROUP Lp Tr Statistics (Stats)

Properties	Operational
Description	This group contains statistical information for the Token Ring port.
Mib	LanDrivers

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Tr lineErrors

Access	Read only
Description	This attribute contains the number of frames or tokens copied or repeated by a station where there is a non-data bit or a FCS error. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr burstErrors

Access	Read only
Description	This attribute contains the number of times the station detects the absence of transitions for five consecutive half-bit times. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr acErrors

Access	Read only
Description	This attribute contains the number of times that a station can not set the AC bits properly. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr abortTransErrors

Access	Read only
Description	This attribute contains the number of aborted frames. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Tr internalErrors

Access	Read only
Description	This attribute contains the number of internal errors. When the value of the counter soars up quickly, it indicates a potential hardware problem. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr lostFrameErrors

Access	Read only
Description	This attribute contains the number of times a station is transmitting and its TRR timer expires. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr receiveCongestions

Access	Read only
Description	This attribute contains the number of times a station is supposed to receive a frame but cannot due to lack of buffer space. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr frameCopiedErrors

Access	Read only
Description	This attribute contains the number of times a station receives a frame addressed to its specific address and detects that the A bit is set. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp Tr tokenErrors

Access	Read only
Description	This attribute contains the number of times a station acting as the active monitor recognizes an error condition that needs a token transmission. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr softErrors

Access	Read only
Description	This attribute contains the number of soft errors or the number of Report Error Mac frames the station has transmitted. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr hardErrors

Access	Read only
Description	This attribute contains the number of times this interface has detected an immediately recoverable fatal error. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr signalLoss

Access	Read only
Description	This attribute contains the number of times signal condition has been lost. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp Tr transmitBeacons

Access	Read only
Description	This attribute contains the number of beacon frames transmitted. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr ringRecoverys

Access	Read only
Description	This attribute contains the number of times the ring has been purged. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr lobeWires

Access	Read only
Description	This attribute contains the number of times the interface has detected a short circuit in the lobe data path. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr removeRings

Access	Read only
Description	This attribute contains the number of Remove Ring Station Mac frames received. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Tr singleStation

Access	Read only
Description	This attribute contains the number of times the station has determined it is the only one on the ring. This is not necessarily an error. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Tr freqErrors

Access	Read only
Description	This attribute contains the number of signal frequency errors detected. This counter wraps around when the maximum value is reached.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	0

GROUP Lp Tr NcMacOperational (NcMacOper)

Properties	Operational
Description	This group contains the operational attributes of the *TokenRing* port component related to non-canonical MAC addresses.
Mib	LanDrivers

ATTRIBUTE Lp Tr ncMacAddress

Access	Read only
Description	This attribute contains the actual MAC address. The value is assigned by the system if *nodeAddress* is not provisioned. This address is displayed in non-canonical form. The canonical version of this address is indicated in *macAddress*.
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lp Tr ncUpStream

Access	Read only
Description	This attribute is the MAC address of the station's up-stream neighbor. This address is displayed in non-canonical form. The canonical version of this address is indicated in *upStream*.

ATTRIBUTE Lp Tr Test frmSize (size)

Access — Read and write

Description — This attribute defines the size of the test data frames in number of bytes.

Mib — LanDrivers

Values — Decimal (4..4096)

Units — bytes

Default — 1024

ATTRIBUTE Lp Tr Test duration (duration)

Access — Read and write

Description — This attribute specifies the duration of the test data transmission. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop.

Mib — LanDrivers

Values — Decimal (1..30240)

Units — minutes

Default — 1

GROUP Lp Tr Test Results (Results)

Properties — Operational

Description — This group contains all the statistics related attributes of the Test component.

Mib — LanDrivers

ATTRIBUTE Lp Tr Test elapsedTime

Access — Read only

Description — This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted.

Copyright © 2006, Nortel Nortel Confidential

Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Tr Test timeRemaining

Access	Read only
Description	This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Tr Test causeOfTermination

Access	Read only
Description	This attribute records the reason the test is terminated.
Mib	LanDrivers
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning
Default	neverStarted

ATTRIBUTE Lp Tr Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.
Mib	LanDrivers
Values	Long Integer
Default	No default

ATTRIBUTE Lp Tr Test bitsTx

Access	Read only
Description	This attribute counts the bits sent during the test period. This counter is not expected to reach its maximum value.

GROUP Lp Sonet Operational (Oper)
GROUP Lp Sonet Statistics (Stats)

Scope: Device

Description: *Lp/n Sonet/n*
This component controls a port using the SONET hierarchy. In particular, it deals with SONET medium, section, and line layers.

On a Nortel Networks Multiservice Switch 7400, a *Path* component can sometimes be automatically created under the *Sonet* component.

Mib: LogicalProcessor

Opt. Subcomp.: COMPONENT Lp Sonet Path
COMPONENT Lp Sonet Sts
COMPONENT Lp Sonet OpticalModule (Om)

Dyn. Subcomp.: COMPONENT Lp Sonet Test (Test)

Common Verbs: Help, List, Display, Add, DELete, LOCK, Unlock

GROUP Lp Sonet Provisioned (Prov)

Properties: Provisioned

Description:
This group contains the provisioning data for a *Sonet* or *Sdh* component.

Mib: LogicalProcessor

ATTRIBUTE Lp Sonet clockingSource

Access: Read and write

Description:
This attribute defines the type of clocking source used for synchronizing the transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means the use of a signal phase-locked to the incoming line rate; ***module*** means the use of a signal phase-locked to the CP reference clock.

When adding a *Sonet* or *Sdh* component, the *clockingSource* attribute is set to ***module*** if the *NetworkSynchronization* component has been added and is set to ***local*** otherwise.

Note that the multiport cell-based cards have one common clock source for each of the three ports when either the clocking source ***local*** or

Copyright © 2006, Nortel Nortel Confidential

module is selected. For this reason, it is not allowed to have at the same time the *clockingSource* attribute set to ***local*** on one port and ***module*** on another port. Furthermore, the *clockingSource* attribute cannot be set to ***module*** if the *NetworkSynchronization* component has not been added.

Mib — LogicalProcessor

Values — local
line
module

Default — No default

ATTRIBUTE Lp Sonet lineAutomaticProtectionSwitch (laps)

Access — Read and write

Criticality — Process

Description

This attribute specifies the name of the *Laps* component. In the case of intra-card configurations, the specified *Laps* component is used to provide sparing of lines which use this port and its mate; in the case of inter-card configurations, the specified *Laps* component is used to provide sparing of lines only.

Mib — LogicalProcessor

Values — Link

Default — No default

ATTRIBUTE Lp Sonet txSectionTrace

Access — Read and write

Description

This attribute specifies the section identifier. The string must be constructed with 7-bit characters only. The section identifier is prefixed by a CRC byte and padded with null characters if necessary to form the 16-octet section trace message transmitted in byte J0 of 16 outgoing frames. At the remote end, the section trace is reassembled, the CRC is checked and the message is compared to the *expectedRxSectionTrace* attribute. If a mismatch is detected, an alarm is issued.

Usage guidelines for the section trace are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.

The functionality supported by this attribute is not available.

Mib — LogicalProcessor

Values — String (0..15, Extended ASCII)

Default — ""

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Sonet expectedRxSectionTrace

Access	Read and write
Description	This attribute specifies the expected section trace identifier which is used to identify the fiber connected to the associated port. This attribute must match the corresponding *txSectionTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. The functionality supported by this attribute is not available.
Mib	LogicalProcessor
Values	String (0..15, Extended ASCII)
Default	""

ATTRIBUTE Lp Sonet s1RxDefault

Access	Read and write
Description	This attribute specifies the default S1 byte reported by the port when the received S1 byte is 0 (quality unknown). No default is applied when this attribute is set to ***none***.
Mib	LogicalProcessor
Values	Decimal (0..15) none
Default	none

ATTRIBUTE Lp Sonet s1TxOverride

Access	Read and write
Description	This attribute specifies the S1 byte transmitted on the port regardless of the Synchronization Status Message (SSM) value provided by the *NetworkSynchronization* component. Changes in SSM value from the *NetworkSynchronization* component are ignored when this attribute is set to a value other than ***none***.
Mib	LogicalProcessor
Values	Decimal (0..15) none
Default	none

ATTRIBUTE Lp Sonet s1RxOverride

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the S1 byte value reported by the port regardless of the received value. Changes in S1 byte on the port are ignored when this attribute is set to a value other than ***none***.
Mib	LogicalProcessor
Values	Decimal (0..15) none
Default	none

ATTRIBUTE Lp Sonet lapsProtocol

Access	Read: Illegal Write: All
Description	This attribute stores the value of the *protocol* attribute provisioned under the *Laps* component. This hidden attribute is updated automatically via a check escape on *Laps* component.
Mib	LogicalProcessor
Values	Decimal (0..10) none
Default	none

ATTRIBUTE Lp Sonet sonetSdhOmType

Access	Read: Illegal Write: All
Description	This attribute stores the value of the *type* attribute provisioned under the *OpticalModule* component.This hidden attribute is updated automatically via the *OpticalModule* component check escape.
Mib	LogicalProcessor
Values	Decimal (1..256) none
Default	none

GROUP Lp Sonet CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet customerIdentifier (cid)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Sonet AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp Sonet commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LogicalProcessor
Values	String (0..60, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp Sonet includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp Sonet IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp Sonet ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp Sonet OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp Sonet OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Lp Sonet operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Sonet usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sonet availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The

Copyright © 2006, Nortel Nortel Confidential

operationalState is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib — LogicalProcessor

migrating

Default — No default

ATTRIBUTE Lp Sonet proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase.

Copyright © 2006, Nortel Nortel Confidential

	If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	LogicalProcessor
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp Sonet controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	LogicalProcessor
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp Sonet alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — LogicalProcessor

Set of
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Lp Sonet standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib LogicalProcessor

Values
false
true

Default false

GROUP Lp Sonet Operational (Oper)

Properties Operational

Description

This group contains the common operational data for a *Sonet* or *Sdh* component.

Mib LogicalProcessor

ATTRIBUTE Lp Sonet losAlarm (los)

Access Read only

Description

This attribute indicates whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds, or if an LOS defect is present when the criteria for LOF failure declaration have been met. An LOS defect is declared when 20+/-3 us of all-zeros pattern is detected. The LOS defect is cleared when two valid framing words are detected and no Loss of Signal condition is detected during an interval of 20+/-3 us. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all

Copyright © 2006, Nortel Nortel Confidential

measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOS alarm condition is cleared. The LOS alarm state is cleared after LOS defects have been absent for a period of 10 seconds +/- 0.5 seconds.
The *losAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Mib — LogicalProcessor

Values — on
off

Default — No default

ATTRIBUTE Lp Sonet lofAlarm (lof)

Access — Read only

Description

This attribute displays whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when LOF defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds, except when an LOS defect or failure is present. An LOF defect is detected when getting contiguous errored frame alignment for at least 3 msec. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when framing has been achieved for a period of 10 seconds +/- 0.5 seconds.
The *lofAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Mib — LogicalProcessor

Values — on
off

Default — No default

ATTRIBUTE Lp Sonet rxAisAlarm (ais)

Access — Read only

Description

This attribute displays whether a Line Alarm Indication Signal (L-AIS) alarm state has been entered. An L-AIS alarm state is entered when L-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The L-AIS defect is the occurrence of the L-AIS signal in five contiguous STS (STM) frames (111 pattern in bits 6,7, and 8 of the K2 bytes). If the L-AIS defects are intermittently occurring, the L-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

Copyright © 2006, Nortel Nortel Confidential

The *Sonet/Sdh* component goes into an operational state of *disabled* until the L-AIS alarm condition is cleared. The condition is cleared after not detecting the L-AIS signal for a period of 10 seconds +/- 0.5 seconds. The *rxAisAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Mib: LogicalProcessor

Values:
on
off

Default: No default

ATTRIBUTE Lp Sonet rxRfiAlarm (rfi)

Access: Read only

Description

This attribute displays whether a Line Remote Failure Indication (LRFI) alarm state has been entered. An L-RFI alarm state is entered when Line Remote Failure Indication (L-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The L-RDI defect is the occurrence of the L-RDI signal in five contiguous valid STS (STM) frame (110 pattern in bits 6,7, and 8 of the K2 bytes). If the L-RDI defects are intermittently occurring, the L-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The *Sonet/Sdh* component goes into an operational state of *disabled* until the L-RFI alarm condition is cleared. The condition is cleared after not detecting the L-RDI signal for a period of 10 seconds +/- 0.5 seconds. The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Mib: LogicalProcessor

Values:
on
off

Default: No default

ATTRIBUTE Lp Sonet txAis

Access: Read only

Description

This attribute displays whether the Line Alarm Indication Signal (L-AIS) signal is being transmitted on the outgoing line. This signal is transmitted when the *Sonet/Sdh* is *locked* and left *offline*.

Mib: LogicalProcessor

Values:
on
off

Default: No default

ATTRIBUTE Lp Sonet txRdi

Access	Read only
Description	This attribute displays whether the Line Remote Defect Indicator (L-RDI) signal is being transmitted over the OC-3 line. The L-RDI signal is transmitted upon the detection of the LOS, LOF or L-AIS defect. This attribute is always set to ***off*** when the component has been *locked* and left *offline*.
Mib	LogicalProcessor
Values	on off
Default	No default

ATTRIBUTE Lp Sonet unusableTxClockRefAlarm (utcr)

Access	Read only
Description	This attribute displays whether an Unusable Transmit Clock Reference (UTCR) alarm state has been entered. A UTCR alarm state is entered when a Sonet/Sdh port provisioned to act as a transmit clock reference has received the code “do not use for synchronization” in the S1 byte (in the SONET/ SDH line overhead) for 2.5 +/- 0.5 seconds. The condition is cleared after not detecting the “do not use for synchronization” code for a period of 10 +/- 0.5 seconds or when the port is no longer provisioned to act as a transmit clock reference. A port is acting as a transmit clock reference if it is provisioned with a) a *clockingSource* of *line*, or b) it has been provisioned as a primaryReference, secondaryReference or tertiaryReference in the NetworkSynchronization component. The *unusableTxClockRefAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.
Mib	LogicalProcessor
Values	on off
Default	No default

ATTRIBUTE Lp Sonet s1Rx (s1R)

Access	Read only
Description	This attribute indicates the current S1 byte received on the port.

GROUP Lp Sonet Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for a *Sonet* or *Sdh* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet runningTime (time)

Access	Read only
Description	This attribute indicates the total number of seconds since the *Sonet/Sdh* component has been activated and been in unlocked state. All the other error counts that follow can be updated when this count is active.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet errorFreeSec (efs)

Access	Read only
Description	This attribute indicates the number of seconds that the *Sonet/Sdh* component has been in a near-end error free state.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet sectCodeViolations (scv)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the total number of Section Code Violations (SCVs) detected. A SCV corresponds to section BIP-8 error. SCV counting is inhibited for second intervals where a Section Severely Errored Second (SSES) is counted. The count wraps at its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet sectErroredSec (ses)

Access	Read only
Description	This attribute indicates the total number of Section Errored Seconds (SESs) that have been counted. A SES is declared for second intervals containing one or more SCVs or one or more Loss Of Signal (LOS) or Severely Errored Frame (SEF) defects. A SEF defect is the occurrence of 4 contiguous errored STS or STM frame alignment words.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet sectSevErroredSec (sses)

Access	Read only
Description	This attribute indicates the total number of Section Severely Errored Seconds (SSESs) that have been counted. A SSES is declared for second intervals containing more than ***X*** SCVs or one or more LOS or SEF defects. The value of ***X*** is 16 for 155 Mbit/s interface.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet sectLosSec (sloss)

Access	Read only
Description	This attribute indicates the total number of Section LOS Seconds (SLOSSs) that have been counted. A SLOSS is declared for second intervals containing one or more LOS defects.

GROUP Lp Sonet Path CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib LogicalProcessor

ATTRIBUTE Lp Sonet Path customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Copyright © 2006, Nortel Nortel Confidential

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib LogicalProcessor

Values Decimal (0; 1..8191)

Default 0

GROUP Lp Sonet Path OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib LogicalProcessor

ATTRIBUTE Lp Sonet Path adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Sonet Path **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sonet Path **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Sonet Path **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Sonet Path proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default	No default

ATTRIBUTE Lp Sonet Path alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — LogicalProcessor

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Lp Sonet Path **standbyStatus (osiStby)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet Path snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp Sonet Path Operational (Oper)

Properties	Operational
Description	This group contains the common operational data for the component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet Path lopAlarm (lop)

Access	Read only
Description	This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

Copyright © 2006, Nortel Nortel Confidential

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib: LogicalProcessor

Values:
on
off

Default: No default

ATTRIBUTE Lp Sonet Path rxAisAlarm (ais)

Access: Read only

Description

This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib: LogicalProcessor

Values:
on
off

Default: No default

ATTRIBUTE Lp Sonet Path rxRfiAlarm (rfi)

Access: Read only

Description

This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or

Copyright © 2006, Nortel Nortel Confidential

STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib — LogicalProcessor

Values — on
off

Default — No default

ATTRIBUTE Lp Sonet Path signalLabelMismatch (slm)

Access — Read only

Description

This attribute displays whether the Path Payload Label Mismatch (P-PLM) or Path Unequipped (P-UNEQ) failure conditions have been entered.

A P-PLM failure condition is entered when P-PLM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A P-PLM defect occurs when detecting an unexpected path signal label. If the P-PLM defects are intermittently occurring, the P-PLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Payload Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

A P-UNEQ failure condition is entered when P-UNEQ defects have been observed and accumulated for a period of 2.5 seconds =/-0.5 seconds. A P-UNEQ defect occurs when detecting an unequipped path signal label. If the P-UNEQ defects are intermittently occurring, the P-UNEQ defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Unequipped failure condition is cleared. The condition is cleared when the P-UNEQ defect is absent for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Description	This attribute counts the one second intervals that the component has been in a near-end error free state. The counter wraps to 0 when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Path **pathCodeViolations (pcv)**

Access	Read only
Description	This attribute counts the detected Path Code Violations (PCVs). Each PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted. The counter wraps to 0 when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Path **pathErroredSec (pes)**

Access	Read only
Description	This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second. The counter wraps to 0 when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Path **pathSevErroredSec (pses)**

Access	Read only
Description	This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than ***X*** PCVs or one or more LOP or path AIS defects. The value of ***X*** is 2400 for

a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sonet Path pathAisLopSec (pals)

Access Read only

Description

This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sonet Path pathUnavailSec (puas)

Access Read only

Description

This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

COMPONENT Lp Sonet Path AtmCell (Cell)

Groups GROUP Lp Sonet Path Cell Provisioned (Prov)
GROUP Lp Sonet Path Cell Operational (Oper)
GROUP Lp Sonet Path Cell Statistics (Stats)

Scope Device

Description

The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

GROUP Lp Sonet Path Cell Provisioned (Prov)

Properties Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp Sonet Path Cell **alarmActDelay (act)**

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	LogicalProcessor
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Lp Sonet Path Cell **scrambleCellPayload (scramble)**

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	LogicalProcessor
Values	off on
Default	No default

ATTRIBUTE Lp Sonet Path Cell **correctSingleBitHeaderErrors**

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Copyright © 2006, Nortel Nortel Confidential

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib: LogicalProcessor

Values: off
on

Default: off

ATTRIBUTE Lp Sonet Path Cell clearDelay (clear)

Access: Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: LogicalProcessor

Values: Decimal (0..60)

Units: minutes

Default: 0

ATTRIBUTE Lp Sonet Path Cell hecSampleInterval (hSample)

Access: Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: LogicalProcessor

Values: Decimal (0..25)

Units: seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp Sonet Path Cell **hecErrorLimit (hLimit)**

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp Sonet Path Cell **lcdStateDelay (delay)**

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp Sonet Path Cell **hecErrorIntervalLimit (hIntLimit)**

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before

Copyright © 2006, Nortel Nortel Confidential

an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib LogicalProcessor

Values Decimal (1..25)

Default 1

GROUP Lp Sonet Path Cell Operational (Oper)

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib LogicalProcessor

ATTRIBUTE Lp Sonet Path Cell lcdAlarm (lcd)

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell*

Copyright © 2006, Nortel Nortel Confidential

component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Default off

GROUP Lp Sonet Path Cell Statistics (Stats)

Properties Operational

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib LogicalProcessor

ATTRIBUTE Lp Sonet Path Cell uncorrectableHeaderErrors (ucErr)

Access Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sonet Path Cell sevErroredSec (ses)

Access Read only

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where

Copyright © 2006, Nortel Nortel Confidential

the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Impact Service

Description

This command invokes a test on the hardware component.
Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp Sonet Test

Impact Service

Description

This command stops a test running on the hardware component.

GROUP Lp Sonet Test OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Copyright © 2006, Nortel Nortel Confidential

here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — LogicalProcessor

ATTRIBUTE Lp Sonet Test adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — LogicalProcessor

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp Sonet Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — LogicalProcessor

Values — enabled (ena)
disabled (dis)

Default — disabled

Values	idle active (activ) busy
Default	idle

GROUP Lp Sonet Test **Setup (Setup)**

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet Test **purpose (purpose)**

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp Sonet Test **type (type)**

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate

Copyright © 2006, Nortel Nortel Confidential

test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

ATTRIBUTE Lp Sonet Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Sonet Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp Sonet Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Sonet Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Sonet Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sonet Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started.

Copyright © 2006, Nortel Nortel Confidential

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib	LogicalProcessor
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning hardwareReconfigured loopCodeSyncFailed patternSyncFailed patternSyncLost
Default	neverStarted

ATTRIBUTE Lp Sonet Test bitsTx

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Test bytesTx

Access	Read only
Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Test bytesRx

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the

Copyright © 2006, Nortel Nortel Confidential

	link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Sonet Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Sonet Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

GROUP Lp Sonet Sts CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	SonetSdh
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Sonet Sts OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — SonetSdh

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp Sonet Sts operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — SonetSdh

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp Sonet Sts usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	SonetSdh
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sonet Sts availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Sonet Sts proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Lp Sonet Sts controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Lp Sonet Sts alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	SonetSdh

Default	No default

ATTRIBUTE Lp Sonet Sts standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service

Copyright © 2006, Nortel Nortel Confidential

but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Properties	Operational
Description	This group contains the common operational data for the component.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts lopAlarm (lop)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds. The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.
Mib	SonetSdh
Values	on off
Default	No default

ATTRIBUTE **Lp Sonet Sts** **rxAisAlarm (ais)**

Access	Read only
Description	This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds. The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.
Mib	SonetSdh
Values	on off

Default No default

ATTRIBUTE Lp Sonet Sts rxRfiAlarm (rfi)

Access Read only

Description

This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib SonetSdh

Values on
off

Default No default

ATTRIBUTE Lp Sonet Sts signalLabelMismatch (slm)

Access Read only

Description

This attribute displays whether the Path Payload Label Mismatch (P-PLM) or Path Unequipped (P-UNEQ) failure conditions have been entered.

A P-PLM failure condition is entered when P-PLM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A P-PLM defect occurs when detecting an unexpected path signal label. If the P-PLM defects are intermittently occurring, the P-PLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Payload Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

A P-UNEQ failure condition is entered when P-UNEQ defects have been observed and accumulated for a period of 2.5 seconds =/-0.5 seconds. A P-UNEQ defect occurs when detecting an unequipped path signal label. If the P-UNEQ defects are intermittently occurring, the P-UNEQ defect

Copyright © 2006, Nortel Nortel Confidential

accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Unequipped failure condition is cleared. The condition is cleared when the P-UNEQ defect is absent for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Sts pathAisLopSec (pals)

Access	Read only
Description	This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP defects. Counting of PALS is inhibited when PUAS is declared over the monitored second. The counter wraps to 0 when it exceeds its maximum value.
Mib	SonetSdh
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Sts pathUnavailSec (puas)

Access	Read only
Description	This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited. The counter wraps to 0 when it exceeds its maximum value.

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Sts pathFailures (pf)

Access	Read only
Description	This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure). The counter wraps to 0 when it exceeds its maximum value.
Mib	SonetSdh
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Sts farEndPathErrorFreeSec (fepefs)

Access	Read only
Description	This attribute counts the one second intervals that the component has been in a far-end error free state. The counter wraps to 0 when it exceeds its maximum value.
Mib	SonetSdh
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sonet Sts farEndPathCodeViolations (fepcv)

Access	Read only
Description	This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared. The counter wraps to 0 when it exceeds its maximum value.
Mib	SonetSdh
Values	Decimal (0..4294967295)
Default	0

GROUP Lp Sonet Sts Provisioned (ChProv)

Properties	Provisioned
Description	This group contains the provisioning data for *Sts* components provisioned under *Sonet* components that support channelization..
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts txPathTrace

Access	Read and write
Description	This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. The path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SONET frames. At the remote end, the path trace is reassembled, and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued.

Copyright © 2006, Nortel Nortel Confidential

The functionality supported by this attribute is not available.

Mib	SonetSdh
Values	String (0..64, ASCII)
Default	""

ATTRIBUTE Lp Sonet Sts expectedRxPathTrace

Access	Read and write
Description	This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. The functionality supported by this attribute is not available.
Mib	SonetSdh
Values	String (0..64, ASCII)
Default	""

ATTRIBUTE Lp Sonet Sts concatNumber

Access	Read and write
Criticality	Process
Description	This attribute specifies the STS concatenation level for the *Sts* component on channelized cards. It must be set to a concatenation level supported by the FP upon which the *Sts* is defined, except for non-channelized cards, in which case it must be set to 0. For example, a value of 1 in this attribute would represent STS-1 concatenation, while a value of 3 would represent STS-3c, a value of 12 would represent STS-12c, and so forth. *Sts* channelization to the tributary level is supported only if this attribute is set to 1.
Mib	SonetSdh
Values	Decimal (0; 1; 3; 12; 48)
Default	No default

COMPONENT Lp Sonet Sts AtmCell (Cell)

Groups	GROUP Lp Sonet Sts Cell Provisioned (Prov) GROUP Lp Sonet Sts Cell Operational (Oper) GROUP Lp Sonet Sts Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes.

Copyright © 2006, Nortel Nortel Confidential

The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

Mib SonetSdh

GROUP Lp Sonet Sts Cell Provisioned (Prov)

Properties Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

Mib SonetSdh

ATTRIBUTE Lp Sonet Sts Cell alarmActDelay (act)

Access Read and write

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib SonetSdh

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Lp Sonet Sts Cell scrambleCellPayload (scramble)

Access Read and write

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether

Copyright © 2006, Nortel Nortel Confidential

or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Mib SonetSdh

Values
off
on

Default No default

ATTRIBUTE Lp Sonet Sts Cell correctSingleBitHeaderErrors

Access Read and write

Description

This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib SonetSdh

Values
off
on

Default off

ATTRIBUTE Lp Sonet Sts Cell clearDelay (clear)

Access Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib SonetSdh

Values Decimal (0..60)

Units minutes

Default 0

ATTRIBUTE Lp Sonet Sts Cell hecSampleInterval (hSample)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	SonetSdh
Values	Decimal (0..25)
Units	seconds
Default	0

ATTRIBUTE Lp Sonet Sts Cell **hecErrorLimit (hLimit)**

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	SonetSdh
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp Sonet Sts Cell **lcdStateDelay (delay)**

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell

Copyright © 2006, Nortel Nortel Confidential

Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib SonetSdh

Values Decimal (1..50)

Units msec

Default No default

ATTRIBUTE Lp Sonet Sts Cell hecErrorIntervalLimit (hIntLimit)

Access Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib SonetSdh

Values Decimal (1..25)

Default 1

GROUP Lp Sonet Sts Cell Operational (Oper)

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib SonetSdh

ATTRIBUTE Lp Sonet Sts Cell lcdAlarm (lcd)

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure

Copyright © 2006, Nortel Nortel Confidential

alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Mib — SonetSdh

Values — on
off

Default — off

GROUP Lp Sonet Sts Cell **Statistics (Stats)**

Properties — Operational

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib — SonetSdh

ATTRIBUTE Lp Sonet Sts Cell **uncorrectableHeaderErrors (ucErr)**

Access — Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

GROUP Lp Sonet Sts Vt1dot5 CustomerIdentifierData (CidData)

Properties — Provisioned

Description — This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib — SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 customerIdentifier (cid)

Access — Read and write

Description — This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib — SonetSdh

Values — Decimal (0; 1..8191)

Default — 0

Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Sonet Sts Vt1dot5 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: SonetSdh

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Sonet Sts Vt1dot5 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: SonetSdh

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Lp Sonet Sts Vt1dot5 availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 **alarmStatus (osiAlarm)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Lp Sonet Sts Vt1dot5 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	SonetSdh
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Sonet Sts Vt1dot5 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	SonetSdh
Values	false true
Default	false

Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 lineType (lineType)

Access	Read and write
Description	This attribute defines the framing of the DS1 tributary. ***d4*** defines a framing pattern of 12 frames per multiframe. ***esf*** defines a framing pattern of 24 frames per multiframe. ***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling. ***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling. ***unframed*** defines an unknown framing pattern for clear channels. For the ***4pDS3ChAtm*** card, only ***d4*** and ***esf*** framing patterns are permitted. The ***4pDS3ChAal1*** card supports the ***d4*** and ***esf*** framing patterns, as well as ***unframed***.
Mib	SonetSdh
Values	d4 esf d4Cas esfCas unframed
Default	esf

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 **zeroCoding (zeroCoding)**

Access	Read and write
Criticality	Component
Description	This attribute defines the zero encoding on the DS1 tributary. ***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8. ***none*** does no zero encoding, it does not change any value of the bits in the timeslot. The value ***none*** is compatible with any zero coding scheme which transports all 8 data bits in a timeslot (this would include both ***ami*** and ***b8zs*** values of the *DS1 zeroCoding* attribute).
Mib	SonetSdh
Values	bit7Stuffing none
Default	none

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 **clockingSource (clockingSource)**

Access	Read and write
Description	This attribute specifies the source of the transmit clock for the DS1 tributary. When the clocking source is ***local***, the crystal on the port generates the clocking for the DS1 tributary. When the clocking source is ***line***, the port synchronizes to the clock from the DS1 tributary. When the clocking source is ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP. When the clocking source is ***sameAsDs3***, the Ds1 port's clock synchronizes to the same clock source as that of its parent Ds3 port. On a ***1pDS3C*** card, if the *NetworkSynchronization (NS)* component is present, the default value of this attribute will be ***module***; otherwise it will be ***line***. On a ***2pDS3cAal*** card, the only valid values are ***local*** and ***module***. If the *NS* component is present, the default value of this attribute will be ***module***; otherwise it will be ***local***. On the ***4pDS3Ch***, ***4pDS3ChAtm***, and ***4pDS3ChAal1*** cards, the only valid value is ***sameAsDs3***. This is because a DS1 must have the same clocking source as its parent DS3.

GROUP Lp Sonet Sts Vt1dot5 DS1 **CustomerIdentifierData (CidData)**

Properties — Provisioned

Description — This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib — SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 **customerIdentifier (cid)**

Access — Read and write

Description — This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib — SonetSdh

Values — Decimal (0; 1..8191)

GROUP Lp Sonet Sts Vt1dot5 DS1 **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 **adminState (osiAdmin)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	SonetSdh
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 **rxAisAlarm (rxAisAlarm)**

Access	Read only
Description	This attribute indicates whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.
Mib	SonetSdh
Values	on off
Default	off

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 **lofAlarm (lofAlarm)**

Access	Read only
Description	This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (2 out of 5 framing bits in error) have been detected for 3 seconds +/- 0.5 seconds. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. This tributary goes into an *operationalState* of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan **timeslotDataRate (dataRate)**

Access — Read and write

Criticality — Component

Description

This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute.

When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Mib — SonetSdh

Values — 56k
doNotOverride

Default — doNotOverride

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan **CustomerIdentifierData (CidData)**

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan **customerIdentifier (cid)**

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	SonetSdh
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan **IfEntryProv (IfEntry)**

Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	SonetSdh
Values	up down testing
Default	up

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan **OsiState (State)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: SonetSdh

Values: idle
active (activ)
busy

Default: idle

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that

Copyright © 2006, Nortel Nortel Confidential

prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	SonetSdh
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	SonetSdh

Copyright © 2006, Nortel Nortel Confidential

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	SonetSdh
Values	idle active (activ) busy
Default	idle

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test **Setup (Setup)**

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **purpose (purpose)**

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	SonetSdh
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **type (type)**

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test.

Copyright © 2006, Nortel Nortel Confidential

manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **frmSize (size)**

Access: Read and write

Description

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: SonetSdh

Values: Decimal (4..4096)

Copyright © 2006, Nortel Nortel Confidential

Units	bytes
Default	1024

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **frmPatternType (fpt)**

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	SonetSdh
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	SonetSdh
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	SonetSdh
Values	Decimal (0..1814400)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	SonetSdh
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started.

Copyright © 2006, Nortel Nortel Confidential

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib	SonetSdh
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning hardwareReconfigured loopCodeSyncFailed patternSyncFailed patternSyncLost
Default	neverStarted

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Mib SonetSdh

Values Long Integer

Default No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **erroredFrmRx**

Access Read only

Description This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Mib SonetSdh

Values Long Integer

Default No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Test **bitErrorRate**

Access Read only

Description

This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be

Copyright © 2006, Nortel Nortel Confidential

updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib — SonetSdh

Values — String (5, ASCII)

Properties Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

Mib SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **alarmActDelay (act)**

Access Read and write

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib SonetSdh

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **scrambleCellPayload (scramble)**

Access Read and write

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Copyright © 2006, Nortel Nortel Confidential

Mib	SonetSdh
Values	off on
Default	No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **correctSingleBitHeaderErrors**

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	SonetSdh
Values	off on
Default	off

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **clearDelay (clear)**

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	SonetSdh
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **hecSampleInterval (hSample)**

Access	Read and write
Description	This attribute specifies the sampling interval (in seconds) for errors

Copyright © 2006, Nortel Nortel Confidential

associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib — SonetSdh

Values — Decimal (0..25)

Units — seconds

Default — 0

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **hecErrorLimit (hLimit)**

Access — Read and write

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib — SonetSdh

Values — Decimal (1..250000)

Default — No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **lcdStateDelay (delay)**

Access — Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.

Copyright © 2006, Nortel Nortel Confidential

This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib SonetSdh

Values Decimal (1..50)

Units msec

Default No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Cell **Operational (Oper)**

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Cell **lcdAlarm (lcd)**

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell

Copyright © 2006, Nortel Nortel Confidential

Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Scope: Device

Description

Lp/n Ds1/n Chan/n Tc
Lp/n E1/n Chan/n Tc
Lp/n Ds3/n Ds1/n Chan/n Tc
Lp/n Sdh/n Vc4/n Vc12/k,l,m E1 Chan/n Tc
Lp/n Sonet/n Sts/n Vt1dot5/l,m Ds1 Chan/n Tc
Laps/n Vc4/n Vc12/k,l,m E1 Chan/n T*c*
Laps/n Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

Copyright © 2006, Nortel Nortel Confidential

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:
bufferUnderflow (BU)
AAL1 protocol errors.

This component needs to be provisioned on 2pDs3cAal and 32pE1Aal FPs.

GROUP Lp Sonet Sts Vt1dot5 DS1 Chan Tc **Provisioned (Prov)**

Properties: Provisioned

Description: This group contains all specific provisioning data for a *Tc* component.

Mib: SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc **replacementData (data)**

Access: Read and write

Description: This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions.

The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values:
DS1 MUX Out Of Service Code = 0x1A
E1 MUX Out Of Service Code = 0xFF

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***.

On the ***4pOC3ChSmIr***, ***2pOC3ChSmIrVsp3*** and *2pVS* cards, the default

Copyright © 2006, Nortel Nortel Confidential

value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.

Mib	SonetSdh
Values	Hex (H.0..H.ff)
Units	Hex
Default	No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc **signalOneDuration (duration)**

Access	Read and write
Description	This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits. If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions. The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds.
Mib	SonetSdh
Values	Decimal (0..60)
Units	seconds
Default	0

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc **noServiceResponse (resp)**

Access	Read and write
Description	This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available: ***autoConfigure*** - automatically configure the channels response. ***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction. ***ais*** - transmit AIS in the egress direction. ***noResponse*** - no response is sent in the egress direction. A value of ***autoConfigure*** will result in TC being transmitted for all card types.
Mib	SonetSdh
Values	autoConfigure tc ais noResponse

Copyright © 2006, Nortel Nortel Confidential

Default	autoConfigure

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc **signalOne (sigOne)**

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.
Mib	SonetSdh
Vector of	Decimal (0..1)
Index	D C B A
Default	(1, 1, 1, 1)

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Chan Tc **signalTwo (sigTwo)**

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted after the duration provisioned in *signalOneDuration* has expired and when a *lineType* that uses CAS has been defined. For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.
Mib	SonetSdh
Vector of	Decimal (0..1)
Index	D C B A
Default	(1, 1, 1, 1)

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **frmSize (size)**

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: SonetSdh

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **frmPatternType (fpt)**

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib: SonetSdh

Copyright © 2006, Nortel
Nortel Confidential

Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	SonetSdh
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	SonetSdh
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	SonetSdh
Values	Decimal (0..30240)

Copyright © 2006, Nortel Nortel Confidential

Units	minutes
Default	5

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Sonet Sts Vt1dot5 DS1 Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	SonetSdh

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib SonetSdh

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sonet Sts Vt1dot5 DS1 Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib	LogicalProcessor

ATTRIBUTE Lp Sdh clockingSource

Access	Read and write
Description	This attribute defines the type of clocking source used for synchronizing the transmit clock: ***local*** means direct use of the local clock oscillator at its centre frequency; ***line*** means the use of a signal phase-locked to the incoming line rate; ***module*** means the use of a signal phase-locked to the CP reference clock. When adding a *Sonet* or *Sdh* component, the *clockingSource* attribute is set to ***module*** if the *NetworkSynchronization* component has been added and is set to ***local*** otherwise. Note that the multiport cell-based cards have one common clock source for each of the three ports when either the clocking source ***local*** or ***module*** is selected. For this reason, it is not allowed to have at the same time the *clockingSource* attribute set to ***local*** on one port and ***module*** on another port. Furthermore, the *clockingSource* attribute cannot be set to ***module*** if the *NetworkSynchronization* component has not been added.
Mib	LogicalProcessor
Values	local line module
Default	No default

ATTRIBUTE Lp Sdh lineAutomaticProtectionSwitch (laps)

Access	Read and write
Criticality	Process
Description	This attribute specifies the name of the *Laps* component. In the case of intra-card configurations, the specified *Laps* component is used to provide sparing of lines which use this port and its mate; in the case of inter-card configurations, the specified *Laps* component is used to provide sparing of lines only.
Mib	LogicalProcessor
Values	Link
Default	No default

ATTRIBUTE Lp Sdh txSectionTrace

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the section identifier. The string must be constructed with 7-bit characters only. The section identifier is prefixed by a CRC byte and padded with null characters if necessary to form the 16-octet section trace message transmitted in byte J0 of 16 outgoing frames. At the remote end, the section trace is reassembled, the CRC is checked and the message is compared to the *expectedRxSectionTrace* attribute. If a mismatch is detected, an alarm is issued. Usage guidelines for the section trace are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format. The functionality supported by this attribute is not available.
Mib	LogicalProcessor
Values	String (0..15, Extended ASCII)
Default	""

ATTRIBUTE Lp Sdh expectedRxSectionTrace

Access	Read and write
Description	This attribute specifies the expected section trace identifier which is used to identify the fiber connected to the associated port. This attribute must match the corresponding *txSectionTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. The functionality supported by this attribute is not available.
Mib	LogicalProcessor
Values	String (0..15, Extended ASCII)
Default	""

ATTRIBUTE Lp Sdh s1RxDefault

Access	Read and write
Description	This attribute specifies the default S1 byte reported by the port when the received S1 byte is 0 (quality unknown). No default is applied when this attribute is set to ***none***.
Mib	LogicalProcessor
Values	Decimal (0..15) none
Default	none

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Sdh s1TxOverride

Access	Read and write
Description	This attribute specifies the S1 byte transmitted on the port regardless of the Synchronization Status Message (SSM) value provided by the *NetworkSynchronization* component. Changes in SSM value from the *NetworkSynchronization* component are ignored when this attribute is set to a value other than ***none***.
Mib	LogicalProcessor
Values	Decimal (0..15) none
Default	none

ATTRIBUTE Lp Sdh s1RxOverride

Access	Read and write
Description	This attribute specifies the S1 byte value reported by the port regardless of the received value. Changes in S1 byte on the port are ignored when this attribute is set to a value other than ***none***.
Mib	LogicalProcessor
Values	Decimal (0..15) none
Default	none

ATTRIBUTE Lp Sdh lapsProtocol

Access	Read: Illegal Write: All
Description	This attribute stores the value of the *protocol* attribute provisioned under the *Laps* component. This hidden attribute is updated automatically via a check escape on *Laps* component.

GROUP Lp Sdh CustomerIdentifierData (CidData)

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib LogicalProcessor

ATTRIBUTE Lp Sdh customerIdentifier (cid)

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib LogicalProcessor

Values Decimal (0; 1..8191)

Default 0

GROUP Lp Sdh AdminInfo (AdminInfo)

Properties Provisioned

Description

This group contains the attributes pertaining to the vendor of the equipment.

Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp Sdh ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp Sdh OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sdh snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp Sdh OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this

Copyright © 2006, Nortel Nortel Confidential

group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — LogicalProcessor

ATTRIBUTE Lp Sdh adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — LogicalProcessor

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp Sdh operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sdh usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sdh availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default — No default

ATTRIBUTE Lp Sdh proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	LogicalProcessor

Default	No default

ATTRIBUTE Lp Sdh controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***suspended*** indicates that the service has been administratively suspended.

partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Lp Sdh alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Lp Sdh standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	LogicalProcessor
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Sdh unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	LogicalProcessor
Values	false true
Default	false

GROUP Lp Sdh Operational (Oper)

Properties	Operational
Description	This group contains the common operational data for a *Sonet* or *Sdh* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sdh losAlarm (los)

Access	Read only
Description	This attribute indicates whether a Loss Of Signal (LOS) alarm state has been entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds, or if an LOS defect is present when the criteria for LOF failure declaration have been met. An LOS defect is declared when 20+/-3 us of all-zeros pattern is detected. The LOS defect is cleared when two valid framing words are detected and no Loss of Signal condition is detected during an interval of 20+/-3 us. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOS alarm condition is cleared. The LOS alarm state is cleared after LOS defects have been absent for a period of 10 seconds +/- 0.5 seconds. The *losAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.
Mib	LogicalProcessor
Values	on off
Default	No default

ATTRIBUTE Lp Sdh lofAlarm (lof)

Access	Read only
Description	This attribute displays whether a Loss Of Frame (LOF) alarm state has been entered. An LOF alarm state is entered when LOF defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds, except when an LOS defect or failure is present. An LOF defect is detected when getting contiguous errored frame alignment for at least 3 msec. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The *Sonet/Sdh* component goes into an operational state of *disabled* until the LOF alarm condition is cleared. The condition is cleared when framing

ATTRIBUTE Lp Sdh rxAisAlarm (ais)

Access Read only

Description

This attribute displays whether a Line Alarm Indication Signal (L-AIS) alarm state has been entered. An L-AIS alarm state is entered when L-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The L-AIS defect is the occurrence of the L-AIS signal in five contiguous STS (STM) frames (111 pattern in bits 6,7, and 8 of the K2 bytes). If the L-AIS defects are intermittently occurring, the L-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The *Sonet/Sdh* component goes into an operational state of *disabled* until the L-AIS alarm condition is cleared. The condition is cleared after not detecting the L-AIS signal for a period of 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Description

This attribute displays whether the Line Remote Defect Indicator (L-RDI) signal is being transmitted over the OC-3 line. The L-RDI signal is transmitted upon the detection of the LOS, LOF or L-AIS defect. This attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Mib LogicalProcessor

Values on
off

Default No default

ATTRIBUTE Lp Sdh unusableTxClockRefAlarm (utcr)

Access Read only

Description

This attribute displays whether an Unusable Transmit Clock Reference (UTCR) alarm state has been entered. A UTCR alarm state is entered when a Sonet/Sdh port provisioned to act as a transmit clock reference has received the code “do not use for synchronization” in the S1 byte (in the SONET/ SDH line overhead) for 2.5 +/- 0.5 seconds.
The condition is cleared after not detecting the “do not use for synchronization” code for a period of 10 +/- 0.5 seconds or when the port is no longer provisioned to act as a transmit clock reference.

Copyright © 2006, Nortel Nortel Confidential

A port is acting as a transmit clock reference if it is provisioned with a) a *clockingSource* of *line*, or b) it has been provisioned as a primaryReference, secondaryReference or tertiaryReference in the NetworkSynchronization component.
The *unusableTxClockRefAlarm* attribute is always set to ***off*** when the component has been *locked* and left *offline*.

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh lineErroredSec (les)

Access	Read only
Description	This attribute indicates the total number of Line Errored Seconds (LESs) that have been counted. A LES is declared for second intervals containing one or more LCVs or one or more line AIS defects. Counting of LES is inhibited over second intervals where a LUAS is counted.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh lineSevErroredSec (lses)

Access	Read only
Description	This attribute indicates the total number of Line Severely Errored Seconds (LSESs) that have been counted. A LSES is declared for second intervals containing more than ***X*** LCVs or one or more L-AIS defects. The value of ***X*** is 32 for 155 Mbits/sec interface. Counting of LSES is inhibited over second intervals where a LUAS is counted.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh lineAisSec (laiss)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the total number of Line AIS Seconds (LAISSs) that have been counted. A LAISS is declared for second intervals containing one or more L-AIS defects. Counting of LAISS is inhibited over second intervals where a LUAS is counted.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh lineUnavailSec (luas)

Access	Read only
Description	This attribute indicates the total number of one second intervals for which the STS line is unavailable. The STS line becomes unavailable at the onset of 10 consecutive LSESs. The 10 LSESs are included in the unavailable time. Once unavailable, the STS line becomes available at the onset of 10 contiguous seconds with no LSES. The 10 seconds with no LSES are excluded from the unavailable time. For second intervals where a Line Unavailable Second (LUAS) is counted, counting of LCV, LES, LSES and LAISS is inhibited.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh lineFailures (lf)

Access	Read only
Description	This attribute indicates the total number of times that a line failure (L-AIS failure) has been declared.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh farEndLineErrorFreeSec (felefs)

Access	Read only
Description	This attribute indicates the number of seconds that the *Sonet* or *Sdh* component has been in a far-end error free state.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	0

ATTRIBUTE Lp Sdh farEndLineCodeViolations (felcv)

Access	Read only
Description	This attribute indicates the total number of line FEBE detected from the incoming line. The counting of line FEBE is inhibited for second intervals where a Far-End Line Severely Errored Second (FELSES) is counted. Counting of FELCVs is also inhibited over second intervals where a Far-End Line Unavailable Second (FELUAS) is counted. The count wraps at its maximum value.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh farEndLineErroredSec (feles)

Access	Read only
Description	This attribute indicates the total number of Far-End Line Errored Seconds (FELESs) that have been counted. A FELES is declared for second intervals containing one or more Far-End Line CVs (FELCVs) or one or more L-RDI defects. Counting of FELES is inhibited over second intervals where a FELUAS is counted.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh farEndLineSevErroredSec (felses)

Access	Read only
Description	This attribute indicates the total number of Far-End Line Severely Errored Seconds (FELSESs) that have been counted. A FELSES is declared for second intervals containing more than ***X*** FELCVs or one or more L-RDI defects. The value of ***X*** is 32 for 155 Mbit/s interface. Counting of FELSES is inhibited over second intervals where a FELUAS is counted.
Mib	LogicalProcessor

GROUP Lp Sdh Path Statistics (Stats)

Scope: Device

Description:

Lp/n Sonet/n Path/0
Lp/n Sdh/n Path/0

This component controls a path signal that is carried within a SONET or SDH signal. The *Path* component can only be added under a *Sonet* or *Sdh* component on a Nortel Networks Multiservice Switch 7400.

The *Path* component exists only on the Nortel Networks Multiservice Switch 7400.

The equivalent components on the Nortel Networks Multiservice Switch 15000 and 20000 are the *Sts* component under a *Sonet* component and the *Vc4* component under an *Sdh* component.

On the Nortel Networks Multiservice Switch 15000 and 20000 a *Path* component is not allowed under a *Sonet* or *Sdh* component.

GROUP Lp Sdh Path CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp Sdh Path customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Sdh Path OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp Sdh Path adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Sdh Path **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sdh Path **usageState (osiUsage)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sdh Path availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp Sdh Path proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default — No default

ATTRIBUTE Lp Sdh Path **controlStatus (osiCntrl)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Lp Sdh Path alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	LogicalProcessor

Default	No default

ATTRIBUTE Lp Sdh Path standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	LogicalProcessor
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Sdh Path **unknownStatus (osiUnknw)**

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	LogicalProcessor
Values	false true
Default	false

GROUP Lp Sdh Path **IfEntryProv (IfEntry)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

GROUP Lp Sdh Path Operational (Oper)

Properties: Operational

Description:

This group contains the common operational data for the component.

Mib: LogicalProcessor

ATTRIBUTE Lp Sdh Path lopAlarm (lop)

Access: Read only

Description:

This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds.

The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib: LogicalProcessor

Values:
on
off

Default: No default

ATTRIBUTE Lp Sdh Path rxAisAlarm (ais)

Access: Read only

Description:

This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect

Copyright © 2006, Nortel Nortel Confidential

has been detected for 10 seconds +/- 0.5 seconds.
The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib — LogicalProcessor

Values — on
off

Default — No default

ATTRIBUTE Lp Sdh Path rxRfiAlarm (rfi)

Access — Read only

Description

This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib — LogicalProcessor

Values — on
off

Default — No default

ATTRIBUTE Lp Sdh Path signalLabelMismatch (slm)

Access — Read only

Description

This attribute displays whether the Path Payload Label Mismatch (P-PLM) or Path Unequipped (P-UNEQ) failure conditions have been entered.

A P-PLM failure condition is entered when P-PLM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A P-PLM defect occurs when detecting an unexpected path signal label. If the P-PLM defects are intermittently occurring, the P-PLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.

Copyright © 2006, Nortel Nortel Confidential

The component goes into an operational state of *disabled* until the Path Payload Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

A P-UNEQ failure condition is entered when P-UNEQ defects have been observed and accumulated for a period of 2.5 seconds =/-0.5 seconds. A P-UNEQ defect occurs when detecting an unequipped path signal label. If the P-UNEQ defects are intermittently occurring, the P-UNEQ defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Unequipped failure condition is cleared. The condition is cleared when the P-UNEQ defect is absent for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib — LogicalProcessor

Description

This attribute counts the one second intervals that the component has been in a far-end error free state.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Path farEndPathCodeViolations (fepcv)

Access Read only

Description

This attribute counts the Far-End Path Code Violations (FEPCVs) detected. Each FEPCV corresponds to a path FEBE. FEPCV counting is inhibited over second intervals where a Far-End Path Severely Errored Second (FEPSES) is declared. Counting of PCVs is also inhibited over

Copyright © 2006, Nortel Nortel Confidential

second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Path farEndPathErroredSec (fepes)

Access Read only

Description

This attribute counts the Far-End Path Errored Seconds (FEPESs) that have been declared. A FEPES is declared for each one second interval containing one or more FEPCVs or one or more path RDI (P-RDI) defects. Counting of FEPES is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Path farEndPathSevErroredSec (fepses)

Access Read only

Description

This attribute counts the Far-End Path Severely Errored Seconds (FEPSESs) that have been declared. A FEPSES is declared for second intervals containing more than ***X*** FEPCVs or one or more P-RDI defects. The value of ***X*** is 2400 for a 155 Mbit/s interface. Counting of FEPSESs is inhibited when FEPUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Path farEndPathAisLopSec (fepals)

Access Read only

Description

This attribute counts the Far-End Path AIS and LOP Seconds (FEPALSs). A FEPALS is declared for each one second interval containing one or more P-RDI defects. Counting of FEPALS is inhibited when FEPUAS is

Copyright © 2006, Nortel Nortel Confidential

declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Path farEndPathUnavailSec (fepuas)

Access Read only

Description

This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Path farEndPathFailures (fepf)

Access Read only

Description

This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure).

The counter wraps to 0 when it exceeds its maximum value.

Mib LogicalProcessor

Values Decimal (0..4294967295)

Default 0

COMPONENT Lp Sdh Path AtmCell (Cell)

Groups GROUP Lp Sdh Path Cell Provisioned (Prov)
GROUP Lp Sdh Path Cell Operational (Oper)
GROUP Lp Sdh Path Cell Statistics (Stats)

Scope Device

Copyright © 2006, Nortel Nortel Confidential

Description

The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

Mib LogicalProcessor

Help
List
Display

GROUP Lp Sdh Path Cell Provisioned (Prov)

Properties Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

Mib LogicalProcessor

ATTRIBUTE Lp Sdh Path Cell alarmActDelay (act)

Access Read and write

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib LogicalProcessor

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Lp Sdh Path Cell scrambleCellPayload (scramble)

Access Read and write

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether

Copyright © 2006, Nortel Nortel Confidential

or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Mib LogicalProcessor

Values
off
on

Default No default

ATTRIBUTE Lp Sdh Path Cell **correctSingleBitHeaderErrors**

Access Read and write

Description

This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib LogicalProcessor

Values
off
on

Default off

ATTRIBUTE Lp Sdh Path Cell **clearDelay (clear)**

Access Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib LogicalProcessor

Values Decimal (0..60)

Units minutes

Default 0

ATTRIBUTE Lp Sdh Path Cell **hecSampleInterval (hSample)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (0..25)
Units	seconds
Default	0

ATTRIBUTE Lp Sdh Path Cell **hecErrorLimit (hLimit)**

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	LogicalProcessor
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp Sdh Path Cell **lcdStateDelay (delay)**

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell

Copyright © 2006, Nortel Nortel Confidential

Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib — LogicalProcessor

Values — Decimal (1..50)

Units — msec

Default — No default

ATTRIBUTE Lp Sdh Path Cell hecErrorIntervalLimit (hIntLimit)

Access — Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib — LogicalProcessor

Values — Decimal (1..25)

Default — 1

GROUP Lp Sdh Path Cell Operational (Oper)

Properties — Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib — LogicalProcessor

ATTRIBUTE Lp Sdh Path Cell lcdAlarm (lcd)

Access — Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure

Copyright © 2006, Nortel Nortel Confidential

alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Mib — LogicalProcessor

Values — on
off

Default — off

GROUP Lp Sdh Path Cell Statistics (Stats)

Properties — Operational

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib — LogicalProcessor

ATTRIBUTE Lp Sdh Path Cell uncorrectableHeaderErrors (ucErr)

Access — Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

VERB START Lp Sdh Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp Sdh Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp Sdh Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp Sdh Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)

Copyright © 2006, Nortel Nortel Confidential

Default	unlocked

ATTRIBUTE Lp Sdh Test operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sdh Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

GROUP Lp Sdh Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sdh Test purpose (purpose)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute records the purpose of the test so that the test results can be associated and properly analyzed.

Mib LogicalProcessor

Values String (0..40, ASCII)

Default No default

ATTRIBUTE Lp Sdh Test type (type)

Access Read and write

Description

This attribute is the type of test to be run. The available test types include the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

ATTRIBUTE Lp Sdh Test frmSize (size)

Access Read and write

Description

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib LogicalProcessor

Values Decimal (4..4096)

Units bytes

Default 1024

ATTRIBUTE Lp Sdh Test frmPatternType (fpt)

Access Read and write

Description

This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib LogicalProcessor

Values ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Default ccitt32kBitPattern

ATTRIBUTE Lp Sdh Test customizedPattern (cp)

Access Read and write

Description

This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.

Mib LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Sdh Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Sdh Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Sdh Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes

Copyright © 2006, Nortel Nortel Confidential

Default	1.00

GROUP Lp Sdh Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Sdh Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima*

Copyright © 2006, Nortel Nortel Confidential

component on an MSA card will never terminate the test under the conditions described by these values.

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame.

Copyright © 2006, Nortel Nortel Confidential

For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp Sdh Test bitErrorRate

Access Read only

Description

This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib LogicalProcessor

Values String (5, ASCII)

Default No default

ATTRIBUTE Lp Sdh Test elapsedTime

Access Read only

Description

This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.

Mib LogicalProcessor

Description

This group contains all of the provisioning data for the component.

Mib SonetSdh

ATTRIBUTE Lp Sdh Vc4 applicationFramerName (framer)

Access Read and write

Description

This attribute defines which application is running on the path.

Mib SonetSdh

Values Link

Default No default

ATTRIBUTE Lp Sdh Vc4 pathTraceLength

Access Read and write

Description

This attribute specifies the transmitted path trace message length. The *pathTraceLength* attribute at transmitting and receiving end must match.

Mib SonetSdh

Values 16
64

Default 16

ATTRIBUTE Lp Sdh Vc4 txPathTrace

Access Read and write

Description This attribute specifies the high order path identifier. The string must be constructed with 7-bit characters only. If *pathTraceLength* is 16, the path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J1 of 16 outgoing SDH frames. If *pathTraceLength* is 64, the path identifier is padded by null characters if necessary to form a 64-octet path trace message transmitted in byte J1 of 64 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked if necessary and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected, an alarm is issued.

Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.

The functionality supported by this attribute is not available.

Mib SonetSdh

Values String (0..64, Extended ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	""

ATTRIBUTE Lp Sdh Vc4 expectedRxPathTrace

Access	Read and write
Description	This attribute specifies the expected path trace identifier which is used to identify the high order path. This attribute must match the corresponding *txPathTrace* provisioned at the transmitting equipment end. If it does not, an alarm is issued. The functionality supported by this attribute is not available.
Mib	SonetSdh
Values	String (0..64, Extended ASCII)
Default	""

ATTRIBUTE Lp Sdh Vc4 concatNumber

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of contiguous Administration Unit 4 (AU-4) concatenated together. AU-4s can be concatenated together to form an AU-4-4c or AU-4-16c (4 or 16 concatenated AU-4s) which can transport payloads requiring greater capacity than one Container-4 capacity. Only *Vc4/0* can have *concatNumber* set to 16 and only *Vc4/0*, *Vc4/4*, *Vc4/8* or *Vc4/12* can have *concatNumber* set to 4. When a *Vc4* uses concatenation, the other concatenated *Vc4* instance number cannot be used. For example, if *Vc4/0 concatNumber* is 4, the next provisionable *Vc4* is *Vc4/4*. *Vc4* channelization, indicated by provisioning subcomponents such as *Vc12*, is allowed only if this attribute is set to 1. This value must be set to 0 for card types which do not support the use of this attribute.
Mib	SonetSdh
Values	0 1 4 16
Default	No default

GROUP Lp Sdh Vc4 CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	SonetSdh
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Sdh Vc4 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: SonetSdh

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Lp Sdh Vc4 operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: SonetSdh

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Sdh Vc4 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	SonetSdh
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sdh Vc4 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually,

Copyright © 2006, Nortel Nortel Confidential

the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	SonetSdh
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp Sdh Vc4 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	SonetSdh
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp Sdh Vc4 controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	SonetSdh
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp Sdh Vc4 alarmStatus (osiAlarm)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	SonetSdh
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp Sdh Vc4 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same

Copyright © 2006, Nortel Nortel Confidential

	information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	SonetSdh
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Sdh Vc4 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	SonetSdh
Values	false true
Default	false

GROUP Lp Sdh Vc4 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	SonetSdh

Copyright © 2006, Nortel Nortel Confidential

Values	up down testing
Default	up

ATTRIBUTE Lp Sdh Vc4 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	SonetSdh
Values	Decimal (1..65535)
Default	No default

GROUP Lp Sdh Vc4 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	SonetSdh
Values	up down testing
Default	up

GROUP Lp Sdh Vc4 Operational (Oper)

Properties	Operational
Description	This group contains the common operational data for the component.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 lopAlarm (lop)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays whether a Loss Of Pointer (LOP) alarm state has been entered. An LOP alarm state is entered when LOP defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOP defect occurs when no valid SPE or VC pointer was received in 8 contiguous frames. If the LOP defects are intermittently occurring, the LOP defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the LOP alarm condition is cleared. The condition is cleared when no more invalid pointer has been reported for 10 seconds +/- 0.5 seconds. The *lopAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.
Mib	SonetSdh
Values	on off
Default	No default

ATTRIBUTE Lp Sdh Vc4 **rxAisAlarm (ais)**

Access	Read only
Description	This attribute displays whether a Path Alarm Indication Signal (P-AIS) alarm state has been entered. A P-AIS alarm state is entered when P-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-AIS defect is the occurrence of the P-AIS signal in three contiguous valid STS or STM frames (all one's in bytes H1 and H2). If the P-AIS defects are intermittently occurring, the P-AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The component goes into an operational state of *disabled* until the P-AIS alarm condition is cleared. The condition is cleared after no P-AIS defect has been detected for 10 seconds +/- 0.5 seconds. The *rxAisAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.
Mib	SonetSdh
Values	on off

Copyright © 2006, Nortel Nortel Confidential

Default No default

ATTRIBUTE Lp Sdh Vc4 rxRfiAlarm (rfi)

Access Read only

Description

This attribute displays whether the Path Remote Failure Indication (P-RFI) alarm state has been entered. A P-RFI alarm state is entered when Path Remote Defect Indicator (P-RDI) defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The P-RDI defect is the occurrence of the P-RDI signal in five contiguous valid STS or STM frames (bit 5 of the G1 byte set to 1). If the P-RDI defects are intermittently occurring, the P-RDI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10)with all measurements based on a 200 ms polling cycle.

The component goes into an operational state of *disabled* until the P-RFI alarm condition is cleared. The condition is cleared after no P-RDI defect has been detected for 10 seconds +/- 0.5 seconds.
The *rxRfiAlarm* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

Mib SonetSdh

Values on
off

Default No default

ATTRIBUTE Lp Sdh Vc4 signalLabelMismatch (slm)

Access Read only

Description

This attribute displays whether the Path Payload Label Mismatch (P-PLM) or Path Unequipped (P-UNEQ) failure conditions have been entered.

A P-PLM failure condition is entered when P-PLM defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A P-PLM defect occurs when detecting an unexpected path signal label. If the P-PLM defects are intermittently occurring, the P-PLM defect accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Payload Label Mismatch failure condition is cleared. The condition is cleared when an expected path signal label is received for 10 seconds +/- 0.5 seconds.

A P-UNEQ failure condition is entered when P-UNEQ defects have been observed and accumulated for a period of 2.5 seconds =/-0.5 seconds. A P-UNEQ defect occurs when detecting an unequipped path signal label. If the P-UNEQ defects are intermittently occurring, the P-UNEQ defect

Copyright © 2006, Nortel Nortel Confidential

accumulator is decremented at a rate of 1/10 of the incrementing rate, with all measurements based on a 200 ms polling cycle.
The component goes into an operational state of *disabled* until the Path Unequipped failure condition is cleared. The condition is cleared when the P-UNEQ defect is absent for 10 seconds +/- 0.5 seconds.

The *signalLabelMismatch* attribute is always set to ***off*** when the component has been *Lock*ed and left *offline* by the operator or when the component has been *Suspend*ed since the parent component has been *Lock*ed.

ATTRIBUTE Lp Sdh Vc4 farEndPathUnavailSec (fepuas)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the one second intervals for which the STS/STM far-end path is unavailable. The far-end path becomes unavailable at the onset of 10 consecutive FEPSESs. The 10 FEPSESs are included in the unavailable time. Once unavailable, the far-end path becomes available at the onset of 10 contiguous seconds with no FEPSES. The 10 seconds with no FEPSES are excluded from the unavailable time. For one-second intervals where a Far-End Path Unavailable Second (FEPUAS) is declared, counting of FEPCV, FEPES, FEPSES and FEPALS is inhibited. The counter wraps to 0 when it exceeds its maximum value.
Mib	SonetSdh
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh Vc4 farEndPathFailures (fepf)

Access	Read only
Description	This attribute counts the declarations of STS/STM far-end path failure (P-RFI failure). The counter wraps to 0 when it exceeds its maximum value.
Mib	SonetSdh
Values	Decimal (0..4294967295)
Default	0

COMPONENT Lp Sdh Vc4 AtmCell (Cell)

Groups	GROUP Lp Sdh Vc4 Cell Provisioned (Prov) GROUP Lp Sdh Vc4 Cell Operational (Oper) GROUP Lp Sdh Vc4 Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM

Copyright © 2006, Nortel Nortel Confidential

cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.

GROUP Lp Sdh Vc4 Cell Provisioned (Prov)

Properties Provisioned

Description

This group contains the provisioning attributes for the *AtmCell* component.

Mib SonetSdh

ATTRIBUTE Lp Sdh Vc4 Cell alarmActDelay (act)

Access Read and write

Description

This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.

Mib SonetSdh

Values Decimal (0..2000)

Units msec

Default No default

ATTRIBUTE Lp Sdh Vc4 Cell scrambleCellPayload (scramble)

Access Read and write

Description

Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled.
It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces.
Note that this setting must be the same at both ends of the link.

Copyright © 2006, Nortel Nortel Confidential

Mib	SonetSdh
Values	off on
Default	No default

ATTRIBUTE Lp Sdh Vc4 Cell correctSingleBitHeaderErrors

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded. Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.
Mib	SonetSdh
Values	off on
Default	off

ATTRIBUTE Lp Sdh Vc4 Cell clearDelay (clear)

Access	Read and write
Description	This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	SonetSdh
Values	Decimal (0..60)
Units	minutes
Default	0

ATTRIBUTE Lp Sdh Vc4 Cell hecSampleInterval (hSample)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: SonetSdh

Values: Decimal (0..25)

Units: seconds

Default: 0

ATTRIBUTE Lp Sdh Vc4 Cell **hecErrorLimit (hLimit)**

Access: Read and write

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: SonetSdh

Values: Decimal (1..250000)

Default: No default

ATTRIBUTE Lp Sdh Vc4 Cell **lcdStateDelay (delay)**

Access: Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The

Copyright © 2006, Nortel Nortel Confidential

valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	SonetSdh
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp Sdh Vc4 Cell hecErrorIntervalLimit (hIntLimit)

Access	Read and write

Description

This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib	SonetSdh
Values	Decimal (1..25)
Default	1

GROUP Lp Sdh Vc4 Cell Operational (Oper)

Properties	Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Cell lcdAlarm (lcd)

Access	Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects

Copyright © 2006, Nortel Nortel Confidential

have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh Vc4 Cell **sevErroredSec (ses)**

Access	Read only
Description	This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted. In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected. If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects. Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.
Mib	SonetSdh
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp Sdh Vc4 Cell **receiveCellUtilization (rxutil)**

Access	Read only
Description	This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute. This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Mib: SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 txPathTrace

Access: Read and write

Description:
This attribute specifies the low order path identifier. The string must be constructed with 7-bit characters only. The path identifier is prefixed with a CRC byte and padded by null characters if necessary to form a 16-octet path trace message transmitted in byte J2 of 16 outgoing SDH frames. At the remote end, the path trace is reassembled, the CRC is checked and the message is compared to the *expectedRxPathTrace* attribute. If a mismatch is detected and the *expectedRxPathTrace* attribute is not an empty string (default value), an alarm is issued.

Usage guidelines for path trace message are found in clause 3 of the ITU G.831 standard which defines the Access Point Identifier format.

The functionality supported by this attribute is available on the *4pOC3Ch* functional processor.

Mib: SonetSdh

Values: String (0..15, Extended ASCII)

Default: ""

ATTRIBUTE Lp Sdh Vc4 Vc12 expectedRxPathTrace

Access: Read and write

Description:
This attribute specifies the expected path trace identifier which is used to identify the low order path. This attribute must match the corresponding

Copyright © 2006, Nortel Nortel Confidential

txPathTrace provisioned at the transmitting equipment end. If it does not, an alarm is issued. If an empty string (default value) is provisioned, the Low Order Path Trace Identification Mismatch (LP-TIM) defect is ignored.

The functionality supported by this attribute is available on the *4pOC3Ch* functional processor.

GROUP Lp Sdh Vc4 Vc12 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	SonetSdh
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Sdh Vc4 Vc12 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations

Copyright © 2006, Nortel Nortel Confidential

described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib SonetSdh

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Lp Sdh Vc4 Vc12 operationalState (osiOper)

Access Read only

Description This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib SonetSdh

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sdh Vc4 Vc12 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sdh Vc4 Vc12 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Sdh Vc4 Vc12 rxAisAlarm

Access	Read only
Description	This attribute indicates whether a Tributary Unit Alarm Indication Signal (TU-AIS) alarm state has been entered. A TU-AIS alarm state is entered when TU-AIS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. The TU-AIS defect occurs when three consecutive TU pointers are in the all 1's state. This alarm is cleared after no TU-AIS defect has been detected for 10 seconds +/- 0.5 seconds.

GROUP Lp Sdh Vc4 Vc12 Statistics (Stats)

Properties Operational

Description

This group contains the statistics data for the component.

Mib SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 pathErrorFreeSec (pefs)

Access Read only

Description

This attribute counts the one second intervals that the component has been in a near-end error free state.

The counter wraps to 0 when it exceeds its maximum value.

Mib SonetSdh

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Vc4 Vc12 pathCodeViolations (pcv)

Access Read only

Description

This attribute counts the detected Path Code Violations (PCVs). Each

Copyright © 2006, Nortel Nortel Confidential

PCV corresponds to a path BIP-8 error. PCV counting is inhibited over second intervals where a Path Severely Errored Second (PSES) is counted. Counting of PCVs is also inhibited over second intervals where a Path Unavailable Second (PUAS) is counted.

The counter wraps to 0 when it exceeds its maximum value.

Mib SonetSdh

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Vc4 Vc12 pathErroredSec (pes)

Access Read only

Description

This attribute counts the declared Path Errored Seconds (PESs). A PES is declared for second intervals containing one or more PCVs or one or more LOP or path AIS defects. Counting of PES is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib SonetSdh

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Vc4 Vc12 pathSevErroredSec (pses)

Access Read only

Description

This attribute counts the declared Path Severely Errored Seconds (PSESs). A PSES is declared for second intervals containing more than ***X*** PCVs or one or more LOP or path AIS defects. The value of ***X*** is 2400 for a 155 Mbit/s interface. Counting of PSES is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib SonetSdh

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Vc4 Vc12 pathAisLopSec (pals)

Access Read only

Description

This attribute counts the path AIS and LOP Seconds (PALSs). A PALS is declared for second intervals containing one or more path AIS or LOP

defects. Counting of PALS is inhibited when PUAS is declared over the monitored second.

The counter wraps to 0 when it exceeds its maximum value.

Mib SonetSdh

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Vc4 Vc12 pathUnavailSec (puas)

Access Read only

Description

This attribute counts the one second intervals during which the STS/STM path is unavailable. The path becomes unavailable at the onset of 10 consecutive PSESs. The 10 PSESs are included in the unavailable time. Once unavailable, the path becomes available at the onset of 10 contiguous seconds with no PSES. The 10 seconds with no PSES are excluded from the unavailable time. For second intervals where a Path Unavailable Second (PUAS) is declared, counting of PCV, PES, PSES and PALS is inhibited.

The counter wraps to 0 when it exceeds its maximum value.

Mib SonetSdh

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp Sdh Vc4 Vc12 pathFailures (pf)

Access Read only

Description

This attribute counts the declarations of a path failure (LOP, P-AIS or Path Signal Label Mismatch failure).

The counter wraps to 0 when it exceeds its maximum value.

Scope Device

Description
Lp/n E1/n
Lp/n Sdh/i Vc4/j Vc12/k,l,m E1
The *E1* component controls and monitors an E1 port or tributary on a Function Processor. The number of ports supported depends on the type of card, and is usually encoded in the *Shelf Card/n cardType*, for example 4pE1Aal1: 4 port. The lowest instance value is usually ***0***, except for the ***32pE1Aal*** card when it is ***1***.
No instance value is used when the E1 is a STM tributary.
Multi-Service cards have an instance range 0..31, except that instance values 30 and 31 are not available for an “ATM UNI port”. (An E1 “ATM UNI port” is an *E1* component with a single *Chan* whose *applicationFramerName* attribute is linked to an *AtmIf* component.)
The instance number of an *E1* “ATM UNI port” must not be the same as the instance number of an *IMA* group under the same *Lp*.

GROUP Lp Sdh Vc4 Vc12 E1 **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains all of the provisioning data for an E1 component.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **lineType (lineType)**

Access	Read and write
Description	This attribute specifies the framing of the E1 line. When ***cas*** (channel associated signalling) is selected, timeslot 16 is reserved for multiframe signalling and only 30 timeslots are available for data. The signalling bits are not interpreted. When ***ccs*** (common channel signalling) is selected, timeslot 16 is not reserved for multiframe signalling and 31 timeslots are available for data. The signalling bits are not interpreted. When ***unframed*** is selected, a clear channel is defined whereby data from all timeslots including the framing data (in timeslot 0) and timeslot 16 are passed transparently. This value is valid only for AAL1 cards. For cell-based cards the ATM Forum specifies that timeslot 16 be reserved, leaving 30 timeslots available for data. The ***8pE1Atm*** and ***1pStm1ChSmIr*** cards support the ***ccs*** value only. The ***4pOC3ChSmIr*** card only supports the ***ccs*** and ***unframed*** values. For both these cards, the default value is ***ccs***. For all other cards, the default value is ***cas***.
Mib	SonetSdh
Values	ccs cas unframed
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **clockingSource (clockingSource)**

Access	Read and write
Description	This attribute defines the source of the transmit clock for the E1 line. When ***local*** is selected, the crystal on the port generates the clocking for the line. When ***line*** is selected, the port synchronizes to the clock from the facility. When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP. When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***.

Copyright © 2006, Nortel Nortel Confidential

When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network.

When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network.

A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured***

If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pE1Atm*** card, which it defaults to ***local***.
On a ***3pE1Atm*** card all ports must have the same value, and be either ***local*** or ***module***.

otherPort is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards.

On ***4E1Aal1*** cards either:

all four ports' *clockingSource* values must be ***local*** OR
all four ports' *clockingSource* values must be ***module*** OR
one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. The ***srtsMode*** clocking source is not supported for this card type.

Mib: SonetSdh

Values:
local
line
module
otherPort
srtsMode
adaptiveMode

Default: No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **crc4Mode**

Access: Read and write

Description

This attribute defines whether the CRC-4 checking and generation on the E1 line is enabled or disabled.

The default CRC-4 mode is ***off*** except for the cell-based cards which default to ***on*** as per the ATM Forum.

Mib: SonetSdh

Values	on off
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **sendRaiOnAis**

Access	Read and write
Description	This attribute defines whether the Remote Alarm Indicator (RAI) will be sent when receiving an AIS alarm. The value is ***yes*** by default; it can be changed to ***no*** only for ports on J2MV cards.
Mib	SonetSdh
Values	no yes
Default	yes

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **raiDeclareAlarmTime**

Access	Read and write
Description	This attribute specifies the period of time that a Remote Alarm Indicator (RAI) must be present before declaring an RAI alarm. The value of ***auto*** sets the RAI declare time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiClearAlarmTime* attribute is ignored and ***auto*** is used. This attribute is for E1 and E1C card types only. For all other card types, the default value must be used.
Mib	SonetSdh
Values	Decimal (1..20000) auto
Units	msec
Default	100

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **raiClearAlarmTime**

Access	Read and write
Description	This attribute specifies the period of time that a Remote Alarm Indicator (RAI) has been absent before clearing an RAI alarm. The value of ***auto*** sets the RAI clear time to the default value for E1 and E1C card types which do not have hardware support for RAI response. On E1C card types with hardware support, if the value of ***auto*** is set, RAI response is done according to the standards. If ***auto*** is set, the value of the *raiDeclareAlarmTime* attribute is ignored and ***auto*** is used. This attribute is

GROUP Lp Sdh Vc4 Vc12 E1 **CustomerIdentifierData (CidData)**

Properties Provisioned

Description This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Mib SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **customerIdentifier (cid)**

Access Read and write

Description This attribute holds the Customer Identifier (CID).

Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component.

Copyright © 2006, Nortel Nortel Confidential

Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Mib SonetSdh

Values Decimal (0; 1..8191)

Default	up

GROUP Lp Sdh Vc4 Vc12 E1 **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **operationalState (osiOper)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	SonetSdh
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **availabilityStatus (osiAvail)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **proceduralStatus (osiProc)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **standbyStatus (osiStby)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **losAlarm (losAlarm)**

Access	Read only
Description	This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOS alarm state.

Copyright © 2006, Nortel Nortel Confidential

The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.

Mib SonetSdh

Default off

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **rxAisAlarm (rxAisAlarm)**

Access Read only

Description

This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms £ T £ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Default off

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **lofAlarm (lofAlarm)**

Access Read only

Description

This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state

Copyright © 2006, Nortel Nortel Confidential

The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Mib SonetSdh

Values on
off

Default off

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 rxRaiAlarm (rxRaiAlarm)

Access Read only

Description

This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).
The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 **multifrmLofAlarm (multiLofAlarm)**

Access Read only

Description

This attribute indicates whether a multiframe LOF (loss of frame) alarm state is entered. A multiframe LOF alarm state is entered when a multiframe LOF defect (2 consecutive errors in the multiframe alignment signal) has been detected and accumulated for 2.5 seconds +/- 0.5 seconds. If the multiframe LOF defects are intermittently occurring, the multiframe LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The alarm is cleared when the defect is not detected for 10 seconds +/- 0.5 seconds. When the multiframe LOF alarm is on, a multiframe RAI alarm indicator is transmitted on the line.

The ***8pE1Atm*** card does not support the multiframe LOF alarm.

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **timeslots (ts)**

Access	Read and write
Criticality	Component
Description	This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component. For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.
Mib	SonetSdh
Set of	none 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **timeslotDataRate (dataRate)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute. When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s. When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s. On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card. On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***. One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.
Mib	SonetSdh
Values	56k doNotOverride
Default	doNotOverride

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **customerIdentifier (cid)**

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	SonetSdh
Values	Decimal (0; 1..8191)
Default	0

Default: idle

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **availabilityStatus (osiAvail)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions,

Copyright © 2006, Nortel Nortel Confidential

the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **proceduralStatus (osiProc)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: SonetSdh

Set of:
initializationRequired (initRq)
notInitialized (notInit)

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **controlStatus (osiCntrl)**

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **alarmStatus (osiAlarm)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	SonetSdh
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

Copyright © 2006, Nortel Nortel Confidential

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Groups	GROUP Lp Sdh Vc4 Vc12 E1 Chan Test OsiState (State) GROUP Lp Sdh Vc4 Vc12 E1 Chan Test Setup (Setup) GROUP Lp Sdh Vc4 Vc12 E1 Chan Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	SonetSdh
Common Verbs	Help List Display

VERB START Lp Sdh Vc4 Vc12 E1 Chan Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp Sdh Vc4 Vc12 E1 Chan Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp Sdh Vc4 Vc12 E1 Chan Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value

Copyright © 2006, Nortel Nortel Confidential

is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — SonetSdh

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **operationalState (osiOper)**

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — SonetSdh

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **usageState (osiUsage)**

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — SonetSdh

payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **frmSize (size)**

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: SonetSdh

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **frmPatternType (fpt)**

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib: SonetSdh

Copyright © 2006, Nortel
Nortel Confidential

Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	SonetSdh
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	SonetSdh
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	SonetSdh
Values	Decimal (0..30240)
Units	minutes

Copyright © 2006, Nortel Nortel Confidential

Default	5

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Sdh Vc4 Vc12 E1 Chan Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been

Copyright © 2006, Nortel Nortel Confidential

looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib: SonetSdh

Values:
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default: neverStarted

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **bitsTx**

Access: Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib: SonetSdh

Values: Long Integer

Default: No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **bytesTx**

Access: Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib: SonetSdh

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **frmTx**

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **bitsRx**

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **bytesRx**

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **frmRx**

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	SonetSdh

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	SonetSdh
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an

Copyright © 2006, Nortel Nortel Confidential

externalLoop test. For a data test, it indicates time since test data was first transmitted.

Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Test **timeRemaining**

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp Sdh Vc4 Vc12 E1 Chan **AtmCell (Cell)**

Groups	GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Provisioned (Prov) GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Operational (Oper) GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.
Mib	SonetSdh
Common Verbs	Help List Display Add DELete

GROUP Lp Sdh Vc4 Vc12 E1 Chan Cell **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisioning attributes for the *AtmCell* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **alarmActDelay (act)**

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	SonetSdh
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **scrambleCellPayload (scramble)**

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	SonetSdh
Values	off on
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **correctSingleBitHeaderErrors**

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Copyright © 2006, Nortel Nortel Confidential

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib: SonetSdh

Values: off
on

Default: off

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **clearDelay (clear)**

Access: Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: SonetSdh

Values: Decimal (0..60)

Units: minutes

Default: 0

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **hecSampleInterval (hSample)**

Access: Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: SonetSdh

Values: Decimal (0..25)

Units: seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **hecErrorLimit (hLimit)**

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	SonetSdh
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **lcdStateDelay (delay)**

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	SonetSdh
Values	Decimal (1..50)
Units	msec
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before

Copyright © 2006, Nortel Nortel Confidential

an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Chan Cell **lcdAlarm (lcd)**

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when

the *Path* or *Channel* component has been suspended since its parent has been locked.

Laps/n Sts/n Vt1dot5/l,m Ds1 Chan/n T*c*

The *Tc* component is used to provision and monitor trunk conditioning options. A separate instance of this component is required for each *Chan* on a Port which is offering a structured constant bit rate service.

Under certain failure alarm conditions, trunk conditioning *replacementData* is substituted into the *timeslots* as defined by the *Chan* component. Trunk conditioning signaling is also substituted into the appropriate Channel Associated Signaling (CAS) bits when a *lineType* that uses CAS has been defined.

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the ATM network under the following conditions:
lossOfSignal (LOS)
lossOfFrame (LOF)
remoteAlarmIndication (RAI)
alarmIndicationSignal (AIS)
bufferUnderflow (BU)
and in addition for E1:
lossOfMultiframe (LOMF)
receiveMultiframeRemoteAlarmIndication (RMRAI)

When used with AAL1 Circuit Emulation Service, trunk conditioning is transmitted towards the PDH network under the following conditions:

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the status of a Frame Relay channel on an E1 line. By combining the E1 channel-associated-signalling (CAS) A-bits status, and HDLC defect, a single value indicates the likely cause of the failure. This mechanism assumes that the far end equipment loops back signaling A-bits for some or all of the timeslots in a channel. The A-bits in channel are transmitted as '0'. If they are all received as '0', it is assumed that the E1 link is up in both directions. The presence of HDLC frames indicates that the service is connected. When A-bits and HDLC frames are correctly received, ***frameLinkUp*** is indicated. When neither are received, ***frameLinkDown*** is indicated. When HDLC frames are not receive but A-bits are not at fault, ***lossOfHdlc*** is indicated. When HDLC frames are received, but there is a fault in any of timeslot's A-bits on a channel ***lossOfAbit*** is indicated.

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **frmSize (size)**

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	SonetSdh
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **frmPatternType (fpt)**

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	SonetSdh
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	SonetSdh
Values	Hex (H.0..H.ffffffff)

Copyright © 2006, Nortel Nortel Confidential

Units	Hex
Default	H.55555555

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	SonetSdh
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	SonetSdh
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **duration**

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp Sdh Vc4 Vc12 E1 Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	SonetSdh

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **bytesRx**

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **frmRx**

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	SonetSdh
Values	Long Integer
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	SonetSdh
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Sdh Vc4 Vc12 E1 Test **timeRemaining**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	SonetSdh
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp Sdh Vc4 Vc12 E1 Dsp

Scope	Device
Description	*LogicalProcessor/n E1/0 Dsp* The *Dsp* component presents the status of the Digital Signal Processors (DSPs) present on a voice card. A voice card's *Dsp* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Dsp* components cannot be added or deleted.
Mib	SonetSdh
Common Verbs	Help List Display

COMPONENT Lp Sdh Vc4 Vc12 E1 Audio

Scope	Device
Description	*LogicalProcessor/n E1/0 Audio* The *Audio* component presents the audio status of the channels on a voice card. A voice card's *Audio* component is created automatically whenever the parent E1 component becomes active, and remains in existence as long as the E1 component exists. *Audio* components cannot be added or deleted.

GROUP Lp Sdh Om OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — SonetSdh

ATTRIBUTE Lp Sdh Om adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: SonetSdh

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Lp Sdh Om operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: SonetSdh

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Sdh Om usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

GROUP Lp JT2 CustomerIdentifierData (CidData)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Jt2

ATTRIBUTE Lp JT2 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Jt2
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp JT2 Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the JT2 specific provisioning data for a JT2 component.
Mib	Jt2

ATTRIBUTE Lp JT2 clockingSource (clockingSource)

Access	Read and write
Description	This attribute defines the source of the transmit clock for the JT2 line. When the clocking source is selected from ***local***, the oscillator on the port generates the clocking for the line. When the clocking source is selected from ***line***, the port synchronizes to the clock recovered from the incoming line signal. When the clocking source is selected from ***module***, the port's clock synchronizes to the clock provided by the oscillator on the active CP. Note:- that when one port is set to ***local***, the other port must also be set to

Copyright © 2006, Nortel Nortel Confidential

local, and when one port is set to ***module***, the other port must also be set to ***module***. If one of the ports is set to ***line***, the other port must be set to ***otherPort***.
Also, if a CP reference clock is available when the JT2 component is added, the clocking source defaults to ***module***, whereas if a CP reference clock is not available when the component is added, the clocking source defaults to ***local***.

Mib	Jt2
Values	local line module otherPort
Default	No default

ATTRIBUTE Lp JT2 lineLength (length)

Access	Read and write
Description	This attribute defines the line length for equalization calculations for the JT2 line. The range is between 0 and 480 feet (1 metre = 3.28 feet).
Mib	Jt2
Values	Decimal (0..480)
Units	feet
Default	0

ATTRIBUTE Lp JT2 applicationFramerName

Access	Read and write
Description	This attribute defines the link to the software stack. It defines which application is running on top of the *JT2* component.
Mib	Jt2
Values	Link (Service, interfaceName)
Default	No default

GROUP Lp JT2 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	Jt2

ATTRIBUTE Lp JT2 ifAdminStatus (ifState)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	Jt2
Values	up down testing
Default	up

ATTRIBUTE Lp JT2 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	Jt2
Values	Decimal (1..65535)
Default	No default

GROUP Lp JT2 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Jt2

ATTRIBUTE Lp JT2 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Jt2
Values	up down testing
Default	up

GROUP Lp JT2 OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Jt2

ATTRIBUTE Lp JT2 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Jt2
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp JT2 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Jt2
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp JT2 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Jt2
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp JT2 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Jt2
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp JT2 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	Jt2
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp JT2 controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — Jt2

Set of — subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Lp JT2 alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — Jt2

ATTRIBUTE Lp JT2 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Jt2
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp JT2 unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Jt2
Values	false true
Default	false

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp JT2 Operational (Oper)

Properties	Operational
Description	This group contains the JT2 specific operational data for a JT2 component in a digital hierarchy interface.
Mib	Jt2

ATTRIBUTE Lp JT2 losAlarm (los)

Access	Read only
Description	This attribute displays whether a LOS (Loss of Signal) alarm state is entered. An LOS alarm state is entered when LOS defects have been observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. An LOS defect is declared at the JT2 line interface when the input data is zero for 20 - 32 clock cycles. If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. An LOS failure alarm is cleared when the LOS defect is absent for a period of 10 seconds +/- 0.5 seconds. The JT2 port goes into an *operationalState* of ***disabled*** for the duration of the LOS alarm condition. While the port is in the LOS alarm state, the port also transmits the far-end RAI defect indicator on the out-going JT2 line.
Mib	Jt2
Values	on off
Default	off

ATTRIBUTE Lp JT2 lofAlarm (lof)

Access	Read only
Description	This attribute indicates whether a LOF (Loss of Frame) alarm state is entered. A LOF alarm state is entered when LOF defects are observed and accumulated for 2.5 seconds +/- 0.5 seconds or more. A LOF defect occurs when seven or more consecutive incorrect frame alignment patterns (4 multiframes) are received. If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The LOF alarm is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds. The port goes into an *operationalState* of ***disabled*** for the duration of the LOF alarm condition. While the port is in the LOF alarm state, the node also transmits the far-end RAI defect indicator on the out-going JT2 line.

Copyright © 2006, Nortel Nortel Confidential

Mib	Jt2
Values	on off
Default	off

ATTRIBUTE Lp JT2 rxAisPhysicalAlarm (rxAisPhys)

Access	Read only
Description	This attribute indicates whether a Physical AIS alarm state is entered. A Physical AIS alarm state is entered when a Physical AIS defect is observed and accumulated for a period of 2.5 seconds +/- 0.5 seconds. A Physical AIS defect is declared when the incoming signal has two or less zeros in a sequence of 3,156 bits (0.5 ms). If the physical AIS defects are intermittently occurring, the physical AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. A Physical AIS alarm is cleared when the Physical AIS defect is absent for a period of 10 seconds +/- 0.5 seconds. The port goes into an *operationalState* of ***disabled*** until the AIS alarm condition is cleared. While the port is in the Physical AIS alarm state, the node also transmits the far-end RAI defect indicator on the out-going JT2 line.
Mib	Jt2
Values	on off
Default	off

ATTRIBUTE Lp JT2 rxAisPayloadAlarm (rxAisPayld)

Access	Read only
Description	This attribute indicates whether a Payload AIS alarm state is entered. A Payload AIS alarm state is entered when a Payload AIS defect persists for a period of 2.5 seconds +/- 0.5 seconds. A Payload AIS defect is declared when the incoming signal of the 6312 kbit/s frame payload (TS1 - TS96) has two or less zeros in a sequence of 3,072 bits (0.5 ms). If the payload AIS defects are intermittently occurring, the payload AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. A Payload AIS failure alarm is cleared when the Payload AIS defect is absent for a period of 10 seconds +/- 0.5 seconds. The port goes into an *operationalState* of ***disabled*** until the AIS alarm condition is cleared. While the port is in the Payload AIS alarm state, the node also transmits the far-end RAI defect indicator on the out-going JT2 line.
Mib	Jt2

Copyright © 2006, Nortel Nortel Confidential

Values	on off
Default	off

ATTRIBUTE Lp JT2 rxRaiAlarm (rxRai)

Access	Read only
Description	This attribute indicates whether a Received RAI alarm state is entered. A received RAI alarm state is entered when the RAI signal is detected on the incoming JT2 Line (when 16 or more consecutive RAI patterns of 1111111100000000 are received on the 4 kbit/s data channel (m-bits) within the framing bits of the JT2 frame). The JT2 port goes into an *operationalState* of ***Disabled*** until the RAI alarm condition is cleared. The RAI alarm is cleared when four or more consecutive non-RAI patterns (anything other than 1111111100000000) are received.
Mib	Jt2
Values	on off
Default	off

ATTRIBUTE Lp JT2 txAisPhysicalAlarm (txAisPhys)

Access	Read only
Description	This attribute indicates whether an AIS (Alarm Indication Signal) alarm is being transmitted on the outgoing JT2 line. Currently the JT2 port only transmits a Physical AIS (no Payload AIS) on the outgoing JT2 line. Since there is no Idle signal defined for JT2, the AIS signal is transmitted when the JT2 port is in the *operationalState* of ***locked.*** The AIS signal may also be transmitted for diagnostic testing.
Mib	Jt2
Values	on off
Default	off

ATTRIBUTE Lp JT2 txRaiAlarm (txRai)

Access	Read only
Description	This attribute indicates whether an RAI defect indication pattern is being sent on the out-going JT2 line. The RAI alarm pattern is transmitted in the 4 kbit/s data channel (m-bits) when the port detects a LOS, AIS or LOF alarm condition.
Mib	Jt2

Copyright © 2006, Nortel Nortel Confidential

Values	on off
Default	off

GROUP Lp JT2 Statistics (Stats)

Properties	Operational
Description	This group contains the statistical data for a JT2 component in a digital hierarchy interface.
Mib	Jt2

ATTRIBUTE Lp JT2 runningTime (runningTime)

Access	Read only
Description	This attribute indicates the number of seconds since the JT2 component was activated and placed in an ***unlocked*** state or used for operational testing. All the other error counts that follow as well as each *JT2* subcomponent's error counts can be updated when this count is active.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 errorFreeSec (efs)

Access	Read only
Description	This attribute indicates the number of seconds that the JT2 port has been in an error free state.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 erroredSec (es)

Access	Read only
Description	This attribute indicates the total number of errored seconds for the JT2 port. An errored second is declared when a second with one or more Code Violation Error events, or one or more LOF or LOS defects occur. A code violation error may be a cyclic redundancy check (CRC) error or a bipolar violation (BPV) error.
Mib	Jt2

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 sevErroredSec (ses)

Access	Read only
Description	This attribute indicates the total number of severely errored seconds for the JT2 port. A severely errored second occurs when a second with 255 or more Code Violation Error events or one or more LOF or LOS defects occur.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 sevErroredFrmSec (sefs)

Access	Read only
Description	This attribute indicates the total number of severely errored framing seconds for the JT2 port. A severely errored framing second occurs when a second with one or more Framing Errors occur.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 unavailSec

Access	Read only
Description	This attribute indicates the total number of seconds that the interface has been in an unavailable state. An unavailable state occurs at the onset of 10 consecutive Severely Errored Seconds. When the unavailable state is entered, the 10 Severely Errored Seconds are immediately transfered to the count of unavailableSeconds by incrementing the count of unavailSec by 10 and decrementing the count of sevErroredSec by 10. Whilst in the unavailable state, an unavailableSecond is counted for each SES or SEFS that occurs, and the count of SES and SEFS are both inhibited. The unavailable state is cleared at the onset of 10 consecutive seconds which are not Severely Errored Seconds.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp JT2 bpvErrors (bpv)

Access	Read only
Description	This attribute indicates the total count of bipolar violations (BPV). A bipolar violation is an error in the alternate mark inversion pattern (AMI) on the line. The value of this attribute will wrap to zero when it reaches its maximum value.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 crcErrors (crcErr)

Access	Read only
Description	This attribute indicates the total number of cyclic redundancy check (CRC-5) errors detected on the incoming JT2 line. The value of this attribute will wrap to 0 when its maximum value is reached.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 frameErrors (frmErr)

Access	Read only
Description	This attribute indicates the total number of Framing Errors that have occured on the JT2 port. A Framing Error is an error in the framing bits. The value of this attribute will wrap to 0 when its maximum value is reached.
Mib	Jt2
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Lp JT2 losStateChanges (losChanges)

Access	Read only
Description	This attribute indicates the total number of times that the incoming signal on the JT2 line has been lost. The value of this attribute will wrap to 0 when its maximum value is reached.
Mib	Jt2

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

GROUP Lp JT2 AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	Jt2

ATTRIBUTE Lp JT2 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	Jt2
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp JT2 commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	Jt2
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp JT2 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	Jt2
Values	no yes
Default	no

Copyright © 2006, Nortel Nortel Confidential

COMPONENT Lp JT2 Test (Test)

Groups	GROUP Lp JT2 Test OsiState (State) GROUP Lp JT2 Test Setup (Setup) GROUP Lp JT2 Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V35*, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	Jt2
Common Verbs	Help List Display

VERB START Lp JT2 Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp JT2 Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp JT2 Test OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Jt2

ATTRIBUTE Lp JT2 Test adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock*

Copyright © 2006, Nortel Nortel Confidential

command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Jt2

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Lp JT2 Test operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Jt2

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp JT2 Test usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

Mib	Jt2
Values	idle active (activ) busy
Default	idle

GROUP Lp JT2 Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	Jt2

ATTRIBUTE Lp JT2 Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Jt2
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp JT2 Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1

Copyright © 2006, Nortel Nortel Confidential

byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Lp JT2 Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: Jt2

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Lp JT2 Test frmPatternType (fpt)

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Copyright © 2006, Nortel
Nortel Confidential

Mib	Jt2
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp JT2 Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Jt2
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp JT2 Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Jt2
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp JT2 Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Jt2

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp JT2 Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Jt2
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp JT2 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Jt2

ATTRIBUTE Lp JT2 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has

Copyright © 2006, Nortel Nortel Confidential

failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib Jt2

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default neverStarted

ATTRIBUTE Lp JT2 Test bitsTx

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib Jt2

Values Long Integer

Default No default

ATTRIBUTE Lp JT2 Test bytesTx

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	Jt2
Values	Long Integer
Default	No default

ATTRIBUTE Lp JT2 Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Jt2
Values	Long Integer
Default	No default

ATTRIBUTE Lp JT2 Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	Jt2
Values	Long Integer
Default	No default

ATTRIBUTE Lp JT2 Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Jt2
Values	Long Integer
Default	No default

ATTRIBUTE Lp JT2 Test frmRx

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Jt2
Values	Long Integer
Default	No default

ATTRIBUTE Lp JT2 Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Jt2
Values	Long Integer
Default	No default

ATTRIBUTE Lp JT2 Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Jt2
Values	String (5, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp JT2 Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	Jt2
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp JT2 Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Jt2
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp JT2 AtmCell (Cell)

Groups	GROUP Lp JT2 Cell Provisioned (Prov) GROUP Lp JT2 Cell Operational (Oper) GROUP Lp JT2 Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.
Mib	Jt2
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp JT2 Cell Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes for the *AtmCell* component.
Mib	Jt2

ATTRIBUTE Lp JT2 Cell alarmActDelay (act)

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	Jt2
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Lp JT2 Cell scrambleCellPayload (scramble)

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	Jt2
Values	off on
Default	No default

ATTRIBUTE Lp JT2 Cell correctSingleBitHeaderErrors

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib: Jt2

Values: off
on

Default: off

ATTRIBUTE Lp JT2 Cell clearDelay (clear)

Access: Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib: Jt2

Values: Decimal (0..60)

Units: minutes

Default: 0

ATTRIBUTE Lp JT2 Cell hecSampleInterval (hSample)

Access: Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port.

Copyright © 2006, Nortel Nortel Confidential

This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib Jt2

Values Decimal (0..25)

Units seconds

Default 0

ATTRIBUTE Lp JT2 Cell hecErrorLimit (hLimit)

Access Read and write

Description

This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.)
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib Jt2

Values Decimal (1..250000)

Default No default

ATTRIBUTE Lp JT2 Cell lcdStateDelay (delay)

Access Read and write

Description

This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib Jt2

Values Decimal (1..50)

Copyright © 2006, Nortel Nortel Confidential

Units	msec
Default	No default

ATTRIBUTE Lp JT2 Cell hecErrorIntervalLimit (hIntLimit)

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Values	Decimal (1..25)
Default	1

GROUP Lp JT2 Cell Operational (Oper)

Properties	Operational
Description	This group contains the common operational attributes for the *AtmCell* component.
Mib	Jt2

ATTRIBUTE Lp JT2 Cell lcdAlarm (lcd)

Access	Read only
Description	This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute. In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected. For an *AtmCell* component located under a *DS3* or *E3* component with

Copyright © 2006, Nortel Nortel Confidential

mapping = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell* component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

Mib Jt2

Values on
off

Default off

GROUP Lp JT2 Cell Statistics (Stats)

Properties Operational

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib Jt2

ATTRIBUTE Lp JT2 Cell uncorrectableHeaderErrors (ucErr)

Access Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Mib Jt2

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Lp JT2 Cell sevErroredSec (ses)

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects.

Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Mib: Jt2

Values: Decimal (0..4294967295)

Default: 0

ATTRIBUTE Lp JT2 Cell receiveCellUtilization (rxutil)

Access: Read only

Description

This attribute is the ratio of the number of valid, assigned cells received on the link to the nominal link capacity. The utilization is calculated over a period of one minute.
This attribute is always set to ***0*** when the parent of the *AtmCell* component has been *locked* and left *offline.* This can also happen when the *Path* or *Channel* component has been *suspended* since its parent has been *locked*.

Mib: Jt2

Values: Decimal (0..100)

GROUP Lp Hssi Provisioned (Prov)

Properties Provisioned

Description

This group contains the specific provisioning data for an *Hssi* component.

Mib LogicalProcessor

ATTRIBUTE Lp Hssi linkMode (mode)

Access Read and write

Description

This attribute defines the intended gender of the HSSI port. The actual gender of the port is determined by the hardware setup.

In ***dte*** mode, the *ta* line signal is driven as specified by the attribute *readyLineState* when the HSSI port passes its diagnostics. The *ta* line signal is then driven as specified by the attribute *dataTransferLineState* when the application is ready to transfer data. On the other hand, the input line signal *ca* is compared against those specified in the attributes *readyLineState* and *dataTransferLineState*. The application will be notified when the specified input line states are observed.

In ***dce*** mode, the ***Hssi*** component behaves similarly as when it is in ***dte*** mode. However, it will be driving the ***dce*** line signal ***(ca)*** and monitoring the ***dte*** line signal (*ta*) as specified by the attributes *readyLineState* and *dataTransferLineState*.

Mib LogicalProcessor

Values
dte
dce

Default dce

ATTRIBUTE Lp Hssi readyLineState (rls)

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the line signal originating from the HSSI interface that will always be turned on, provided the HSSI interface passes it diagnostics. This set of signal is generally required for maintaining the connection. Note that both *dte* and *dce* signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the operational attribute *actualLinkMode.* See also *linkMode*.
Mib	LogicalProcessor
Set of	ca ta
Default	(ca, ta)

ATTRIBUTE Lp Hssi dataTransferLineState (dtls)

Access	Read and write
Description	This attribute specifies the line signals required to indicate that the external equipment is in a good state (that is, data transfer can proceed). Note that both ***dte*** and ***dce*** signals are specified in this attribute. The appropriate set of specified signals will be turned on or checked according to the operational attribute *actualLinkMode*. The value of this attribute must be a superset of that of the *readyLineState* attribute. See also *linkMode*.
Mib	LogicalProcessor
Set of	ca ta
Default	(ca, ta)

ATTRIBUTE Lp Hssi lineSpeed (speed)

Access	Read and write
Description	This attribute specifies the speed of the line for source clocking. This attribute is ignored if the interface is not providing a clock. Note that the actual clock rate are available in the operational attributes *actualTxLineSpeed* and *actualRxLineSpeed*.
Mib	LogicalProcessor
Values	Decimal (1000000..50000000)
Units	bit/s
Default	45000000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Hssi applicationFramerName (framer)

Access	Read and write
Description	This attribute specifies the component name of a *Framer* which is associated with the *Hssi* component.
Mib	LogicalProcessor
Values	Link (Service, interfaceName)
Default	No default

GROUP Lp Hssi CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LogicalProcessor

ATTRIBUTE Lp Hssi customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	LogicalProcessor
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Hssi AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp Hssi vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LogicalProcessor
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp Hssi commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	LogicalProcessor
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp Hssi includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LogicalProcessor
Values	no yes
Default	no

GROUP Lp Hssi IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LogicalProcessor

ATTRIBUTE Lp Hssi ifAdminStatus (ifState)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

ATTRIBUTE Lp Hssi ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LogicalProcessor
Values	Decimal (1..65535)
Default	No default

GROUP Lp Hssi OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LogicalProcessor

ATTRIBUTE Lp Hssi snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LogicalProcessor
Values	up down testing
Default	up

GROUP Lp Hssi OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp Hssi adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Hssi operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values: enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Hssi usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: LogicalProcessor

Values: idle
active (activ)
busy

Default: idle

ATTRIBUTE Lp Hssi availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	LogicalProcessor
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp Hssi proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	LogicalProcessor
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp Hssi controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — LogicalProcessor

Set of
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Lp Hssi alarmStatus (osiAlarm)

Access — Read only

Description

If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

ATTRIBUTE Lp Hssi standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	LogicalProcessor
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Hssi unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	LogicalProcessor
Values	false true
Default	false

ATTRIBUTE Lp Hssi Test frmSize (size)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	LogicalProcessor
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp Hssi Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	LogicalProcessor
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Hssi Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Hssi Test dataStartDelay (dsd)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Hssi Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Hssi Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Hssi Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor

ATTRIBUTE Lp Hssi Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Default neverStarted

ATTRIBUTE Lp Hssi Test bitsTx

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp Hssi Test bytesTx

Access Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp Hssi Test frmTx

Access Read only

Description

This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp Hssi Test bitsRx

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Hssi Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Hssi Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Hssi Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Hssi Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Hssi Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Hssi Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)

Copyright © 2006, Nortel Nortel Confidential

Units	minutes
Default	0.00

GROUP Lp IlsFwdr IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	LanDrivers

ATTRIBUTE Lp IlsFwdr ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	LanDrivers
Values	up down testing
Default	up

ATTRIBUTE Lp IlsFwdr ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	LanDrivers
Values	Decimal (1..65535)
Default	No default

GROUP Lp IlsFwdr OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LanDrivers

ATTRIBUTE Lp IlsFwdr adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LanDrivers
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp IlsFwdr operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LanDrivers
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp IlsFwdr usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	LanDrivers
Values	idle active (activ) busy
Default	idle

GROUP Lp IlsFwdr OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LanDrivers

ATTRIBUTE Lp IlsFwdr snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LanDrivers
Values	up down testing
Default	up

GROUP Lp IlsFwdr Statistics (Stats)

Properties	Operational
Description	This group contains the operational frame statistics related attributes of the *IlsForwarder* component.
Mib	LanDrivers

ATTRIBUTE Lp IlsFwdr framesReceived

Access	Read only
Description	This attribute counts the total number of frames that have been received by this card. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp IlsFwdr processedCount

Access	Read only
Description	This attribute counts the number of frames successfully processed by this card. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Long Integer
Default	No default

ATTRIBUTE Lp IlsFwdr errorCount

Access	Read only
Description	This attribute counts the number of internal errors detected in transferring frames from an ATM card to this card. A continuous increment of this count indicates that the hardware may probably be defective. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Long Integer
Default	No default

ATTRIBUTE Lp IlsFwdr framesDiscarded

Access	Read only
Description	This attribute counts the number of frames which are discarded due to local buffer congestion. This counter will wrap around after it reaches its maximum value.
Mib	LanDrivers
Values	Long Integer
Default	No default

The Test component is used to do StartUp port test for LAN cards.

Mib	LanDrivers
Common Verbs	Help List Display

VERB Start **Lp IlsFwdr Test**

Impact	Service
Description	This verb is used to start a test as per the attributes set within each subcomponent of Test.

VERB Stop **Lp IlsFwdr Test**

Impact	Service
Description	This verb is used to stop a test.

VERB Reset **Lp IlsFwdr Test**

Impact	Service
Description	This verb is used to reset the Test component.

GROUP **Lp IlsFwdr Test** **PortTestOp (PTO)**

Properties	Operational
Description	This group contains the operational data for the *LanPortTest* component.
Mib	LanDrivers

ATTRIBUTE **Lp IlsFwdr Test** **type (type)**

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors.

COMPONENT Lp InverseMultiplexerAtm (Ima)

Instance	Decimal (0..113)
Groups	GROUP Lp Ima Provisioned (Prov) GROUP Lp Ima Operational (Oper) GROUP Lp Ima Statistics (Stats) GROUP Lp Ima CustomerIdentifierData (CidData) GROUP Lp Ima OsiState (State)
Scope	Device

Copyright © 2006, Nortel Nortel Confidential

Description	*Lp/n InverseMultiplexerAtm/n* *Lp/n Ds3/n InverseMultiplexerAtm/n* This component is used to define an inverse multiplexing for ATM (IMA) group. IMA provides a data rate greater than DS1 E1 in increments of DS1 E1. To use IMA on an 8pDS1E1, MSA32, MSA8, 2pSTM1eCh or 2pSTM1Ch function processor, add an *Lp/n InverseMultiplexerAtm/n* component. To use IMA on a 4pDS3ChAtm function processor, add an *Lp/n Ds3/n InverseMultiplexerAtm/n* component. To use IMA in a protected configuration on the 2pSTM1Ch, add a *Laps/n InverseMultiplexerAtm/n* component. The instance range 0..7 applies to 8pDS1Atm, 8pE1Atm, 8pDS1Msa and 8pE1Msa cards. The instance range 0..13 applies to 4pDS3ChAtm cards. The instance range 0..29 applies to MSA32 cards. The instance range 0..113 applies to the 2pStm1eCh and 2pSTM1Ch cards. The instance number of an *IMA* group must not be the same as the instance number of a *DS1*/*E1* "ATM UNI port" under the same *Lp*. An "ATM UNI port" is a *DS1* or *E1* component with a single *Chan* whose *applicationFramer* attribute is linked to an *AtmIf* component. On an MSA32 card, ports that are used as IMA links have two immiscible sub-ranges: 0..15 and 16..31. The instance number of an *IMA* group must be in the same sub-range as all of its ports. IMA sub-ranges also exist on the 2pStm1eCh and 2pSTM1Ch cards, instances 0..56 are allowed on port SDH 0, and instances 57..113 are allowed on port SDH 1.
Mib	Ima
Opt. Subcomp.	COMPONENT Lp Ima Link (Lk)
Dyn. Subcomp.	COMPONENT Lp Ima Test (Test)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Lp Ima Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Ima* component. The default values of *linkSelectionCriterion* and *linkRetryTimeout* depend on card type.
Mib	Ima

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Ima linkSelectionCriterion (select)

Access	Read and write
Description	This attribute specifies the method to be used by the IMA group when selecting links to be activated. This comes into effect only when the configured links do not respect the maximum differential delay (otherwise all links are accepted). If ***leastDelay*** is chosen, first the link having the smallest delay is selected as the reference link. The IMA group includes all links which respect the maximum differential delay relative to the reference link. If ***maxBandwidth*** is chosen, the IMA group selects the maximum possible number of links, with each selected link respecting the maximum differential delay relative to every other selected link. When more than one possibility exists, the combination which offers the least delay is selected. The default value for Multi-Service Access cards is ***leastDelay***, and for all other cards is ***maxBandwidth***. On Multi-Service Access cards ***leastDelay*** is the only acceptable provisionable value.
Mib	Ima
Values	leastDelay maxBandwidth
Default	No default

ATTRIBUTE Lp Ima maxDiffDelay (delay)

Access	Read and write
Description	This attribute specifies the maximum differential delay between links acceptable in the IMA group. If a link violates that maximum differential delay, it will not be active in the IMA group and an alarm will be generated. For the 4pDS3ChAtm card, the value must not exceed 70.
Mib	Ima
Values	Decimal (1..100)
Units	msec
Default	25

ATTRIBUTE Lp Ima linkRetryTimeout (retry)

Access	Read and write
Description	This attribute specifies the amount of time before reactivation of a link is attempted after it recovers from a failure condition. The default value for Multi-Service Access cards is ***1***, and for all other

Copyright © 2006, Nortel Nortel Confidential

cards is ***10***. On Multi-Service Access cards ***1*** is the only acceptable provisionable value.

Mib	Ima
Values	Decimal (0..1000)
Units	seconds
Default	No default

ATTRIBUTE Lp Ima applicationFramerName (framer)

Access	Read and write
Description	This attribute defines the link to the *AtmIf* component using the *Ima*. An example is *AtmIf/31.*
Mib	Ima
Values	Link (Service, interfaceName)
Default	No default

ATTRIBUTE Lp Ima transmitClockMode (clock)

Access	Read and write
Description	This attribute specifies the transmit clocking mode. If ***itc*** (Independent Transmit Clock) is chosen, the physical ports used by the IMA group may have different clocking sources. If ***ctc*** (Common Transmit Clock) is chosen, it is recommended that the physical ports used by the IMA group have the same clocking source. However, if the physical ports have different clocking sources, the operator should ensure that all the clocking sources have the same rate.
Mib	Ima
Values	itc ctc
Default	itc

ATTRIBUTE Lp Ima protocol (prot)

Access	Read and write
Criticality	Component
Description	This attribute specifies which IMA protocol the component should run. If ***atmForum10*** is chosen, the ATM Forum's IMA protocol (version 1.0) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The IMA group will come up only if the far end IMA also uses the ATM Forum's IMA protocol 1.0. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If ***atmForum11*** is chosen, the ATM Forum's IMA protocol (version 1.1) will be used and signalled in outgoing IMA Control Protocol (ICP) cells.The

Copyright © 2006, Nortel Nortel Confidential

IMA group will come up only if the far end IMA uses the ATM Forum's IMA protocol 1.0 or 1.1. Feature ***imaAtmForum*** must be provisioned on the LP for this protocol to be used. If the far end is 1.0, then the near end downgrades to 1.0. After the downgrade, this attribute continues to specify the provisioned protocol version, while the *activeProtocol* operational attribute of the IMA component specifies the protocol version effectively running.
If ***proprietary*** is chosen, Nortel's proprietary IMA protocol will be used. This protocol version is not currently supported as the IMA group will not inter-operate with IMA implementations from other vendors. Feature ***ima*** must be provisioned on the LP for this protocol to be used.

The DEFAULT on the 2pStm1eCh and 2pSTM1Ch function processors is atmForum11.

Mib: Ima

Values:
atmForum10
proprietary
atmForum11

Default: No default

GROUP Lp Ima Operational (Oper)

Properties: Operational

Description: This group contains the operational attributes for the *Ima* component.

Mib: Ima

ATTRIBUTE Lp Ima failureCause (cause)

Access: Read only

Description: This attribute indicates the cause of the current local end failure experienced by the IMA group. The failure may have occurred during a start-up procedure or during normal operation. Possible values are:
noFailure: no local end failure.
noGoodLinksInStartup: no good links were available during IMA start-up.
badGidInStartup: during start-up, different group identifiers (GIDs) were received on the links.
badLidInStartup: during start-up, duplicate link identifiers (LIDs) were received on the links.
unsupportedFrameLengthInStartup: during start-up, an unsupported frame length was received.
timeoutInStartup: a time-out has occurred during start-up.
noGoodLinks: no good links are available in the IMA group.
remoteFailure: the far end is down.
unsupportedSymmetryInStartup: the symmetry proposed by the far end is not supported on the near-end. This value will occur when the IMA group is running the ATM Forum protocol and the far end is proposing a group symmetry other than "symmetric configuration and operation".

Copyright © 2006, Nortel Nortel Confidential

unsupportedVersionInStartup: the ima version proposed by the far end is not supported on the near-end.

Mib	Ima
Values	noFailure noGoodLinksInStartup badGidInStartup badLidInStartup unsupportedFrameLengthInStartup timeoutInStartup noGoodLinks remoteFailure unsupportedSymmetryInStartup unsupportedVersionInStartup
Default	No default

ATTRIBUTE Lp Ima remoteDefect (remDef)

Access	Read only
Description	This attribute indicates the cause of the current far end defect experienced by the IMA group. For the ATM Forum IMA protocol, possible values are: ***noDefect***: no defect. ***unsupportedFrameLengthInStartup***: during the far end's start-up, an unsupported frame length was received. ***unsupportedSymmetryInStartup***: during the far end's start-up, an unsupported symmetry configuration was received. ***otherAbortStartup***: the far end has aborted its start-up for another reason. This could be because different Gids were received on the links or if duplicate link identifiers (LIDs) were received. ***insufficientLinks***: the far end does not have sufficient links active. This value will be displayed if the far end IMA group is locked. ***blocked***: the far end IMA group is blocked. For the proprietary IMA protocol, possible values are: ***noDefect***: no defect. ***noGoodLinksInStartup***: no good links were available during the far end's start-up. ***badGidInStartup***: during the far end's start-up, different GIDs were received on the links. ***badLidInStartup***: during the far end's start-up, duplicate link identifiers (LIDs) were received on the links. ***unsupportedFrameLengthInStartup***: during the far end's start-up, an unsupported frame length was received. ***timeoutInStartup***: a time out has occurred during the far end's start-up. ***noGoodLinks***: no good links are available in the far end IMA group. ***blocked***: the far end IMA group is locked. ***unsupportedVersionInStartup***: the ima version proposed by the far end is not supported on the near-end.

Default	No default

ATTRIBUTE Lp Ima remoteLidsConfig (remConf)

Access	Read only
Description	This attribute indicates all the links which have been configured in the remote IMA group. For example, if links 1, 3 and 5 have been configured in the remote IMA group, this attribute would contain ***1 3 5***.
Mib	Ima
Set of	Decimal (0..31)
Default	No default

ATTRIBUTE Lp Ima remoteLidsActive (remAct)

Access	Read only
Description	This attribute indicates all the links which are active in the remote IMA group. For example, if links 1 and 5 are active in the remote IMA, this attribute would contain ***1 5***.
Mib	Ima
Set of	Decimal (0..31)
Default	No default

ATTRIBUTE Lp Ima cellCapacity (cap)

Access	Read only
Description	This attribute indicates the total cell capacity (in cells per second) which is provided to the ATM layer. This cell capacity takes into account the physical and IMA level overheads.
Mib	Ima
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Units	cell/s
Default	No default

ATTRIBUTE Lp Ima remoteGid (remGid)

Access	Read only
Description	This attribute indicates the IMA group identifier (GID) used by the remote IMA. A value of 0 will be displayed if the group is not receiving IMA Control Protocol (ICP) cells.
Mib	Ima
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Lp Ima clockingModeMismatch (mismatch)

Access	Read only
Description	This attribute indicates whether or not both ends of the IMA group are using the same transmit clocking mode (***itc***/***ctc***). Its value will be ***yes*** if both ends are not using the same transmit clocking mode. A clocking mode mismatch does not prevent an IMA group from coming up and can be corrected by using the same clocking mode at both ends.
Mib	Ima
Values	no yes
Default	No default

ATTRIBUTE Lp Ima activeProtocol (activeProt)

Access	Read only
Description	This attribute indicates which IMA protocol the *Ima* component is effectively running. This attribute is supported on the 8pDs1Atm, 8pE1Atm, 4pDS3ChAtm, 2pStm1eCh and 2pSTM1Ch cards. This attribute is not supported on the MSA32 and MSA8 cards. The value of this attribute is the same as the provisioned *protocol* attribute if the IMA is operating at the provisioned protocol version. The value of this attribute indicates the dongraded protocol version if the IMA has gone through a protocol version downgrade upon IMA 1.1 to IMA 1.0 interworking.
Mib	Ima
Values	atmForum10 proprietary atmForum11

Default	No default

GROUP Lp Ima Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Ima* component.
Mib	Ima

ATTRIBUTE Lp Ima runningTime (running)

Access	Read only
Description	This attribute indicates the length of time (in seconds) for which the *Ima* component has been in the unlocked state or has been used for operational testing.
Mib	Ima
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Lp Ima unavailSec (unavail)

Access	Read only
Description	This attribute indicates the number of one second intervals during which the *Ima* component has been unlocked and out of service.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Ima failures (fail)

Access	Read only
Description	This attribute indicates the number of complete failures, during start-up or normal operation, that the *Ima* component has experienced since being added. It must be noted that a service degradation, such as 1 of the 3 links in an IMA group being down, is not counted as a failure. If an *Ima* component is in a failure loop and does not come up, this count will only increase by 1.
Mib	Ima
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Ima receiveCellUtilization (rxutil)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the ratio of the number of valid, assigned user cells received on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.
Mib	Ima
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp Ima transmitCellUtilization (txutil)

Access	Read only
Description	This attribute indicates the ratio of the number of user cells transmitted on the IMA group to the IMA cell capacity (based on the number of active links). The utilization is calculated over a one minute period.
Mib	Ima
Values	Decimal (0..100)
Units	%
Default	No default

GROUP Lp Ima CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Ima

ATTRIBUTE Lp Ima customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component.

Copyright © 2006, Nortel Nortel Confidential

Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Mib Ima

Values Decimal (0; 1..8191)

Default 0

GROUP Lp Ima OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Ima

ATTRIBUTE Lp Ima adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib Ima

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Lp Ima operationalState (osiOper)

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Ima usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Ima availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default	No default

ATTRIBUTE Lp Ima proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Lp Ima controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	Ima
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp Ima alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Default — No default

ATTRIBUTE Lp Ima standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Ima unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Ima
Values	false true
Default	false

COMPONENT Lp Ima Test (Test)

Groups	GROUP Lp Ima Test OsiState (State) GROUP Lp Ima Test Setup (Setup) GROUP Lp Ima Test Results (Results)
Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	Ima
Common Verbs	Help List Display

VERB START Lp Ima Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

Copyright © 2006, Nortel Nortel Confidential

VERB STOP Lp Ima Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp Ima Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ima

ATTRIBUTE Lp Ima Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ima
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Ima Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	Ima
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Ima Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ima
Values	idle active (activ) busy
Default	idle

GROUP Lp Ima Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	Ima

ATTRIBUTE Lp Ima Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Ima
Values	String (0..40, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Ima Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted). Note that not all test types are not supported by all function processors.
Mib	Ima
Values	card manual localLoop remoteLoop externalLoop payloadLoop remoteLoopThisTrib v54RemoteLoop pn127RemoteLoop lineBIP8Error sectionBIP8Error pathBIP8Error pathBIP2Error
Default	card

ATTRIBUTE Lp Ima Test frmSize (size)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	Ima
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp Ima Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Ima
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Ima Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Ima
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Ima Test dataStartDelay (dsd)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Ima
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Ima Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Ima
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Ima Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Ima
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Ima Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ima

ATTRIBUTE Lp Ima Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

ATTRIBUTE Lp Ima Test bitsTx

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib Ima

Values Long Integer

Default No default

ATTRIBUTE Lp Ima Test bytesTx

Access Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib Ima

Values Long Integer

Default No default

ATTRIBUTE Lp Ima Test frmTx

Access Read only

Description

This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.

This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Mib Ima

Values Long Integer

Default No default

ATTRIBUTE Lp Ima Test bitsRx

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	Ima
Values	Long Integer
Default	No default

ATTRIBUTE Lp Ima Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Ima
Values	Long Integer
Default	No default

ATTRIBUTE Lp Ima Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Ima
Values	Long Integer
Default	No default

ATTRIBUTE Lp Ima Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Ima
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Ima Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Ima
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Ima Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	Ima
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Ima Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.

Description	This group contains the operational attributes for the *Link* subcomponent.
Mib	Ima

ATTRIBUTE Lp Ima Lk failureCause (cause)

Access	Read only
Description	This attribute indicates the failure cause on this link. Possible values are: ***noFailure***: there is no failure on this link. ***interfaceDown***: the physical port used by the link is down. ***lif***: the link is in loss of IMA frame (LIF) state. ***lods***: the link is in loss of delay synchronization (LODS) state; that is, it has exhibited a differential delay which is greater than the maximum differential delay tolerated by the IMA group. It must be noted that hysteresis is used for the LODS condition. ***protocolError***: the link is down because of a time-out or because bad values are being received in IMA Control Protocol (ICP) cells. ***remoteFailure***: the far end link is down. ***misconnected***: the link is down because the IMA group has declared, after using its transmit test pattern procedure, that this link is not properly connected. This value can occur only if the *protocol for the IMA group is* ***atmForum10.*** ***unsupportedFrameLength***: the link is down because it is receiving from the far end a frame length which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.*** ***unsupportedSymmetry***: the link is down because it is receiving from the far end a group symmetry which is not supported by the local IMA group. This value can occur only if the *protocol for the IMA group is* ***atmForum10.*** ***noIcp***: the link is down because it is not receiving IMA Control Protocol (ICP) cells. This value can occur only if the *protocol* for the IMA group is ***atmForum10***. ***unsupportedVersion***: the link is down because it is receiving from the far end a group version that is not supported by the local IMA group.

GROUP Lp Ima Lk OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ima

ATTRIBUTE Lp Ima Lk adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ima
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Ima Lk operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Ima

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Ima Lk usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Ima

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Lp Ima Lk availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be

Copyright © 2006, Nortel Nortel Confidential

present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Ima Lk proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	Ima
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Lp Ima Lk controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib — Ima

Set of — subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Lp Ima Lk alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	Ima
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp Ima Lk standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Ima
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Ima Lk unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

Copyright © 2006, Nortel Nortel Confidential

The value ***true*** indicates that the actual state of the component is not known for sure.

Common Verbs	Help List Display Add DELete

GROUP Lp Eng Ds Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *DataStream Ov* components under *Lp Engineering*.
Mib	LogicalProcessor

ATTRIBUTE Lp Eng Ds Ov agentQueueSize (agentQ)

Access	Read and write
Description	This attribute specifies the maximum size of the DCS Agent's queue for this data stream on this LP. For more details on the defaults and other information, refer to the parent component's *agentQueueSize* attribute. The size should be set to 0 if absolutely no data is to be accepted from applications. There are threshold alarms based on the value of the Agent's *currentQueueSize* attribute (a Set when the queue becomes 75% full and a Clear after dropping back to 50% full). To properly determine what to set this to, consult the "Nortel Networks Multiservice Switch Engineering Notes and Guidelines". The size should not be 0 for the log stream. A semantic check prevents a user from setting the value of this attribute to 0 for the log stream. For security reasons, only a system administrator is allowed to set the value of this attribute for the log stream.
Mib	LogicalProcessor
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Lp Eng FrameRelaySystem (Frs)

Groups	GROUP Lp Eng Frs Operational (Oper)
Scope	Device

Description	*Lp Eng FrameRelaySystem* This component holds engineering parameters and statistics used by Frame Relay on this LP.
Mib	FrameRelayEng
Opt. Subcomp.	COMPONENT Lp Eng Frs Override (Ov)
Common Verbs	Help List Display Add DELete

GROUP Lp Eng Frs Operational (Oper)

Properties	Operational
Description	This group contains the Frame Relay default or current engineering parameters and statistics for this LP.
Mib	FrameRelayEng

ATTRIBUTE Lp Eng Frs maxCalls

Access	Read only
Description	This attribute indicates the maximum number of Frame Relay (FR) calls of any type (PVC, SPVC, or SVC) which can be simultaneously “current” on the LP. Note that “current” doesn’t necessarily mean that the call is in data transfer. It minimally means that such a call can subsequently generate accounting records. When the value of *currentCalls* reaches the value of *maxCalls* for FR on this LP, subsequent call attempts are rejected by the FR service.
Mib	FrameRelayEng
Values	Decimal (0..1000000)
Default	1000000

ATTRIBUTE Lp Eng Frs headroomCalls

Access	Read only
Description	This attribute indicates a number which allows a network engineer to do some statistical multiplexing for admitting calls when certain overload conditions are reached. For setting this, refer to the Engineering Guidelines. It depends on conditions such as the expected sustained SVC call setup/clear rates and how conservative one wants to be in certain “error” conditions where many calls are cleared simultaneously.
Mib	FrameRelayEng
Values	Decimal (0..1000000)

Copyright © 2006, Nortel Nortel Confidential

Default	1000000

ATTRIBUTE Lp Eng Frs currentCalls

Access	Read only
Description	This attribute counts the total number of Frame Relay calls (initially just FrUni and FrNni) which are “current”. Note that “current” doesn’t necessarily mean that the call is in data transfer. It minimally means that such a call can subsequently generate accounting records.
Mib	FrameRelayEng
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eng Frs callsRefused

Access	Read only
Description	This attribute counts the total number of call connections (including calls from the link as well as calls from the subnet) that have been refused because *currentCalls* has reached the limits, as specified by the engineering formulas for *Frs* on this LP.
Mib	FrameRelayEng
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Lp Eng Frs Override (Ov)

Groups	GROUP Lp Eng Frs Ov Provisioned (Prov)

GROUP Lp Eng Arc Operational (Oper)

Properties	Operational
Description	This group describes the usage of ATM-specific resources on a Logical Processor running ATM services. The attributes contained in thsi group represent Queue Controller resource usage for all ATM cards (CQC for CQC-based cards and PQC for ATM IP cards).
Mib	AtmBase

ATTRIBUTE Lp Eng Arc multicastBranchesAvailable (mcastAvail)

Access	Read only
Description	This attribute indicates the total number of available multicast branches for un-spared *AtmIf*s on this FP.
Mib	AtmBase
Values	Decimal (0..16384)
Default	No default

ATTRIBUTE Lp Eng Arc multicastBranchesUsage (mcastUsage)

Access	Read only
Description	This attribute indicates the total number of multicast branches that are in use on this FP for un-spared *AtmIf*s.
Mib	AtmBase
Values	Decimal (0..16384)
Default	No default

ATTRIBUTE Lp Eng Arc txCellMemoryAllocation (txCell)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the fraction of the transmit memory that is allocated for the transmission of cells on the FP. Cell memory is used for ATM Bearer Services, ATM SVCs and ATM PVCs. The remaining transmit memory is allocated for the transmission of frames. Frame memory is used for trunks, ATM VCC testing and for inter-card communication. This attribute is not available on APC-based and QRD-based FPs. On APC-based and QRD-based FPs, Tx cell memory is completely separated among individual ports.
Mib	AtmBase
Values	Decimal (1..99)
Units	%
Default	No default

ATTRIBUTE Lp Eng Arc txCellMemoryCongestionState (txCellCong)

Access	Read only
Description	This attribute indicates the congestion state of the transmit cell memory for this FP. This attribute indicates which *txCellMemoryThresholds* corresponds to the current value of *txCellMemoryUsage*. The congestion state is used to determine if cells of a particular discard priority (DP) are discarded before being queued for transmit. The congestion state of transmit cell memory is indicated by a numeric value ranging from 3 to 0. When transmit cell memory is in congestion state “x”, traffic with DP > “x” is discarded before transmit. Traffic with DP < “x” may be queued for transmit, depending on the congestion level of the connection transmit queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *txCellMemoryUsage* is to the next threshold as displayed in *txCellMemoryThresholds*. For example, CLP1 traffic is queued until the value indicated by *txCellMemoryUsage* equals the value indicated in *txCellMemoryThresholds* 3. At that point, CLP1 traffic is discarded. This attribute is not displayed on APC-based and QRD-based FPs.
Mib	AtmBase
Values	Decimal (0..3)
Default	No default

ATTRIBUTE Lp Eng Arc rxCellMemoryAllocation (rxCell)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the fraction of the receive memory which is allocated for the reception of cells on the FP. Cell memory is used for ATM Bearer Services, ATM SVCs, and ATM PVCs. The remaining receive memory is allocated to the reception of frames. Frame memory is used for trunks, ATM VCC testing, and for inter-card communication. This attribute is not available on APC-based and QRD-based FPs.
Mib	AtmBase
Values	Decimal (1..99)
Units	%
Default	No default

ATTRIBUTE Lp Eng Arc rxCellMemoryCongestionState (rxCellCong)

Access	Read only
Description	This attribute indicates the congestion state of the receive cell memory on this FP. This attribute indicates which *rxCellMemoryThresholds* corresponds to the current value of *rxCellMemoryUsage*. The congestion state is used to determine if cells of a particular discard priority (DP) are discarded before being queued for processing on this FP. The congestion state of receive cell memory is indicated by a numeric value ranging from 3 to 0. When receive cell memory is in congestion state “x”, traffic with DP > “x” is discarded before processing. Traffic with DP < “x” may be queued for processing, depending on the congestion level of the processor or bus queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *rxCellMemoryUsage* is to the next threshold as displayed in *rxCellMemoryThresholds*. For example, CLP1 traffic is queued until the value indicated by *rxCellMemoryUsage* equals the value indicated in *rxCellMemoryThresholds* 3. At that point, CLP1 traffic is discarded. This attribute is not displayed on APC-based and QRD-based FPs.

ATTRIBUTE Lp Eng Arc txCellMemoryMaxUsage (txCellMaxUsage)

Access Read only

Description On CQC-based ATM FPs, this attribute indicates the maximum usage of transmit cells for all ports on this FP.

On ATM IP FPs, this attribute indicates the maximum usage of transmit cells in the PQC. Queuing of ATM cells for transmit normally occurs in the AQM, that is indicated in the *Lp Eng Arc Aqm/x txCellMemoryUsage* attribute. Transmit cells should only be queued in the PQC under circumstances of extreme transient congestion.

This attribute is not available on APC-based and QRD-based FPs. On APC-based and QRD-based FPs, Tx cell memory is completely separated among individual ports. The maximum Tx cell memory usage is available on a per-APC basis under each individual *Lp Eng Arc Apc/x* component.

This value is reset to the current usage every 15 minutes and when the card is reset.

Mib AtmBase

Values Decimal (0..163839)

Mib	AtmBase
Values	Decimal (0..163839)
Units	cells
Default	No default

ATTRIBUTE Lp Eng Arc perVcQueueAvailable (queueAvail)

Access	Read only
Description	This attribute indicates the number of available per-VC queue resources for use by connections on this FP. Whether or not a connection requires a per-VC queue resource is determined by the connection's ATM service category provisioning. A per-VC queue resource is required when the ATM service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc*** and also when the ATM service category has the *unshapedTransmitQueueing* attribute provisioned with a value of ***perVc***. This attribute is only applicable to ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, and is filtered from the display on all other cards

ATTRIBUTE Lp Eng Arc txCellMemoryThresholds (txCellThresh)

Access	Read only
Description	This attribute is a vector that indicates the size and three discard thresholds for transmit cell memory for this FP. The transmit cell memory is used for storing ATM cells to be transmitted by this FP. This attribute is not applicable and is not displayed on APC-based and QRD-based FPs. The first value indicates the transmit cell memory size. This is derived based on the total transmit memory capacity of this FP, and the value of the *connectionPoolCapacity* and the *txCellMemoryAllocation* attributes. The current value of *txCellMemoryUsage* together with the vector of values in *txCellMemoryThresholds* determines the *txCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or queued for transmit. When the *txCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *txCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total transmit cell memory size. When the *txCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *txCellMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total transmit cell memory size. When the *txCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *txCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total transmit cell memory size. When the *txCellMemoryUsage* attribute is below threshold 3, the *txCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

ATTRIBUTE Lp Eng Arc rxCellMemoryThresholds (rxCellThresh)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute is a vector which indicates the size and three discard thresholds for receive cell memory for this FP. Receive cell memory is used for storing ATM cells received by this FP which are queued either for handling by the processor on this FP or queued for transmitting over the backplane to other FPs on this switch. The first value indicates the receive cell memory size. This is derived based on the total receive memory capacity of this FP, and the value of the *connectionPoolCapacity* and the *rxCellMemoryAllocation* attributes. The current value of *rxCellMemoryUsage* together with the vector of values in *rxCellMemoryThresholds* determines the *rxCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or queued. When the *rxCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *rxCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total receive cell memory size. When the *rxCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *rxCellMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total receive cell memory size. When the *rxCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *rxCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total receive cell memory size. When the *rxCellMemoryUsage* attribute is below threshold 3, the *rxCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued. This attribute is not displayed on APC-based and QRD-based FPs.

Values	Decimal (0..16384)
Default	0

ATTRIBUTE Lp Eng Arc Ov txCellMemoryAllocation (txCell)

Access	Read and write
Criticality	Process
Description	This attribute specifies the fraction of the transmit memory which should be allocated to the transmission of cells on an FP. The remaining memory is allocated for the transmission of frames. Frame memory is used for trunks, ATM VCC testing and for inter-card communication. Cell memory is used for ATM Bearer Service, ATM SVCs and ATM PVCs. There is an absolute minimum quantity of frame buffers which is required by ATM software on the FP. If the value of this attribute is smaller than the absolute minimum, the ATM software allocates the minimum required, rather than the actual number requested. The actual percentage of the transmit memory allocated to the transmit cell memory is indicated by the *Arc txCellMemoryAllocation* attribute. A difference between the provisioned and the operational values may exist due to the requirement for a minimum number of frame buffers or rounding during computation within the FP.

ATTRIBUTE Lp Eng Arc Ov protectedMcastBranchesCapacity (protMcastCap)

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of multicast branches that can be established for all spared *AtmIfs* on this FP. A multicast branch is used for cell replication on a VCC connection whose *Vcc distributionType* attribute is set to a value of ***pointToMultipoint***. A branch represents one ATM destination for the replicated cells. This attribute can only be non-zero if the Logical Processor is associated with a card of one of the following card types: ***4pOC3SmIrAtm***, ***4pOC3MmAtm***, ***12pDS3Atm***, ***12pE3Atm***, or ***1pOC12SmLrAtm***. If any port on the Logical Processor is provisioned in an inter-card *LAPS* configuration, then this attribute must have the same value on both associated Logical Processors. Increasing the value of this attribute reduces the memory available for the cell and frame memory.
Mib	AtmBase
Values	Decimal (0..16384)
Default	0

ATTRIBUTE Lp Eng Arc Ov connectionPoolCapacity (connCap)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of un-spared *AtmIf* connections (VCC, VPC, and VPT) that can be established on this FP. One connection resource is used for VCC and VPC connections, two connection resources for a basic VPT and three connection resources for a standard VPT.

Copyright © 2006, Nortel Nortel Confidential

If the Logical Processor is associated with a card of a card type other than one of the following: ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, ***2pJ6MAtm***; the value of the attribute restricts the sum of the (*maxVccs* + *maxVpcs+ (maxVpts * 3) + 1)* for all *AtmIfs* bound to this Logical Processor.

If the Logical Processor is associated with a card of one of the following card types: ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, ***2pJ6MAtm***; the number of available connections are distributed equally across the ports on the FP. The number of connections associated to a particular port limits the size of the VCC space which can be defined by the *ConnMap* of the *AtmIf* linked to the port. If the *ConnMap* component does not exist, its default settings are used for this check. Furthermore, the value of this attribute is restricted based on the number of ports on the card. For one port cards, the minimum is 512, the maximum is 4096 and the value must be divisible by 256. For two port cards, the minimum is 1024, the maximum is 8192 and the value must be divisible by 512. For three port cards, the minimum is 1536, the maximum is 7680 and the value must be divisible by 768.

If the Logical Processor is associated with a card of one of the following card types: ***8pE1Atm*** *or* ***8pDS1Atm***, the maximum value for this attribute is 10752.

If the Logical Processor is associated with a card of one of the following card types: ***32pDS1Msa*** or ***32pE1Msa***, the default value of the attribute is 4096.

If the Logical Processor is associated with a card of one of the following card types: ***1pOC48SmSrPos*** or ***1pOC48SmIrPos***, the maximum value for this attribute is 24000.

If the Logical Processor is associated with a card of one of the following card types: ***32pDS1MsaMtp***, ***32pE1MsaMtp***, ***32pDS1MsaMt, 32pE1MsaMt, 32pDS1MsaStp, 32pE1MsaStp, 32pDS1MsaSt*** *or* ***32pE1MsaSt***; the default value of the attribute is 8192.

The default value of the attribute is 3072 for Logical Processor associated with all other card types.

The maximum number of supported connections per APC is 16000 for ***16pOC3SmIrAtm, 4pOC12SmIrAtm,*** and ***4pOC12SmLrAtm*** cards.

For ATM IP cards, the *Connmap* attributes are set to their default values.

Increasing the value of this attribute reduces the memory available for cell and frame memory.

This attribute must be set to 0 if the *connectionPoolCapacity* attribute of the *Arc Cqc Ov* component is set to non-zero values.

Copyright © 2006, Nortel Nortel Confidential

The actual size of the pool is reflected in the *Lp Eng Arc connnectionPoolAvailable* attribute.

If the Logical Processor is associated with a card of one of the following card types: ***16pOC3SmIrAtm, 4pOC12SmIrAtm***, ***4pOC12SmLrAtm, 1pOC48ChSmIrAtm***, the maximum value for operational attribute *connectionPoolAvailable* is 56000.

To achieve the maximum *connectionPoolAvailable*, the *Lp Eng Fcrc Pqc* Ov *ipRoutesPoolCapacity* must be provisioned to 0. This requires there to be no IP features in the relevant *sw lpt featureList.*

If the total number of connections defined by adding the values of the *protectedConnectionPoolCapacity* and the *connectionPoolCapacity* attributes can not be satisfied, then the *protectedConnectionPoolCapacity* requirements are satisfied before the requirements of the *connectionPoolCapacity*.

Mib	AtmBase
Values	Decimal (0..64000)
Default	No default

ATTRIBUTE Lp Eng Arc Ov protectedConnectionPoolCapacity (protConnCap)

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum number of spared *AtmIf* connections (VCC, VPC, and VPT) that can be established on this FP. One connection resource is used for VCC and VPC connections. Three connection resources are used for a VPT connection. This attribute can only be non-zero if the logical Processor is associated with a card of one of the following card types: ***4pOC3SmIrAtm***, ***4pOC3MmAtm***, ***12pDS3Atm***, ***12pE3Atm***, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***1pOC48ChSmIrAtm***, ***4pDS3ChAtm***, or ***2pSTM1eCh***. If the Logical Processor is associated with ***2pSTM1eCh***, the default value of the attribute is 3072. The default value of the attribute is 0 for Logical Processor associated with all other card types. If any port on the Logical Processor is provisioned in an inter-card *LAPS* configuration, then this attribute must have the same value on both associated Logical Processors.

Copyright © 2006, Nortel Nortel Confidential

The value of the attribute restricts the sum of the (*maxVccs* + *maxVpcs* + 3**maxVpts* + 1) across all spared *AtmIfs* bound to this Logical Processor.

The maximum number of supported connections per APC is 16000 for ***16pOC3SmIrAtm, 4pOC12SmIrAtm***, and ***4pOC12SmLrAtm*** cards.

Increasing the value of this attribute reduces the memory available for cell and frame memory.

The actual size of the pool is reflected in the *Lp Eng Arc protectedConnectionPoolAvailable* attribute.

If the Logical Processor is associated with a card of one of the following card types: ***16pOC3SmIrAtm, 4pOC12SmIrAtm***, ***4pOC12SmLrAtm, 1pOC48ChSmIrAtm,*** the maximum value for operational attribute *protectedConnectionPoolAvailable* is 56000.

To achieve the maximum *protectedConnectionPoolAvailable*, the *Lp Eng Fcrc Pqc* Ov *ipRoutesPoolCapacity* must be provisioned to 0. This requires there to be no IP features in the relevant *sw lpt featurelist.*

If the total number of connections defined by adding the values of the *protectedConnectionPoolCapacity* and the *connectionPoolCapacity* attributes can not be satisfied, then the *protectedConnectionPoolCapacity* requirements are satisfied before the requirements of the *connectionPoolCapacity*.

Values Decimal (1.0; 1.4; 2.0; 2.8; 4.0; 5.6)

Default 1.0

ATTRIBUTE Lp Eng Arc Cqc Ov **cdvReduction (cdv)**

Access Read and write

Criticality Process

Description This attribute specifies the reduction of the maximum Cell Delay Variation (CDV) of shaped transmit traffic.

When the value of this attribute is set to ***disabled,*** the CDV value can be determined by the following equation:

CDV <= 2/ASR + 1/LS

where ASR is the Actual Shaping Rate of the connection and LS is the Link Speed of the interface.

When the value of this attribute is set to ***enabled,*** the CDV relationship changes to the following equation:

CDV <= 1/ASR + 1/LS

As can be noted from the equations above, setting this attribute to ***enabled*** can reduce the CDV significantly. CDV reduction may be used to conform to policers which have strict Cell Delay Variance Tolerance (CDVT). However using this function reduces the transmit bandwidth utilization of the following cards: ***3pDS3Atm***, ***3pOC3Atm***, ***2pJ6MAtm.***

When the value is ***cardDependent***, CDV reduction is disabled for card types ***3pDS3Atm***, ***3pOC3Atm***, ***2pJ6MAtm***, ***4pDs1Aal1***, ***4pE1Aal1*** and enabled for all other cards.

Mib AtmBase

enabled
cardDependent

Default cardDependent

ATTRIBUTE Lp Eng Arc Cqc Ov **portCongestionPolicy (portCong)**

Access Read and write

Criticality Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the congestion behavior of all ports on this FP. It applies only to transmit traffic served on the common queues and does not apply to per-VC queues. When the value is ***aggregate***, the enqueue decision of cells or frames to a common queue is based upon the congestion state of the entire port to which the queue belongs. A port is defined to be as congested as the most congested queue amongst all its common queues: the low, medium and high emission priority queues. Thus, for example, if the low priority queue is congested, the high priority queue also experiences discards even though the high priority queue may itself not be congested. Setting this attribute to ***aggregate*** assures that the low priority queues are also serviced in the event of congestion. When the value of this attribute is set to ***individualQueue***, the enqueue decision of cells or frames to a common queue is based solely upon the congestion state of that queue, not the port. This setting assures that the absolute priority of the traffic is taken into account, regardless of whether the lower priority queues are being served.
Mib	AtmBase
Values	aggregate individualQueue
Default	aggregate

ATTRIBUTE Lp Eng Arc Cqc Ov **connectionPoolCapacity (connCap)**

Access	Read and write
Criticality	Process
Description	This attribute is provided for backward compatibility and can only be used if the Logical Processor is associated with a card of one of the following card types: ***3pE3Atm***, ***3pDS3Atm***, ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE1Atm***, ***3pDS1Atm***, ***2pJ6MAtm***. This attribute can be used when the desired distribution of connections across ports cannot be achieved using the *connectionPoolCapacity* attribute of the *Lp Eng Arc Ov* component. This attribute defines the maximum number of connections (VCC, VPC and VPT) that are available on each port. VCC and VPC connections use one resource, whereas a basic *VPT* uses two connection resources. The entries are indexed by port number. This number limits the range of the *ConnMap* entries. If the *Connmap* component does not exist, its default settings are used for this check. Note that the value of this attribute must be evenly divisible by 256, and that port 2 supports at most 2560 connections, not the full 4096. The connection pool for each port must be set to 0 if the

Copyright © 2006, Nortel Nortel Confidential

	connectionPoolCapacity attribute in the *Lp Eng Arc Ov* component is set to a non-zero value.
Mib	AtmBase

Index	Decimal (0..2)
Default	([3] 0)

COMPONENT Lp Eng Arc Aqm (Aqm)

Instance	Decimal (0..3)
Groups	GROUP Lp Eng Arc Aqm Operational (Oper)
Scope	Device
Description	*Lp/n Eng Arc Aqm/n* The *Aqm* component describes the usage of ATM-specific resources on a Logical Processor running ATM services for a specific ATM Queue Manager. This component is always dynamically created under any *LP Eng* which supports an ATM IP FP. The number of instances depends upon the type of card. For the 4-port OC3 cards, in unprotected mode one *AQM* instance is used per *Sonet* or *SDH* port, where the *AQM* instance is the same as the *Sonet* or *SDH* port instance. For example, Sonet/0 uses AQM/0. In protected mode, ports 0 and 1 work together and ports 2 and 3 work together. If ports 0 and 1 are a protection pair, then AQM/0 is used. AQM/1 is dormant. If ports 2 and 3 are a protection pair, then AQM/2 is used. AQM/3 is dormant. For the ***32pE1MsaMtp, 32pE1MsaMt, 32pDS1MsaMtp, 32pDS1MsaMt, 32pE1MsaStp, 32pE1MsaSt, 32pDS1MsaStp*** *and* ***32pDS1MsaSt*** cards, AQM/0 exists for the *E1* or *DS1* electrical ports and AQM/1 exists for the *Sonet* or *SDH* optical ports. Optical ports 0 and 1 can only both exist, as a protected pair. For the ***32pE1Msa*** *and* ***32pDS1Msa*** cards, only AQM/0 exists for the *E1* or *DS1* electrical ports. For the ***1pOC12SmLrAtm*** card, only AQM/0 exists. Two physical ports exist, but if both ports are provisioned the second may be used for protection only. For ***12pDS3Atm*** and ***12pE3Atm*** cards, an *AQM* instance exists for each set of three ports. As clarification, DS3/0, DS3/1, and DS3/2 use AQM/0.

Copyright © 2006, Nortel Nortel Confidential

DS3/3, DS3/4, and DS3/5 use AQM/1. DS3/6, DS3/7, and DS3/8 use AQM/2. DS3/9, DS3/10, and DS3/11 use AQM/3.

ATTRIBUTE Lp Eng Arc Aqm **txCellMemoryCongestionState (txCellCong)**

Access	Read only
Description	This attribute indicates the congestion state of the transmit cell memory for the ATM Queue Manager (AQM) ASIC on this FP. This attribute indicates which *txCellMemoryThresholds* corresponds to the current value of *txCellMemoryUsage*. The congestion state is used to determine if cells of a particular discard priority (DP) are discarded before being queued for transmit. The congestion state of transmit cell memory is indicated by a numeric value ranging from 3 to 0. When transmit cell memory is in congestion state “x”, traffic with DP > “x” is discarded before transmit. Traffic with DP < “x” may be queued for transmit, depending on the congestion level of the connection transmit queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *txCellMemoryUsage* is to the next threshold as displayed in *txCellMemoryThresholds*. For example, CLP1 traffic is queued until the value indicated by *txCellMemoryUsage* equals the value indicated in *txCellMemoryThresholds* 3. At that point, CLP1 traffic is discarded. This attribute is not available on APC-based and QRD-based FPs since the txCellMemoryUsage attribute is not available.
Mib	AtmBase
Values	Decimal (0..3)

ATTRIBUTE Lp Eng Arc Aqm txCellMemoryUsage (txCellUsage)

Access	Read only
Description	This attribute indicates the current number of transmit cells which are in use on this FP. Transmit cell memory is used for storing ATM cells to be transmitted by connections for the ATM Queue Manager (AQM) ASIC on this FP. It includes all cells in all connections at all service categories. This attribute is not available on APC-based and QRD-based FPs. On APC-based FPs, Tx cell memory per APC device is completely partitioned among emission priorities (and also among the ports per-APC). The usage of cell memory per APC device does not adequately reflect the usage of cell memory for individual emission priorities.

ATTRIBUTE Lp Eng Arc Aqm txCellMemoryThresholds (txCellThresh)

Access	Read only
Description	This attribute is a vector which indicates the size and three discard thresholds for transmit cell memory for the ATM Queue Manager (AQM) ASIC on this FP. Transmit cell memory is used for storing ATM cells to be transmitted by connections. It includes all cells in all connections at all service categories. The first value indicates the transmit cell memory size. It is the amount of transmit memory which is available for cell queuing, after the amount of memory specified by *connectionPoolCapacity*. The current value of *txCellMemoryUsage* together with the vector of values in *txCellMemoryThresholds* determines the *txCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or queued for transmit. When the *txCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *txCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total transmit cell memory size. When the *txCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *txCellMemoryCongestionState* indicates the value 1. In

Copyright © 2006, Nortel Nortel Confidential

congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *txCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is below threshold 3, the *txCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

This attribute is not available on APC-based and QRD-based FPs since the *txCellMemoryUsage* attribute is not available.

Flags	HCA_SUPPORT

ATTRIBUTE Lp Eng Arc Aqm Ov **highPriorityEpdOffset (hiEpdO)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the high priority Early Packet Discard (EPD) offset for connection queues. On ATM IP FPs a given connection queue is associated with one of eight emission priorities (EP). These include six unshaped EPs, one exclusive VBR shaper EP and one ABR/VBR shaper EP. This attribute specifies the EPD offset for the exclusive VBR shaper EP and the first four (higher priority) unshaped EPs. This offset is used to derive a connection EPD threshold for a given Congestion Control (CC) level by subtracting the offset from the All Packet Discard (APD) threshold at the same CC level. The APD thresholds are themselves derived from the transmit queue limit. The EPD threshold only applies to a connection if the Packet-Wise Discard

Copyright © 2006, Nortel Nortel Confidential

feature is requested. The Packet-Wise Discard feature can be enabled only if the transmit queue limit is at least 5.71 times the EPD offset. This ensures that the derived EPD threshold will never be less than 17.5% of the transmit queue limit. If this condition is not satisfied, the Packet-Wise Discard feature for the connection is automatically disabled.

Due to the above constraint, if the operator wishes to decrease the transmit queue limit and still have Packet-Wise Discard feature enabled on the connection then this offset must be set to a lower value that meets the above requirement.

Due to hardware granularity the actual value of the EPD offset may not match exactly the value provisioned. The actual value is displayed under the ATM Connection Administrator service category subcomponents on ATM IP FPs.

This attribute does not apply to CQC FPs.

ATTRIBUTE Lp Eng Arc Aqm Ov **portCongestionPolicy (portCong)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the congestion behavior of all ports on this FP. It applies only to transmit traffic and does not apply to the CBR service category. When the value is ***aggregate***, the enqueue decision of cells or frames to a queue is based upon the congestion state of the entire port to which the queue belongs. A port is defined to be as congested as the most congested queue amongst all its queues. Thus, for example, if an nrt-VBR queue is congested, the rt-VBR queue also experiences discards even though the rt-VBR queue may itself not be congested. Setting this attribute to ***aggregate*** assures that the low priority queues are also serviced in the event of congestion. If this attribute is set to ***aggregate*** then rt-VBR must not be configured to do common queuing and its emission priority should be set to a number numerically smaller than or equal to 3. Another impact of setting this attribute to ***aggregate*** is that the per connection queue limits for nrt-VBR and UBR connections will be increased to the link pool size and their discard thresholds will be modified to be aligned with the free list discard thresholds. When the value of this attribute is set to ***individualQueue***, the enqueue decision of cells or frames to a queue is based solely upon the congestion state of that queue, not the port. This setting assures that the absolute priority of the traffic is taken into account, regardless of whether the lower priority queues are being served. On 3pOC3SmAtm2 and 3pOC3MmAtm2 cards, if more than one override component exists, they must have the same setting for this attribute. Otherwise, setting the attribute under one override component applies to the entire card.

ATTRIBUTE Lp Eng Arc Apc **txCellMemoryCongestionState (txCellCong)**

Access	Read only
Description	This attribute indicates the congestion state of the transmit cell memory for the ATM Queue Manager (AQM) ASIC on this FP. This attribute indicates which *txCellMemoryThresholds* corresponds to the current value of *txCellMemoryUsage*. The congestion state is used to determine if cells of a particular discard priority (DP) are discarded before being queued for transmit. The congestion state of transmit cell memory is indicated by a numeric value ranging from 3 to 0. When transmit cell memory is in congestion state “x”, traffic with DP > “x” is discarded before transmit. Traffic with DP < “x” may be queued for transmit, depending on the congestion level of the connection transmit queue. Traffic with DP = “x” may be either queued or discarded depending on how close the value of *txCellMemoryUsage* is to the next threshold as displayed in *txCellMemoryThresholds*. For example, CLP1 traffic is queued until the value indicated by *txCellMemoryUsage* equals the value indicated in *txCellMemoryThresholds* 3. At that point, CLP1 traffic is discarded. This attribute is not available on APC-based and QRD-based FPs since the txCellMemoryUsage attribute is not available.

Description	This attribute indicates the current number of transmit cells which are in use on this FP. Transmit cell memory is used for storing ATM cells to be transmitted by connections for the ATM Queue Manager (AQM) ASIC on this FP. It includes all cells in all connections at all service categories. This attribute is not available on APC-based and QRD-based FPs. On APC-based FPs, Tx cell memory per APC device is completely partitioned among emission priorities (and also among the ports per-APC). The usage of cell memory per APC device does not adequately reflect the usage of cell memory for individual emission priorities.
Mib	AtmBase
Values	Decimal (0..163839)
Units	cells
Default	No default

ATTRIBUTE Lp Eng Arc Apc **txCellMemoryThresholds (txCellThresh)**

Access	Read only
Description	This attribute is a vector which indicates the size and three discard thresholds for transmit cell memory for the ATM Queue Manager (AQM) ASIC on this FP. Transmit cell memory is used for storing ATM cells to be transmitted by connections. It includes all cells in all connections at all service categories. The first value indicates the transmit cell memory size. It is the amount of

Copyright © 2006, Nortel Nortel Confidential

transmit memory which is available for cell queuing, after the amount of memory specified by *connectionPoolCapacity*.

The current value of *txCellMemoryUsage* together with the vector of values in *txCellMemoryThresholds* determines the *txCellMemoryCongestionState*. The congestion state determines whether cells of a given discard priority (DP) are discarded or queued for transmit.

When the *txCellMemoryUsage* attribute is between threshold 0 and threshold 1, the *txCellMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 1 and threshold 2, the *txCellMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set approximately at 85 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is between threshold 2 and threshold 3, the *txCellMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total transmit cell memory size.

When the *txCellMemoryUsage* attribute is below threshold 3, the *txCellMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

This attribute is not available on APC-based and QRD-based FPs since the *txCellMemoryUsage* attribute is not available.

ATTRIBUTE Lp Eng Arc Apc Ov **highPriorityEpdOffset (hiEpdO)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the high priority Early Packet Discard (EPD) offset for connection queues. On ATM IP FPs a given connection queue is associated with one of eight emission priorities (EP). These include six unshaped EPs, one exclusive VBR shaper EP and one ABR/VBR shaper EP. This attribute specifies the EPD offset for the exclusive VBR shaper EP and the first four (higher priority) unshaped EPs. This offset is used to derive a connection EPD threshold for a given Congestion Control (CC) level by subtracting the offset from the All Packet Discard (APD) threshold at the same CC level. The APD thresholds are themselves derived from the transmit queue limit. The EPD threshold only applies to a connection if the Packet-Wise Discard feature is requested. The Packet-Wise Discard feature can be enabled only if the transmit queue limit is at least 5.71 times the EPD offset. This ensures that the derived EPD threshold will never be less than 17.5% of the transmit queue limit. If this condition is not satisfied, the Packet-Wise Discard feature for the connection is automatically disabled. Due to the above constraint, if the operator wishes to decrease the transmit queue limit and still have the Packet-Wise Discard feature enabled on the connection then this offset must be set to a lower value that meets the above requirement. Due to hardware granularity the actual value of the EPD offset may not match exactly the value provisioned. The actual value is displayed under the ATM Connection Administrator service category subcomponents on ATM IP FPs. This attribute does not apply to CQC FPs.

ATTRIBUTE Lp Eng Arc Apc Ov **bufferLimitPerEP (buffPerEP)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum buffer size allowed for each of the eight emission priorities of traffic towards the link. A class buffer pool limit is designed to prevent one emission priority from consuming all the available buffer space. The eight *bufferLimitPerEP* values represent maximum buffer size per emission priority, in number of cells. To guarantee proper buffer isolation among emission priorities, the sum of *bufferLimitPerEP* values for all emission priorities must not exceed the total buffer space available, which is 261118 cells. The default values are approximately 15%, 0%, 15%, 50%, 15%, 0%, 0%, and 5% of total available buffer space for emission priorities 0 through 7 respectively. Note: For APC based cards, the minimum value of *bufferLimitPerEP* for EP0 is 32. This limitation for EP 0 is because it uses different scheduler.

ATTRIBUTE Lp Eng Fcrc txFrameMemoryMaxUsage (txFrMaxUsage)

Access	Read only
Description	This attribute indicates the maximum number which has recently occurred for the *txFrameMemoryUsage* attribute. On CQC-based ATM FPs, this number indicates the maximum usage of transmit frames for all ports on this FP.

Copyright © 2006, Nortel Nortel Confidential

	On ATM IP FPs, this number indicates the maximum usage of transmit frames in the PQC ASIC. Queuing of frames for transmit only occurs in the PQC. This value is reset to the current usage every 15 minutes and when the card is reset.
Mib	AtmBase
Values	Decimal (0..32767)
Units	frameBlocks
Default	No default

ATTRIBUTE Lp Eng Fcrc txFrameMemoryUsage (txFrUsage)

Access	Read only
Description	This attribute indicates the current number of transmit frames which are in use for this FP. On CQC-based ATM FPs, this number indicates the total transmit frames which are in use for all ports on this FP. On ATM IP FPs, this number indicates the number of transmit frames which are in use in the PQC ASIC. Queuing of frames for transmit only occurs in the PQC.
Mib	AtmBase
Values	Decimal (0..32767)
Units	frameBlocks
Default	No default

ATTRIBUTE Lp Eng Fcrc rxFrameMemoryMaxUsage (rxFrMaxUsage)

Access	Read only
Description	This attribute indicates the maximum number which has recently occurred for the *rxFrameMemorySize* attribute. On CQC-based ATM FPs, this number indicates the maximum usage of receive frames for all ports on this FP. On ATM IP FPs, this number indicates the maximum usage of received frames in the PQC ASIC. Queuing of received frames only occurs in the PQC. This value is reset to the current usage every 15 minutes and when the card is reset.

Values	Decimal (0..32767)
Units	frameBlocks
Default	No default

ATTRIBUTE Lp Eng Fcrc txFrameMemoryThresholds (txFrThresh)

Access	Read only
Description	This attribute is a vector which indicates the size and three discard thresholds for transmit frame memory for this FP. The transmit frame memory is used for storing frames to be transmitted by this FP. The first value indicates the transmit frame memory size. This is derived based on the total transmit memory capacity of this FP, and the number of connections specified. The current value of *txFrameMemoryUsage* together with the vector of values in *txFrameMemoryThresholds* determines the *txFrameMemoryCongestionState*. The congestion state determines whether frames of a given discard priority (DP) are discarded or queued for transmit. When the *txFrameMemoryUsage* attribute is between threshold 0 and threshold 1, the *txFrameMemoryCongestionState* indicates the value 0. In congestion state 0, traffic with DP > 0 is discarded. Threshold 1 is set approximately at 90 percent of threshold 0, the total transmit frame memory size. When the *txFrameMemoryUsage* attribute is between threshold 1 and threshold 2, the *txFrameMemoryCongestionState* indicates the value 1. In congestion state 1, traffic with DP > 1 is discarded. Threshold 2 is set

Copyright © 2006, Nortel Nortel Confidential

approximately at 85 percent of threshold 0, the total transmit frame memory size.

When the *txFrameMemoryUsage* attribute is between threshold 2 and threshold 3, the *txFrameMemoryCongestionState* indicates the value 2. In congestion state 2, traffic with DP > 2 is discarded. Threshold 3 is set approximately at 75 percent of threshold 0, the total transmit frame memory size.

When the *txFrameMemoryUsage* attribute is below threshold 3, the *txFrameMemoryCongestionState* indicates the value 3. In congestion state 3, traffic with DP=3 is queued.

GROUP Lp Eng Fcrc Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains frame services provisionable engineering parameters for this *LogicalProcessor*. Note that altering any of these parameters will result in a card reset.
Mib	AtmBase

ATTRIBUTE Lp Eng Fcrc Ov subConnectionPoolCapacity (subConnCap)

Access	Read and write
Criticality	Process
Description	This attribute indicates the maximum number of sub-connections for the *LogicalProcessor*.

Copyright © 2006, Nortel Nortel Confidential

A sub-connection is used for interworking the ATM services with the frame oriented services such as Frame Relay and Path Oriented Routing System (PORS). When a frame is received at a sub-connection, the frame header is modified to be compatible with the service it is to be forwarded to.

Due to limited resources, not all of the sub-connections requested by this attribute may be allocated. The desired number of sub-connections allocated is indicated by the sum of *fcrc subConnectionPoolAvailable* and *fcrc subConnectionPoolUsage* attributes.

This pool is used for connection oriented services only. Each of the following services uses one or more sub-connections from this pool:
Any Frame Relay DLCI (provisioned [permanent] or signalled (SVC))[FRUNI, FRNNI, FRATM, BNX, IP Optimized]
Any PORS LCN
Any MPLS connection

When the sub-connection pool is exhausted, no more connections are accepted from the services which utilize this pool.

Note: Ip Routing entries also compete for this memory.

The maximum size of this pool is 8192 for CQC based cards. The default ***cardDependent*** has the effect of setting *subConnectionPoolCapacity* to 1024 for both CQC cards and SGAF cards.

Mib	AtmBase
Values	Decimal (0..49152) cardDependent
Default	cardDependent

ATTRIBUTE Lp Eng Fcrc Ov **InnConnectionPoolCapacity (InnConnCap)**

Access	Read and write
Criticality	Process
Description	This attribute indicates the maximum number of resource records for the connections which utilize Logical Network Number (LNN) on the *LogicalProcessor*.

A logical network is a subset of nodes together with a subset of trunks that interconnect those nodes. It carries the traffic for a defined set of network protocols. An LNN is used to identify a logical network. The connectionless services that utilize the logical networks require some processing at the intermediate nodes. This pool is allocated at the intermediate nodes to sustain these connectionless services.

If the *McsMgr DprsMcsEpG/n Ep/n EpD transportConnectionPreference* attribute is set to ***atmOnly***, each instance of the *McsMgr DprsMcsEpG/n*

Copyright © 2006, Nortel Nortel Confidential

Ep/n component uses one resource record from this pool, otherwise it does not use this pool.

Note: Frame and Cell queues also compete for this memory.

Each DPRS instance requires two resource records from this pool. The maximum size of this pool is 256 for CQC based cards. The default ***cardDependent*** has the effect of setting *InnConnectionPoolCapacity* to 128 for CQC cards and 256 for SGAF cards.

Mib	AtmBase
Values	Decimal (1..2048) cardDependent
Default	cardDependent

Description	This group describes the usage of resources specific to frame services on a PQC based FP.
Mib	AtmBase

ATTRIBUTE Lp Eng Fcrc Pqc ipRoutesPoolSize (ipRts)

Access	Read only
Description	This attribute indicates the number of IP routing entries permitted on the Logical Processor. If there are enough resources on the card, this value is equal to the provisioned attribute (in *Fcrc Pqc Ov*) *ipRoutesPoolCapacity*.
Mib	AtmBase

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..100000)
Default	No default

ATTRIBUTE Lp Eng Fcrc Pqc ipRoutesPoolUsage (ipRtsUsage)

Access	Read only
Description	This attribute represents the current number of IP routing entries that are in use.
Mib	AtmBase
Values	Decimal (0..100000)
Default	No default

ATTRIBUTE Lp Eng Fcrc Pqc ipRoutesPoolAvailableEst (ipRtsAvail)

Access	Read only
Description	Each IP routing resource can hold between one and three IP routing entries. Therefore, it is not possible to know exactly how many more IP routing entries can be added to the IP routing table. This attribute specifies the estimated number of IP routing entries that are available on the Logical Processor. It is an approximation based on the current average number of IP routing entries per IP routing resource.
Mib	AtmBase
Values	Decimal (0..100000)
Default	No default

ATTRIBUTE Lp Eng Fcrc Pqc ipInputRecordsPoolSize (ipInput)

Access	Read only
Description	This attribute contains the maximum number of IP input records that are available on a PQC based Logical Processor. IP input records are used by IP-aware media associated to a *Vr Pp* component. In general, one IP input record is used per Layer 2 connection used by IP-aware media.
Mib	AtmBase
Values	Decimal (0..32768)
Default	No default

ATTRIBUTE Lp Eng Fcrc Pqc ipInputRecordsPoolUsage (ipInputUsage)

Access	Read only
Description	This attribute indicates the current number of IP input records that are used by the IP instances on this Logical Processor.If this number exceeds *ipInputRecordsPoolSize*, some IP-aware media protocol ports will not be able to receive traffic.
Mib	AtmBase

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..32768)
Default	No default

ATTRIBUTE Lp Eng Fcrc Pqc ipOutputRecordsPoolSize (ipOutput)

Access	Read only
Description	This attribute contains the maximum number of IP output records that are available on this Logical Processor.
Mib	AtmBase
Values	Decimal (0..32768)
Default	No default

ATTRIBUTE Lp Eng Fcrc Pqc ipOutputRecordsPoolUsage (ipOutputUsage)

Access	Read only
Description	This attribute contains the current number of IP output records that are used by the IP instances currently active on a PQC based Logical Processor. IP output records are used by every active IP next hop onto which a flow has been exercised. If Equal-Cost Multi-Path (ECMP) IP routes are used on this node, IP output records can become exhausted rapidly. ECMP can be turned off by setting *Vr Ip Ospf ecmpStatus* attribute to ***disabled***.
Mib	AtmBase
Values	Decimal (0..32768)
Default	No default

Mib	AtmBase

ATTRIBUTE Lp Eng Fcrc Pqc Ov ipRoutesPoolCapacity (ipRtsCap)

Access	Read and write
Criticality	Process
Description	This attribute indicates the number of desired IP routing entries for the Logical Processor. It is used to determine the number of IP routing resources to be allocated on the card. Each IP routing resource can hold between one and three IP routing entries. To calculate the number of IP routing resources required, an average of 2 IP routing entries per IP routing resource is used. If there are not enough resources on the card, a smaller pool is allocated. Operational attribute (in Fcrc Pqc) *ipRoutesPoolSize* indicates the actual size of the pool.
Mib	AtmBase
Values	Decimal (0..100000)

GROUP Lp Vsp OsiState (State)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LogicalProcessor
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Vsp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LogicalProcessor
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Lp Vsp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LogicalProcessor
Values	idle active (activ) busy
Default	idle

COMPONENT Lp Vsp ProcessingModule (PModule)

Mib	LogicalProcessor

ATTRIBUTE Lp Vsp PModule moduleType (modType)

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of processing module expected for this *ProcessingModule* instance. A value of ***vpm*** refers to a processing module instance that is capable of processing voice, voiceband data, and data. A value of ***spm*** refers to a processing module instance that is capable of processing signaling, and hosting a media or signaling gateway. A value of ***none*** refers to a processing module instance that is unavailable for use.
Mib	LogicalProcessor
Values	none vpm spm
Default	none

GROUP Lp Vsp PModule OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp PModule adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — LogicalProcessor

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp Vsp PModule operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — LogicalProcessor

Values — enabled (ena)

COMPONENT Lp Vsp PModule ProcessingBlock (PBlock)

Instance: Decimal (1..2)

Groups:
GROUP Lp Vsp PModule PBlock Operational (Oper)
GROUP Lp Vsp PModule PBlock Utilization (Util)

Scope: Device

Description:
Lp/n Vsp PModule/n ProcessingBlock/n
Dlep/n Vsp PModule/n ProcessingBlock/n

This dynamic component represents a block of Data Processors within a *ProcessingModule*.

The Processing Block is the smallest unit on the Voice Services Processor (VSP) FP on which different Data Processing software algorithms may be executed, or on which diagnostics may be performed.

Mib: LogicalProcessor

Common Verbs:

Description	This group contains status information about the *ProcessingBlock* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp PModule PBlock serviceList (servList)

Access	Read only
Description	This attribute indicates the components that have resources allocated on this *ProcessingBlock* component. This attribute is not displayed if the *Shelf Card cardType* attribute is set to ***2pOC3ChSmIrVsp3*** or ***2pVS***.
Mib	LogicalProcessor
List of	The name of the component
Default	No default

GROUP Lp Vsp PModule PBlock Utilization (Util)

Properties	Operational
Description	This group contains information about processing utilization of this *PBlock* component. This group is filtered if the *modType* attribute of the parent *PModule* component is not set to ***spm***, or on the ***12mVspAal*** card.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp PModule PBlock timeInterval

Access	Read only
Description	This attribute indicates the time period for which the average, minimum, and maximum utilization values are calculated. If the associated *Vsp* component is locked this attribute will be reset to ***0***. This attribute is reset to ***0*** every 15 minutes.
Mib	LogicalProcessor
Values	Decimal (0..15)
Units	minutes
Default	No default

ATTRIBUTE Lp Vsp PModule PBlock cpuUtil

Access	Read only
Description	This attribute indicates the approximate processing utilization of this *PBlock* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp Vsp PModule PBlock cpuUtilAvg

Access	Read only
Description	This attribute indicates average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute.
Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp Vsp PModule PBlock cpuUtilAvgMin

Access	Read only
Description	This attribute indicates the minimum average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute.
Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%
Default	No default

ATTRIBUTE Lp Vsp PModule PBlock cpuUtilAvgMax

Access	Read only
Description	This attribute indicates the maximum average processing utilization of this *PBlock* component over the time period indicated in the *timeInterval* attribute.
Mib	LogicalProcessor
Values	Decimal (0..100)
Units	%
Default	No default

COMPONENT Lp Vsp Test (Test)

Groups	GROUP Lp Vsp Test OsiState (State) GROUP Lp Vsp Test Setup (Setup) GROUP Lp Vsp Test Results (Results)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	LogicalProcessor
Common Verbs	Help List Display

VERB START Lp Vsp Test

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp Vsp Test

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP Lp Vsp Test **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — LogicalProcessor

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp Vsp Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — LogicalProcessor

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp Vsp Test usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — LogicalProcessor

Values — idle
active (activ)
busy

Default	idle

GROUP Lp Vsp Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	LogicalProcessor
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp Vsp Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of

Copyright © 2006, Nortel Nortel Confidential

V5 byte inverted).
Note that not all test types are not supported by all function processors.

Mib: LogicalProcessor

Values:
card
manual
localLoop
remoteLoop
externalLoop
payloadLoop
remoteLoopThisTrib
v54RemoteLoop
pn127RemoteLoop
lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Lp Vsp Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: LogicalProcessor

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Lp Vsp Test frmPatternType (fpt)

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib: LogicalProcessor

Values:
ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Copyright © 2006, Nortel
Nortel Confidential

Default	ccitt32kBitPattern

ATTRIBUTE Lp Vsp Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	LogicalProcessor
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Vsp Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	LogicalProcessor
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Vsp Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	LogicalProcessor
Values	Decimal (0..30240)
Units	minutes
Default	5

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Vsp Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Vsp Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of

Copyright © 2006, Nortel Nortel Confidential

transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib LogicalProcessor

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default neverStarted

ATTRIBUTE Lp Vsp Test bitsTx

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib LogicalProcessor

Values Long Integer

Default No default

ATTRIBUTE Lp Vsp Test bytesTx

Access Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.

Copyright © 2006, Nortel Nortel Confidential

Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	LogicalProcessor
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Vsp Test elapsedTime

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Vsp Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	LogicalProcessor
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

Default	idle

GROUP Lp Vsp GigE Eth1000Operational (Oper)

Properties	Operational
Description	This group contains the port operational attributes of the *VspEth1000BaseSX* component.
Mib	LogicalProcessor

ATTRIBUTE Lp Vsp GigE macAddress (macAdd)

Access	Read only
Description	This attribute indicates the medium access controller address. The value of this attribute will be assigned by the system. The medium access controller address is displayed in canonical format.
Mib	LogicalProcessor
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lp Vsp GigE autoNegotiationStatus (negStatus)

Access	Read only
Description	This attribute indicates the status of the auto negotiation at the physical level.

Copyright © 2006, Nortel Nortel Confidential

Possible values are:

succeeded – auto-negotiation has completed successfully.

failed – auto-negotiation has failed to negotiate a compatible set of capabilities.

inProgress – auto-negotiation is currently in progress.

disabled – the port has detected that the far end does not support auto-negotiation.

Mib	LogicalProcessor
Values	succeeded failed inProgress disabled
Default	No default

ATTRIBUTE Lp Vsp GigE ingressFlowControlStatus (ingFcStatus)

Access	Read only
Description	This attribute indicates whether the ingress flow control has been successfully negotiated with the link partner. Possible values are: ***enabled*** - this state will generate pause frames when internal congestion is detected. ***disabled*** - in this state, no pause frames are generated. In addition, there is a risk that the received packets may be discarded due to lack of internal resources.
Mib	LogicalProcessor
Values	enabled disabled
Default	No default

ATTRIBUTE Lp Vsp GigE lossofSyncAlarm (syncAlarm)

Access	Read only
Description	This attribute indicates whether the loss of synchronization alarm is ***on*** or ***off***. Possible values are: ***on*** - the alarm is set.

Copyright © 2006, Nortel Nortel Confidential

off - the alarm is clear.

Mib	LogicalProcessor
Values	on off
Default	No default

ATTRIBUTE Lp Vsp GigE autoNegIncompleteAlarm (negAlarm)

Access	Read only
Description	This attribute indicates whether the auto-negotiation incomplete alarm is ***on*** or ***off***. Possible values are: ***on*** - the alarm is set. ***off*** - the alarm is clear.
Mib	LogicalProcessor
Values	on off
Default	No default

ATTRIBUTE Lp Vsp GigE remoteFaultIndicationAlarm (remFaultAlarm)

Access	Read only
Description	This attribute indicates whether the remote fault indication alarm is ***on*** or ***off***. Possible values are: ***on*** - the alarm is set. ***off*** - the alarm is clear.
Mib	LogicalProcessor
Values	on off
Default	No default

GROUP Lp Vsp GigE Eth1000Statistics (Stats)

Properties	Operational
Description	This group contains the statistics for the *VspEth1000BaseSX* component.

Access	Read only
Description	This attribute counts the frames that were transmitted without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE framesReceivedOk (frmRxOk)

Access	Read only
Description	This attribute counts the number of frames that were received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE octetsTransmittedOk (octetsTxOk)

Access	Read only
Description	This attribute counts the octets that were transmitted without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE octetsReceivedOk (octetsRxOk)

Access	Read only
Description	This attribute counts the octets that were received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE pauseFramesTransmitted (txPause)

Access	Read only
Description	This attribute counts the pause medium access controller control frames transmitted. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE pauseFramesReceived (rxPause)

Access	Read only
Description	This attribute counts the pause medium access controller control frames received. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE undersizeFrames (underFrm)

Access	Read only
Description	This attribute counts the frames that were received but were less than the minimum size (64 bytes). This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE framesTooLong (longFrm)

Access	Read only
Description	This attribute counts the frames that were received but were greater than the maximum size. The count includes frames which have a bad frame check sequence. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE frameCheckSequenceErrors (fcsErr)

Access	Read only
Description	This attribute counts the frames received that were an integral number of octets in length and did not pass the FCS check. This count does not include frames received that were too long or too short. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp Vsp GigE symbolErrors (symErr)

Access	Read only
Description	This attribute counts the times a valid length frame was received and had at least one occurance of a data reception or symbol error. This counter increments once per valid Carrier Event as defined by the specification IEEE 802.3 - 2000 edition. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE broadcastFramesReceivedOk (bcastRxOk)

Access	Read only
Description	This attribute counts the valid broadcast frames received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

ATTRIBUTE Lp Vsp GigE discardedFrames (discFrm)

Access	Read only
Description	This attribute counts the valid frames discarded because of a lack of resources available to receive them. This counter wraps to zero after it reaches its maximum value.
Mib	LogicalProcessor
Values	Long Integer
Default	No default

COMPONENT Lp Ethernet100BaseT (Eth100)

GROUP Lp Eth100 CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	LanDrivers

ATTRIBUTE Lp Eth100 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

ATTRIBUTE Lp Eth100 autoNegotiation

Access	Read and write
Description	This attribute is used to select whether or not the port does auto negotiation. The provisionable values of *duplexMode* and *lineSpeed* are ignored if auto negotiation is successful. Refer to the operational attribute *autoNegStatus* for auto negotiation results.
Mib	LanDrivers
Values	enabled disabled
Default	enabled

ATTRIBUTE Lp Eth100 applicationFramerName (framer)

Access	Read and write
Description	This attribute contains the component name of a Framer which is associated with the Eth100BaseT component. This defines which Lan Application will be using this Eth100BaseT interface.
Mib	LanDrivers
Values	Link (Service, interfaceName)
Default	No default

ATTRIBUTE Lp Eth100 switchoverOnFailure (switch)

Access	Read and write
Description	This attribute specifies if a FP switchover should occur when a port or link failure is detected by the initial test process or if a steady state link failure is observed. The switchover occurs only if the standby FP's port is operational. This value '***enabled***' specifies that a switchover should take

Copyright © 2006, Nortel Nortel Confidential

	place if a port or link failure is detected. This value '***disabled***' specifies that a switchover should not take place when a port or link failure is detected.
Mib	LanDrivers
Values	enabled disabled
Default	disabled

ATTRIBUTE Lp Eth100 switchoverHoldoff (soHoldoff)

Access	Read and write
Description	This attribute specifies the time interval between detection of a port or link failure and initiation of FP switchover. This attribute is ignored if *switchoverOnFailure* is ***disabled***. The switchover occurs only if the standby FP's port is operational. The attribute gives the customer a choice to have a switchover immediate upon changing cable or hold-off time up to 3 minutes. The default value is 0 (no hold-off). Note that a non-zero value will result in outage but will allow the link time to recover before initiating a switchover.
Mib	LanDrivers
Values	Decimal (0..180)
Units	seconds
Default	0

GROUP Lp Eth100 AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	LanDrivers

ATTRIBUTE Lp Eth100 vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	LanDrivers
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp Eth100 commentText

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	Any miscellaneous text about the facility.
Mib	LanDrivers
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp Eth100 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	LanDrivers
Values	no yes
Default	no

GROUP Lp Eth100 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	LanDrivers

ATTRIBUTE Lp Eth100 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	LanDrivers
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Eth100 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	LanDrivers
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Eth100 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	LanDrivers
Values	idle active (activ) busy
Default	idle

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp Eth100 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	LanDrivers

ATTRIBUTE Lp Eth100 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	LanDrivers
Values	up down testing
Default	up

GROUP Lp Eth100 Operational (Oper)

Properties	Operational
Description	This group contains the Port operational attributes of the *Eth100BaseT* component.
Mib	LanDrivers

ATTRIBUTE Lp Eth100 macAddress

Access	Read only
Description	This attribute indicates the medium access controller (MAC) address. The MAC address is displayed in canonical format.
Mib	LanDrivers
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lp Eth100 autoNegStatus

Access	Read only
Description	This attribute displays the status of the auto negotiation at the Phy level.
Mib	LanDrivers
Values	succeeded failed disabled

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp Eth100 actualLineSpeed

Access	Read only
Description	This attribute indicates the line speed of the Eth100BaseT port.
Mib	LanDrivers
Values	Decimal (10; 100)
Units	Mbit/s
Default	No default

ATTRIBUTE Lp Eth100 actualDuplexMode

Access	Read only
Description	This attribute indicates whether the hardware is in half duplex or full duplex mode.
Mib	LanDrivers
Values	half full
Default	No default

ATTRIBUTE Lp Eth100 activeStatus

Access	Read only
Description	This attribute indicates the status of the Ethernet port on the active FP.
Mib	LanDrivers
Values	available notavailable
Default	No default

ATTRIBUTE Lp Eth100 standbyStatus

Access	Read only
Description	This attribute indicates the status of the Ethernet port on the standby FP.
Mib	LanDrivers
Values	available notavailable
Default	No default

GROUP Lp Eth100 Eth100Statistics (Eth100Stats)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the statistical attributes for the *Eth100BaseT* component.
Mib	LanDrivers

ATTRIBUTE Lp Eth100 framesTransmittedOk (frmTxOk)

Access	Read only
Description	This attribute counts the number of frames which were transmitted without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 framesReceivedOk (frmRxOk)

Access	Read only
Description	This attribute counts the number of frames which were received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 octetsTransmittedOk (octetsTxOk)

Access	Read only
Description	This attribute counts the number of octets which were transmitted without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 octetsReceivedOk (octetsRxOk)

Access	Read only
Description	This attribute counts the number of octets which were received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 undersizeFrames (undersizeFrm)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames that were received but were less than the minimum size (64 bytes). This counter wraps to zero after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 receivedOctetsIntoRouterBr (rxOctetsRtrBr)

Access	Read only
Description	This attribute counts the number of octets that were not hardware switched but were passed the Router or Bridge software. This counter wraps to zero after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 receivedFramesIntoRouterBr (rxFrmRtrBr)

Access	Read only
Description	This attribute counts the number of frames which were not hardware switched but were passed to the Router or Bridge software. This counter wraps to zero after it reaches its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

GROUP Lp Eth100 Statistics (Stats)

Properties	Operational
Description	This group contains statistical attributes for the *Ethernet* component.
Mib	LanDrivers

ATTRIBUTE Lp Eth100 alignmentErrors

Access	Read only
Description	The *alignmentErrors* counter indicates the number of frames received which were not an integral number of octets in length. Frames will be checked for *alignmentErrors* before they are checked for Frame Check Sequence (FCS) errors. If there is an alignment error, the error will only be counted here and not in *fcsErrors*. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 fcsErrors

Access	Read only
Description	The *fcsErrors*, Frame Check Sequence (FCS) error, counter indicates the number of frames received which were an integral number of octets in length and did not pass the FCS check. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 singleCollisionFrames

Access	Read only
Description	The *singleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced exactly one collision. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 multipleCollisionFrames

Access	Read only
Description	The *multipleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced more than one collision. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 sqeTestErrors

Access	Read only
Description	The *sqeTestErrors*, Signal Quality Error (SQE) Test errors, counter indicates the number of times the “SQE Test Error” message has been generated for the station. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp Eth100 deferredTransmissions

Access	Read only
Description	The *deferredTransmissions* counter indicates the number of frames which experienced a transmission delay because the medium was busy. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 lateCollisions

Access	Read only
Description	The *lateCollisions* counter indicates the number of times a collision was detected later than 512 bit-times into the transmission of a packet. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 excessiveCollisions

Access	Read only
Description	The *excessiveCollisions* counter indicates the number of frames which failed to get transmitted due to excessive collisions. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 macTransmitErrors

Access	Read only
Description	The Medium Access Controller (MAC) transmit error counter indicates the number of times that a transmission failed due to internal MAC transmit errors. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Eth100 carrierSenseErrors

Access	Read only
Description	The carrier sense error counter indicates the number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 frameTooLongs

Access	Read only
Description	The frame too long counter indicates the number of frames received which exceeded the maximum frame size. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Eth100 macReceiveErrors

Access	Read only
Description	The Medium Access Controller (MAC) receive error counter indicates the number of times a receive failed due to internal MAC receive errors. This counter wraps around after it exceeds its maximum value.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Default	No default

Properties	Operational
Description	This group contains the operational data for the *LanPortTest* component.
Mib	LanDrivers

ATTRIBUTE **Lp Eth100 Test** **type (type)**

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: card test sets up an internal loop on the board and runs a bit error rate test; manual test assumes the line is looped back externally and a bit error rate test is performed; localLoop test loops back the local modem and performs a bit error rate test; remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test; externalLoop test loops back the line to the far end; payloadLoop test only loops back the payload data received from the incoming line; Note that localLoop, remoteLoop and payloadLoop are not supported by all function processors.

Default — No default

ATTRIBUTE Lp Eth100 Test frmSize (size)

Access — Read and write

Description — This attribute defines the size of the test data frames in number of bytes.

Mib — LanDrivers

Values — Decimal (4..4096)

Units — bytes

Default — 1024

ATTRIBUTE Lp Eth100 Test duration (duration)

Access — Read and write

Description — This attribute specifies the duration of the test data transmission. In the case of an externalLoop, this is the time that the loop is in effect. Note that dataStartDelay does not apply to the externalLoop.

Mib — LanDrivers

Values — Decimal (1..30240)

Units — minutes

Default — 1

GROUP Lp Eth100 Test Results (Results)

Properties — Operational

Description — This group contains all the statistics related attributes of the Test component.

Mib — LanDrivers

ATTRIBUTE Lp Eth100 Test elapsedTime

Access — Read only

Description — This attribute is the number of minutes elapsed since the test started for an externalLoop test. For a data test, this is the time since test data was first transmitted.

Copyright © 2006, Nortel Nortel Confidential

Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Eth100 Test timeRemaining

Access	Read only
Description	This attribute is the number of minutes remaining before the test is to be stopped according to the duration attribute.
Mib	LanDrivers
Values	Decimal (0..4294967295)
Units	minutes
Default	0

ATTRIBUTE Lp Eth100 Test causeOfTermination

Access	Read only
Description	This attribute records the reason the test is terminated.
Mib	LanDrivers
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning
Default	neverStarted

ATTRIBUTE Lp Eth100 Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value.
Mib	LanDrivers
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth100 Test bitsTx

Access	Read only
Description	This attribute counts the bits sent during the test period. This counter is not expected to reach its maximum value.

GROUP Lp OamEnet Operational (Oper)
GROUP Lp OamEnet OamEnetStatistics (OamEnetStats)
GROUP Lp OamEnet Statistics (Stats)

Scope: Device

Description:
Lp/0 OamEthernet
This component represents an Ethernet port on the control processor.

Only one instance of this component may be created corresponding to the one hardware port on the control processor. This port is designed specifically and exclusively for Operations, Administration, and Maintenance purposes; any other use of this port is unsupported and not advised.

Mib: OamEthernet

Dyn. Subcomp.:
COMPONENT Lp OamEnet LanTest (Lt)
COMPONENT Lp OamEnet Test

Common Verbs:
Help
List
Display
Add
DELete
Unlock

VERB LOCK **Lp OamEnet**

Impact: Service

Description:
Lock [-force] [-forever] <component name>
This verb causes the *OamEthernet* component to first enter the OSI shuttingDown state. In this state all connections to the OAM Ethernet port are severed and any new connections are not accepted. Once shuttingDown state is reached the OSI state will change to locked. When the port is locked it can be tested using the *Test* component.

The default behavior for this verb is for the port to remain locked for a period of five minutes before automatically unlocking. This behavior can be overridden with the forever option.

Options:
-force
If this option is present, service to current clients is terminated and the locked state is entered immediately (that is, without first going through the shuttingDown state). Without this option, *Lock* behaves as described above.
-forever
If this option is present, then after the locked state is entered an *Unlock* command is required to get the service into the unlocked state.

GROUP Lp OamEnet CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	OamEthernet
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp OamEnet IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	OamEthernet
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

ATTRIBUTE Lp OamEnet ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	OamEthernet
Values	Decimal (1..65535)
Default	No default

GROUP Lp OamEnet Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioned attributes for the *OamEthernet* component.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet applicationFramerName (framer)

Access	Read and write
Criticality	Process
Description	This attribute specifies which *Lan Application* is running on this port.
Mib	OamEthernet
Values	Link (Service, interfaceName)
Default	No default

ATTRIBUTE Lp OamEnet switchoverOnFailure (switch)

Access	Read and write
Description	This attribute specifies if a CP switchover should occur if a port or link failure is detected by the initial test process or if a steady state link failure is observed. The switchover will occur only if the standby CP OAM Ethernet port is operational. This attribute can be set to one of the following values: ***enabled***: This value indicates that a switchover will take place if a port or link failure is detected. ***disabled***: This value indicates that a switchover will not take place if a port or link failure is detected.
Mib	OamEthernet

Copyright © 2006, Nortel Nortel Confidential

Values	enabled disabled
Default	enabled

ATTRIBUTE Lp OamEnet extendedStatistics (extStats)

Access	Read and write
Description	This attribute specifies if extended statistics are to be collected for the *OamEthernet* component. The extended statistics include: *singleCollisionFrames*, *multipleCollisionFrames*, *lateCollisions*, *excessiveCollisions*, *carrierSenseErrors*, and *clearToSendSignalLoss*. These statistics all require extra processing to gather and store which may have a negative impact on the overall performance of the OAM Ethernet port. If *extendedStatistics* is set to disabled, then these particular statistical attributes will be suppressed from display operations.
Mib	OamEthernet
Values	enabled disabled
Default	disabled

ATTRIBUTE Lp OamEnet lineSpeed

Access	Read and write
Description	This attribute specifies the operating speed for the OAM Ethernet port. The operating speed is either ***tenMeg***, ***hundredMeg***, or ***autoConfig***. If the attribute is set to ***autoConfig*** then the operating speed is determined by the auto-negotiation process. The actual line speed is reported by the *actualLineSpeed* attribute.
Mib	OamEthernet
Values	tenMeg hundredMeg autoConfig
Default	autoConfig

ATTRIBUTE Lp OamEnet duplexMode

Access	Read and write
Description	This attribute specifies the duplex mode for the OAM Ethernet port. If the attribute is set to ***autoConfig*** then the duplex mode determined by the auto-negotiation process. The actual duplex mode is reported by the *actualDuplexMode* attribute.

Copyright © 2006, Nortel Nortel Confidential

Mib	OamEthernet
Values	half full autoConfig
Default	autoConfig

ATTRIBUTE Lp OamEnet switchoverHoldoff (soHoldoff)

Access	Read and write
Description	This attribute specifies the time interval between detection of a port or link failure and initiation of CP switchover. This attribute is ignored if *switchoverOnFailure* is ***disabled***. The switchover will occur only if the standby CP OAM Ethernet port is operational.
Mib	OamEthernet
Values	Decimal (10..60)
Units	seconds
Default	30

GROUP Lp OamEnet AdminInfo (AdminInfo)

Properties	Provisioned
Description	This group contains the attributes pertaining to the vendor of the equipment.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet vendor

Access	Read and write
Description	This is the name of the vendor supplying the facility.
Mib	OamEthernet
Values	String (0..20, ASCII)
Default	No default

ATTRIBUTE Lp OamEnet commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	OamEthernet
Values	String (0..60, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp OamEnet includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	OamEthernet
Values	no yes
Default	no

GROUP Lp OamEnet OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	OamEthernet

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp OamEnet operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	OamEthernet
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp OamEnet usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	OamEthernet
Values	idle active (activ) busy
Default	idle

GROUP Lp OamEnet OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	OamEthernet

ATTRIBUTE Lp OamEnet snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	OamEthernet
Values	up down testing
Default	up

GROUP Lp OamEnet Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *OamEthernet* component.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet macAddress

Access	Read only
Description	This attribute indicates the medium access controller (MAC) address automatically assigned to the *Oam Ethernet* port by the system. The MAC address is displayed in canonical format.
Mib	OamEthernet
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lp OamEnet activeStatus

Access	Read only
Description	This attribute indicates the status of the *Oam Ethernet* port on the active CP.
Mib	OamEthernet
Values	available notAvailable
Default	No default

ATTRIBUTE Lp OamEnet standbyStatus

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the status of the *Oam Ethernet* port on the standby CP.
Mib	OamEthernet
Values	available notAvailable
Default	No default

ATTRIBUTE Lp OamEnet actualLineSpeed

Access	Read only
Description	This attribute indicates the actual line speed of the *Oam Ethernet* port.
Mib	OamEthernet
Values	Decimal (10; 100)
Units	Mbit/s
Default	No default

ATTRIBUTE Lp OamEnet actualDuplexMode

Access	Read only
Description	This attribute indicates the actual duplex mode of operation, half, or full.
Mib	OamEthernet
Values	half full
Default	No default

GROUP Lp OamEnet OamEnetStatistics (OamEnetStats)

Properties	Operational
Description	This group contains statistical attributes for the *OamEthernet* component.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet clearToSendSignalLoss

Access	Read only
Description	This attribute counts how often the clear to send signal was lost when attempting to transmit a frame. This counter wraps to zero when it exceeds its maximum value. This attribute is only active if the *extendedStatistics* attribute is enabled.
Mib	OamEthernet
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp OamEnet frameTooShort

Access	Read only
Description	This attribute counts the frames received whose length is less than the allowed minimum frame length. This counter wraps to zero when it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet numberOfRxCollisions

Access	Read only
Description	This attribute counts the collisions detected during reception. This counter wraps to zero when it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet lackOfResourcesDiscards

Access	Read only
Description	This attribute counts the good frames discarded because of a lack of resources available to contain them on the system. This counter wraps to zero when it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet overrunErrors

Access	Read only
Description	This attribute counts the frames known to be lost because the local system bus was not available. This counter wraps to zero when it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp OamEnet Statistics (Stats)

Properties	Operational
Description	This group contains statistical attributes for the *Ethernet* component.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet alignmentErrors

Access	Read only
Description	The *alignmentErrors* counter indicates the number of frames received which were not an integral number of octets in length. Frames will be checked for *alignmentErrors* before they are checked for Frame Check Sequence (FCS) errors. If there is an alignment error, the error will only be counted here and not in *fcsErrors*. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet fcsErrors

Access	Read only
Description	The *fcsErrors*, Frame Check Sequence (FCS) error, counter indicates the number of frames received which were an integral number of octets in length and did not pass the FCS check. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet singleCollisionFrames

Access	Read only
Description	The *singleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced exactly one collision. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet multipleCollisionFrames

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The *multipleCollisionFrames* counter indicates the number of frames successfully transmitted which experienced more than one collision. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet sqeTestErrors

Access	Read only
Description	The *sqeTestErrors*, Signal Quality Error (SQE) Test errors, counter indicates the number of times the “SQE Test Error” message has been generated for the station. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet deferredTransmissions

Access	Read only
Description	The *deferredTransmissions* counter indicates the number of frames which experienced a transmission delay because the medium was busy. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet lateCollisions

Access	Read only
Description	The *lateCollisions* counter indicates the number of times a collision was detected later than 512 bit-times into the transmission of a packet. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet excessiveCollisions

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The *excessiveCollisions* counter indicates the number of frames which failed to get transmitted due to excessive collisions. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet macTransmitErrors

Access	Read only
Description	The Medium Access Controller (MAC) transmit error counter indicates the number of times that a transmission failed due to internal MAC transmit errors. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet carrierSenseErrors

Access	Read only
Description	The carrier sense error counter indicates the number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet frameTooLongs

Access	Read only
Description	The frame too long counter indicates the number of frames received which exceeded the maximum frame size. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp OamEnet macReceiveErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The Medium Access Controller (MAC) receive error counter indicates the number of times a receive failed due to internal MAC receive errors. This counter wraps around after it exceeds its maximum value.
Mib	OamEthernet
Values	Decimal (0..4294967295)
Default	No default

Description	Lp/0 OamEthernet Test The *Test* component appears only for 10BaseT OAM Ethernet ports on the CP. It is used to run the port test for the OAM Ethernet port.
Mib	OamEthernet
Common Verbs	Help List Display

VERB Start Lp OamEnet Test

Impact	System_admin
Description	This verb is used to start a port test on the OAM Ethernet port as per the configuration of the *Test* component's attributes. If the port is not in the locked state when the *Start* command is issued it will automatically be locked by the *Test* component before the tests are run.

GROUP Lp OamEnet Test Operational (Oper)

Properties	Operational
Description	This group contains the operational data for the Test component.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet Test type

Access	Read: System_admin Write: System_admin
Description	This attribute is the type of test to be run. The four types of tests available are: the port hardware logic test, the configure and dump memory registers test, the memory mapping test and the Time Domain Reflectometry (TDR) test. The possible values of this attribute are: ***hardwareLogic***: this test checks the port hardware controller for logic errors in some of the on-chip counters and shift registers. ***configuration***: this test configures the memory registers of the hardware controller in a predetermined way and then dumps the registers and checks their contents for errors. ***memoryMap***: this test does an extensive test of the memory structures used by the OAM Ethernet port to verify that they are configured correctly and are error-free. ***tdr***: this test is used to detect and locate cable faults caused by either a short or an open circuit on the coaxial cable.

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP Lp OamEnet Test Results

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	OamEthernet

ATTRIBUTE Lp OamEnet Test causeOfTermination

Access	Read only
Description	This attribute records the reason why the test terminated. The possible values of this attribute are: ***testTimeExpired***: this value indicates the time allotted for the test to run has expired which caused the test terminate. If the port is locked without the forever option then it will remain locked for only five minutes before being automatically unlocked. If the port unlocks itself after five minutes while the test is running then this attribute will be set to ***testTimeExpired***. If the forever option is used then the test will run until completion, failure, or a *Stop* command. ***stoppedByOperator***: this value indicates that the test was terminated when an operator issued a *Stop* command. ***unknown***: this value indicates that the test terminated for an unknown reason. ***neverStarted***: this value indicates that the test never started because the port could not be locked or because there is a hardware failure preventing the tests from running. ***testRunning***: this value indicates that the test is currently running. ***testComplete***: this value indicates that the test completed normally.

Description

This group contains all of the provisioning data for an *EDS1* component.

Mib ExternalTimingDS1

ATTRIBUTE Lp EDS1 lineType (lineType)

Access Read and write

Description

This attribute defines the framing format of the DS1 line. The option ***d4*** defines a framing pattern of 12 frames per multiframe. The option ***esf*** defines a framing pattern of 24 frames per multiframe. The default option ***esf*** is permitted.

Mib ExternalTimingDS1

Values
d4
esf

Default esf

ATTRIBUTE Lp EDS1 ssmRxDefault

Access Read and write

Description

This attribute specifies the Synchronization Status Message (SSM) reported to the *NS* component.
If this attribute is set to ***none***, the SSM value received and decoded from the Extended Superframe Format (ESF) data link will be reported to the *NS* component. Note that the SSM messages can not be decoded when *lineType* is set to ***d4*** and in this case this attribute can not be set to ***none*** and the recommended value for this attribute is ***4***.
If this attribute is set to a valid SSM value then this value will be reported to *NS* component, regardless of the SSM value received and decoded from the ESF data link.
The valid SSM values are specified in the ANSI T1.403, bits 30-17:
2 (000010) - Stratum 1 Traceable
4 (000100) - Synchronized, Traceability Unknown
6 (000110) - Stratum 2 Traceable
8 (001000) - Stratum 3 Traceable
17 (010001) - SONET Minimum Clock Traceable
20 (010100) - Stratum 4 Traceable
24 (011000) - Do not use for Synchronization
32 (100000) - Reserved for Network synchronization
60 (111100) - Transmit Node Clock
62 (111110) - Stratum 3E Traceable

GROUP Lp EDS1 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	ExternalTimingDS1

ATTRIBUTE Lp EDS1 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	ExternalTimingDS1
Values	up down testing
Default	up

GROUP Lp EDS1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	ExternalTimingDS1

ATTRIBUTE Lp EDS1 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — ExternalTimingDS1

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp EDS1 operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — ExternalTimingDS1

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Lp EDS1 usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	ExternalTimingDS1
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp EDS1 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

Copyright © 2006, Nortel Nortel Confidential

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	ExternalTimingDS1
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp EDS1 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Lp EDS1 controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: ExternalTimingDS1

subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

ATTRIBUTE Lp EDS1 alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — ExternalTimingDS1

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Lp EDS1 standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Default false

GROUP Lp EDS1 Operational (Oper)

Properties Operational

Description

This group contains the common operational data for *EE1* and *EDS1* components.

Mib ExternalTimingDS1

ATTRIBUTE Lp EDS1 losAlarm (losAlarm)

Access Read only

Description

This attribute indicates whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been observed and accumulated for a period of 2 seconds +/- 0.5 second . A LOS defect is detected upon observing all zeros for 150 ms . If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** until the LOS alarm

Copyright © 2006, Nortel Nortel Confidential

state is cleared. The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 second.

Mib ExternalTimingDS1

Values
on
off

Default off

ATTRIBUTE Lp EDS1 lofAlarm (lofAlarm)

Access Read only

Description

This attribute indicates whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 second . If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 second.

Mib ExternalTimingDS1

Values
on
off

Default off

ATTRIBUTE Lp EDS1 rxAisAlarm (rxAisAlarm)

Access Read only

Description

This attribute indicates whether an AIS (Alarm Indication Signal) alarm has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 second. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period. If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurement based on a 200 ms polling cycle. The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state. The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 second.

ATTRIBUTE Lp EDS1 levelAlarm (level)

Access	Read only
Description	This attribute indicates the levelof EDS1/EE1 support present on the active CP and standby CP. The Level alarm is declared if the active CP or the standby CP cannot support the EDS1/EE1 functionality and EDS1 or EE1 port is provisioned. The EDS1/EE1 port goes into an operational state of ***disabled*** when the active CP hw does not support EDS1/EE1 functionality and it goes into an operational state of ***degraded*** when the standby CP hw does not support EDS1/EE1 functionality.
Mib	ExternalTimingDS1
Values	on off
Default	off

ATTRIBUTE Lp EDS1 ssmRx (ssmRx)

Access	Read only
Description	This attribute indicates the current Synchronization Status Message (SSM) received on the *EE1* or *EDS1* port or the *ssmRxDefault* value if no valid SSM was received. The *EE1* SSM is received on the E1 Sa Bits, and the possible values are [0..15]. The *EDS1* SSM is received on the Extended Superframe Format (ESF) data link, bits 17 - 30, and the valid values are [2,4,6,8,17,20,24,32,60,62].

GROUP Lp EE1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	ExternalTimingE1

ATTRIBUTE Lp EE1 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	ExternalTimingE1
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp EE1 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: ExternalTimingE1

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp EE1 usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: ExternalTimingE1

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Lp EE1 availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

Copyright © 2006, Nortel Nortel Confidential

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Default	No default

ATTRIBUTE Lp Pcusp standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	Pcusp
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Pcusp unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Pcusp
Values	false true
Default	false

component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — Pcusp

ATTRIBUTE Lp Pcusp PModule adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Pcusp

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Lp Pcusp PModule operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Pcusp

Values — enabled (ena)
disabled (dis)

Default — disabled

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Pcusp
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp Pcusp Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include

Copyright © 2006, Nortel Nortel Confidential

the following:
card test sets up an internal loop on the board and runs a bit error rate test.
manual test assumes the line is looped back externally and a bit error rate test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

pathBIP2Error

Default: card

ATTRIBUTE Lp Pcusp Test frmSize (size)

Access: Read and write

Description:

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Copyright © 2006, Nortel Nortel Confidential

Mib	Pcusp
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Lp Pcusp Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Pcusp
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Pcusp Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Pcusp
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Pcusp Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.

Copyright © 2006, Nortel Nortel Confidential

Mib	Pcusp
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Lp Pcusp Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Pcusp
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Pcusp Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Pcusp
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Pcusp Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Pcusp

ATTRIBUTE Lp Pcusp Test causeOfTermination

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback. a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback. a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered. Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

ATTRIBUTE Lp Pcusp Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusp
Values	Long Integer
Default	No default

ATTRIBUTE Lp Pcusp Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Pcusp
Values	Long Integer
Default	No default

ATTRIBUTE Lp Pcusp Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Pcusp
Values	Long Integer
Default	No default

ATTRIBUTE Lp Pcusp Test bitErrorRate

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Pcusp
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Pcusp Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	Pcusp
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Pcusp Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Pcusp
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

Access	Read and write
Description	This attribute specifies the link to the *Framer* component using the *Mlfr component*. An example is *Framer/3*.
Mib	Mlfr
Values	Link (Service, interfaceName)
Default	No default

ATTRIBUTE Lp Mlfr activationClass (actClass)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the conditions under which the bundle is activated. There are four classes of activation: ***class A***: One or more bundle links are up. ***class B***: All bundle links are up. ***class C***: A minimum threshold is provisioned. The threshold represents the minimum number of bundle links that must up.
Mib	Mlfr
Values	classA classB classC
Default	classA

ATTRIBUTE Lp Mlfr activationThreshold (thresh)

Access	Read and write
Description	This attribute specifies the minimum number of links that must be up before the bundle will be up. The value of this attribute is only used when the *activationClass* attribute is set to ***classC***.
Mib	Mlfr
Values	Decimal (1..28)
Default	1

ATTRIBUTE Lp Mlfr maxDiffDelay (delay)

Access	Read and write
Description	This attribute specifies the maximum acceptable round-trip differential delay between links in the MLFR bundle. An alarm is generated for links violating the maximum differential delay. Such links are not allowed to remain up.
Mib	Mlfr
Values	Decimal (20..600)
Units	msec
Default	132

ATTRIBUTE Lp Mlfr helloTimer (hello)

Access	Read and write
Description	This attribute specifies the amount of time between consecutive HELLO messages, sent on each link that is up.
Mib	Mlfr
Values	Decimal (1..180)
Units	seconds

Copyright © 2006, Nortel Nortel Confidential

Default	10

ATTRIBUTE Lp Mlfr ackTimer (ack)

Access	Read and write
Description	This attribute specifies the maximum time period to wait for an ADD_LINK_ACK, HELLO_ACK, or REMOVE_LINK_ACK message. If *ackTimer* expires before a bundle link endpoint receives a HELLO_ACK or ADD_LINK_ACK message, then every *ackTimer* seconds a HELLO message is sent and every (*maxRetries* + 1) **ackTimer* seconds an ADD_LINK message is sent. If *ackTimer* expires before a bundle link endpoint receives a REMOVE_LINK_ACK message, then every *ackTimer* seconds a HELLO message is sent and after (*maxRetries* + 1) **ackTimer* seconds the bundle link enters in idle state.
Mib	Mlfr
Values	Decimal (1..10)
Units	seconds
Default	4

ATTRIBUTE Lp Mlfr maxRetries (retries)

Access	Read and write
Description	This attribute specifies the maximum number of retransmission attempts for consecutive HELLO or REMOVE_LINK messages following the expiration of *ackTimer*.
Mib	Mlfr
Values	Decimal (1..5)
Default	2

ATTRIBUTE Lp Mlfr fragmenting (frag)

Access	Read and write
Description	This attribute specifies whether fragmentation of transmitted frames is permitted. If the value is ***enabled***, frames which are at least *fragmentingThreshold* octets in length are divided into fragments which are at most *fragmentSize* octets long. The value enabled may be used only if the remote end can accept fragmented frames. If the value is ***disabled***, frames are always transmitted without fragmentation. Fragmentation of received frames is always acceptable, regardless of the value of this attribute.
Mib	Mlfr
Values	enabled disabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Mlfr fragmentSize (fragSize)

Access	Read and write
Description	This attribute specifies the fragment size. A frame is divided in data fragments which are sent over different links in a bundle. The fragment size is configured in the transmitter, and two peer transmitters need not use the same fragment size. The value of this attribute is only used when the *fragmenting* attribute is set to ***enabled***.
Mib	Mlfr
Values	Decimal (10..8000)
Units	octets
Default	128

ATTRIBUTE Lp Mlfr fragmentingThreshold (fragTresh)

Access	Read and write
Description	This attribute specifies the minimum size a frame must have in order to be fragmented. The value of this attribute is only used when the *fragmenting* attribute is set to ***enabled***. Frames smaller than this size will not be fragmented. The *fragmentingThreshold* value must be bigger or equal to *fragmentSize* value.
Mib	Mlfr
Values	Decimal (10..8000)
Units	octets
Default	192

ATTRIBUTE Lp Mlfr resequenceTimer (reseqTim)

Access	Read and write
Description	This attribute specifies the interval of time to wait for receiving out-of-order fragments and frames.
Mib	Mlfr
Values	Decimal (20..132)
Units	msec
Default	50

GROUP Lp Mlfr Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Mlfr* component.
Mib	Mlfr

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Mlfr remoteName (remName)

Access	Read only
Description	This attribute indicates the name of the remote bundle, as it was received from the *Link* component.
Mib	Mlfr
Values	String (1..49, ASCII)
Default	No default

GROUP Lp Mlfr Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Mlfr* component.
Mib	Mlfr

ATTRIBUTE Lp Mlfr runningTime (running)

Access	Read only
Description	This attribute counts the length of time for which the *Mlfr* component has been in the ***unlocked*** state or has been used for operational testing. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Lp Mlfr unavailSec (unavail)

Access	Read only
Description	This attribute counts the length of time for which the *Mlfr* component has been ***unlocked*** and ***disabled***. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Lp Mlfr resequenceErrors (reseqErr)

Access	Read only
Description	This attribute counts the resequencing errors. These are the errors caused by lost or duplicated frames or data fragments. When the maximum count

Copyright © 2006, Nortel Nortel Confidential

	is exceeded, the count wraps to zero. For example, sequence number 56, 59 and 60 are received for DLCI 100. It is decided by some means that sequence 57 and 58 are lost. This counter would then be incremented by one, even though two frames were lost.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Mlfr discardedFrames (discFrames)

Access	Read only
Description	This attribute counts frames and fragments discarded by the receiver bundle due to re sequencing errors. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

GROUP Lp Mlfr CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Mlfr

ATTRIBUTE Lp Mlfr customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Copyright © 2006, Nortel Nortel Confidential

Mib	Mlfr
Values	Decimal (0; 1..8191)
Default	0

GROUP Lp Mlfr OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Mlfr

ATTRIBUTE Lp Mlfr adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Mlfr
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Mlfr operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	Mlfr
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Mlfr usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Mlfr
Values	idle active (activ) busy
Default	idle

Mib	Mlfr
Common Verbs	Help List Display Add DELete

GROUP Lp Mlfr Lk Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Link* subcomponent.
Mib	Mlfr

ATTRIBUTE Lp Mlfr Lk interfaceName

Access	Read and write
Criticality	Component
Description	This attribute specifies the *Link* subcomponent associated with a specific interface on a function processor, for example: *Lp/5 Ds3/0 Ds1/3 Chan/0*. The following checks are performed: 1. The *Link*'s *interfaceName* must link to a *DS1 Channel/0* component on the same *Lp* as the *Mlfr* component. 2. All the *Link*s of the same *Mlfr* component must be bound to *DS1 Channel/0* components under the same *DS3*. 3. All the *Link*s of the same *Mlfr* component must be bound to *DS1 Channel/0* components having the same value for *timeslotDataRate*. 4. All the 24 timeslots of the *DS1 Channel/0* component must be provisioned.
Mib	Mlfr
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP Lp Mlfr Lk Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Link* subcomponent.
Mib	Mlfr

ATTRIBUTE Lp Mlfr Lk errorCause (cause)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the error cause on the near end of this link. Possible values are: ***noError***: there is no error on the near end of this link. ***inconsistentBundle***: Possible configuration mismatch detected for the remote name of the MLFR bundle. ***unknownVendor***: Unrecognized Organizationally Unique Identifier (OUI) received. ***linkIdle***: The link is not *operational*. ***linkDown***: The link physical layer is *down*. ***diffDelay***: The link differential delay exceeds the maximum allowed. ***loopbackDetected***: The link has detected a potential loopback condition. ***unexpectedAddLink***: An ADD_LINK message was received when the link was up.
Mib	Mlfr
Values	noError inconsistentBundle unknownVendor linkIdle linkDown diffDelay loopbackDetected other unexpectedAddLink
Default	No default

ATTRIBUTE Lp Mlfr Lk remoteCause (remCause)

Access	Read only
Description	This attribute indicates the error cause on the far end of his link. Possible values are: ***noError***: there is no error on the far end of this link. ***inconsistentBundle***: Possible configuration mismatch detected for the remote name of the MLFR bundle. ***unknownVendor***: Unrecognized Organizationally Unique Identifier (OUI) received. ***linkIdle***: The link is not *operational*. ***linkDown***: The link physical layer is *down*. ***diffDelay***: The link differential delay exceeds the maximum allowed. ***loopbackDetected***: The link has detected a potential loopback condition. ***unexpectedAddLink***: An ADD_LINK message was received when the link was up. ***“”***: No error cause was received yet from the far end.
Mib	Mlfr
Values	noError inconsistentBundle unknownVendor linkIdle

Copyright © 2006, Nortel Nortel Confidential

	linkDown diffDelay loopbackDetected other unexpectedAddLink
Default	No default

ATTRIBUTE Lp Mlfr Lk remoteName (remName)

Access	Read only
Description	This attribute indicates the name of the remote link.
Mib	Mlfr
Values	String (1..49, ASCII)
Default	No default

ATTRIBUTE Lp Mlfr Lk diffDelay (diff)

Access	Read only
Description	This attribute indicates the differential delay between this link and the link, in the same MLFR bundle, having the least delay. The value ***notMeasured*** means that the relative delay could not be measured. This can be due to physical layer problems or to no MLFR Link Integrity Protocol (LIP) messages being received on the link.
Mib	Mlfr
Values	Decimal (0..4294967294) notMeasured
Units	msec
Default	No default

GROUP Lp Mlfr Lk Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Link* subcomponent.
Mib	Mlfr

ATTRIBUTE Lp Mlfr Lk runningTime (running)

Access	Read only
Description	This attribute counts the length of time for which the *Link* component has been in the *unlocked* state or has been used for operational testing. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Lp Mlfr Lk unavailSec (unavail)

Access	Read only
Description	This attribute counts the length of time for which the *Link* component has been ***unlocked*** and out of service. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Units	seconds
Default	No default

ATTRIBUTE Lp Mlfr Lk failures (fail)

Access	Read only
Description	This attribute counts the number of failures that the *Link* component has experienced since being created. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Mlfr Lk framesLipTx (lipTx)

Access	Read only
Description	This attribute counts the number of Link Integrity Protocol (LIP) frames sent on the link. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Mlfr Lk framesLipRx (lipRx)

Access	Read only
Description	This attribute counts the number of LIP frames received on the link. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Mlfr Lk framesLipInvalid (lipInv)

Access	Read only
Description	This attribute counts the number of invalid LIP frames received on the link. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Mlfr Lk timerExpired (timExp)

Access	Read only
Description	This attribute counts the number of times the HELLO or ACK timers expired. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Mlfr Lk loopback (loop)

Access	Read only
Description	This attribute counts the number of times a loopback has been suspected on the link. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Mlfr Lk mismatch (mis)

Access	Read only
Description	This attributes counts the number of times far end bundle name doesn't correspond to *remoteName* for *Mlfr* component. When the maximum count is exceeded, the count wraps to zero.
Mib	Mlfr
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Ap operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	AdjunctProcessor
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Ap usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	AdjunctProcessor
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Ap availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Ap proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Lp Ap controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	AdjunctProcessor
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp Ap alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	AdjunctProcessor
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp Ap standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE Lp Ap RncAp processorRole (role)

Access	Read only
Description	This attribute indicates the functional behavior of the Adjunct Processor. Possible values are: - ***none*** indicates that this Adjunct Processor has not been assigned a role yet. This value is only attained when the Adjunct Processor is disabled or just after it has become enabled. Within a few minutes at most, the role will take on one of the 4 pending values, and quickly change the corresponding permanent value. - ***protocolConverterPending*** indicates that initialization of the Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of protocolConverter. - ***radioAccessBearerPending*** indicates that initialization of the Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of radioAccessBearer. - ***activeMasterPending*** indicates that initialization of the Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of activeMaster. - ***standbyMasterPending*** indicates that initialization of the Adjunct Processor is still in progress. Once initialization is complete, the role will take on the value of standbyMaster. - ***protocolConverter*** indicates that this Adjunct Processor is responsible for converting packets to and from AAL2 for Iub and IuCS. - ***radioAccessBearer*** indicates that this Adjunct Processor is responsible for supporting all radio protocols. - ***activeMaster*** indicates that this Adjunct Processor handles all shelf-wide Packet Server support. - ***standbyMaster*** indicates that this Adjunct Processor is a spare for the activeMaster. - ***activeNetworkInterfacePending*** indicates that the initialization of this Adjunct Processor is still in progress, once the initialization is completed, this processor will be the active Network Interface. - ***standbyNetworkInterfacePending*** indicates that the initialization of this

COMPONENT Lp NetworkProcessingUnit (Npu)

Groups	GROUP Lp Npu Provisioned (Prov)
Scope	Device
Description	*Lp NetworkProcessingUnit* (*Npu*) This component contains the attributes that are associated with the NetworkProcessingUnit (NPU) device on board a Generic Queue Manager (GQM) based card. The NPU is a specialized device that can process data packets at a high data rate. This component is allowed and is mandatory only for the following card types: ***16pOC3PosAtm*** This component must not be used with other card types which do not allow the provisioning of an *Npu* component.
Mib	NetworkProcessingUnit
Common Verbs	Help List Display Add DELete

GROUP Lp Npu Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Npu* component.
Mib	NetworkProcessingUnit

ATTRIBUTE Lp Npu serviceBundleName (sbn)

Access	Read and write
Description	This attribute specifies the name of the service bundle to be used for a ***16pOC3PosAtm*** card. The ***16pOC3PosAtm*** card is the only card that requires the provisioning of the *Npu* component which contains this attribute. For a ***16pOC3PosAtm*** card, this attribute must be set to one of the followings: ***allServices*** ***mplsAtmIp*** ***porsAtmIp*** Both the ***mplsAtmIp*** and ***porsAtmIp*** bundles have support for the ***atmCore***, ***ip***, and ***atmTrunks*** features. Service bundle ***mplsAtmIp***, in addition, supports all the MPLS related features including ***mplsLdp***, ***mplsRsvpTe***, ***mplsStaticLsp***, ***mplsTeEmulation***, ***l2vpnAtmAccessFpSp*** and ***rfc2547bis***. This service bundle does not support the ***porsTrunk*** feature. Service bundle ***porsAtmIp***, in addition, supports the ***porsTrunk*** feature. This service bundle does not support any of the MPLS features. Service bundle ***allServices*** has no feature support restrictions. It supports

Copyright © 2006, Nortel Nortel Confidential

all the services that run on the card. This service bundle cannot be used with cards whose product code start with NTHW44. Because ***allServices*** has support for all the services that run on the card, it is the service bundle of choice for the ***16pOC3PosAtm*** cards whose product code do not start with NTHW44. However, one of ***mplsAtmIp*** or ***porsAtmIp*** must be used on a card if there is a need to have it interchangeable with a card having product code NTHW44.
The *serviceBundleName* attribute has a default setting of ***serviceBundleNotDefined***. The user must change this setting to a valid service bundle that is appropriate for the card and can support the features in the *Sw Lpt featurelist* attribute.
A change to the ***serviceBundleName*** attribute is a critical change to the *Lp* component only on cards whose product code start with NTHW44.

Mib	NetworkProcessingUnit
Values	serviceBundleNotDefined allServices mplsAtmIp porsAtmIp
Default	serviceBundleNotDefined

COMPONENT Lp Sets

Instance	Decimal (0..1)
Groups	GROUP Lp Sets Provisioned (Prov) GROUP Lp Sets OperationalStatus (OperStatus) GROUP Lp Sets OsiState (State) GROUP Lp Sets SetsOperational (SetsOper)
Scope	Application
Description	*Lp/0 sets/n* The Sync Equipment Timing Source (*Sets)* component controls an the E1 external timing port on a ***CP***. The port provides timing towards a 2 MHz (2 Mbit/s) station clock output signal. The *Sets* componentcan only be added under the *LP/0* component and only if the CP type is ***CP***.
Mib	ExternalTimingE1
Common Verbs	Help List Display Add DELete LOCK Unlock

Copyright © 2006, Nortel Nortel Confidential

GROUP Lp Sets Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisioning data for a *Sets* component.
Mib	ExternalTimingE1

ATTRIBUTE Lp Sets txSynchClk

Access	Read and write
Description	This attribute specifies if the *Sets* port is transmitting a 2.048 MHz square wave synchronization (analog) clock or a E1 data frame signal as output. A value of ***squareWave*** indicates that the analog clock is transmitted. A value of ***e1Signal*** indicates the E1 data frame signal is transmitted.
Mib	ExternalTimingE1
Values	e1Signal squareWave
Default	e1Signal

ATTRIBUTE Lp Sets ssmE1SaNumber (ssmSa)

Access	Read and write
Description	This attribute specifies which of the five available Sa bits (Sa4 to Sa8) recommended in ITU G.704 are to be used for sending the Synchronization Status Messages (SSM). If set to ***none***, the transmission of SSM is disabled on this port.
Mib	ExternalTimingE1
Values	Decimal (4..8) none
Default	none

GROUP Lp Sets OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	ExternalTimingE1

ATTRIBUTE Lp Sets snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates

Copyright © 2006, Nortel Nortel Confidential

the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Mib ExternalTimingE1

Values
up
down
testing

Default up

GROUP Lp Sets OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib ExternalTimingE1

ATTRIBUTE Lp Sets adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib ExternalTimingE1

Values
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Sets operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	ExternalTimingE1
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Sets usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	ExternalTimingE1
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Sets availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Sets proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Lp Sets controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	ExternalTimingE1
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp Sets alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	ExternalTimingE1
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp Sets standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

GROUP Lp Eth CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Ethernet

ATTRIBUTE Lp Eth customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Ethernet

Description	Any miscellaneous text about the facility.
Mib	Ethernet
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Lp Eth includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	Ethernet
Values	no yes
Default	no

GROUP Lp Eth IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	Ethernet

ATTRIBUTE Lp Eth ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	Ethernet
Values	up down testing
Default	up

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Eth ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	Ethernet
Values	Decimal (1..65535)
Default	No default

GROUP Lp Eth OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Ethernet

ATTRIBUTE Lp Eth snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Ethernet
Values	up down testing
Default	up

GROUP Lp Eth OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ethernet

ATTRIBUTE Lp Eth adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ethernet
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Eth operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ethernet
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Eth usageState (osiUsage)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Ethernet
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Eth availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Ethernet
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Lp Eth proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal

Copyright © 2006, Nortel Nortel Confidential

functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — Ethernet

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE Lp Eth controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib	Ethernet
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Lp Eth alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Ethernet
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Lp Eth standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	Ethernet
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Lp Eth unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Ethernet
Values	false true
Default	false

GROUP Lp Eth Operational (Oper)

Properties	Operational
Description	This group contains the operational data for an *Ethernet* component.
Mib	Ethernet

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Eth failureCause

Access	Read only
Description	This attribute indicates the failure cause of an Ethernet port. The port enters a failed state after the condition has been observed for a period of 2.5 seconds +/-0.5 seconds. The port comes out of the failed state when the condition has been cleared for a period of 10 seconds +/- 0.5 seconds. The attribute is set to one of the following values while the OSI *availabilityStatus* attribute is set to ***failed***: ***lossOfSync***: Port synchronization cannot be achieved. ***remoteOffline***: The far end is offline. ***remoteLinkFailure***: The far end has detected a link failure. ***autoNegError***: The far end does not support a compatible set of auto-negotiation capabilities, or auto-negotiation has failed. ***noFailure***: There is no failure.
Mib	Ethernet
Values	lossOfSync remoteLinkFailure remoteOffline autoNegError noFailure
Default	noFailure

ATTRIBUTE Lp Eth autoNegStatus

Access	Read only
Description	This attribute indicates the status of the Ethernet port auto-negotiation. The possible values are: ***succeeded***: Auto-negotiation has completed successfully. ***failed***: Auto-negotiation has failed to mediate a compatible set of capabilities. ***inProgress***: Auto-negotiation is currently in progress. ***disabled****:* The far end does not support auto-negotiation.
Mib	Ethernet
Values	succeeded failed inProgress disabled

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp Eth actualLineSpeed

Access	Read only
Description	This attribute indicates the line speed of the Ethernet port.
Mib	Ethernet
Values	Decimal (10; 100; 1000)
Units	Mbit/s
Default	No default

ATTRIBUTE Lp Eth actualDuplexMode

Access	Read only
Description	This attribute indicates the duplex mode of the ethernet port.
Mib	Ethernet
Values	unknown half full
Default	No default

GROUP Lp Eth Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for an *Ethernet* component. Each attribute is a positive integer that monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	Ethernet

ATTRIBUTE Lp Eth framesTransmittedOk (frmTxOk)

Access	Read only
Description	This attribute counts the frames that were transmitted without error.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth framesReceivedOk (frmRxOk)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the frames that were received without error.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth octetsTransmittedOk (octTxOk)

Access	Read only
Description	This attribute counts the octets that were transmitted without error. The count includes data, padding octets, destination address (DA), source address (SA), length field, and frame check sequence (FCS), but excludes preamble and source field delimiter (SFD).
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth octetsReceivedOk (octRxOk)

Access	Read only
Description	This attribute counts the octets that were received without error. The count includes data, padding octets, destination address (DA), source address (SA), length field, and frame check sequence (FCS), but excludes preamble and source field delimiter (SFD). The count also excludes octets contained within received frames that are classified as being errored (fcsErrors etc.).
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth undersizeFrames

Access	Read only
Description	This attribute counts the discarded frames that were received with less than the minimum size (64 bytes).
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth fragments

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the discarded frames that were received with less than the minimum size (64 bytes) with a bad frame check sequence (FCS).
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth framesTooLong

Access	Read only
Description	This attribute counts the discarded frames that were received and exceeds the maximum permitted frame size. The maximum size of a frame depends on it supported encapsulated types.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth jabbers

Access	Read only
Description	This attribute counts the discarded frames that were received and exceeds the maximum permitted frame size with a bad frame check sequence (FCS). The maximum size of a frame depends on it supported encapsulated types.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth fcsErrors

Access	Read only
Description	This attribute counts the discarded received frames with an integral number of octets in length and did not pass the Frame Check Sequence (FCS). The count does not include frames received that are too long (jabbers) or too short (fragments).
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth symbolErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the discarded received frames with a valid length, but at least one data reception error or one symbol error was observed. This counter increments once per valid Carrier Event.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth pauseFramesReceived

Access	Read only
Description	This attribute counts the PAUSE Media Access Control (MAC) control frames received.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth alignmentErrors

Access	Read only
Description	This attribute counts the frames received that were not an integral number of octets in length. Frames will be checked for alignment errors before they are checked for Frame Check Sequence (FCS) errors. If there is an alignment error, the error will only be counted by the *alignmentErrors* attribute and not by the *fcsErrors* attribute.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth singleCollisionFrames

Access	Read only
Description	This attribute counts the successfully transmitted frames that experienced exactly one collision.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth multipleCollisionFrames

Access	Read only
Description	This attribute counts the successfully transmitted frames that experienced more than one collision.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth deferredTransmissions

Access	Read only
Description	This attribute counts the frames that experienced a transmission delay because the medium was busy.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth lateCollisions

Access	Read only
Description	This attribute counts the number of times a collision was detected later than 512 bit-times into the transmission of a packet.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth excessiveCollisions

Access	Read only
Description	This attribute counts the frames that failed to get transmitted due to excessive collisions.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth macTransmitErrors

Access	Read only
Description	This attribute counts the number of times that a transmission failed due to internal MAC transmit errors.
Mib	Ethernet
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Eth carrierSenseErrors

Access	Read only
Description	This attribute counts the number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth macReceiveErrors

Access	Read only
Description	This attribute counts the number of times a receive failed due to internal MAC receive errors.
Mib	Ethernet
Values	Long Integer
Default	No default

COMPONENT Lp Eth TrafficManager (Tm)

Scope	Device
Description	*Lp/x Ethernet/y Tm* This component contains the emission priority queue (*GrmEmissionPriority*), and service category (*GrmServiceCategory*) subcomponents. It provides traffic management capabilities for absolute (strict) queueing and fair-weighted queueing. This component is required for the 4pGE FP.
Mib	Ethernet
Opt. Subcomp.	COMPONENT Lp Eth Tm EmissionPriority (Ep) COMPONENT Lp Eth Tm ServiceCategory (Sc)
Common Verbs	Help List Display

COMPONENT Lp Eth Tm EmissionPriority (Ep)

Instance	Decimal (0..7)
Groups	GROUP Lp Eth Tm Ep Operational (Oper) GROUP Lp Eth Tm Ep ProvQueue (ProvQ)
Scope	Application
Description	*Lp/x Ethernet/y Tm Ep/n* This component defines the characteristics of the corresponding emission

Copyright © 2006, Nortel Nortel Confidential

priority queue for the associated physical links.

This component have instances of *Ep/0* and *Ep/1* which are absolute priority queues having precedence over queues under *Ep2* to *Ep7* components. Component *Ep/0* has the highest priority. All traffic in *Ep/0* is transmitted on the link first, then traffic from component *Ep/1* is transmitted. When all traffic at *Ep/0* and *Ep/1* have been sent, other *Ep* component queues get the opportunity to transmit with the residual bandwidth.

This component has instances from *Ep/2* to *Ep/7* that operate under the weighted fair queue strategy, with each queue using a bandwidth attribute for weight to allocate service opportunities left over by *Ep/0* and *Ep/1*.

Mib	Ethernet
Common Verbs	Help List Display

GROUP Lp Eth Tm Ep Operational (Oper)

Properties	Operational
Description	This group contains operational attributes of the *Ep* component.
Mib	Ethernet

ATTRIBUTE Lp Eth Tm Ep percentMinimumBandwidthGuarantee (pMinBw)

Access	Read only
Description	This attribute indicates the weight as a percentage of the link residual bandwidth available to this queue.
Mib	Ethernet
Values	Decimal (0.00..100.00) abs
Units	%
Default	No default

ATTRIBUTE Lp Eth Tm Ep minimumBandwidthGuaranteeOp (minBwOp)

Access	Read only
Description	This attribute indicates the minimum bandwidth guaranteed for this queue.
Mib	Ethernet
Values	Decimal (0.00..100.00) abs
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Eth Tm Ep congestionState (cs)

Access	Read only
Description	This attribute indicates the congestion control discard priority (CCDP) of traffic destined for each of the 8 queues (*Ep/0* to *Ep/7*). There are 4 discard priorities (***ccdp0*** to ***ccdp3*** corresponding to values 0 to 3, respectively) with ***ccdp0*** traffic being the most sensitive to loss. For example, when the count of cell blocks currently in the queue is greater than the ***ccdp0*** discard threshold, the hardware device discards the arriving ***ccdp0*** traffic.
Mib	Ethernet
Values	ccdp0 ccdp1 ccdp2 ccdp3
Default	No default

ATTRIBUTE Lp Eth Tm Ep txQueueSizeOp (qsOp)

Access	Read only
Description	This attribute indicates the queue size associated with the queue for buffering traffic.
Mib	Ethernet
Values	Decimal (0..7168000)
Units	bytes
Default	No default

ATTRIBUTE Lp Eth Tm Ep txQueueUsage (qu)

Access	Read only
Description	This attribute indicates the current usage of the queue as a percentage of the total queue bandwidth.
Mib	Ethernet
Values	Decimal (0.00..100.00)
Units	%
Default	No default

ATTRIBUTE Lp Eth Tm Ep txQueueMin (qmin)

Access	Read only
Description	This attribute indicates the lowest count of bytes allocated to traffic in the queue.
Mib	Ethernet

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..7168000)
Units	bytes
Default	No default

ATTRIBUTE Lp Eth Tm Ep txQueueMax (qmax)

Access	Read only
Description	This attribute indicates the largest count of bytes allocated to traffic in the queue.
Mib	Ethernet
Values	Decimal (0..7168000)
Units	bytes
Default	No default

GROUP Lp Eth Tm Ep ProvQueue (ProvQ)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Ep* component.
Mib	Ethernet

ATTRIBUTE Lp Eth Tm Ep redMode (red)

Access	Read and write
Description	This attribute specifies whether random early packet discard is set to a value of either ***disable*** or ***enable*** for the queue. It serves as an early warning of congestion with the occasional packet being discarded when the queue begins to be congested, but it is not a congestion control mechanism in itself. No frame is randomly discarded if this attribute is set to ***disable***. If it is set to ***enable***, only the frames whose red bit is set are targeted to be randomly discarded. In PCR5.1, the upstream device sets the red bit of every frame so that random eary discard is controlled by the setting of this attribute. The default is ***disable***.
Mib	Ethernet
Values	disable enable
Default	disable

ATTRIBUTE Lp Eth Tm Ep txQueueSize (qs)

Access	Read and write
Description	This attribute specifies the maximum size of the link associated with the queue for buffering traffic. For the 4pGE card, each of the port's 8 *Ep/x* queues have a maximum

Copyright © 2006, Nortel Nortel Confidential

queue size for its *txQueueSize* attribute. The maximum queue sizes are 500K, 500K, 500K, 500K, 7M, 4.2M, 3M, and 2.2M for each *Ep/0, Ep/1, Ep/2, Ep/3, Ep/4, Ep/5, Ep/6* and *Ep/7* components, respectively. The default values are 100K, 300K, 300K, 300K, 7M, 4.2M, 3M, and 2.2M for each of *Ep/0, Ep/1, Ep/2, Ep/3, Ep/4, Ep/5, Ep/6* and *Ep/7* components, respectively. The autoConfig sets the *txQueueSize* to the default value corresponding to the component instance.

Mib	Ethernet
Values	Decimal (0..7168000) autoConfig
Units	bytes
Default	autoConfig

ATTRIBUTE Lp Eth Tm Ep minimumBandwidthGuarantee (minBw)

Access	Read and write
Description	This attribute specifies the weight available to this queue. It determines the relative amount of residual bandwidth left by components *Ep/0* and *Ep/1* that is allocated to this queue. The amount of bandwidth allocated is the weight of this queue divided by the sum of the weights of components *Ep/2* through *Ep/7* multiplied against the residual bandwidth. For example, if the weight of this queue divided by the sum of the weights from *Ep/2* through *Ep/7* is 2%, and 80% of the link bandwidth is left after *Ep/0* and *Ep/1* traffic is sent, then the amount of bandwidth available to this *Ep* queue is 2% of 80% (or 1.6%) of the link bandwidth. The default weight values are 50, 25, 10, 7, 5, 3 assigned to components *Ep/2, Ep/3, Ep/4, Ep/5, Ep/6*, and *Ep/7*, respectively.
Mib	Ethernet
Values	Decimal (0.00..100.00) autoConfig
Default	autoConfig

GROUP Lp Eth Om OsiState (State)

Properties — Operational

Description — This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — Ethernet

ATTRIBUTE Lp Eth Om adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: Ethernet

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Lp Eth Om operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: Ethernet

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Lp Eth Om usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

Mib	Ethernet
Values	idle active (activ) busy
Default	idle

GROUP Lp Eth Om Operational (Oper)

Properties	Operational
Description	This group contains the operational data for the *OpticalModule* component.
Mib	Ethernet

ATTRIBUTE Lp Eth Om insertedType

Access	Read only
Description	This attribute indicates the inserted optical module type. ***none***: This value indicates that there is no optical module inserted in the card. ***LX***: This value indicates that the optical module is a gigabit ethernet type with the following specifications: Wavelength = 1310nm, Media = Single-Mode. ***SX***: This value indicates that the optical module is a gigabit ethernet type with the following specifications: Wavelength = 850nm, Media = Multi-Mode. ***OC3SmLr***: This value indicates that the optical module is an OC3 type with the following specifications: Wavelength =1310 nm, Media = Single-Mode, Reach = 80Km (Long Reach). ***OC3SmIr***: This value indicates that the optical module is an OC3 type with the following specifications: Wavelength = 1310 nm, Media = Single-Mode, Reach = 15Km (Intermediate Reach). ***OC3MmSr***: This value indicates that the optical module is an OC3 type with the following specifications: Wavelength = 1310 nm, Media = Multi-Mode, Reach = 2Km (Short Reach). ***OC12SmLr***: This value indicates that the optical module is an OC12 type with the following specifications: Wavelength = 1310 nm, Media = Single-Mode, Reach = 80Km (Long Reach). ***OC12SmIr***: This value indicates that the optical module is an OC12 type with the following specifications: Wavelength = 1310 nm, Media = Single-Mode, Reach = 15Km (Intermediate Reach).

Copyright © 2006, Nortel Nortel Confidential

OC48SmLr: This value indicates that the optical module is an OC48 type with the following specifications: Wavelength = 1310 nm, Media = Single-Mode, Reach = 80Km (Long Reach).

OC48SmLr2: This value indicates that the optical module is an OC48 type with the following specifications: Wavelength = 1550 nm, Media = Single-Mode, Reach = 80Km (Long Reach).

OC48SmIr: This value indicates that the optical module is an OC48 type with the following specifications: Wavelength = 1310 nm, Media = Single-Mode, Reach = 15Km (Intermediate Reach).

Mib	Ethernet
Values	none LX SX OC3SmLr OC3SmIr OC3MmSr OC12SmLr OC12SmIr OC48SmLr OC48SmLr2 OC48SmIr
Default	none

ATTRIBUTE Lp Eth Om serialNumber

Access	Read only
Description	This attribute indicates the serial number of the inserted optical module.
Mib	Ethernet
Values	String (0..64, Extended ASCII)
Default	""

ATTRIBUTE Lp Eth Om failureCause

Access	Read only
Description	This attribute indicates the cause for the optical module's failure. The possible values are: ***typeMismatch***: This error indicates a mismatch between the *type* and *insertedType* attributes. ***internalError***: This error indicates an internal diagnostic failure of the optical module. ***unsupportedOm:*** This error indicates that the inserted optical module is not supported on this card.

Copyright © 2006, Nortel Nortel Confidential

absentOm: This error indicates that no optical module are currently present on this port.

noFailure: There is no failure.

Mib: Ethernet

Values:
typeMismatch
internalError
unsupportedOm
absentOm
noFailure

Default: noFailure

COMPONENT Lp Eth Test (Test)

Groups:
GROUP Lp Eth Test OsiState (State)
GROUP Lp Eth Test Setup (Setup)
GROUP Lp Eth Test Results (Results)

Scope: Application

Description:

The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.

Mib: Ethernet

Common Verbs:
Help
List
Display

VERB START Lp Eth Test

Impact: Service

Description:

This command invokes a test on the hardware component.
Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Lp Eth Test

Impact: Service

Description:

This command stops a test running on the hardware component.

GROUP Lp Eth Test OsiState (State)

Properties: Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Ethernet

ATTRIBUTE Lp Eth Test adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Ethernet
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Lp Eth Test operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Ethernet
Values	enabled (ena) disabled (dis)

Default	disabled

ATTRIBUTE Lp Eth Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Ethernet
Values	idle active (activ) busy
Default	idle

GROUP Lp Eth Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	Ethernet

ATTRIBUTE Lp Eth Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Ethernet
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Lp Eth Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate

Copyright © 2006, Nortel Nortel Confidential

test is performed.
localLoop test loops back the local modem and performs a bit error rate test.
remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

lineBIP8Error
sectionBIP8Error
pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Lp Eth Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: Ethernet

Values: Decimal (4..4096)

Copyright © 2006, Nortel Nortel Confidential

Units	bytes
Default	1024

ATTRIBUTE Lp Eth Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Ethernet
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Lp Eth Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Ethernet
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Lp Eth Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Ethernet
Values	Decimal (0..1814400)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	0

ATTRIBUTE Lp Eth Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Ethernet
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Lp Eth Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Ethernet
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Lp Eth Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Ethernet

ATTRIBUTE Lp Eth Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started.

Copyright © 2006, Nortel Nortel Confidential

a value of ***testRunning*** indicates that the test has been started.

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib	Ethernet
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning hardwareReconfigured loopCodeSyncFailed patternSyncFailed patternSyncLost
Default	neverStarted

ATTRIBUTE Lp Eth Test bitsTx

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth Test bytesTx

Access	Read only
Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	Ethernet
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Eth Test bytesRx

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Ethernet
Values	Long Integer
Default	No default

ATTRIBUTE Lp Eth Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported

Copyright © 2006, Nortel Nortel Confidential

For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09.
Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.

Mib	Ethernet
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Lp Eth Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	Ethernet
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Lp Eth Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Ethernet
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Lp LinkAggregation (Lag)

Instance	Decimal (0..7)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP Lp Lag Provisioned (Prov) GROUP Lp Lag Operational (Oper) GROUP Lp Lag Statistics (Stats) GROUP Lp Lag CustomerIdentifierData (CidData) GROUP Lp Lag OsiState (State)
Scope	Device
Description	*LinkAggregation/n* This component is used to define a link aggregation group (LAG). LAG provides the ability to aggregate Ethernet ports for greater bandwidth and resiliency. As needed, Ethernet ports with the same port speed are added to the LAG group in increments. To use LAG on a 4pGigE function processor, add a *LinkAggregation/n* component. The instance number of a LAG group is unique across the shelf.
Mib	Lag
Opt. Subcomp.	COMPONENT Lp Lag Link (Lk)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Lp Lag Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Lag* component.
Mib	Lag

ATTRIBUTE Lp Lag collectorMaxDelay (delay)

Access	Read and write
Description	This attribute specifies the timeout period, in milliseconds, for the near-end system to assume that the destination system has received or discarded all frames transmitted prior to starting the timer. This timer is used by the Marker protocol. After expiry of the timer, the near-end system will restart frame transmission on another link in the LAG.
Mib	Lag
Values	Decimal (0..656)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	10

ATTRIBUTE Lp Lag lacpMode (mode)

Access	Read and write
Description	This attribute specifies the LACP mode of the near-end system.
Mib	Lag
Values	passive active
Default	active

ATTRIBUTE Lp Lag lacpPeriod (period)

Access	Read and write
Description	This attribute specifies the timeout period for the near-end system to send and receive LACP frames. Where fast is 1second for sending and 3 seconds for receiving and slow is 30 seconds for sending and 90 seconds for receiving.
Mib	Lag
Values	fast slow
Default	fast

ATTRIBUTE Lp Lag minActiveLinks (minimumLinks)

Access	Read and write
Description	This attribute specifies the minimum number of links that must be active for the LAG to remain operational. For the 4pGigE function processor, this attribute can have a value between 1 and 4. This attribute should be set to the default value, when interoperating with third-party equipment. In addition, changing this attribute can impact the operation of the LAG.
Mib	Lag
Values	Decimal (1..31)
Default	1

ATTRIBUTE Lp Lag partnerAdminSystemId (partnerAdminId)

Access	Read and write
Description	This attribute specifies the administrative value for the far-end LAG MAC address and Key. This attribute is used when the near-end and far-end systems operate in LACP passive mode.
Mib	Lag
Values	String (6, Dashed Hex)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Lp Lag partnerAdminKey (partnerKey)

Access	Read and write
Description	This attribute specifies the administrative value for the far-end LAG MAC address and Key. This attribute is used when the near-end and far-end systems operate in LACP passive mode. This attribute must be set if *lacpMode* is set to ***active***.
Mib	Lag
Values	Decimal (0..65536)
Default	No default

ATTRIBUTE Lp Lag partnerAdminSystemPriority (partnerPriority)

Access	Read and write
Description	This attribute specifies the administrative value for the far-end LAG priority. This attribute is used when the near-end and far-end systems operate in LACP *passive* mode. This attribute must be set if *lacpMode* is set to ***active***.
Mib	Lag
Values	Decimal (1..65535)
Default	32768

ATTRIBUTE Lp Lag applicationFramerName (framer)

Access	Read and write
Description	This attribute defines the link to the *Framer* component using the *Lag* component. An example is *La/15 Framer.*
Mib	Lag
Values	Link (Service, interfaceName)
Default	No default

GROUP Lp Lag Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Lag* component.
Mib	Lag

ATTRIBUTE Lp Lag failureCause (cause)

Access	Read only
Description	This attribute indicates the cause of the current local end failure experienced by the LAG. The failure may have occurred during a start-up

Copyright © 2006, Nortel Nortel Confidential

	procedure or during normal operation. Possible values are: ***noFailure***: no local end failure. ***noGoodLinks***: no good links were available during LAG start-up or normal operation. ***badLagIdInStartup***: during start-up, different LAG identifiers (LAGIDs) were received on the links. ***badLidInStartup***: during start-up, duplicate LAG link identifiers (LIDs) were received on the links. ***remoteFailure***: all the links at the far end are down. ***minActiveLinksThreshold***: the number of links active in the LAG group is less than the value set in *minActiveLinks*.
Mib	Lag
Values	noFailure noGoodLinks badLagIdInStartup badLidInStartup remoteFailure minActiveLinksThreshold
Default	No default

ATTRIBUTE Lp Lag actorSystemId (actorId)

Access	Read only
Description	This attribute indicates the MAC address used by the near-end LAG.
Mib	Lag
Values	String (6, Dashed Hex)
Default	No default

ATTRIBUTE Lp Lag partnerOperSystemId (partnerOperId)

Access	Read only
Description	This attribute indicates the operational value for the far-end LAG MAC address.
Mib	Lag
Values	String (6, Dashed Hex)
Default	No default

GROUP Lp Lag Statistics (Stats)

Properties	Operational
Description	This group contains the statistics data for the *Lag* component.
Mib	Lag

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Lag runningTime (running)

Access	Read only
Description	This attribute indicates the length of time (in seconds) for which the *Lag* component has been in the unlocked state or has been used for operational testing.
Mib	Lag
Values	Long Integer
Units	seconds
Default	No default

ATTRIBUTE Lp Lag unavailSecs (unavail)

Access	Read only
Description	This attribute indicates the number of one second intervals during which the *Lag* component has been unlocked and out of service.
Mib	Lag
Values	Long Integer
Default	No default

ATTRIBUTE Lp Lag failures (fail)

Access	Read only
Description	This attribute counts the complete failures, that the *Lag* component has experienced since being added. It must be noted that a service degradation, such as 1 of the 3 links in a LAG group being down, is not counted as a failure. If an *Lag* component is in a failure loop and does not come up, then this count will only increase by 1.
Mib	Lag
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Lp Lag rxFrameOctets (rxOctets)

Access	Read only
Description	This attribute counts the valid user frames, in octets, received on the LAG.
Mib	Lag
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Lp Lag txFrameOctets (txOctets)

Access	Read only
Description	This attribute counts the valid user frames, in octets, transmitted on the LAG.
Mib	Lag
Values	Long Integer
Default	No default

ATTRIBUTE Lp Lag rxFramePackets (rxPackets)

Access	Read only
Description	This attribute counts the valid packets received on the LAG.
Mib	Lag
Values	Long Integer
Default	No default

ATTRIBUTE Lp Lag txFramePackets (txPackets)

Access	Read only
Description	This attribute indicates the total number of valid packets transmitted on the LAG.
Mib	Lag
Values	Long Integer
Default	No default

ATTRIBUTE Lp Lag rxFrameDiscards (rxDiscards)

Access	Read only
Description	This attribute counts the discarded user frames after they were received on the LAG.
Mib	Lag
Values	Long Integer
Default	No default

ATTRIBUTE Lp Lag txFrameDiscards (txDiscards)

Access	Read only
Description	This attribute counts the discarded user frames during transmission on the LAG.

Access	Read only
Description	This attribute counts the invalid user frames received on the LAG.
Mib	Lag
Values	Long Integer
Default	No default

ATTRIBUTE Lp Lag txFrameErrors (txErrors)

Access	Read only
Description	This attribute counts the invalid user frames prior to their transmission on the LAG.
Mib	Lag
Values	Long Integer
Default	No default

GROUP Lp Lag CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Lag

ATTRIBUTE Lp Lag customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component.

Copyright © 2006, Nortel Nortel Confidential

Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Mib Lag

Values Decimal (0; 1..8191)

Default 0

GROUP Lp Lag OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Lag

ATTRIBUTE Lp Lag adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib Lag

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE Lp Lag operationalState (osiOper)

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Lag
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Lp Lag usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Lag
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Lp Lag availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE Lp Lag proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Lp Lag controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — Lag

Set of — underRepair (repair)

ATTRIBUTE Lp Lag standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

GROUP McsMgr Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *McsManager.*
Mib	McsMgr

ATTRIBUTE McsMgr maxEps (mEps)

Access	Read and write
Description	This attribute specifies the number of end points that will be allowed on the module.This includes end points originating from and terminating on this module. When this limit is reached calls requiring the creation of an end

Copyright © 2006, Nortel

Nortel Confidential

point are rejected. The current number of EPs is indicated by the *currentEps* attribute.

Mib	McsMgr
Values	Decimal (1..16384)
Default	512

ATTRIBUTE McsMgr epAlarmThreshold (epThresh)

Access	Read and write
Description	This attribute specifies the maximum number of end points that can exist before an alarm is raised. When *currentEps* exceeds this value an alarm is generated. The alarm is cleared when *currentEps* falls below this value.
Mib	McsMgr
Values	Decimal (1..16384)
Default	128

ATTRIBUTE McsMgr overrideNsapAddress (oNsap)

Access	Read and write
Criticality	Component
Description	This attribute specifies the NSAP address to use as the address of the *McsManager*. If this attribute is left empty the default *McsManager* NSAP address is used. The *nsapAddress* attribute indicates the NSAP address used by the *McsManager*. The default NSAP address for the *McsManager* takes the form: <26 byte module prefix>0020480d100100
Mib	McsMgr
Values	String (0..44, AESANsapAddress)
Default	""

ATTRIBUTE McsMgr security (sec)

Access	Read and write
Description	This attribute enables or disables security for the *McsManager*. In the case of DPRS MCS Switched Paths, if security is set to ***on*** this node must have a *DprsMcsEpGroup* with the *nsapAddress* of the *Addr* subcomponent set to the same value as the node originating the call setup for the call to be accepted.If this attribute is set to ***off*** this node will accept DPRS MCS setup requests from any other node in the network. This attribute has no effect on the setup of FRF5 switched paths since an originating and terminating EP are required to establish an FRF5 switched path.

Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

ATTRIBUTE McsMgr proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE McsMgr standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

VERB Ping McsMgr DprsMcsEpG Ep

Impact	Passive
Description	*Ping McsMgr DprsMcsEpG/n Ep/n* A *Ping* issued against the *Ep* causes a query packet to be sent to the remote *Ep*, allowing the user to verify that the underlying PORS or ATM transport connection is up. The ping query packet sent includes 10 octets of data and 4 octets of ping packet headers. A ping reply packet expected in response to a ping query also includes 10 octets of data and 4 octets of packet headers.

GROUP McsMgr DprsMcsEpG Ep OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations

Copyright © 2006, Nortel Nortel Confidential

	described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	DprsMcsEp

ATTRIBUTE McsMgr DprsMcsEpG Ep adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	DprsMcsEp
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE McsMgr DprsMcsEpG Ep operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	DprsMcsEp
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE McsMgr DprsMcsEpG Ep usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	DprsMcsEp
Values	idle active (activ) busy
Default	idle

ATTRIBUTE McsMgr DprsMcsEpG Ep availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate

Copyright © 2006, Nortel Nortel Confidential

because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Properties	Operational
Description	This group contains the operational attributes of the *EndPoint* component.
Mib	DprsMcsEp

ATTRIBUTE McsMgr DprsMcsEpG Ep lastTransportConnectionClearCause (lastTrConClearCause)

Access	Read only
Description	This attribute indicates the most recent clear cause for the transport connection. This indicates the causes provided by the network. A value of zero indicates that the transport connection has never been cleared. A value of 1000 indicates that the network has not provided a clear cause for the transport connection clearing. Section 5.4.5.15 of the ATMF UNI 3.1 specification lists the clear causes provided by the network.
Mib	DprsMcsEp
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep type

Access	Read only
Description	This attribute indicates the type of the end point. If the value is ***originating***, this *Ep* is provisioned and is responsible for initiating the SPVC call to set up the PORS or ATM connection. If the value is ***terminating***, this *Ep* is created dynamically by the McsMgr at the destination node when it receives a call setup request.
Mib	DprsMcsEp
Values	originating (orig) terminating (term)
Default	originating

ATTRIBUTE McsMgr DprsMcsEpG Ep supportedTransferPriorities (supTps)

Access	Read only

Description	This attribute indicates the transfer priority used to establish the transport connection.
Mib	DprsMcsEp
Values	Decimal (0..15)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep serviceCategory (sc)

Access	Read only
Description	This attribute indicates the ATM service category of the transport connection.
Mib	DprsMcsEp
Values	ubr cbr rtVbr nrtVbr
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep remoteComponentName (remoteName)

Access	Read only
Description	This attribute indicates the component name of the remote *Ep,* learned from the remote end. For example: *"EM/NODEY2D0 McsMgr DprsMcsEpG/1 Ep/1".* The value is a null string if the transport connection is down.
Mib	DprsMcsEp
Values	String (0..46, ASCII)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep remoteRoutingId (remoteRid)

Access	Read only
Description	This attribute indicates the routing identifier (RID) associated with the node on which the remote *Ep* resides. The remote RID is learned from the remote *Ep*. The value is valid when the transport connection is up and zero otherwise.
Mib	DprsMcsEp
Values	Decimal (0..126)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE McsMgr DprsMcsEpG Ep remoteModuleId (remoteMid)

Access	Read only
Description	This attribute indicates the module identifier (MID) associated with the node on which the remote *Ep* resides. The remote MID is learned from the remote *Ep*. The value is valid when the transport connection is up and zero otherwise.
Mib	DprsMcsEp
Values	Decimal (0..1909)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep lastTrConnDiagCode (lastTrConnDiagCode)

Access	Read only
Description	This attribute indicates the diagnostic code of the most recently cleared transport connection. This indicates the diagnostic code (associated with the *lastTransportConnectionClearCause*) provided by the network. A string containing only a 0 or 00 (zero) indicates that the network has not provided a diagnostic code for the most recently cleared transport connection. Section 5.4.5.15 of the ATMF UNI 3.1 specification lists the diagnostic codes that can be provided by the network.
Mib	DprsMcsEp
Values	String (0..10, Hex)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep forwardBandwith (fBw)

Access	Read only
Description	This attribute indicates the bandwidth at which the transport connection agrees to transfer information in the forward (from the originating to the dynamic End Point) direction.
Mib	DprsMcsEp
Values	Decimal (0..155000000)
Units	bit/s
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep reverseBandwidth (rBw)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the bandwidth at which the transport connection agrees to transfer information in the reverse (from the dynamic to the to the originating End Point) direction.
Mib	DprsMcsEp
Values	Decimal (0..155000000)
Units	bit/s
Default	No default

GROUP McsMgr DprsMcsEpG Ep Statistics (Stats)

Properties	Operational
Description	This group contains statistics of traffic received on the DPRS MCS Switched Path.
Mib	DprsMcsEp

ATTRIBUTE McsMgr DprsMcsEpG Ep setupAttempts

Access	Read only
Description	This attribute counts the number of attempts made to set up the transport connection. The counter wraps around to zero when the maximum value is exceeded.
Mib	DprsMcsEp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr DprsMcsEpG Ep pktDiscErroredFromMcs

Access	Read only
Description	This attribute counts errored packets received on the DPRS MCS Switched Path; these packets are discarded. The counter wraps around to zero when the maximum value is exceeded.
Mib	DprsMcsEp
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep pktFromMcs

Access	Read only
Description	This attribute counts the packets received on the DPRS MCS Switched Path for each discard priority. This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***),

COLLECTED STATS McsManager DprsMcsEndPointGroup EndPoint

Description	The statistics record generated by the McsManager DprsMcsEndPointGroup EndPoint component.

ATTRIBUTE McsMgr DprsMcsEpG Ep remoteComponentName (remoteName)

Description	This attribute indicates the component name of the remote *Ep,* learned from the remote end. For example: *"EM/NODEY2D0 McsMgr DprsMcsEpG/1 Ep/1".* The value will be a null string if the transport connection is down at the end of the statistics collection interval.
Values	String (0..46, ASCII)

ATTRIBUTE McsMgr DprsMcsEpG Ep bandwidthHWM

Description	This attribute indicates the high-water mark of the bandwidth at which the transport connection agrees to transfer data during the last statistics collection interval. The value for this attribute is equal to the provisioned bandwidth when the connection is up, and is 0 when the transport connection is down. This attribute, when combined with *bandwidthLWM* can also be used to indicate a transport connection outage occurrence.
Values	Decimal (0..155000000)
Units	bit/s

ATTRIBUTE McsMgr DprsMcsEpG Ep bandwidthLWM

Description	This attribute indicates the low-water mark of the bandwidth at which the transport connection agrees to transfer data during the last statistics collection interval. The value for this attribute is equal to the provisioned bandwidth when the connection is up, and is 0 when the transport connection is down. This attribute, when combined with *bandwidthHWM* can also be used to indicate a transport connection outage occurrence.
Values	Decimal (0..155000000)
Units	bit/s

ATTRIBUTE McsMgr DprsMcsEpG Ep serviceCategory (sc)

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the ATM service category of the transport connection.
Values	ubr cbr rtVbr nrtVbr

ATTRIBUTE McsMgr DprsMcsEpG Ep pktFromMcs

Description	This attribute indicates the number of packets received on the DPRS MCS Switched Path End Point for each discard priority in the last statistics collection interval. This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0(***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).
Vector of	Long Integer
Index	discardPriority0 (dp0) discardPriority1 (dp1) discardPriority2 (dp2) discardPriority3 (dp3)

ATTRIBUTE McsMgr DprsMcsEpG Ep octetsFromMcs

Description	This attribute indicates the octets received on the DPRS MCS Switched Path End Point for each discard priority in the last statistics collection interval. This attribute is a vector with four entries. Each vector entry is a counter indexed by one of four discard priorities, namely, discard priority 0 (***dp0***), discard priority 1 (***dp1***), discard priority 2 (***dp2***), or discard priority 3 (***dp3***).
Vector of	Long Integer
Index	discardPriority0 (dp0) discardPriority1 (dp1) discardPriority2 (dp2) discardPriority3 (dp3)

ATTRIBUTE McsMgr DprsMcsEpG Ep pktDiscCongestedFromMcs

Description	This attribute indicates the number of packets received on the DPRS MCS Switched Path End Point for each discard priority that have been discarded at the transport card in the last statistics collection interval due to congestion at the access card. This attribute is a vector with four entries. Each vector entry is a counter

ATTRIBUTE McsMgr DprsMcsEpG Ep EpD supportedTransferPriorities (supTps)

Access	Read and write
Description	This attribute specifies the Frame Relay transfer priorities that are supported through the transport connection. It is used to determine which *EndPoint* within a *DprsMcsEndPointGroup* is to multiplex a particular Frame Relay DLCI. A particular transfer priority can be specified on at most one *EndPoint* within a *DprsMcsEndPointGroup.*
Mib	DprsMcsEp
Set of	Decimal (0..15)
Default	(0)

ATTRIBUTE McsMgr DprsMcsEpG Ep EpD forwardBandwidth (fBw)

Access	Read and write
Description	This attribute specifies the bandwidth this End Point will request when setting up a transfer connection which the transport in the forward (from the originating to the terminating End Point) direction. A conservative value would be the sum of the committed information rates (CIRs) of all individual Frame Relay DLCIs multiplexed on the transport connection. For ATM connections, the value is converted to an equivalent Peak Cell Rate (PCR01) for all cells with Cell Loss Priority (CLP), CLP = 0 and CLP = 1. Note that the conversion to an equivalent cell rate for ATM connections may result in some wasted bandwidth depending on the average frame size to cell ratio.
Mib	DprsMcsEp
Values	Decimal (56000..155000000)
Units	bit/s
Default	512000

ATTRIBUTE McsMgr DprsMcsEpG Ep EpD reverseBandwidth (rBw)

Access	Read and write
Description	This attribute specifies the bandwidth this End Point will request when setting up a transfer connection which the transport in the reverse (from the terminating to the originating End Point) direction. A conservative value would be the sum of the committed information rates (CIRs) of all individual Frame Relay DLCIs multiplexed on the transport connection. For ATM connections, the value is converted to an equivalent Peak Cell Rate (PCR01) for all cells with Cell Loss Priority (CLP), CLP = 0 and CLP = 1.

Mib	DprsMcsEp
Common Verbs	Help List Display

VERB RERoute McsMgr DprsMcsEpG Ep LCo

Impact	Service
Description	RERoute ..Lc This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified. This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively. When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path. If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP McsMgr DprsMcsEpG Ep LCo **PathData**

Properties	Operational
Description	This group contains all operational attributes for the path oriented LCo.
Mib	DprsMcsEp

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **state**

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route

Copyright © 2006, Nortel Nortel Confidential

	selection but received no route and is now waiting to retry route selection again.
Mib	DprsMcsEp
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **overrideRemoteName (orn)**

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	DprsMcsEp
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **end**

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	DprsMcsEp
Values	calling called
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **costMetric (cost)**

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	DprsMcsEp

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0.
Mib	DprsMcsEp
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	DprsMcsEp
Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.

Copyright © 2006, Nortel Nortel Confidential

Mib	DprsMcsEp
Values	Decimal (0..4)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo holdingPriority (hpri)

Access	Read only
Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	DprsMcsEp
Values	Decimal (0..4)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	DprsMcsEp
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredRxBandwidth (rbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value
Mib	DprsMcsEp
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo requiredTrafficType (rttyp)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.
Mib	DprsMcsEp
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **permittedTrunkTypes (pttyp)**

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	DprsMcsEp
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **requiredSecurity (rsec)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	DprsMcsEp
Values	Decimal (0..7)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **requiredCustomerParameter (rcparm)**

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	DprsMcsEp
Values	Decimal (0..7)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **emissionPriority (epri)**

Access	Read only
Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority*. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	DprsMcsEp
Values	Decimal (0..2)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **discardPriority (dpri)**

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority*. One is used for

Copyright © 2006, Nortel Nortel Confidential

paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).

Mib	DprsMcsEp
Values	Decimal (1..3)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **pathType (pType)**

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	DprsMcsEp
Values	normal manual forced
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **retryCount (rcount)**

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.

Copyright © 2006, Nortel Nortel Confidential

Mib	DprsMcsEp
Values	Decimal (0..255)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo pathFailureCount (pfcount)

Access	Read only
Description	This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.
Mib	DprsMcsEp
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo reasonForNoRoute (rnr)

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.
Mib	DprsMcsEp

Default	none

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo lastTearDownReason

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons: ***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up. ***normalShutDown*** - This path has gone down due to normal call termination. ***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction. ***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction. ***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute. ***trunkCardFailure***- A trunk FP card has failed along the path. ***accessCardFailure***- The FP on which the peer access service was running has failed. ***operatorForced***- The path has terminated due to the operator locking a trunk along the path. ***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC. ***networkCongestion*** - The path has failed due to control information being lost and not recoverable. ***trunkNotFound*** - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly. ***farEndNotFound*** - The far end is not provisioned or is not up. Check remote Name. ***wrongModuleReached*** - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*. ***farEndBusy*** - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning. ***callLoopedBack*** - This LCo is provisioned to call itself. Re-provision since this is invalid. ***unknownReason*** - The failure was not resolved. ***farEndNotReady*** - The remote end was reached but the connection was refused due to the remote end not being enabled. ***remoteNameMismatch*** - The remote end has alarmed and rejected this setup due to remoteName provisioning. ***serviceTypeMismatch*** - The remote Service Type does not match this service type. Check provisioning.

Copyright © 2006, Nortel Nortel Confidential

reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **pathFailureAction**

Access — Read only

Description — This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If

Copyright © 2006, Nortel Nortel Confidential

disconnectConnection is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Mib	DprsMcsEp
Values	reRoutePath disconnectConnection
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **bumpPreference (bpref)**

Access	Read only
Description	This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.
Mib	DprsMcsEp
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep LCo **optimization (opt)**

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

GROUP McsMgr DprsMcsEpG Ep Cac Operational (Oper)

Properties Operational

Description This group contains the operational attributes of the *CallAdmissionControl* component.

Mib DprsMcsEp

ATTRIBUTE McsMgr DprsMcsEpG Ep Cac effectiveBandwidth (eBw)

Access Read only

Description This attribute indicates the total bandwidth which is used as the bandwidth pool for tracking call admission requests.
On the originating End Point the *effectiveBandwidth* is equal to the *forwardBandwidth* attribute specified in this End Point's *Epd* component multiplied by the *forwardOversubFactor* specified in the *Cacd* subcomponent.
On the terminating End Point the *effectiveBandwidth* is equal to the *reverseBandwidth* attribute specified in this End Point's *Epd* component multiplied by this End Point's *reverseOversubFactor* specified in the *Cacd* subcomponent.
This value indicates CIR bandwidth when the *cacType* attribute of the *Cacd* subcomponent is specified as ***cir***.
This value indicates EIR bandwidth when the *cacType* attribute of the *Cacd* subcomponent is specified as ***eir***.

Mib DprsMcsEp

Values Long Integer

Units bit/s

Default No default

ATTRIBUTE McsMgr DprsMcsEpG Ep Cac effectiveBandwidthAvailable (eBwAvail)

Access Read only

Description This attribute indicates the effective bandwidth that is still available in the bandwidth pool for use by Frame Relay service connections requesting

Copyright © 2006, Nortel Nortel Confidential

bandwidth. This value is the amount of *effectiveBandwith* less the amount reserved by Frame Relay service connections that have been admitted.
To display the specific Frame Relay service connections which have successfully completed call admission and to see the amount of bandwidth they have reserved, the network operator can use the following command:
*Display McsMgr DprsMcsEpG/n Ep/n Connection/**
This value indicates CIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is specified as ***cir***.
This value indicates EIR bandwidth when the *cacType* attribute of the *Cac* subcomponent is specified as ***eir***.

Mib	DprsMcsEp
Values	Long Integer
Units	bit/s
Default	No default

ATTRIBUTE McsMgr DprsMcsEpG Ep Cac numberOfCallsActive (numOfCalls)

Access	Read only
Description	This attribute indicates the total number of Frame Relay service connections which have successfully completed call admission and are currently in service. To display the specific Frame Relay service connections which have successfully completed call admission and to see the amount of bandwidth they have reserved the network operator can use the following command: *Display McsMgr DprsMcsEpG/n Ep/n Connection/**

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Frf5Ep

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE McsMgr Frf5EpG Ep operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Frf5Ep

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE McsMgr Frf5EpG Ep usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: Frf5Ep

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

ATTRIBUTE McsMgr Frf5EpG Ep availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Frf5Ep
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE McsMgr Frf5EpG Ep proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Default	No default

ATTRIBUTE McsMgr Frf5EpG Ep controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	Frf5Ep
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE McsMgr Frf5EpG Ep alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — Frf5Ep

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE McsMgr Frf5EpG Ep **standbyStatus (osiStby)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

ATTRIBUTE McsMgr Frf5EpG Ep avgFrameSize (afs)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the average frame size that is used in the traffic parameter conversion policy calculations for this end point.
Mib	Frf5Ep
Values	Decimal (1..8187)
Units	bytes
Default	128

ATTRIBUTE McsMgr Frf5EpG Ep trafficParmConvPolicy (tpcp)

Access	Read only
Description	This attribute indicates the traffic parameter conversion policy used to specify the equivalent ATM bandwidth rate at this end point. Policy 3 characterizes the traffic in the following way: - ATM traffic descriptor type 6 is selected - PCR0+1 is based on the AR - SCR0+1 is based on the CIR and EIR - MBS0+1 is based on Bc, Be, CIR, EIR, and AR - Takes into account that the instantaneous rate of the frame relay stream can burst above CIR and up to the AR. Policy 4 characterizes the traffic in the following way: - ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer. - PCR0+1 is based on the AR - SCR0 is based on the CIR - MBS0 is based on Bc, CIR, and AR - There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR. Policy 5 characterizes the traffic in the following way: - ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer - PCR0+1 is based on CIR and EIR - SCR0 is based on the CIR - MBS0 is based on the Bc, CIR, and AR - The maximum PCR is no longer based on AR but based on the CIR and EIR. Policy 6 characterizes the traffic in the following way: - ATM traffic descriptor type 3 is selected - PCR0+1 is based only on CIR.
Mib	Frf5Ep

Values	none ansi ccitt
Default	ccitt

ATTRIBUTE McsMgr Frf5EpG Ep Lmi asyncStatusReport (asr)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute selects the use of asynchronous PVC status report procedures as specified in the CCITT specification (ITU-T Q.933, Annex A), and the ANSI specification Annex D.

Mib: Frf5Ep

Values: off
on

Default: on

ATTRIBUTE McsMgr Frf5EpG Ep Lmi errorEventThreshold (n392)

Access: Read and write

Description

For the network side procedure, an event is defined as follows: (1) receipt of a STATUS ENQUIRY message, or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid format of an LMI message; (3) invalid receive sequence number.
For the user side procedure, an event is defined as a polling cycle or a status enquiry and status report exchange. An error event is (1) non-receipt of a STATUS within the polling cycle, or (2) invalid format of an LMI message, or (3) invalid sequence number.

This attribute specifies the number of error events which, if they occur within *eventCount* events, will cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur.

It must be less than or equal to *eventCount* (n393).

Mib: Frf5Ep

Values: Decimal (1..10)

Default: 3

ATTRIBUTE McsMgr Frf5EpG Ep Lmi eventCount (n393)

Access: Read and write

Description

This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed.

It must be greater than or equal to *errorEventThreshold* (n392).

Mib: Frf5Ep

Values: Decimal (1..10)

Default: 4

ATTRIBUTE McsMgr Frf5EpG Ep Lmi checkPointTimer (t392)

Access: Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. It must be greater than *linkVerificationTimer* (t391).
Mib	Frf5Ep
Values	Decimal (5..255)
Units	seconds
Default	200

ATTRIBUTE McsMgr Frf5EpG Ep Lmi side

Access	Read and write
Description	This attribute selects the user side procedure (DTE), or the network side procedure (DCE), or both the user side and the network side procedures of the LMI. This attribute can be set to ***user, network*** or ***both***.
Mib	Frf5Ep
Values	network user both
Default	both

GROUP McsMgr Frf5EpG Ep Lmi NniProtocolParameters (NniParms)

Properties	Provisioned
Description	This group contains the provisionable attributes of the FRF.5 LMI procedures which are unique to NNI.
Mib	Frf5Ep

ATTRIBUTE McsMgr Frf5EpG Ep Lmi fullStatusPollingCycles (n391)

Access	Read and write
Description	This attribute specifies how frequently the FRF.5 LMI initiates a Status Enquiry for a full PVC status report. A polling cycle is a Status Enquiry and Status Report exchange.
Mib	Frf5Ep
Values	Decimal (1..255)
Default	1

ATTRIBUTE McsMgr Frf5EpG Ep Lmi linkVerificationTimer (t391)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies how frequently the FRF.5 LMI initiates a Status Enquiry for link integrity verification. It must be less than *checkPointTimer* (t392).
Mib	Frf5Ep
Values	Decimal (5..255)
Units	seconds
Default	180

GROUP **McsMgr Frf5EpG Ep Lmi** **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Frf5Ep

ATTRIBUTE **McsMgr Frf5EpG Ep Lmi** **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Frf5Ep
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE **McsMgr Frf5EpG Ep Lmi** **operationalState (osiOper)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Frf5Ep
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Frf5Ep
Values	idle active (activ) busy
Default	idle

GROUP McsMgr Frf5EpG Ep Lmi **ProtocolStatusInfo (Psi)**

Properties	Operational
Description	This group provides the protocol status of the Local Management Interface.
Mib	Frf5Ep

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **protocolStatus**

Access	Read only
Description	This attribute indicates whether the LMI is in an error condition or whether

Copyright © 2006, Nortel Nortel Confidential

the protocol is behaving normally. This attribute will be set to ***errorCondition*** after enough LMI errors have been detected to warrant a change in condition. This occurs when *n392* of the last *n393* events are in error.
The error condition is lifted when a sufficient number of consecutive events has occurred without error. This occurs when *n393* consecutive good events take place.
The consequence of an error condition is that all DLCIs on this interface will become inactive in both directions.

Mib: Frf5Ep

Values:
errorCondition
normalCondition

Default: normalCondition

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **opProcedures (opProc)**

Access: Read only

Criticality: Process

Description: This attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are supported:

none: Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures.

ansi: Local Management Interface procedures from the ANSI specification are being used. DLCI 0 is used for the LMI protocol.

itu: Local Management Interface procedures from the ITU-T specification are being used. DLCI 0 is used for the LMI protocol.

Mib: Frf5Ep

Values:
none
ansi
itu

Default: No default

GROUP McsMgr Frf5EpG Ep Lmi **Statistics (Stats)**

Properties: Operational

Description:
This group contains the operational statistics for the FRF.5 NNI Local Management Interface.

Mib: Frf5Ep

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **keepAliveStatusToInterface (kasti)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the Local Management Interface keep alive status messages sent to the ATM VCC in response to a status enquiry for keep alive status. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **fullStatusToInterface (fsti)**

Access	Read only
Description	This attribute counts the Local Management Interface full status messages sent to the ATM VCC in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **keepAliveStatusEnqFromInterface (kafi)**

Access	Read only
Description	This attribute counts the Local Management Interface valid keep alive status enquiry messages received from the ATM VCC. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **fullStatusEnqFromInterface (fsfi)**

Access	Read only
Description	This attribute counts the Local Management Interface valid full status enquiry messages received from the ATM VCC. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **networkSideEventHistory (nsh)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is either a T392 timer expiry or receipt of a status enquiry with an incorrect sequence number.
Mib	Frf5Ep
Values	String (1..10, ASCII)
Default	No default

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **userSideEventHistory (ush)**

Access	Read only
Description	This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a T391 timer expiry or receipt of a status message with an incorrect sequence number.
Mib	Frf5Ep
Values	String (1..10, ASCII)
Default	No default

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **protocolErrors (proto)**

Access	Read only
Description	This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors* and *statusSequenceErrors*) and timeout (*pollingVerifTimeouts* and *noStatusReportCount*) errors. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **unexpectedIes (uie)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is not a protocol error. When the maximum count is reached, this counter wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **sequenceErrors (seq)**

Access	Read only
Description	This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **statusSequenceErrors (stseq)**

Access	Read only
Description	This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi **unexpectedReports (ur)**

Access	Read only
Description	This attribute counts the number of Local Management Interface frames received with an unknown or unexpected report type. An unexpected report type is not a protocol error. When the maximum count is reached the counter wraps to zero.
Mib	Frf5Ep

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi pollingVerifTimeouts (tmo)

Access	Read only
Description	This attribute counts the *checkPointTimer* (T392) expiries occurring on the Local Management Interface. When the maximum count is reached the counter wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi noStatusReportCount (nsrc)

Access	Read only
Description	This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented: i) after a status enquiry is sent out and the T391 timer expires without having a status report received. ii) if an invalid status report is received. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi keepAliveEnqTolf (kaeti)

Access	Read only
Description	This attribute counts the number of Local Management Interface keep alive enquiry status messages sent to the external user device for keep alive status. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Lmi fullStatusEnqTolf (fseti)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero.
Mib	Frf5Ep
Values	Decimal (0..4294967295)
Default	0

COMPONENT McsMgr Frf5EpG Ep EndPointDescriptor (Epd)

Groups	GROUP McsMgr Frf5EpG Ep Epd Provisioned (Prov) GROUP McsMgr Frf5EpG Ep Epd CustomerIdentifierData (CidData)
Scope	Application
Description	*McsMgr Frf5EpG/n Ep/n EndPointDescriptor* This component describes the ATM SPVC which supports the FRF.5 connection.
Mib	Frf5Ep
Common Verbs	Help List Display

GROUP McsMgr Frf5EpG Ep Epd Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the FRF.5 End Point.
Mib	Frf5Ep

ATTRIBUTE McsMgr Frf5EpG Ep Epd remoteConnectionIdentifier (rci)

Access	Read and write
Description	This attribute specifies the remote connection identifier. It either represents the VPI.VCI logical channel number assignment of a remote ATM interface, or the *Endpoint.Frf5EndPointGroup* instances of a remote FRF.5 EndPoint.
Mib	Frf5Ep
Values	Integer Sequence (0..255; 0..16128)
Default	No default

ATTRIBUTE McsMgr Frf5EpG Ep Epd connectionTransferPriority (conntp)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the transfer priority used to establish the ATM connection. The *EndPoint* references the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component to determine the ATM service category to be used by the connection. This attribute is also used to determine which *EndPoint* within an *Frf5EndPointGroup* is to multiplex a particular *FrAtm Dlci*.
Mib	Frf5Ep
Values	Decimal (0..15)
Default	No default

ATTRIBUTE McsMgr Frf5EpG Ep Epd **committedInformationRate (cir)**

Access	Read and write
Description	This attribute specifies the committed information rate (CIR), and represents the rate at which the network FRF.5 ATM VCC agrees to transfer information under normal conditions. A conservative CIR value would be the sum of the CIRs of all the individual *FrAtm Dlci*s multiplexed by the VCC. The *cir* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component.
Mib	Frf5Ep
Values	Decimal (0..50000000)
Units	bit/s
Default	64000

ATTRIBUTE McsMgr Frf5EpG Ep Epd **excessInformationRate (eir)**

Access	Read and write
Description	This attribute specifies the excess information rate (EIR), and represents the rate at which the network FRF.5 ATM VCC attempts to transfer information. A conservative EIR value would be the sum of the EIRs of all the individual *FrAtm Dlci*s multiplexed by the VCC. The *eir* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component.
Mib	Frf5Ep
Values	Decimal (0..50000000)
Units	bit/s
Default	0

ATTRIBUTE McsMgr Frf5EpG Ep Epd **committedBurstSize (bc)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the committed burst size (Bc), and represents the amount of data that the network FRF.5 ATM VCC agrees to transfer under normal conditions. A conservative Bc value would be the sum of the Bcs of all the individual *FrAtm Dlci*s multiplexed by the VCC. The *bc* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component.
Mib	Frf5Ep
Values	Decimal (0..50000000)
Units	bits
Default	16000

ATTRIBUTE McsMgr Frf5EpG Ep Epd **type**

Access	Read and write
Description	This attribute specifies the FRF.5 End Point type. If the value is provisioned as ***master***, this End Point is responsible for initiating the SPVC call to set up the FRF.5 ATM VCC. If the value is provisioned as ***slave***, this End Point receives call setup requests from a master remote end.
Mib	Frf5Ep
Values	master slave
Default	master

ATTRIBUTE McsMgr Frf5EpG Ep Epd **accessRate (ar)**

Access	Read and write
Description	This attribute represents the access rate of the FRF.5 EndPoint. A conservative value would be the sum of the access rates of all the *FrAtms'* that have DLCIs multiplexed by the VCC. The access rate is converted into ATM service parameters when conversion policies 3, 4 and 5 are used. For policy 6, this attribute is ignored.
Mib	Frf5Ep
Values	Decimal (0..50000000)
Units	bit/s
Default	1536000

ATTRIBUTE McsMgr Frf5EpG Ep Epd **excessBurstSize (be)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the excess burst size (Be), and represents the amount of uncommitted data that the network FRF.5 ATM VCC agrees to transfer under normal conditions. A conservative Be value would be the sum of the Bes of all the individual *FrAtm Dlci*s multiplexed by the VCC. The *be* is converted into ATM service parameters according to the conversion policy specified by the *connectionTransferPriority* attribute. The conversion policy is defined under the *ModuleData FrameRelayService AtmNetworking TransferPriority/n* component.
Mib	Frf5Ep
Values	Decimal (0..50000000)
Units	bits
Default	0

GROUP McsMgr Frf5EpG Ep Epd **CustomerIdentifierData (CidData)**

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Frf5Ep

ATTRIBUTE McsMgr Frf5EpG Ep Epd **customerIdentifier (cid)**

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Frf5Ep
Values	Decimal (0; 1..8191)
Default	0

COMPONENT McsMgr Frf5EpG Ep **DataLinkConnectionIdentifier (Dlci)**

Instance	Decimal (16..1007; 1022)

Copyright © 2006, Nortel Nortel Confidential

Groups	GROUP McsMgr Frf5EpG Ep Dlci Operational (Oper)

GROUP McsMgr Frf5EpG Ep Dlci Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the FRF.5 DLCI.
Mib	Frf5Ep

ATTRIBUTE McsMgr Frf5EpG Ep Dlci aBitStatusToIf (abti)

Access	Read only
Description	This attribute indicates the most recent A-bit status sent to the ATM VCC. If the value is ***inactive***, the reason for the LMI failure is given by the *aBitReasonToNetwork*.
Mib	Frf5Ep
Values	inactive active
Default	inactive

ATTRIBUTE McsMgr Frf5EpG Ep Dlci aBitReasonToIf (abrti)

Access	Read only
Description	This attribute indicates the reason for the latest inactive A-bit status sent to the ATM VCC. The value is ***notApplicable*** when the *aBitStatusToNetwork* is ***active***. The value is ***remoteUserSignaled*** if the *FrAtm* originating the A-Bit status has detected that the virtual circuit is down at the remote network through the LMI protocol. The *FrAtm* must be running network site LMI protocol for this A-Bit status reason to be sent. The value is ***localLmiError*** if the LMI protocol is down at this *Ep*. The value is ***remoteLmiError*** if the LMI protocol is down at the *FrAtm* originating this A-Bit status reason. The value is ***localLinkDown*** if the physical interface is disabled at this *Ep*. The value is ***pvcDown*** if no A-Bit status has been sent to this *Ep* (i.e., no A-Bit status has been relayed from the *FrAtm*). The value is ***remoteLinkDown*** if the physical interface is disabled at the *FrAtm* originating this A-Bit status reason.

COMPONENT MaintenanceMonitorTx (MmTx)

Instance	Decimal (1..15)
Groups	GROUP MmTx CustomerIdentifierData (CidData) GROUP MmTx Provisioned (Prov) GROUP MmTx OsiState (State) GROUP MmTx Operational (Oper)
Scope	Application
Description	*MaintenanceMonitorTx/n* A *MaintenanceMonitorTx* component identifies an instance of the MaintenanceMonitor AAL1 Circuit Emulation Service. The service that is used to transport the copy of the monitored traffic to a local or remote observer is basic structured AAL1 CES. This stream is mono directional from the monitor point to the observer. Any ATM traffic that is received from the observer (which may occur if the observer uses a standard AAL1 CES service) is discarded at the monitoring point. A separate instance of this component is required for each monitored channel. Instance numbers, which are used to uniquely identify *MaintenanceMonitorTx* component instances, are arbitrary. Only one instance of *MaintenanceMonitorTx* may be linked to a particular *LogicalProcessor.*

GROUP MmTx CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	CircuitEmulationService

ATTRIBUTE MmTx customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	CircuitEmulationService
Values	Decimal (0; 1..8191)
Default	0

GROUP MmTx Provisioned (Prov)

Properties	Provisioned
Description	This group contains basic provisioning data for the Maintenance Monitor Transmitter (MmTx). A MmTx represents a mono-directional AAL1 Circuit Emulation Service. AAL1 CES attributes in this group are essential information to the operator about the AAL1 CES service that must be matched in the *Aal1Ces* component that receives the monitored stream. The check escape checks that only one instance of a *MaintenanceMonitorTx* is linked to any one *Lp*.
Mib	CircuitEmulationService

ATTRIBUTE MmTx linkToLogicalProcessor (lpName)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the instance of a hardware component to which an instance of this component is linked. Only *Lp* components may be linked.
Mib	CircuitEmulationService
Values	Link (Hardware, linkToApplications)
Default	No default

ATTRIBUTE MmTx monitoredDirection (direction)

Access	Read and write
Criticality	Process
Description	This attribute specifies the direction of the monitored traffic. When ***ingress*** value is specified, the traffic coming from the interface and going to the backplane is monitored and specified by *chanToMonitor.* When ***Egress*** value is specified, the traffic coming from the backplane and going to the interface is monitored and specified by *chanToMonitor.*
Mib	CircuitEmulationService
Values	ingress egress
Default	ingress

ATTRIBUTE MmTx serviceType (servType)

Access	Read and write
Criticality	Process
Description	This attribute specifies the service type of the CES. The *serviceType* attribute in the receiving *Aal1Ces* component must have the same value as this attribute.
Mib	CircuitEmulationService
Values	basicStructured
Default	basicStructured

ATTRIBUTE MmTx partialFill (partFill)

Access	Read and write
Criticality	Component
Description	This attribute specifies the number of octets that are carried in an ATM cell by the AAL1 CES service. A full cell contains 47 octets. The *partialFill* attribute in the receiving *Aal1Ces* component must have the same value as this attribute.

Copyright © 2006, Nortel Nortel Confidential

Mib	CircuitEmulationService
Values	Decimal (47)
Units	octets
Default	47

GROUP MmTx OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	CircuitEmulationService

ATTRIBUTE MmTx adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	CircuitEmulationService
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE MmTx operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	CircuitEmulationService
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE MmTx usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	CircuitEmulationService
Values	idle active (activ) busy
Default	idle

ATTRIBUTE MmTx availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE MmTx proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE MmTx controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	CircuitEmulationService
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE MmTx alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	CircuitEmulationService
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE MmTx standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Mib	CircuitEmulationService
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE MmTx unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	CircuitEmulationService
Values	false true
Default	false

GROUP MmTx Operational (Oper)

Properties	Operational
Description	This group contains status information about the AAL1 Circuit Emulation Service and the related ATM service. It also specifies the Channel to be monitored.
Mib	CircuitEmulationService

ATTRIBUTE MmTx connectionStatus (connStatus)

Access	Read only
Description	This attribute indicates if a service is non-operational because of a problem with the service interface side of the service (in which case, it is set to ***channelNotReady***) or because of a problem with the ATM side of the service (in which case, it is set to ***atmNotConfigured*** or ***atmNotReady***). When this attribute is set to ***channelNotReady***, it is an indication that the corresponding *Chan* component (as defined by the attribute *interfaceName*) or the *Chan* component's parent port component (*Lp/n Ds1/m* or *Lp/n E1/m*) is locked. When this attribute is set to ***atmNotConfigured***, it is an indication that no sub-component has been provisioned, and thus no ATM connection has been configured for the service.

Copyright © 2006, Nortel Nortel Confidential

When this attribute is set to ***atmNotReady***, it is an indication that the ATM connection with which the service is associated (as defined by a sub-component) has been lost or that it is currently unable to carry CES data.

When this attribute is set to ***channelNotSpecified***, it is an indication that the *chanToMonitor* attribute is not set to a valid channel.

This attribute is set to ***connected*** when a service is operational (that is, the OSI attribute *operationalState* is ***enabled***.)

Mib — CircuitEmulationService

Values — connected
channelNotReady
atmNotReady
atmNotConfigured
channelNotSpecified

Default — channelNotReady

ATTRIBUTE MmTx chanToMonitor (chan)

Access — Read and write

Description — *chanToMonitor* specifies the LP, port (*E1* or *DS1*), and channel to monitor. The LP must be the same LP specified in the provisionable attribute *linkToLogicalProcessor*. This attribute's value is of the form Lp/x E1/y Chan/z or Lp/x DS1/y Chan/z.

Mib — CircuitEmulationService

Values — The name of the component

Default — No default

COMPONENT MmTx NailedUpAdaptationPoint (Nap)

Groups — GROUP MmTx Nap Provisioned (Prov)

Scope — Application

Description — *Aal1Ces/n NailedUpAdaptationPoint*

A *NailedUpAdaptationPoint* is a nailed-up point which straddles the CBR/ATM domains and which is associated with the adaptation of CBR data to/from ATM cells.

If a *NailedUpAdaptationPoint* component is provisioned under an *Aal1Ces*

Copyright © 2006, Nortel Nortel Confidential

component, no other components may be provisioned under the same *Aal1Ces* component.

Mib	CircuitEmulationService
Common Verbs	Help List Display Add DELete

GROUP MmTx Nap Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning data for the *NailedUpAdaptationPoint* component.
Mib	CircuitEmulationService

ATTRIBUTE MmTx Nap atmConnection (ac)

Access	Read and write
Criticality	Component
Description	This attribute specifies the identity of the component to which the *NailedUpAdaptationPoint* is linked. This is an *AtmIf Vcc NailedUpEndPoint or an AtmIf Vpt Vcc NailedUpEndPoint* (the AAL1 cells are transported off the switch over an ATM UNI, where they are routed to the appropriate AAL1 entity at the other end by the ATM bearer service).
Mib	CircuitEmulationService

COMPONENT ModuleData (Mod)

Groups	GROUP Mod Provisioned (Prov)
Scope	Network
Description	Module wide provisioning data is used to define a number of attributes used by various systems within the module.
Mib	BaseShelf
Subcomponents	COMPONENT Mod FrameRelaySystem (Frs)
Opt. Subcomp.	COMPONENT Mod VirtualCircuitSystem (Vcs)
Common Verbs	Help List Display

GROUP Mod Provisioned (Prov)

Properties	Provisioned
Description	*Mod Provisionable* This group provides attributes that are used by internal and external systems to identify the module.
Mib	BaseShelf

ATTRIBUTE Mod nodeId

Access	Read and write
Criticality	Module
Description	This attribute specifies a number that uniquely identifies a node in the network. Changing the value of the *nodeId* attribute causes the node to be restarted.
Mib	BaseShelf
Values	Decimal (1..4095)
Default	No default

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE Mod nodeName

Access	Read and write
Criticality	Module
Description	This attribute specifies a string that is unique to this module in the network. This name is the component instance value of EM - the root of the component hierarchy. It has, therefore, the same restriction and behavior as any string instance value (for example, it is converted to upper case). Note that the EM component is typically suppressed on output. Changing the value of the *nodeName* attribute causes the node to restarted.
Mib	BaseShelf
Values	String (1..12, ASCII)
Default	NONAME

ATTRIBUTE Mod namsId

Access	Read and write
Criticality	Module
Description	This attribute specifies the Network Administration (Nams) Identifier associated with the node. It must be unique across the entire network of nodes supporting the transport of DPN traffic as well as all RMs and AMs in the network. The *namsId* attribute must be set when a *DpnAddressPlan* component is configured on a node. The value of the *namsId* attribute is used in accounting records, statistics records, and time change accounting records; it identifies nodes in these records. The Nams Id is assigned by the network administrator. A value of ***49151*** indicates that no Nams Id has been assigned to the module. Changing the value of the *namsId* attribute causes the node to be restarted.
Mib	BaseShelf
Values	Decimal (256..49151)
Default	49151

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mod regionId

Access	Read and write
Description	This attribute specifies the Topology Region to which the node belongs. Nodes only exchange topological information with connected nodes in the same region. Changing the value of the *regionId* attribute does NOT cause the node to be restarted.
Mib	BaseShelf
Values	Decimal (0..126)
Default	0

ATTRIBUTE Mod nodePrefix

Access	Read and write
Criticality	Module
Description	This attribute specifies an NSAP prefix which is distributed to all other nodes whose *clusterNode* attribute under the *Rtg* component is provisioned with the same value as this node within a Topology region. The attribute can be used to identify this node. This prefix is used by PORS, PNNI routing, and MCS. PORS calls that use NSAP addressing (for example, CES) look for the node with the longest NSAP prefix that matches the called party address. The NSAP prefixes that PORS matches against are the *nodePrefix* and the *alternatePorsPrefixes*. PNNI forms the default value of the *nodeAddressPrefix* attribute under the *AtmPnni* component with this NSAP prefix followed by a unique MAC address. MCS uses the *nodePrefix* to form an NSAP address that is registered with the Networking API. This NSAP address is used to identify this node when establishing an MCS switched path. The value entered must be 26 characters long. All characters must be hexadecimal with the following restrictions: - the first two characters are in the range of ‘10’ to ‘FE’, inclusive. - if the first two characters are ‘45’, the 18th character must be an ‘f’ or an ‘F’
Mib	BaseShelf
Values	String (0..26, ASCII)
Default	""

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mod alternatePorsPrefixes

Access	Read and write
Criticality	Module
Description	This attribute specifies four NSAP prefixes which are distributed to all other nodes whose *clusterNode* attribute under the *Rtg* component is provisioned with the same value as this node within a Topology region. The attribute can be used to identify this node. These prefixes are used by PORS. PORS calls that use NSAP addressing (for example, CES) look for the node with the longest NSAP prefix that matches the called party address. The NSAP prefixes that PORS matches against are the *alternatePorsPrefixes* and the *nodePrefix*. These prefixes may contain up to 40 hexadecimal characters.
Mib	BaseShelf
Vector of	String (0..40, ASCII)
Index	Decimal (0..3)
Default	([4] "")

COMPONENT Mod VirtualCircuitSystem (Vcs)

Groups	GROUP Mod Vcs AccountingOptions (AccOpt) GROUP Mod Vcs WindowOptions (WinOpt) GROUP Mod Vcs AddressingOptions (AddOpt) GROUP Mod Vcs InterfaceOptions (IntOpt)
Scope	Application
Description	*ModuleData Vcs* *ModuleData VirtualCircuitSystem* is used to define a number of general characteristics for all *Vcs* that originate from or terminate on a particular module. As an example, the *Vc* Window matrix is defined on a module basis to provide the expected virtual circuit window sizes to associate with all *Vcs* on the module. All the modules in the network should have identical *VirtualCircuitSystem* attributes. If these attributes are not consistent across the network applications which need *Vc* may not be able to establish calls.
Mib	SubnetInterface
Common Verbs	Help List Display Add DELete

Copyright © 2006, Nortel Nortel Confidential

GROUP Mod Vcs AccountingOptions (AccOpt)

Properties	Provisioned
Description	Accounting information is owned by the *Vc* System; it is stored in the *Vc* Accounting component, which itself is considered to be a component on the switch. The Accounting Component contains a bit map indicating which of the accounting facilities are to be spooled in the accounting record - for example, bit '0' if set indicates that the accounting facility with facility code H.00 should be spooled if present in the *Vc* for accounting purposes. The data contained in the *Vc* Accounting must be identical network wide even though the component can be changed and upgraded on a module by module basis.
Mib	SubnetInterface

ATTRIBUTE Mod Vcs segmentSize

Access	Read and write
Description	This attribute specifies the segment size for accounting of national calls. Minimum allowed segment size is ***1***. If data segment is sent which is less than *segmentSize* it is still counted as one segment.
Mib	SubnetInterface
Values	1 2 4 8 16 32 64 128 256 512 1024 2048 4096
Default	128

ATTRIBUTE Mod Vcs unitsCounted

Access	Read and write
Description	This attribute specifies what is counted by frame services. If set to frames, frames are counted, else segments are counted.
Mib	SubnetInterface
Values	segments frames
Default	segments

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mod Vcs accountingFax (afax)

Access	Read and write
Description	Each value corresponds to an accounting facility code, of which there are currently 10 facility codes defined with codes H.00 to H.09, and corresponding to the above 10 facilities. Each of the above facilities may or may not be present and stored in the Vc for accounting purposes, depending on the nature of the call. For example, only those Vcs where a NUI (Network User Identifier) is used for charging or identification purposes will have a NUI stored in the Vc.
Mib	SubnetInterface
Set of	originalCalledAddressFax
Default	(originalCalledAddressFax)

ATTRIBUTE Mod Vcs generationMode (genMod)

Access	Read and write
Description	This attribute specifies part of the rules by which the network generates accounting records. If set to ***bothEnds***, then both ends of the *Vc* generate accounting records. If set to ***singleEnd***, then the charged end of the *Vc* generates accounting records. In single end generation mode, if the call does not clear gracefully, both ends of the *Vc* will generate accounting record.
Mib	SubnetInterface
Values	bothEnds singleEnd
Default	singleEnd

GROUP Mod Vcs WindowOptions (WinOpt)

Properties	Provisioned
Description	*WindowOptions group* defines attributes used when establishing *Vc*. These attributes are common to each *Vc* unless overridden by other options in a call. For example X.25 options used in call request.
Mib	SubnetInterface

ATTRIBUTE Mod Vcs windowSize (wins)

Access	Read and write
Description	This is the *windowSize* corresponding to the given packet size and throughput class. All *Vcs* using the windowSize matrix support large *Vc* windows on both ends of the *Vc*, and support the signaling of the chosen *Vc* window size from the destination (called) end to the source (calling)

Copyright © 2006, Nortel Nortel Confidential

	end. This is the only matrix supported. The *windowSize* should be configured in the same way network wide, though it can be upgraded on a module by module basis. *Vcs* using the *windowSize* matrix will run properly if the matrices on different nodes differ since the *Vc* window is selected by the destination (called) side of the *Vc*.
Mib	SubnetInterface
Array of	Decimal (1..63)
Row	packetSize (pkt) [16 32 64 128 256 512 1024 2048 4096 8192 32768 65535]
Column	throughputClass (tpt) [Decimal (0..15)]
Default	([12 * 16] 4)

GROUP Mod Vcs AddressingOptions (AddOpt)

Properties	Provisioned
Description	The *Vc AddressingOptions* group describes the addressing parameters. It is currently owned by the *Vc*. Most of the data contained in the *Vc AddressingOptions* group is identical network wide even though the group can be changed and upgraded on a module by module basis.
Mib	SubnetInterface

ATTRIBUTE Mod Vcs defaultNumberingPlan (npi)

Access	Read and write
Criticality	Process
Description	This attribute specifies the numbering plan used which determines the address format: X.121-- the international numbering plan for public packet switched data networks or E.164-- the international numbering plan for ISDN and PSTN. The default numbering plan does not need to be consistent across all of the nodes in the network.

Copyright © 2006, Nortel Nortel Confidential

Mib	SubnetInterface
Values	x121 e164
Default	x121

ATTRIBUTE Mod Vcs networkIdType (nit)

Access	Read only
Description	This attribute specifies whether the network uses a DNIC or INIC. It is used by X.75 Gateways to indicate whether in network the DNIC or INIC is used in various utilities. If it is DNIC it can be DNIC or DCC type. If it is INIC it can be 4 digits only.
Mib	SubnetInterface
Values	dnic inic
Default	dnic

ATTRIBUTE Mod Vcs x121Type (xtyp)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether DNIC mode or DCC mode is used in X.121 address of international calls. If DCC is specified, then the first 3 digits of each DNA must be the Network ID Code. If this attribute is changed all Dnas in the network must start with this code. Numbering plan is affected by the change.
Mib	SubnetInterface
Values	dnic dcc
Default	dnic

ATTRIBUTE Mod Vcs networkIdCode (nic)

Access	Read and write
Description	This attribute specifies the DNIC (Data Network ID Code) of the network or DCC code.
Mib	SubnetInterface
Values	BCD (3..4)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mod Vcs x121IntlAddresses (xia)

Access	Read and write
Description	This attribute indicates if any DTE is allowed to signal international addresses.
Mib	SubnetInterface
Values	disallowed allowed
Default	allowed

ATTRIBUTE Mod Vcs x121IntlPrefixDigit (xipd)

Access	Read and write
Description	This attribute indicates the prefix digit to be used for X.121 international calls. When this digit is provided the call will have full international address.
Mib	SubnetInterface
Values	Decimal (0..9)
Default	9

ATTRIBUTE Mod Vcs x121MinAddressLength (xmial)

Access	Read and write
Description	This attribute indicates minimum length of x121 address.
Mib	SubnetInterface
Values	Decimal (1..16)
Default	1

ATTRIBUTE Mod Vcs x121MaxAddressLength (xmaal)

Access	Read and write
Description	This attribute indicates maximum length of x121 address.
Mib	SubnetInterface
Values	Decimal (1..16)
Default	15

ATTRIBUTE Mod Vcs x121ToE164EscapeSignificance (xtees)

Access	Read and write
Description	This attribute specifies whether an X.121 to E.164 escape digit has significance in selecting an X.32 (analog) or an ISDN switched path. If two values are significant (the value 0 or the value 9) then yes is set to this

Copyright © 2006, Nortel Nortel Confidential

attribute. If the value of the originally entered escape digit is not significant in routing the call then value of no is assigned to this attribute.

Mib SubnetInterface

Values
no
yes

Default no

ATTRIBUTE Mod Vcs e164IntlFormatAllowed (eifa)

Access Read and write

Description

This attribute indicates whether or not to allow national format E.164 addresses. If this attribute is set to a value of Yes (=1) then national format E.164 addresses are not allowed and international format addresses only are allowed. If this attribute is set to a value of No (=0), then national format E.164 addresses are allowed.

If only international format E.164 addresses are allowed, then the 'e164NatlPrefixDigit' attribute is not required, nor is the 'e164IntlPrefixDigits' required.

Mib SubnetInterface

Values
disallowed
allowed

Default allowed

ATTRIBUTE Mod Vcs e164IntlPrefixDigits (eipd)

Access Read and write

Description

This attribute specifies the E.164 international prefix digits. If applicable, it is specified as 1 to 3 BCD digits.

The 3 BCD digits are stored with the length of the international prefix in the low order nibble, nibble [0] followed by the most significant digit of the international prefix in the next low order nibble, nibble [1], etc.

This attribute is not required if the corresponding attribute, 'e164IntlFormatOnly' is set to a value of Yes (=1).

Mib SubnetInterface

Values BCD (0..3)

Default 0

ATTRIBUTE Mod Vcs e164NatlPrefixDigit (enpd)

Access Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute contains the E.164 national prefix which may be added in front of E.164 local or national call. If e164IntlFormatOnly is set to 1, this attribute is not needed.
Mib	SubnetInterface
Values	Decimal (0..9)
Default	1

ATTRIBUTE Mod Vcs e164LocalAddressLength (elal)

Access	Read and write
Description	This attribute indicates the length of a local E.164 DNA on this module. This attribute is not required if the corresponding attribute, e164IntlFormatOnly is set to a value of yes. This attribute does not need to be consistent across all of the nodes in the network.
Mib	SubnetInterface
Values	Decimal (4..15)
Default	7

ATTRIBUTE Mod Vcs e164TeleCountryCode (etcc)

Access	Read and write
Description	This attribute specifies the E.164 Telephone Country Code (TCC) for the country in which the network resides. If applicable, it is specified as 1 to 3 BCD digits. The 3 BCD digits are stored with the length of the TCC in the low order nibble, nibble [0] followed by the most significant digit of the TCC in the next low order nibble, nibble [1], etc.
Mib	SubnetInterface
Values	BCD (1..4)
Default	1

ATTRIBUTE Mod Vcs e164NatlMinAddressLength (enmial)

Access	Read and write
Description	This attribute indicates minimum length of e164 national address.
Mib	SubnetInterface
Values	Decimal (1..16)

Copyright © 2006, Nortel Nortel Confidential

Default	1

ATTRIBUTE Mod Vcs e164NatlMaxAddressLength (enmaal)

Access	Read and write
Description	This attribute indicates maximum length of e164 national address.
Mib	SubnetInterface
Values	Decimal (1..16)
Default	15

ATTRIBUTE Mod Vcs e164IntlMinAddressLength (eimial)

Access	Read and write
Description	This attribute indicates minimum length of e164 international address.
Mib	SubnetInterface
Values	Decimal (1..16)
Default	1

ATTRIBUTE Mod Vcs e164IntlMaxAddressLength (eimaal)

Access	Read and write
Description	This attribute indicates maximum length of e164 international address.
Mib	SubnetInterface
Values	Decimal (1..16)
Default	15

ATTRIBUTE Mod Vcs e164LocalMinAddressLength (elmial)

Access	Read and write
Description	This attribute indicates minimum length of e164 local address.
Mib	SubnetInterface
Values	Decimal (1..16)
Default	1

ATTRIBUTE Mod Vcs e164LocalMaxAddressLength (elmaal)

Access	Read and write
Description	This attribute indicates maximum length of e164 local address.
Mib	SubnetInterface
Values	Decimal (1..16)
Default	15

Copyright © 2006, Nortel Nortel Confidential

GROUP Mod Vcs InterfaceOptions (IntOpt)

Properties	Provisioned
Description	The *Vc InterfaceOptions* group defines *Vc* system parameters common in the network. It is owned by the *Vc* and is considered to be a module wide component on the switch. The data contained in the *Vc InterfaceOptions* group must be identical network wide even though this group can be changed and upgraded on a module by module basis.
Mib	SubnetInterface

ATTRIBUTE Mod Vcs highPriorityPacketSizes (hpps)

Access	Read only
Description	This attribute indicates which packet sizes are supported for high priority calls within the network.
Mib	SubnetInterface
Set of	16 32 64 128 256 512 1024 2048 4096
Default	(16, 32, 64, 128, 256, 512, 1024, 2048, 4096)

ATTRIBUTE Mod Vcs maxSubnetPacketSize (msps)

Access	Read and write
Description	This attribute specifies the maximum subnet packet size used for the connections originating or terminating on this module. All modules in the same network should have the same *maxSubnetPacketSize*. If this value is not identical throughout the network, the following points need to be considered: a) When a Nortel Networks Multiservice Switch and a DPN switch are connected in the same network, the *maxSubnetPacketSize* on a DPN switch can be at most 2048 and the DPN part of the network must be configured with hardware that supports this size: - Dedicated PE386 Network link/Trunk

Copyright © 2006, Nortel Nortel Confidential

- Minimum measured link speed of 256kbit/s

This hardware has to be present on every potential data path between connecting end points!

b) The calling end of the connection signals the *maxSubnetPacketSize* value to the called end. The called end then compares this value to its own provisioned value and selects the smaller value. Note that this smaller value is not signaled back to the calling end. The calling and called ends can therefore have different *maxSubnetPacketSize* values.

Mib: SubnetInterface

Values:
16
32
64
128
256
512
1024
2048
4096

Default: 512

ATTRIBUTE Mod Vcs callSetupTimer (cst)

Access: Read and write

Description

This attribute specifies the *Vc callSetupTimer* in units of 1 second ticks. This timer specifies how long the *Vc* will wait, after sending a subnet Call Request packet into the network, for a response from the remote end of the *Vc* (in the form of a subnet Raccept packet). If, after sending a subnet Call packet into the network, a response is not received within this time period, the *Vc* will time out, clearing the call in the assumption that the remote end is unreachable. This timer must be long enough to take into account the time required for routing the subnet Call Request through the Source Call Routing and the Destination Call Routing systems in order to be delivered to the final destination.

Mib: SubnetInterface

Values: Decimal (5..100)

Default: 5

ATTRIBUTE Mod Vcs callRetryTimer (crt)

Access: Read and write

Description: This attribute specifies, for *Vc* implementing Direct Calls with the auto-call retry feature (including PVCs), the *Vc callRetryTimer* in units of 1 second

Copyright © 2006, Nortel Nortel Confidential

ticks. This timer specifies how long the *Vc* will wait between unsuccessful call attempts.

Mib	SubnetInterface
Values	Decimal (30..300)
Default	60

ATTRIBUTE Mod Vcs delaySubnetAcks (dsa)

Access	Read and write
Description	This attribute specifies delay acknowledgment timer mechanism. If this attribute is set to ***no***, then the *Vc* will automatically return acknowledgment packets without delay. If this attribute is set to ***yes***, then the *Vc* will wait for one second in an attempt to piggyback the acknowledgment packet on another credit or data packet. If the *Vc* cannot piggyback the acknowledgment packet within this time, then the packet is returned without piggybacking.
Mib	SubnetInterface
Values	no yes
Default	no

COMPONENT Mod FrameRelaySystem (Frs)

Scope	Application
Description	*Mod FrameRelaySystem* The *Frs* component defines the overall module wide data that is applicable to the Frame Relay system.

cbr
rtVbr
nrtVbr

Default nrtVbr

ATTRIBUTE Mod Frs AtmNet Tpm avgFrameSize (afs)

Access Read and write

Description This attribute specifies the average frame size that is used in the traffic parameter conversion policy calculations for this transfer priority to determine the overhead factor for FR to ATM interworking. The overhead

Copyright © 2006, Nortel Nortel Confidential

factor affects the granularity of the bandwidth requirements. The values should be identical across the network. Otherwise, there may result in bandwidth conversion inconsistencies.

Mib ModAtmQos

Values Decimal (1..8187)

Units bytes

Default 128

ATTRIBUTE Mod Frs AtmNet Tpm trafficParmConvPolicy (tpcp)

Access Read and write

Description This attribute specifies the traffic parameter conversion policy to use for this transfer priority to specify the equivalent bandwidth rate at the FrAtm interface.

Policy 3 characterizes the traffic in the following way:
- ATM traffic descriptor type 6 is selected
- PCR0+1 is based on the AR
- SCR0+1 is based on the CIR and EIR
- MBS0+1 is based on Bc,Be,CIR,EIR and AR
- Takes into account that the instantaneous rate of the frame relay stream can burst above CIR and up to the AR.

Policy 4 characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer.
- PCR0+1 is based on the AR
- SCR0 is based on the CIR
- MBS0 is based on Bc,CIR and AR
- There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR.

Policy 5 characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected . Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer
- PCR0+1 is based on CIR and EIR
- SCR0 is based on the CIR
- MBS0 is based on the Bc,CIR and AR
- The maximum PCR is no longer based on AR but based on the CIR and EIR.

Policy 6 characterizes the traffic in the following way:
- ATM traffic descriptor type 3 is selected
- PCR0+1 is based only on CIR.

ATTRIBUTE Mod Frs AtmNet Tpm assignedBandwidthPool (asgBwPool)

Access	Read and write
Description	This attribute specifies the bandwidth pool which is used to support this transfer priority. The bandwidth pool is defined in the *frAtm Ca* component.
Mib	ModAtmQos
Values	0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
Default	0

COMPONENT Mod Frs DprsNetworking (DprsNet)

Scope	Application
Description	*Mod Frs DprsNetworking* *DprsNetworking* is used to define a number of general characteristics for all Frame Relay connections using DPRS networking. All the modules in the network should have identical *DprsNetworking* attributes. If these attributes are not consistent across the network, then the service may be degraded.

COMPONENT Mod Frs DprsNet TransferPriorityMappingDprsNet (Tpm)

Instance	Decimal (0..15)
Groups	GROUP Mod Frs DprsNet Tpm Provisioned (Prov)
Scope	Application
Description	*Mod Frs DprsNet TransferPriorityMappingDprsNet/n* This component represents default transfer priority mappings for Frame Relay connections using DPRS networking.
Mib	ModDprsQos
Common Verbs	Help List Display Add

GROUP Mod Frs DprsNet Tpm Provisioned (Prov)

Properties	Provisioned
Description	This group specifies the mapping from the defined transfer priority to the egress emission priority and routing class of service. The mapping of transfer priority to egress emission priority and routing class of service may be modified by the user. Any changes to transfer priority mappings take effect on new calls. Existing connections are not affected by changes to transfer priority mappings unless the service is reset by locking and unlocking the connection or resetting the card where the service resides.
Mib	ModDprsQos

ATTRIBUTE Mod Frs DprsNet Tpm emissionPriority (ep)

Access	Read and write
Description	This attribute specifies the egress emission priority at the Frame Relay interface. A value of ***3*** specifies the highest priority, whereas a value of ***0*** specifies the lowest priority.
Mib	ModDprsQos
Values	Decimal (0..3)
Default	0

ATTRIBUTE Mod Frs DprsNet Tpm routingClassOfService (rcos)

Access	Read and write
Description	This attribute specifies the routing class of service value to be used on a transport connection. A value of ***multimedia*** specifies the highest class of service and a value of ***throughput*** specifies the lowest class of service.
Mib	ModDprsQos

Copyright © 2006, Nortel Nortel Confidential

Values	throughput delay multimedia
Default	throughput

ATTRIBUTE Mod Frs DprsNet Tpm assignedIngressBandwidthPool (asgInBwPool)

Access	Read and write
Description	This attribute specifies the ingress bandwidth pool which is used to support this transfer priority at the *FrUni* and *FrNni* interface. For *FrUni* and *FrNni*, this pool is defined by provisioning attributes *ingressCirBandwidthPool* and *ingressEirBandwidthPool* under the *FrUni Ca* and *FrNni Ca* component respectively. The value of this attribute can be overridden at the interface level by provisioning attribute *assignedIngressBandwidthPool* under the *FrUni Ca Tpm/n* and *FrNni Ca Tpm/n* component respectively.
Mib	ModDprsQos
Values	Decimal (0..15)
Default	0

ATTRIBUTE Mod Frs DprsNet Tpm assignedEgressBandwidthPool (asgEgBwPool)

Access	Read and write
Description	This attribute specifies the egress bandwidth pool which is used to support this transfer priority at the *FrUni* and *FrNni* interface. For *FrUni* and *FrNni*, this pool is defined by provisioning attributes *egressCirBandwidthPool* and *egressEirBandwidthPool* under the *FrUni Ca* and *FrNni Ca* component respectively. The value of this attribute can be overridden at the interface level by provisioning attribute *assignedEgressBandwidthPool* under the *FrUni Ca Tpm/n* and *FrNni Ca Tpm/n* component respectively.
Mib	ModDprsQos
Values	Decimal (0..15)
Default	0

COMPONENT Mod Frs IpCosToFrQos (IpCosToFrQos)

Scope	Application
Description	*Mod Frs IpCosToFrQos* This component is used to define a number of general characteristics for all Frame Relay connections using Frame Relay IP Traffic management. All the modules in the network should have identical *IpCosToFrQos*

Copyright © 2006, Nortel Nortel Confidential

attributes. If these attributes are not consistent across the network, then the service may be degraded.

Mib	ModIpCosToFrQos
Subcomponents	COMPONENT Mod Frs IpCosToFrQos TypeOfServiceMapping (Tosm)

COMPONENT Mod Frs IpCosToFrQos TypeOfServiceMapping (Tosm)

Instance	Decimal (0..255)
Groups	GROUP Mod Frs IpCosToFrQos Tosm Provisioned (Prov)
Scope	Application
Description	*Mod Frs IpCosToFrQos TypeOfServiceMapping/n* This component represents the type of service mappings for Frame Relay connections using Frame Relay IP Traffic Management. The instance corresponds to a particular IP TOS value. All 256 possible instances are always present. Instances of this component cannot be deleted.
Mib	ModIpCosToFrQos
Common Verbs	Help List Display Add

GROUP Mod Frs IpCosToFrQos Tosm Provisioned (Prov)

Properties	Provisioned
Description	This group specifies the mapping from the IP type of service value to the egress emission priority and discard priority. Any changes to TOS mappings will immediately take effect on new calls.
Mib	ModIpCosToFrQos

ATTRIBUTE Mod Frs IpCosToFrQos Tosm emissionPriority (ep)

Access	Read and write
Description	This attribute specifies the egress emission priority at the Frame Relay interface. A value of ***3*** specifies the highest priority, whereas a value of ***0*** specifies the lowest priority. Changes to this attribute effect only new calls.
Mib	ModIpCosToFrQos

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..3)
Default	0

ATTRIBUTE Mod Frs IpCosToFrQos Tosm discardPriority (dp)

Access	Read and write
Description	This attribute specifies the egress discard priority at the Frame Relay interface. A value of ***normal*** specifies the lowest priority (more readily discarded), whereas a value of ***high*** specifies the highest priority (less readily discarded). Changes to this attribute effect only new calls.
Mib	ModIpCosToFrQos
Values	normal high
Default	normal

GROUP Mpanl CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for the MPANL component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl customerIdentifier (cid)

Access	Read only
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to

Copyright © 2006, Nortel Nortel Confidential

as “NetMan” in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Mib	MpaNetworkLink
Values	Decimal (0; 1..8191)
Default	0

GROUP Mpanl Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes of the MPANL service.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl commentText

Access	Read and write
Description	This attribute specifies the name the customer wishes to associate with this MPANL interface.
Mib	MpaNetworkLink
Values	String (0..40, ASCII)
Default	No default

GROUP Mpanl EmissionPriorityQs

Properties	Provisioned
Description	This group contains the provisionable attribute to specify the number of Frame Relay egress emission priority queues to be used on that Frame Relay Interface
Mib	MpaNetworkLink

ATTRIBUTE Mpanl numberOfEmissionQs

Access	Read only
Criticality	Process
Description	This attribute specifies the number of egress emission priority queues that will be used for that Frame Relay interface. The possible values of this attribute are 2 or 4: For V.35, V.11, HSSI, E1, DS1, E3, DS3 or 8pDS1 the possible values are: 2 (in which case they are hardware queues), or 4 (in which case they are software queues). For DS1C, E1C or DS3C the possible values are 2, 4 (in all cases they are software queues).

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	Decimal (2; 4)
Default	4

GROUP Mpanl OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	MpaNetworkLink
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Mpanl operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: MpaNetworkLink

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Mpanl usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: MpaNetworkLink

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE Mpanl availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test

Copyright © 2006, Nortel Nortel Confidential

procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Copyright © 2006, Nortel Nortel Confidential

Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Mpanl proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	MpaNetworkLink
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Mpanl controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	MpaNetworkLink
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Mpanl alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	MpaNetworkLink
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Mpanl standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Mpanl unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	MpaNetworkLink
Values	false true
Default	false

GROUP Mpanl Statistics (Stats)

Properties	Operational
Description	FrUni/n Statistics This group contains the statistics about the operational behavior of the service at the interface level.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl lastUnknownDlci (ludlc)

Access	Read only
Description	This attribute identifies the most recent DLCI which user frames were received on for which a DLCI has not been provisioned on the port.
Mib	MpaNetworkLink
Values	Decimal (0..1023)
Default	0

ATTRIBUTE Mpanl unknownDlciFramesFromIf (unknown)

Access	Read only
Description	This attribute contains a count of the number of frames received from the

Copyright © 2006, Nortel Nortel Confidential

	interface with an unknown DLCI (DLCI which is not provisioned). When the maximum is reached the count wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl invalidHeaderFramesFromIf (invalid)

Access	Read only
Description	This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is reached the count wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

GROUP Mpanl TrafficStatistics (TrafficStats)

Properties	Operational
Description	This operational group provides the traffic statistics of the service at the interface level. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl frmToIf

Access	Read only
Description	This attribute counts frames transmitted to the interface. This count may differ from its framer counterpart because Voice over Frame Relay function may fragment and pack the Frame Relay frames before transmission. When the maximum is reached the count wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl octetToIf

Access	Read only
Description	This attribute counts octets transmitted to the interface. This count may differ from its framer counterpart because Voice over Frame Relay function may fragment and pack the Frame Relay frames before transmission. When the maximum is reached the count wraps to zero.

GROUP Mpanl IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	MpaNetworkLink
Values	up down testing
Default	up

ATTRIBUTE Mpanl ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	MpaNetworkLink
Values	Decimal (1..65535)
Default	No default

GROUP Mpanl OperationalStatus (OperStatus)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	MpaNetworkLink
Values	up down testing
Default	up

GROUP Mpanl Operational (Oper)

Properties	Operational
Description	This group contains miscellaneous operational attributes of the MPANL service.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the round trip delay of the MPANL interface. The round trip delay measurement is only made when this attribute is displayed. The measured value is rounded up to the next millisecond. This attribute has the value 0, if the delay measurement cannot be made.
Mib	MpaNetworkLink
Values	Decimal (0..10000)
Units	msec

List
Display

GROUP Mpanl Dna OutgoingOptions

Properties Provisioned

Description *DnaOutOptionsProv* group defines call options of a *Dna* for calls which are made out of the interface represented by *Dna*. All these options are not used for calls arriving to the interface represented by *Dna*.

Mib MpaNetworkLink

ATTRIBUTE Mpanl Dna defaultTransferPriority (dtp)

Access Read and write

Description This attribute specifies the default transfer priority to network for all outgoing calls using this particular *Dna*.

The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15.

Each transfer priority n, where n indicates the transfer priority index, contains a default setting for routing class of service (multimedia, delay or throughput) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.

The default *defaultTransferPriority* is ***0***.

Properties Provisioned

Description *DnaCallOptions* group defines additional options for calls not related directly to direction of a call.

Mib MpaNetworkLink

ATTRIBUTE Mpanl Dna accountClass (acl)

Access Read and write

Description This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator.
This attribute is returned by the local VC in the accounting record for all calls setup using this particular DNA.

Mib MpaNetworkLink

Values Decimal (0..255)

Default 0

ATTRIBUTE Mpanl Dna accountCollection (aco)

Access Read and write

Description This set attribute indicates that accounting records are to be collected by the network for the various reasons: billing, test, study, auditing. The last of the parameters, force, indicates that accounting records are to be collected irrespective of other collection reasons. The force option is available for X.75 Gateways only. If none of these reasons are set, then accounting will be suppressed.

To set a specific accounting collection reason, the reason is entered and the corresponding bit in the structure is set to a value of 1. To turn off a specific accounting collection reason, the reason is entered preceded with the '^' character, and the corresponding bit in the structure is set to a value of 0.

The bit placement for the accounting collection reasons is as follows:
Bit 0 - Bill
Bit 1 - Test

Copyright © 2006, Nortel Nortel Confidential

Bit 2 - Study
Bit 3 - Audit
Bit 4 - Force

Mib: MpaNetworkLink

Set of:
bill
test
study
audit
force

Default: (bill)

ATTRIBUTE Mpanl Dna serviceExchange (sre)

Access: Read and write

Description: This attribute is an arbitrary number, Data Service Exchange, as entered by the network operator and reported in accounting record. It is converted into an internal 8-bit integer value for use in the accounting record as well as in various X.25 and X.75 Tariff utilities.

Mib: MpaNetworkLink

Values: Decimal (0..255)

Default: 0

ATTRIBUTE Mpanl Dna egressAccounting (ega)

Access: Read and write

Description:

This attribute specifies if Egress accounting is enabled by the MPANL service. Disabling of Egress accounting means that only segment counts are collected by VC and there are no frame relay counts in accounting records for the MPANL service. Enabling of Egress accounting means that the accounting records for MPANL contain frame relay specific counts.

Mib: MpaNetworkLink

Values:
yes
no

Default: no

COMPONENT Mpanl Framer

Groups:
GROUP Mpanl Framer Provisioned (Prov)
GROUP Mpanl Framer LinkOptions (Link)
GROUP Mpanl Framer OsiState (State)
GROUP Mpanl Framer Statistics (Stats)
GROUP Mpanl Framer LinkUtilization (Util)

COLLECTED STATS MpaNetworkLink Framer

Copyright © 2006, Nortel Nortel Confidential

Scope	Network
Description	*Mpanl/<n> Framer* The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).
Mib	MpaNetworkLink
Common Verbs	Help List Display Add DELete

GROUP Mpanl Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP Mpanl Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Framer dataInversion

Access	Read and write
Description	This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed. This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted. This attribute may only take its default value for non-MSA cards.
Mib	MpaNetworkLink
Values	off on
Default	off

ATTRIBUTE Mpanl Framer frameCrcType

Access	Read and write
Description	This attribute defines the type of CRC used. The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used. This attribute may take only its default value for non-MSA cards.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	crc16 crc32 noCrc
Default	crc16

ATTRIBUTE Mpanl Framer flagsBetweenFrames

Access	Read and write
Description	This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.
Mib	MpaNetworkLink
Values	Decimal (1..16)
Default	1

GROUP Mpanl Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Mpanl Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	MpaNetworkLink
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Mpanl Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	MpaNetworkLink
Values	idle active (activ) busy
Default	idle

GROUP Mpanl Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink

ATTRIBUTE Mpanl Framer aborts

Access	Read only
Description	This attribute is the total number of aborts received.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer crcErrors

Access	Read only
Description	This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer lrcErrors

Access	Read only
Description	This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer nonOctetErrors

Access	Read only
Description	This attribute is the total number of frames that were non octet aligned.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer overruns

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is the total number of frames received from the link for which overruns occurred.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer underruns

Access	Read only
Description	This attribute is the total number of frames transmitted to the link for which underruns occurred.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer largeFrmErrors

Access	Read only
Description	This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer frmModeErrors

Access	Read only
Description	This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Framer frmToIf

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The number of frames transmitted to the link interface by Framer. Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component.
Mib	MpaNetworkLink
Values	Long Integer
Default	No default

ATTRIBUTE Mpanl Framer frmFromIf

Access	Read only
Description	The number of frames received from the link interface by Framer.
Mib	MpaNetworkLink
Values	Long Integer
Default	No default

ATTRIBUTE Mpanl Framer octetFromIf

Access	Read only
Description	The number of bytes received from the link interface by Framer.
Mib	MpaNetworkLink
Values	Long Integer

Description	*Clear Mpanl/n Dlci/n* This command is used to clear an MPANL connection.

GROUP Mpanl Dlci **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: MpaNetworkLink

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Mpanl Dlci operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	MpaNetworkLink
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Mpanl Dlci availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of

Copyright © 2006, Nortel Nortel Confidential

disabled is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Mpanl Dlci proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is

Copyright © 2006, Nortel Nortel Confidential

enabled.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Mpanl Dlci alarmStatus (osiAlarm)

Access — Read only

Copyright © 2006, Nortel Nortel Confidential

Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	MpaNetworkLink
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Mpanl Dlci standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

Copyright © 2006, Nortel Nortel Confidential

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — MpaNetworkLink

Values — hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default — notSet

ATTRIBUTE Mpanl Dlci unknownStatus (osiUnknw)

Access — Read only

Description — This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib — MpaNetworkLink

Values — false
true

Default — false

GROUP Mpanl Dlci CallData (CallId)

Properties — Operational

Description — This group of attributes describes the characteristics of the call such as call type and call state.

Mib — MpaNetworkLink

ATTRIBUTE Mpanl Dlci q933CallState (qstate)

Access — Read only

Description

This attribute indicates the Q.933 state of an SVC call. In the description that follows, “local” refers to the user who has initiated the SETUP request, and “remote” refers to the user to whom the local user wishes to connect.

State description:
In the ***null*** state, the network has neither received nor sent call setup requests for this DLCI.

Copyright © 2006, Nortel Nortel Confidential

In the ***callInitiated*** state, the network has received a SETUP message from the local user.
In the ***outgoingCallProceeding*** state, the network has sent a CALL PROCEEDING message to the local user in response to the SETUP message.
In the ***callPresent*** state, the network has sent a SETUP message to the remote user.
In the ***incomingCallProceeding*** state, the network has received a CALL PROCEEDING message from the remote user in response to a SETUP message.
In the ***active*** state, either the network has sent a CONNECT message to the local user, or the network has received a CONNECT from the remote user.
In the ***disconnectRequest*** state, the network has received a DISCONNECT message from the local user.
In the ***disconnectIndication*** state, the network has sent a DISCONNECT to the local user.
In the ***releaseRequest*** state, the network has sent out a RELEASE message to the local user.
The ***notApplicable*** state indicates that this attribute is meaningless because the DLCI is a PVC.

Mib: MpaNetworkLink

releaseRequest
notApplicable

Default: No default

ATTRIBUTE Mpanl Dlci q933CallReference (callref)

Access: Read only

Description:
This attribute indicates the Q.933 call reference number associated with this DLCI.

Mib: MpaNetworkLink

Values: Decimal (0..32767)

Default: No default

GROUP Mpanl Dlci ServiceParametersOp (SpOp)

Properties: Operational

Copyright © 2006, Nortel
Nortel Confidential

Description	This group contains the service parameters specific to this instance of *Dlci*.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci maximumFrameSize (n203)

Access	Read only
Description	This attribute specifies the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Frame Relay Vendor Forum Specification.
Mib	MpaNetworkLink
Values	Decimal (1..4096)
Units	octets
Default	No default

ATTRIBUTE Mpanl Dlci committedBurstSize (bc)

Access	Read only
Description	This attribute indicates the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	MpaNetworkLink
Values	Decimal (0..50000000)
Units	bits
Default	No default

ATTRIBUTE Mpanl Dlci excessBurstSize (be)

Access	Read only
Description	This attribute indicates the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..50000000)
Units	bits
Default	No default

ATTRIBUTE Mpanl Dlci accounting (ac)

Access	Read only
Description	This attribute indicates whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be occur, the *accountingOn* attribute must be ***on*** and at least one of the *accountCollection* options in the *DataNetworkAddress* component must be selected.
Mib	MpaNetworkLink
Values	off on
Default	No default

ATTRIBUTE Mpanl Dlci emissionPriorityToIf (epToIf)

Access	Read only
Description	This attribute indicates the emission priority of frames sent to the interface. A larger value denotes a higher priority.
Mib	MpaNetworkLink
Values	Decimal (0; 1; 2; 3)
Default	No default

ATTRIBUTE Mpanl Dlci transferPriorityToNetwork (tpToNwk)

Access	Read only
Description	This attribute indicates the priority at which data is transferred to the network. The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15. Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay*** or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered

Description	This attribute counts the number of frames with BECN set by the MPANL service. It is incremented whenever the MPANL service sets BECN on a frame upon detecting local congestion. This count is incremented regardless of whether the frame already bears a set BECN bit since its use is to determine the place of congestion. When the count reaches maximum, it wraps to zero.

ATTRIBUTE Mpanl Dlci callReferenceNumber

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl Dlci elapsedDifference

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since the call started.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

GROUP Mpanl Dlci ABitStatus (Abit)

Properties	Operational
Description	This group contains the A-Bit status information for this Data Link Connection Identifier. A-Bit status information is only applicable for SPVCs. For SVCs, the values of attributes under this group are all **notApplicable**.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci aBitStatusToIf (abti)

Access	Read only
Description	This attribute is the most recent A-Bit status sent to the interface. The A-Bit status is originated from the SPVC end point at the remote end of the subnet and it is relayed to the interface by *Mpanl.* When an inactive setting is sent out, *Mpanl* will discard any data offered from the interface. When an active setting is sent out, *Mpanl* will try to relay all data offered from the interface to the other end of the SPVC.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	inactive active notApplicable
Default	inactive

ATTRIBUTE Mpanl Dlci aBitReasonToIf (abrti)

Access	Read only
Description	This attribute provides the reason (if any) for an inactive status to be sent to the interface. This reason is not applicable for an active status. A-Bit status reason description: The A-Bit status reason is ***notApplicable*** when the A-Bit status is active. The A-Bit status reason is ***remoteUserSignaled*** if the SPVC end point originating the A-Bit status has detected that the virtual circuit is down at the remote network through the LMI protocol. The SPVC end point must be running network site LMI protocol for this A-Bit status reason to be sent. The A-Bit status reason is ***remoteLmiError*** if the LMI protocol is down at the SPVC end point originating this A-Bit status reason. The A-Bit status reason is ***remoteLinkDown*** if the physical interface is disabled at the SPVC end point originating this A-Bit status reason. The A-Bit reason is ***vcDown*** if no A-Bit status has been sent to the interface (i.e., no A-Bit status has been relayed).
Mib	MpaNetworkLink
Values	notApplicable remoteUserSignaled remoteLmiError remoteLinkDown vcDown

VERB Ping **Mpanl Dlci Vc**

Impact: Passive

Description: *Ping [-roundTripDelay] [-sendPktDataSize(octets)] [-returnPktDataSize(octets)] Mpanl/<n> Dlci/<n> Vc*

Ping causes a query packet to be sent to the destination module where an MPANL Frame Relay DLCI VC terminates. This command can only be used on an MPANL Frame Relay VC type. It can be used to either display the path of the VC being used by the Frame Relay DLCI or to measure the round trip delay of the Frame Relay DLCI connection. Since the query packet carries the same path selector as the Frame Relay data packets and the Frame Relay VC's transfer priority (TP) is used to set the RCOS, reliability and emission priority of the query packet, the path taken by the *ping* query packet will be the same as that of the Frame Relay data except at the source and destination module. The *ping* packets originate from the CP rather than the MPANL Frame Relay DLCI's FP. At the far end, it is also the CP that receives the ping packets and returns them, rather than the MPANL FP.

Note that this command does not provide any information regarding the status of the far end VC process. If, however, the destination module is unreachable or the VC path is congested, the operator will be notified.

The *ping* command can be issued with or without options. If no options are specified, the command reports the path of the VC associated with the Frame Relay DLCI. When the command is used to find the VC path, it displays the RID and MID of each module that the query packet passes through on its way to the destination. If the *roundTripDelay* option is specified, the command reports the time taken to reach the destination and back. For the *roundTripDelay* option, the path taken by the query packets in both directions (from the source to the destination and from the destination back to the source) is the same as that of the Frame Relay data except at the source and destination where the *ping* packets are generated and bounced back by the CP rather than the MPANL Frame Relay DLCI's FP.

The *ping* command supports the following options:

-roundTripDelay (-rtd): If this option is selected, the round trip delay time to reach the destination and back will be reported. The round trip delay is calculated by timing how long it takes to send five packets to the destination node and back. The packet size can be specified using the *sendPktSize* and *returnPktSize* options. The minimum, maximum and average time taken by the returned packets are reported. If this option is not selected, the path taken to the destination is displayed.

-sendPktDataSize: This option specifies the number of data octets to be included in the round trip delay query packet. The rtd query packet consists of the Nortel Networks proprietary common header (2 octets), the

Copyright © 2006, Nortel Nortel Confidential

subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are sent to the destination. The actual number of data octets sent is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the time-out response.

-returnPktDataSize: This option specifies the number of data octets to be included in the round trip delay acknowledge packet. The rtd acknowledge packet consists of the Nortel Networks proprietary common header (2 octets), the subnet header (11 octets), plus the data. The minimum data size is 12, since 12 octets are required to carry the ping control information. If the value specified for this option is less than 12, 12 octets are returned to the source. The actual number of data octets returned is displayed in the ping response. Note that the total packet size (headers plus data) is identical to that of a Frame Relay packet carrying the same number of octets of data.

If this option is not selected the default value is 64 octets if *transferPriority* of the *Frame Relay DLCI Dc* is 11, and 128 octets otherwise. This option is ignored if the *-rtd* option is not specified. If the specified packet data size exceeds the capability of some facilities on the path, the packet will be discarded and the operator will get the time-out response.

GROUP Mpanl Dlci Vc CallData (Cad)

Properties	Operational
Description	This group represents operational call data related to Frame Relay *Vc*. It can be displayed only for Frame Relay *Vc* which is created by application.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci Vc type

Access	Read only
Description	This attribute displays the type of call, ***pvc***, ***svc, spvc*** or ***frf10spvc***.
Mib	MpaNetworkLink
Values	pvc svc spvc frf10spvc

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Mpanl Dlci Vc state

Access	Read only
Description	This attribute displays the state of call control. P5 state is not supported but is listed for completeness. Transitions from one state to another take very short time. *state* most often displayed is ***dataTransferP4***.
Mib	MpaNetworkLink
Values	creating readyP1 dteWaitingP2 dceWaitingP3 dataTransferP4 unsupportedP5 dteClearRequestP6 dceClearIndicationP7 termination
Default	No default

ATTRIBUTE Mpanl Dlci Vc previousState

Access	Read only
Description	This attribute displays the previous state of call control. This is a valuable field to determine how the processing is progressing.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci Vc accountingEnabled

Access	Read only
Description	This attribute indicates that this optional section of accounting record is suppressed or permitted. If *accountingEnabled* is ***yes***, conditions for generation of accounting record were met. These conditions include billing options, vc recovery conditions and Module wide accounting data options.
Mib	MpaNetworkLink
Values	yes no
Default	No default

ATTRIBUTE Mpanl Dlci Vc fastSelectCall

Access	Read only
Description	This attribute displays that this is a fast select call.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	yes no
Default	No default

ATTRIBUTE Mpanl Dlci Vc pathReliability

Access	Read only
Description	This attribute displays the path reliability.
Mib	MpaNetworkLink
Values	high normal
Default	No default

ATTRIBUTE Mpanl Dlci Vc accountingEnd

Access	Read only
Description	This attribute indicates if this end should generate an accounting record. Normally, ***callingEnd*** is the end to generate an accounting record.
Mib	MpaNetworkLink
Values	callingEnd calledEnd
Default	No default

ATTRIBUTE Mpanl Dlci Vc priority

Access	Read only
Description	This attribute displays whether the call is a ***normal*** or a ***high*** priority call.
Mib	MpaNetworkLink
Values	normal high
Default	No default

ATTRIBUTE Mpanl Dlci Vc segmentSize

Access	Read only
Description	This attribute displays the segment size (in bytes) used on the call. It is used to calculate the number of segments transmitted and received.
Mib	MpaNetworkLink
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Mpanl Dlci Vc maxSubnetPktSize

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the maximum packet size allowed on the *Vc*.
Mib	MpaNetworkLink
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE Mpanl Dlci Vc rcosToNetwork (rcosto)

Access	Read only
Description	This attribute indicates the routing metric routing class of service to the network.
Mib	MpaNetworkLink
Values	throughput delay multimedia
Default	No default

ATTRIBUTE Mpanl Dlci Vc rcosFromNetwork (rcosfrom)

Access	Read only
Description	This attribute displays the routing metric Routing Class of Service from the Network.
Mib	MpaNetworkLink
Values	throughput delay multimedia
Default	No default

ATTRIBUTE Mpanl Dlci Vc emissionPriorityToNetwork (epto)

Access	Read only
Description	This attribute displays the network internal emission priority to the network.
Mib	MpaNetworkLink
Values	normal high interrupting
Default	No default

ATTRIBUTE Mpanl Dlci Vc emissionPriorityFromNetwork (epfrom)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the network internal emission priority from the network.
Mib	MpaNetworkLink
Values	normal high interrupting
Default	No default

ATTRIBUTE Mpanl Dlci Vc dataPath (dapa)

Access	Read only
Description	This attribute indicates the data path used by the connection. The data path is provisioned in *Dna* and *DirectCall* components. The displayed value of this attribute can be different from the provisioned value. If the connection is using ***dprsOnly*** data path, the string ***dprsOnly*** is displayed. (dynamic packet routing system) If the connection is using ***dprsMcsOnly*** data path, the string ***dprsMcsOnly*** is displayed. If the connection is using ***dprsMcsFirst*** data path, the string ***dprsMcsFirst*** is displayed.
Mib	MpaNetworkLink
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Mpanl Dlci Vc dprsMcsEndPoint (dmep)

Access	Read only
Description	This attribute displays the data path used by the connection. Data path is provisioned in *Dna* and *DirectCall* components. If the connection is using ***dprsOnly*** data path, this attribute is empty. If the connection is using ***dprsMcsOnly*** or ***dprsMcsFirst*** data path, this attribute displays component name of the dprsMcsEndPoint.
Mib	MpaNetworkLink

GROUP Mpanl Dlci Vc IntervalData (Intd)

Properties	Operational
Description	This group defines display of interval data collected by *Vc*. Data in this group is variable and may depend on time when this *display* command is issued.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci Vc elapsedTimeTillNow

Access	Read only
Description	This attribute displays the elapsed time representing the period of this interval data. It is elapsed time in 0.1 second increments since *Vc* started.
Mib	MpaNetworkLink
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Mpanl Dlci Vc segmentsRx

Access	Read only
Description	This attribute displays the number of segments received at the time command was issued. This is the segment received count maintained by accounting at each end of the *Vc*. This counter is updated only when the packet cannot be successfully delivered out of the sink *Vc* and to the sink AP Conditions in which packets may be discarded by the sink *Vc* include: missing packets due to subnet discards, segmentation protocol violations due to subnet discard, duplicated and out-of-ranged packets and packets that arrive while *Vc* is in path recovery state.
Mib	MpaNetworkLink
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Mpanl Dlci Vc segmentsSent

Access	Read only
Description	This attribute displays the number of segments sent at the time command was issued. This is the segment sent count maintained by accounting at the source *Vc*. *Vc* only counts packets that *Vc* thinks can be delivered successfully into the subnet. In reality, these packets may be dropped by trunking, for instance. This counter is not updated when splitting fails, when *Vc* is in a path recovery state, when packet forwarding fails to forward this packet and when subsequent packets have to be discarded as we want to minimize the chance of out-of-sequence and do not intentionally send out-of-sequenced packets into the subnet.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	Decimal (0..16777215)
Default	No default

ATTRIBUTE Mpanl Dlci Vc startTime

Access	Read only
Description	This attribute displays the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes.
Mib	MpaNetworkLink
Values	Time (DHMS)
Default	No default

ATTRIBUTE Mpanl Dlci Vc callReferenceNumber

Access	Read only
Description	This attribute displays the call reference number which is a unique number generated by the switch.The same Call Reference Number is stored in the interval data (accounting record) at both ends of the call. It can be used as one of the attributes in matching duplicate records generated at each end of the call.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

GROUP Mpanl Dlci Vc FrameRelayData (Frd)

Properties	Operational
Description	This group defines Frame Relay attributes collected by Frame Relay *Vc*. The purpose of *Vc* attributes is to aid end users and verification people to understand the *Vc* internal behavior. This is particularly useful when the network has experienced abnormality and we want to isolate problems and pinpoint trouble spots. Attributes are collected on a per *Vc* basis. Until a need is identified, statistics are not collected at a processor level. Each attribute is stored in a 32 bit field and is initialized to zero when a *Vc* enters into the data transfer state. When a PVC is disconnected and then connected again, the attributes will be reset. Attributes cannot be reset through other methods. Frame Relay *Vc* uses a best effort data packet delivery protocol and a different packet segmentation and combination methods from the General *Vc*. The Frame Relay *Vc* uses the same call setup and control mechanism (e.g. the support of non-flow control data packets) as in a General *Vc*.

Copyright © 2006, Nortel Nortel Confidential

	Most General *Vc* statistics and internal variables are used in a Frame Relay *Vc* and are displayed by software developers
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci Vc frmCongestedToSubnet

Access	Read only
Description	This attribute displays the number of frames from link discarded due to lack of resources. It keeps track of the number of frames from link that have to be discarded. The discard reasons include insufficient memory for splitting the frame into smaller subnet packet size.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc cannotForwardToSubnet

Access	Read only
Description	This attribute displays the number of discarded packets that can not be forwarded into the subnet because of subnet congestion. Number of frames from link discarded due to failure in forwarding a packet from *Vc* into the subnet.- This attribute is increased when packet forwarding fails to forward a packet into the subnet. If a frame is split into multiple subnet packets and a partial packet has to be discarded, all subsequent partial packets that have not yet been delivered to the subnet will be discarded as well.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc notDataXferToSubnet

Access	Read only
Description	This attribute records the number of frames from link discarded when the *Vc* tries to recover from internal path failure.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc outOfRangeFrmFromSubnet

Access	Read only
Description	This attribute displays the number of frames from subnet discarded due to out of sequence range for arriving too late.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Mpanl Dlci Vc combErrorsFromSubnet

Access	Read only
Description	This attribute records the number of subnet packets discarded at the sink *Vc* due to the *Vc* segmentation and combination protocol error. Usually, this occurs when the subnet discards packets and thus this statistics can be used to guest the number of subnet packets that are not delivered to the *Vc*. It cannot be used as an actual measure because some subnet packets may have been delivered to *Vc* but have to be discarded because these are partial packets to a frame in which some other partial packets have not been properly delivered to *Vc*
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc duplicatesFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded due to duplication. Although packets are not retransmitted by the Frame Relay *Vc*, it is possible for the subnet to retransmit packets. When packets are out-of-sequenced and copies of the same packets arrive, then this attribute is increased.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc notDataXferFromSubnet

Access	Read only
Description	This attribute displays the number of subnet packets discarded when data transfer is suspended in *Vc* recovery.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc frmLossTimeouts

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of lost frame timer expiries. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc ooSeqByteCntExceeded

Access	Read only
Description	This attribute displays the number times that the out of sequence byte threshold is exceeded. When the threshold is exceeded, this condition is treated as if the loss frame timer has expired and all frames queued at the sink *Vc* are delivered to the AP. We need to keep this count to examine if the threshold is engineered properly. This should be used in conjunction with the peak value of out-of-sequenced queue and the number of times the loss frame timer has expired. This count should be relatively small when compared with loss frame timer expiry count.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc peakOoSeqPktCount

Access	Read only
Description	This attribute displays the frame relay peak packet count of the out of sequence queue. This attribute records the maximum queue length of the out-of-sequenced queue. The counter can be used to deduce the message buffer requirement on a *Vc*.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc peakOoSeqFrmForwarded

Access	Read only
Description	This attribute displays the frame relay peak size of the sequence packet queue. The subnet may deliver packets out-of-sequenced. These packets are then queued in an out-of-sequenced queue, waiting for a packet with the expected sequence number to come. When that packet arrives, this attribute records the maximum number of packets that were out-of-sequenced, but now have become in-sequenced. The statistics is used to measure expected queue size due to normal subnet packet disorder (not due to subnet packet discard). Current

Copyright © 2006, Nortel Nortel Confidential

	implementation also uses this statistics to set a maximum size for the out-of-sequenced queue.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc sendSequenceNumber

Access	Read only
Description	This attribute displays the Vc internal packet's send sequence number. Note that a "packet" in this context, may be either a user data packet, or an OAM frame.
Mib	MpaNetworkLink
Values	Decimal (0..1048575)
Default	No default

ATTRIBUTE Mpanl Dlci Vc pktRetryTimeouts

Access	Read only
Description	This attribute displays the number of packets which have retransmission time-outs. When this count is excessive, the network is very congested and packets have been discarded in the subnet.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc peakRetryQueueSize

Access	Read only
Description	This attribute displays the peak size of retransmission queue. This attribute is used as an indicator of the acknowledgment behavior across the subnet. Records the largest body of unacknowledged packets.
Mib	MpaNetworkLink
Values	Decimal (0..5000)
Default	No default

ATTRIBUTE Mpanl Dlci Vc subnetRecoveries

Access	Read only
Description	This attribute displays the number of successful *Vc* recovery attempts.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..5000)
Default	No default

VERB RERoute Mpanl Dlci LCo

Impact	Service
Description	RERoute.Lc This command is used to request a *Logical Connection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the RERoute is not completely successful. The connection must not be attempting rerouting at present. If this command is attempted on a connection that is not up but is in state pathDownRetrying an immediate route request is sent.

GROUP Mpanl Dlci LCo **PathData**

Properties	Operational
Description	This group contains all operational attributes for the path oriented LCo.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci LCo **state**

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates that the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to the route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.
Mib	MpaNetworkLink
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

ATTRIBUTE Mpanl Dlci LCo **end**

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	MpaNetworkLink
Values	calling called
Default	No default

ATTRIBUTE Mpanl Dlci LCo **costMetric (cost)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an *LCo* that is originated and terminated on the same module is 0.
Mib	MpaNetworkLink
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Mpanl Dlci LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an *LCo* that is originated and terminated on the same module is 0.
Mib	MpaNetworkLink
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE Mpanl Dlci LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	MpaNetworkLink
Values	Decimal (0..200000)
Units	msec

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Mpanl Dlci LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.
Mib	MpaNetworkLink
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Mpanl Dlci LCo holdingPriority (hpri)

Access	Read only
Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	MpaNetworkLink
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Mpanl Dlci LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	MpaNetworkLink
Values	Decimal (0..2048000)
Units	bit/s
Default	No default

ATTRIBUTE Mpanl Dlci LCo requiredRxBandwidth (rbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value

ATTRIBUTE Mpanl Dlci LCo requiredTrafficType (rttyp)

Access	Read only
Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.
Mib	MpaNetworkLink
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE Mpanl Dlci LCo permittedTrunkTypes (pttyp)

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE Mpanl Dlci LCo requiredSecurity (rsec)

Access	Read only
Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	MpaNetworkLink
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Mpanl Dlci LCo requiredCustomerParameter (rcparm)

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	MpaNetworkLink
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Mpanl Dlci LCo emissionPriority (epri)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	MpaNetworkLink
Values	Decimal (0..2)
Default	No default

ATTRIBUTE Mpanl Dlci LCo discardPriority (dpri)

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).
Mib	MpaNetworkLink
Values	Decimal (1..3)
Default	No default

ATTRIBUTE Mpanl Dlci LCo retryCount (rcount)

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of the connection. This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.
Mib	MpaNetworkLink
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Mpanl Dlci LCo pathFailureCount (pfcount)

Access	Read only
Description	This attribute is the count of the number of times the path has successfully reconnected. It is set to zero the first time the path is up. If a path fails anytime after connecting, this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See

Default — none

ATTRIBUTE Mpanl Dlci LCo lastTearDownReason

Access — Read only

Description — This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may indicate why the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:
none - This path has no information for the teardown. ***normalShutDown*** - This path has gone down due to normal call termination.
insufficientTxLcOrBandwidth - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.
insufficientRxLcOrBandwidth - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.

Copyright © 2006, Nortel Nortel Confidential

trunkFailure- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
trunkCardFailure- A trunk FP card has failed along the path.
accessCardFailure- The FP on which the peer access service was running has failed.
operatorForced- The path has terminated due to the operator locking a trunk along the path.
lostLcnClash- The path has terminated because the PAs at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LCs). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
networkCongestion - The path has failed due to control information being lost and not recoverable.
trunkNotFound - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
farEndNotFound - The far end is not provisioned or is not up. Check remote Name.
wrongModuleReached - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing. Check remote provisioned DNA.
farEndBusy - The far end has been reached but it is busy. Check remote provisioned DNA and remote end provisioning.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
serviceTypeMismatch - The remote service type does not match this service type. Check provisioning.
reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority,* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active; this just indicates why the path changed.

ATTRIBUTE Mpanl Dlci LCo pathFailureAction

Access	Read only
Description	This attribute displays whether the application is set to tolerate a momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure. With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. All *pathTypes* respect this attribute. Also, on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends.
Mib	MpaNetworkLink
Values	reRoutePath disconnectConnection
Default	No default

ATTRIBUTE Mpanl Dlci LCo bumpPreference (bpref)

Access	Read only
Description	This attribute specifies when bumping will occur during the route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *holdingPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.
Mib	MpaNetworkLink

Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE Mpanl Dlci LCo optimization (opt)

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.
Mib	MpaNetworkLink

GROUP Mpanl Dlci Jvc **Statisticsl (Stat)**

Properties	Operational
Description	This group contains the statistics collected by the *Jvc* component.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Dlci Jvc **packetsFromSubnet (pfs)**

Access	Read only
Description	This attribute counts all packets including control packets received from the subnet. This number reflects also the packets sent to the MPANL process since the JVC does not drop or generate packets in this direction.The value of this attribute wraps to 0 when the maximum value is reached.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Dlci Jvc **packetsToSubnet (pts)**

Access	Read only
Description	This attribute counts all packets including control packets sent into the subnet. This number includes Renew Call Timer Packets that are

Copyright © 2006, Nortel Nortel Confidential

generated by the JVC. The value of this attribute wraps to 0 when the maximum value is reached.

Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Dlci Jvc packetsDiscarded (pdis)

Access	Read only
Description	This attribute counts discarded packets that can not be forwarded into the subnet because of subnet congestion. This attribute is increased when packet forwarding fails to forward a packet into the subnet.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Dlci Jvc protocolErrors (err)

Access	Read only
Description	This attribute counts the number of protocol errors detected by the JVC in both the MPANL and the subnet directions. A protocol error is counted in the following cases: - reception of a packet from MPANL while waiting for a Raccept packet from the subnet, - reception of a packet from the subnet following a call packet and before the callAccepted is received from MPANL, - reception of a packet from the subnet or from MPANL that is shorter than the subnet header. The value of this attribute wraps to 0 when the maximum value is reached.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

Properties	Provisioned
Description	This group contains the provisionable Q.933 system parameters.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Sig callSetupTimer (t303)

Access	Read and write
Description	This attribute specifies the time the network will wait for a response to the SETUP message sent to the called user. Upon timer expiry, the SETUP message is retransmitted. The second expiry of this timer causes the call to be cleared. This value is specified in seconds.
Mib	MpaNetworkLink
Values	Decimal (1..255)
Units	seconds
Default	4

ATTRIBUTE Mpanl Sig disconnectTimer (t305)

Access	Read and write
Description	This attribute specifies the time the network will wait for a response to the DISCONNECT message sent to the user. Upon timer expiry, the RELEASE message is sent. This value is specified in seconds.
Mib	MpaNetworkLink
Values	Decimal (1..255)
Units	seconds
Default	30

ATTRIBUTE Mpanl Sig releaseTimer (t308)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time the network will wait for a response to the RELEASE message sent to the user. Upon timer expiry, the RELEASE message is retransmitted. The second expiry of the timer causes the call to be released. This value is specified in seconds.
Mib	MpaNetworkLink
Values	Decimal (1..255)
Units	seconds
Default	4

ATTRIBUTE Mpanl Sig callProceedingTimer (t310)

Access	Read and write
Description	This attribute specifies the time the network will wait for the CONNECT message from the called user after the network has received the optional CALL PROCEEDING message from the called user. Upon timer expiry, the call is cleared. This value is specified in seconds.
Mib	MpaNetworkLink
Values	Decimal (1..255)
Units	seconds
Default	10

ATTRIBUTE Mpanl Sig networkType (type)

Access	Read and write
Description	This attribute specifies whether this Frame Relay service is running on a public or a private network. This value is used solely in populating applicable information elements within those Q.933 messages that require a public or private network indication.
Mib	MpaNetworkLink
Values	private public
Default	private

ATTRIBUTE Mpanl Sig restartReqTimer (t316)

Access	Read and write
Description	This attribute specifies the time the network waits for the RESTART ACKNOWLEDGE message from the adjacent network after sending a first RESTART message. Upon timer expiry, another RESTART message is sent. After the second expiry, the interface is treated as idle.

Copyright © 2006, Nortel Nortel Confidential

If the *restartReqTimer* attribute is set to the default value, then the interface is treated as idle when it receives an indication that the link is up and does not send a RESTART message.

Mib	MpaNetworkLink
Values	Decimal (0..255)
Units	seconds
Default	0

ATTRIBUTE Mpanl Sig restartRcvTimer (t317)

Access	Read and write
Description	This attribute specifies the time the local network waits for the processing of a RESTART message received by the interface. Upon expiry of this timer, an alarm will be displayed to report the problem. The timer value must be less than the *restartReqTimer* provisioned value at the other end.
Mib	MpaNetworkLink
Values	Decimal (1..255)
Units	seconds
Default	110

GROUP Mpanl Sig LapfSystemParameters (LapfSys)

Properties	Provisioned
Description	This group contains the provisionable attributes for the SVC data link layer. The data link layer is governed primarily through ITU specification Q.922, and operates over DLCI 0.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Sig windowSize (ws)

Access	Read and write
Description	This attribute specifies the window size. This is the maximum number of unacknowledged sequenced frames that may be outstanding from or to this interface at any one time.
Mib	MpaNetworkLink
Values	Decimal (1..127)
Default	7

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mpanl Sig retransmitLimit (rtl)

Access	Read and write
Description	This attribute specifies the number of times a frame can be retransmitted by the SVC data link layer before appropriate recovery action is taken.
Mib	MpaNetworkLink
Values	Decimal (0..20)
Default	3

ATTRIBUTE Mpanl Sig ackTimer (at)

Access	Read and write
Description	This attribute specifies the period in milliseconds that the network will wait for an acknowledgment to a sent frame. The value set for *ackTimer* must be less than the value set for *idleProbeTimer*.
Mib	MpaNetworkLink
Values	Decimal (1000..10000)
Units	msec
Default	1500

ATTRIBUTE Mpanl Sig ackDelayTimer (adt)

Access	Read and write
Description	This attribute specifies the maximum period in milliseconds that the network will wait before sending an acknowledgment for a received in-sequence I-frame. A value of 0 means there will be no delay in acknowledgment.
Mib	MpaNetworkLink
Values	Decimal (0..10000)
Units	msec
Default	0

ATTRIBUTE Mpanl Sig idleProbeTimer (ipt)

Access	Read and write
Description	This attribute specifies the time period in milliseconds the link will be permitted to remain idle (that is, no frames are exchanged on the data link). Upon expiry of this timer, the network's side link layer polls its peer for status. The value set for *idleProbeTimer* must be greater than the value set for *ackTimer*.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	Decimal (1000..65535000)
Units	msec
Default	30000

GROUP Mpanl Sig FrsSvcAcc (Svcacc)

Properties	Provisioned
Description	This group contains the provisionable attribute to define the defaultAccounting attribute..
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Sig defaultAccounting (defAcc)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***defaultAccounting*** bit and at least one of the ***accountCollection*** bits in the ***FrsDataNetworkAddress*** component must be set to on.
Mib	MpaNetworkLink
Values	off on
Default	on

GROUP Mpanl Sig OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Sig adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — MpaNetworkLink

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Mpanl Sig operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — MpaNetworkLink

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Mpanl Sig usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	MpaNetworkLink
Values	idle active (activ) busy
Default	idle

GROUP Mpanl Sig Statistics (Stats)

Properties	Operational
Description	This group contains the statistics related to the SVC signaling layer at the interface level.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Sig currentNumberOfSvcCalls (ncall)

Access	Read only
Description	This attribute shows the number of Frame Relay SVCs currently existing on this interface.
Mib	MpaNetworkLink
Values	Decimal (0..991)
Default	No default

ATTRIBUTE Mpanl Sig inCalls (incall)

Access	Read only
Description	This attribute indicates the current number of incoming SVCs on this interface (that is, the number of SVCs for which this interface represents the destination end of the call).
Mib	MpaNetworkLink
Values	Decimal (0..991)
Default	No default

ATTRIBUTE Mpanl Sig inCallsRefused (icr)

Access	Read only
Description	This attribute counts the number of incoming SVC call requests that are rejected by either this interface or by the called user. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Mpanl Sig outCalls (outcall)

Access	Read only
Description	This attribute shows the current number of outgoing SVCs on this interface (that is, the number of SVCs for which this interface represents the source end of the call).
Mib	MpaNetworkLink
Values	Decimal (0..991)
Default	No default

ATTRIBUTE Mpanl Sig outCallsFailed (ocf)

Access	Read only
Description	This attribute counts the number of outgoing SVC call requests that are rejected by either this interface, or by the network side of the destination end, or by the called user. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig protocolErrors (pe)

Access	Read only
Description	This attribute counts the number of times a Q.933 protocol error has occurred. Any one of the following events constitutes a protocol error: 1. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir*, *Bc* and *Be* are all zero; 2. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, *Cir* is zero but *Bc* is non-zero, or *Bc* is zero but *Cir* is non-zero; 3. In the user-signaled *Link Layer Core Parameters* IE within the SETUP or CONNECT messages, the *minimum acceptable Cir* is greater than *Cir*; 4. At the destination end, any of the destination to source direction link layer core parameters has been increased in the CONNECT message from the called user; 5. At the destination end, the destination to source direction *Cir* in the CONNECT message is smaller than the corresponding *minimum acceptable Cir* signaled to the called user; 6. At the source end, any of the source to destination direction link layer core parameters in the CONNECT message from the

Copyright © 2006, Nortel Nortel Confidential

	destination end has been increased; 7. At the source end, the source to destination direction *Cir*, after negotiation, is smaller than the corresponding *minimum acceptable Cir*; 8. The network has received a STATUS message from the user with an incompatible Q.933 state. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig qualityOfServiceNotAvailable (qosna)

Access	Read only
Description	This attribute counts the number of incoming and outgoing SVCs that are rejected because the quality of service requested cannot be met by the network. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig setupTimeout (setupt)

Access	Read only
Description	This attribute counts the number of times the T303 setup timer has expired. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig lastCauseInStatusMsgReceived (lcis)

Access	Read only
Description	This attribute shows the cause value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute. The initial value of this attribute is **0** which means that no STATUS message has been received for an existing call.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..255)
Default	No default

ATTRIBUTE Mpanl Sig lastStateInStatusMsgReceived (lsis)

Access	Read only
Description	This attribute shows the state value in the last received user's STATUS message to an existing call. The DLCI to which this STATUS message applies is specified in the *lastDlciReceivedStatus* attribute. The initial value of this attribute is ***notApplicable***.
Mib	MpaNetworkLink

callPresent
incomingCallProceeding
active
disconnectRequest
disconnectIndication
releaseRequest
notApplicable

Default — No default

ATTRIBUTE Mpanl Sig lastTimeMsgBlockCongested (ltmbc)

Access — Read only

Description — This attribute displays the most recent time that an SVC DLCI has failed to get a message block due to message block congestion. Exceptional behavior can occur due to this. The DLCI that has most recently encountered this is indicated by the *lastDlciWithMsgBlockCongestion* attribute. However, all SVC DLCIs may be affected.

The initial value of this attribute is **0000-00-00 00:00**.

Mib — MpaNetworkLink

Values — Time (DHM)

Default — No default

ATTRIBUTE Mpanl Sig lastDlciWithMsgBlockCongestion (ldmbc)

Access — Read only

Description — This attribute shows the value of the DLCI that has most recently failed to get a message block due to message block congestion.

The initial value of this attribute is **0**.

Mib — MpaNetworkLink

Values — Decimal (0; 16..1007)

Default — No default

GROUP Mpanl Sig LapfStatus (LapfStatus)

Properties — Operational

Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mpanl Sig frmrReceive (frmrr)

Access	Read only
Description	This attribute shows the information field of the FRMR most recently received.
Mib	MpaNetworkLink
Values	String (0..8, Hex)
Default	No default

ATTRIBUTE Mpanl Sig currentQueueSize (queues)

Access	Read only
Description	This attribute shows the current number of frames in the SVC data link layer transmit queue.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

GROUP Mpanl Sig LapfStatistics (LapfStats)

Properties	Operational
Description	This group contains the statistics for the SVC data link layer.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Sig stateChange

Access	Read only
Description	This attribute counts the number of times the SVC data link layer interface has changed state. Frequent state changes may indicate a problem with the line quality. While the data link layer is in **informationTransfer** state, this counter will increment on each expiry of *idleProbeTimer* as its state goes from **informationTransfer** to **waitingAck** and back. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig remoteBusy

Access	Read only
Description	This attribute counts the number of times transmission of an I-frame was

Copyright © 2006, Nortel Nortel Confidential

unsuccessful due to a perceived remote busy condition (window closed or remote busy). When this count reaches maximum, it wraps to zero.

Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig receiveRejectFrame

Access	Read only
Description	This attribute counts the number of REJ frames received by the interface. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig ackTimeout

Access	Read only
Description	This attribute counts the number of times the *ackTimer* has expired. Frequent increments of this counter indicate a problem at the link or improper values have been chosen for *ackTimer* and *ackDelayTimer* between the local and remote sides. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig iFramesTransmitted

Access	Read only
Description	This attribute counts the number of SVC I-frames transmitted to the interface on DLCI 0. An I-frame may be counted more than once if there are retransmissions at the SVC data link layer. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig iFramesTxDiscarded

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of SVC I-frames that are bound for the link but have been discarded. Discard reasons may be one of the following: 1.the frame length is beyond allow limit. 2.the SVC data link layer is in **disconnected** state. 3. the transmit queue has been purged because the queue length has reached the *reset* threshold. 4.the transmit queue or the queue waiting for acknowledgment has been purged because the link cannot be re-established. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig iFramesReceived

Access	Read only
Description	This attribute counts the number of SVC I-frames received from the interface. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Mpanl Sig iFramesRcvdDiscarded

Access	Read only
Description	This attribute counts the number of SVC I-frames received but have been discarded. The discard reasons are: 1. incorrect frame size 2. frame is out of sequence 3. frame received while the network side of the SVC data link layer is not in the **informationTransfer** or **waitingAck** state. When this count reaches maximum, it wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Mpanl SignalingMpanl (SigMpanl)

Groups	GROUP Mpanl SigMpanl OsiState (State) GROUP Mpanl SigMpanl Profile

GROUP Mpanl SigMpanl Statistics (Stats)
GROUP Mpanl SigMpanl LapfStatus (LapfStatus)
GROUP Mpanl SigMpanl LapfStatistics (LapfStats)

Scope: Network

Description: *Mpanl/<n> SignalingMpanl*

This component contains attributes relating to the MPANL signaling DLCI at the MPANL interface. This includes operational Q.922 (LAPF) information for this DLCI.

Mib: MpaNetworkLink

Common Verbs: Help, List, Display

GROUP Mpanl SigMpanl OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: MpaNetworkLink

ATTRIBUTE Mpanl SigMpanl adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Mpanl SigMpanl operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	MpaNetworkLink
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Mpanl SigMpanl usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	MpaNetworkLink
Values	idle active (activ) busy
Default	idle

GROUP Mpanl SigMpanl Profile

Properties	Operational
Description	This group contains attributes which are populated by the information received from the MPA in the Profile Association command of the MPANL protocol.

GROUP Mpanl VoFr Operational (Oper)

Properties	Operational
Description	This group contains operational attributes of the *VoFr* component.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl VoFr maximumFrameSize

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum size of VoFr frames transmitted to MPA. The size excludes HDLC flags and CRC octets. MPA signals the required value as part of the MPANL initial staging, which is then used to set the value of this attribute. Default value is used before MPANL staging is completed.
Mib	MpaNetworkLink
Values	Decimal (50..4100)
Units	octets
Default	4100

ATTRIBUTE Mpanl VoFr transmitInformationRate

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum information rate towards MPA. Value may change over time, as signalled by MPA. Default value is used before MPANL staging is completed.
Mib	MpaNetworkLink
Values	Decimal (16000..4294967295)
Units	bit/s
Default	16000

Copyright © 2006, Nortel Nortel Confidential

GROUP Mpanl VoFr Statistics (Stats)

Properties	Operational
Description	This group contains statistics attributes of the *VoFr* component.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl VoFr fragmentedHighestPriorityFrames

Access	Read: All Write: Illegal
Description	This attribute counts egress frames with the highest priority, which had to be fragmented because they were larger than *maximumFrameSize*. This could happen when a data call is setup to use the highest emission priority, or MPA is provisioned with too low maximum frame size. When the maximum is reached the count wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl VoFr lostFragmentsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts lost VoFr fragments from the interface. Presence of lost fragments indicates a link problem. Note that lost whole frames cannot be detected. When the maximum is reached the count wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Mpanl VoFr protocolViolationsFromIf

Access	Read: All Write: Illegal
Description	This attribute counts VoFr protocol violations detected in the data from the interface. When the maximum is reached the count wraps to zero.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

COMPONENT Mpanl FrMuxSetup

Groups	GROUP Mpanl FrMuxSetup Operational (Op)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*Mpanl/n FrMuxSetup* This component contains operational attributes for egress traffic shaping as well as the component name of the *FrMux Dlci* to which this *Mpanl/n* is associated.
Mib	MpaNetworkLink
Subcomponents	COMPONENT Mpanl FrMuxSetup PvcSetup
Common Verbs	Help List Display Add DELete

GROUP Mpanl FrMuxSetup Operational (Op)

Properties	Operational
Description	This group contains the following operational parameters: committedInformationRate of the PVC connection used for tunnelling the MPANL traffic, and the component name of the *Dlci* which carries the traffic for this MPANL.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl FrMuxSetup committedInformationRate (cir)

Access	Read only
Description	This attribute specifies, in bit/s, the committed information rate (CIR) to which the traffic transmitted towards the interface is shaped.
Mib	MpaNetworkLink
Values	Decimal (16000..4294967295)
Units	bit/s
Default	16000

ATTRIBUTE Mpanl FrMuxSetup dlciCompName

Access	Read only
Description	This attribute specifies the component name of the *Dlci* with which the application using this *FrMuxSetup* component is associated. The name is a string *FrMux/n Dlci/m*. For a PVC this is the same component name as provisioned under the subcomponent *FrMuxPvcSetup*.
Mib	MpaNetworkLink
Values	The name of the component

Copyright © 2006, Nortel Nortel Confidential

Default	No default

COMPONENT Mpanl FrMuxSetup **PvcSetup**

Groups	GROUP Mpanl FrMuxSetup PvcSetup Provisioned (Prov)
Scope	Application
Description	*Mpanl/n FrMuxSetup PvcSetup* This component contains provisionable attributes for setting up a *Dlci* associated with the application using this component. The *Dlci* is of a PVC type.
Mib	MpaNetworkLink
Common Verbs	Help List Display

GROUP Mpanl FrMuxSetup PvcSetup **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains provisionable attributes for setting up a *Dlci* associated with the application using the *FrMuxSetup* component. The *Dlci* is of the PVC type.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl FrMuxSetup PvcSetup **dlciName**

Access	Read and write
Criticality	Process
Description	This attribute is the link to the *Dlci* which is associated with the application using the *FrMuxSetup* component.
Mib	MpaNetworkLink
Values	Link (Hardware, applicationName)
Default	No default

COMPONENT Mpanl **Isdn**

Groups	GROUP Mpanl Isdn Provisioned (Prov) GROUP Mpanl Isdn Operational (Oper)
Scope	Network
Description	*Mpanl/n Isdn* This component defines the parameters associated with the ISDN B-

Copyright © 2006, Nortel Nortel Confidential

	Channel interface. Adding this component makes the *Mpanl* behave as an ISDN access to the MPA.
Mib	MpaNetworkLink
Common Verbs	Help List Display Add DELete

GROUP Mpanl Isdn Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *Isdn* component.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Isdn t320

Access	Read and write
Criticality	Process
Description	This attribute specifies the waiting time for a silent B-Channel (no active VCs associated with the *Mpanl*) to be disconnected and made available. A value of 0 means t320 never times out.
Mib	MpaNetworkLink
Values	Decimal (0..255)
Units	seconds
Default	60

ATTRIBUTE Mpanl Isdn addressSignalling (asig)

Access	Read and write
Criticality	Process
Description	This attribute defines whether the ISDN Calling Party Number is to be signaled to the remote DTE during an SVC call establishment. Otherwise, no changes to the current behavior of SVC call establishment (that is, the DNA is used in the calling party number information element).
Mib	MpaNetworkLink
Values	IsdnDna normalBehavior
Default	normalBehavior

Copyright © 2006, Nortel Nortel Confidential

GROUP Mpanl Isdn Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes of the *Isdn* component.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Isdn dataSigChan

Access	Read only
Description	This attribute indicates the instance number of the *dataSigChan* component controlling the allocation of this *Mpanl Isdn* component.
Mib	MpaNetworkLink
Values	Decimal (1..255)
Default	No default

ATTRIBUTE Mpanl Isdn bChannelState (bState)

Access	Read only
Description	This attribute indicates the state of the B-Channel. If the value is ***idle*** it means that no VCs are connected and this B-Channel is available. If the value is ***busy*** it means this B-Channel has been allocated and is not available. If the value is ***disabled*** it means the application interface or the port is locked or disabled.
Mib	MpaNetworkLink
Values	idle busy disabled
Default	No default

ATTRIBUTE Mpanl Isdn lastUsedCgpn (lucgpn)

Access	Read only
Description	This attribute indicates the calling party number currently using the B-Channel. When the B-Channel is free, the value of this attribute is an empty string.
Mib	MpaNetworkLink
Values	BCD (0..15)
Default	No default

ATTRIBUTE Mpanl Isdn bChanIntState (bInt)

Access	Read only
Description	Debug information

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	isdnInit waitAccEnable waitLnsResponse waitFramerData enabling waitAccRegAck up down releasing
Default	No default

ATTRIBUTE Mpanl Isdn activeVirtualCircuitsCount (vcCount)

Access	Read only
Description	Current number of virtual circuits (switched and permanent) in data transfer.
Mib	MpaNetworkLink
Values	Decimal (0..4294967295)
Default	0

COMPONENT Mpanl Voice

Groups	GROUP Mpanl Voice Provisioned (Prov)
Scope	Device
Description	*Mpanl/n Vcp* This component defines the Voice Control Point characteristics of an instance of the *Mpanl* top level component. This includes SAP-x control message tracing for the MPANL instance, enabling Short Path Oriented (SPO) connections over Mpanl and accounting for Voice Calls over this instance of *Mpanl*.
Mib	MpaNetworkLink
Subcomponents	COMPONENT Mpanl Voice MpaVoiceAccounting (Acct)
Common Verbs	Help List Display

GROUP Mpanl Voice Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attribute used for SPO connections.
Mib	MpaNetworkLink

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Mpanl Voice useSpo (spo)

Access	Read: All Write: All
Description	ATM Adaptation Layer Short Path Oriented (AALSPO) is used to optimize the voice traffic over ATM interfaces encapsulating a voice packet of an exact 45 byte size in a single ATM cell. Using AAL5, two cells are required to transport 45 byte packet because an 8 byte AAL5 trailer is needed by the protocol. AALSPO optimizes the disassembly/reassembly mechanism performed at AAL level by replacing the AAL5 trailer with a small sized 3 byte LRC field. By setting this attribute to ***yes*** the voice call will be routed on a AALSPO connection (specific to voice or video traffic) if a circuit of this type is properly provisioned. If not properly provisioned the system defaults to AAL5. The frame size for this virtual circuit will be 45 bytes, regardless of the frame size signaled by the MPA side. If no ATM interfaces are used it is recommended that this attribute be set to the default value (***no***).
Mib	MpaNetworkLink
Values	no yes
Default	no

COMPONENT Mpanl Voice MpaVoiceAccounting (Acct)

Groups	GROUP Mpanl Voice Acct Provisioned (Prov)
Scope	Application
Description	*Mpanl/n Voice MpaVoiceAccounting* The *VoiceAccounting* component defines the operational characteristics of the accounting system of the *Mpanl Voice* component. Accounting record generation for calls on the *Mpanl* is managed by this component.
Mib	MpaNetworkLink
Common Verbs	Help List Display

GROUP Mpanl Voice Acct Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of a *VoiceAccounting* component.
Mib	MpaNetworkLink

ATTRIBUTE Mpanl Voice Acct accountCollection (aco)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies that accounting records are to be collected for the various reasons: ***bill***, ***test***, ***study***, ***audit***. If none of these reasons is set, then accounting is suppressed.
Mib	MpaNetworkLink
Set of	bill test study audit
Default	No default

ATTRIBUTE Mpanl Voice Acct **accountClass (acl)**

Access	Read: All Write: All
Description	This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. The use of this attribute is decided by the network operator.
Mib	MpaNetworkLink
Values	Decimal (0..255)
Default	0

ATTRIBUTE Mpanl Voice Acct **serviceExchange (sre)**

Access	Read: All Write: All
Description	This attribute specifies a user defined value, Data Service Exchange, as entered by the network operator and reported in the accounting record.
Mib	MpaNetworkLink
Values	Decimal (0..255)
Default	0

ATTRIBUTE Mpanl Voice Acct **digitsSuppressed (ds)**

Access	Read: All Write: All
Description	This attribute specifies the number of trailing digits which will be suppressed in the *calledNumber* in the accounting records. Each of the specified number of trailing digits are replaced with an “X”. This option exists to satisfy privacy requirements in a number of countries.

Copyright © 2006, Nortel Nortel Confidential

Mib	MpaNetworkLink
Values	Decimal (0..8)
Default	0

ATTRIBUTE Mpanl Voice Acct accountingOptions (ao)

Access	Read: All Write: All
Description	This attribute specifies optional settings for the voice networking accounting system. The option is: ***suppressTerminatingEndRecords*** - setting this option suppresses the generation of accounting records at the destination node. This reduces the volume of accounting data. This option has local significance only. It only suppresses the generation of accounting records for calls received by this node.
Mib	MpaNetworkLink
Set of	suppressTerminatingEndRecords (ster)
Default	No default

Description	*Nmis Telnet* Both the Telnet server and client are supported. The *Session* subcomponent corresponds to the server connection, while the *Session*'s *Client* subcomponent corresponds to the client connection. The server (that is, the network management interface) is accessed from a remote computer using the Telnet protocol. The Telnet operator interface is otherwise identical to the local operator interface. Each server can set up

Copyright © 2006, Nortel Nortel Confidential

a single client connection. Note that Telnet clients are accessible only from a Telnet session, not from Local, FMIP, FTP or Ssh sessions.

Mib	MgmtInterfaces
Dyn. Subcomp.	COMPONENT Nmis Telnet Session
Common Verbs	Help List Display LOCK : System_admin Unlock : System_admin

GROUP Nmis Telnet OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	MgmtInterfaces

ATTRIBUTE Nmis Telnet adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	MgmtInterfaces
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Nmis Telnet operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	MgmtInterfaces
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Nmis Telnet usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	MgmtInterfaces
Values	idle active (activ) busy
Default	idle

GROUP Nmis Telnet Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for an NMIS manager. This group is common to all NMIS managers.
Mib	MgmtInterfaces

ATTRIBUTE Nmis Telnet maxAllowedSessions

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the maximum number of simultaneous sessions the manager will allow.
Mib	MgmtInterfaces
Values	Decimal (2..35)
Default	No default

ATTRIBUTE Nmis Telnet activeSessions

Access	Read only
Description	For FMIP, FTP, Telnet and Ssh interface, this attribute indicates the number of simultaneous sessions currently active under the manager of the particular interface. Note that there may be fewer *Session* components than what is shown here, since an active session could be in the midst of logging in and may not yet be fully up. For Local Operator interface, this attribute indicates the number of users actually logged in at that particular instant.
Mib	MgmtInterfaces
Values	Decimal (0..35)
Default	No default

GROUP Nmis Telnet Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Telnet* component.
Mib	MgmtInterfaces

ATTRIBUTE Nmis Telnet timeoutPeriod

Access	Read: System_admin Write: System_admin
Description	This attribute specifies the time-out period applicable to all Telnet sessions. When changed, the new value takes effect only for sessions created after the changes are activated. Setting this attribute to a value between ***5*** and ***120*** minutes forces sessions that are left idle to be automatically terminated after the specified amount of time. Using shorter time-out values, while increasing security, forces operators to monitor sessions more closely. This time-out period can be disabled for particular users by setting the value of the *timeoutProtocol* attribute of the *AccessControl Userid* component to ***disabled***.
Mib	MgmtInterfaces

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (5..120) disabled
Units	minutes
Default	disabled

COMPONENT Nmis Telnet Session

Instance	Decimal (1..16)
Groups	GROUP Nmis Telnet Session Operational (Oper)
Scope	Application
Description	*Nmis Telnet Session/n* This component supports a single remote Telnet operator logged in using the Telnet protocol. Optionally, a single outgoing Telnet client connection can be established from here. On a CP, the maximum number of concurrent telnet sessions supported is 8; on a CP2, it is 12; on a CP3, it is 16.
Mib	MgmtInterfaces

Common Verbs	Help List Display

VERB CLEAR Nmis Telnet Session

Impact	System_admin
Description	*Clear Nmis Telnet Session/n* This command terminates the session connection as well as the client connection if it was up.

GROUP Nmis Telnet Session Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for a *Telnet Session* component.
Mib	MgmtInterfaces

ATTRIBUTE Nmis Telnet Session userid

Access	Read only
Description	This attribute indicates the ID of the user associated with the session.
Mib	MgmtInterfaces
Values	String (1..8, ASCII)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Nmis Telnet Session **dataStreams**

Access	Read: Passive Write: Passive
Description	This attribute indicates which data streams (alarm, debug, log, scn and rtStats) will be transmitted back to the operator through this session. Only a user with a command impact of system administration may register for logs. When a client connection is up through this interface, all of the values are turned off. This means that this data is discarded when the session has a Telnet client connection set up. When the client connection terminates, the data which was being received prior to the client being set up is requested again.
Mib	MgmtInterfaces
Set of	alarm (ala) debug (deb) log scn rtStats (rts)
Default	No default

ATTRIBUTE Nmis Telnet Session **remoteIpAddr (address)**

Access	Read only
Description	This attribute indicates the IP address of the remote device connected to the session.
Mib	MgmtInterfaces
Values	IP address
Default	No default

ATTRIBUTE Nmis Telnet Session **remoteTcpPort (port)**

Access	Read only
Description	This attribute indicates the TCP port number of the Telnet client being used on the remote device connected to the session.
Mib	MgmtInterfaces
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Nmis Telnet Session **screenWidth (width)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute indicates the maximum width (in characters) of operator command responses. Beyond this maximum, responses are either truncated or wrapped onto the next line, as appropriate. Asynchronous responses, such as alarms, are always displayed using a 79 character width.
Mib	MgmtInterfaces
Values	Decimal (79..2000)
Default	79

ATTRIBUTE Nmis Telnet Session loginTime

Access	Read: Passive Write: Illegal
Description	This attribute indicates the time at which the user logged in.
Mib	MgmtInterfaces
Values	Time (DHMS)
Default	No default

ATTRIBUTE Nmis Telnet Session idleTime

Access	Read: All Write: Illegal
Description	This attribute indicates the period of time the session has remained idle.
Mib	MgmtInterfaces
Values	Decimal (0..4294967295)
Units	minutes
Default	No default

ATTRIBUTE Nmis Telnet Session role

Access	Read: System_admin Write: Illegal
Description	This attribute indicates the *Role* component associated with the user of this telnet session. A role is associated with a set of access privileges that is used for authorization.
