ATTRIBUTE Atmlf Vpt Uni Sig **lastTxDiagCode**

Access	Read: All Write: Illegal
Description	This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0.

Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Uni Sig Vcd** **atmServiceCategory (service)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections. The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are

Copyright © 2006, Nortel Nortel Confidential

made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

ATTRIBUTE Atmlf Vpt Uni Sig Vcd **weight**

Access — Read and write

Criticality — Component

Description

This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These
attributes can be found under the atmif/n ca <atmServiceCategory>/ m.

This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs.

When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***.

When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT.

When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.

ATTRIBUTE Atmlf Vpt Uni Sig Vcd **qosClass (qos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values	0 1 2 3 4
Default	2
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Uni Sig Vcd **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

Copyright © 2006, Nortel Nortel Confidential

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Uni Sig Vcd** **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmUni
Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Uni Sig Vcd** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has

Copyright © 2006, Nortel Nortel Confidential

UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component.

When ***disabled*** is selected, UPC for this connection is disabled.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values: disabled
sameAsCa

Default: disabled

Flags: HCA_SUPPORT

ATTRIBUTE **AtmIf Vpt Uni Sig Vcd trafficDescParm (tdp)**

Access: Read: All
Write: All

Criticality: Component

Description: This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP

Copyright © 2006, Nortel Nortel Confidential

equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

Instance	address [String (1..40, ASCII)] addressType [primary alternate registered default]
Groups	GROUP Atmlf Vpt Uni Addr Operational (Oper)
Scope	Device

Copyright © 2006, Nortel Nortel Confidential

Description	*AtmIf/n Uni Address/address,type* *AtmIf/n Vpt/m Uni Address/address,type* This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wild-card ('?'), and a type. The type identifies whether the Address component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address. The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses. Virtual interfaces do not have addresses of type ***default***. The wild-card is only valid for provisioned addresses. If the address is a single wild-card, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wild-card static address, then the choice is made using a round robin algorithm. The round robin algorithm first tries the primary routes. If none of the primary routes succeed, then the alternate routes are tried. Note that the ***UniInfo*** and ***PnniInfo*** sub-components are mutually exclusive. Only one of these may be added under the ***AtmIf Uni Addr*** component.

COMPONENT Atmlf Vpt Uni PathTraceFilter (Ptf)

Groups:
GROUP Atmlf Vpt Uni Ptf Criteria
GROUP Atmlf Vpt Uni Ptf Operational (Oper)
GROUP Atmlf Vpt Uni Ptf RecordControl (Record)

Scope: Device

Description:
AtmIf/n Aini PathTraceFilter
AtmIf/n Iisp PathTraceFilter
AtmIf/n Uni PathTraceFilter
AtmIf/n Pnni PathTraceFilter
AtmIf/n Vpt/vpi Aini PathTraceFilter
AtmIf/n Vpt/vpi Iisp PathTraceFilter
AtmIf/n Vpt/vpi Uni PathTraceFilter
AtmIf/n Vpt/vpi Pnni PathTraceFilter

This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced.

When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop,* and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When

Copyright © 2006, Nortel
Nortel Confidential

AtmPathTraceFilter component is deleted, all records are cleared.

Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted.

The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

VERB START **AtmIf Vpt Uni Ptf**

Impact: Service

Description:
START AtmIf/n Aini PathTraceFilter
START AtmIf/n Iisp PathTraceFilter
START AtmIf/n Uni PathTraceFilter
START AtmIf/n Pnni PathTraceFilter
START AtmIf/n Vpt/vpi Aini PathTraceFilter
START AtmIf/n Vpt/vpi Iisp PathTraceFilter
START AtmIf/n Vpt/vpi Uni PathTraceFilter
START AtmIf/n Vpt/vpi Pnni PathTraceFilter

This command starts the path tracing based on the specified filtering criteria.

When the command is issued, the *traceTimeout* timer is reset.

VERB STOP **AtmIf Vpt Uni Ptf**

Impact: Service

Description:
STOP AtmIf/n Aini PathTraceFilter
STOP AtmIf/n Iisp PathTraceFilter
STOP AtmIf/n Uni PathTraceFilter
STOP AtmIf/n Pnni PathTraceFilter
STOP AtmIf/n Vpt/vpi Aini PathTraceFilter
STOP AtmIf/n Vpt/vpi Iisp PathTraceFilter
STOP AtmIf/n Vpt/vpi Uni PathTraceFilter
STOP AtmIf/n Vpt/vpi Pnni PathTraceFilter

This command causes the filter to stop, but keeps the trace records.

Copyright © 2006, Nortel Nortel Confidential

VERB CLEAR **AtmIf Vpt Uni Ptf**

Impact	Service
Description	*CLEAR AtmIf/n Aini PathTraceFilter* *CLEAR AtmIf/n Iisp PathTraceFilter* *CLEAR AtmIf/n Uni PathTraceFilter* *CLEAR AtmIf/n Pnni PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Aini PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Iisp PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Uni PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Pnni PathTraceFilter* This command clears the path trace records associated with this filter. This command is rejected on an active filter.

GROUP **AtmIf Vpt Uni Ptf** **Criteria**

Properties	Operational
Description	This group contains the operational criteria for the *PathTraceFilter* component.
Mib	AtmUni

ATTRIBUTE **AtmIf Vpt Uni Ptf** **traceInfo (tInfo)**

Access	Read: All Write: All
Description	This attribute specifies the trace information that is included in the trace records. ***crankBack***: Crankback information is included if the connection is cranked back during the connection setup phase. If the option is turned on, all attempted paths including the final one are recorded. If the option is turned off, only the information of the final path is recorded. If the connection fails to reach the destination, no path information is returned. ***connId***: Connection Identifier information is included. ***callRef***: For point-to-point connections, the call reference is included. For point-to-multipoint connections, the call reference and end point reference are both included. Basic trace information, such as node and port identifiers, are always included.
Mib	AtmUni
Set of	crankBack connId callRef
Default	(crankBack, connId, callRef)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Uni Ptf **calledPartyPrefix (cldPref)**

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the called party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	AtmUni
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Uni Ptf **callingPartyPrefix (clgPref)**

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the calling party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	AtmUni
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Uni Ptf **connectionType (type)**

Access	Read: All Write: All
Description	This attribute specifies a connection type (SVC, SPVC, SVP, SPVP), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	AtmUni
Set of	svc spvc svp spvp
Default	(svc, spvc, svp, spvp)

ATTRIBUTE Atmlf Vpt Uni Ptf **connectionConfiguration (config)**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a type of topology (point-to-point or point-to-multipoint), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	AtmUni
Set of	ptp ptmp
Default	(ptp, ptmp)

ATTRIBUTE Atmlf Vpt Uni Ptf **serviceCategory (svcCat)**

Access	Read: All Write: All
Description	This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match successfully, the call is traced.
Mib	AtmUni
Set of	cbr rtVbr nrtVbr ubr
Default	(cbr, rtVbr, nrtVbr, ubr)

GROUP Atmlf Vpt Uni Ptf **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the *PathTraceFilter* component.
Mib	AtmUni

ATTRIBUTE Atmlf Vpt Uni Ptf **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the filter. ***active***: Indicates the filter is active. ***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out.
Mib	AtmUni
Values	active inactive

Copyright © 2006, Nortel Nortel Confidential

Default	inactive

ATTRIBUTE Atmlf Vpt Uni Ptf **recordCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords,* which ever is less.
Mib	AtmUni
Values	Decimal (0..200)
Default	No default

ATTRIBUTE Atmlf Vpt Uni Ptf **matchedConnections**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of connections that match the criteria of this filter.
Mib	AtmUni
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Atmlf Vpt Uni Ptf **elapsedTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes that have elapsed since the start of the filter.
Mib	AtmUni
Values	Decimal (0..70560)
Units	minutes
Default	No default

ATTRIBUTE Atmlf Vpt Uni Ptf **timeRemaining**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes remaining before the filter terminates itself.
Mib	AtmUni
Values	Decimal (0..70560)

Copyright © 2006, Nortel Nortel Confidential

Units	minutes
Default	No default

COMPONENT Atmlf Vpt Uni PathTraceTestConnection (Ptt)

Groups	GROUP Atmlf Vpt Uni Ptt Operational (Oper)
Scope	Device
Description	*Atmlf/n Aini PathTraceTestConnection* *Atmlf/n Iisp PathTraceTestConnection* *Atmlf/n Uni PathTraceTestConnection* *Atmlf/n Pnni PathTraceTestConnection* *Atmlf/n Vpt/vpi Aini PathTraceTestConnection* *Atmlf/n Vpt/vpi Iisp PathTraceTestConnection* *Atmlf/n Vpt/vpi Uni PathTraceTestConnection* *Atmlf/n Vpt/vpi Pnni PathTraceTestConnection* This component provides the capability to control the Path Trace Test Connection. A test connection is one way to find the logical nodes and ports that a connection traverses to a destination interface. The *Trace* verb is used to initiate the test connection. The test connection is always released once it reaches the trace destination. The test connection responds with the trace results collected during a complete or partial trace.

ATTRIBUTE Atmlf Vpt Uni Ptt **atmServiceCategory (service)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the ATM service category for both directions of the connection.

If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection.

If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications.

The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS.

Copyright © 2006, Nortel
Nortel Confidential

	The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.
Mib	AtmUni
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE **AtmIf Vpt Uni Ptt** **fwdQosClass (fwdQos)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the quality of service for the forward direction for this connection. Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video). Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video). Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer). Class ***4*** supports a QOS that will meet Service Class D performance requirements (connection-less data transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.
Mib	AtmUni

ATTRIBUTE **Atmlf Vpt Uni Ptt** **bearerClassBbc (bcBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network. The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Copyright © 2006, Nortel Nortel Confidential

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

ATTRIBUTE Atmlf Vpt Uni Ptt **transferCapabilityBbc (tcBbc)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

NotApplicable specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation.

Copyright © 2006, Nortel Nortel Confidential

The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data.

The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing.

The value ***yes*** for end-to-end timing indicates that end-to-end timing is required.

The value ***no*** for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE **Atmlf Vpt Uni Ptt txTrafficDescParm (txTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

Copyright © 2006, Nortel Nortel Confidential

When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter

Copyright © 2006, Nortel Nortel Confidential

3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

Mib	AtmUni
Vector of	Decimal (0..2147483647)
Index	Decimal (1..5)
Default	([5] 0)

ATTRIBUTE **Atmlf Vpt Uni Ptt** **rxTrafficDescParm (rxTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC). When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must

Copyright © 2006, Nortel Nortel Confidential

be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or

Copyright © 2006, Nortel Nortel Confidential

I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

VERB OPTIMIZE Atmlf Vpt Uni Reroute

Impact	Service
Description	*Optimize [-all] AtmIf/n Uni Reroute* *Optimize [-all] AtmIf/n Aini Reroute* *Optimize [-all] AtmIf/n Iisp Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Uni Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Aini Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Iisp Reroute* This command triggers path optimization for the connection segments managed by the Reroute component. By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the localOptimalMetricValue attribute under the RerouteInfo component for the connection. The -all option causes all connection segments subscribed to path optimization to be considered. Using the Optimize command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP Atmlf Vpt Uni Reroute LocalOperational (LOper)

Properties	Operational
Description	This group contains the operational attributes that indicate the local rerouting activities at the interface level.
Mib	AtmUni

ATTRIBUTE Atmlf Vpt Uni Reroute localSubscribedConnections (lsub)

Access	Read only
Description	This attribute counts the connection segments that are subscribed to one or more local rerouting capabilities. Note that a given connection segment is subscribed to either local rerouting capabilities, not both.
Mib	AtmUni
Values	Decimal (0..4294967295)
Default	No default

GROUP AtmIf Vpt Uni Reroute Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.
Mib	AtmUni

ATTRIBUTE AtmIf Vpt Uni Reroute Ov protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.

Copyright © 2006, Nortel Nortel Confidential

localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values:
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE Atmlf Vpt Uni Reroute Ov **numOptAttempts**

Access: Read and write

Description: This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Mib: AtmUni

Values:
Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

ATTRIBUTE Atmlf Vpt Tm **txQosClass (txQos)**

Access	Read only
Description	This attribute indicates the quality of service for the calling to called direction for this connection. This is only applicable to Soft PVC and SVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified QOS class; no objective is specified for the performance parameters. A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.
Mib	AtmCore
Values	0 1 2 3 4 notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Tm **txQueueLength (txQLen)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the current number of cells in the transmit queue for this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the length of the common queue which is used for this ATM service category. If this connection has *unshapedTransmitQueueing* attribute displayed as ***fifo***, this attribute indicates the number of cells for this connection which are enqueued in a first-in-first-out queuing method for this ATM service category. This will only occur for connections on ATM IP cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the length of the per-VC queue. For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current number of cells in the link class queue used by this connection to buffer its traffic. This attribute does not apply to basic *Vpt*s.
Mib	AtmCore
Values	Decimal (0..1011840)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpt Tm **txQueueCongestionState (txQCong)**

Access	Read only
Description	This attribute indicates the congestion state of the transmit queue for this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the congestion state of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the congestion state of the per-VC queue. The congestion state of a queue is indicated by a numeric value ranging from 0 to 3. When a queue is in a congested state x, only traffic with discard priority (DP) 0 to x are enqueued. Traffic with DP > x is discarded. For example, if the congestion state is 3, there is no congestion and all traffic is enqueued. Likewise, when the congestion state is 0, there is maximum congestion and only traffic with DP=0 is enqueued on that queue. For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current

Copyright © 2006, Nortel Nortel Confidential

congestion state of the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

Mib — AtmCore

Values — Decimal (0..3)

Default — No default

ATTRIBUTE Atmlf Vpt Tm holdingPriority (hpri)

Access — Read only

Description — This attribute indicates the actual holding priority in effect for this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. Some applications, for example *Vcc Test*, may override the provisioned holding priority.

A value of ***notApplicable*** is displayed when this is an elastic connection. Holding priority does not apply to bandwidth elastic connections.

Holding priority has no effect if the equivalent cell rate (ECR) for a connection is zero.

This attribute does not apply to *Vpt Vcc*s.

ATTRIBUTE Atmlf Vpt Tm atmServiceCategory (service)

Access — Read only

Description — This attribute indicates the ATM service category used for traffic in both directions of the connection.

Copyright © 2006, Nortel Nortel Confidential

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to have significantly reduced value for the application.

The ***rtVariableBitRate*** service category is intended for real time applications; that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

ATTRIBUTE **Atmlf Vpt Tm** **trafficShaping (trShaping)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the traffic shaping state of the connection. A value of ***notApplicable*** indicates that traffic shaping is not applicable or not supported for this connection. This is the case: - when the *txTrafficDescType* is 1 or 2. - for standard *Vpt Vcc*s and basic *Vpt*s. - for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, when the *atmServiceCategory* is ***constantBitRate***. In these cases, the value of ***notApplicable*** is indicated regardless of whether traffic shaping is enabled or disabled in the provisioning data. A value of ***disabled*** indicates that traffic shaping is applicable and supported for the type of connection but has been turned off in the provisioning data. A value of ***linear*** or ***inverseUpc*** indicates that traffic shaping is applicable and supported for the type of connection and has been turned on in the provisioning data. This is the only case that indicates that traffic shaping is performed on the connection. In this case, the actual shaping rate is reflected in the *txTrafficDescParm* attribute, parameter number 4. A value of ***linear*** indicates that traffic is being shaped at the constant rate indicated in *txTrafficDescParm* 4. A value of ***inverseUpc*** indicates that the shaper strictly conforms to the requirements of a dual leaky bucket UPC enforcer. This value is indicated if traffic shaping is enabled, and the *txTrafficDescType* for this connection is 6, 7 or 8. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, traffic shaping is not available, therefore this attribute is always ***disabled***. Traffic shaping for connections with *atmServiceCategory* as ***availableBitRate*** (*txTrafficDescType* 9) depends upon the *abrConnectionType* attribute. If *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, the value of this attribute is ***linear***. If *abrConnectionType* is ***erSwitch*** or ***efciSwitch***, this attribute is ***notApplicable***.
Mib	AtmCore
Values	disabled linear inverseUpc notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Tm bearerClassBbc (bcBbc)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the bearer capability for this connection. Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is displayed, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents. Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements.When ***c*** is displayed, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it. Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol. Class vp service is used to indicate a transparent VP service when the user is requesting an ATM only service from the network. In this case, the network does not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except for VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP and SVP connections. A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.
Mib	AtmCore
Values	a c x vp notApplicable
Default	No default

ATTRIBUTE **Atmlf Vpt Tm** **transferCapabilityBbc (tcBbc)**

Access	Read only
Description	This attribute indicates the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> 0: NoIndication, NoIndication 1: NoIndication, yes 2: NoIndication, no

Copyright © 2006, Nortel Nortel Confidential

5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance, or in the case that the transfer capability in the call request was set to NoIndication.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value NoIndication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

The value yes for end-to-end timing indicates that end-to-end timing is required for the connection.

The value no for end-to-end timing indicates that end-to-end timing is not required for the connection.

ATTRIBUTE **AtmIf Vpt Tm** **clippingBbc (cBbc)**

Access — Read only

Description — This attribute indicates the value of the clipping susceptibility parameter in the broadband bearer capability (BBC) Information Element.

Clipping is an impairment in which the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Values	no yes notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Tm **unshapedTransmitQueueing (unshap)**

Access	Read only
Description	This attribute indicates the unshaped transmit queuing state of the connection. A value of ***common*** indicates that transmit traffic is being enqueued onto the common transmit queue for this service category. The *txQueueLength* attribute indicates the current length of the common transmit queue. A value of ***fifo*** indicates that transmit traffic is being queued in a first-in-first-out basis for this service category. This is similar to ***common*** queuing, but the *txQueueLength* attribute indicates the number of cells in this connection queue. A value of ***fifo*** will only be indicated for connections on ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***. A value of ***perVc*** indicates that transmit traffic is being enqueued onto a per-VC queue for this connection. A value of ***notApplicable*** indicates that transmit traffic is being shaped for this connection, or that unshaped transmit queuing is not applicable for this type of connection. Transmit traffic for a shaped connection is enqueued onto a per-VC queue, but this attribute is only applicable for unshaped connections. Unshaped transmit queuing is not applicable for basic *Vpt*s.

ATTRIBUTE AtmIf Vpt Tm forceTagging (tagging)

Access — Read only

Description — This attribute indicates the state of force tagging option for this connection. Force tagging refers to setting the CLP bit for all cells on a connection.

A value of ***enabled*** indicates that the CLP bit is being set to 1 for all cells in the transmit direction on this connection.

A value of ***disabled*** indicates that the CLP bit is unchanged for cells in the transmit direction on this connection. The value ***disabled*** is always displayed for *Vpt*s since forced tagging is applied on a per *Vpt Vcc* basis.

Mib — AtmCore

Values — disabled
enabled

Default — No default

ATTRIBUTE AtmIf Vpt Tm weight

Access — Read only

Description — This attribute indicates the relative weight of this unshaped connection. Connections with a larger weight get a larger proportion of the link bandwidth or in the case of standard *Vpt Vcc*s, the *Vpt* bandwidth.

For all but standard *Vpt Vcc*s, the default connection weight is determined by the weight policy for a service category and the traffic descriptor for a connection. For standard *Vpt Vcc*s, the default connection weight is determined by the *Vcc*'s service category.

A value from 1 to 4095 indicates an actual weight. The value ***upToQueueLimit*** indicates that the weight of a connection is up to the transmit queue limit for this connection and is used for connections which have the value of the *unshapedTransmitQueueing* attribute displayed as ***fifo***.

Copyright © 2006, Nortel Nortel Confidential

This attribute has a displayed value of ***notApplicable*** in the following cases:
- This connection has the value of the *trafficShaping* attribute displayed as either ***linear*** or ***inverseUpc***.
- This connection has the value of the *trafficShaping* attribute displayed as ***disabled***, but the connection's service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc***.
- This connection has the value of the *unshapedTransmitQueueing* attribute displayed as ***common***.
- This is a basic *Vpt* connection.
- For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, since per-connection weight is not supported.

Mib — AtmCore

Values — Decimal (1..4095)
upToQueueLimit
notApplicable

Default — No default

ATTRIBUTE Atmlf Vpt Tm **usageParameterControl (upc)**

Access — Read only

Description — This attribute indicates the UPC state of the connection.

A value of ***notApplicable*** indicates that UPC is not applicable or not supported for the connection. This is the case:
- when the connection's *rxTrafficDescType* is 1 or 2.
- for standard *Vpt Vcc*s and basic *Vpt*s.

A value of ***notApplicable*** is set regardless of whether UPC is disabled or enabled in provisioning data.

A value of ***disabled*** indicates that UPC is applicable and supported for the type of connection but has been turned off in the provisioning data.

A value of ***enforced*** indicates that UPC is actively checking conformance for the connection and is discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. On some ATM cards, the counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

A value of ***monitored*** indicates that UPC is actively checking conformance for the connection and counting the violations, but is not discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. The counts of UPC violations

Copyright © 2006, Nortel Nortel Confidential

are visible in the *Vcc*, *Vpc* or *Vpt. rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

If the *atmServiceCategory* for this connection is ***availableBitRate***, a value of ***enforced*** indicates that Dynamic Generic Cell Rate Algorithm (DGCRA) is active for the connection. The traffic descriptor parameters used for DGCRA enforcement are reflected in the *rxTrafficDescParm* of the connection.

Mib — AtmCore

ATTRIBUTE Atmlf Vpt Tm txPacketWiseDiscard (txpd)

Access — Read only

Description

This attribute indicates the current set of packet-wise discard functions in effect in the transmit data direction at this connection point.

This attribute is not applicable for *Vpt*s.

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point.

A value of ***wred*** indicates that Weighted Random Early Detection is in effect at this connection point. W-RED can be enabled by provisioning for PVCs and SPVCs.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Packet-wise functions are not applicable to virtual path connections (VPCs) on these cards.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards,

Copyright © 2006, Nortel Nortel Confidential

packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

Mib	AtmCore
Set of	ppd epd wred
Default	No default

ATTRIBUTE Atmlf Vpt Tm **rxPacketWiseDiscard (rxpd)**

Access	Read only
Description	This attribute indicates the current set of packet-wise discard functions in effect in the receive data direction at this connection point. This attribute is not applicable for *Vpt*s. A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements. A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, packet-wise functions are not applicable to virtual path connections (VPCs). For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch, 4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs. For ***1pOC48ChSmIrAtm*** card, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs.

Copyright © 2006, Nortel Nortel Confidential

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Note that a provisioned value of ***enabled*** for the *Vcc/Vpc Vcd/Vpd Tm rxPacketWiseDiscard* provisionable attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in actually enabling packet-wise discard functions in the receive data direction of a connection locally on these cards, thus does not affect the operational value displayed.

Mib — AtmCore

Set of — ppd, epd

Default — No default

ATTRIBUTE Atmlf Vpt Tm bandwidthElastic (bwElastic)

Access — Read only

Description — This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application (for example, *Trunk*) running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced is displayed in the *bandwidthReduction* attribute.

A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection is not released.

A value of ***no*** indicates that the bandwidth for this connection is not reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority*.

Bandwidth elasticity has no effect for connections which have an equivalent cell rate (ECR) of zero.

This attribute is not applicable for *Vpt*s and *Vpt Vcc*s.

Mib — AtmCore

Values — no, yes

Default — No default

ATTRIBUTE Atmlf Vpt Tm bandwidthReduction (bwReduction)

Access — Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute shows the amount by which the bandwidth has been reduced for this connection. This value is non-zero only for connections which have *bandwidthElastic* displayed as ***yes***, and which are also operating in a reduced bandwidth mode. This is typically the case for selected connections running over an IMA link. This attribute takes a value from 0 (no reduction) up to the ECR. For all connections which are running at their full allocated bandwidth, *bwReduction* has the value 0. Connections which have been reduced in allocated bandwidth have a positive number for this attribute. The *bwReduction* may be subtracted from the ECR (which is displayed as *txTrafficDescParm* 5) to determine the actual bandwidth allocated to this connection.
Mib	AtmCore
Values	Decimal (0..2147483647)
Units	cell/s
Default	No default

ATTRIBUTE Atmlf Vpt Tm **abrConnectionType (abrType)**

Access	Read only
Description	This attribute indicates the type of ABR behavior which is in effect at this connection. This attribute is only applicable if the *atmServiceCategory* attribute is ***availableBitRate***. If the *atmServiceCategory* attribute is not ***availableBitRate***, this attribute value is set to ***notApplicable***. For ATM cards which do not support ABR connections, the possible values for this attribute are ***notApplicable***, ***efciSwitch***, or ***nonAbrInterworking***. In EFCI marking mode, the Explicit Forward Congestion Indication (EFCI) field in the data cell headers is used to indicate transmit queue congestion. For ATM cards which do support ABR connections, if the *connectionPointType* is ***connectionEndPoint***, the value of this attribute is ***sourceDest***. In this mode, the ABR Source and Destination behavior is in effect at this connection. This attribute is also ***sourceDest*** in the case where the next hop connection is specified as ***nonAbrInterworking***. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of the *Nrp* or *Rp* component. If the *connectionPointType* is not ***connectionEndPoint***, the value of this attribute depends upon the *abrConnectionType* provisioning and the card type to which the traffic is forwarded on the backplane. The default *abrConnectionType* is provisioned at the *CA Abr abrConnectionType* attribute, and may be overridden for a provisioned connection in the *Vcd Tm abrConnectionType* or *Vpd Tm abrConnectionType* attribute. If the *CA Abr abrConnectionType* attribute is ***virtualSourceDest*** at either one of the two connection points, and if both the connection points are defined on ATM cards which support ABR connections, virtual source and destination behavior is applied to the connection. In this instance, the attribute displays the value ***virtualSourceDest***.

Copyright © 2006, Nortel Nortel Confidential

This attribute has the value ***erSwitch*** if ABR explicit rate functionality is in effect at this connection. In this mode, the switch may modify the Explicit Rate (ER) field of backward Resource Management (RM) cells to indicate the status of congestion at this connection point.

This attribute has the value ***nonAbrInterworking*** in the case where this connection point is functioning as an SPVC origin for an ABR connection where the link side of this connection is configured as a non-ABR ATM service category. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.

Mib — AtmCore

Values
erSwitch
efciSwitch
virtualSourceDest
sourceDest
nonAbrInterworking
notApplicable

Default — No default

ATTRIBUTE Atmlf Vpt Tm **txTrafficDescParm (txTdp)**

Access — Read only

Description — This attribute is a vector of five transmit traffic parameters whose mapping is defined by the *txTrafficDescType* attribute.

The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR), actual cell rate (ACR), explicit rate (ER), equivalent cell rate (ECR), and actual shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds.

When *txTrafficDescType* is 1 or 2, parameters 1 through 5 are unused.

In this description, PCR is the greater of either the PCR or the requested shaping rate (parameter 1 or parameter 5) specified in the *txTrafficDescParm* attribute under the *Vcd Tm* or *Vpd Tm* component.

When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 or 1 traffic; parameters 2 and 3 are unused.

When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard.

When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging.

Copyright © 2006, Nortel
Nortel Confidential

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, parameter 4 reflects the actual shaping rate in cell/s for this connection. For CQC-based ATM cards, the set of available shaping rates is based on the number of interfaces doing shaping (attribute *perVcQueueInterfaces*), and the *shapingScalingFactor* attribute of the *Arc Cqc Override* component. A rate of zero (0) indicates that shaping is not performed, or that the interface is down.

When *txTrafficDescType* is 9***,*** parameter 1 represents the PCR; parameter 2 represents the Cell Delay Variation Toleration (CDVT); parameter 3 represents the Minimum Cell Rate (MCR); the meaning of parameter 4 depends upon the value of the *abrConnectionType* attribute. if *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, parameter 4 represents the Allowed Cell Rate (ACR); If *abrConnectionType* is ***erSwitch***, parameter 4 represents the Explicit Rate (ER); and if *abrConnectionType* is ***efciSwitch***, parameter 4 reflects the actual shaping rate in cell/s for this connection.

When *txTrafficDescType* is 3, 4, 5, 6, 7, 8, or 9, parameter 5 reflects the equivalent cell rate in cell/s for this connection as determined by the Connection Admission Control (CAC) algorithm. The equivalent cell rate is useful in determining the admission characteristics of this connection.

Vector of	Decimal (0..2147483647)
Index	Decimal (1..5)
Default	No default

ATTRIBUTE Atmlf Vpt Tm **txQueueThresholds (txQThresh)**

Access	Read only
Description	This attribute indicates the queue limit and the discard thresholds for the transmit queue of this connection.

Copyright © 2006, Nortel Nortel Confidential

If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the thresholds of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the thresholds of the per-VC queue.

The first element indicates the queue limit. The provisioned value of the transmit queue limit is derived from the *txQueueLimit* attribute under the service category subcomponents of the *CA* component for the service category of this connection.

The second element is the threshold that marks the transition from congestion state 1 to congestion state 0. This is the threshold at which traffic with discard priority (DP) = 1 is discarded. This threshold is set at approximately 90 percent of the first parameter, the operational queue limit.

The third element is the threshold that marks the transition from congestion state 2 to congestion state 1. This is the threshold at which traffic with DP = 2 is discarded. This threshold is set at approximately 75 percent of the first parameter, the operational queue limit.

The fourth element is the threshold that marks the transition from congestion state 3 to congestion state 2. This is the threshold at which traffic with DP = 3 is discarded. This threshold is set at approximately 35 percent of the first parameter, the operational queue limit.

For ***1pOC48ChSmIrAtm*** cards, this attribute displays the thresholds of the link class queue used by this connection to buffer it traffic.

This attribute does not apply to basic *Vpt*s.

Mib	AtmCore
Vector of	Decimal (0..1011840)
Units	cells
Index	Decimal (0..3)
Default	No default

ATTRIBUTE **Atmlf Vpt Tm** **rxTrafficDescParm (rxTdp)**

Access	Read only
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. Cell delay variation tolerance (CDVT) is expressed in microseconds.

Copyright © 2006, Nortel Nortel Confidential

When *rxTrafficDescType* is 1 or 2, none of the parameters are used.

When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents CDVT; parameter 3 represents the MCR; parameter 4 is not used.

If *upc* is ***disabled*** for this connection, the values of PCR, SCR, MBS and CDVT are the provisioned parameters.

If *upc* is ***enabled***, the values of PCR, SCR, MBS, and CDVT are exactly the values used by the usage parameter control hardware in policing the arriving traffic. These may vary slightly from the provisioned values due to granularity of the hardware. In the case where the PCR is equal to the SCR, the effective MBS is zero.

ATTRIBUTE Atmlf Vpt Tm rxQosParameters (rqp)

Access	Read only
Description	This attribute is a vector of three elements that indicate the quality of service parameters for the backward direction for this connection. This attribute is used for SPVC and SVC connections on a PNNI interface. The ***cdv*** element indicates the acceptable peak-to-peak Cell Delay Variation (CDV) of real-time connections (CBR and rt-VBR). The ***ctd*** element indicates the acceptable maximum Cell Transfer Delay (maxCtd) of real-time connections (CBR and rt-VBR). The ***clr*** element indicates the acceptable Cell Loss Ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections.

COMPONENT Atmlf Vpt Tm AvailableBitRate (Abr)

Groups	GROUP Atmlf Vpt Tm Abr Operational (Oper)

Copyright © 2006, Nortel Nortel Confidential

Scope	Device
Description	*AtmIf/n Vpc/vpi Tm AvailableBitRate,* *AtmIf/n Vcc/vpi.vci Tm AvailableBitRate,* *AtmIf/n Vpt/vpi Tm AvailableBitRate,* *AtmIf/n Vpt/vpi Vcc/vci Tm AvailableBitRate* This component contains ABR-related operational attributes of a connection. It is dynamically created for connections where the value of the *atmServiceCategory* attribute is ***availableBitRate***, and where the value of the *abrConnectionType* attribute is ***sourceDest***, or ***virtualSourceDest***.
Mib	AtmCore
Common Verbs	Help List Display

GROUP Atmlf Vpt Tm Abr Operational (Oper)

Properties	Operational
Description	This group contains operational attributes for connections using ABR service category.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Tm Abr initialCellRate (icr)

Access	Read only
Description	This attribute indicates the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. For nailed-up connections, this attribute is determined by the provisioned value of the *initialCellRate* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element. The ICR for a connection is a value between the MCR and the PCR. Furthermore, ICR has an upper bound determined by the *transientBufferExposure* divided by *fixedRoundTripTime*.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	cell/s
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr transientBufferExposure (tbe)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the resource to send during start-up periods, before the first Resource Management (RM) cell returns. For nailed-up connections, this attribute is determined by the provisioned value of the *transientBufferExposure* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **fixedRoundTripTime (frtt)**

Access	Read only
Description	This attribute indicates the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. For nailed-up connections, this attribute is determined by the provisioned value of the *fixedRoundTripTime* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **rateDecreaseFactor (rdf)**

Access	Read only
Description	This attribute indicates the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. For nailed-up connections, this attribute is determined by the provisioned value of the *rateDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **rateIncreaseFactor (rif)**

Access	Read only
Description	This attribute indicates the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64. RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR. For nailed-up connections, this attribute is determined by the provisioned value of the *rateIncreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..15)
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **maxCellPerRmCell (nrm)**

Access	Read only
Description	This attribute indicates the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell. For nailed-up connections, this attribute is determined by the provisioned value of the *maxCellsPerRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **maxTimeBetweenRmCell (trm)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the TRM parameter for this connection. TRM provides an upper bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least 2 other cells have been sent, the next cell to be transmitted would be a forward RM cell. For nailed-up connections, this attribute is determined by the provisioned value of the *maxTimeBetweenRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)
Units	microsec
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **cutoffDecreaseFactor (cdf)**

Access	Read only
Description	This attribute indicates the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero. CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the *forwardRmCellLimit* attribute, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. For nailed-up connections, this attribute is determined by the provisioned value of the *cutoffDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (0; 1; 2; 4; 8; 16; 32; 64)
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **acrDecreaseTimeFactor (adtf)**

Access	Read only
Description	This attribute indicates the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection.

Copyright © 2006, Nortel Nortel Confidential

	ADTF is the time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*. For nailed-up connections, this attribute is determined by the provisioned value of the *acrDecreaseTimeFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..1023)
Units	centiseconds
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **forwardRmCellLimit (crm)**

Access	Read only
Description	This attribute indicates the CRM parameter for this connection. CRM is the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. The value of CRM is obtained as *transientBufferExposure* divided by *maxCellsPerRmCell*.
Mib	AtmCore
Values	Decimal (1; 3; 7; 15; 31; 63; 127; 255; 511; 1023; 2047; 4095)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **txRateChangeInfo (txrci)**

Access	Read only
Description	This attribute indicates the rate change information put into the last forward Resource Management (RM) cell turned around as a backward-RM cell. For connections configured as an ABR Source or Destination, the turned around backward-RM cell is sent over the interface. For connections configured as an ABR Virtual Source or Virtual Destination, the turned around backward-RM cell is sent over the backplane.
Mib	AtmCore

Copyright © 2006, Nortel Nortel Confidential

Values	congestionIndicated noIncreaseIndicated explicitRateIndicated
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **acrRateChangeInfo (arci)**

Access	Read only
Description	This attribute indicates the type of change in the Allowed Cell Rate (ACR) as a result of the information in the last backward Resource Management (B-RM) cell received from the interface. This attribute value is only applicable when the *Vcc Tm* or *Vpc Tm* *abrConnectionType* attribute is ***sourceDest*** or ***VirtualSourceDest***. In all other cases, this attribute value is ***notApplicable***. A value of ***noChange*** indicates that the rate did not change as a result of the last backward RM cell received. A value of ***decreasedByRdf*** or ***increasedByRif*** indicates that the ACR was increased or decreased by the corresponding factor. This change is as a result of the CI or NI bit setting in the last backward RM cell, or an ADTF timeout. A value of ***setToExplicitRate*** indicates that the ACR was set to the ER value in the last backward RM cell.
Mib	AtmCore
Values	noChange decreasedByRdf increasedByRif setToExplicitRate notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Tm Abr **txFwdRmCells**

Access	Read only
Description	This attribute counts the number of forward Resource Management (RM) cells sent over the interface since the last backward RM-cell was received from the interface. If the value of this attribute is greater than or equal to the value of *forwardRmCellLimit*, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. This counter is reset to zero each time a backward-RM cell is received. This counter does not wrap to zero if it reaches its maximum value of 4095 in order to indicate that no backward RM cell has been received.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore
Values	Decimal (0..4095)
Units	cells
Default	No default

ATTRIBUTE **AtmIf Vpt Tm Abr** **rxEfci**

Access	Read only
Description	This attribute indicates the value of the Explicit Forward Congestion Indication (EFCI) bit of the last data cell received from the interface. When a forward Resource Management (RM) cell is turned around as a backward-RM cell, the Congestion Indication (CI) field of the backward-RM cell is set to 1, if the value of this attribute is ***indicated***. This attribute is set to ***notIndicated*** each time a backward-RM cell is transmitted.
Mib	AtmCore
Values	notIndicated indicated
Default	No default

GROUP Atmlf Vpt Aini Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Aini* component.
Mib	AtmAini

ATTRIBUTE Atmlf Vpt Aini side

Access	Read: All Write: All
Criticality	Component
Description	This attribute indicates which side the interface is, user or network.
Mib	AtmAini
Values	networkSide userSide
Default	networkSide

ATTRIBUTE Atmlf Vpt Aini softPvpAndPvcRetryPeriod (sRetryPeriod)

Access	Read: All Write: All
Description	This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. Due to the group timer implementation, it can take from 100% to 150% of the provisioned timer value for the retry to be triggered.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmAini
Values	Decimal (20..999999)
Units	seconds
Default	60

ATTRIBUTE Atmlf Vpt Aini softPvpAndPvcHoldOffTime (sHoldOffTime)

Access	Read: All Write: All
Description	This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value.
Mib	AtmAini
Values	Decimal (0; 50..20000)
Units	msec
Default	0

ATTRIBUTE Atmlf Vpt Aini passAlongRequest

Access	Read: All Write: All
Description	This attribute specifies whether unrecognized messages and information elements with the pass along request set are accepted when received at the interface. If they are not allowed, then they are discarded and the procedures specified by the message or information element's action indicator field are followed.
Mib	AtmAini
Values	allowed discarded
Default	allowed

GROUP Atmlf Vpt Aini AccountingOptions (AcctOpt)

Properties	Provisioned
Description	This group contains the provisionable attributes for accounting.
Mib	AtmAini

ATTRIBUTE Atmlf Vpt Aini accountCollection (aco)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations: - on a TODA changeover if TODA is enabled; - every 12 hours (per connection) if TODA is disabled; - on every call clear (a call record with final cell counts). If none of the reasons is present, then accounting will be suppressed. The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate.
Mib	AtmAini
Set of	bill test study audit force
Default	No default

ATTRIBUTE Atmlf Vpt Aini accountConnectionType (act)

Access	Read: All Write: All
Description	This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records. If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***. If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.
Mib	AtmAini
Values	origTerm intermediate
Default	intermediate

ATTRIBUTE Atmlf Vpt Aini accountClass (acl)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.
Mib	AtmAini
Values	Decimal (0..255)
Default	0

ATTRIBUTE Atmlf Vpt Aini **serviceExchange (sre)**

Access	Read: All Write: All
Description	This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate.
Mib	AtmAini
Values	Decimal (0..255)
Default	0

ATTRIBUTE Atmlf Vpt Aini Sig addressConversion

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.
Mib	AtmAini
Values	none nativeE164 nsap
Default	none

ATTRIBUTE Atmlf Vpt Aini Sig **operatingMode**

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	AtmAini
Values	normal provisionedOnly
Default	normal

GROUP Atmlf Vpt Aini Sig **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmAini

ATTRIBUTE Atmlf Vpt Aini Sig **adminState (osiAdmin)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmAini
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE **Atmlf Vpt Aini Sig** **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmAini
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE **Atmlf Vpt Aini Sig** **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	AtmAini
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpt Aini Sig **Operational (Oper)**

Properties	Operational
Description	This attribute contains the operational attributes for the AtmSignalling component.
Mib	AtmAini

ATTRIBUTE Atmlf Vpt Aini Sig **lastTxCauseCode**

Access	Read: All Write: Illegal
Description	This attribute indicates the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmAini
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Sig **lastTxDiagCode**

Access	Read: All Write: Illegal
Description	This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0.
Mib	AtmAini
Values	Hex (H.0..H.ff)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Sig **lastRxCauseCode**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute contains the cause code in the last received signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmAini
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Sig **lastRxDiagCode**

Access	Read: All Write: Illegal
Description	This attribute contains the diagnostic code in the last received signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to 0.
Mib	AtmAini
Values	Hex (H.0..H.ff)
Default	No default

GROUP Atmlf Vpt Aini Sig **Statistics (Stats)**

Properties	Operational
Description	This attribute group contains the statistics associated with the AtmSignalling component.
Mib	AtmAini

ATTRIBUTE Atmlf Vpt Aini Sig **peakConnections**

Access	Read: All Write: Illegal
Description	This attribute indicates the high water mark of active point-to-point connections.
Mib	AtmAini
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Sig **successfulConnections**

ATTRIBUTE Atmlf Vpt Aini Sig Vcd **atmServiceCategory (service)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the ATM service category for both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application.

The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are

Copyright © 2006, Nortel
Nortel Confidential

made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

ATTRIBUTE Atmlf Vpt Aini Sig Vcd **weight**

Access Read and write

Criticality Component

Description This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These
attributes can be found under the atmif/n ca <atmServiceCategory>/ m.

This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs.

When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***.

When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT.

When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.

ATTRIBUTE Atmlf Vpt Aini Sig Vcd **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

Copyright © 2006, Nortel Nortel Confidential

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Aini Sig Vcd **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmAini
Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Vpt Aini Sig Vcd **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has

Copyright © 2006, Nortel Nortel Confidential

UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component.

When ***disabled*** is selected, UPC for this connection is disabled.

The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Flags: HCA_SUPPORT

ATTRIBUTE **Atmlf Vpt Aini Sig Vcd trafficDescParm (tdp)**

Access: Read: All
Write: All

Criticality: Component

Description: This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP

Copyright © 2006, Nortel Nortel Confidential

equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

Description	*AtmIf/n Aini Address/address,type* *AtmIf/n Iisp Address/address,type* *AtmIf/n Uni Address/address,type* *AtmIf/n Pnni Address/address,type* *AtmIf/n Vpt/m Aini Address/address,type* *AtmIf/n Vpt/m Iisp Address/address,type* *AtmIf/n Vpt/m Uni Address/address,type* *AtmIf/n Vpt/m Pnni Address/address,type* This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wildcard ('?'), and a type. The type identifies whether the *Address* component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address. The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses.Virtual interfaces do not have addresses of type ***default***. The wildcard is only valid for provisioned addresses. If the address is a single wildcard, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wildcard static address, then the choice is driven through a round robin algorithm. The round robin algorithm tries the primary routes and then the alternate routes if none of the primary routes succeed. If this node participates in a PNNI hierarchy, then a *PnniInfo* subcomponent can be provisioned under the *AtmAddress* component to specify the level to which this address will be advertised.

AtmIf/n Vpt/vpi Aini PathTraceFilter
AtmIf/n Vpt/vpi Iisp PathTraceFilter
AtmIf/n Vpt/vpi Uni PathTraceFilter
AtmIf/n Vpt/vpi Pnni PathTraceFilter

This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced.

When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop,* and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When

Copyright © 2006, Nortel
Nortel Confidential

AtmPathTraceFilter component is deleted, all records are cleared.

Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted.

The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

START AtmIf/n Vpt/vpi Pnni PathTraceFilter

This command starts the path tracing based on the specified filtering criteria.

When the command is issued, the *traceTimeout* timer is reset.

VERB STOP **AtmIf Vpt Aini Ptf**

Impact: Service

Description:
STOP AtmIf/n Aini PathTraceFilter
STOP AtmIf/n Iisp PathTraceFilter
STOP AtmIf/n Uni PathTraceFilter
STOP AtmIf/n Pnni PathTraceFilter
STOP AtmIf/n Vpt/vpi Aini PathTraceFilter
STOP AtmIf/n Vpt/vpi Iisp PathTraceFilter
STOP AtmIf/n Vpt/vpi Uni PathTraceFilter
STOP AtmIf/n Vpt/vpi Pnni PathTraceFilter

This command causes the filter to stop, but keeps the trace records.

Copyright © 2006, Nortel Nortel Confidential

VERB CLEAR **AtmIf Vpt Aini Ptf**

Impact	Service
Description	*CLEAR AtmIf/n Aini PathTraceFilter* *CLEAR AtmIf/n Iisp PathTraceFilter* *CLEAR AtmIf/n Uni PathTraceFilter* *CLEAR AtmIf/n Pnni PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Aini PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Iisp PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Uni PathTraceFilter* *CLEAR AtmIf/n Vpt/vpi Pnni PathTraceFilter* This command clears the path trace records associated with this filter. This command is rejected on an active filter.

GROUP **AtmIf Vpt Aini Ptf** **Criteria**

Properties	Operational
Description	This group contains the operational criteria for the *PathTraceFilter* component.
Mib	AtmAini

ATTRIBUTE **AtmIf Vpt Aini Ptf** **traceInfo (tInfo)**

Access	Read: All Write: All
Description	This attribute specifies the trace information that is included in the trace records. ***crankBack***: Crankback information is included if the connection is cranked back during the connection setup phase. If the option is turned on, all attempted paths including the final one are recorded. If the option is turned off, only the information of the final path is recorded. If the connection fails to reach the destination, no path information is returned. ***connId***: Connection Identifier information is included. ***callRef***: For point-to-point connections, the call reference is included. For point-to-multipoint connections, the call reference and end point reference are both included. Basic trace information, such as node and port identifiers, are always included.
Mib	AtmAini
Set of	crankBack connId callRef
Default	(crankBack, connId, callRef)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Aini Ptf **calledPartyPrefix (cldPref)**

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the called party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	AtmAini
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf **callingPartyPrefix (clgPref)**

Access	Read: All Write: All
Description	This attribute specifies an NSAP address prefix, which is compared with the calling party IE in the connection setup request. When all the criteria in the filter match successfully, the call is traced. An empty string matches any address.
Mib	AtmAini
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf **connectionType (type)**

Access	Read: All Write: All
Description	This attribute specifies a connection type (SVC, SPVC, SVP, SPVP), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	AtmAini
Set of	svc spvc svp spvp
Default	(svc, spvc, svp, spvp)

ATTRIBUTE Atmlf Vpt Aini Ptf **connectionConfiguration (config)**

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies a type of topology (point-to-point or point-to-multipoint), which is compared against the connection setup request. When all the criteria in the filter match successfully, the call is traced.
Mib	AtmAini
Set of	ptp ptmp
Default	(ptp, ptmp)

ATTRIBUTE Atmlf Vpt Aini Ptf **serviceCategory (svcCat)**

Access	Read: All Write: All
Description	This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match successfully, the call is traced.
Mib	AtmAini
Set of	cbr rtVbr nrtVbr ubr
Default	(cbr, rtVbr, nrtVbr, ubr)

GROUP Atmlf Vpt Aini Ptf **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the *PathTraceFilter* component.
Mib	AtmAini

ATTRIBUTE Atmlf Vpt Aini Ptf **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the filter. ***active***: Indicates the filter is active. ***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out.
Mib	AtmAini
Values	active inactive

Copyright © 2006, Nortel Nortel Confidential

Default	inactive

ATTRIBUTE Atmlf Vpt Aini Ptf **recordCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords,* which ever is less.
Mib	AtmAini
Values	Decimal (0..200)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf **matchedConnections**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of connections that match the criteria of this filter.
Mib	AtmAini
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf **elapsedTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes that have elapsed since the start of the filter.
Mib	AtmAini
Values	Decimal (0..70560)
Units	minutes
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf **timeRemaining**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes remaining before the filter terminates itself.
Mib	AtmAini
Values	Decimal (0..70560)

Copyright © 2006, Nortel Nortel Confidential

Units	minutes
Default	No default

GROUP Atmlf Vpt Aini Ptf **RecordControl (Record)**

Properties	Operational
Description	This group contains the operational attributes for the record control of the *PathTraceFilter* component.
Mib	AtmAini

ATTRIBUTE Atmlf Vpt Aini Ptf **traceTimeout**

Access	Read: All Write: All
Description	This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available.
Mib	AtmAini
Values	Decimal (1..70560)
Units	minutes
Default	60

ATTRIBUTE Atmlf Vpt Aini Ptf **maxTraceRecords (mRecords)**

Access	Read: All Write: All
Description	This attribute specifies the maximum number of records allowed to be stored with the filter. Once the maximum has been reached, the oldest record is removed.
Mib	AtmAini
Values	Decimal (1..200)
Default	2

COMPONENT Atmlf Vpt Aini Ptf **PathTraceRecord (PTRecord)**

GROUP AtmIf Vpt Aini Ptf PTRecord Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the path trace record component.
Mib	AtmAini

ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord status

Access	Read: All Write: Illegal
Description	This attribute indicates the status of the trace. The string is one of the following: ***Completed normally****:* The trace completed normally. ***Incomplete****:* Partial trace returned. ***Exceeded information element length limitations****:* The number of traced nodes exceeded the maximum number of hops. ***Exceeded message length limitations****:* The message length exceeded the maximum allowed size.
Mib	AtmAini
Values	Completed normally Incomplete Exceeded information element length limitations Exceeded message length limitations
Default	No default

ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord timeStamp

Access	Read: All Write: Illegal
Description	This attribute records the date and time of when the trace is completed.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmAini
Values	Time (DHMS)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord **srcPortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmAini
Values	Decimal (1..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord **srcPortName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmAini
Values	String (40, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord **causeCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmAini
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord **diagCode**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmAini
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **ingressEndPointReference (epref)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the end point reference value used for this hop on the ingress side. This is the ingress side with respect to the trace or setup messages. The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint.
Mib	AtmAini
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **nodeId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the lowest level node ID traversed for this hop.
Mib	AtmAini
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **nodeName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the *nodeName* under the *ModuleData* component for this hop. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmAini
Values	String (12, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **portId**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages.
Mib	AtmAini
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop **portName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmAini
Values	String (55, ASCII)
Default	No default

ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop **pnniTraceContRefusalIndPresent (refusal)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.
Mib	AtmAini
Values	absent present
Default	absent

ATTRIBUTE AtmIf Vpt Aini Ptf PTRecord Hop **crankbackDestNodeIndPresent (dest)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback

Copyright © 2006, Nortel Nortel Confidential

	Received at Trace Destination Node" indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface.
Mib	AtmAini
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **pnniCrankbackGapIndPresent (gap)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the "PNNI Crankback Gap" indicator is present. The "PNNI Crankback Gap" indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback.
Mib	AtmAini
Values	absent present
Default	absent

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **crankBackCause (cause)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	AtmAini
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **blockedTransitType (type)**

Access	Read: All Write: Illegal
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the blocked transit type. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	AtmAini
Values	Succeeding end blocked Blocked node Blocked link
Default	No default

ATTRIBUTE **AtmIf Vpt Aini Ptf PTRecord Hop** **blockedNodeId (bNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked node ID during the call setup request. The blocked node ID identifies the logical node where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked node.***
Mib	AtmAini
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf Vpt Aini Ptf PTRecord Hop** **blockedLinkPrecedingNodeId (pNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's preceding node ID during the call setup request. The blocked link's preceding node ID identifies the logical node preceding a link, where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked link***.
Mib	AtmAini
Values	String (22, Hex)
Default	No default

ATTRIBUTE **AtmIf Vpt Aini Ptf PTRecord Hop** **blockedLinkPortId (bPortId)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's port identifier used for this connection during the call setup request. The blocked link's port identifier identifies a logical port of the blocked link's preceding node identifier. This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***
Mib	AtmAini
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **blockedLinkSucceedingNodeId (sNodeId)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the blocked link's succeeding node ID during the call setup request. The blocked link's succeeding node ID identifies the logical node succeeding a link where the connection or party has been blocked. This attribute is present when the *blockedTransitType* attribute is ***Blocked link.***
Mib	AtmAini
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf Vpt Aini Ptf PTRecord Hop **dstVpiVci**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the VPI.VCI values on the destination side. This attribute only appears in the trace result for the trace destination node. This attribute is only displayed for ATM interfaces. The VPI.VCI is included in the trace when the *traceInfo* attribute sets the ***connId*** value.
Mib	AtmAini

COMPONENT Atmlf Vpt Aini PathTraceTestConnection (Ptt)

Groups: GROUP AtmIf Vpt Aini Ptt Operational (Oper)

Scope: Device

Description:

AtmIf/n Aini PathTraceTestConnection
AtmIf/n Iisp PathTraceTestConnection
AtmIf/n Uni PathTraceTestConnection
AtmIf/n Pnni PathTraceTestConnection
AtmIf/n Vpt/vpi Aini PathTraceTestConnection
AtmIf/n Vpt/vpi Iisp PathTraceTestConnection
AtmIf/n Vpt/vpi Uni PathTraceTestConnection
AtmIf/n Vpt/vpi Pnni PathTraceTestConnection

This component provides the capability to control the Path Trace Test Connection. A test connection is one way to find the logical nodes and ports that a connection traverses to a destination interface.

The *Trace* verb is used to initiate the test connection. The test connection is always released once it reaches the trace destination. The test connection responds with the trace results collected during a complete or partial trace.

Mib: AtmAini

Common Verbs:
- Help
- List
- Display

VERB TRACE Atmlf Vpt Aini Ptt

Impact: Passive

Description:

TRACE AtmIf/n Aini AtmPathTraceTest
TRACE AtmIf/n Iisp AtmPathTraceTest
TRACE AtmIf/n Uni AtmPathTraceTest
TRACE AtmIf/n Pnni AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Aini AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Iisp AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Uni AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Pnni AtmPathTraceTest

This command is used to initiate a Path Trace Test Connection and then responds with a list of logical nodes and ports from the trace source node to the trace destination node.

Only one *Trace* command is allowed at a time per signaling interface. If the test connection times out, the command fails.

GROUP Atmlf Vpt Aini Ptt Operational (Oper)

Properties: Operational

sameAsTx

Default: sameAsTx

ATTRIBUTE **Atmlf Vpt Aini Ptt** **atmServiceCategory (service)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the ATM service category for both directions of the connection.

If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection.

If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications.

The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS.

Copyright © 2006, Nortel
Nortel Confidential

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.

ATTRIBUTE **Atmlf Vpt Aini Ptt** **bearerClassBbc (bcBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network. The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Copyright © 2006, Nortel Nortel Confidential

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

ATTRIBUTE Atmlf Vpt Aini Ptt **transferCapabilityBbc (tcBbc)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> ***0***: NoIndication, NoIndication ***1***: NoIndication, yes ***2***: NoIndication, no ***5***: CBR, yes ***8***: VBR, NoIndication ***9***: VBR, yes ***10***: VBR, no ***NotApplicable*** specifies that the user does not want to specify the transfer capability. The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation.

Copyright © 2006, Nortel Nortel Confidential

The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data.

The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing.

The value ***yes*** for end-to-end timing indicates that end-to-end timing is required.

The value ***no*** for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Vpt Aini Ptt **txTrafficDescParm (txTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

Copyright © 2006, Nortel Nortel Confidential

When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter

Copyright © 2006, Nortel Nortel Confidential

3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

Vector of	Decimal (0..2147483647)
Index	Decimal (1..5)
Default	([5] 0)

ATTRIBUTE **Atmlf Vpt Aini Ptt** **rxTrafficDescParm (rxTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC). When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must

Copyright © 2006, Nortel
Nortel Confidential

be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or

Copyright © 2006, Nortel Nortel Confidential

I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

VERB OPTIMIZE Atmlf Vpt Aini Reroute

Impact	Service
Description	*Optimize [-all] AtmIf/n Uni Reroute* *Optimize [-all] AtmIf/n Aini Reroute* *Optimize [-all] AtmIf/n Iisp Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Uni Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Aini Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Iisp Reroute* This command triggers path optimization for the connection segments managed by the Reroute component. By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the localOptimalMetricValue attribute under the RerouteInfo component for the connection. The -all option causes all connection segments subscribed to path optimization to be considered. Using the Optimize command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP AtmIf Vpt Aini Reroute Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.
Mib	AtmAini

ATTRIBUTE AtmIf Vpt Aini Reroute Ov protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.

Copyright © 2006, Nortel Nortel Confidential

localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Mib: AtmAini

Values:
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE Atmlf Vpt Aini Reroute Ov **numOptAttempts**

Access: Read and write

Description: This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Mib: AtmAini

Values:
Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

Default: sameAs

ATTRIBUTE Atmlf Vpt Aini Reroute Ov **moduleOptimizationConnections**

Access: Read and write

Description: This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni*

Copyright © 2006, Nortel Nortel Confidential

Reroute component.

One of the following values can be specified:
sameAsARtgPnniReroute: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.
none: No connection segments are considered for path optimization.
recoveredOnly: Only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
allSubscribed: All connection segments subscribed to path optimization are considered.

Mib: AtmAini

Values:
none
recoveredOnly
allSubscribed
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE Atmlf Vpt Aini Reroute Ov **switchoverMechanism**

Access: Read and write

Description: This attribute specifies the mechanism used for switchover of a rerouted connection segment.

One of the following values can be specified:
sameAsARtgPnniReroute: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.
standard: The mechanism described in the ATM Forum “Domain based Rerouting” specification is used for switchover. This value ensures interoperability with other vendors’ equipment running ATM Forum “Domain based Rerouting”.
rcl: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Nortel Networks extension to the standard mechanism, allowing for faster switchover time.

Mib: AtmAini

Values:
standard
rcl

Scope — Device

Description — *AtmIf/n Vpt/vpi VirtualChannelConnection/vci*
This component represents a virtual channel connection terminated by a *Virtual Path Terminator (VPT)*.

For *Vccs* beneath *Vpts*, the instance value defines the VCI value for this connection—for example, Vpt/16 Vcc/32 would define a connection with a VPI of 16, and a VCI of 32. The VPI value of the *Vcc* is inherited from the parent *Vpt*.

The VPI can be in the range of 0 to 4095 and the VCI can be in the range

Copyright © 2006, Nortel
Nortel Confidential

of 0 to 65535. Note that a *Vcc* instance of 0.0 is invalid as defined in the ATM Forum. Thus, the combination of *Vpt/0 Vcc/0* is also invalid.

VERB TRACE **AtmIf Vpt Vcc**

Impact	Service
Description	*TRACE AtmIf/n Vpt/vpi Vcc/vci* *TRACE -s -v -a -e AtmIf/n Vpt/vpi Vcc/vci* *TRACE -p AtmIf/n Vpt/vpi Vcc/vci* This command traces the path of an intra-network segment of a connection. It displays the names of interface and connection components along this segment of a connection. The Trace response for a *Vcc* does not show any hops of a connection which are conveyed on a path connection (VPC). In this case the Trace command only shows the *Vcc* hop points. Note however, that if the connection traverses a *Vcc* which resides beneath a *Vpt*, the *Vpt/vpi Vcc/vci* hierarchy is displayed in the trace results. The option for the OAM trace is as follows: *-p*: Selects the Nortel Networks proprietary OAM Connection Management Trace instead of the proprietary OAM Legacy Loopback Trace. If no options are provided, the default configuration uses the Legacy Loopback Trace.

Copyright © 2006, Nortel Nortel Confidential

The options for the signaling trace are as follows:

-s: Selects the PNNI signaling call trace instead of the Nortel Networks proprietary OAM-based trace procedure. Option *-s* must be present if any one of options *-v, -a,* and *-e* are present. Otherwise, it defaults to the OAM-based trace.

-v: Requests that the VPI.VCI values be collected along the trace. This option is only valid when the *-s* option is present.

-a: Requests that the call reference/end point reference values be collected along the trace. This option is only valid when the *-s* option is present.

-e: Used on point-to-multipoint connections to specify the end point reference value indicating which party to trace. If no *-e* option is used for a point-to-multipoint connection, the default traces the path with endpoint reference 0, which is the first party. This option is only valid when the *-s* option is present.

Only one connection trace is supported at a time. An error message is returned if a response from the network is not received within 30 seconds.

If the verb is issued with the *-s* option for the *Vpt/vpi Vcc/vci* values that are not active or were not created by signaling (for example, control channels), the command is refused

VERB CLEAR **Atmlf Vpt Vcc**

Impact	Service
Description	*CLEAR AtmIf/n Vpt/vpi Vcc/vci* This command is used to clear a switched connection which is under a *Vpt*.

GROUP **Atmlf Vpt Vcc** **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmCore

ATTRIBUTE **Atmlf Vpt Vcc** **adminState (osiAdmin)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmCore
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vpt Vcc operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmCore
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vpt Vcc usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — AtmCore

Values — idle
active (activ)
busy

Default — idle

GROUP Atmlf Vpt Vcc **Operational (Oper)**

Properties — Operational

Description — This group contains operational information for a *Vcc, Vpc,* or *Vpt* component.

Mib — AtmCore

ATTRIBUTE Atmlf Vpt Vcc **connectionPointType (cpt)**

Access — Read only

Description — This attribute reflects the role of the connection component at this interface.

A value of ***connectionEndPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are processed by the connection component.

A value of ***segmentEndPoint*** indicates that user cells and end-to-end OAM cells are relayed by the connection component, while segment OAM cells are processed by the connection component.

A value of ***connectingPoint*** indicates that user cells, end-to-end OAM cells, and segment OAM cells are relayed by the connection component.

A value of ***unknown*** indicates that the connection component is inactive.

Mib — AtmCore

Values — connectionEndPoint
segmentEndPoint
connectingPoint
unknown

Default — No default

GROUP Atmlf Vpt Vcc **ConnectionInfo (ConnInfo)**

Properties — Operational

Description — This group contains operational connection characteristics information for a *Vcc* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc distributionType (distrbt)

Access	Read only
Description	This attribute indicates the way data is distributed in the connection. A value of ***pointToPoint*** indicates this connection point is part of a point-to-point connection. A value of ***pointToMultipoint*** indicates this connection point is part of a point-to-multipoint connection.
Mib	AtmCore
Values	pointToPoint pointToMultipoint
Default	pointToPoint

ATTRIBUTE Atmlf Vpt Vcc numLeaves (nlvs)

Access	Read only
Description	This attribute indicates the number of destination leaves of the connection. If the *distributionType* is ***pointToPoint*** the value of this attribute is 0.
Mib	AtmCore
Values	Decimal (0..2147483647)
Default	0

ATTRIBUTE Atmlf Vpt Vcc callDirection (cdir)

Access	Read only
Description	This attribute indicates the direction of the call setup request for an SVC. A value of ***fromLink*** means that the call setup originated from the link. A value of ***toLink*** means that the call setup was directed to the link. For PVC connections, the value of this attribute is ***notApplicable.*** For SPVC connections, the value of this attribute is ***notApplicable*** for *Vccs* with the *SourcePVC* and *DestinationPVC* subcomponents. For Signaling channels, the value of this attribute is ***notApplicable***.
Mib	AtmCore
Values	fromLink toLink notApplicable

Copyright © 2006, Nortel Nortel Confidential

Default	notApplicable

GROUP Atmlf Vpt Vcc Status

Properties	Operational
Description	This group contains operational status information for a *Vcc, Vpc* or *Vpt* component.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc operStatus (opStat)

Access	Read only
Description	This attribute indicates the present operational status of the *Vcc, Vpc* or *Vpt* component. Its value is dependent upon the current state of the *segLinkSideLoopbackState* and *endToEndLoopbackState* attributes. The value is ***end2endUp*** when the *endToEndLoopbackState* is ***good*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***end2endDown*** when the *endToEndLoopbackState* is ***bad*** and the *segLinkSideLoopbackState* is either ***good*** or ***unknown***. The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***unknown*** and the *segLinkSideLoopbackState* is ***good***. The value is ***localDown*** when *segLinkSideLoopbackState* is ***bad***. The value is ***localUpEnd2endUnknown*** when the *endToEndLoopbackState* is ***notApplicable*** and the *segLinkSideLoopbackState* is ***good***. The value is ***unknown*** when the *endToEndLoopbackState* is either ***unknown*** or ***notApplicable*** and the *segLinkSideLoopbackState* is ***unknown***.
Mib	AtmCore
Values	unknown end2endUp end2endDown localUpEnd2endUnknown localDown
Default	No default

ATTRIBUTE Atmlf Vpt Vcc localFailureCause

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the failure cause of the *Vcc, Vpc* or *Vpt* component. A value of ***noFailure*** indicates that there is currently no bandwidth related failure for this connection. A value of ***portDown*** indicates that the interface corresponding to the parent *AtmIf* is down. A value of ***localBwLoss*** indicates that the *AtmIf* has lost some, but not all bandwidth, and as a result, this connection has been released. A value of ***notAdmitted*** indicates that this connection has failed to be admitted by the Connection Admission Control (CAC) algorithm. A value of ***appNotRegistered*** indicates that there is no application registered to use this connection. This may be the case, for example when there is a *Vcc Test* application, but the test has not been started. Check the status of the application to determine why it is not functional. A value of ***disabledByApp*** indicates that the application using this connection has requested that the connection be disabled. An example is a connection used by a trunk application where the trunk has timed out on an attempt to stage. Check the application to determine why it is not fully functional. A value of ***bwReduced*** indicates that this connection is operating in a reduced bandwidth state. It is a bandwidth elastic connection which currently has been allocated less than the requested (equivalent) bandwidth. A value of ***vpDown*** indicates that this connection has been notified of a fault detected at the associated VP-layer. A value of ***vpDown*** is applicable for *Vpt Vcc*s only.
Mib	AtmCore
Values	noFailure localBwLoss portDown notAdmitted appNotRegistered disabledByApp bwReduced vpDown
Default	No default

ATTRIBUTE **Atmlf Vpt Vcc** **troubled**

Access	Read only
Description	This attribute indicates whether or not the connection is in a troubled state. Connections become troubled because of OAM failures; when one of the attributes *segLinkSideLoopbackState*, *segSwitchSideLoopbackState*,

Copyright © 2006, Nortel Nortel Confidential

endToEndLoopbackState, *aisState* (when receiving AIS cells only) or *rdiState* go bad, this attribute is set to ***yes***; otherwise it is set to ***no***.

Mib	AtmCore
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpt Vcc **segLinkSideLoopbackState (segLkLbkState)**

Access	Read only
Description	This attribute contains the current state of the link-side segment loopback for this connection. Link-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the link (port). The value of this attribute is dependent upon the current setting of the *segLinkSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable). The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***. The value is ***good*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the segment link side loopback is working. The value is ***bad*** when the *segLinkSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** or a ***connectionEndPoint***, and the link side segment loopback is not working. The value is ***unknown*** when the *segLinkSideLoopback* is ***off***. The value is ***unknown*** when the value of the *segLinkSideLoopback* attribute is ***on***, the *connectionPointType* attribute is set to ***segmentEndPoint*** or ***connectionEndPoint***, and the segment link side loopback has not yet been determined. The state of this attribute determines, in part, the value of the *operStatus* attribute.
Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Vcc **segSwitchSideLoopbackState (segSwLbkState)**

Access	Read only
Description	This attribute contains the current state of the switch-side segment loopback for this connection. Switch-side segment loopback cells are transmitted (inserted) by a connection component in the direction of the bus. The value of this attribute is dependent upon the current setting of the *segSwitchSideLoopback* provisionable attribute, the connection point type as specified by the *connectionPointType* attribute, and the current loopback state (if applicable). The value is only applicable when the *connectionPointType* is a ***segmentEndPoint***. The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or ***connectionEndPoint***. The value is ***notApplicable*** when the *distributionType* is ***pointToMultipoint***. The value is ***good*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback is working. The value is ***bad*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the switch side segment loopback is not working. The value is ***unknown*** when the *segSwitchSideLoopback* is ***off***. The value is ***unknown*** when the *segSwitchSideLoopback* is ***on***, the *connectionPointType* is a ***segmentEndPoint*** and the segment switch side loopback has not been determined.
Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Vcc **endToEndLoopbackState (eeLbkState)**

Access	Read only
Description	This attribute contains the current state of the end-to-end loopback for this connection. Its value is dependent upon the current setting of the *endToEndLoopback* provisionable attribute and the connection point type as specified by the *connectionPointType* attribute.

Copyright © 2006, Nortel Nortel Confidential

The value is only applicable when the *connectionPointType* is a ***connectionEndPoint***.

The value is ***notApplicable*** when the *connectionPointType* is a ***connectingPoint*** or s***egmentEndPoint***.

The value is ***notApplicable*** when the *distributionType* is a ***pointToMultipoint***.

The value is ***good*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is working.

The value is ***bad*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback is not working.

The value is ***unknown*** when the *endToEndLoopback* is ***off***.

The value is ***unknown*** when the *endToEndLoopback* is ***on***, the *connectionPointType* is a ***connectionEndPoint*** and the end-to-end loopback status has not been determined.

The state of this attribute determines, in part, the value of the *operStatus* attribute.

Mib	AtmCore
Values	good bad unknown notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Vcc rxOamCellCongestionState (rxOamCongState)

Access	Read only
Description	This attribute contains the current state of the receive side OAM cell congestion for this connection. Its value reflects whether the rate of received OAM cells for this connection is below a specified threshold. The connection maintains a count of the number of OAM cells which are terminated per second. Once that count exceeds the specified threshold, extraction of all OAM cells for this connection is disabled for a period of one minute. This is a congestion management mechanism to prevent the processor from being overloaded with handling OAM cells for a particular connection. This mechanism ensures that tasks, such as trunks obtain enough processor cycles to remain in service, and are not adversely affected by excessive rate of OAM cells on a particular connection. The value is ***good*** when the rate of received OAM cells is less than the allowed threshold.

Copyright © 2006, Nortel Nortel Confidential

The value is ***bad*** when the arrival rate has exceeded the allowed threshold. It remains ***bad*** for one minute, before returning to ***good*** again. During this timeout, extraction of all OAM cells is disabled for this connection. As a result, other loopback failure conditions may occur.

The value is ***unknown*** when the application has not yet begun to use this connection. An example is the *Test* component before a test has been started.

Each type of OAM cell is counted separately. The threshold for AIS cells is three cells per second. If more than three AIS cells are received within a one second interval, this attribute is set to ***bad***. The threshold for RDI cells and each loopback type is also three, but the threshold for trace cells is 250 per second.

The state of this attribute has no direct effect on the value of the *operStatus* attribute or on the number of troubled connections.

Default: No default

ATTRIBUTE Atmlf Vpt Vcc **aisState**

Access: Read only

Description: This attribute contains the current state of the Alarm Indication Signal for this connection.

A value of ***good*** indicates that the connection's application is active and no alarm has occurred.

A value of ***bad*** indicates that the connection's application is active and an alarm has occurred.

A value of ***unknown*** indicates that the connection's application is inactive.

A value of ***notApplicable*** occurs when the *connectionPointType* is either a ***segmentEndPoint*** or a ***connectingPoint***.

ATTRIBUTE Atmlf Vpt Vcc txCellDiscard (txcd)

Access	Read only
Description	This attribute counts the number of cells received from the backplane on this connection that have been discarded. Discarded cells are not counted in the *txCell* attribute. Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point. For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscard* values for all connections associated with the *Vpt*. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Default	No default

ATTRIBUTE Atmlf Vpt Vcc txCellDiscardClp (txcdClp)

Access	Read only
Description	This attribute counts the number of cells received from the backplane on this connection with CLP=1 that have been discarded.

Copyright © 2006, Nortel Nortel Confidential

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, this attribute is not applicable and is not displayed.

This count is included in the *txCellDiscard* attribute. Discarded cells are not counted in the *txCellClp* attribute.

Cells are discarded due to transmit congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection's interface is disabled.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable to connections that segment frames into cells (AAL5 adaptation). Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *txCellDiscardClp* values for all connections associated with the *Vpt*.

When both ingress and egress of a port is down, txcells are silently discarded.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE **AtmIf Vpt Vcc** **txFrameDiscard (txfd)**

Access	Read only
Description	This attribute counts the number of frames received from the backplane on this connection that have been discarded.

Frames are discarded due to congestion, Partial Packet Discard (PPD), Early Packet Discard (EPD), and Weighted Random Early Detection (W-RED) mechanisms, or when the connection interface is disabled.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtmcards***, this attribute does not count frames discarded due to congestion at the main traffic management device toward the link.

This count is independent of the *txCell* or *txCellDiscard* attribute.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is

ATTRIBUTE Atmlf Vpt Vcc rxAal5FrameError (rxfer)

Access	Read only
Description	This attribute counts the number of frames received from the interface on this connection that have AAL5 length errors or AAL5 CRC errors. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed. AAL5 length or CRC errors typically occur because of cell discards due to congestion, UPC, or due to corruption of data between the AAL5 segmentation and reassembly end points. This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point. For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameError* values for all connections associated with the *Vpt*. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc rxAal5FrameAbort (rxfa)

Access	Read only
Description	This attribute counts the number of frames received from the interface on this connection that have the AAL5 length field set to zero. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, this attribute is not applicable and is not displayed.

Copyright © 2006, Nortel Nortel Confidential

An AAL5 length of zero is an indication by the far end segmentation point, to this reassembly point, that the frame is to be discarded without reassembly. This mechanism is typically used by a segmentation point if it detects an error in a frame after some of the cells belonging to that frame have already been transmitted.

This attribute is applicable only to connections that reassemble incoming cells into frames. Such connections usually have a *connectionPointType* of ***connectionEndPoint***. AAL1 connections are an exception to this rule; although they have a *connectionPointType* of ***connectionEndPoint***, they do not do AAL5 adaptation at this point.

For *Vpt*s, this attribute provides an aggregated total of all *rxAal5FrameAbort* values for all connections associated with the *Vpt*.

The counter wraps to zero if it exceeds its maximum value of (2**64)-1.

Common Verbs	Help List Display

GROUP Atmlf Vpt Vcc Vcd Loopback (Lbk)

Properties	Provisioned
Description	This group contains the provisionable loopback attributes for a *Vcc, Vpc,* or *Vpt* component. Note that certain loopback requests may not be possible on a given connection. In such cases, the corresponding operational loopback attribute in the *Status* group of the *Vcc, Vpc,* or *Vpt* component indicates ***notApplicable*** and the requested loopback is not performed. If loopbacks are provisioned to be on, and for any reason the segment or end-to-end OAM loopback cells are not relayed, the connection component becomes troubled, and user cell traffic may be discarded. If loopbacks are provisioned to be on, all of the nodes in the segment, and external networks which are in the end-to-end connection must relay the OAM loopback cells.

Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc Vcd **segLinkSideLoopback (segLkLbk)**

Access	Read and write
Description	This attribute specifies whether link-side segment loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the link-side segment loopback insertion for the connection is based on the *segLinkSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has link-side segment loopback insertion turned on, then link-side segment loopback insertion is also on for the connection. A value of ***on***, or ***off*** means link-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component. Note that link-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint***. Link-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint***. In such cases, the operational *segLinkSideLoopbackState* attribute indicates ***notApplicable*** and link-side segment loopback insertion is not performed. Link-side segment loopback insertion is always possible on a *Vpt*.
Mib	AtmCore
Values	on off sameAsInterface
Default	sameAsInterface

ATTRIBUTE Atmlf Vpt Vcc Vcd **segSwitchSideLoopback (segSwLbk)**

Access	Read and write
Description	This attribute specifies whether switch-side segment loopback insertion should be performed on this connection. A value of ***sameAsInterface*** means the switch-side segment loopback insertion for the connection is based on the *segSwitchSideLoopback* attribute of the connection's parent *AtmIf* component—if the ATM interface has switch-side segment loopback insertion turned on, then switch-side segment loopback insertion is also on for the connection. A value of ***on***, or ***off*** means switch-side segment loopback insertion is turned on or off respectively for the connection regardless of the provisioning of the parent *AtmIf* component.

Copyright © 2006, Nortel Nortel Confidential

Note that switch-side segment loopback insertion is not possible if the value of the *connectionPointType* attribute of the *Vcc* or *Vpc* component is ***connectingPoint*** or ***connectionEndPoint***. Switch-side segment loopback insertion is also not possible if the value of the *distributionType* attribute of the *Vcc* is ***pointToMultipoint*** In such cases, the operational *segSwitchSideLoopbackState* attribute indicates ***notApplicable*** and switch-side segment loopback insertion is not performed.

Switch-side segment loopback is never possible on a *Vpt*.

Values	0 1 2 3 4
Default	0

ATTRIBUTE **AtmIf Vpt Vcc Vcd Tm txQueueLimit (txQlim)**

Access	Read and write
Criticality	Component
Description	This attribute specifies an override to the default transmit queue limit for this connection. A value of ***sameAsCa*** means that the default common or per-VC transmit queue limit, as defined by the CA service category, is used for this connection. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***sameAsCa*** must be specified. A value from 5 to 512,000 means that the connection transmit queue limit differs from the default common or per-VC transmit queue limit, as defined by the CA service category. A value other than ***sameAsCa*** is ignored for connections where common queuing is specified for the service category. For ***1pOC48ChSmIrAtm*** cards, this attribute is used to set the per-VC utilization limit of the service category common queue.

Copyright © 2006, Nortel Nortel Confidential

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, the valid range for this attribute is from 5 to 512000 inclusive.

For ***16pOC3PosAtm*** cards, the valid range for this attribute is from ***32*** to ***261120*** inclusive.

For ***4pMRPosAtm*** cards, the valid range for this attribute is from ***32*** to ***1011840*** inclusive.

On all other cards, the valid range for this attribute is from 5 to 63488 inclusive.

The actual transmit queue limit for a connection is visible in the *Vcc Tm*, *Vpc Tm* or *Vpt txQueueThresholds* attribute.

This attribute is not applicable for basic *Vpt*s.

Mib	AtmCore
Values	Decimal (5..1011840) sameAsCa
Units	cells
Default	sameAsCa

ATTRIBUTE **AtmIf Vpt Vcc Vcd Tm** **holdingPriority (hpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. The default holding priority for a provisioned connection is higher then default holding priorities for dynamic (SVC) connections. The value of this attribute may be overridden by certain applications, for example *Vcc Test*, which use this connection. This attribute is not applicable for *Vpt Vcc*s.
Mib	AtmCore
Values	0 1 2 3 4
Default	2

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **rxTrafficDescType (rxTdt)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the type of traffic management which is applied to the receive direction of this connection as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute. The value ***sameAsTx*** means the *rxTrafficDescType* as well as the *rxTrafficDescParm* attribute values are taken from the values of the *txTrafficDescType* and *txTrafficDescParm* attributes.
Mib	AtmCore
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **bwdQosClass (bwdQos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for the backward direction for this connection. This attribute is only used for SPVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class 3 supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Copyright © 2006, Nortel Nortel Confidential

The ***sameAsFwd*** selection sets the backward quality of service to be the same as the forward quality of service.

Mib	AtmCore
Values	0 1 2 3 4 sameAsFwd
Default	sameAsFwd

ATTRIBUTE **AtmIf Vpt Vcc Vcd Tm** **atmServiceCategory (service)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The value ***derivedFromBBC*** may only be used if the *Src* or *Dst* component is provisioned under this connection. Otherwise a specific ATM service category must be specified. A value of ***derivedFromBBC*** means the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. A value other than ***derivedFromBBC*** means the value of this attribute is used to override the provisioned BBC Information Element parameters. In this case, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. The ***rtVariableBitRate*** service category is intended for real-time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real-time VBR service may support statistical multiplexing of real-time sources. The ***nrtVariableBitRate*** service category is intended for non-real time

Copyright © 2006, Nortel Nortel Confidential

applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non real-time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non real-time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Mib	AtmCore
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) availableBitRate (abr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE **Atmlf Vpt Vcc Vcd Tm** **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. This attribute is ignored if the *atmServiceCategory* is ***availableBitRate***. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, traffic shaping is not available, therefore this attribute is ignored. A value of ***sameAsCa*** means traffic shaping for the connection is based on the value of the *trafficShaping* attribute of the connection's service category component under the *CA.* If the service category has *trafficShaping* set to ***enabled*** or ***inverseUpc***, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the

Copyright © 2006, Nortel Nortel Confidential

trafficShaping operational attribute, which is under the *Vcc Tm, Vpc Tm,* or *Vpt Tm* components.

A value of ***disabled*** means traffic shaping for this connection is disabled regardless of the provisioning of the connection's service category component.

Mib: AtmCore

Values: disabled
sameAsCa

Default: sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **unshapedTransmitQueueing (unshap)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the transmit queuing method for this connection if it is unshaped. The two possible methods are per-VC queuing and common queuing. This attribute does not apply if the connection is shaped.

A value of ***sameAsCa*** means the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *CA*.

A value of ***common*** means transmit traffic on this unshaped connection is destined for the common queue.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm***, ***1pOC48ChSmIrAtm***, and ***4pMRPosAtm*** cards, this attribute must have the value ***sameAsCa***.

This attribute is ignored in the following situations:
- if the connection has *trafficShaping* ***enabled*** or ***inverseUpc***, or
- if the *atmServiceCategory* is ***availableBitRate***, or
- if the *atmServiceCategory* is ***constantBitRate***, or
- for basic *Vpt*s and standard *Vpt Vcc*s.

Mib: AtmCore

Values: common
sameAsCa

Default: sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **weight**

Access: Read and write

Criticality: Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies an override for the weight of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, and basic *Vpt*s. A value of ***sameAsCa*** means the weight is determined by the *weightPolicy* attribute under the *CA* service category component for all but standard *Vpt Vcc*s. For standard *Vpt Vcc*s, the weight is determined by the *Vcc*'s service category, when the value is set to ***sameAsCa***. A value from 1 to 4095 means that value is used for the fairness weight of this connection relative to other connections. For all but standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard *Vpt Vcc*s, fairness weight determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the *Vpt*. A value of ***upToQueueLimit*** means the fairness weight is limited only by the *txQueueLimit*. This attribute is not applicable and is ignored for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, ***1pOC12SmLrAtm***, and ***1pOC48ChSmIrAtm*** cards. For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, the value ***upToQueueLimit*** is not permitted.
Mib	AtmCore
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa

ATTRIBUTE **AtmIf Vpt Vcc Vcd Tm** **forceTagging (tagging)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether force tagging of the CLP bit is enforced for cells of this connection. Force tagging can be enabled for permanent connections of any service category and on switched connections of UBR service category. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards, and for *Vpt*s, this attribute is not applicable and is ignored.

Copyright © 2006, Nortel Nortel Confidential

A value of ***sameAsCa*** means the force tagging functionality is determined by the *forceTagging* attribute under the *CA* service category component.

A value of ***enabled*** means force tagging is enabled. When this option is selected, the CLP bit is set to 1 for all cells on the connection.

A value of ***disabled*** means force tagging is disabled. When this option is selected, the CLP bit is unchanged for cells on the connection.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction. In this case, cells which are tagged are counted in the *txCellClp* attribute.

Mib	AtmCore
Values	sameAsCa enabled disabled
Default	sameAsCa

ATTRIBUTE **AtmIf Vpt Vcc Vcd Tm** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enables usage parameter control (UPC) when receiving traffic from the ATM interface. The value ***sameAsCa*** means UPC for the connection is based on the value of the *usageParameterControl* attribute of the service category component under the *AtmIf CA.* If the service category has UPC ***enforced*** or ***monitored***, then UPC is enabled on the connection. The value ***disabled*** means UPC for this connection is disabled regardless of the provisioning of the service category. The value ***enforced*** means UPC for this connection is enforced regardless of the provisioning of the service category. When UPC is enforced, non-conforming cells are either tagged or discarded depending on the *rxTrafficDescriptorType*. The value ***monitored*** means UPC for this connection is monitored regardless of the provisioning of the service category. When UPC is monitored, instead of the non-conforming cells being tagged or discarded, they are merely counted in the UPC violations counts and passed on unchanged. Note that setting UPC to ***enforced*** or ***monitored*** may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc, Vpc,*

Copyright © 2006, Nortel Nortel Confidential

and *Vpt* components.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the value ***monitored*** is not supported.

For ***1pOC48ChSmIrAtm*** cards, the values ***enforced***, and ***monitored***, are not supported.

Mib — AtmCore

Values — enforced
disabled
sameAsCa
monitored

Default — sameAsCa

ATTRIBUTE **AtmIf Vpt Vcc Vcd Tm** **bearerClassBbc (bcBbc)**

Access — Read and write

Criticality — Component

Description — This attribute specifies the bearer capability. This attribute is only used for SPVC and SPVP connections. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***) and timing requirements are user defined (that is, transparent to the network).When ***x*** is set the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class **vp** service is used to specify a transparent VP service. When the value of this attribute is vp, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except or VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP connections.

ATTRIBUTE **Atmlf Vpt Vcc Vcd Tm** **transferCapabilityBbc (tcBbc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> 0: NoIndication, NoIndication 1: NoIndication, yes 2: NoIndication, no 5: CBR, yes 8: VBR, NoIndication 9: VBR, yes 10: VBR, no The value ***notApplicable*** specifies that the user does not want to specify the transfer capability. The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data. The value no indication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing. The value yes for end-to-end timing indicates that end-to-end timing is required. The value no for end-to-end timing indicates that end-to-end timing is not required.

Copyright © 2006, Nortel Nortel Confidential

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm txWredThreshold

Access: Read and write

Criticality: Component

Description

This attribute specifies the threshold for weighted random early detection (WRED). This threshold is calculated as a percentage of the early packet discard (EPD) threshold, which is 85% of the transmit queue length. When the value is ***25%***, WRED starts as soon as the queue is 25% of the way to the EPD threshold. When the value is ***50%***, WRED starts later, after the queue is 50% of the way to the EPD threshold. When the value is ***75%***, WRED starts only when the queue is 75% of the way to the EPD threshold.

This attribute is ignored if the value of the *txWredMode* or *txPacketWiseDiscard* attributes is ***disabled.***

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

Values	indicated notIndicated derivedFromServiceCategory (derived)
Default	derivedFromServiceCategory

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **txPacketWiseDiscard (txpd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the transmit data direction for this connection.

Copyright © 2006, Nortel Nortel Confidential

Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s.

Packet-wise functions increase the “goodput” of the link. The transmit packet-wise functions are Early Packet Discard (EPD) and Partial Packet Discard (PPD).

EPD allows the connection to discard an entire frame once the transmit queue has reached the EPD threshold. EPD increases the “goodput” of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell.

PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the packet-wise discard functions are PPD and EPD. PPD is applicable at cell-transfer points. PPD is not applicable at frame-to-cell conversion points, and is not applicable for *Vpc*s. PPD is configured by this attribute. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded. EPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Both PPD and EPD are controlled by this attribute. This attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

Copyright © 2006, Nortel Nortel Confidential

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points. This attribute may safely be set to ***enabled*** for VCCs since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

A value of ***enabled*** means packet-wise discard functions are applied to transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the backward direction. When this attribute is set to ***disabled***, backward frame discard is not requested in the SPVC call setup.

The transmit packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute.

Mib	AtmCore
Values	disabled enabled
Default	disabled

ATTRIBUTE **AtmIf Vpt Vcc Vcd Tm** **rxPacketWiseDiscard (rxpd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the receive data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. This attribute is not applicable for *Vpt*s. Packet-wise functions increase the “goodput” of the link. The receive packet-wise function is Partial Packet Discard (PPD). PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted. For ***1pOC12SmLrAtm*** cards, this attribute is not applicable and is ignored. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***,

Copyright © 2006, Nortel Nortel Confidential

3pDS1Atm, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD is available at all VCC connection points where UPC may be activated. PPD is not applicable for *Vpcs*. Packet-wise discards should only be enabled for connections carrying AAL5 segmentation traffic. Setting the value to ***enabled*** for any other traffic type may result in traffic being discarded. PPD is automatically ***enabled*** at frame-to-cell conversion points, independent of the setting of this attribute.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, this attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***1pOC48ChSmIrAtm*** cards, this attribute may safely be set to ***enabled*** for VCCs, since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. A value of ***enabled*** for the *rxPacketWiseDiscard* attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in enabling packet-wise discard functions on these cards. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

A value of ***enabled*** means packet-wise discard functions are applied to receive traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward direction. When this attribute is set to ***disabled***, forward frame discard is not requested in the SPVC call setup.

The receive packet-wise discard functions that are active are visible in the *Vcc/Vpc Tm rxPacketWiseDiscard* operational attribute.

Default	disabled

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **txWredMode**

Access	Read and write
Criticality	Component
Description	This attribute specifies the activation of weighted random early detection (WRED) functionality. WRED is considered a packet-wise discard function and as such applies only to AAL5 frame traffic. WRED is applied in the transmit direction for this connection. WRED function should be enabled only for connections which are transferring TCP/IP traffic. WRED acts to prevent synchronization of multiple TCP/IP sources by randomly discarding a small percentage of frames when transmit queue congestion reaches the designated level. WRED may also be used to differentiate service on VCC's by preferentially discarding one VCC before another. Discards start at 0% of cells, when the queue is part-way to the Early Packet Discard (EPD) threshold, and rise to 100% of cells discarded at the EPD threshold. WRED discards all the cells in a frame. A value of ***enabled*** means WRED is enabled for all applications linked to the given *Vcc*. A value of ***perFlow*** means each TCP application has individual control over whether to enable or disable WRED. If the value of the *txPacketWiseDiscard* attribute is ***disabled***, or if the value of this attribute is ***disabled***, WRED functionality is disabled. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC12SmLrAtm*** cards, the value of this attribute must be ***disabled***. If WRED is active, it is visible in the *Vcc/Vpc Tm txPacketWiseDiscard* operational attribute. This attribute is not applicable for *Vpt*s or *Vpt Vcc*s.
Mib	AtmCore
Values	disabled enabled perFlow
Default	disabled

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **abrConnectionType (abrType)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies the type of ABR behavior which is to be enforced at this connection. This attribute is only applicable if the value of the *atmServiceCategory* attribute is ***availableBitRate***. If the value of the *atmServicecategory* attribute is not ***availableBitRate***, this attribute is ignored. The value ***sameAsCa*** is used to request the default behavior as specified in the *CA Abr* component for this *Vcc*. Otherwise, this attribute overrides the default behavior. The value ***virtualSourceDest*** is used to request that this connection point function as a virtual source/virtual destination. The value ***sourceDest*** requires that this connection point function as a S/D for RM cells. S/D mode is automatically invoked at this connection point either if this is a connection end point, or if the next hop connection point is configured as ***nonAbrInterworking***. The value ***nonAbrInterworking*** is used to request that this connection point function as an interworking between ABR and non-ABR service categories. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***. The value ***abrSwitch*** is used to request ABR switch behavior for this connection point. The ABR switch behavior is first, to conform to ***virtualSourceDest*** or ***nonAbrInterworking*** setting on the next hop, and otherwise to implement ABR ER switch behavior. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, the only allowable values are ***sameAsCa***, ***nonAbrInterworking*** or ***abrSwitch***. If ***abrSwitch*** is selected, EFCI marking behavior is implemented. For ***1pOC12SmLrAtm*** cards, the only allowable values are ***sameAsCa*** or ***abrSwitch.*** If ***abrSwitch*** is selected, EFCI marking behavior is implemented. For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the only allowable value is ***sameAsCa***. The actual ABR functionality which is in effect is visible in the *Vcc/Vpc/Vpt Tm abrConnectionType* operational attribute.

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **txTrafficDescParm (txTdp)**

Access Read and write

Criticality Component

Description This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute.

The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR, MCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

When *txTrafficDescType* is 1 or 2, all of the parameters must be set to zero.

When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1

Copyright © 2006, Nortel Nortel Confidential

traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5, must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 4 and parameter 5 represent are not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may be optionally zero.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate. When the *atmServiceCategory* is ***availableBitRate*** (ABR), the shaping rate is dynamically chosen, based on the ABR flow control mechanism, as a value between the MCR and the PCR or the requested shaping rate if applicable.

For *txTrafficDescType* 3, 4 and 5, the transmit traffic is shaped at the next available shaping rate less than the PCR.

For *txTrafficDescType* 6, 7 and 8 if linear traffic shaping is selected, the transmit traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

For *txTrafficDescType* 3 ,4,5,6,7 and 8, with ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, parameter 4 must be less than or equal to 643,000.

Copyright © 2006, Nortel Nortel Confidential

For *txTrafficDescType* 6, 7 and 8 if inverse-UPC traffic shaping is selected, the transmit traffic is shaped at a variable rate which conforms to the PCR, SCR and MBS of the connection traffic descriptor.

Default	([5] 0)

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **rxTrafficDescParm (rxTdp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. If the value of the *rxTrafficDescType* attribute is ***sameAsTx***, the values provisioned in this attribute are ignored. The traffic parameters for the receive direction are taken from the *txTrafficDescParm* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), and Minimum Cell Rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. The value of CDVT is expressed in microseconds. The values of PCR, SCR, MCR, MBS and CDVT are used for usage parameter control (UPC). When *rxTrafficDescType* is 1 or 2, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; and parameter 4 represents the CDVT. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must

Copyright © 2006, Nortel Nortel Confidential

be non-zero. Parameter 1 must be greater than or equal to Parameter 2.

When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; and parameter 4 represents the CDVT. Parameter 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must be non-zero and must be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

If the value of CDVT either in parameter 2 or in parameter 4 is zero, the CDVT is taken from the *CA* defaults for the particular *atmServiceCategory* of this connection.

Parameter 5 of the *rxTrafficDescParm* is always unused.

When *rxTrafficDescriptorType* is 3 through 8, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware. The *check prov* command detects such cases and generates an error message. If this happens, adjust the parameters until they fall within the supported limits.
To calculate the limits, use the following formulae:
I1 = 1,000,000,000 / PCR
L1 = CDVT * 1000
I2 = 1,000,000,000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is 6 through 8.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, I1 and I2 must be less than or equal to 335,523,840. I1 + L1 must be less than or equal to 1,342,156,800. I2 + L2 must be less than or equal to 1,342,156,800. If the values of I1, L1, I2 or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41,940,480 or
I2 > 41,940,480 or
I1 + L1 > 167,769,600 or
I2 + L2 > 167,769,600
then both I1 and I2 must be greater than 20,480.

Copyright © 2006, Nortel Nortel Confidential

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, L2 must be less than or equal to 2,674,011,406.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, L2 must be less than or equal to 17,179,869,180.

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **fwdQosParameters (fqp)**

Access	Read and write
Criticality	Component
Description	This attribute is a vector of three elements that specify the quality of service parameters for the forward direction for this connection. This attribute is used for SPVC connections. The *cdv* element specifies the acceptable peak-to-peak Cell Delay Variation (CDV) of real-time connections (CBR and rt-VBR). It is signaled through the extended QoS information element. For nrt-VBR and UBR the CDV is irrelevant, and its value is forced to the default. The *ctd* specifies the acceptable maximum Cell Transfer Delay (maxCtd) of real-time connections (CBR and rt-VBR). It is signaled through the end to end transit delay information element. For nrt-VBR and UBR the CTD is irrelevant, and its value is forced to the default. The *clr* specifies the acceptable Cell Loss Ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections. It is signaled through the extended QoS information element. For UBR the CLR is irrelevant, and its value is forced to the default.

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm **bwdQosParameters (bqp)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is a vector of two elements that specify the quality of service parameters for the backward direction for this connection. This attribute is used for SPVC connections. The *cdv* specifies the acceptable peak-to-peak Cell Delay Variation (CDV) of real-time connections (CBR and rt-VBR). It is signaled through the extended QoS information element. For nrt-VBR and UBR, the CDV is irrelevant, and its value is forced to the default. The *clr* specifies the acceptable Cell Loss Ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections. It is signaled through the extended QoS information element. For UBR the CLR is irrelevant, and its value is forced to the default.

COMPONENT Atmlf Vpt Vcc Vcd Tm **AvailableBitRate (Abr)**

Groups	GROUP AtmIf Vpt Vcc Vcd Tm Abr Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Vcd Tm AvailableBitRate,* *AtmIf/n Vpc/vci Vpd Tm AvailableBitRate,* *AtmIf/n Vpt/vpi Vpd Tm AvailableBitRate,* *AtmIf/n Vpt/vpi Vcc/vci Vcd Tm AvailableBitRate* This component contains provisioned ABR-related attributes of a connection. It is an optional subcomponent of the *Vcd Tm* and *Vpd Tm* component. It is used to override DGCRA-related defaults in the *CA Abr* component. It contains the specific configuration for the ABR connection at this connection point. If this is the source of an SPVC connection, this component also contains the ABR parameters required for the SPVC call request.

Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **initialCellRate (icr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. The value ***sameAsCa*** means the initial cell rate is determined by the *AtmIf CA Abr*/0 *icr* attribute. The value ***useMcr*** means ICR is set to the same value as the Minimum Cell Rate (MCR) for the connection. The value ***usePcr*** means ICR is set to the same value as the Peak Cell Rate (PCR) for the connection. If the value is less than the MCR of the connection, then the MCR is used as the ICR. If the value is more than PCR of the connection, then PCR is used as the ICR. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..16777215) sameAsCa useMcr usePcr
Units	cell/s
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **transientBufferExposure (tbe)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the source to send during start-up periods, before the first Resource Management (RM) cell returns. TBE divided by *fixedRoundTripTime* determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. TBE divided by *maxCellsPerRmCell* specifies the operational value of

Copyright © 2006, Nortel Nortel Confidential

forwardRmCellLimit, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* is set to ***erSwitch***.

Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	16777215

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **fixedRoundTripTime (frtt)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. The value of *transientBufferExposure* divided by the value of FRTT (in seconds) determines an upper bound for the operational value of *initialCellRate*, the rate at which a source should send initially and after an idle period. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec
Default	5000000

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **rateDecreaseFactor (rdf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256. RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be

Copyright © 2006, Nortel Nortel Confidential

reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib	AtmCore
Values	Decimal (0..15) sameAsCa
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **rateIncreaseFactor (rif)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the provisioned value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64. RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.
Mib	AtmCore
Values	Decimal (0..15) sameAsCa
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **maxCellPerRmCell (nrm)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the maximum number of cells an ABR source may transmit for each forward Resource Management (RM) cell. The count of the cells transmitted includes data cells, OAM cells, backward RM cells, and the forward RM cell. A value of 2 is not recommended although it is permitted according to the ATM Forum standard. When this attribute is set to a value of 2, it is possible that only one forward and one backward RM cell are repeatedly

Copyright © 2006, Nortel Nortel Confidential

transmitted, and all data traffic is queued up indefinitely.

This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***.

Mib	AtmCore
Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256) sameAsCa
Units	cells
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **maxTimeBetweenRmCells (trm)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the TRM parameter for this connection. TRM provides an lower bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least two other cells have been sent, then the next cell to be transmitted would be a forward RM cell. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* has the value ***erSwitch***. The provisioned value of 781 is signaled as TRM = 0, in the ABR Additional Parameters Information Element. 1563 is signaled as TRM = 1. 3125 is signaled as TRM = 2. 6250 is signaled as TRM = 3. 12500 is signaled as TRM = 4 25000 is signaled as TRM = 5. 50000 is signaled as TRM = 6. 100000 is signaled as TRM = 7.
Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **cutoffDecreaseFactor (cdf)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero. CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the CRM parameter, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. The value of CRM is indicated by the *forwardRmCellLimit* attribute. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0; 1; 2; 4; 8; 16; 32; 64) sameAsCa
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **acrDecreaseTimeFactor (adtf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection. ADTF is the maximum time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*. This attribute is ignored under all conditions where the operational attribute *abrConnectionType* indicates ***erSwitch*** or ***efciSwitch***.
Mib	AtmCore
Values	Decimal (0..1023) sameAsCa
Units	centiseconds
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **dgcraMaximumDelay (dgcraMaxDelay)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute specifies an upper bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward direction). This upper bound may be approximated as the sum of the round trip fixed and propagation delays and the maximum queuing delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When there is a reduction in the Allowed Cell Rate (ACR), the policer waits for a correspondingly longer period of time before it enforces at the new cell rate. The value of this attribute must not be less than the *dgcraMinimumDelay* attribute.
Mib	AtmCore
Values	Decimal (1..16700000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **dgcraMinimumDelay (dgcraMinDelay)**

Access	Read and write
Criticality	Component
Description	This attribute specifies a lower bound on the delay after which the rate change induced by a backward Resource Management (RM) cell departing from this connection point (in the backward direction) is expected to be observed at this connection point (in the forward connection). This lower bound may be approximated as the sum of the round trip fixed and propagation delays between the ABR source and this interface. The value of this attribute is used in policing an ABR connection using the Dynamic General Cell Rate Algorithm (DGCRA). A smaller value for this attribute implies a more lenient policer. When there is a increase in the Allowed Cell Rate (ACR), the policer waits for a correspondingly shorter period of time before it enforces at the new cell rate.
Mib	AtmCore

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..16700000) sameAsCa
Units	microsec
Default	sameAsCa

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **farEndAcrDecreaseTimeFactor (feAdtf)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Allowed Cell Rate Decrease Time Factor (ADTF) of the far end ABR source. The value specified should be the same as the ADTF parameter at the far end of this ABR connection. The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the value of this attribute, the policer begins to limit enforce the incoming traffic at the initial cell rate (ICR) of the far end, as specified by the *farEndInitialCellRate* attribute.
Mib	AtmCore
Values	Decimal (0..1023)
Units	centiseconds
Default	50

ATTRIBUTE Atmlf Vpt Vcc Vcd Tm Abr **farEndInitialCellRate (felcr)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the Initial Cell Rate (ICR) of the far end ABR source. The value specified should be the same as the ICR parameter at the far end of this ABR connection. The value of this attribute is used in policing an ABR connection using the Dynamic Generic Cell Rate Algorithm (DGCRA). A larger value for this attribute implies a more lenient policer. When the delay between two consecutive forward Resource Management (RM) cells received at this interface corresponds to a value greater than the *farEndAcrDecreaseTimeFactor* attribute, the policer begins to enforce the incoming traffic at the value of this attribute. If this attribute is specified less than the MCR of the connection, then the MCR is used as the *felcr*. If this attribute is more than the PCR of the connection, then PCR is used as the *felcr*.

ATTRIBUTE Atmlf Vpt Vcc Vcd Pm **controlMode (mode)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the control mode of Performance Monitoring (PM) measurements for the connection. A value of ***autoStart*** means that PM activation procedures will start when the provisioned data is activated. A value of ***onDemand*** means that PM activation procedures will start when the operator issues the *Start* command. The PM measurements in this mode will continue until the operator issues the *Stop* command. A value of ***sameAsInterface*** means that the behavior will be as specified by the *controlMode* attribute of the *AtmIf Pm* component.
Mib	AtmCore
Values	autoStart (auto) onDemand (onDemand) sameAsInterface (sameAsIf)
Default	sameAsInterface

ATTRIBUTE Atmlf Vpt Vcc Vcd Pm **switchSideClrType (clrType)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies how the Cell Loss Ratio (CLR) Performance Monitoring (PM) is measured on a switch-side configuration for the connection. A value of ***complete*** indicates that egress discards at the segment end points are included in the CLR measurement as per ITU standards. A value of ***partial*** indicates that egress discards do not contribute to the CLR measurement. A value of ***sameAsInterface*** means that the behavior is as specified by the *switchSideClrType* attribute of the *AtmIf Pm* component.
Mib	AtmCore
Values	complete partial sameAsInterface (sameAsIf)
Default	sameAsInterface

COMPONENT Atmlf Vpt Vcc Loop (Loop)

Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Loop* The *Loop* component configures an ATM connection so that cells received from the ATM interface are retransmitted back to the interface through that connection. The *Loop* component requires exclusive use of its parent *Vcc* or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Nrp*, and *Test*).
Mib	AtmCore
Common Verbs	Help List Display Add DELete

COMPONENT Atmlf Vpt Vcc NailedUpRelayPoint (Nrp)

Groups	GROUP Atmlf Vpt Vcc Nrp Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Nrp* This component is used to establish a single hop of a nailed-up ATM Bearer Service (ABS) connection. By linking together two *Nrp*s within a module, the associated connections are configured to relay ATM cells to one another. The *Nrp* component requires exclusive use of its parent *Vcc*

Copyright © 2006, Nortel Nortel Confidential

	or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Test*, and *Loop*).

Properties	Provisioned
Description	This group contains the provisionable attributes for the *Nrp* component.
Mib	AtmBearerService

ATTRIBUTE AtmIf Vpt Vcc Nrp **nextHop (nextHop)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the *Nrp* component with which this *Nrp* is associated. A sample value is *AtmIf/31 Vcc/0.32 Nrp.*
Mib	AtmBearerService
Values	Link (Service, nextHop)
Default	No default

ATTRIBUTE AtmIf Vpt Vcc Nrp **oamSegmentBoundary (sb)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the OAM segment boundary desired for a *Nrp* component. It affects the connection point type value visible in the parent component's *connectionPointType* attribute. The desired OAM segment boundary can be specified directly as ***yes***, ***no*** or ***sameAsInterface***. If ***sameAsInterface*** is specified, the OAM segment boundary is same as the *oamSegmentBoundary* attribute of the associated *AtmIf* and the switch will set the *connectionPointType*, choosing ***segmentEndPoint*** for a segment-boundary ATM interface and ***connectingPoint*** for a non-segment-boundary ATM interface.
Mib	AtmBearerService
Values	no yes sameAsInterface

Copyright © 2006, Nortel Nortel Confidential

Default	sameAsInterface

ATTRIBUTE Atmlf Vpt Vcc Nrp **bandwidthElastic (bwElastic)**

Access	Read and write
Criticality	Component
Description	This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the *bandwidthReduction* attribute. A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Nrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid. A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority*.
Mib	AtmBearerService
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpt Vcc Nrp **overrideHoldingPriority (ohpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used.
Mib	AtmBearerService
Values	0 1 2 3

COMPONENT Atmlf Vpt Vcc Test (Test)

Groups	GROUP AtmIf Vpt Vcc Test OsiState (State) GROUP AtmIf Vpt Vcc Test Setup (Setup) GROUP AtmIf Vpt Vcc Test Results (Results)
Scope	Device

Copyright © 2006, Nortel Nortel Confidential

Description	*AtmIf/n Vcc/vpi.vci Test* The *Test* component allows test traffic to be sent over an ATM connection. It is used to verify the integrity of hardware carrying ATM traffic, and provides test capabilities similar to those provided by non-ATM port and line tests. The *Test* component requires exclusive use of its parent *Vcc* and cannot co-exist with other ATM service components (such as *Nep*, *Nrp*, and *Loop*). An ATM connection test circulates traffic through a VCC having a *Test* component at one end and the other end configured to loop back ATM cells. The *Test* component generates test frames, transforms them into ATM cells using AAL5 segmentation, and transmits them through the VCC; the returned cells are received by the *Test* component, reassembled back into frames, and the frames are consumed. The test frames generated by the test are grouped into two independent streams. 1) The loading frame stream circulates a set of “loading frames” through the connection as rapidly as possible. The intent of this stream is to verify the operation of the connection under a controlled load. 2) The verification stream transmits a series of “verification frames” through the connection; as each frame is returned, the *Test* component verifies its contents and the next verification frame in the series is transmitted. The intent of this stream is to verify that frames are not being corrupted. The test can be configured to send frames from either or both streams. The size and content of the test frames can also be controlled.

Common Verbs	Help List Display Add DELete

VERB START **AtmIf Vpt Vcc Test**

Impact	Service
Description	*START AtmIf/n Vcc/vpi.vci Test* This verb invokes an ATM connection test. It has no effect when the test is already running.

VERB STOP **AtmIf Vpt Vcc Test**

Impact	Service
Description	*STOP AtmIf/n Vcc/vpi.vci Test* This verb stops an ATM connection test. It has no effect when the test is not running.

GROUP **AtmIf Vpt Vcc Test** **OsiState (State)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc Test **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmCore
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vpt Vcc Test **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmCore

Copyright © 2006, Nortel Nortel Confidential

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vpt Vcc Test usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmCore
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpt Vcc Test Setup (Setup)

Properties	Operational
Description	This group contains attributes that govern the operation of an ATM connection test. These attributes cannot be changed while the test is running.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc Test frmTypes (types)

Access	Read and write
Description	This attribute specifies the types of the test frames to be transmitted during the ATM connection test. It must contain at least one of the following: ***loading***: A set of “loading frames” is circulated over the link as rapidly as possible. This frame type should be selected when the test is intended to verify the operation of the connection under a specified load. These frames are not checked for bit errors. ***verification***: A single “verification frame” is transmitted over the link; when the frame is returned, its contents are verified and the next verification frame in the series is transmitted. This frame type should be selected when the test is intended to verify that frames are not being corrupted as they pass over the connection.

Copyright © 2006, Nortel Nortel Confidential

Set of	loading verification
Default	(loading, verification)

ATTRIBUTE Atmlf Vpt Vcc Test **frmSize (size)**

Access	Read and write
Description	This attribute defines the size of the test frames used in an ATM connection test.
Mib	AtmCore
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Atmlf Vpt Vcc Test **frmPatternType (fpt)**

Access	Read and write
Description	This attribute specifies the bit sequence used to fill the frames used in the ATM connection test. It must contain one of the following values: ***ccitt32kBitPattern***: a pseudo-random sequence of 32 Kbit is used ***ccitt8MBitPattern***: a pseudo-random sequence of 8Mbit is used ***customizedPattern***: the pattern defined in the *customizedPattern* attribute is used
Mib	AtmCore
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Atmlf Vpt Vcc Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute specifies a 32 bit sequence to be used to fill frames when the *framePatternType* attribute is set to ***customizedPattern***. The default value gives a pattern of alternating 0 and 1 bits.
Mib	AtmCore
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Atmlf Vpt Vcc Test **duration**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the maximum number of minutes that the ATM connection test is allowed to run. The maximum allowed value permits the test to be run for up to 21 days.
Mib	AtmCore
Values	Decimal (1..30240)
Units	minutes
Default	1

ATTRIBUTE Atmlf Vpt Vcc Test **bandwidthElastic (bwElastic)**

Access	Read and write
Description	This attribute specifies whether the connection (*VCC*) should be configured with elastic bandwidth or not. Elastic bandwidth is of importance in conjunction with IMA links, where some links fail and the resulting bandwidth is less than the requested bandwidth for all connections. In that case, some connections may be reduced in bandwidth based on the setting of the *bwElastic* attribute. If this attribute is set to ***yes***, the Test application signals to the connection that the bandwidth for this connection is elastic, and may be reduced in the case of IMA link failures. If the bandwidth is reduced, the rate of test cells which can be handled by the connection will also be reduced. If this attribute is set to ***no***, the Test application signals to the connection that the bandwidth for this connection must be maintained at the requested level. If the connection cannot maintain the full bandwidth, the connection may be released (cleared) based on the holding priority of the connection.
Mib	AtmCore
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpt Vcc Test **overrideHoldingPriority (ohpri)**

Access	Read and write
Description	This attribute specifies the override holding priority which should be signaled to the *VCC* connection at the start of the test. Holding priority is of importance in conjunction with IMA links, where some links fail and the resulting bandwidth is less than the requested bandwidth for all connections. In that case, some connections may be released based on the connection's holding priority. ***Zero*** (0) is the highest holding priority, and ***four*** (4) is the lowest priority. A setting of ***zero*** to ***four*** overrides whatever holding priority that has been

Copyright © 2006, Nortel Nortel Confidential

configured at the connection (*VCC*). A setting of ***noOverride*** means that the connection should use its internally configured holding priority.

Mib	AtmCore
Values	0 1 2 3 4 noOverride
Default	noOverride

GROUP **Atmlf Vpt Vcc Test** **Results (Results)**

Properties	Operational
Description	This group contains attributes that show the result of an ATM connection test; if no test is running, the attribute group contains the results of the most recently completed test. The attributes of the *Results* group are reset to their initial values whenever a test is started or any attribute of the *Setup* group is set.
Mib	AtmCore

ATTRIBUTE **Atmlf Vpt Vcc Test** **elapsedTime**

Access	Read only
Description	This attribute displays the number of minutes that the test has been running.
Mib	AtmCore
Values	Decimal (0..30240)
Units	minutes
Default	0

ATTRIBUTE **Atmlf Vpt Vcc Test** **timeRemaining**

Access	Read only
Description	This attribute displays the number of minutes that the test will continue to run before stopping automatically.
Mib	AtmCore
Values	Decimal (0..30240)
Units	minutes
Default	0

ATTRIBUTE **Atmlf Vpt Vcc Test** **causeOfTermination**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the reason the test ended. It contains one of the following values. ***testTimeExpired***: the test ran for the specified duration ***stoppedByOperator***: a *STOP* command was issued ***neverStarted***: the test has not been started ***testRunning***: the test is currently running
Mib	AtmCore
Values	testTimeExpired stoppedByOperator neverStarted testRunning
Default	neverStarted

ATTRIBUTE Atmlf Vpt Vcc Test **bytesTx**

Access	Read only
Description	This attribute displays the number of bytes sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **bytesRx**

Access	Read only
Description	This attribute displays the number of bytes received during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **loadingFrmTx**

Access	Read only
Description	This attribute displays the number of loading frames sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **loadingFrmRx**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of loading frames received during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **loadingFrmLost**

Access	Read only
Description	This attribute displays the number of loading frames that were lost during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **verificationFrmTx**

Access	Read only
Description	This attribute displays the number of verification frames sent during the test. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **verificationFrmRx**

Access	Read only
Description	This attribute displays the number of verification frames received during the test (including errored verification frames). The counter wraps to zero if it exceeds its maximum value of (2**64)-1. Note that the number of verification frames lost during the test can be computed by the expression *verificationFrmTx* - *verificationFrmRx*.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **verificationFrmBad**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the number of errored verification frames received during the test. A verification frame is considered to be errored if it contains a recognizable verification frame header, but does not match the transmitted frame bit for bit. (Thus, a verification frame that returns after the succeeding verification frame has been transmitted is considered to be errored.) The counter wraps to zero if it exceeds its maximum value of (2**64)-1. Note that the number of correct verification frames received during the test can be computed by the expression *verificationFrmRx* - *verificationFrmBad*.
Mib	AtmCore
Values	Long Integer
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Test **unrecognizableFrmRx**

Access	Read only
Description	This attribute displays the number of frames received during the test which do not contain a valid loading frame header or verification frame header. The counter wraps to zero if it exceeds its maximum value of (2**64)-1.
Mib	AtmCore
Values	Long Integer
Default	No default

COMPONENT Atmlf Vpt Vcc **TrafficManagement (Tm)**

Groups	GROUP AtmIf Vpt Vcc Tm Operational (Oper)
Scope	Device
Description	*AtmIf/n Vpc/vpi TrafficManagement,* *AtmIf/n Vcc/vpi.vci TrafficManagement,* *AtmIf/n Vpt/vpi TrafficManagement,* *AtmIf/n Vpt/vpi Vcc/vci TrafficManagement* The *Tm* subcomponent contains the operational traffic management attributes of a connection. It is created dynamically for each activated *Vcc*, *Vpc,* or *Vpt* component.

Dyn. Subcomp.	COMPONENT AtmIf Vpt Vcc Tm AvailableBitRate (Abr)
Common Verbs	Help List Display

GROUP Atmlf Vpt Vcc Tm **Operational (Oper)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Operational
Description	This group contains attributes for the *Tm* component to reflect operational traffic attributes.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc Tm **txTrafficDescType (txTdt)**

Access	Read only
Description	T his attribute indicates the type of traffic management which is applied to the transmit direction of this connection as defined in the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute.
Mib	AtmCore
Values	1 2 3 4 5 6 7 8 9
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm **txQosClass (txQos)**

Access	Read only
Description	This attribute indicates the quality of service for the calling to called direction for this connection. This is only applicable to Soft PVC and SVC connections. Class 1 supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class 2 supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class 4 supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class 0 is the unspecified QOS class; no objective is specified for the performance parameters. A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmCore
Values	0 1 2 3 4 notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm txQueueLength (txQLen)

Access	Read only
Description	This attribute indicates the current number of cells in the transmit queue for this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the length of the common queue which is used for this ATM service category. If this connection has *unshapedTransmitQueueing* attribute displayed as ***fifo***, this attribute indicates the number of cells for this connection which are enqueued in a first-in-first-out queuing method for this ATM service category. This will only occur for connections on ATM IP cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the length of the per-VC queue. For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current number of cells in the link class queue used by this connection to buffer its traffic. This attribute does not apply to basic *Vpt*s.
Mib	AtmCore
Values	Decimal (0..1011840)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm txQueueCongestionState (txQCong)

Access	Read only
Description	This attribute indicates the congestion state of the transmit queue for this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the congestion state of the common queue. If this connection has *unshapedTransmitQueueing* attribute

Copyright © 2006, Nortel Nortel Confidential

displayed as ***perVc*** or as ***notApplicable***, this attribute displays the congestion state of the per-VC queue.

The congestion state of a queue is indicated by a numeric value ranging from 0 to 3. When a queue is in a congested state x, only traffic with discard priority (DP) 0 to x are enqueued. Traffic with DP > x is discarded.

For example, if the congestion state is 3, there is no congestion and all traffic is enqueued. Likewise, when the congestion state is 0, there is maximum congestion and only traffic with DP=0 is enqueued on that queue.

For ***1pOC48ChSmIrAtm*** cards, this attribute displays the current congestion state of the link class queue used by this connection to buffer its traffic.

This attribute does not apply to basic *Vpt*s.

Mib — AtmCore

Values — Decimal (0..3)

Default — No default

ATTRIBUTE **Atmlf Vpt Vcc Tm holdingPriority (hpri)**

Access — Read only

Description — This attribute indicates the actual holding priority in effect for this connection. In a situation where the link bandwidth fluctuates, such as over an IMA link, holding priority is used to determine which connections are held and which are released. Holding priority 4 connections are the first to be released. Holding priority 0 connections are the last to be released. Some applications, for example *Vcc Test*, may override the provisioned holding priority.

A value of ***notApplicable*** is displayed when this is an elastic connection. Holding priority does not apply to bandwidth elastic connections.

Holding priority has no effect if the equivalent cell rate (ECR) for a connection is zero.

This attribute does not apply to *Vpt Vcc*s.

ATTRIBUTE Atmlf Vpt Vcc Tm **atmServiceCategory (service)**

Access — Read only

Description — This attribute indicates the ATM service category used for traffic in both directions of the connection.

The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to have significantly reduced value for the application.

The ***rtVariableBitRate*** service category is intended for real time applications; that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by Cell Transfer Delay are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources.

The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections.

The ***availableBitRate*** service is an ATM layer service category for which the limiting ATM layer transfer characteristics provided by the network may change subsequent to connection establishment. ABR service has a flow control mechanism which supports several types of feedback to control the source rate in response to changing ATM layer transfer characteristics. ABR service is not intended to support real-time applications.

The ***unspecifiedBitRate*** service is intended for non-real time applications, that is those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are

Copyright © 2006, Nortel
Nortel Confidential

made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

Mib	AtmCore
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtVbr) nrtVariableBitRate (nrtVbr) availableBitRate (abr)
Default	No default

ATTRIBUTE **AtmIf Vpt Vcc Tm** **trafficShaping (trShaping)**

Access	Read only
Description	This attribute indicates the traffic shaping state of the connection. A value of ***notApplicable*** indicates that traffic shaping is not applicable or not supported for this connection. This is the case: - when the *txTrafficDescType* is 1 or 2. - for standard *Vpt Vcc*s and basic *Vpt*s. - for ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, when the *atmServiceCategory* is ***constantBitRate***. In these cases, the value of ***notApplicable*** is indicated regardless of whether traffic shaping is enabled or disabled in the provisioning data. A value of ***disabled*** indicates that traffic shaping is applicable and supported for the type of connection but has been turned off in the provisioning data. A value of ***linear*** or ***inverseUpc*** indicates that traffic shaping is applicable and supported for the type of connection and has been turned on in the provisioning data. This is the only case that indicates that traffic shaping is performed on the connection. In this case, the actual shaping rate is reflected in the *txTrafficDescParm* attribute, parameter number 4. A value of ***linear*** indicates that traffic is being shaped at the constant rate indicated in *txTrafficDescParm* 4. A value of ***inverseUpc*** indicates that the shaper strictly conforms to the requirements of a dual leaky bucket UPC enforcer. This value is indicated if traffic shaping is enabled, and the *txTrafficDescType* for this connection is 6, 7 or 8. For ***1pOC12SmLrAtm*** and ***1pOC48ChSmIrAtm*** cards, traffic shaping is not available, therefore this attribute is always ***disabled***. Traffic shaping for connections with *atmServiceCategory* as ***availableBitRate*** (*txTrafficDescType* 9) depends upon the *abrConnectionType* attribute. If *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, the value of this attribute is ***linear***. If

Default: No default

ATTRIBUTE Atmlf Vpt Vcc Tm bearerClassBbc (bcBbc)

Access: Read only

Description: This attribute indicates the bearer capability for this connection.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end to end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is displayed, the user is requesting more than an ATM only service. The network may look at the AAL to provide interworking based upon its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements.When ***c*** is displayed, the user is requesting more than an ATM only service. The network interworking function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.

Class vp service is used to indicate a transparent VP service when the user is requesting an ATM only service from the network. In this case, the network does not process any higher layer protocol. This service differs from class x service in that with the class vp service both the VCI field (except for VCI values 0, 3, 4, and 6 through 15) and Payload Type field are transported transparently by the network. This attribute value is only applicable to SPVP and SVP connections.

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.

notApplicable

Default — No default

ATTRIBUTE Atmlf Vpt Vcc Tm transferCapabilityBbc (tcBbc)

Access — Read only

Description — This attribute indicates the transfer capability for this connection. Uni 3.0/3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance, or in the case that the transfer capability in the call request was set to NoIndication.

The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data.

The value NoIndication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing.

The value yes for end-to-end timing indicates that end-to-end timing is required for the connection.

The value no for end-to-end timing indicates that end-to-end timing is not required for the connection.

ATTRIBUTE Atmlf Vpt Vcc Tm clippingBbc (cBbc)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the value of the clipping susceptibility parameter in the broadband bearer capability (BBC) Information Element. Clipping is an impairment in which the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through. A value of ***notApplicable*** is displayed in the case of nailed-up PVCs for which this attribute has no significance.
Mib	AtmCore
Values	no yes notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm **unshapedTransmitQueueing (unshap)**

Access	Read only
Description	This attribute indicates the unshaped transmit queuing state of the connection. A value of ***common*** indicates that transmit traffic is being enqueued onto the common transmit queue for this service category. The *txQueueLength* attribute indicates the current length of the common transmit queue. A value of ***fifo*** indicates that transmit traffic is being queued in a first-in-first-out basis for this service category. This is similar to ***common*** queuing, but the *txQueueLength* attribute indicates the number of cells in this connection queue. A value of ***fifo*** will only be indicated for connections on ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards with *atmServiceCategory* of ***nrtVbr*** or ***ubr***. A value of ***perVc*** indicates that transmit traffic is being enqueued onto a per-VC queue for this connection. A value of ***notApplicable*** indicates that transmit traffic is being shaped for this connection, or that unshaped transmit queuing is not applicable for this type of connection. Transmit traffic for a shaped connection is enqueued onto a per-VC queue, but this attribute is only applicable for unshaped connections. Unshaped transmit queuing is not applicable for basic *Vpt*s.

Values	indicated notIndicated notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm forceTagging (tagging)

Access	Read only
Description	This attribute indicates the state of force tagging option for this connection. Force tagging refers to setting the CLP bit for all cells on a connection. A value of ***enabled*** indicates that the CLP bit is being set to 1 for all cells in the transmit direction on this connection. A value of ***disabled*** indicates that the CLP bit is unchanged for cells in the transmit direction on this connection. The value ***disabled*** is always displayed for *Vpt*s since forced tagging is applied on a per *Vpt Vcc* basis.
Mib	AtmCore
Values	disabled enabled
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm weight

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the relative weight of this unshaped connection. Connections with a larger weight get a larger proportion of the link bandwidth or in the case of standard *Vpt Vcc*s, the *Vpt* bandwidth. For all but standard *Vpt Vcc*s, the default connection weight is determined by the weight policy for a service category and the traffic descriptor for a connection. For standard *Vpt Vcc*s, the default connection weight is determined by the *Vcc*'s service category. A value from 1 to 4095 indicates an actual weight. The value ***upToQueueLimit*** indicates that the weight of a connection is up to the transmit queue limit for this connection and is used for connections which have the value of the *unshapedTransmitQueueing* attribute displayed as ***fifo***. This attribute has a displayed value of ***notApplicable*** in the following cases: - This connection has the value of the *trafficShaping* attribute displayed as either ***linear*** or ***inverseUpc***. - This connection has the value of the *trafficShaping* attribute displayed as ***disabled***, but the connection's service category has the *trafficShaping* attribute provisioned as either ***enabled*** or ***inverseUpc***. - This connection has the value of the *unshapedTransmitQueueing* attribute displayed as ***common***. - This is a basic *Vpt* connection. - For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm*** cards, since per-connection weight is not supported.
Mib	AtmCore
Values	Decimal (1..4095) upToQueueLimit notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm usageParameterControl (upc)

Access	Read only
Description	This attribute indicates the UPC state of the connection. A value of ***notApplicable*** indicates that UPC is not applicable or not supported for the connection. This is the case: - when the connection's *rxTrafficDescType* is 1 or 2. - for standard *Vpt Vcc*s and basic *Vpt*s. A value of ***notApplicable*** is set regardless of whether UPC is disabled or enabled in provisioning data. A value of ***disabled*** indicates that UPC is applicable and supported for the type of connection but has been turned off in the provisioning data.

Copyright © 2006, Nortel Nortel Confidential

A value of ***enforced*** indicates that UPC is actively checking conformance for the connection and is discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. On some ATM cards, the counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

A value of ***monitored*** indicates that UPC is actively checking conformance for the connection and counting the violations, but is not discarding or tagging cells which do not conform to the connection traffic contract. The traffic descriptor parameters used for UPC conformance are reflected in the *rxTrafficDescParms* of the connection. The counts of UPC violations are visible in the *Vcc*, *Vpc* or *Vpt. rxUpcViolationsOnEnforcer1* or *rxUpcViolationsOnEnforcer2* attributes.

If the *atmServiceCategory* for this connection is ***availableBitRate***, a value of ***enforced*** indicates that Dynamic Generic Cell Rate Algorithm (DGCRA) is active for the connection. The traffic descriptor parameters used for DGCRA enforcement are reflected in the *rxTrafficDescParm* of the connection.

Mib	AtmCore
Values	enforced disabled monitored notApplicable
Default	No default

ATTRIBUTE **AtmIf Vpt Vcc Tm txPacketWiseDiscard (txpd)**

Access	Read only
Description	This attribute indicates the current set of packet-wise discard functions in effect in the transmit data direction at this connection point. This attribute is not applicable for *Vpt*s. A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements. A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point. A value of ***wred*** indicates that Weighted Random Early Detection is in effect at this connection point. W-RED can be enabled by provisioning for PVCs and SPVCs.

Copyright © 2006, Nortel Nortel Confidential

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Packet-wise functions are not applicable to virtual path connections (VPCs) on these cards.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

For ***16pOC3PosAtm***, ***4pMRPosAtm*** and ***1pOC48ChSmIrAtm*** cards, packet-wise discard functions apply to individual VCCs, as well as VCCs within VPCs at the VPC termination points, known as VPTs. PPD and EPD do not apply to tandem VPC connection points.

Mib — AtmCore

Set of — ppd
epd
wred

Default — No default

ATTRIBUTE Atmlf Vpt Vcc Tm **rxPacketWiseDiscard (rxpd)**

Access — Read only

Description — This attribute indicates the current set of packet-wise discard functions in effect in the receive data direction at this connection point.

This attribute is not applicable for *Vpt*s.

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly.

For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, and ***2pJ6MAtm*** cards, packet-wise

Copyright © 2006, Nortel Nortel Confidential

functions are not applicable to virtual path connections (VPCs).

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch, 4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, and MSA32 cards, packet-wise discard functions apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs.

For ***1pOC48ChSmIrAtm*** card, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, packet-wise discard functions are not available for the receive data direction of a connection. PPD and EPD are enabled by default at a connection endpoint which is performing AAL5 segmentation and assembly. Note that a provisioned value of ***enabled*** for the *Vcc/Vpc Vcd/Vpd Tm rxPacketWiseDiscard* provisionable attribute is used only for signaling SPVC/SPVP setup across the network, and does not result in actually enabling packet-wise discard functions in the receive data direction of a connection locally on these cards, thus does not affect the operational value displayed.

Mib — AtmCore

Set of — ppd
epd

Default — No default

ATTRIBUTE Atmlf Vpt Vcc Tm **bandwidthElastic (bwElastic)**

Access — Read only

Description — This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application (for example, *Trunk*) running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced is displayed in the *bandwidthReduction* attribute.

A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection is not released.

A value of ***no*** indicates that the bandwidth for this connection is not reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority.*

Bandwidth elasticity has no effect for connections which have an

Copyright © 2006, Nortel Nortel Confidential

equivalent cell rate (ECR) of zero.

This attribute is not applicable for *Vpt*s and *Vpt Vcc*s.

Mib — AtmCore

Values — no
yes

Default — No default

ATTRIBUTE Atmlf Vpt Vcc Tm bandwidthReduction (bwReduction)

Access — Read only

Description — This attribute shows the amount by which the bandwidth has been reduced for this connection. This value is non-zero only for connections which have *bandwidthElastic* displayed as ***yes***, and which are also operating in a reduced bandwidth mode. This is typically the case for selected connections running over an IMA link. This attribute takes a value from 0 (no reduction) up to the ECR. For all connections which are running at their full allocated bandwidth, *bwReduction* has the value 0. Connections which have been reduced in allocated bandwidth have a positive number for this attribute. The *bwReduction* may be subtracted from the ECR (which is displayed as *txTrafficDescParm* 5) to determine the actual bandwidth allocated to this connection.

Mib — AtmCore

Values — Decimal (0..2147483647)

Units — cell/s

Default — No default

ATTRIBUTE Atmlf Vpt Vcc Tm abrConnectionType (abrType)

Access — Read only

Description — This attribute indicates the type of ABR behavior which is in effect at this connection. This attribute is only applicable if the *atmServiceCategory* attribute is ***availableBitRate***. If the *atmServiceCategory* attribute is not ***availableBitRate***, this attribute value is set to ***notApplicable***.

For ATM cards which do not support ABR connections, the possible values for this attribute are ***notApplicable***, ***efciSwitch***, or ***nonAbrInterworking***. In EFCI marking mode, the Explicit Forward Congestion Indication (EFCI) field in the data cell headers is used to indicate transmit queue congestion.

For ATM cards which do support ABR connections, if the *connectionPointType* is ***connectionEndPoint***, the value of this attribute is ***sourceDest***. In this mode, the ABR Source and Destination behavior is in effect at this connection. This attribute is also ***sourceDest*** in the case where the next hop connection is specified as ***nonAbrInterworking***. The next hop connection is the *Vcc* or *Vpc* identified by the *nextHop* attribute of

Copyright © 2006, Nortel Nortel Confidential

the *Nrp* or *Rp* component.

If the *connectionPointType* is not ***connectionEndPoint***, the value of this attribute depends upon the *abrConnectionType* provisioning and the card type to which the traffic is forwarded on the backplane. The default *abrConnectionType* is provisioned at the *CA Abr abrConnectionType* attribute, and may be overridden for a provisioned connection in the *Vcd Tm abrConnectionType* or *Vpd Tm abrConnectionType* attribute. If the *CA Abr abrConnectionType* attribute is ***virtualSourceDest*** at either one of the two connection points, and if both the connection points are defined on ATM cards which support ABR connections, virtual source and destination behavior is applied to the connection. In this instance, the attribute displays the value ***virtualSourceDest***.

This attribute has the value ***erSwitch*** if ABR explicit rate functionality is in effect at this connection. In this mode, the switch may modify the Explicit Rate (ER) field of backward Resource Management (RM) cells to indicate the status of congestion at this connection point.

This attribute has the value ***nonAbrInterworking*** in the case where this connection point is functioning as an SPVC origin for an ABR connection where the link side of this connection is configured as a non-ABR ATM service category. This means that there are no RM cells on the link side of this connection, and that the next hop connection point is performing as an ABR ***sourceDest***.

Default: No default

ATTRIBUTE Atmlf Vpt Vcc Tm txTrafficDescParm (txTdp)

Access: Read only

Description: This attribute is a vector of five transmit traffic parameters whose mapping is defined by the *txTrafficDescType* attribute.

The values of peak cell rate (PCR), sustained cell rate (SCR), Minimum Cell Rate (MCR), actual cell rate (ACR), explicit rate (ER), equivalent cell rate (ECR), and actual shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds.

When *txTrafficDescType* is 1 or 2, parameters 1 through 5 are unused.

In this description, PCR is the greater of either the PCR or the requested

Copyright © 2006, Nortel Nortel Confidential

shaping rate (parameter 1 or parameter 5) specified in the *txTrafficDescParm* attribute under the *Vcd Tm* or *Vpd Tm* component.

When *txTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 or 1 traffic; parameters 2 and 3 are unused.

When *txTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard.

When *txTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging.

When *txTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic.

When *txTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic.

When *txTrafficDescType* is 3, 4, 5, 6, 7, or 8, parameter 4 reflects the actual shaping rate in cell/s for this connection. For CQC-based ATM cards, the set of available shaping rates is based on the number of interfaces doing shaping (attribute *perVcQueueInterfaces*), and the *shapingScalingFactor* attribute of the *Arc Cqc Override* component. A rate of zero (0) indicates that shaping is not performed, or that the interface is down.

When *txTrafficDescType* is 9***,*** parameter 1 represents the PCR; parameter 2 represents the Cell Delay Variation Toleration (CDVT); parameter 3 represents the Minimum Cell Rate (MCR); the meaning of parameter 4 depends upon the value of the *abrConnectionType* attribute. if *abrConnectionType* is ***sourceDest*** or ***virtualSourceDest***, parameter 4 represents the Allowed Cell Rate (ACR); If *abrConnectionType* is ***erSwitch***, parameter 4 represents the Explicit Rate (ER); and if *abrConnectionType* is ***efciSwitch***, parameter 4 reflects the actual shaping rate in cell/s for this connection.

When *txTrafficDescType* is 3, 4, 5, 6, 7, 8, or 9, parameter 5 reflects the equivalent cell rate in cell/s for this connection as determined by the Connection Admission Control (CAC) algorithm. The equivalent cell rate is useful in determining the admission characteristics of this connection.

ATTRIBUTE Atmlf Vpt Vcc Tm **txQueueThresholds (txQThresh)**

Access	Read only
Description	This attribute indicates the queue limit and the discard thresholds for the transmit queue of this connection. If this connection has *unshapedTransmitQueueing* attribute displayed as ***common***, this attribute displays the thresholds of the common queue. If this connection has *unshapedTransmitQueueing* attribute displayed as ***perVc*** or as ***notApplicable***, this attribute displays the thresholds of the per-VC queue. The first element indicates the queue limit. The provisioned value of the transmit queue limit is derived from the *txQueueLimit* attribute under the service category subcomponents of the *CA* component for the service category of this connection. The second element is the threshold that marks the transition from congestion state 1 to congestion state 0. This is the threshold at which traffic with discard priority (DP) = 1 is discarded. This threshold is set at approximately 90 percent of the first parameter, the operational queue limit. The third element is the threshold that marks the transition from congestion state 2 to congestion state 1. This is the threshold at which traffic with DP = 2 is discarded. This threshold is set at approximately 75 percent of the first parameter, the operational queue limit. The fourth element is the threshold that marks the transition from congestion state 3 to congestion state 2. This is the threshold at which traffic with DP = 3 is discarded. This threshold is set at approximately 35 percent of the first parameter, the operational queue limit. For ***1pOC48ChSmIrAtm*** cards, this attribute displays the thresholds of the link class queue used by this connection to buffer it traffic. This attribute does not apply to basic *Vpt*s.

ATTRIBUTE Atmlf Vpt Vcc Tm **rxTrafficDescParm (rxTdp)**

Access	Read only
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. Cell delay variation tolerance (CDVT) is expressed in microseconds. When *rxTrafficDescType* is 1 or 2, none of the parameters are used. When *rxTrafficDescType* is 3, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 4, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard; parameter 4 represents the CDVT. When *rxTrafficDescType* is 5, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging; parameter 4 represents the CDVT. When *rxTrafficDescType* is 6, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 7, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT. When *rxTrafficDescType* is 9, parameter 1 represents the PCR; parameter 2 represents CDVT; parameter 3 represents the MCR; parameter 4 is not used. If *upc* is ***disabled*** for this connection, the values of PCR, SCR, MBS and CDVT are the provisioned parameters. If *upc* is ***enabled***, the values of PCR, SCR, MBS, and CDVT are exactly the values used by the usage parameter control hardware in policing the arriving traffic. These may vary slightly from the provisioned values due to granularity of the hardware. In the case where the PCR is equal to the SCR, the effective MBS is zero.

GROUP Atmlf Vpt Vcc Tm Abr **Operational (Oper)**

Properties	Operational
Description	This group contains operational attributes for connections using ABR service category.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **initialCellRate (icr)**

Access	Read only
Description	This attribute indicates the Initial Cell Rate (ICR) parameter for this connection. ICR is the rate at which a source should send initially and after an idle period. For nailed-up connections, this attribute is determined by the provisioned value of the *initialCellRate* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element. The ICR for a connection is a value between the MCR and the PCR. Furthermore, ICR has an upper bound determined by the *transientBufferExposure* divided by *fixedRoundTripTime*.

Mib	AtmCore
Values	Decimal (0..16777215)
Units	cell/s
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **transientBufferExposure (tbe)**

Access	Read only
Description	This attribute indicates the Transient Buffer Exposure (TBE) for this connection. TBE is the negotiated number of cells that the network would like to limit the resource to send during start-up periods, before the first Resource Management (RM) cell returns. For nailed-up connections, this attribute is determined by the provisioned value of the *transientBufferExposure* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..16777215)
Units	cells
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **fixedRoundTripTime (frtt)**

Access	Read only
Description	This attribute indicates the Fixed Round-Trip Time (FRTT) parameter for this connection. FRTT is the sum of the fixed and propagation delays from the source to a destination and back. For nailed-up connections, this attribute is determined by the provisioned value of the *fixedRoundTripTime* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..16700000)
Units	microsec
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **rateDecreaseFactor (rdf)**

Access	Read only
Description	This attribute indicates the Rate Decrease Factor (RDF) for this connection. The RDF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 8, RDF is 2E-8 = 1/256.

Copyright © 2006, Nortel Nortel Confidential

RDF controls the amount by which the cell transmission rate may decrease upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) field set to 1, the Allowed Cell Rate (ACR) value would be reduced by the amount (RDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR.

For nailed-up connections, this attribute is determined by the provisioned value of the *rateDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Mib AtmCore

Values Decimal (0..15)

Default No default

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **rateIncreaseFactor (rif)**

Access Read only

Description This attribute indicates the Rate Increase Factor (RIF) for this connection. The RIF value is computed by using the operational value of this attribute, n, as 2 to the inverse power n. For example, if the value of this attribute is 6, RIF is 2E-6 = 1/64.

RIF controls the amount by which the cell transmission rate may increase upon receipt of a backward Resource Management (RM) cell. For example, if a backward RM cell is received with the Congestion Indication (CI) and the No Increase (NI) fields both set to 0, the Allowed Cell Rate (ACR) value would be increased by the amount (RIF*ACR). The ACR is not allowed to exceed the Peak Cell Rate (PCR), in which case the ACR is set to PCR.

For nailed-up connections, this attribute is determined by the provisioned value of the *rateIncreaseFactor* attribute. For signaled connections, it is indicated in the ABR Setup Parameters Information Element.

Mib AtmCore

Values Decimal (0..15)

Values	Decimal (2; 4; 8; 16; 32; 64; 128; 256)
Units	cells
Default	No default

ATTRIBUTE **Atmlf Vpt Vcc Tm Abr** **maxTimeBetweenRmCell (trm)**

Access	Read only
Description	This attribute indicates the TRM parameter for this connection. TRM provides an upper bound on the time interval between forward Resource Management (RM) cells for an ABR source. Since the last forward RM cell was sent, if at least TRM time has elapsed since and at least 2 other cells have been sent, the next cell to be transmitted would be a forward RM cell. For nailed-up connections, this attribute is determined by the provisioned value of the *maxTimeBetweenRmCell* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (781; 1563; 3125; 6250; 12500; 25000; 50000; 100000)
Units	microsec
Default	No default

ATTRIBUTE **Atmlf Vpt Vcc Tm Abr** **cutoffDecreaseFactor (cdf)**

Access	Read only
Description	This attribute indicates the Cutoff Decrease Factor (CDF) parameter for this connection. When the value of this attribute is non-zero, CDF is computed as the inverse of the value. For example, if the value is 32, the value of CDF is 1/32. When the value of this attribute is 0, CDF is also zero. CDF controls the decrease in the Allowed Cell Rate (ACR) associated with the *forwardRmCellLimit* attribute, the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the ACR value would be decreased by the amount (CDF*ACR). The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. For nailed-up connections, this attribute is determined by the provisioned value of the *cutoffDecreaseFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **acrDecreaseTimeFactor (adtf)**

Access	Read only
Description	This attribute indicates the Allowed Cell Rate Decrease Time Factor (ADTF) parameter for this connection. ADTF is the time interval permitted between sending forward Resource Management (RM) cells before the Allowed Cell Rate (ACR) is decreased to *initialCellRate*. In other words, if the source does not transit a forward RM cell for the period specified by *adtf*, it reduces its ACR to the value of its *initialCellRate*. For nailed-up connections, this attribute is determined by the provisioned value of the *acrDecreaseTimeFactor* attribute. For signaled connections, it is indicated in the ABR Additional Parameters Information Element.
Mib	AtmCore
Values	Decimal (0..1023)
Units	centiseconds
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **forwardRmCellLimit (crm)**

Access	Read only
Description	This attribute indicates the CRM parameter for this connection. CRM is the limit of the number of forward Resource Management (RM) cells which may be sent in the absence of received backward RM cells. When this limit is crossed, the Allowed Cell Rate (ACR) value would be decreased by the amount (CDF*ACR), where CDF is determined by the *cutoffDecreaseFactor*. The ACR is not allowed to fall below the Minimum Cell Rate (MCR), in which case the ACR is set to MCR. The value of CRM is obtained as *transientBufferExposure* divided by *maxCellsPerRmCell*.

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the rate change information put into the last forward Resource Management (RM) cell turned around as a backward-RM cell. For connections configured as an ABR Source or Destination, the turned around backward-RM cell is sent over the interface. For connections configured as an ABR Virtual Source or Virtual Destination, the turned around backward-RM cell is sent over the backplane.
Mib	AtmCore
Values	congestionIndicated noIncreaseIndicated explicitRateIndicated
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **acrRateChangeInfo (arci)**

Access	Read only
Description	This attribute indicates the type of change in the Allowed Cell Rate (ACR) as a result of the information in the last backward Resource Management (B-RM) cell received from the interface. This attribute value is only applicable when the *Vcc Tm* or *Vpc Tm* *abrConnectionType* attribute is ***sourceDest*** or ***VirtualSourceDest***. In all other cases, this attribute value is ***notApplicable***. A value of ***noChange*** indicates that the rate did not change as a result of the last backward RM cell received. A value of ***decreasedByRdf*** or ***increasedByRif*** indicates that the ACR was increased or decreased by the corresponding factor. This change is as a result of the CI or NI bit setting in the last backward RM cell, or an ADTF timeout. A value of ***setToExplicitRate*** indicates that the ACR was set to the ER value in the last backward RM cell.
Mib	AtmCore
Values	noChange decreasedByRdf increasedByRif setToExplicitRate notApplicable
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Tm Abr **txFwdRmCells**

Access	Read only
Description	This attribute counts the number of forward Resource Management (RM) cells sent over the interface since the last backward RM-cell was received from the interface. If the value of this attribute is greater than or equal to

GROUP AtmIf Vpt Vcc Src Provisioned (Prov)

Properties	Provisioned
Description	This attribute group contains the provisionable attributes of the *SourcePvc* component.
Mib	AtmNetworking

ATTRIBUTE AtmIf Vpt Vcc Src callingAddress

Access	Read: All Write: All
Criticality	Component
Description	This attribute represents the calling address of the soft PVC. If it is a null string, then the calling address is the address of the current interface (that is, where the soft PVC originates).
Mib	AtmNetworking
Values	String (0..20, Hex)
Default	""

ATTRIBUTE AtmIf Vpt Vcc Src calledAddress

Access	Read: All Write: All
Criticality	Component
Description	This attribute represents the called (remote) address of the soft PVC.
Mib	AtmNetworking
Values	String (20, Hex)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmIf Vpt Vcc Src **calledVpiVci**

Access	Read: All Write: All
Criticality	Component
Description	This attribute represents the remote VPI and VCI of the soft PVC.
Mib	AtmNetworking
Values	Integer Sequence (0..4095; 1..65535)
Default	No default

ATTRIBUTE AtmIf Vpt Vcc Src **adminControl**

Access	Read: All Write: All
Description	This attribute specifies the initial state of the connection. If this attribute is set to ***permLocked***, the connection initially remains down following activation. Setting this attribute to ***unlocked*** causes the connection to be established when it is activated.
Mib	AtmNetworking
Values	permLocked unlocked
Default	unlocked

ATTRIBUTE AtmIf Vpt Vcc Src **aisGeneration (ais)**

Access	Read and write
Description	This attribute specifies whether OAM-AIS generation occurs on the connection towards this interface when the SPVC is down. If this attribute is ***enabled***, OAM-AIS cells are generated for this SPVC when the SPVC is not up. The only exception is that when the source SPVC attribute *adminControl* is set to ***permLocked***, OAM-AIS cells are not generated for the source SPVC. If this attribute is set to ***disabled***, OAM-AIS cells are not generated.
Mib	AtmNetworking
Values	enabled disabled
Default	disabled

GROUP AtmIf Vpt Vcc Src **Operational (Oper)**

Copyright © 2006, Nortel Nortel Confidential

Properties	Operational
Description	This attribute group contains the operational attributes associated with the *SrcPvp* or *SrcPvc* component.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpt Vcc Src **retryCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of failed attempts to set up the soft PVP or soft PVC since the last time the connection failed.
Mib	AtmNetworking
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Atmlf Vpt Vcc Src **lastFailureCauseCode**

Access	Read: All Write: Illegal
Description	This attribute contains the cause code in the last transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages. The default value for this attribute is set to 0.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src **lastFailureDiagCode**

Access	Read: All Write: Illegal
Description	This attribute contains the diagnostic code in the last transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmNetworking
Values	String (0..8, ASCII)
Default	No default

GROUP Atmlf Vpt Vcc Src **OsiState (State)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpt Vcc Src **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vpt Vcc Src **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmNetworking
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE Atmlf Vpt Vcc Src **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmNetworking
Values	idle active (activ) busy
Default	idle

GROUP Atmlf Vpt Vcc Src **CallRedirectionOper (RedirectOp)**

Properties	Operational
Description	This group contains the operational attributes associated with the *CallRedirection* subcomponent.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpt Vcc Src **currentDestination**

Access	Read: All Write: Illegal
Description	This attribute indicates the current destination of the soft PVC or soft PVP. A ***notConnected*** status indicates that the connection is not established. A ***primary*** status indicates that the connection is established to the remote destination specified by *calledAddress* and *calledVpiVci/calledVpi* attributes under *Atmif Vcc Src* or *Atmif Vpc Src* or *Atmif Vpt Vcc Src* Component. A ***secondary*** status indicates that the connection is established to the remote destination specified by *secondaryCalledAddress* and *secondaryCalledVpiVci/secondaryCalledVpi* attributes under *Atmif Vcc Src CallRedirection* or *Atmif Vpc Src CallRedirection* or *Atmif Vpt Vcc Src CallRedirection* Component.
Mib	AtmNetworking
Values	notConnected primary secondary

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src **primaryAdminState**

Access	Read: All Write: Illegal
Description	This attribute indicates the OSI Administrative State of the primary destination. The value ***locked*** indicates that the primary destination is precluded from call setup attempts. The value ***unlocked*** indicates that the primary destination is considered in call setup attempts.
Mib	AtmNetworking
Values	locked unlocked
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src **secondaryAdminState**

Access	Read: All Write: Illegal
Description	This attribute indicates the OSI Administrative State of the secondary destination. The value ***locked*** indicates that the secondary destination is precluded from call setup attempts. The value ***unlocked*** indicates that the secondary destination is considered in call setup attempts.
Mib	AtmNetworking
Values	locked unlocked
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src **lastSecondaryFailureCauseCode**

Access	Read: All Write: Illegal
Description	This attribute indicates the cause code value of the last signalling message to the secondary destination which contained the CAUSE information element. If there has been no previous failure, the value for this attribute is 0.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src **lastSecondaryFailureDiagCode**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the diagnostic code associated with the *lastSecondaryFailureCauseCode* attribute. If the diagnostic code was not provided with that CAUSE information element or if there has been no previous failure, this attribute is empty.
Mib	AtmNetworking
Values	String (0..8, ASCII)
Default	No default

COMPONENT **AtmIf Vpt Vcc Src** **CallRedirection (Redirect)**

Groups	GROUP AtmIf Vpt Vcc Src Redirect Provisioned (Prov)
Scope	Device
Description	*Atmif/n Vcc/vpi.vci SrcPvc CallRedirection* *Atmif/n Vpt/vpi Vcc/vci SrcPvc CallRedirection* This component represents the secondary destination information for the source end of a soft PVC. The addition of this subcomponent is not critical to the parent SPVC. Deletion of this subcomponent or changes to its attributes will impact service of the SPVC if it is established to the secondary destination.
Mib	AtmNetworking
Common Verbs	Help List Display Add DELete

VERB LOCK **AtmIf Vpt Vcc Src Redirect**

Impact	Service
Description	*Lock Atmif Vcc Src CallRedirection* *Lock -primary Atmif Vcc Src CallRedirection* *Lock -secondary Atmif Vcc Src CallRedirection* *Lock Atmif Vpt Vcc Src CallRedirection* *Lock -primary Atmif Vpt Vcc Src CallRedirection* *Lock -secondary Atmif Vpt Vcc Src CallRedirection* This verb selectively precludes a provisioned destination address from consideration during call setup attempts for a Src PVC. If [*-primary*] option is present, then the primary destination address is

Copyright © 2006, Nortel Nortel Confidential

precluded from call setup attempts. If the connection is established to the primary destination address at the time of issuing the command, the connection is torn down and an immediate attempt is made to re-establish the connection to the secondary destination address.

If [*-secondary*] option is present, then the secondary destination address is precluded from call setup attempts. If the connection is established to the secondary destination address at the time of issuing the command, the connection is torn down and an immediate attempt is made to re-establish the connection to the primary destination address.

If no option is present, the secondary destination is locked. This command will have the same effect as providing the *secondary* option.

Only one of the primary or the secondary addresses may be locked at any given time.

VERB UNLOCK **Atmlf Vpt Vcc Src Redirect**

Impact: Service

Description:

Unlock Atmif Vcc Src CallRedirection
Unlock -primary Atmif Vcc Src CallRedirection
Unlock -secondary Atmif Vcc Src CallRedirection
Unlock -primary -secondary Atmif Vcc Src CallRedirection

Unlock Atmif Vpt Vcc Src CallRedirection
Unlock -primary Atmif Vpt Vcc Src CallRedirection
Unlock -secondary Atmif Vpt Vcc Src CallRedirection
Unlock -primary -secondary Atmif Vpt Vcc Src CallRedirection

This verb selectively unlocks a destination address. The indicated address will be considered in subsequent call setup attempts.

If [*-primary*] option is present, then the primary destination address is unlocked and it is considered for subsequent call setup attempts. This action does not have any impact on established connections.

If [*-secondary*] option is present, then the secondary destination address is unlocked and it is considered in subsequent call setup attempts. This action does not have any impact on established connections.

If no option is present the secondary destination address is unlocked. This command will have the same effect as providing the *secondary* option.

If both options are provided, either of the primary or the secondary address which may have been locked will be unlocked.

GROUP **Atmlf Vpt Vcc Src Redirect** **Provisioned (Prov)**

Properties: Provisioned

VERB REConnect **AtmIf Vpt Vcc Src Mdtl**

Impact	Service
Description	*REConnect AtmIf/n Vcc/vpi.vci Src Mdtl* *REConnect -primary AtmIf/n Vcc/vpi.vci Src Mdtl* *REConnect -alternate AtmIf/n Vcc/vpi.vci Src Mdtl* *REConnect -automatic AtmIf/n Vcc/vp.vci Src Mdtl* This command is used to trigger a connection to attempt to connect using the requested path. The behavior of this command differs for connections which do and do not subscribe to Path Optimization capabilities provided by rerouting services. To summarize: 1. Non-reroute Subscribed connections A reconnect comand will result in the connection being taken down and re-establishment attempts being made. By default (if no option is specified), the primary path is attempted first otherwise the path specified by the option is first attempted. In the event of reconnect failure, subsequent re-establishment attempts will be progressed through a sequence of primary, alternate and automatic (traditional PNNI routing) paths. 2. Reroute Subscribed connections A reconnect comand will utilize make-before-break functionality. If an option is specified then only that path will be attempted. If a connection can be established, then datapath switching will be used to replace the existing connection minimizing cell loss. If no option is specified, the connection establishment attempts will be progressed through a sequence of primary, alternate and automatic (traditional PNNI routing) paths only until such time that a successfully established connection would be deemed more optimal than the incumbent. For instance, if a reconnect command is issued for a connection which is on it's alternate path and establishment on the primary path fails then the reconnect operation is considered complete and the connection will remain on the alternate path.

GROUP **AtmIf Vpt Vcc Src Mdtl** **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the Manual DTL selection paths for provisioned connections. The normal sequence for connection retry is: First try to establish the connection using the *primaryPath*. If the connection is not successful and if the *alternatePath* has been provisioned, try to connect using the *alternatePath*. If the connection is still unsuccessful, use the PNNI routing protocol to generate the path.
Mib	AtmNetworking

ATTRIBUTE **AtmIf Vpt Vcc Src Mdtl** **primaryPath (priPath)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the name of the primary MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni*.
Mib	AtmNetworking
Values	String (1..32, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src Mdtl **alternatePath (altPath)**

Access	Read and write
Description	This attribute specifies the name of the alternate MDTL path. The value must match the instance value of one of the *Mdtl* components under *Artg Pnni.* An empty string disables the alternate path.
Mib	AtmNetworking
Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src Mdtl **automaticFallback (auto)**

Access	Read and write
Description	This attribute specifies whether PNNI routing is to be used to establish a connection if connection attempts using the primary and alternate paths fail. If the value is ***enable***, PNNI routing will be attempted; if the value is ***disable***, it will not.
Mib	AtmNetworking
Values	disable enable
Default	enable

ATTRIBUTE Atmlf Vpt Vcc Src Mdtl **mdtlVersion (vers)**

Access	Read and write
Description	This attribute indicates a version number for Specified Paths and will ensure that the reroute behaviors (not subscribed) are maintained following a software migration to a software version where global rerouting is supported for Specified Path connections. This is an internal attribute intended for the above purpose only and should not be altered.
Mib	AtmNetworking
Values	notRerouteCapable rerouteCapable
Default	notRerouteCapable

GROUP Atmlf Vpt Vcc Src Mdtl **Operational (Oper)**

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute group contains the operational attributes associated with the *atmSrcMdtl* component
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpt Vcc Src Mdtl **currentPath (curPath)**

Access	Read: All Write: Illegal
Description	This attribute indicates the current connection status of the Specified Path connection. A ***not connected*** status indicates that the connection is not established. The retry sequence did not succeed. The network operator can issue the *Reconnect* command to restart the retry sequence. A ***primary*** status indicates that the connection is using the path specified by the *primaryPath* attribute. An ***alternate*** status indicates that the connection is using the path specified by the *alternatePath* attribute. An ***automatic*** status indicates that the connection is using the path generated by the PNNI routing protocol. An ***unknown*** status indicates that the provisioning data for the path upon which the connection is established has been altered. A ***waiting connection*** status indicates that the connection is in a retry phase.
Mib	AtmNetworking
Values	not connected primary alternate automatic unknown waiting connection
Default	"not connected"

ATTRIBUTE Atmlf Vpt Vcc Src Mdtl **primaryPathFailCause (priPathFail)**

Access	Read: All Write: Illegal
Description	This attribute identifies the last cause code failure for the primary path. The value is reset to zero when the *primaryPath* attribute is set to a new value.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Atmlf Vpt Vcc Src Mdtl **alternatePathFailCause (altPathFail)**

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute identifies the last cause code failure for the alternate path. The value is set to zero when the *alternatePath* attribute is set to a new value.
Mib	AtmNetworking
Values	Decimal (0..255)
Default	No default

COMPONENT Atmlf Vpt Vcc Src RerouteOverride (RerOv)

Groups	GROUP AtmIf Vpt Vcc Src RerOv Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci SrcPvc RerouteOverride* *AtmIf/n Vpc/vpi SrcPvp RerouteOverride* *AtmIf/n Vpt/vpi Vcc/vci SrcPvc RerouteOverride* *FrAtm/n Dlci/x Siwf RerouteOverride* This component represents the ability to override rerouting capability subscription options on a per connection basis for provisioned SPVC and SPVP connections. The addition of this component and changes to the attributes contained in this component are critical to the parent SPVC or SPVP. However, the deletion of this component is not a critical change for the connection. If this component is deleted, the connection remains active with the last provisioned subscription options. Subscription is lost when the connection goes down and re-establishes.
Mib	AtmNetworking
Common Verbs	Help List Display Add DELete

VERB OPTIMIZE **AtmIf Vpt Vcc Src RerOv**

Impact	Service
Description	*OPTimize AtmIf/n Vcc/<vpi.vci> Src RerOv* *OPTimize AtmIf/n Vpc/<vpi> Src RerOv* *OPTimize AtmIf/n Vpt/<vpi> Vcc/<vci> Src RerOv* *OPTimize FrAtm/n Dlci/x Siwf RerOv* This command triggers path optimization for the connection segment. If the interface is already processing a path optimization request, then the *Optimize* command is cancelled. Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP **AtmIf Vpt Vcc Src RerOv** **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes related to rerouting subscription options for provisioned connections.
Mib	AtmNetworking

ATTRIBUTE **AtmIf Vpt Vcc Src RerOv** **protocol**

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by the connection segment. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsInterface***: The requested rerouting protocols are specified by the *protocol* attribute under the *Reroute Ov* component for the interface. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***localEbr***: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature. ***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

COMPONENT Atmlf Vpt Vcc DestinationPvc (Dst)

Groups	GROUP Atmlf Vpt Vcc Dst Operational (Oper) GROUP Atmlf Vpt Vcc Dst OsiState (State)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci DstPvc* *AtmIf/n Vpt/vpi Vcc/vci DstPvc* This component represents the destination end of a soft PVC. This component can be dynamically created or provisioned. When this component is dynamically created, it implicitly indicates that a connection has been established. This dynamically created component does not exist when there is no connection.

Copyright © 2006, Nortel Nortel Confidential

When this component is provisioned, it does not imply that a connection has been established. The existence of a provisioned *destinationPVC* component allows the possibility of generating OAM-AIS cells when the SPVC is down. The attribute *aisGeneration* under component *Configuration* is used to specify AIS generation at the destination end of a soft PVC.

Mib	AtmNetworking
Subcomponents	COMPONENT AtmIf Vpt Vcc Dst Configuration (Config)
Common Verbs	Help List Display Add DELete

GROUP AtmIf Vpt Vcc Dst Operational (Oper)

Properties	Operational
Description	This attribute group contains the operational attributes for the *DestinationPvc* component.
Mib	AtmNetworking

ATTRIBUTE AtmIf Vpt Vcc Dst calledAddress

Access	Read: All Write: Illegal
Description	This attribute represents the called address of the soft PVC.
Mib	AtmNetworking
Values	String (20, Hex)
Default	No default

ATTRIBUTE AtmIf Vpt Vcc Dst callingAddress

Access	Read: All Write: Illegal
Description	This attribute represents the remote address of the soft PVC. If the address in not known, then the value of this address is ***Unknown***.
Mib	AtmNetworking
Values	String (7..40, ASCII)
Default	No default

ATTRIBUTE AtmIf Vpt Vcc Dst callingVpiVci

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute represents the remote VPI and VCI of the soft PVC. If the VPI and VCI values are not known, this attribute is set to ***Unknown***.
Mib	AtmNetworking
Values	String (7..9, ASCII)
Default	No default

GROUP Atmlf Vpt Vcc Dst **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmNetworking

ATTRIBUTE Atmlf Vpt Vcc Dst **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmNetworking
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Atmlf Vpt Vcc Dst **operationalState (osiOper)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmNetworking
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Atmlf Vpt Vcc Dst usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmNetworking
Values	idle active (activ) busy
Default	idle

COMPONENT Atmlf Vpt Vcc Dst Configuration (Config)

Groups	GROUP Atmlf Vpt Vcc Dst Config DstProv
Scope	Device
Description	*Atmif/n Vcc/x.y Dst Override* This *Override* component contains provisioned attributes for this destination SPVC.

Copyright © 2006, Nortel Nortel Confidential

If this component does not exist, the destination SPVC behaves as if this component had been provisioned with default values for all its attributes.

Common Verbs	Help List Display

GROUP AtmIf Vpt Vcc Dst Config DstProv

Properties	Provisioned
Description	This group contains provisionable attributes for destination SPVC/Ps.
Mib	AtmNetworking

ATTRIBUTE AtmIf Vpt Vcc Dst Config aisGeneration (ais)

Access	Read and write
Description	This attribute specifies whether OAM-AIS generation occurs on the connection towards this interface when the SPVC or SPVP is down. If this attribute is ***enabled***, OAM-AIS cells are generated for this SPVC or SPVP when the SPVC or SPVP is not up. If this attribute is set to ***disabled***, OAM-AIS cells are not generated.
Mib	AtmNetworking
Values	enabled disabled
Default	disabled

COMPONENT AtmIf Vpt Vcc MulticastNailedUpRelayPoint (Mnrp)

Groups	GROUP AtmIf Vpt Vcc Mnrp Provisioned (Prov)
Scope	Device
Description	*AtmIf/n Vcc/vpi.vci Mnrp* This component is used to establish a root of a multicast nailed-up ATM Bearer Service (ABS) connection. By linking a *Mnrp* to a *Nrp*, the associated connections are configured to relay ATM cells from *Mnrp* to *Nrp*. The *Mnrp* component requires exclusive use of its parent *Vcc* or *Vpc* and cannot co-exist with other ATM service components (such as *Nep*, *Test*, *Nrp* and *Loop*). This component is supported only on

Copyright © 2006, Nortel Nortel Confidential

4pOC3SmIrAtm and 4pOC3MmAtm cards.This component is not supported under *Vpt Vcc* and *Vpt Vpc*.

Mib: AtmBearerService

Common Verbs: Help, List, Display, Add, DELete

GROUP Atmlf Vpt Vcc Mnrp **Provisioned (Prov)**

Properties: Provisioned

Description: This group contains the provisionable attributes for the *Mnrp* component.

Mib: AtmBearerService

ATTRIBUTE Atmlf Vpt Vcc Mnrp **oamSegmentBoundary (sb)**

Access: Read and write

Criticality: Component

Description: This attribute specifies the OAM segment boundary desired for a *Mnrp* component. It affects the connection point type value visible in the parent component's *connectionPointType* attribute.
The desired OAM segment boundary can be specified directly as ***yes***, ***no*** or ***sameAsInterface***. If ***sameAsInterface*** is specified, the OAM segment boundary is same as the *oamSegmentBoundary* attribute of the associated *AtmIf* and the switch will set the *connectionPointType*, choosing ***segmentEndPoint*** for a segment-boundary ATM interface and ***connectingPoint*** for a non-segment-boundary ATM interface.

Mib: AtmBearerService

Values: no, yes, sameAsInterface

Default: sameAsInterface

ATTRIBUTE Atmlf Vpt Vcc Mnrp **bandwidthElastic (bwElastic)**

Access: Read and write

Criticality: Component

Description: This attribute is only of importance for connections which are carried on a link with a variable bandwidth. For example, the bandwidth may be reduced in the event that one or more physical links in the IMA group fail, such that the originally requested bandwidth cannot be maintained. This attribute shows whether the application running on this connection can continue to operate if the bandwidth is reduced. If the bandwidth is reduced, the amount by which it is reduced will be displayed in the

Copyright © 2006, Nortel Nortel Confidential

bandwidthReduction attribute.
A value of ***yes***, indicates that this connection is elastic, and the bandwidth may be reduced but the connection will not be released. Currently, this attribute should only be set to ***yes*** for situations where this *Mnrp* is functioning as a loopback on one side of an IMA link. There are no other situations where this setting is valid.
A value of ***no*** indicates that the bandwidth for this connection will not be reduced in the event of link bandwidth reduction. However, this connection may be released based on its *holdingPriority.*

Mib	AtmBearerService
Values	no yes
Default	no

ATTRIBUTE Atmlf Vpt Vcc Mnrp **overrideHoldingPriority (ohpri)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the holding priority of this connection. Holding priority is used when there is an IMA group where some physical links have failed. Holding priority determines the order in which connections are released. 4 is the lowest holding priority and is released first. 0 is a higher priority and is released last. The value specified in this attribute will override whatever *holdingPriority* that has been provisioned at the *Vcd* (or *Vpd*). If the value is left at the default of ***noOverride***, the *holdingPriority* provisioned at the *Vcd* (or *Vpd*) will be used.
Mib	AtmBearerService
Values	0 1 2 3 4 noOverride
Default	noOverride

ATTRIBUTE Atmlf Vpt Vcc Mnrp **nextHop (nextHop)**

Access	Read and write
Description	This attribute specifies the list of *Nrp* components with which this *Mnrp* is associated. A sample value is *AtmIf/31 Vcc/0.32 Nrp.* This attribute must be provisioned with at least one Nrp component under a compatible connection type.
Mib	AtmBearerService

Properties	Operational
Description	This group contains attributes indicating the status of each Performance Monitoring (PM) measurement.
Mib	AtmCore

ATTRIBUTE Atmlf Vpt Vcc Pm clrMeasurementStatus (clr)

Access	Read only
Description	This attribute displays the Cell Loss Ratio (CLR) measurement status of the connection. The value ***inactive*** indicates the test is inactive. The value ***activating*** indicates the test is activating. The value ***active*** indicates the test is in progress The value ***activationFailed*** indicates the test failed to be activated. Refer to the *failureCause* attribute for failure cause.
Mib	AtmCore
Values	inactive activating active activationFailed
Default	inactive

ATTRIBUTE Atmlf Vpt Vcc Pm arMeasurementStatus (arStatus)

Access	Read only
Description	This attribute indicates the Availability Ratio (AR) measurement status of the connection. The value ***inactive*** indicates the test is inactive. The value ***activating*** indicates the test is activating. The value ***active*** indicates the test is in progress The value ***activationFailed*** indicates the test failed to be activated. Refer to the *failureCause* attribute for the failure cause.
Mib	AtmCore
Values	inactive activating active activationFailed
Default	inactive

ATTRIBUTE Atmlf Vpt Vcc Pm failureCause (cause)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the failure cause of Performance Monitoring (PM) measurements. The following are possible causes: The value ***noError*** indicates no error. The value ***unknownCause*** indicates unknown failure cause. The value ***softwareResourcesUnavailable*** indicates software resources reserved for a maximum of 255 active PMs on the local FP card have been used up. The value ***hardwareResourcesUnavailable*** indicates hardware resources reserved for a maximum of 512 active PMs CLR card have been used up on the Link Side local card. The value ***remoteEndNoResponse*** indicates no response from remote end during activation. The value ***activationCollision*** indicates activation collision was detected. Usually this is caused by both ends of the connection being provisioned to request PM. Only one end should be so provisioned. The value ***remoteEndRejectedActivation*** indicates the remote end has rejected an activation request. Usually this is due to the remote end reaching a resource limit. The value ***pcrUnsupported*** indicates the Tx or Rx PCR is out of range. The PCR value must be between 0 and 409601. The value ***nextHopConnectionUnsupported*** indicates the next hop card type or connection type do not allow access to the necessary hardware to support PM measurements. The value ***upcNotDisabled*** indicates UPC is not disabled on the local next hop card for this connection. PM measurements are not supported when UPC is either enforced or monitored.
Mib	AtmCore

Default	noError

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Vpt Vcc Pm clrEnhancementStatus (enhanced)

Access	Read only
Description	This attribute indicates an enhanced mode of operation for Cell Loss Ratio (CLR) measurements by including cell discards from the remote segment end point which are not covered by the performance measurement (PM) cell. The value ***inactive*** indicates that CLR enhanced mode of operation has not been activated. The value ***active*** indicates that discards at the remote segment end point are being included in CLR measurements. The value ***remoteEndNotProvidingStatistics*** indicates that the remote end is not replying to proprietary requests for additional discard counts. This occurs when the remote end does not have the software necessary to recognize these requests.
Mib	AtmCore
Values	inactive active remoteEndNotProvidingStatistics
Default	inactive

GROUP Atmlf Vpt Vcc Pm FwdClrMeasurements (FwdClr)

Properties	Operational
Description	This group contains Cell Loss Ratio (CLR) measurements for the forward direction of the connection. The local end is always the provisioned end which sends the activation request, and the remote end is the end which receives the activation request.
Mib	AtmCore

COMPONENT AtmIf **EmissionPriority (Ep)**

Instance	Decimal (2..7)
Groups	GROUP AtmIf Ep Provisioned (Prov)
Scope	Device
Description	*AtmIf/n EmissionPriority/n* This component controls the characteristics of an emission priority for an *AtmIf* component. This component is optional for an *AtmIf* component. For ***3pOC3MmAtm***, ***3pOC3SmAtm***, ***3pE3Atm***, ***3pDS3Atm***, ***3pE1Atm***, ***3pDS1Atm***, ***8pE1Atm***, ***8pDS1Atm***, ***2pJ6MAtm***, and ***1pOC48ChSmIrAtm*** cards, this component is not permitted. There are eight emission priorities (EP). EP 0 is the highest priority and EP 7 is the lowest priority. Normally, link bandwidth is allocated in strict precedence of emission priority. All traffic at EP 0 is transmitted on the link first. Then, when there is an unused cell opportunity, a cell from EP 1 is transmitted. When EP 0 and 1 have nothing to send, then EP 2 gets the transmit cell opportunities. Each emission priority 2 through 7 has a corresponding *Ep* component with instance number 2 through 7. Emission priorities 0 and 1 do not have corresponding *Ep* components since there is no configuration which is relevant for those EPs. Traffic is associated with an EP in the following way. Each *Vcc* or *Vpc* has an associated *atmServiceCategory*. Under the *AtmIf* component there is a service category component which provides default characteristics for that service category. For example, *AtmIf*/n *CA Cbr*/0 defines the default characteristics for connections of the CBR service category. Each service category has an *emissionPriority* (*ep*) attribute, for example *AtmIf*/n *CA Cbr*/0 *ep*. The value provisioned in that *ep* attribute maps to the corresponding *Ep* component. If the value of the *AtmIf*/n *CA Cbr*/0 *ep* attribute is ***2***, the CBR service category is associated with *AtmIf*/n *Ep*/2. EP 0 and EP 1 are in the absolute priority range. Traffic in the absolute priority range always gets first choice for a transmit cell opportunity. EP 2

Copyright © 2006, Nortel Nortel Confidential

through EP 7 are in the guaranteed bandwidth range. Traffic at EP 3 through EP 7, in the guaranteed bandwidth range, may achieve a priority which is different from the strict hierarchical priority, if a minimum bandwidth guarantee is provisioned for the *Ep*.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, EPs 5 and 6 are not supported.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, EP 0 and EP 1 are in the absolute priority range while EP 2 through EP 7 are allocated link bandwidth using a conventional Weighted Fair Queue (WFQ) discipline. EP 2 through EP 7 have their service preference over one another determined by their minimum bandwidth guarantee. Link bandwidth is first allocated to EP 0 and EP 1 in absolute priority fashion. Any remaining bandwidth is distributed to EP 2 through EP 7 in proportion to the minimum bandwidth guarantee provisioned for the *Ep*. The default values of the *minimumBandwidthGuarantee* attribute for the *Ep* components emulate the strict precedence of emission priority.

DELete

GROUP AtmIf Ep Provisioned (Prov)

Properties: Provisioned

Description: This group contains provisioned attributes which specify the behavior of an emission priority for the ATM interface.

Mib: AtmCore

ATTRIBUTE AtmIf Ep minimumBandwidthGuarantee (minBw)

Access: Read and write

Criticality: Process

Description: This attribute specifies the minimum bandwidth guarantee associated with this *EmissionPriority.* A minimum bandwidth guarantee is designed to prevent starvation of traffic at this EP by traffic at higher EPs. Minimum bandwidth guarantees only operate for EPs within the guaranteed bandwidth range 2 through 7.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmIrAtm*** cards, EPs 5 and 6 are not supported.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***,

Copyright © 2006, Nortel Nortel Confidential

3pDS3Atm2, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, ***1pOC12SmLrAtm***, ***4pOC12SmlrAtm***, ***4pOC12SmLrAtm***, and ***16pOC3SmlrAtm*** cards, the following description applies:

The minimum bandwidth guarantee specified is a percentage of the bandwidth which remains after all traffic at EP 0 and EP 1 is served. For example, if EP 0 and EP 1 traffic consumes 20% of the link bandwidth, the minimum bandwidth guarantee applies to the remaining 80% of the link bandwidth. A minimum bandwidth guarantee of 2% would actually result in this EP getting 2% of 80% for a total 1.6% of the link bandwidth. If this EP uses less than this link bandwidth, the extra opportunities are allocated to the other EPs in priority. Due to scheduling and cell arrival times, traffic at this EP may not necessarily achieve full utilization of its minimum bandwidth guarantee.

The value ***priority*** specifies that this *Ep* gets bandwidth based solely on the hierarchy of emission priorities. In this case, there is no minimum bandwidth guarantee.

For ***16pOC3PosAtm*** and ***4pMRPosAtm*** cards, the following description applies:

The minimum bandwidth guarantee specified is the proportion of the bandwidth which remains after all traffic at EP 0 and EP 1 is served. In other words, the bandwidth allocated to an EP is:
(bandwidth unused by EP 0 and 1) * *minimumBandwidthGuarantee*
(the sum of the values of the *minimumBandwidthGuarantee* attributes for all active EPs*)*

For example, if EP 0 and EP 1 traffic consumes 20% of the link bandwidth, the minimum bandwidth guarantee applies to the remaining 80% of the link bandwidth. Assume *Ep/2*, *Ep/3*, and *Ep/4* have a *minimumBandwidthGuarantee* attribute value of ***70***, ***20***, and ***10*** respectively.

If all EPs are actively sending traffic, then the bandwidth is allocated as follows:
- EP 2 = 80% * 70/(70+20+10) = 56% of the link bandwidth
- EP 3 = 80% * 20/(70+20+10) = 16% of the link bandwidth
- EP 4 = 80% * 10/(70+20+10) = 8% of the link bandwidth

If some time later EP 3 has no traffic to send, then its share of the bandwidth is allocated to EP 2 and EP 4 in proportion to their *minimumBandwidthGuarantee* attribute values as follows:
- EP 2 = 80% * 70/(70+10) = 70% of the link bandwidth
- EP 4 = 80% * 10/(70+10) = 10% of the link bandwidth

If some time later only one out the EP 2, EP 3, and EP 4 has traffic to send, then it would be allocated the entire 80% of the link bandwidth. Additionally, if both EP 0, and EP 1 have no traffic to send, the remaining active EP would be allocated 100% of the link bandwidth irrespective of

Copyright © 2006, Nortel Nortel Confidential

the value of its *minimumBandwidthGuarantee* attribute.

The value ***priority*** emulates the strict precedence of emission priority by assigning default values to the *minimumBandwidthGuarantee* attribute. Depending on how many EPs are in use in the guaranteed bandwidth range 2 through 7, these default values change:
- For one EP, the value is ***100***.
- For two EPs, the values are ***99***, and ***1***.
- For three EPs, the values are ***90***, ***9***, and ***1***.
- For four EPs, the values are ***77***, ***18***, ***4***, and ***1***.

For all cards, when specifying a value for the *minimumBandwidthGuarantee* attribute, consider the effect on cell delay variation (CDV) of traffic which would normally be of higher priority. For example, if *RtVbr* service category traffic is assigned to *Ep*/2 and *Ubr* traffic is assigned on *Ep*/7 where *Ep*/7 has a *minimumBandwidthGuarantee* of ***25***, there can be a large impact on the CDV of the *RtVbr* traffic. Traffic of the *Cbr* or *RtVbr* service category which is sensitive to CDV, and is of known volume, can be assigned on EP 0 or EP 1 which are independent of the effects of minimum bandwidth guarantee.

For ***2pOC3MmAtm2***, ***2pOC3SmAtm2***, ***2pSTM1eAtm***, ***2pSTM1eCh***, ***2pSTM1Ch***, ***4pOC3MmAtm***, ***4pOC3SmIrAtm***, ***4pDS3ChAtm***, ***3pDS3Atm2***, ***3pE3Atm2***, ***12pDS3Atm***, ***12pE3Atm***, MSA32, and ***1pOC12SmLrAtm*** cards, the allowed values of this attribute are ***priority***, or a numeric value between ***1*** and ***48***.

For ***4pOC12SmIrAtm***, ***4pOC12SmLrAtm***, ***16pOC3SmIrAtm***, ***16pOC3PosAtm,*** and ***4pMRPosAtm*** cards, the allowed values of this attribute are ***priority***, or a numeric value between ***1*** and ***100***.

For all cards, the sum of the values of the *minimumBandwidthGuarantee* attribute for all *Ep*s under an *AtmIf* component must not exceed 100%.

ATTRIBUTE AtmIf Pm controlMode (mode)

Access	Read and write
Criticality	Component
Description	This attribute specifies the default control mode of Performance Monitoring (PM) measurements for all *AtmIf Vcc* and *AtmIf Vpc* connections on the ATM interface. ***autoStart*** means Performance Monitoring (PM) measurements start when the provisioned data is activated. ***onDemand*** means PM measurements start when the operator issues the *Start* command. The PM measurements in this mode continue until the operator issues the *Stop* command.
Mib	AtmCore
Values	autoStart (auto) onDemand (onDemand)
Default	autoStart

ATTRIBUTE AtmIf Pm switchSideClrType (clrType)

Access	Read and write
Description	This attribute specifies how the Cell Loss Ratio (CLR) Performance Monitoring (PM) is measured on a switch side configuration for all *AtmIf Vcc* and *AtmIf Vpc* connections on the ATM interface. ***complete*** indicates that egress discards at the segment end points are included in the CLR measurement as per ITU standards. ***partial*** indicates that egress discards do not contribute to the CLR measurement.
Mib	AtmCore
Values	complete partial
Default	complete

COMPONENT AtmIf LinkTxUtilization (Ltu)

Groups	GROUP AtmIf Ltu Provisioned (Prov) GROUP AtmIf Ltu Operational (Oper)
Scope	Device
Description	*AtmIf/n LinkTxUtilization* This component allows the users to specify whether alarms should be

Copyright © 2006, Nortel Nortel Confidential

generated when the ATM link transmit utilization exceeds provisioned threshold *criticalTxUtilAlarmThreshold*.

The ATM link transmit utilization is calculated once per minute over the preceding one minute interval. The decision to set or clear an alarm is made at every sample period except the first 2 minutes right after the measurement starts.

When three consecutive measurements of the ATM link transmit utilization are above the provisioned threshold, a SET alarm is generated if there is no outstanding SET alarm.

When three consecutive measurements of the ATM link transmit utilization are at or below the provisioned threshold, and there is an outstanding SET alarm, a CLEAR alarm is generated.

GROUP Atmlf Ltu Provisioned (Prov)

Properties Provisioned

Description This group contains provisioned attributes to control ATM link transmit utilization alarms.

Mib AtmCore

ATTRIBUTE Atmlf Ltu criticalTxUtilAlarmThreshold (critThresh)

Access Read and write

Description This attribute specifies the critical alarm threshold for the ATM link transmit utilization.

A value of ***disabled*** means the ATM link transmit utilization is not measured and no alarms are generated.

A change from ***disabled*** to a numeric value resets the value of the *lastAlarmPeakTxUtilization* attribute to zero and starts the ATM link transmit utilization measurement.

When three consecutive samples of the ATM link transmit utilization, over the 3-minute sliding window, are above the provisioned threshold and there is no outstanding alarm, a critical alarm is generated. While the alarm is outstanding, the value of the *lastAlarmPeakTxUtilization* attribute indicates the peak sample of the ATM link transmit utilization.

Copyright © 2006, Nortel Nortel Confidential

When three consecutive samples of the ATM link transmit utilization, over the 3-minute sliding window, are at or below the provisioned threshold, any outstanding alarm is cleared. The value of the *lastAlarmPeakTxUtilization* attribute is not reset when the alarm is cleared.

A change from one numeric value to another restarts the ATM link transmit utilization measurement with a new 3-minute probation period. The value of the *lastAlarmPeakTxUtilization* attribute is not affected by this change.

A change from a numeric value to ***disabled*** causes any outstanding alarm to be cleared immediately. The value of the *lastAlarmPeakTxUtilization* attribute is not affected by this change.

ATTRIBUTE AtmIf Aini Sig addressConversion

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.
Mib	AtmAini

Copyright © 2006, Nortel Nortel Confidential

Values	none nativeE164 nsap
Default	none

ATTRIBUTE Atmlf Aini Sig **operatingMode**

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	AtmAini
Values	normal provisionedOnly
Default	normal

GROUP Atmlf Aini Sig **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmAini

ATTRIBUTE Atmlf Aini Sig **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmAini
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE AtmIf Aini Sig operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmAini
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE AtmIf Aini Sig usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmAini
Values	idle active (activ) busy
Default	idle

Description	This attribute specifies the type of traffic management which is applied to both the transmit and receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.
Mib	AtmAini
Values	3 6 7 8
Default	6
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Aini Sig Vcd atmServiceCategory (service)

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections. The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.
Mib	AtmAini
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr)
Default	rtVariableBitRate
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Aini Sig Vcd** **weight**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT. When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.
Mib	AtmAini
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Aini Sig Vcd** **qosClass (qos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).

Copyright © 2006, Nortel Nortel Confidential

Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).

Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values	0 1 2 3 4
Default	2
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf Aini Sig Vcd trafficShaping (trShaping)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components. When ***disabled*** is selected, traffic shaping for this connection is disabled.
Mib	AtmAini
Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE AtmIf Aini Sig Vcd unshapedTransmitQueueing (unshap)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmAini
Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Aini Sig Vcd** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE **AtmIf Aini Sig Vcd trafficDescParm (tdp)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2. When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2. When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to

Copyright © 2006, Nortel Nortel Confidential

0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

COMPONENT Atmlf Aini Address (Addr)

Instance	address [String (1..40, ASCII)] addressType [primary alternate default]
Groups	GROUP Atmlf Aini Addr Operational (Oper)
Scope	Device
Description	*AtmIf/n Aini Address/address,type* *AtmIf/n Iisp Address/address,type* *AtmIf/n Uni Address/address,type* *AtmIf/n Pnni Address/address,type* *AtmIf/n Vpt/m Aini Address/address,type* *AtmIf/n Vpt/m Iisp Address/address,type* *AtmIf/n Vpt/m Uni Address/address,type* *AtmIf/n Vpt/m Pnni Address/address,type*

This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wildcard ('?'), and a type. The type identifies whether the *Address* component is for

Copyright © 2006, Nortel Nortel Confidential

a ***primary***, ***alternate***, ***registered***, or ***default*** address.

The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses.Virtual interfaces do not have addresses of
type ***default***.

The wildcard is only valid for provisioned addresses. If the address is a single wildcard, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wildcard static address, then the choice is driven through a round robin algorithm.

The round robin algorithm tries the primary routes and then the alternate routes if none of the primary routes succeed.
If this node participates in a PNNI hierarchy, then a *PnniInfo* subcomponent can be provisioned under the *AtmAddress* component to specify the level to which this address will be advertised.

COMPONENT AtmIf Aini PathTraceFilter (Ptf)

Groups	GROUP AtmIf Aini Ptf Criteria GROUP AtmIf Aini Ptf Operational (Oper) GROUP AtmIf Aini Ptf RecordControl (Record)
Scope	Device
Description	*AtmIf/n Aini PathTraceFilter* *AtmIf/n Iisp PathTraceFilter* *AtmIf/n Uni PathTraceFilter* *AtmIf/n Pnni PathTraceFilter* *AtmIf/n Vpt/vpi Aini PathTraceFilter* *AtmIf/n Vpt/vpi Iisp PathTraceFilter* *AtmIf/n Vpt/vpi Uni PathTraceFilter* *AtmIf/n Vpt/vpi Pnni PathTraceFilter* This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced. When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop,* and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When *AtmPathTraceFilter* component is deleted, all records are cleared. Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted. The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

Description	This attribute specifies the service categories, which is compared against the connection setup request. When the all criteria in the filter match successfully, the call is traced.
Mib	AtmAini
Set of	cbr rtVbr nrtVbr ubr
Default	(cbr, rtVbr, nrtVbr, ubr)

GROUP Atmlf Aini Ptf **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the *PathTraceFilter* component.
Mib	AtmAini

ATTRIBUTE Atmlf Aini Ptf **state**

Access	Read: All Write: Illegal
Description	This attribute indicates the current state of the filter. ***active***: Indicates the filter is active. ***inactive:*** Indicates the filter is inactive. The records are available if the filter is stopped by the user using the *Stop* verb or if the filter has timed out.
Mib	AtmAini
Values	active inactive
Default	inactive

ATTRIBUTE Atmlf Aini Ptf **recordCount**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of records that have been acquired so far for this filter. The maximum number of records that can be stored is specified by *Lp/n Eng PathTrace maxTraceRecords* or *AtmPathTraceFilter maxTraceRecords,* which ever is less.
Mib	AtmAini
Values	Decimal (0..200)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Aini Ptf **matchedConnections**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of connections that match the criteria of this filter.
Mib	AtmAini
Values	Decimal (0..2147483647)
Default	No default

ATTRIBUTE Atmlf Aini Ptf **elapsedTime**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes that have elapsed since the start of the filter.
Mib	AtmAini
Values	Decimal (0..70560)
Units	minutes
Default	No default

ATTRIBUTE Atmlf Aini Ptf **timeRemaining**

Access	Read: All Write: Illegal
Description	This attribute indicates the number of minutes remaining before the filter terminates itself.
Mib	AtmAini
Values	Decimal (0..70560)
Units	minutes
Default	No default

GROUP Atmlf Aini Ptf **RecordControl (Record)**

Properties	Operational
Description	This group contains the operational attributes for the record control of the *PathTraceFilter* component.
Mib	AtmAini

ATTRIBUTE Atmlf Aini Ptf **traceTimeout**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Description	This attribute specifies how long this filter remains active. At the end of this time, the filter is stopped and all trace records associated with this filter are available.
Mib	AtmAini
Values	Decimal (1..70560)
Units	minutes
Default	60

ATTRIBUTE AtmIf Aini Ptf **maxTraceRecords (mRecords)**

Access	Read: All Write: All
Description	This attribute specifies the maximum number of records allowed to be stored with the filter. Once the maximum has been reached, the oldest record is removed.
Mib	AtmAini
Values	Decimal (1..200)
Default	2

COMPONENT AtmIf Aini Ptf **PathTraceRecord (PTRecord)**

GROUP Atmlf Aini Ptf PTRecord **Operational (Oper)**

Properties	Operational
Description	This group contains the operational attributes for the path trace record component.
Mib	AtmAini

ATTRIBUTE Atmlf Aini Ptf PTRecord **status**

Access	Read: All Write: Illegal
Description	This attribute indicates the status of the trace. The string is one of the following: ***Completed normally****:* The trace completed normally. ***Incomplete****:* Partial trace returned. ***Exceeded information element length limitations****:* The number of traced nodes exceeded the maximum number of hops. ***Exceeded message length limitations****:* The message length exceeded the maximum allowed size.
Mib	AtmAini
Values	Completed normally Incomplete Exceeded information element length limitations Exceeded message length limitations
Default	No default

ATTRIBUTE Atmlf Aini Ptf PTRecord **timeStamp**

Access	Read: All Write: Illegal
Description	This attribute records the date and time of when the trace is completed.
Mib	AtmAini
Values	Time (DHMS)
Default	No default

ATTRIBUTE Atmlf Aini Ptf PTRecord **srcPortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the trace's source port identifier used for this connection. This attribute only appears in the trace result for the trace source hop.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmAini
Values	Decimal (1..4294967295)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord **srcPortName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the name of the source port used for this connection. This attribute only appears in the trace result for the trace source hop.
Mib	AtmAini
Values	String (40, ASCII)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord **causeCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the cause code in the transmitted signaling message that contains the CAUSE information element. The cause code is used to describe the reason for generating certain signaling messages.
Mib	AtmAini
Values	Decimal (0..255)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord **diagCode**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute contains the diagnostic code in the transmitted signaling message. The diagnostic code is contained in the CAUSE information element and identifies an information element type or timer type. The diagnostic code is present only if a procedural error is detected by the signaling protocol. A diagnostic code is always accompanied by the cause code. If there is no failure, this attribute is set to NULL.
Mib	AtmAini
Values	String (0..8, ASCII)
Default	No default

	The end point reference is included in the trace when the *traceInfo* attribute sets the ***callRef*** value and the connection is point-to-multipoint.
Mib	AtmAini
Values	Hex (H.0..H.ffff)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord Hop **nodeId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the lowest level node ID traversed for this hop.
Mib	AtmAini
Values	String (22, Hex)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord Hop **nodeName**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the *nodeName* under the *ModuleData* component for this hop. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmAini
Values	String (12, ASCII)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord Hop **portId**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port identifier value for this hop on the egress side. This is the egress side with respect to the trace or setup messages.
Mib	AtmAini
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord Hop **portName**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the port name for this hop on the egress side. This is the egress side with respect to the trace or setup messages. The Nortel Networks Multiservice Switch provides this information by including it in the vendor-specific information group.
Mib	AtmAini
Values	String (55, ASCII)
Default	No default

ATTRIBUTE AtmIf Aini Ptf PTRecord Hop **pnniTraceContRefusalIndPresent (refusal)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Trace Continuation Refusal” indicator is present. The “PNNI Trace Continuation Refusal” indicator indicates that this hop has refused to participate in the trace.
Mib	AtmAini
Values	absent present
Default	absent

ATTRIBUTE AtmIf Aini Ptf PTRecord Hop **crankbackDestNodeIndPresent (dest)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Received at the Trace Destination Node” indicator is present. The “PNNI Crankback Received at Trace Destination Node” indicator indicates that this hop is acting as a trace destination node, receiving a crankback for this call from a non-PNNI interface.
Mib	AtmAini
Values	absent present
Default	absent

ATTRIBUTE AtmIf Aini Ptf PTRecord Hop **pnniCrankbackGapIndPresent (gap)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates whether the “PNNI Crankback Gap” indicator is present. The “PNNI Crankback Gap” indicator indicates that the call experienced a crankback, where no Trace Transit List IE was returned by the node initiating the crankback.
Mib	AtmAini
Values	absent present
Default	absent

ATTRIBUTE **AtmIf Aini Ptf PTRecord Hop** **crankBackCause (cause)**

Access	Read: All Write: Illegal
Criticality	Component
Description	This attribute indicates the crankback cause. Please refer to Private-Network-to-Network-Interface Specification Version 1.0 for more information. This attribute is present when the *traceInfo* attribute sets the ***crankBack*** value and the connection has initiated the crankback procedure.
Mib	AtmAini
Values	Decimal (0..1000)
Default	No default

ATTRIBUTE **AtmIf Aini Ptf PTRecord Hop** **blockedTransitType (type)**

Access	Read: All Write: Illegal

ATTRIBUTE Atmlf Aini Ptt **txTrafficDescType (txTdt)**

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management applied to the transmit direction, as defined by the ATM Forum. The *txTrafficDescType* determines the number and meaning of the parameters in the *txTrafficDescParm* attribute.
Mib	AtmAini
Values	1 2 3 4 5 6 7 8 9
Default	1

ATTRIBUTE Atmlf Aini Ptt **rxTrafficDescType (rxTdt)**

Access	Read: All Write: All
Description	This attribute specifies the type of traffic management, which is applied to the receive direction of this connection, as defined in the ATM Forum. The *rxTrafficDescType* determines the number and meaning of the parameters in the *rxTrafficDescParm* attribute When ***sameAsTx*** is selected, the *rxTrafficDescType* and the *rxTrafficDescParm* are taken from the transmit values.
Mib	AtmAini
Values	1 2 3 4 5 6 7 8 9 sameAsTx
Default	sameAsTx

ATTRIBUTE Atmlf Aini Ptt **atmServiceCategory (service)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications. The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS. The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.
Mib	AtmAini
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr) derivedFromBBC (derived)
Default	unspecifiedBitRate

ATTRIBUTE **Atmlf Aini Ptt** **fwdQosClass (fwdQos)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the quality of service for the forward direction for this connection. Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video). Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video). Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer). Class ***4*** supports a QOS that will meet Service Class D performance requirements (connection-less data transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.
Mib	AtmAini
Values	0 1 2 3 4
Default	0

ATTRIBUTE **Atmlf Aini Ptt** **bwdQosClass (bwdQos)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the quality of service for the backward direction for this connection. Class ***1*** supports a QOS that will meet Service Class A performance requirements (circuit emulation, constant bit rate video). Class ***2*** supports a QOS that will meet Service Class B performance requirements (variable bit rate audio and video). Class ***3*** supports a QOS that will meet Service Class C performance requirements (connection-oriented data transfer). Class ***4*** supports a QOS that will meet Service Class D performance requirements (connection-less data transfer).

Copyright © 2006, Nortel Nortel Confidential

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

The ***sameAsFwd*** selection sets the backward quality of service to be the same as the forward quality of service.

ATTRIBUTE Atmlf Aini Ptt bearerClassBbc (bcBbc)

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting

Copyright © 2006, Nortel
Nortel Confidential

an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

a
c
x
derivedFromServiceCategory

Default: derivedFromServiceCategory

ATTRIBUTE AtmIf Aini Ptt transferCapabilityBbc (tcBbc)

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

NotApplicable specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data.

The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing.

The value ***yes*** for end-to-end timing indicates that end-to-end timing is required.

The value ***no*** for end-to-end timing indicates that end-to-end timing is not required.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to

Copyright © 2006, Nortel
Nortel Confidential

derivedFromServiceCategory or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Atmlf Aini Ptt **clippingBbc (cBbc)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the value for the clipping susceptibility parameter in the BBC IE. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes.

Clipping is an impairment where the first fraction of a second of information to be transferred is lost. It occurs after a call is answered and before an associated connection is switched through.

Mib: AtmAini

Values:
no
yes

Default: no

ATTRIBUTE Atmlf Aini Ptt **bestEffort**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor IE. It is one of the Broadband Bearer Capability attributes.

The value ***indicated*** implies that the quality of service for this connection is not guaranteed.

The value ***notIndicated*** implies that the quality of service for this connection is guaranteed.

Copyright © 2006, Nortel Nortel Confidential

	The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection, is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Values	String (0..32, ASCII)
Default	No default

ATTRIBUTE Atmlf Aini Ptt **bwdQosParameters (bqp)**

Access	Read and write
Description	This attribute is a vector of three elements that specify the quality of service parameters for the backward direction for this connection. This attribute is used for SPVC connections. The ***cdv*** element specifies the acceptable peak-to-peak cell delay variation (CDV) of real-time connections (CBR and rt-VBR). It is signaled through the extended QoS information element. The ***ctd*** specifies the acceptable maximum cell transfer delay (maxCtd) of real-time connections (CBR and rt-VBR). It is signaled through the end-to-end transit delay information element. The ***clr*** specifies the acceptable cell loss ratio (CLR) of CBR, rt-VBR, and nrt-VBR connections. It is signaled through the extended QoS information element.

ATTRIBUTE **AtmIf Aini Ptt** **txTrafficDescParm (txTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR.

Copyright © 2006, Nortel Nortel Confidential

Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if

Copyright © 2006, Nortel Nortel Confidential

there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

Vector of	Decimal (0..2147483647)
Index	Decimal (1..5)
Default	([5] 0)

ATTRIBUTE **AtmIf Aini Ptt** **rxTrafficDescParm (rxTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC). When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2. When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be

Copyright © 2006, Nortel
Nortel Confidential

greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

VERB OPTIMIZE Atmlf Aini Reroute

Impact	Service
Description	*Optimize [-all] AtmIf/n Uni Reroute* *Optimize [-all] AtmIf/n Aini Reroute* *Optimize [-all] AtmIf/n Iisp Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Uni Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Aini Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Iisp Reroute* This command triggers path optimization for the connection segments managed by the Reroute component. By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the localOptimalMetricValue attribute under the RerouteInfo component for the connection. The -all option causes all connection segments subscribed to path optimization to be considered. Using the Optimize command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP AtmIf Aini Reroute Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.
Mib	AtmAini

ATTRIBUTE AtmIf Aini Reroute Ov protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.

Copyright © 2006, Nortel Nortel Confidential

globalOnly: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

ebrOnly
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE Atmlf Aini Reroute Ov **numOptAttempts**

Access: Read and write

Description: This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

GROUP Atmlf Pnni Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the Pnni component.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni softPvpAndPvcRetryPeriod

Access	Read: All Write: All
Description	This attribute represents the time in seconds to wait between soft PVP or soft PVC call setup retries. Due to the group timer implementation, it can take from 100% to 150% of the provisioned timer value for the retry to be triggered.
Mib	AtmPnni
Values	Decimal (20..999999)
Units	seconds
Default	60

ATTRIBUTE Atmlf Pnni softPvpAndPvcHoldOffTime (sHoldOffTime)

Access	Read: All Write: All
Description	This attribute specifies how long to hold off retries following the release of a connection. Due to the way group timers are implemented, it can take

Copyright © 2006, Nortel Nortel Confidential

	from 100% to 150% of the provisioned timer to trigger the desired action. Since SPVC retries are paced, in cases where there are many connections, the entire process can take more than 150% of the provisioned timer value.
Mib	AtmPnni
Values	Decimal (0; 50..20000)
Units	msec
Default	0

GROUP Atmlf Pnni AdminWeights

Properties	Provisioned
Description	This group contains the provisionable administrative weights for the *Pnni* component. These weights will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni cbrWeight (cbrWt)

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Constant Bit Rate (CBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)
Default	5040

ATTRIBUTE Atmlf Pnni rtVbrWeight (rtVbrWt)

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Real-Time Variable Bit Rate (RT-VBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)

Copyright © 2006, Nortel Nortel Confidential

Default	5040

ATTRIBUTE Atmlf Pnni nrtVbrWeight (nrtVbrWt)

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Non Real-Time Variable Bit Rate (NRT-VBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)
Default	5040

ATTRIBUTE Atmlf Pnni ubrWeight (ubrWt)

Access	Read: All Write: All
Description	This attribute specifies the administrative weight assigned for setting up switched calls with a service category of Unspecified Bit Rate (UBR) for this PNNI interface. The value specified will be used by Generic Connection Admission Control (GCAC) if administrative weight is the selected optimization criterion; the higher the value, the less desirable the link will be in path selection.
Mib	AtmPnni
Values	Decimal (1..16777215)
Default	5040

GROUP Atmlf Pnni AccountingOptions (AcctOpt)

Properties	Provisioned
Description	This group contains the provisionable attributes for accounting.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni accountCollection (aco)

Access	Read: All Write: All
Description	This attribute is used to turn accounting on or off for SVC and SPVC connections. It also specifies the reason(s) for which accounting data is collected: ***billing***, ***test***, ***study***, ***audit***, or ***force***. If the set of reasons is not empty then accounting records will be generated by this interface in the following situations:

Copyright © 2006, Nortel Nortel Confidential

- on a TODA changeover if TODA is enabled;
- every 12 hours (per connection) if TODA is disabled;
- on every call clear (a call record with final cell counts).

If none of the reasons is present, then accounting will be suppressed.

The reason for collection is recorded in the accounting record, in the attribute *callingCollectReason* or *calledCollectReason* as appropriate.

Mib: AtmPnni

Set of:
bill
test
study
audit
force

Default: No default

ATTRIBUTE Atmlf Pnni accountConnectionType (act)

Access:
Read: All
Write: All

Description: This attribute specifies whether accounting records generated by this interface should be marked as originating, terminating or intermediate. This attribute, in combination with the direction of the call, determines the value of attribute *connPointType* of the accounting record and may be used by downstream accounting processes to correlate the records.

If the value is ***origTerm*** then records generated for incoming calls will be marked as ***originating*** and records generated for outgoing calls will be marked as ***terminating***.

If the value is ***intermediate*** then records generated for all calls will be marked as ***intermediate***.

Mib: AtmPnni

Values:
origTerm
intermediate

Default: intermediate

ATTRIBUTE Atmlf Pnni accountClass (acl)

Access:
Read: All
Write: All

Description: This attribute specifies the accounting class associated with the interface. Its meaning is determined by the network operator.

Its value is simply recorded in the accounting records generated by this

Copyright © 2006, Nortel Nortel Confidential

	interface, in the attribute *callingServiceType* or *calledServiceType* as appropriate.
Mib	AtmPnni
Values	Decimal (0..255)
Default	0

ATTRIBUTE Atmlf Pnni serviceExchange (sre)

Access	Read: All Write: All
Description	This attribute specifies the data service exchange associated with this interface. Its meaning is determined by the network operator. Its value is simply recorded in the accounting records generated by this interface, in the attribute *callingDse* or *calledDse* as appropriate.
Mib	AtmPnni
Values	Decimal (0..255)
Default	0

GROUP Atmlf Pnni Operational

Properties	Operational
Description	This group contains the operational attributes for a *Pnni* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni portId

Access	Read: All Write: Illegal
Description	This attribute indicates the port id of the PNNI interface, which is the parent *AtmIf*'s instance number.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

GROUP Atmlf Pnni Threshold

Properties	Provisioned
Description	This group contains the provisionable attributes for the change threshold for the *Atmif Pnni* component.
Mib	AtmPnni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Pnni avcrMt

Access	Read: All Write: All
Description	This attribute, multiplied by the Maximum Cell Rate, specifies the minimum threshold used in the algorithms that determine significant change for average cell rate parameters for this interface. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrMt*.
Mib	AtmPnni
Values	Decimal (1..99) sameAsPnni
Units	%
Default	sameAsPnni

ATTRIBUTE Atmlf Pnni avcrPm

Access	Read: All Write: All
Description	This attribute multiplied by the current Available Cell Rate (AvCr) specifies the threshold used in the algorithms that determine significant change for AvCR parameters for this interface. If the resulting threshold is lower than the AvCr, the minimum threshold (*Atmif pnni avcrMt*) is used. Increasing the value of the attribute increases the range of insignificance and reduces the amount of PTSP flooding due to changes in resource availability. If the value of this attribute is ***sameAsPnni***, then the actual value is taken from *ARtg Pnni avcrPm*.
Mib	AtmPnni
Values	Decimal (1..99) sameAsPnni
Units	%
Default	sameAsPnni

GROUP Atmlf Pnni TraceProv (Trace)

Properties	Provisioned
Description	This group contains the provisionable trace attributes for the Pnni component.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni traceDestination (tDst)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies if this node is a trace destination. A PNNI interface may be a trace destination interface. By default, it's not. If an operator wants to trace only until this PNNI interface, this interface can be set to trace destination by setting this attribute.
Mib	AtmPnni
Values	no yes
Default	no

GROUP AtmIf Pnni LrbgProv (Lrbg)

Properties	Provisioned
Description	This group contains the provisionable attributes for the Pnni component.
Mib	AtmPnni

ATTRIBUTE AtmIf Pnni loadReBalancingGroupLink (lrbgLink)

Access	Read: All Write: Illegal
Description	This attribute indicates the Artg Pnni Lrbg Link component associated with this particular Atmif Pnni component.
Mib	AtmPnni
Values	Link
Default	No default

Properties	Provisioned
Description	This attribute group contains the provisionable attributes for the *Signalling* component.
Mib	AtmPnni

ATTRIBUTE AtmIf Pnni Sig vci

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the signaling channel number.
Mib	AtmPnni
Values	Decimal (0..65535)
Default	5

ATTRIBUTE AtmIf Pnni Sig addressConversion

Access	Read: All Write: All
Description	This attribute specifies the address conversion on the outgoing signaling PDUs. The options are ***none***, ***nativeE164***, or ***nsap***. The ***none*** option is the default and if this option is chosen then nothing is done to the address information element (IE) in the outgoing signaling message. If ***nativeE164*** option is chosen, then only NSAP encapsulated E.164 addresses with zeros in the ESI are converted to native E.164 format in the outgoing signaling message. If the NSAP address is not encapsulated E.164 or the ESI field is not zeros and the ***nativeE164*** option is chosen, then the call is cleared. If the ***nsap*** option is chosen, then native E.164 addresses are converted to NSAP E.164 with zeros in the ESI field; otherwise the address is in NSAP format and is not changed.
Mib	AtmPnni

Copyright © 2006, Nortel Nortel Confidential

Values	none nativeE164 nsap
Default	none

ATTRIBUTE Atmlf Pnni Sig operatingMode

Access	Read: All Write: All
Description	This attribute specifies the operating mode of the signaling channel ***provisionedOnly*** indicates that only SPVCs and SPVPs are supported on the interface and SVCs are not supported. This value is permitted only on UNI interfaces. ***normal*** indicates that SVCs, SPVCs, and SPVPs are supported on the interface.
Mib	AtmPnni
Values	normal provisionedOnly
Default	normal

GROUP Atmlf Pnni Sig OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni Sig adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — AtmPnni

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Atmlf Pnni Sig operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — AtmPnni

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Atmlf Pnni Sig usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — AtmPnni

Values — idle
active (activ)
busy

Default — idle

Default: 6

Flags: HCA_SUPPORT

ATTRIBUTE Atmlf Pnni Sig Vcd atmServiceCategory (service)

Copyright © 2006, Nortel
Nortel Confidential

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections. The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.
Mib	AtmPnni
Values	unspecifiedBitRate (ubr) constantBitRate (cbr) rtVariableBitRate (rtvbr) nrtVariableBitRate (nrtvbr)
Default	rtVariableBitRate
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Pnni Sig Vcd** **weight**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT. When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.
Mib	AtmPnni
Values	Decimal (1..4095) sameAsCa upToQueueLimit
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Pnni Sig Vcd** **qosClass (qos)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video).

Copyright © 2006, Nortel Nortel Confidential

Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video).

Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer).

Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer).

Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Default: 2

Flags: HCA_SUPPORT

ATTRIBUTE Atmlf Pnni Sig Vcd **trafficShaping (trShaping)**

Access: Read and write

Criticality: Component

Description: This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface.

When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components.

When ***disabled*** is selected, traffic shaping for this connection is disabled.

Mib: AtmPnni

Values:
disabled
sameAsCa

Default: disabled

Flags: HCA_SUPPORT

ATTRIBUTE Atmlf Pnni Sig Vcd **unshapedTransmitQueueing (unshap)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmPnni
Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Pnni Sig Vcd** **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used

Values	disabled sameAsCa
Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Pnni Sig Vcd **trafficDescParm (tdp)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled. When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2. When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2. When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to

Copyright © 2006, Nortel Nortel Confidential

0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

GROUP AtmIf Pnni Rcc Provisioned (Prov)

Properties	Provisioned
Description	This group contains the generic provisionable attributes of an *Rcc* component.
Mib	AtmPnni

ATTRIBUTE AtmIf Pnni Rcc vci

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the VCI for the Routing Control Channel (RCC). The value should not be changed from the default of 18 unless absolutely necessary. If a different VCI is specified, ensure that the RCC at the far end is provisioned to use the same VCI, otherwise the RCC will not come up.
Mib	AtmPnni
Values	Decimal (0..65535)
Default	18

ATTRIBUTE AtmIf Pnni Rcc aggregationToken

Access	Read: All Write: All
Description	This attribute specifies the aggregation token for this interface at the local end of the link. The aggregation tokens at both ends are use to form the *derivedAggregationToken* for the link. The aggregation token controls how links are aggregated together. Except for the lowest level nodes, links between two logical nodes are aggregated together if they have the same aggregation token. Link aggregation is not done at the lowest level node, except in the degenerate node situation, where the lowest level node is a neighbor to an LGN. The value is ignored for links having a type value of ***unknown*** or ***lowestLevelHorizLink***.
Mib	AtmPnni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

GROUP Atmlf Pnni Rcc HelloParms (HIParms)

Properties	Provisioned
Description	This group contains the provisionable Hello protocol parameters for an *Rcc* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni Rcc helloHoldDown (hhd)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the rate at which this node sends out Hello packets. It specifies the default minimum length of time between successive Hellos used by routing control channels on this node. A provisioning check is made to ensure that this value cannot be greater than *helloInterval*. A value of 0 specifies that the value provisioned for the *helloHoldDown* attribute of the *ARtg Pnni* component should be used.
Mib	AtmPnni
Values	Decimal (0.0..65535.0)
Units	seconds
Default	0.0

ATTRIBUTE Atmlf Pnni Rcc helloInterval (hli)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the default duration of the Hello Timer for routing control channels on this node. Every *helloInterval* seconds, this node sends out a Hello packet to the neighbor node, subject to the *helloHoldDown* timer having expired at least once since the last Hello packet was sent. A provisioning check is made to ensure that this value cannot be less than *helloHoldDown*. A value of 0 specifies that the value provisioned for the *helloInterval* attribute of the *ARtg Pnni* component should be used.
Mib	AtmPnni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..65535)
Units	seconds
Default	0

ATTRIBUTE Atmlf Pnni Rcc helloInactivityFactor (hif)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the number of Hello intervals allowed to pass without receiving a Hello from a neighbor, before an attempt is made to stage the RCC to that neighbor. The hello inactivity timer is enabled when the *helloState* is one of ***oneWayInside***, ***twoWayInside***, ***oneWayOutside***, ***twoWayOutside*** or ***commonOutside***. A value of 0 specifies that the value provisioned for the *helloInactivityFactor* attribute of the *ARtg Pnni* component should be used.
Mib	AtmPnni
Values	Decimal (0..65535)
Default	0

GROUP Atmlf Pnni Rcc OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni Rcc adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — AtmPnni

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Atmlf Pnni Rcc operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — AtmPnni

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Atmlf Pnni Rcc usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — AtmPnni

Values — idle
active (activ)
busy

Default — idle

GROUP Atmlf Pnni Rcc Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for an *Rcc* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni Rcc type

Access	Read: All Write: Illegal
Description	This attribute indicates the role of this link in the PNNI hierarchy. The following values are possible: ***unknown***: the Hello protocol has not yet determined the role of the link. ***lowestLevelHorizLink***: the link is a horizontal link between two lowest level nodes. ***lowestLevelOutsideLink***: the link is an outside link between two border nodes. ***horizontalLinkToLgn***: the link is a horizontal link to a Logical Group Node (LGN). ***uplink***: the link is a uplink to a higher level LGN.
Mib	AtmPnni
Values	unknown lowestLevelHorizLink lowestLevelOutsideLink horizontalLinkToLGN uplink
Default	No default

ATTRIBUTE Atmlf Pnni Rcc negotiatedVersion

Access	Read: All Write: Illegal
Description	This attribute indicates the PNNI version negotiated with the neighbor node.
Mib	AtmPnni
Values	unsupported version1point0
Default	No default

ATTRIBUTE Atmlf Pnni Rcc helloState

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute indicates the state of the Hello protocol exchange over this link. The following are the possible values for this attribute: ***down***: the link is down. No PNNI routing packets are sent or received over such a link. This is the initial state of the Hello Finite State Machine, and can also be reached when lower-level protocols have indicated that the link is not usable. ***attempt***: no Hello packets or Hello packets, with mismatched information, have been received recently from the neighbor. Attempts are made to contact the neighbor node by sending out Hello packets every *helloInterval* seconds. ***oneWayInside***: Hello packets have been recently received from the neighbor and it has been established that both nodes are members of the same peer group, but the remote node ID and remote port ID in the neighbor's Hello packets were set to zero. A Hello packet is sent to the neighbor and the Hello timer is restarted. ***twoWayInsid***e: Bidirectional communication over this link between this node and the neighbor node has been achieved. ***oneWayOutside***: Hello packets have been recently received from the neighbor and it has been established that both nodes are members of a different peer group, but the remote node ID and remote port ID in the neighbor's Hello packets were set to zero. ***twoWayOutside***: Hello packets have recently been received from the neighbor indicating that the neighbor node belongs to a different peer group. The correct remote node ID and remote port ID fields were included in the Hello packet, but the nodal hierarchy list did not include any common peer group. This state can also be reached if a hierarchy mismatch occurs while in the ***commonOutside*** state. ***commonOutside***: A common level of the routing hierarchy has been found, in addition to achieving full bidirectional communication between the two nodes.
Mib	AtmPnni
Values	notApplicable down attempt oneWayInside twoWayInside oneWayOutside twoWayOutside commonOutside

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Atmlf Pnni Rcc **remoteNodeId**

Access	Read: All Write: Illegal
Description	This attribute indicates the node id at the far end of the link.
Mib	AtmPnni
Values	String (22, Hex)
Default	No default

ATTRIBUTE Atmlf Pnni Rcc **remotePortId**

Access	Read: All Write: Illegal
Description	This attribute indicates the Port ID of the neighboring node, which is an unsigned integer of 32 bits. When the remote end of a PNNI physical link is terminated by a Nortel Networks Multiservice Switch, the first 16 bits of the hex encoded format represent the *AtmIf* instance of the PNNI link of the remote node, the next 12 bits correspond to the VPI of the PNNI link and the last 4 bits are unspecified (that is, it provide no value for physical interpretation).
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Pnni Rcc **derivedAggregationToken**

Access	Read: All Write: Illegal
Description	This attribute indicates the derived aggregation token value used on this link. The algorithm for computing the value of the derived aggregation token is: 1. If neighbors exchange identical values of the configured aggregation token, that value is the derived aggregation token value. 2. If the configured aggregation token value of one neighbor is zero (default), and that of the other neighbor is non-zero, the non-zero value is the derived aggregation token value. 3. If the configured aggregation token values of the neighbors are different and both non-zero, the derived aggregation token value is zero. The attribute is not displayed for links having a type value of ***unknown*** or ***lowestLevelHorizLink***.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Atmlf Pnni Rcc **remoteNodeName**

Access	Read: All Write: Illegal
Description	This attribute indicates the node name and the hierarchy level for the node at the far end of the link. A typical value for this attribute has the following form: ***OBELIX@96***. Here, ***OBELIX*** is the node name and ***96*** is the hierarchy level for the up node. The ***@*** symbol is used to separate the node name from the hierarchy level in the display. The value of this attribute is an empty string if the far end is not a Nortel Networks Multiservice Switch.
Mib	AtmPnni
Values	String (1..16, ASCII)
Default	No default

ATTRIBUTE Atmlf Pnni Rcc **remoteInterfaceName**

Access	Read: All Write: Illegal
Description	This attribute indicates the interface name of the node at the far end of the link. When the far end of the link is a Nortel Networks Multiservice Switch, this attribute's value can take one of the following forms: (a) ***AtmIf/<1-4095>*** - If the far end is an ATM interface. (b) ***AtmIf/<1-4095> Vpt/<1-4095>*** - If the far end is a VPT interface. (c) Values ***0-4294967295*** - If the link is a logical link. The value of this attribute is an empty string if the far end is not a Nortel Networks Multiservice Switch.
Mib	AtmPnni
Values	String (0..19, ASCII)
Default	No default

GROUP Atmlf Pnni Rcc **Statistics (Stats)**

Properties	Operational
Description	This group contains the statistical attributes for an *Rcc* component.
Mib	AtmPnni

ATTRIBUTE Atmlf Pnni Rcc **helloPacketsRx**

Copyright © 2006, Nortel Nortel Confidential

Access	Read: All Write: Illegal
Description	This attribute counts the total number of Hello packets received across this RCC, including bad and mismatched Hello packets. The counter wraps to zero when it exceeds the maximum value.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Pnni Rcc **helloPacketsTx**

Access	Read: All Write: Illegal
Description	This attribute counts the total number of Hello packets transmitted across this RCC. The counter wraps to zero when it exceeds the maximum value.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Pnni Rcc **mismatchedHelloPacketsRx**

Access	Read: All Write: Illegal
Description	This attribute counts the total number of mismatched Hello packets received over this RCC. The counter wraps to zero when it exceeds the maximum value.
Mib	AtmPnni
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Atmlf Pnni Rcc Vcd **atmServiceCategory (service)**

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. The ***constantBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. The consistent availability of a fixed quantity of bandwidth is considered appropriate for CBR service. Cells which are delayed beyond the value specified by CellTransfer Delay are assumed to be of significantly reduce value to the application. The ***rtVariableBitRate*** service category is intended for real time applications, that is those requiring tightly constrained delay and delay variation, as would be appropriate for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells which are delayed beyond the value specified by CTD are assumed to be of significantly reduced value to the application. Real time VBR service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and which can be characterized in terms of a PCR, SCR, and MBS. For those cells which are transferred within the traffic contract, the application expects a low cell loss ratio. For all connections, it expects a bound on the mean cell transfer delay. Non-real time VBR service may support statistical multiplexing of connections. The ***unspecifiedBitRate*** service is intended for non-real time applications; that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. UBR service supports a high degree of statistical multiplexing among sources. UBR service does not specify traffic related service guarantees. No numerical commitments are made with respect to the cell loss ratio experienced by a UBR connection, or as to the cell transfer delay experienced by cells on the connection.

ATTRIBUTE Atmlf Pnni Rcc Vcd **weight**

Access	Read and write
Criticality	Component
Description	This VCD component has an attribute that is called atmServiceCategory. This attribute specifies the service category that is used by the sig, rcc or ilmi channel. The *weight* attribute is related to two other attributes which are *weightPolicy* and *txQueueLimit*, as mentioned in the following description. These attributes can be found under the atmif/n ca <atmServiceCategory>/ m. This attribute specifies an override for the *weight* of this unshaped connection. This attribute is ignored for shaped connections, for ABR connections, for connections on a CQC-based ATM FPs and basic VPTs. When the value is set to ***sameAsCa***, the *weight* is determined by the *weightPolicy* attribute under the CA service category component for all but standard VPT VCCs. For standard VPT VCCs, the *weight* is determined by the VCC's service category, when the value is set to ***sameAsCa***. When this attribute is set to a value from ***1*** to ***4095***, that value is used for the *weightPolicy* of this connection relative to other connections. For all but standard VPT VCCs, *weightPolicy* determines the proportion of transit cell opportunities which are allocated to this connection, compared to other connections in the same service category. For standard VPT VCCs, *weightPolicy* determines the proportion of transmit cell opportunities which are allocated to this connection, compared to other connections associated with the VPT. When the value is set to ***upToQueueLimit***, the *weightPolicy* is limited only by the *txQueueLimit*.

ATTRIBUTE Atmlf Pnni Rcc Vcd **qosClass (qos)**

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the quality of service for both the forward and backward direction for this connection. Class ***1*** supports a QOS that meets Service Class A performance requirements (Circuit emulation, constant bit rate video). Class ***2*** supports a QOS that meets Service Class B performance requirements (Variable bit rate audio and video). Class ***3*** supports a QOS that meets Service Class C performance requirements (Connection-Oriented Data Transfer). Class ***4*** supports a QOS that meets Service Class D performance requirements (Connectionless Data Transfer). Class ***0*** is the unspecified bit rate QOS class; no objective is specified for the performance parameters.

Values	0 1 2 3 4
Default	2
Flags	HCA_SUPPORT

ATTRIBUTE **Atmlf Pnni Rcc Vcd** **trafficShaping (trShaping)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection uses traffic shaping when transmitting traffic to the ATM interface. When ***sameAsCa*** is selected, traffic shaping for this connection is based on the *trafficShaping* attribute of the connection's service category component under the *AtmIf CA*. If the service category has traffic shaping enabled, then traffic shaping is enabled for the connection. Note that enabling traffic shaping may have no effect under certain cases. These cases are listed in the description of the *trafficShaping* operational attribute, which is under the *Vcc Tm* and *Vpc Tm* components. When ***disabled*** is selected, traffic shaping for this connection is disabled.
Mib	AtmPnni
Values	disabled sameAsCa

Default	disabled
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Pnni Rcc Vcd **unshapedTransmitQueueing (unshap)**

Access	Read and write
Criticality	Component
Description	This attribute only applies when this connection is unshaped. This attribute specifies the transmit queuing method for this connection if it is unshaped. Refer to the *unshapedTransmitQueueing* attribute under the *AtmIf CA* service category subcomponent for more details on the meaning of this attribute. When this attribute is set to ***sameAsCa***, the transmit queuing method for the connection is based on the *unshapedTransmitQueueing* attribute of the connection's service category component under the *ConnectionAdministrator*. When this attribute is set to ***common***, transmit traffic on this unshaped connection is destined for the common queue. The value ***sameAsInterface*** is for migration from previous software releases, but should no longer be used
Mib	AtmPnni
Values	common sameAsCa
Default	sameAsCa
Flags	HCA_SUPPORT

ATTRIBUTE Atmlf Pnni Rcc Vcd **usageParameterControl (upc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this connection enforces usage parameter control when receiving traffic from the ATM interface. When ***sameAsCa*** is selected, UPC for the connection is based on the *usageParameterControl* attribute of the connection's service category component under the *ConnectionAdministrator*. If the service category has UPC enabled, then UPC is enabled for the connection. Note that enabling UPC may have no effect under certain cases. These cases are listed in the description of the *usageParameterControl* operational attribute, which is under the *Vcc Tm* or *Vpc Tm* component. When ***disabled*** is selected, UPC for this connection is disabled.

Default — disabled

Flags — HCA_SUPPORT

ATTRIBUTE Atmlf Pnni Rcc Vcd **trafficDescParm (tdp)**

Access — Read: All
Write: All

Criticality — Component

Description — This attribute is a vector of five traffic parameters whose meanings are defined by the *trafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR) and requested shaping rate are expressed in cell/s. Maximum burst size (MBS) is expressed in cells. CDVT is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for connection admission control (CAC). The value of CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, CDVT is ignored. The values of PCR, SCR and requested shaping rate are used to determine the actual shaping rate where traffic shaping is enabled.

When *trafficDescType* is ***3***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero.

When *trafficDescType* is ***6***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 and 1 traffic; parameter 3 represents the MBS for CLP equal to 0 and 1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***7***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to

Copyright © 2006, Nortel
Nortel Confidential

parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *trafficDescType* is ***8***, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in calculations of CAC and shaping rate.

For *trafficDescType* ***3*** the traffic is shaped at the next rate less than the PCR.

For *trafficDescType* ***6***, ***7***, and ***8***, the traffic is shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic is shaped at the next rate above the PCR.

AtmIf/n Vpt/m Uni Address/address,type
AtmIf/n Vpt/m Pnni Address/address,type

This component represents an address (dynamic or static) associated with the interface. The index is a string of 1 to 40 hex digits or a single wildcard ('?'), and a type. The type identifies whether the *Address* component is for a ***primary***, ***alternate***, ***registered***, or ***default*** address.

The types ***primary*** and ***alternate*** are used for provisioned addresses. The type ***registered*** is used for dynamic addresses registered through ILMI. The type ***default*** is used for Soft PVP and Soft PVC addresses.Virtual interfaces do not have addresses of
type ***default***.

The wildcard is only valid for provisioned addresses. If the address is a single wildcard, then that indicates that the interface supports all addresses. If there is no better match, then this interface may be chosen in the routing. If there is more than one interface with a single wildcard static address, then the choice is driven through a round robin algorithm.

The round robin algorithm tries the primary routes and then the alternate routes if none of the primary routes succeed.
If this node participates in a PNNI hierarchy, then a *PnniInfo* subcomponent can be provisioned under the *AtmAddress* component to specify the level to which this address will be advertised.

COMPONENT AtmIf Pnni PathTraceFilter (Ptf)

Groups	GROUP AtmIf Pnni Ptf Criteria GROUP AtmIf Pnni Ptf Operational (Oper) GROUP AtmIf Pnni Ptf RecordControl (Record)
Scope	Device
Description	*AtmIf/n Aini PathTraceFilter* *AtmIf/n Iisp PathTraceFilter* *AtmIf/n Uni PathTraceFilter* *AtmIf/n Pnni PathTraceFilter* *AtmIf/n Vpt/vpi Aini PathTraceFilter* *AtmIf/n Vpt/vpi Iisp PathTraceFilter* *AtmIf/n Vpt/vpi Uni PathTraceFilter* *AtmIf/n Vpt/vpi Pnni PathTraceFilter* This component represents the path trace filtering capability on the ATM signaling interface. This capability allows the user to trace connections during the call setup phase against the criteria associated with this component. Only the connections that match all the criteria are traced. When this component is provisioned, the network operator can control tracing activities by using the *Start*, *Stop,* and *Clear* verbs. When the *Start* verb is issued, the *traceTimeout* timer restarts. Once the timer times out, filtering stops and records are not removed. When the *Stop* verb is issued, the filter stops and the trace records are kept until the user clears them. When the *Clear* verb is issued, the trace records are cleared. When *AtmPathTraceFilter* component is deleted, all records are cleared. Once the maximum specified by *maxTraceRecords* attribute under the *PathTraceFilter* component or *maxTraceRecords* attribute under the *Lp/n Eng PTrace* component has been reached, the oldest record is deleted.

Copyright © 2006, Nortel Nortel Confidential

The *AtmPathTraceFilter* component is not permitted to be added when the *Lp/n Eng PTrace Ov maxTraceRecords* attribute is set to zero.

AtmIf/n Vpt/vpi Pnni PathTraceTestConnection

This component provides the capability to control the Path Trace Test Connection. A test connection is one way to find the logical nodes and ports that a connection traverses to a destination interface.

The *Trace* verb is used to initiate the test connection. The test connection is always released once it reaches the trace destination. The test connection responds with the trace results collected during a complete or partial trace.

Mib: AtmPnni

Common Verbs:

List
Display

VERB TRACE **AtmIf Pnni Ptt**

Impact: Passive

Description:
TRACE AtmIf/n Aini AtmPathTraceTest
TRACE AtmIf/n Iisp AtmPathTraceTest
TRACE AtmIf/n Uni AtmPathTraceTest
TRACE AtmIf/n Pnni AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Aini AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Iisp AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Uni AtmPathTraceTest
TRACE AtmIf/n Vpt/vpi Pnni AtmPathTraceTest

This command is used to initiate a Path Trace Test Connection and then responds with a list of logical nodes and ports from the trace source node to the trace destination node.

Only one *Trace* command is allowed at a time per signaling interface. If the test connection times out, the command fails.

GROUP **AtmIf Pnni Ptt** **Operational (Oper)**

ATTRIBUTE Atmlf Pnni Ptt atmServiceCategory (service)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the ATM service category for both directions of the connection. If this attribute is set to ***derivedFromBBC***, the Broadband Bearer Capability (BBC) and *bestEffort* attributes are used to determine the *atmServiceCategory* of this connection. If this attribute is set to a possible attribute other than ***derivedFromBBC***, the value of this attribute is used to override the provisioned BBC IE parameters. In those cases, the BBC attributes are not used. The ***constantBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation such as for voice and video applications. The ***rtVariableBitRate*** service category is intended for real time applications, that is, those requiring tightly constrained delay and delay variation, such as for voice and video applications. Sources are expected to transmit at a rate which varies with time. Equivalently, the source can be described as “bursty”. Cells, which are delayed beyond the value specified by CTD, are assumed to be of significantly reduced value to the application. The VBR real time service may support statistical multiplexing of real time sources. The ***nrtVariableBitRate*** service category is intended for non-real time applications which have bursty traffic characteristics and can be characterized in terms of a PCR, SCR, and MBS. The ***unspecifiedBitRate*** service is intended for non-real time applications, that is, those not requiring tightly constrained delay and delay variation. UBR sources are expected to be bursty. The UBR service supports a high degree of statistical multiplexing among sources.

ATTRIBUTE Atmlf Pnni Ptt **bearerClassBbc (bcBbc)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the bearer capability. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network.

The value ***derivedFromServiceCategory*** specifies that the actual value, which is used for this connection and is derived from the value of the *atmServiceCategory*. Either this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Class ***a*** service is a connection-oriented, constant bit rate ATM transport service. Class ***a*** service has end-to-end timing requirements and may require stringent cell loss, cell delay and cell delay variation performance.When ***a*** is set, the user is requesting more than an ATM only service. The network may look at the AAL to provide inter-working based on its contents.

Class ***c*** service is a connection-oriented, variable bit rate ATM transport service. Class ***c*** service has no end-to-end timing requirements. When ***c*** is set, the user is requesting more than an ATM only service. The network inter-working function may look at the AAL and provide service based on

Copyright © 2006, Nortel
Nortel Confidential

it.

Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***), and timing requirements are user defined (that is, transparent to the network).When ***x*** is set, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocols.

Mib: AtmPnni

Values:
a

x
derivedFromServiceCategory

Default: derivedFromServiceCategory

ATTRIBUTE Atmlf Pnni Ptt **transferCapabilityBbc (tcBbc)**

Access:
Read: All
Write: All

Criticality: Component

Description: This attribute specifies the transfer capability for this connection. UNI 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows:
<transferCapability: TrafficType, Timing>
0: NoIndication, NoIndication
1: NoIndication, yes
2: NoIndication, no
5: CBR, yes
8: VBR, NoIndication
9: VBR, yes
10: VBR, no

NotApplicable specifies that the user does not want to specify the transfer capability.

The CBR traffic type refers to the traffic offered on services such as a constant bit rate video service or a circuit emulation.

The VBR traffic type refers to the traffic offered on services such as packetized audio and video, or data.

The value ***NoIndication*** for traffic type is used if the user has not set the traffic type. This is also the case for end-to-end timing.

The value ***yes*** for end-to-end timing indicates that end-to-end timing is required.

The value ***no*** for end-to-end timing indicates that end-to-end timing is not required.

Copyright © 2006, Nortel Nortel Confidential

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection and is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory*** or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE **Atmlf Pnni Ptt** **txTrafficDescParm (txTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of five traffic parameters whose meanings are defined by the *txTrafficDescType* attribute. The values of peak cell rate (PCR), sustained cell rate (SCR), minimum cell rate (MCR) and requested shaping rate are expressed in cells/second. THe maximum burst size (MBS) is expressed in cells. The cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS, MCR and CDVT are used for the connection admission control (CAC). The value of the CDVT is only used for connections where the *atmServiceCategory* is ***constantBitRate***. For all other values of *atmServiceCategory*, the CDVT is ignored. The values of PCR, SCR, and the requested shaping rate are used to determine the actual shaping rate, where traffic shaping is enabled. When *txTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero. When *txTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be non-zero. Parameters 2 and 3 must be zero. When *txTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic with cell discard; parameter 2 represents the PCR for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero. When *txTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic with cell tagging; parameter 2 represents the PCR for CLP

Copyright © 2006, Nortel Nortel Confidential

equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must be greater than or equal to parameter 2. Parameters 1 and 2 must be non-zero. Parameter 3 must be zero.

When *txTrafficDescType* is ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***7***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic; parameter 4 represents the CDVT; and parameter 5 represents the requested shaping rate. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2. Parameter 5 must either be zero (unused) or greater than or equal to parameter 2.

When *txTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR; parameter 5 represents the requested shaping rate; and parameter 4 is not used and must be zero. A non-zero value in parameter 5 overrides any value in parameter 1. This result is used as the PCR. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may be optionally zero. Parameter 5 must either be zero (unused) or greater than or equal to parameter 3.

Whenever it is valid for PCR to be specified, parameter 5 may also be used to specify a requested shaping rate. A non-zero value in parameter 5 overrides the value in parameter 1 and is used as the peak cell rate in the calculations of CAC and the shaping rate.

For *txTrafficDescType* ***3***, ***4***, ***5*** and ***9***, the transmit traffic should be shaped at the next rate less than the PCR.

Copyright © 2006, Nortel Nortel Confidential

For *txTrafficDescType* ***6***, ***7,*** and ***8***, the transmit traffic should be shaped at the highest available rate which is between PCR and SCR. However, if there is no available shaping rate between PCR and SCR, traffic should be shaped at the next rate above the PCR.

ATTRIBUTE **Atmlf Pnni Ptt** **rxTrafficDescParm (rxTdp)**

Access	Read: All Write: All
Description	This attribute is a vector of four traffic parameters whose meanings are defined by the *rxTrafficDescType* attribute. The values of the peak cell rate (PCR) and sustained cell rate (SCR) are expressed in cells/second. The maximum burst size (MBS) is expressed in cells. The value of the cell delay variance tolerance (CDVT) is expressed in microseconds. The values of PCR, SCR, MBS and CDVT are used for the usage parameter control (UPC). When *rxTrafficDescType* is ***1*** or ***2***, all of the parameters must be set to zero (unused). When *rxTrafficDescType* is ***3***, parameter 1 represents the PCR for CLP0+1 traffic. Parameter 1 must be non-zero. Parameters 2 and 3 must be set to zero (unused). When *rxTrafficDescType* is ***4***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell discard. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is ***5***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the PCR for CLP equal to 0 traffic with cell tagging. Parameters 1 and 2 must be non-zero. Parameter 3 must be set to zero (unused). Parameter 1 must be greater than or equal to parameter 2. When *rxTrafficDescType* is a ***6***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP0+1 traffic; parameter 3 represents the MBS for CLP0+1 traffic. Parameters 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to Parameter 2. When *rxTrafficDescType* is ***7***, parameter 1 represents the PCR for

Copyright © 2006, Nortel Nortel Confidential

CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell discard; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameters 1, 2 and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***8***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging; parameter 3 represents the MBS for CLP equal to 0 traffic. Parameter 1, 2, and 3 must be non-zero. Parameter 1 must be greater than or equal to parameter 2.

When *rxTrafficDescType* is ***9***, parameter 1 represents the PCR for CLP0+1 traffic; parameter 2 represents the CDVT; parameter 3 represents the MCR. Parameter 4 is not used and must be zero. Parameter 1 must either be zero or be greater than or equal to parameter 3. Parameter 3 may optionally be zero.

When *rxTrafficDescType* is any value from ***3*** through ***8***, parameter 4 represents the CDVT. If this value is zero, the CDVT is taken from the *ConnectionAdministrator* defaults for the particular *atmServiceCategory* of this connection.

When *rxTrafficDescriptorType* is ***3*** through ***9***, there are certain extreme combinations of *rxTrafficDescParm* which are outside the capabilities of the UPC hardware.

To calculate the limits, use the following formulae:
I1 = 1 000 000 000 / PCR
L1 = CDVT * 1000
I2 = 1 000 000 000 / SCR
L2 = CDVT + (MBS - 1) * (I2 - I1)
I1 and I2 must be less than or equal to 335 523 840. I1 + L1 must be less than or equal to 1 342 156 800. I2 + L2 must be less than or equal to 1 342 156 800. Note that I2 and L2 only apply when the *rxTrafficDescriptorType* is ***6*** through ***8***.

If the values of I1, L1, I2, or L2 are closer to the limits described above, a further restriction applies. Specifically, if either:
I1 > 41 940 480 or
I2 > 41 940 480 or
I1 + L1 > 167 769 600 or
I2 + L2 > 167 769 600
then both I1 and I2 must be greater than 20 480.

Parameter 5 of the *rxTrafficDescParm* is always unused.

If the *rxTrafficDescType* is ***sameAsTx***, the values in this attribute are taken from the *txTrafficDescParm*.

VERB OPTIMIZE **AtmIf Pnni Reroute**

Impact	Service
Description	*Optimize [-all] AtmIf/n Pnni Reroute* *Optimize [-all] AtmIf/n Vpt/vpi Pnni Reroute* This command triggers path optimization for the connection segments managed by the *Reroute* component. By default, only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection. The *-all* option causes all connection segments subscribed to path optimization to be considered. Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP AtmIf Pnni Reroute Ov Provisioned (Prov)

Properties Provisioned

Description This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.

Mib AtmPnni

ATTRIBUTE AtmIf Pnni Reroute Ov protocol

Access Read and write

Description This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning.

One of the following values can be specified:
sameAsARtgPnniReroute: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute.
localGlobal: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature.
localOnly: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
globalOnly: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature.
localEbr: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Default	sameAsARtgPnniReroute

ATTRIBUTE Atmlf Pnni Reroute Ov **numOptAttempts**

Access	Read and write
Description	This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization. If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization. If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Access	Read and write
Description	This attribute should be set to the name of the desired trace receiver before starting a trace session. All available trace receivers are listed under the *SrvTrace Rcvr* component. This attribute cannot be set while the service trace is active. The receiver name is validated by the trace manager when the service *SrvTrace* is started.
Mib	AtmPnniTrace
Values	String (0..8, ASCII)
Default	No default

ATTRIBUTE **AtmIf Pnni SrvTrace** **duration**

Access	Read and write
Description	This attribute specifies the duration, in minutes, of a trace session. A value of ***0*** indicates unlimited duration in which case a trace session remains active until a *Stop* command is issued. This attribute cannot be set while a trace is active.
Mib	AtmPnniTrace
Values	Decimal (0..9999)
Units	minutes
Default	60

ATTRIBUTE **AtmIf Pnni SrvTrace** **queueLimit**

Access	Read and write
Description	This attribute specifies the total number of bytes of traced data which may be queued for transmission to the trace receiver. When this limit is

Copyright © 2006, Nortel Nortel Confidential

	exceeded, incoming traced frames are discarded. This attribute can be set while a trace is active and takes effect immediately.
Mib	AtmPnniTrace
Values	Decimal (1..100)
Units	Kbyte
Default	20

ATTRIBUTE AtmIf Pnni SrvTrace session

Access	Read only
Description	This attribute indicates the *SrvTrace Session* component that is forwarding the trace data. This attribute is set automatically, and is empty unless the service trace is active.
Mib	AtmPnniTrace
Values	The name of the component
Default	No default

COMPONENT AtmMultiprotocolEncapsulation (AtmMpe)

Instance	Decimal (0..2047)
Groups	GROUP AtmMpe CustomerIdentifierData (CidData) GROUP AtmMpe IfEntryProv (IfEntry) GROUP AtmMpe Provisioned (Prov) GROUP AtmMpe MediaProvisioned (MediaProv) GROUP AtmMpe OsiState (State) GROUP AtmMpe OperationalStatus (OperStatus)
Scope	Application
Description	*AtmMpe/n* This component represents a logical interface between the Virtual Router and an ATM media (*AtmIf*). Multiprotocol Encapsulation as specified in RFC1483 is used to transfer higher-layer protocol data across virtual channels in an ATM network. *AtmMpe* components provide a means to associate multiple ATM virtual channel connections with a single *VirtualRouter ProtocolPort*. The *AtmMpe* component is associated with a *ProtocolPort* via a linkage attribute and virtual channel connections via a linkage attribute in each *AtmConnection* subcomponent.

GROUP AtmMpe CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	AtmMpe

ATTRIBUTE AtmMpe customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	AtmMpe
Values	Decimal (0; 1..8191)
Default	0

GROUP AtmMpe IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	AtmMpe

ATTRIBUTE AtmMpe ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	AtmMpe
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

ATTRIBUTE AtmMpe ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	AtmMpe
Values	Decimal (1..65535)
Default	No default

GROUP AtmMpe Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *AtmMpe* component.
Mib	AtmMpe

ATTRIBUTE AtmMpe maxTransmissionUnit (mtu)

Access	Read and write
Description	This attribute sets the size of the largest datagram which can be sent on the interface. This includes the size of the Logical Link Control header (if applicable) as well as the protocol data unit.
Mib	AtmMpe
Values	Decimal (256..9188)
Units	octets
Default	9188

ATTRIBUTE AtmMpe encapType (etype)

Access	Read and write
Criticality	Component
Description	This attribute specifies the RFC-1483 encapsulation type to be used for the *AtmConnections* under this *AtmMpe*. Specifying ***llcEncap*** allows multiplexing of multiple protocols over the *VCCs*. The protocol of the carried PDU will be identified by an IEEE 802.2 Logical Link Control header. If Inverse ARP is to be carried over a VCC, ***llcEncap*** must be used. If the *Stp* component exists under the *AtmMpe*, ***llcEncap*** must be used. Specifying ***ipVcEncap*** indicates that all the VCCs (that is,

Copyright © 2006, Nortel Nortel Confidential

*AtmConnection*s) under an *AtmMpe* component will use VC-based multiplexing and will carry IP PDUs only.

Specifying ***llcBridgeEncap*** indicates that the VCC (that is, the *AtmConnection*) under an *AtmMpe* component will use the bridged Ethernet encapsulation format specified in RFC-1483. Note that when setting the *encapType* attribute to ***llcBridgeEncap***, the *maxTransmissionUnit* must be set within the ***[256 .. 1524]*** range.

Mib	AtmMpe
Values	llcEncap ipVcEncap llcBridgeEncap
Default	llcEncap

ATTRIBUTE AtmMpe ilsForwarder

Access	Read and write
Criticality	Component
Description	This attribute specifies the *IlsForwarder* component this *AtmMpe* component is using. This attribute is only applicable when all *AtmConnection* components under the *AtmMpe* component are associated with PVC VCCs residing on a CQC-based ATM FP.
Mib	AtmMpe
Values	Link (Service, linkToTrafficSource)
Default	No default

GROUP AtmMpe MediaProvisioned (MediaProv)

Properties	Provisioned
Description	This group contains the base provisioning data for the *AtmMpe* component.
Mib	AtmMpe

ATTRIBUTE AtmMpe linkToProtocolPort

Access	Read and write
Criticality	Component
Description	This attribute contains a protocol port component name. The attribute associates an *AtmMpe* application with a protocol port.
Mib	AtmMpe
Values	Link (Service, linkToMedia)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP AtmMpe OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmMpe

ATTRIBUTE AtmMpe adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmMpe
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE AtmMpe operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmMpe
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE AtmMpe usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmMpe
Values	idle active (activ) busy
Default	idle

GROUP AtmMpe OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	AtmMpe

ATTRIBUTE AtmMpe snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	AtmMpe
Values	up down testing
Default	up

Dyn. Subcomp.	COMPONENT AtmMpe Ac AtmConnection (AtmCon)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP AtmMpe Ac Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *AtmConnection* component.
Mib	AtmMpe

ATTRIBUTE AtmMpe Ac atmConnection (link)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the ATM nailed up endpoint, *AtmIf/n Vcc/vpi.vci Nep,* that this connection is associated with. It must not be provisioned for an SPVC connection.
Mib	AtmMpe
Values	Link (Service, applicationName)
Default	No default

ATTRIBUTE AtmMpe Ac ipCos

Access	Read and write
Criticality	Component
Description	This attribute specifies the connection class of the *AtmConnection.* This value is used to distinguish the connection from others for the purpose of IP and MPLS forwarding and accounting. Connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers. If a packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one *AtmConnection*, then one of the connections is selected for transmitting the packet. For IP packets the selection is based on either the Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet. For MPLS packets the selection is based on either the DSCP field of the IP packet or the EXP field of the MPLS packet. DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component. EXP based selection of the the outgoing connection is explained in the description of the *MplsServiceMap* component. Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component. Modifying this attribute will reset the *AtmConnection*. If the *AtmConnection* is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the *AtmConnection*. See the description of *Vr Ip CosPolicyGroup* for more information.
Mib	AtmMpe
Values	Decimal (0..3)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmMpe Ac mplsSignaling (mplsSig)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether this AtmMpe Ac is dedicated for MPLS signaling (LDP or CR-LDP), or shared between MPLS and IP. If the value is ***dedicated***, the *Ac* is dedicated for MPLS signaling; the route is not found in IP ARP. If the value is ***shared***, the *Ac* is accessible by IP. The checking of this provisionable attribute is done through semantic checking. The attribute takes on the value ***shared*** by default, and can only be ***dedicated*** if there are more than one *Ac* under the *AtmMpe*.
Mib	AtmMpe
Values	shared dedicated
Default	shared

GROUP AtmMpe Ac OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	AtmMpe

ATTRIBUTE AtmMpe Ac adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	AtmMpe

Copyright © 2006, Nortel Nortel Confidential

Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE AtmMpe Ac operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	AtmMpe
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE AtmMpe Ac usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	AtmMpe
Values	idle active (activ) busy
Default	idle

GROUP AtmMpe Ac Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *AtmConnection* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	AtmMpe

ATTRIBUTE AtmMpe Ac speed

Access	Read only
Description	This attribute indicates the approximate bit rate for the connection. The bit rate is determined from the cell rate provisioned for the *Vcc* linked to this connection. The cell rate is multiplied by 53 bytes per cell and 8 bits per byte to obtain the bit rate. The *ifSpeed* of the entry in the ifTable corresponding to the *AtmMpe* component is the lowest speed of all the connections associated with the *AtmMpe* component. This attribute is always equal to 0 for an SPVC.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

GROUP AtmMpe Ac Statistics (Stats)

Properties	Operational
Description	This group contains the frame based statistics maintained for the *AtmConnection* component. For cell based statistics, see the *Vcc* component.
Mib	AtmMpe

ATTRIBUTE AtmMpe Ac outPackets

Access	Read only
Description	This attribute counts the total number of packets sent on this connection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE AtmMpe Ac outOctets

Access	Read only
Description	This attribute counts the total number of octets sent on this connection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmMpe Ac outDiscards

Access	Read only
Description	This attribute counts the total number of packets which were supposed to be sent on this connection but were discarded due to congestion or the connection being down. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE AtmMpe Ac inPackets

Access	Read only
Description	This attribute counts the total number of packets received on this connection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE AtmMpe Ac inOctets

Access	Read only
Description	The attribute counts the total number of octets received on this connection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE AtmMpe Ac inUnknownProtos

Access	Read only
Description	This attribute counts the total number of packets received on this connection which were discarded because they contained an unknown or unsupported protocol (includes packets received for protocols not currently bound to the associated *ProtocolPort* component). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmMpe Ac inErrors

Access	Read only
Description	This attribute counts the total number of packets received on the connection which contained errors preventing them from being delivered to a higher-layer protocol (includes short frames). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	AtmMpe
Values	Decimal (0..4294967295)
Default	No default

GROUP AtmMpe Ac IpIfLink

Properties	Provisioned
Description	This group contains the link between this component and an *IpLogicalInterface*.
Mib	AtmMpe

ATTRIBUTE AtmMpe Ac linkToIpLogicalInterface (ipIf)

Access	Read and write
Description	This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with. This attribute is not applicable and cannot be set when the *AtmConection* component is added under an *Rtr If AtmMpe* or an *Rtr Vrf If AtmMpe* component. When set, the value of this attribute must be consistent with the *linkToPrototocolPort* attribute value of the parent *AtmMpe* component. That is, they must both point to the same *PrototocolPort* component.
Mib	AtmMpe
Values	Link (Service, linkToMediaConnection)
Default	No default

ATTRIBUTE AtmMpe Ac AtmCon nextHop

Access	Read only
Description	This attribute shows the component name of the *AtmIf Vcc Ep* or *AtmCon* component to which this switched connection is established.
Mib	AtmMpeSpvc
Values	The name of the component
Default	No default

COMPONENT AtmMpe SpvcTerminationPoint (Stp)

Groups	GROUP AtmMpe Stp Provisioned (Prov) GROUP AtmMpe Stp Operational (Oper)
Scope	Application
Description	*AtmMpe/n Stp* *Rtr/<string> If/<IP addr> AtmMpe Stp* *Rtr/<string> Vrf/<string> If/<IP addr> AtmMpe Stp* This component specifies the SPVC related provisioning for the *AtmMpe*

Copyright © 2006, Nortel Nortel Confidential

component. Its presence identifies an *AtmMpe* component that contains one or more SPVC connections.

Mib	AtmMpeSpvc
Common Verbs	Help List Display Add DELete

GROUP AtmMpe Stp Provisioned (Prov)

Properties	Provisioned
Description	This attribute group contains the provisionable attributes of the *SpvcTerminationPoint* component.
Mib	AtmMpeSpvc

ATTRIBUTE AtmMpe Stp localAddress (laddr)

Access	Read: All Write: All
Criticality	Component
Description	This attribute specifies the NSAP address of this *AtmMpe* component. The default is an empty string. If no NSAP address is provisioned, a default NSAP address is provided. To view the generated default address refer to the *opLocalAddress* attribute under this component after the *act prov* command is executed.
Mib	AtmMpeSpvc
Values	String (0..20, Hex)
Default	No default

ATTRIBUTE AtmMpe Stp softPvcRetryPeriod (retry)

Access	Read: All Write: All
Description	This attribute specifies the interval at which an SPVC connection attempts establishment after a failed setup attempt occurs. The *softPvcRetryPeriod* attribute applies to all connections managed by the parent *AtmMpe* component.
Mib	AtmMpeSpvc
Values	Decimal (10..3600)
Units	seconds
Default	20

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE AtmMpe Stp softPvcHoldOffTime (sHoldOffTime)

Access	Read: All Write: All
Description	This attribute specifies how long to hold off before attempting to reestablish a connection after an established SPVC connection is cleared/ released. The *softPvcHoldOffTime* attribute applies to all connections managed by the parent *AtmMpe* component.
Mib	AtmMpeSpvc
Values	Decimal (0; 50..3600000)
Units	msec
Default	20000

GROUP AtmMpe Stp Operational (Oper)

Properties	Operational
Description	This attribute group contains the operational attributes associated with the *SpvcTerminationPoint* component.
Mib	AtmMpeSpvc

ATTRIBUTE AtmMpe Stp opLocalAddress (addr)

Access	Read: All Write: Illegal
Description	This attribute indicates the NSAP address of this *AtmMpe* component. The value is the same as the provisioned *laddr*. If the *laddr* is not provisioned, the value of *addr* is automatically generated by the software.
Mib	AtmMpeSpvc
Values	String (0..20, Hex)
Default	""

GROUP Btds CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	BitTransparent

ATTRIBUTE Btds customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	BitTransparent
Values	Decimal (0; 1..8191)
Default	0

GROUP Btds IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	BitTransparent

ATTRIBUTE Btds ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	BitTransparent
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

ATTRIBUTE Btds ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	BitTransparent
Values	Decimal (1..65535)
Default	No default

GROUP Btds OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	BitTransparent

ATTRIBUTE Btds snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	BitTransparent
Values	up down testing
Default	up

GROUP Btds OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	BitTransparent

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	BitTransparent
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Btds operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	BitTransparent
Values	enabled (ena) disabled (dis)
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	BitTransparent
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Btds availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	BitTransparent
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Btds proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The

Copyright © 2006, Nortel Nortel Confidential

operationalState is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	BitTransparent
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Btds controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.

Copyright © 2006, Nortel Nortel Confidential

Mib	BitTransparent
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Btds alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	BitTransparent
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Btds standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	BitTransparent
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Btds unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	BitTransparent
Values	false true
Default	false

GROUP Btds Operational

Properties	Operational
Description	This group contains operational attributes related to a *Btds*.
Mib	BitTransparent

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds serviceFailureReason

Access	Read: Passive Write: Illegal
Description	This attribute indicates the result of end to end negotiation with the remote end across the subnet. If *serviceFailureReason* is ***undetermined***, this *Btds* component has not performed end to end negotiation with the remote end, and may or may not be up. *serviceFailureReason* is ***undetermined*** if this *Btds* just became enabled, if there is not enough available bandwidth to perform negotiation or if the remote end cannot perform negotiation with this *Btds* component. If *serviceFailureReason* is ***none***, end to end negotiation passed. If *serviceFailureReason* is ***mismatchedService***, end to end negotiation failed because the remote end service is not a *Btds*. If *serviceFailureReason* is ***mismatchedTimeSlotAlignment***, end to end negotiation failed because the local *Btds Framer. timeSlotAlignment* does not match the remote *Btds Framer timeSlotAlignment*. If *serviceFailureReason* is ***mismatchedCallDiscriminator***, the local *Btds* call discrimination subcomponents (*Btds Mcdn* and *Btds Dpnss1*) do not match the remote *Btds* call discrimination subcomponents. If *serviceFailureReason* is ***compDecodeFailed***, end to end negotiation failed because the information received from the remote end was not recognized as valid data. If serviceFailureReason is dspFailure, the associated DSP is broken. This value is only applicable for 1pMVPe and 4pMVPe FPs.
Mib	BitTransparent
Set of	none undetermined logicalConnection mismatchedService mismatchedTimeSlotAlignment mismatchedCallDiscriminator compDecodeFailed dspFailure
Default	No default

COMPONENT Btds Framer (Framer)

Groups	GROUP Btds Framer Provisioned (Prov) GROUP Btds Framer ChannelOptions (Channel) GROUP Btds Framer OsiState (State) GROUP Btds Framer Statistics (Stats)

COLLECTED STATS BitTransparentDataService Framer

Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*Btds/n Framer* The Framer component controls link layer framing for application components sending and receiving data on a link interface. It is also through Framer, that an application component is associated with a specific hardware link interface. The Framer component provides provisionable attributes related to datapath aspects of the hardware interface rather than interface specific attributes which are associated with specific hardware components (such as V35/n or DS1/n). The Framer component also provides a provisionable attribute which binds the application component to a specific hardware component. The Framer component contains operational attributes for link interface datapath statistics (such as frame counts).
Mib	BitTransparent
Common Verbs	Help List Display

GROUP Btds Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	BitTransparent

ATTRIBUTE Btds Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	BitTransparent
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP Btds Framer ChannelOptions (Channel)

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains attributes defining the framing of data on the link interface or n*64kbps channel.
Mib	BitTransparent

ATTRIBUTE Btds Framer protocol

Access	Read and write
Criticality	Process
Description	This attribute specifies the ingress frames suppressed by this *Btds*. If *protocol* is ***none***, this *Btds* does not suppress any ingress frames. If *protocol* is ***hdlc***, this *Btds* suppresses ingress frames where each byte is an identical non-inverted HDLC idle pattern, but only after two or more consecutive frames meet this description. If *protocol* is ***nrziHdlc***, this *Btds* suppresses ingress frames where each byte is an identical NRZI encoded HDLC idle pattern, but only after two or more consecutive frames meet this description. If *protocol* is ***universal***, this *Btds* suppresses ingress frames where each 16-bit word is identical, but only after a provisionable number of consecutive frames meet this description. The number of consecutive frames is determined by *numOfIdleBytesToMonitor.* Note that the number of idle bytes suppressed at the ingress side does not necessarily equal the number of idle bytes generated at the egress side. It is a semantic check warning if *protocol* is ***hdlc***, ***nrziHdlc*** or ***universal*** and this *Btds* is running on a ***1pE1Mvp***, ***1pDS1Mvp*** or ***1pTTC2mMvp*** card.
Mib	BitTransparent
Values	none hdlc nrziHdlc universal
Default	none

ATTRIBUTE Btds Framer numOfIdleBytesToMonitor

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of consecutive repeated ingress 16-bit words this *Btds* must encounter before suppressing universal ingress idle frames. This attribute is only used if *protocol* is ***universal***. *numOfIdleBytesToMonitor* should be larger than the largest frame size that can be sent into this *Btds*.
Mib	BitTransparent
Values	Decimal (0..32000)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds Framer **idlePattern**

Access	Read and write
Criticality	Process
Description	This attribute specifies how to fill a local egress frame when the remote *Btds* suppressed an ingress frame.
Mib	BitTransparent
Values	Hex (H.0..H.ff)
Units	Hex
Default	H.ff

ATTRIBUTE Btds Framer **timeSlotAlignment (tsa)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the time slot alignment of this *Btds*. With time slot alignment, data sent out on a particular time slot to a link is received on the same time slot. A value of unaligned specifies the regular Btds application. A value of ***frameAligned*** enables frame aligned Btds. When framed aligned Btds is specified, only one channel may be provisioned since only one fraction of N x 64kbit/s is presently available. timeSlotAlignment can not be set to frameAligned unless this Btds is running on a ***DS1V***, ***E1V***, ***1pDS1V*** or ***1pE1V*** card *timeSlotAlignment* must have the same value at both ends of a *Btds*. If *timeSlotAlignment* does not have the same value at both ends of a *Btds*, the *Btds* will be out of service. In this case, *Btds serviceFailureReason* is ***mismatchedTimeSlotAlignment***.
Mib	BitTransparent
Values	unaligned frameAligned
Default	unaligned

ATTRIBUTE Btds Framer **insertedOutputDelay**

Access	Read and write
Criticality	Process
Description	This attribute defines the amount of added output delay to compensate for cross network delay variations. Cross network delay variations is a function of the network topology. Setting this attribute will allow the Btds service to deal with cross network delay variations. This attribute provides for delay in addition to the elastic buffer. Total egress delay is approximately the *insertedOutputDelay* plus the elastic buffer. The elastic buffer is the packetization timex5 cells in the buffer.

Copyright © 2006, Nortel Nortel Confidential

	Packetization time per cell is calculated by taking the inverse of [line speed (kbit/s) x (byte/8bits) x (1/cell size (bytes))]. The value for *insertedOutputDelay* should be increased if the *frmUnderRuns* is increasing and *frmLostInNetwork* is not increasing.
Mib	BitTransparent
Values	Decimal (0..50)
Units	msec
Default	12

ATTRIBUTE Btds Framer **btdsCellSize**

Access	Read and write
Criticality	Process
Description	This attribute allows selection of larger BTDS cell sizes. Larger BTDS cell sizes improve efficiency but increase the minimum egress queue delay. If the associated channel is using less than 5 *timeslots* (320kbit/s), the default *btdsCellSize* will be used. Setting *btdsCellSize* to **84** is only allowed on DS1 and E1 FPs.
Mib	BitTransparent
Values	44 84
Units	bytes
Default	44

GROUP Btds Framer **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	BitTransparent

ATTRIBUTE Btds Framer **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — BitTransparent

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Btds Framer operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — BitTransparent

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Btds Framer usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — BitTransparent

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

GROUP Btds Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	BitTransparent

ATTRIBUTE Btds Framer frmFromIf

Access	Read only
Description	This attribute counts the number of frames received from the link interface by Framer. The counter wraps to zero when it exceeds its maximum value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Btds Framer suppressedFrames

Access	Read only
Description	This attribute counts the number of frames dropped at the interface due to the idle pattern being detected. The counter wraps to zero when it exceeds its maximum value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Btds Framer frmToIf

Access	Read only
Description	This attribute counts the number of frames transmitted to the link interface by Framer. The counter wraps to zero when it exceeds its maximum value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds Framer lrcErrors

Access	Read only
Description	This attribute counts the number of frames received from the network with LRC errors. The counter wraps to zero when it exceeds its maximum value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Btds Framer frmLostInNetwork

Access	Read only
Description	This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the far end. The counter wraps to zero when it exceeds its maximum value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Btds Framer frmUnderRuns

Access	Read only
Description	This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network. This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates. The counter wraps to zero when it exceeds its maximum value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Btds Framer frmDumped

Access	Read only
Description	This attribute counts the number of frames which have been dumped because the local interface output queue grew too large. This can occur if the clock rate on the local interface is faster than the clock rate on the remote interface and there are no silence periods to absorb the difference. The counter wraps to zero when it exceeds its maximum value.
Mib	BitTransparent
Values	Decimal (0..4294967295)

Default 0

COLLECTED STATS BitTransparentDataService Framer

Description The statistics record generated by the BitTransparentDataService Framer component.

ATTRIBUTE Btds Framer rxBytes

Description This attribute provides the number of bytes received on the link by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE Btds Framer rxFrames

Description This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.

Values Long Integer

ATTRIBUTE Btds Framer txBytes

Description This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE Btds Framer txFrames

Description This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.

Values Long Integer

ATTRIBUTE Btds Framer rxTotalLinkUtil

Description This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.

Values Decimal (0..100)

COMPONENT Btds PermanentLogicalConnection (Plc)

Groups GROUP Btds Plc Provisioning (Prov)

Scope Application

Copyright © 2006, Nortel Nortel Confidential

Description	*Btds/n PLC* This is the description of the PLC Component for the BTDS service.
Mib	BitTransparent
Common Verbs	Help List Display

GROUP Btds Plc Provisioning (Prov)

Properties	Provisioned
Description	This group contains all provisionable attributes for a permanent logical connection. Note that all of the attributes are valid and provisionable on both ends of a connection. However with the exception of *remoteName*, all operational attributes are derived from the originating end provisioning, which may be either end unless *remoteName* is not provisioned on one end.
Mib	BitTransparent

ATTRIBUTE Btds Plc remoteName (rName)

Access	Read and write
Criticality	Process
Description	This attribute specifies the PLC's remote end point's address in the format of a component name. The syntax of a component is: "em/node type/instance". For an alternative representation of end point's addresses, see *addressToCall* and l*ocalAddress PLC* attributes. When using the component name representation, end points are identified using a node name and a service name. As an example, the end point component for a third Btds service on node MoonBase is: "*EM/MoonBase BTDS/3*". If the *remoteName* is provisioned, it must match the name of the remote end or the connection will not be established even if the remote end is provisioned correctly. If no *remoteName* is provisioned, then this *LC* will accept connections from any other remote *LC* and it will not originate calls. Connections establish faster and are unique if both ends are provisioned with *remoteName*. *RemoteName* should be used when the remote end of the connection resides within the same topology region. If it resides in a different topology region, then *addressToCall* and *localAddress PLC* attributes should be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*. These strings are case insensitive, but the complete component name must be input.

Mib	BitTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Btds Plc setupPriority (spri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The *holdingPriority*, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	BitTransparent
Values	Decimal (0..4)
Default	2

ATTRIBUTE Btds Plc holdingPriority (hpri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the priority that a path holds once it is established. Zero(0) is the highest priority and four(4) is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	BitTransparent
Values	Decimal (0..4)
Default	2

ATTRIBUTE Btds Plc requiredTxBandwidth (tbw)

Access	Read and write
Criticality	Process
Description	This attribute specifies the bandwidth (in bits per second) reserved by a path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is

Copyright © 2006, Nortel Nortel Confidential

	desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that Transmit at this end represents Receive at the remote end. Note that when the values do not correspond the originating end of the connection determines the value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Units	bit/s
Default	64000

ATTRIBUTE Btds Plc requiredRxBandwidth (rbw)

Access	Read and write
Criticality	Process
Description	This attribute specifies the bandwidth (in bits per second) reserved by a path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. This value should be chosen to achieve the amount of statistical bandwidth sharing that is desired by the network administration. This reservation is not enforced and is used to determine how many paths can be supported on a trunk. Both ends should be provisioned with the correct values allowing for the fact that transmit at this end represents receive at the remote end. Note that when the values do not correspond, the originating end of the connection determines the value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Units	bit/s
Default	64000

ATTRIBUTE Btds Plc requiredTrafficType (rttyp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of traffic transmitted over the path. There are eight(8) possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five(5) other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,***

Copyright © 2006, Nortel Nortel Confidential

then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.

Mib	BitTransparent
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	video

ATTRIBUTE Btds Plc permittedTrunkTypes (pttyp)

Access	Read and write
Criticality	Process
Description	This attribute specifies up to eight(8) types of trunk that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six(6) remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.
Mib	BitTransparent
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	(terrestrial, satellite, trunkType1, trunkType2, trunkType3)

ATTRIBUTE Btds Plc requiredSecurity (rsec)

Access	Read and write
Criticality	Process
Description	This attribute specifies the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.

Copyright © 2006, Nortel Nortel Confidential

Mib	BitTransparent
Values	Decimal (0..7)
Default	4

ATTRIBUTE Btds Plc requiredCustomerParm (rcparm)

Access	Read and write
Criticality	Process
Description	This attribute specifies the allowed customer defined parameter of the trunks on the route. Its value, a number from zero to seven, is chosen by network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	BitTransparent
Values	Decimal (0..7)
Default	4

ATTRIBUTE Btds Plc pathAttributeToMinimize (pamin)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a selected route is the sum of the trunk delay metric for all trunks included in the route.
Mib	BitTransparent
Values	cost delay
Default	cost

ATTRIBUTE Btds Plc maximumAcceptableCost (maxCost)

Access	Read and write
Criticality	Process
Description	This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being

Copyright © 2006, Nortel Nortel Confidential

selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.

Mib	BitTransparent
Values	Decimal (0..65535)
Default	1280

ATTRIBUTE Btds Plc maximumAcceptableDelay (maxDelay)

Access	Read and write
Criticality	Process
Description	This attribute specifies an upper bound on the delay of a route, which is the sum of the delay of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512-byte packet. Remember, that the trunk during its staging measures a *measuredRoundTripDelay*. This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512-byte packet is used to perform the measurement. If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay*.
Mib	BitTransparent
Values	Decimal (0..100000)
Units	msec
Default	100000

ATTRIBUTE Btds Plc emissionPriority (epri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. *EmissionPriority* of Zero(0) indicates the highest emission priority, while two (2) indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	BitTransparent

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..2)
Default	0

ATTRIBUTE Btds Plc discardPriority (dpri)

Access	Read and write
Criticality	Process
Description	This attribute specifies the importance of the packets on the path. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority* (numerically) are discarded after packets with a higher *discardPriority* (numerically).
Mib	BitTransparent
Values	Decimal (1..3)
Default	1

ATTRIBUTE Btds Plc pathType (pType)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the path for this PLC is determined automatically or by static provisioning. The default (***normal***) is to automatically choose a route with Route Selection. ***Normal*** *pathTypes* require less provisioning and can dynamically handle path failures. The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	BitTransparent
Values	normal manual forced
Default	normal

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds Plc pathFailureAction (pfa)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is chosen, the application is informed as soon as possible about a failure by disconnection. If the attribute is set to ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure. With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect. All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends.
Mib	BitTransparent
Values	reRoutePath disconnectConnection
Default	reRoutePath

ATTRIBUTE Btds Plc bumpPreference (bpref)

Access	Read and write
Criticality	Process
Description	This attribute specifies when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *holdingPriority* in order to acquire its bandwidth and be established. By default, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. A connection may be set to always bump in order to find the best route it may have.
Mib	BitTransparent
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	bumpWhenNecessary

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds Plc optimization (opt)

Access	Read and write
Criticality	Process
Description	This attribute is specifies whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.
Mib	BitTransparent
Values	disabled enabled
Default	enabled

ATTRIBUTE Btds Plc addressToCall (addrToCall)

Access	Read and write
Criticality	Process
Description	This attribute specifies the PLC's remote end point's address in the format of a NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. For an alternative representation of end point's addresses, see *remoteName* attribute. If the *addressToCall* is provisioned, it must match *localAddress* provisioned on the remote end or the connection will not be established. Connections establish faster and are unique if both ends are provisioned with *addressToCall*. *AddressToCall* must be used when the remote end of the connection resides in different topology region. If it resides in the same topology region, then *remoteName* may be used. When both *remoteName* and *addressToCall* are provisioned, *addressToCall* takes precedence. That is, connection will be established to the service specified by *addressToCall*.
Mib	BitTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Btds Plc localAddress (localAddr)

Access	Read and write
Criticality	Process
Description	This attribute specifies the PLC's end point address in the format of an NSAP address. As such it must consist of a string of hex digits although not all 40 digits must be specified. *LocalAddress* must share a prefix with MOD nodePrefix or one of MOD alternatePorsPrefixes for this node,

Copyright © 2006, Nortel Nortel Confidential

	otherwise PORS will not be able to route calls to this service. *LocalAddress* is used in conjunction with *addressToCall*. That is, the end responsible for originating calls must have *addressToCall* provisioned, while the end responsible for terminating calls must have *localAddress* provisioned. In such a case, *addressToCall* on the originating end must match exactly the *localAddress* of the terminating end. Note that both ends may be originating and terminating at the same time. That is, both ends may have *addressToCall* and *localAddress* provisioned as long as *addressToCall* and *localAddress* on different ends are identical.
Mib	BitTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Btds Plc maximumAcceptableGatewayCost (maxGateCost)

Access	Read and write
Criticality	Process
Description	This attribute specifies an upper bound on the gateway cost metric of a route, which is the sum of the gateway cost metrics of all gateway links on the route. It has the same semantics as the *maximumAcceptableCost* except that gateway cost metrics are used instead of trunk cost metrics. Gateway cost metrics are provisioned under *Trunk Address* component of a gateway link specifying a gateway costs of reaching an address through the link.
Mib	BitTransparent
Values	Decimal (0..65535)
Default	2048

ATTRIBUTE Btds Plc manualPath (mpath)

Access	Read and write
Criticality	Process
Description	This attribute is specifies the sequence of trunks to be used as the route for the path, thus bypassing PORS' automatic route selection. If the path fails the validation, no other path can be selected[1]. This attribute should only be used in special cases since the route selection algorithm is able to find and maintain the best routes. A related path attribute, the *pathType*, determines if this route will be used as a manual or forced path type. As an example, the trunk component name for the third trunk on node MoonBase is "*EM/MoonBase Trk/3*". Note that only the first end of the trunk that the packet would encounter is provisioned. These strings are case insensitive but the complete component name must be input. Note 1: the trunk designation must be a 3-letter form, e.g., 'trk'.

Copyright © 2006, Nortel Nortel Confidential

Note 2: only the outbound trunks component names are used to provision the ***manualPath***.

Note 3: It is recommended to have two independent routes specified for a manual path by specifying a different ***manualPath*** (non-symmetric) for each end. In this case, there is no way to select which route will be used (first up wins) but if one path is torn down due to a failure then the other ***manualPath*** may be used to reroute the path.

Mib	BitTransparent
Vector of	String (0..40, ASCII)
Index	Decimal (0..9)

COMPONENT Btds LogicalConnection (LCo)

Groups	GROUP Btds LCo PathData GROUP Btds LCo Statistics (Stats)
Scope	Application
Description	*...Lc* This component contains all of the operation attributes for a Path Oriented Logical Connection.
Mib	BitTransparent
Common Verbs	Help List Display

Copyright © 2006, Nortel Nortel Confidential

VERB RERoute Btds LCo

Impact	Service
Description	RERoute ..Lc This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified. This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively. When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path. If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP Btds LCo PathData

Properties	Operational
Description	This group contains all operational attributes for the path oriented LCo.
Mib	BitTransparent

ATTRIBUTE Btds LCo state

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.
Mib	BitTransparent
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Btds LCo overrideRemoteName (orn)

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	BitTransparent
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Btds LCo end

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	BitTransparent
Values	calling called
Default	No default

ATTRIBUTE Btds LCo costMetric (cost)

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	BitTransparent
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Btds LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established.

Copyright © 2006, Nortel Nortel Confidential

	The delay for an LCo that is originated and terminated on the same module is 0.
Mib	BitTransparent
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE Btds LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	BitTransparent
Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE Btds LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.
Mib	BitTransparent
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Btds LCo holdingPriority (hpri)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	BitTransparent
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Btds LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	BitTransparent
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Btds LCo requiredRxBandwidth (rbw)

Access	Read only

ATTRIBUTE Btds LCo requiredCustomerParameter (rcparm)

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	BitTransparent
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Btds LCo emissionPriority (epri)

Access	Read only
Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority*. *EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	BitTransparent
Values	Decimal (0..2)
Default	No default

ATTRIBUTE Btds LCo discardPriority (dpri)

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority*. One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).

ATTRIBUTE Btds LCo pathType (pType)

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	BitTransparent
Values	normal manual forced
Default	No default

ATTRIBUTE Btds LCo retryCount (rcount)

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.
Mib	BitTransparent
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Btds LCo pathFailureCount (pfcount)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.
Mib	BitTransparent
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Btds LCo reasonForNoRoute (rnr)

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.
Mib	BitTransparent
Values	none destinationNameTooLong destinationNotSpecified unknownDestinationName incorrectDestination incorrectDestinationEndPoint unknownSource unknownDestination sameNode routeCostTooMuch routesDelayTooLong attributesNotMet anError attributeProfileProblem manualPathIndexProblem
Default	none

ATTRIBUTE Btds LCo lastTearDownReason

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons:

Copyright © 2006, Nortel Nortel Confidential

none - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up.
normalShutDown - This path has gone down due to normal call termination.
insufficientTxLcOrBandwidth - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction.
insufficientRxLcOrBandwidth - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction.
trunkFailure- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute.
trunkCardFailure- A trunk FP card has failed along the path.
accessCardFailure- The FP on which the peer access service was running has failed.
operatorForced- The path has terminated due to the operator locking a trunk along the path.
lostLcnClash- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC.
networkCongestion - The path has failed due to control information being lost and not recoverable.
trunkNotFound - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
farEndNotFound - The far end is not provisioned or is not up. Check remote Name.
wrongModuleReached - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
farEndBusy - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
callLoopedBack - This LCo is provisioned to call itself. Re-provision since this is invalid.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
remoteNameMismatch - The remote end has alarmed and rejected this setup due to remoteName provisioning.
serviceTypeMismatch - The remote Service Type does not match this service type. Check provisioning.
reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.

Copyright © 2006, Nortel Nortel Confidential

trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

ATTRIBUTE Btds LCo pathFailureAction

Access — Read only

Description — This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are

Copyright © 2006, Nortel Nortel Confidential

different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Mib	BitTransparent
Values	reRoutePath disconnectConnection
Default	No default

ATTRIBUTE Btds LCo bumpPreference (bpref)

Access	Read only
Description	This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.
Mib	BitTransparent
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE Btds LCo optimization (opt)

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

Properties	Operational
Description	This group contains attributes which count layer 2 frames potentially significant for voice/data call discrimination. See also the description of the *HdlcStatistics* group.
Mib	BitTransparent

ATTRIBUTE Btds Dpnss1 frmProcessed

Access	Read only
Description	This attribute counts the valid layer 2 frames containing an Information Field with a protocol message. Changes to operational mode of a *VoiceService* are triggered only by a subset of processed frames. Many frames refer to the call progress and are ignored from the standpoint of

Copyright © 2006, Nortel Nortel Confidential

voice/data call discrimination.

The counter wraps to zero when it exceeds its maximum value.

Mib BitTransparent

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Btds Dpnss1 frmInvalid

Access Read only

Description This attribute counts the invalid layer 2 frames.

For DPNSS 1, a frames is counted as invalid if:
- it is shorter than 3 octets or longer than 48 octets (excluding two octets of Cyclic Redundancy Check), or
- it has an invalid bit combination in the Address Field, or
- the Control Field is inconsistent with the Address Field, or
- the type of data is invalid, or
- it relates to time slot 0.

For MCDN, a frame is counted as invalid if:
- it is shorter than 4 or longer than 264 octets (excluding two octets of Cyclic Redundancy Check), or
- it has an invalid bit combination in the Address Field, or
- it has missing or incorrect mandatory information elements.

The counter wraps to zero when it exceeds its maximum value.

Mib	Bridge

ATTRIBUTE CB adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Bridge
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE CB operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Bridge
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE CB usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Bridge
Values	idle active (activ) busy
Default	idle

GROUP CB OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Bridge

ATTRIBUTE CB snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

COMPONENT Collector (Col)

Instance	accounting (acc) alarm (ala) log debug (deb) scn trap stats rtStats (rts) applicationSpecific (appl)
Groups	GROUP Col Provisioned (Prov) GROUP Col Statistics (Stats)

COLLECTED STATS Collector

Scope	Device
Description	*Collector/<dataType>* There is a *Collector* for each data stream. It is a permanent component that resides on the active CP. Its main function is to coordinate the collection of data from all its *Agent* subcomponents and distribute that data to the downstream applications which have requested it (for example, one or more *Session*s or its *Spooler* subcomponent). It also coordinates the time-of-day accounting (TODA) schedules and spooled statistics probes.
Mib	DataCollection

Mib	DataCollection

ATTRIBUTE Col collectionTimes (times)

Access	Read and write
Description	This attribute specifies the scheduled times at which data should be collected. Only accounting applications need the capability to generate data in this way. Setting this attribute for other streams has no effect. The user can enter the times in any order and duplicates are prevented at data entry. There is a limit of 24 entries, which is imposed at semantic check time. The collection times are triggered in chronological order. A semantic check error is issued if any 2 entries are less than 1 hour apart or if any 2 entries are more than 12 hours apart (which implies that if any entries are provided, there must be at least 2 entries). Note that by default (that is, in the absence of a provisioned schedule), a Virtual Circuit (VC) starts its own 12-hour accounting timer. If any collection times are provisioned here, then the Time-Of-Day-Accounting (TODA) method is used in place of 12-hour accounting. This is applicable to both Switched VCs and Permanent VCs.
Mib	DataCollection
List of	Time (HM)
List Size	24
Default	No default

ATTRIBUTE Col peakWaterMarkInterval (peak)

Access	Read and write
Description	This attribute specifies the length of the accounting peak water mark interval. It is at least one minute and at most 15 minutes long. An accounting peak water mark within a given accounting interval is the accounting count which occurred during a peak water mark interval with the highest traffic. Peak water marks are used to determine traffic bursts. If no value is provisioned for this attribute, a value of 5 minutes is assumed. Peak water mark is only measured if the attribute *collectionTimes* in *Collector/account* is provisioned.

VERB Newfile Col Sp

Impact: Service

Description: *Newfile Col/<datatype> Sp*
This command causes the *Spooler* to open a new file to continue spooling. Typically, this is done because the user wants to retrieve the latest set of records for this type of data. If the new file can be opened, the existing spooling file is closed and moved into the standard “closed” disk directory; otherwise, the existing file is not closed and it remains in the directory containing the open spooling files.

This command operates on all opened files being used in the applicationSpecific stream.

The command succeeds if the new file can be opened; otherwise, the command fails. As long as the file system is available, spooling can continue in the existing open file. Of course, any time the file system is unavailable, spooling stops.

GROUP Col Sp **Provisioned (Prov)**

Properties: Provisioned

Description:
This group specifies all of the provisioning data for a DCS *Spooler*.

Mib: DataCollection

ATTRIBUTE Col Sp **spooling (spool)**

Access: Read and write

Description:
This attribute specifies whether or not this type of data is spooled to the disk. If set to ***off***, it is roughly equivalent to Locking the *Spooler* (except this will survive processor restarts).

The following defaults are used:
- alarm: on
- accounting: on
- log: on
- debug: off
- scn: on
- trap: off (see Note below)
- stats: on
- rtStats: off (see Note below)
- applicationSpecific: on

Note that SNMP Traps and rtStats cannot be spooled. A semantic check prevents the user from setting the value to ***on*** for the trap stream.

Spooling is always turned on for the log stream. A user is prevented from setting the value to ***off*** for the log stream.

Copyright © 2006, Nortel Nortel Confidential

Mib	DataCollection
Values	on off
Default	No default

ATTRIBUTE Col Sp maximumNumberOfFiles (maxFile)

Access	Read and write
Description	This attribute specifies the maximum number of files that should be kept on the disk in the directory containing the closed files of this type. The value 0 is defined to mean “unlimited”. A different default for each type of *Spooler* is defined as follows: - alarm: 30 - accounting: 200 - debug: 2 - log: 0 (see Note below) - scn: 10 - trap: 2 (this value is meaningless and is ignored) - stats: 200 - rtStats: 2 (this value is meaningless and is ignored) - applicationSpecific: 200 Note that the value of this attribute cannot be modified for the log stream.
Mib	DataCollection
Values	Decimal (0..200)
Default	No default

ATTRIBUTE Col Sp daysToRetainFiles

Access	Read and write
Description	This attribute specifies the number of days a spooled file should be kept on the disk in the directory containing the closed files of this type. The value 0 is defined to mean “unlimited”. The spooled files are purged, if the age of a file in days exceeds the value of the *daysToRetainFiles* attribute or the number of spooled files exceeds the value of the *maximumNumberOfFiles* attribute for a particular data type. The default for each type of *Spooler* except log is 0. The default for the log stream is 5. The value of this attribute cannot be modified for all types of *Spooler* except log.

Copyright © 2006, Nortel Nortel Confidential

Note that the value of this attribute cannot be set to 0 for the log stream. A semantic check prevents the user from setting the value to 0 for the log stream.

For security reasons, only a system administrator is allowed to set the value of this attribute for the log stream.

Mib DataCollection

Values Decimal (0..30)

Default No default

GROUP Col Sp OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib DataCollection

ATTRIBUTE Col Sp adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

ATTRIBUTE Col Sp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	DataCollection
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Col Sp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	DataCollection
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Col Sp availabilityStatus (osiAvail)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description

If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Col Sp proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Col Sp controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE Col Sp standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Description	This attribute indicates the OSI Operational State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — CallRedirection

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Crs usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — CallRedirection

Values — idle
active (activ)
busy

Default — idle

GROUP Crs Statistics (Stat)

Properties — Operational

Description — The *Statistics* operational group defines the statistics associated with the *CallRedirectionServer* component.

Mib — CallRedirection

ATTRIBUTE Crs totalAddresses

Access — Read only

Description — The *totalAddresses* attribute indicates the number of *PrimaryAddress* components associated with the *CallRedirectionServer* component.

Mib — CallRedirection

Values — Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Crs requestsReceived (reqRx)

Access	Read only
Description	The *requestsReceived* attribute counts the number of redirection requests received by the *CallRedirectionServer* component. This counter wraps to 0 when it exceeds its maximum value.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs primaryMatches (pMatch)

Access	Read only
Description	The *primaryMatches* attribute counts the Call Redirection Server attempts to find a matching *PrimaryAddress* where the lookup attempt was successful. This counter wraps to 0 when it exceeds its maximum value.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs secAddressListExhausted (sAddrEx)

Access	Read only
Description	The *secAddressListExhausted* attribute counts the Call Redirection Server attempts to find a *SecondaryAddress* component given a *PrimaryAddress* component where the lookup attempt resulted in the exhaustion of the secondary redirection list. This counter wraps to 0 when it exceeds its maximum value.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs maxAddrLenExceeded (maxAddrExc)

Access	Read only
Description	The *maxAddrLenExceeded* attribute counts how often the concatenation of the secondary address and the suffix digits from the original called address have exceeded the maximum of 15 digits. The suffix digits can be determined by removing the primary address digits from the front of the original called address. If appending the suffix digits to a secondary address causes the resulting address to exceed 15 digits, this secondary member is skipped and the

Copyright © 2006, Nortel Nortel Confidential

next secondary member is tried.

Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs secRidMidUnsuccessful (sRidMidUnsuc)

Access	Read only
Description	The *secRidMidUnsuccessful* attribute counts the number of RID/MID redirections resulting in the destination address not being reached. This situation could occur when the destination address does not exist on the specified module or the specified module could not be reached.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs secAddrUnsuccessful (sAddrUnsuc)

Access	Read only
Description	The *secAddrUnsuccessful* attribute counts the number of Address redirections resulting in the destination user not being reached. This situation could occur when the destination user line is disabled, the destination address does not exist on the specified module, or the specified module could not be reached.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs ridRedirected (ridRed)

Access	Read only
Description	The *ridRedirected* attribute counts requests received by the Call Redirection Server resulting in the request being redirected to another RID specified by the *AlternateRid* component. This counter wraps to 0 when it exceeds its maximum value.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs ridMidRedirected (ridMidRed)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The *ridMidRedirected* attribute counts requests received by the Call Redirection Server resulting in the request being redirected to another RID/MID specified by the *SecondaryRidMid* component. This counter wraps to 0 when it exceeds its maximum value.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs addressRedirected (addrRed)

Access	Read only
Description	The *addressRedirected* attribute counts requests received by the Call Redirection Server resulting in the request being redirected to another Address specified by the *SecondaryAddress* component. This counter wraps to 0 when it exceeds its maximum value.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Crs altRidUnsuccessful (aRidUnsuc)

Access	Read only
Description	The *altRidUnsuccessful* attribute counts the number of RID redirections resulting in the destination address not being reached. This situation could occur when the alternate RID cannot be reached, the module hosting the destination address is isolated, or the port associated with the secondary address is unavailable at the alternate RID.
Mib	CallRedirection
Values	Decimal (0..4294967295)
Default	0

COMPONENT Crs PrimaryAddress (PAddr)

Instance	String (1..17, NativeAddressWith15DigitX121)
Scope	Network
Description	*Crs PrimaryAddress*/<address> The *PrimaryAddress* component defines a primary address for which a list of alternate destinations are specified. This primary address has either a secondary RID/MID destination or up to seven secondary addresses associated with it. A primary address matches the original destination address if, beginning with the most significant digit, all digits are identical and the primary address is less than or equal to the original destination address in length. The “best match” is the longest such primary address.

Copyright © 2006, Nortel Nortel Confidential

The PrimaryAddress component instance value takes the form:
x.<X.121 address> or e.<E.164 address>

Mib — CallRedirection

Opt. Subcomp. — COMPONENT Crs PAddr SecondaryRidMid (SRidMid)
COMPONENT Crs PAddr SecondaryAddress (SAddr)

Common Verbs — Help, List, Display, Add, DELete

COMPONENT Crs PAddr SecondaryRidMid (SRidMid)

Groups — GROUP Crs PAddr SRidMid RidMidProv

Scope — Network

Description — *Crs Paddr/<address> SecondaryRidMid*
The *SecondaryRidMid* component identifies an alternate destination module on which the primary address is also supported. RID/MID redirection allows the call redirection server to effectively override the original destination identified by the call routing system and forward the call to a different module.

Mib — CallRedirection

Common Verbs — Help, List, Display, Add, DELete

GROUP Crs PAddr SRidMid RidMidProv

Properties — Provisioned

Description — The *SecRidMidProv* group defines the secondary RID/MID pair associated with a specific primary address.

Mib — CallRedirection

ATTRIBUTE Crs PAddr SRidMid routingId (rid)

Access — Read and write

Description — This attribute specifies a group of one or more interconnected nodes (called a subnet) to which the primary address is redirected.

Mib — CallRedirection

Values — Decimal (1..126)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Crs PAddr SRidMid **moduleId (mid)**

Access	Read and write
Description	This attribute specifies a node to which the primary address is redirected.
Mib	CallRedirection
Values	Decimal (1..1909)
Default	No default

COMPONENT Crs PAddr **SecondaryAddress (SAddr)**

Instance	Decimal (1..7)
Groups	GROUP Crs PAddr SAddr SecAddrProv
Scope	Network
Description	Crs Paddr/<address> SecondaryAddress/n The SecondaryAddress component identifies an alternate destination address. Address redirection allows the call redirection server to effectively override the original destination address and forward the call to a different destination within the network.
Mib	CallRedirection
Common Verbs	Help List Display Add DELete

GROUP Crs PAddr SAddr **SecAddrProv**

Properties	Provisioned
Description	The *SecAddrProv* group defines one of the secondary addresses associated with a specific primary address.
Mib	CallRedirection

ATTRIBUTE Crs PAddr SAddr **address (addr)**

Access	Read and write
Description	This attribute specifies a secondary address to which the primary address is redirected. The *address* attribute includes the Numbering Plan Indicator (NPI) and the digits which form a unique identifier of the customer interface. The address may belong to the X.121 or E.164 addressing plan. Address digits are selected and assigned by network operators.

	The *address* attribute takes the form: x.<X.121 address> or e.<E.164 address>
Mib	CallRedirection
Values	String (1..17, NativeAddressWith15DigitX121)
Default	No default

COMPONENT Crs AlternateRid (AltRid)

Groups	GROUP Crs AltRid AltRidProv
Scope	Network
Description	*Crs AlternateRid* The *AlternateRid* component defines the routing identifier value that is used as the alternate DPRS routing information when routing to the RID specified by the Call Router (CR) is unsuccessful. This component should only be provisioned as a temporary measure.When activated the RID redirection feature as significant impact on the normal redirection operation, since RID redirection is always attempted first. One of the possible application of this feature being RID splitting, the *AlternateRid* component should be deleted as soon as all module have been migrated from their original RID and the Call Router (CR) throughout the network have been updated with the new RID information.
Mib	CallRedirection
Common Verbs	Help List Display Add DELete

GROUP Crs AltRid AltRidProv

Properties	Provisioned
Description	The *AltRidProv* group defines the alternate RID associated with the *Crs* component.

COMPONENT CallRouter (CR)

Scope	Network
Description	CallRouter This component performs the call routing function. It is a database containing prefix-DNAs. Unlike the DNAs under the NumberingPlanIndicator component which are only local DNAs, the DNAs under this component can refer to local DNAs and DNAs resident on other nodes. This component represents a database that is used to translate a DNA in a call setup packet into a ModuleId or a RoutingId so that the call setup packet can be routed to the correct node within the subnet or to the correct subnet. This call router can only be used for a network composed of Nortel Networks Multiservice Switches. This call router only provides service when there is no CSRM attached to the subnet. If a CSRM is connected to the subnet, the CSRM will provide the call routing service.

COMPONENT CR Npi DataNetworkAddress (Dna)

Instance	BCD (1..15, Wildcarded)
Groups	GROUP CR Npi Dna Provisioned (Prov)
Scope	Network
Description	Cr Npi/<x121,e164> Dna/<BCD(1..15, WILDCARDED)> This subcomponent represents a prefix-DNA in the numbering plan. The instance value must be 1 to 15 digits each of value 0 through 9 or wildcard.Wild digits may be used so that the digit position specified by the wild digit is ignored when making a routing decision. This will reduce the number of prefix-DNAs needed to properly route the calls. The wild digit is represented by “?”. Wildcarding inconsistencies can not exist. If a prefix-DNA already exists in the database with a specific digit in position 3, new prefix-DNAs may not be added with a wildcard in position 3. Similarly, if the prefix-DNA already exists with a wildcard in a particular position, a similar prefix-DNA cannot be added with a specific digit in the same position.

ATTRIBUTE DataSigChan commentText

Access	Read: All Write: All
Description	This attribute specifies the name of the customer that is using this *DataSigChan*. Typical use of this attribute is to store customer name.
Mib	DataIsdn
Values	String (0..40, ASCII)
Default	No default

GROUP DataSigChan CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	DataIsdn

ATTRIBUTE DataSigChan customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	DataIsdn
Values	Decimal (0; 1..8191)
Default	0

GROUP DataSigChan IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	DataIsdn

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DataSigChan ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	DataIsdn
Values	up down testing
Default	up

ATTRIBUTE DataSigChan ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	DataIsdn
Values	Decimal (1..65535)
Default	No default

GROUP DataSigChan OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	DataIsdn

ATTRIBUTE DataSigChan adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — DataIsdn

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE DataSigChan operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — DataIsdn

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE DataSigChan usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

GROUP **DataSigChan TS014** **Tools**

Properties	Operational
Description	This group contains a series of operational attributes which turn on and off several kinds of tracing.
Mib	DisdnTS014

ATTRIBUTE **DataSigChan TS014** **tracing**

Access	Read: All Write: All
Description	This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in Col/debug must be greater than 0 and a Telnet NMIS session must list the debug stream in its data streams (for example, *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously. Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages. Types of tracing include: ***protocolErrors*** - get details of any protocol errors which are occurring.

Copyright © 2006, Nortel Nortel Confidential

Protocol errors are also reported in summary form as alarms.
q931Summary - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
q931Hex - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
q931Symbolic - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
portHex - Messages in hex format being sent and received on the link.

COMPONENT DataSigChan TS014 Framer (Framer)

Groups:
GROUP DataSigChan TS014 Framer Provisioned (Prov)
GROUP DataSigChan TS014 Framer OsiState (State)
GROUP DataSigChan TS014 Framer Statistics (Stats)

COLLECTED STATS DataSignallingChannel TS014 Framer

Scope: Application

Description

DataSigChan/n ts014 Framer

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

The e1/ds1 port number of the physical channel linked to the *Framer* component is restricted to 0-3 for all FP including MSA32.

Mib	DisdnTS014
Common Verbs	Help List Display

GROUP DataSigChan TS014 Framer **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	DisdnTS014

ATTRIBUTE DataSigChan TS014 Framer **interfaceName**

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	DisdnTS014
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP DataSigChan TS014 Framer **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	DisdnTS014

ATTRIBUTE DataSigChan TS014 Framer **adminState (osiAdmin)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	DisdnTS014
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE DataSigChan TS014 Framer **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	DisdnTS014
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE DataSigChan TS014 Framer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Description

DataSigChan/n ts014 Framer

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

The e1/ds1 port number of the physical channel linked to the *Framer* component is restricted to 0-3 for all FP including MSA32.

GROUP DataSigChan Etsi Framer **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	DisdnETSI

ATTRIBUTE DataSigChan Etsi Framer **interfaceName**

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	DisdnETSI
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP DataSigChan Etsi Framer **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	DisdnETSI

ATTRIBUTE DataSigChan Etsi Framer **adminState (osiAdmin)**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	DisdnETSI
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE DataSigChan Etsi Framer **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	DisdnETSI
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE DataSigChan Etsi Framer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Default	No default

GROUP DataSigChan Ins **Tools**

Properties	Operational
Description	This group contains a series of operational attributes which turn on and off several kinds of tracing.
Mib	DisdnJapanIns

ATTRIBUTE DataSigChan Ins **tracing**

Access	Read: All Write: All
Description	This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in Col/debug must be greater than 0 and a Telnet NMIS session must list the debug stream in its data streams (for example, *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously. Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages. Types of tracing include: ***protocolErrors*** - get details of any protocol errors which are occurring.

Copyright © 2006, Nortel Nortel Confidential

Protocol errors are also reported in summary form as alarms.
q931Summary - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
q931Hex - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
q931Symbolic - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
portHex - Messages in hex format being sent and received on the link.

GROUP DataSigChan Ni2 Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	DisdnNI2

ATTRIBUTE DataSigChan Ni2 Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	DisdnNI2
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP DataSigChan Ni2 Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	DisdnNI2

ATTRIBUTE DataSigChan Ni2 Framer adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	DisdnNI2
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE DataSigChan Ni2 Framer **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	DisdnNI2
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE DataSigChan Ni2 Framer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib DisdnNI2

Values
idle
active (activ)
busy

Default idle

GROUP DataSigChan Ni2 Framer Statistics (Stats)

Properties Operational

Description
This group contains the operational statistics data for a Framer component.

Mib DisdnNI2

ATTRIBUTE DataSigChan Ni2 Framer aborts

Access Read only

Description
This attribute counts the total number of aborts received.
This count wraps to zero after reaching its maximum value.

Mib DisdnNI2

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE DataSigChan Ni2 Framer crcErrors

Access Read only

Description
This attribute counts the total number of frames with CRC errors.
This count wraps to zero after reaching its maximum value.

Mib DisdnNI2

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE DataSigChan Ni2 Framer lrcErrors

Access Read only

Description
This attribute counts the total number of frames with LRC errors.
This count wraps to zero after reaching its maximum value.

Values	network user
Default	user

GROUP DataSigChan Nis Operational (Oper)

Properties	Operational
Description	This group provides the operational attributes for the signalling protocol.
Mib	DisdnNIS

ATTRIBUTE DataSigChan Nis activeChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the number of currently active channels. This includes data and voice channels.
Mib	DisdnNIS
Values	Decimal (0..128)
Default	0

ATTRIBUTE DataSigChan Nis peakActiveChannels

Access	Read: All Write: Illegal
Description	This attribute indicates the maximum number of channels that have been active on this signalling channel during the last polling period.
Mib	DisdnNIS
Values	Decimal (0..128)
Default	0

ATTRIBUTE DataSigChan Nis dChanStatus (dCh)

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the state of the D-channel. ***outOfService*** means that there is no layer 2 or layer 3 connectivity to the PBX. ***establishing*** means that the signalling channel is attempting to stage the layer 2. ***established*** means that the layer 2 is enabled. If the signalling channel stays in the ***established*** state, then it is waiting for a restart from the PBX. ***enabling*** means that the resources for processing calls are being initialized. If the signalling channel stays in the ***enabling*** state then it is waiting for a restart acknowledgement from the PBX. ***inService*** means that the resources for processing calls are available. ***restarting*** means that the resources for call processing are being re-initialized.
Mib	DisdnNIS
Values	outOfService establishing established enabling inService restarting
Default	No default

GROUP DataSigChan Nis Tools

Properties	Operational
Description	This group contains a series of operational attributes which turn on and off several kinds of tracing.
Mib	DisdnNIS

ATTRIBUTE DataSigChan Nis tracing

Access	Read: All Write: All
Description	This attribute defines which types of tracing are active for this signalling channel. The tracing messages are sent to the debug stream. To see the messages the *agentQueue* attribute in Col/debug must be greater than 0 and a Telnet NMIS session must list the debug stream in its data streams (for example, *set nmis telnet session/1 dataStreams debug*). Different types of tracing can be enabled simultaneously. Note that tracing consumes additional CPU resources and will slow down call processing on a heavily loaded card. If there is message block exhaustion tracing will be suspended for a period and then automatically re-enabled. An alarm is generated on tracing suspension and resumption. This mechanism protects the function processor against excessive numbers of tracing messages. Types of tracing include: ***protocolErrors*** - get details of any protocol errors which are occurring.

Copyright © 2006, Nortel Nortel Confidential

Protocol errors are also reported in summary form as alarms.
q931Summary - Summary of the Q.931 messages on the signalling link, including certain call details (calling number, called number, release codes).
q931Hex - Q.931 messages displayed in hex format. Useful to determine protocol compliance in case of errors reported on local or remote ends.
q931Symbolic - Q.931 messages parsed to give maximum detail. Useful for understanding content of messages flowing on the link.
portHex - Messages in hex format being sent and received on the link.

COMPONENT DataSigChan Nis Framer (Framer)

Groups:
GROUP DataSigChan Nis Framer Provisioned (Prov)
GROUP DataSigChan Nis Framer OsiState (State)
GROUP DataSigChan Nis Framer Statistics (Stats)

COLLECTED STATS DataSignallingChannel Nis Framer

Scope: Application

Description

DataSigChan/n ts014 Framer

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

The e1/ds1 port number of the physical channel linked to the *Framer* component is restricted to 0-3 for all FP including MSA32.

ATTRIBUTE Dcl idlePattern

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies an *idlePattern* in the channel received from the E1 interface, which is required to determine if the channel is active or not. When the end of the *idlePattern* is detected it indicates the start of a new speech call. When this *idlePattern* is detected it indicates the end of a speech call. When changing this attribute make sure that the *alternateIdlePattern* signal is set correctly.
Mib	Dcme
Values	Hex (H.0..H.ff)
Units	Hex
Default	H.d5

ATTRIBUTE Dcl alternateIdlePattern

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies an *alternateIdlePattern* in the channel received from the E1 interface, after the end of a 64kbit/s call. The value of this attribute should be different than the value of the *idlePattern* attribute only if the ISC is programmed for Even/Odd Bit Inversion (EBI/OBI). This is only the case when the ISC is performing A to Mu or Mu to A Law conversion. When the end of the *alternateIdlePattern* is detected it indicates the start of a new speech call.
Mib	Dcme
Values	Hex (H.0..H.ff)
Units	Hex
Default	H.d5

Access	Read only
Description	This attribute indicates the last TRM signal received from the ISC. The received TRM signal can be one of: ***Invalid (xxx)***: this signal should never be received, ***Switching Centre normal (101)***: this signal is always transmitted by the ISC when there is no other signal to be sent, ***Maintenance release ack(110)***: this signal is transmitted by the ISC if it accepts the maintenance release request, ***Dcme clear of traffic***: this signal is transmitted by the ISC if it has accepted the maintenance release request signal and now informs the DCME when all circuits are idle,
Mib	Dcme
Values	None(000) Invalid (001) Invalid (010) Invalid (011) Invalid (100) Switching Centre normal (101) Maintenance release ack (110) Dcme clear of traffic (111)
Default	No default

ATTRIBUTE Dcl transmittedTrmSignal

Access	Read only
Description	This attribute indicates the last TRM signal transmitted to the ISC. The transmitted TRM signal can be one of: ***Dcme normal (100)***: , this signal is always transmitted by the DCME when there is no other signal to be sent, ***No 64 kbit/s capacity (101)***: this signal is transmitted by the DCME when it is not able to handle new 64 kbit/s call requests, ***Maintenance release request(110)***: this signal is transmitted by the DCME when the DCME is to be removed from the service for maintenance,

Copyright © 2006, Nortel Nortel Confidential

No capacity available (111) this signal is transmitted by the DCME when there is bearer capacity available to set up new 3.1 kHz audio or speech calls,

Mib	Dcme
Values	None(000) Dcme normal(100) No 64 kbit/s capacity (101) Maintenance release request (110) No capacity available (111)
Default	No default

GROUP Dcl Statistics (Stats)

Properties	Operational
Description	This group contains statistics for the *DcmeLink* component.
Mib	Dcme

ATTRIBUTE Dcl totalSpeechCalls

Access	Read: All Write: Illegal
Description	This attribute counts the total number of speech calls that have been handled by this *DcmeLink*, including rejected calls. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Dcl total3kHzCalls

Access	Read: All Write: Illegal
Description	This attribute counts the total number of audio 3.1 kHz calls that have been handled by this *DcmeLink*, including rejected calls. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Dcl total64kCalls

Access	Read: All Write: Illegal

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of unrestricted 64 kbit/s calls that have been handled by this *DcmeLink*, including rejected calls. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Dcl rejectedSpeechCalls

Access	Read: All Write: Illegal
Description	This attribute counts the total number of speech calls that have been rejected by this *DcmeLink* because there was no preestablished LC available. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Dcl rejected3kHzCalls

Access	Read: All Write: Illegal
Description	This attribute counts the total number of audio 3.1 KHz calls that have been rejected by this *DcmeLink* because there was no preestablished LC available. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Dcl rejected64kCalls

Access	Read: All Write: Illegal
Description	This attribute counts the total number of unrestricted 64 kbit/s calls that have been rejected by this *DcmeLink*. This counter wraps to zero when it reaches its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dcl invalidTrmSignals

Access	Read: All Write: Illegal
Description	This attribute counts the number of invalid TRM/Maintenance signals received from the ISC by this *DcmeLink*. The most probable cause of an invalid TRM/Maintenance signal is an invalid ISC provisioning or a transmission error. The invalid bit settings are 000, 001, 010, 011, 100. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

COMPONENT Dcl DataNetworkAddress (Dna)

Groups	GROUP Dcl Dna Address
Scope	Network
Description	*DcmeLink/n DataNetworkAddress* This is the description of the DCME link *Dna* component. It includes the attributes which apply to all connections established between *DcmeLink* and its peer *DcmeLink*.
Mib	Dcme
Common Verbs	Help List Display

GROUP Dcl Dna Address

Properties	Provisioned
Description	The *Address* group contains attributes common to all *Dna's*. Every *Dna* used in the network is defined with this group of 2 attributes. The string of address digits is complemented by the type of address or Npi. These attributes are used to interpret the format of the address digits.
Mib	Dcme

ATTRIBUTE Dcl Dna numberingPlanIndicator (npi)

Access	Read: All Write: All
Description	This attribute indicates the Numbering Plan Indicator (NPI) of the *Dna* that is entered. An address may belong to the X.121 or E.164 numbering plans. X.121 is used in packet switched data networks.
Mib	Dcme

Copyright © 2006, Nortel Nortel Confidential

Values	x121 e164
Default	e164

ATTRIBUTE Dcl Dna dataNetworkAddress (dna)

Access	Read: All Write: All
Description	The *Dna* attribute contains digits which form a unique identifier of the customer interface. It can be compared (approximation only) to a telephone number where each phone number identifies a unique telephone set. *Dna* digits are selected and assigned by network operators.
Mib	Dcme
Values	BCD (1..15)
Default	No default

COMPONENT Dcl Framer (Framer)

Groups	GROUP Dcl Framer Provisioned (Prov) GROUP Dcl Framer OsiState (State)
Scope	Application
Description	*DcmeLink/n Framer* The *Framer* component controls link layer framing for application components sending and receiving data on the link interface to the ISC. It is also through the *Framer* that an application component is associated with a specific hardware link interface. The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as CRC and frame length). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).
Mib	Dcme
Common Verbs	Help List Display

GROUP Dcl Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component.

Copyright © 2006, Nortel Nortel Confidential

Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

Mib Dcme

ATTRIBUTE Dcl Framer interfaceName

Access Read and write

Criticality Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Mib Dcme

Values Link (Hardware, applicationFramerName)

Default No default

GROUP Dcl Framer OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Dcme

ATTRIBUTE Dcl Framer adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dcme
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Dcl Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Dcme
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Dcl Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Dcme
Values	idle active (activ) busy
Default	idle

COMPONENT Dcl VoiceService (Vs)

GROUP Dcl Vs Operational (Oper)

Properties	Operational
Description	This group provides the operational attributes for the *DcmeVoiceService* component.
Mib	Dcme

ATTRIBUTE Dcl Vs status

Access	Read: All Write: Illegal
Description	This attribute indicates the current status of the channel. ***idle*** means that there is no call currently active on this channel. ***seized*** means that the channel has currently an active call.
Mib	Dcme
Values	idle seized
Default	No default

ATTRIBUTE Dcl Vs callType (ct)

Access	Read: All Write: Illegal
Description	This attribute indicates the type of call that this channel is currently carrying. If no call is active, then it displays the value for the last call.
Mib	Dcme
Values	none speech 3.1 kHz 64 kbit/s
Default	No default

ATTRIBUTE Dcl Vs receivedAbBits

Access	Read only
Description	This attribute indicates the most recently received AB bits.
Mib	Dcme
Values	None (00) Normal service available (01) 3.1 kHz request (10) 64 kbit/s request (11)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dcl Vs transmittedAbBits

Access	Read only
Description	This attribute indicates the AB bits currently being transmitted.
Mib	Dcme
Values	None(00) Normal service available (01) Special service ack (10) Channel out of service (11)
Default	No default

GROUP Dcl Vs Statistics (Stats)

Properties	Operational
Description	This group provides the operational attributes for the *DcmeVoiceService* component.
Mib	Dcme

ATTRIBUTE Dcl Vs totalCalls (tc)

Access	Read: All Write: Illegal
Description	This attribute counts the call attempts processed on this channel (in both directions). This count includes both successful and unsuccessful calls. The value wraps when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Dcl Vs totalCallSeconds (tcs)

Access	Read: All Write: Illegal
Description	This attribute counts the total number of seconds that this channel is handling a call. This is regardless of whether the call is successful or not. In other words, this is the amount of time that the channel is not in the idle state. The value wraps when it reaches its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Units	seconds
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dcl Vs invalidAbBits

Access	Read: All Write: Illegal
Description	This attribute counts the number of invalid AB bits signals received from the ISC on this channel. The invalid bit setting is 00. This counter wraps to zero when it reaches its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

GROUP Dcl Vs Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	Dcme

ATTRIBUTE Dcl Vs Framer totalCells

Access	Read only
Description	This attribute counts the cells received from the interface. Each cell contains 44 bytes of data from the DS0 channel. Since a DS0 provides data at 64kbit/s, each cell contains 5.5 ms of audio data. This data flow is measured before compression is performed on the channel. The counter wraps to zero when it exceeds its maximum value.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dcl Vs Framer audioCells

Access	Read only
Description	This attribute counts the total number of cells containing audio data received from the interface while the channel was seized. A CCS channel is always considered to be seized. Audio data includes cells containing voice as well modem audio, but not silence. A cell contains 44 bytes of data from the DS0 channel(5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer silenceCells

Access	Read only
Description	This attribute counts the total number of cells containing silence data received from the interface which was not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the operation of the silence suppression feature or for CAS channels when the ABCD signalling bits go idle. A cell contains 44 bytes of data from the DS0 channel(5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer lrcErrors

Access	Read only
Description	This attribute counts the number of frames received from the network with LRC errors.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer frmLostInNetwork

Access	Read only
Description	This attribute counts the number of frames which the service knows it did not receive from the network although they were sent in to the network from the far end.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer frmUnderRuns

Access	Read only
Description	This attribute counts the number of times that a frame was needed but was not available because it had been delayed too long in the network. This error may occur repeatedly if the interface clocks at the two access points to the network are operating at different rates.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer frmDumped

Access	Read only
Description	This attribute counts the number of frames which have been dumped because the output queue grew too large. This can occur if the clock rate on the incoming interface is faster than the clock rate on the outgoing interface and there are no silence periods to absorb the difference, or when a compression rate change occurs. This count wraps to zero after reaching its maximum value.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer faxRelayCells

Access	Read only
Description	This attribute counts the total number of fax relay cells sent to the network. This counter wraps to zero after reaching its maximum value.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer modemFaxCells

Access	Read only
Description	This attribute counts the total number of cells containing modem data received from the interface while the channel was seized. A CCS channel

Copyright © 2006, Nortel Nortel Confidential

	is always considered to be seized. Cells are considered to be modem data if a constant energy level above -25 dBmO is detected for more than 900 ms. An energy level below -36 dBmO for more than 650 ms is required to detect that the modem is no longer present. A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE Dcl Vs Framer faxIdleCells

Access	Read only
Description	This attribute counts the total number of cells containing silent fax data received from the interface which were not forwarded into the network, thus saving bandwidth. A channel may go into silence due to the silence Suppression feature or for CAS channels when the ABCD signalling bits go idle. A cell contains 44 bytes of data from the DS0 channel (5.5 ms). This flow is measured before compression is performed on the channel. This counter wraps to zero after reaching its maximum value.
Mib	Dcme
Values	Decimal (0..4294967295)

Description	This attribute indicates the result of negotiating DTMF regeneration with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp dtmfRegeneration*. If *negotiatedDtmfRegeneration* is ***on***, DTMF tones received from the link

Copyright © 2006, Nortel Nortel Confidential

	are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is generated before being sent to the link. If *negotiatedDtmfRegeneration* is ***off***, DTMF tones are transported transparently.
Mib	Dcme
Values	off on
Default	No default

ATTRIBUTE Dcl Vs Framer negotiatedV17AsG711G726 (nV17AsG711G726)

Access	Read only
Description	This attribute indicates how this *SwitchedVoiceService* negotiates with V.17 fax machines, as determined by negotiation with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp v17EncodedAsG711G726*. If *negotiatedV17AsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29, and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay. If *negotiatedV17AsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is encoded using G.711 or G.726, at the rates given in *negotiatedRates*.
Mib	Dcme
Values	yes no
Default	No default

ATTRIBUTE Dcl Vs Framer negotiatedTandemPassThrough (nTpt)

Access	Read only
Description	This attribute indicates the result of negotiating tandem pass through with the remote end across the subnet. The parameter used for negotiating with the remote end is provisioned in *Vncs Vp tandemPassThrough*.
Mib	Dcme
Values	enabled disabled
Default	No default

ATTRIBUTE Dcl Vs Framer negotiatedEncoding (nEncoding)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the results of negotiating audio call encodings for ***voice***, ***modemFax*** and ***fax*** traffic with the remote end across the subnet. The parameters used for negotiating with the remote end are provisioned in *Vncs Vp voiceEncodingChoice* and *Vncs Vp modemFaxEncodingChoice*. ***voice*** traffic is all traffic from the start of a call or speech until a 2100 Hz tone or call release. ***modemFax*** traffic is all traffic after a 2100 Hz tone but before a fax preamble, speech or call release. ***fax*** traffic is all traffic after a fax preamble but before speech or call release. ***g711*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 is the negotiated encoding. ***g726*** indicates that Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 is the negotiated encoding. ***g711G726*** indicates that pulse code modulation (PCM) defined by ITU-T G.711 and Adaptive Differential Pulse Code Modulation (ADPCM) defined by ITU-T G.726 are both negotiated encodings. If *negotiatedEncoding* is ***g711G726***, the actual encoding performed can be either G.711 or G.726, depending on network congestion. ***g728*** indicates that Low Delay Coded Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.728 is the negotiated encoding. ***g729*** indicates that Conjunctive Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) defined by ITU-T G.729 is the negotiated encoding. ***v29V27Relay*** indicates that fax relay using ITU-T V.29 or ITU-T V.27 is the negotiated encoding. ***v17V29V27Relay*** indicates that fax relay using ITU-T V.17, ITU-T V.29, or ITU-T V.27 is the negotiated encoding. If all negotiated encodings are ***none***, the negotiation of audio call encodings is not complete.

Description — *Vsr/n Svs/m Framer PcmCapture*
This component contains attributes for PCM data capture.

Mib — Dcme

Common Verbs — Help, List, Display

COMPONENT Dcl Vs LogicalConnection (LCo)

Groups — GROUP Dcl Vs LCo PathData
GROUP Dcl Vs LCo Statistics (Stats)

Scope — Application

Description — *...Lc*
This component contains all of the operation attributes for a Path Oriented Logical Connection.

Mib — Dcme

Common Verbs — Help, List, Display

VERB RERoute Dcl Vs LCo

Impact — Service

Description — RERoute ..Lc
This command is used to request a *LogicalConnection (LCo)* to attempt a reroute. A new path will be established if it is better than the current path. The current path will not be interrupted if the *RERoute* command is not completely successful. The connection must not be attempting rerouting at present. This command is only valid on components with the *PLC remoteName* specified.
This command is intended to be used on the calling end of a connection. For a single region call, it may be used on the called end of a connection if all the *PLC* parameters match. Note that the calling end or the called end of a connection means the *end* attribute of an *LCo* is equal to the value of ***calling*** or ***called*** respectively.

When used on an *LCo* with *pathType* attribute set to ***manual*** or ***forced,*** this command can be used to re-setup the path.

If this command is attempted on a connection that is not up but its *state* attribute is equal to ***pathDownRetrying,*** an immediate route request is sent.

GROUP Dcl Vs LCo PathData

Properties — Operational

Copyright © 2006, Nortel
Nortel Confidential

Description	This group contains all operational attributes for the path oriented LCo.
Mib	Dcme

ATTRIBUTE Dcl Vs LCo state

Access	Read only
Description	This attribute reflects the current state of the connection. The ***pathDown*** state indicates a connection that has no remote end provisioned or the application has not yet signaled for a path. The ***selectingRoute*** state occurs when a request has been sent to route selector and it has not yet responded. The ***connectingState*** occurs while a path is being established. The ***pathUp*** state is the normal operational state of a path. The ***pathDownRetrying*** state indicates a path that attempted route selection but received no route and is now waiting to retry route selection again.
Mib	Dcme
Values	pathDown selectingRoute connecting pathUp pathDownRetrying
Default	No default

ATTRIBUTE Dcl Vs LCo overrideRemoteName (orn)

Access	Read: All Write: All
Description	If set ***and*** the current PLC remoteName is blank this remoteName will override the blank PLC remoteName. Usually you would set this attribute and then lock/unlock the service component which will result in this new overrideRemoteName being used as if it had been provisioned into the PLC remoteName. The advantage of this attribute is that the connection's remoteName can be changed immediately without having to "activate prov" but the disadvantage is that the overrideRemoteName is not permanent and if the card or switch is reset the override will be lost.
Mib	Dcme
Values	String (0..40, ASCII)
Default	""

ATTRIBUTE Dcl Vs LCo end

Access	Read only
Description	This attribute identifies whether this is the calling or called end of the path.
Mib	Dcme

Copyright © 2006, Nortel Nortel Confidential

Values	calling called
Default	No default

ATTRIBUTE Dcl Vs LCo costMetric (cost)

Access	Read only
Description	This attribute gives the route's total cost metric. It is calculated as the sum of the cost metric of all trunks in the path at the time the connection was established. The cost metric of a trunk is defined by the *trunkCost* attribute of the Trunk component. The *costMetric* for an LCo that is originated and terminated on the same module is 0.
Mib	Dcme
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Dcl Vs LCo delayMetric (delay)

Access	Read only
Description	This attribute gives the total delay of the route as the one way delay for a 512 byte packet. It is calculated as the sum of the delays of all trunks in the path stored in topology at the time the connection was established. The delay for an LCo that is originated and terminated on the same module is 0.
Mib	Dcme
Values	Decimal (0..100000)
Units	msec
Default	No default

ATTRIBUTE Dcl Vs LCo roundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the time taken for a packet (cell) of 44 bytes to be transmitted inband to the remote *LCo* and return to this LCo. The value reported is rounded to the nearest millisecond. For Unack PORS trunks and AAL5 MUX PORS trunks, the test packet is sent inband and receives the same treatment as regular data packets, giving a round trip delay which corresponds to regular data traffic. For SPO MUX PORS trunks and MAP PORS trunks, the test packet is sent along the parent trunk's VCC, giving a round trip delay which corresponds to the parent trunk's round trip delay. The round trip delay does not directly reflect the round trip delay of data packets travelling on the non-parent VCC. When the *LCo* is originated and terminated on the same module, a value

Copyright © 2006, Nortel Nortel Confidential

	of 1 millisecond is reported. The value of 1 millisecond is the minimum reported time even though the delay may be less than 1 millisecond.
Mib	Dcme
Values	Decimal (0..200000)
Units	msec
Default	No default

ATTRIBUTE Dcl Vs LCo setupPriority (spri)

Access	Read only
Description	This attribute gives the priority at which the current path is established. Zero is the highest priority and four is the lowest. The *holdingPriority*, a complementary attribute of this component, indicates the priority a path maintains once it is established.
Mib	Dcme
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Dcl Vs LCo holdingPriority (hpri)

Access	Read only
Description	This attribute gives the priority at which a path holds its current path once the path is established. Zero is the highest priority and four is the lowest. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time.
Mib	Dcme
Values	Decimal (0..4)
Default	No default

ATTRIBUTE Dcl Vs LCo requiredTxBandwidth (tbw)

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of the trunks of its route. This attribute represents the bandwidth for traffic outgoing to the remote end point. The originating end of the connection determines this value.
Mib	Dcme
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Dcl Vs LCo requiredRxBandwidth (rbw)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute gives the actual bandwidth (in bits per second) reserved by this path on each of trunks of its route. This attribute represents the bandwidth for traffic incoming from the remote end point. The originating end of the connection determines this value
Mib	Dcme
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE Dcl Vs LCo requiredTrafficType (rttyp)

Access	Read only
Description	This operational attribute indicates the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. These are arbitrary designations for traffic type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1*** then only trunks that include ***trafficType1*** in *supportedTrafficType,* will be candidates for this connection.
Mib	Dcme
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	No default

ATTRIBUTE Dcl Vs LCo permittedTrunkTypes (pttyp)

Access	Read only
Description	This operational attribute lists up to eight types of trunk that can be used on the route. The originating end of the connection determines the types. The ***terrestrial*** and ***satellite*** trunk types have been defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS only chooses trunks whose *trunkType* are in the *permittedTrunkTypes* for the path.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dcme
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)
Default	No default

ATTRIBUTE Dcl Vs LCo requiredSecurity (rsec)

Access	Read only
Description	This attribute indicates the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	Dcme
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Dcl Vs LCo requiredCustomerParameter (rcparm)

Access	Read only
Description	This attribute indicates the allowed customer defined parameter of the trunks on the route.The originating end of the connection determines the customer defined parameter. Its value, a number from zero to seven, is chosen by a network administration to have a meaning specific to their network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	Dcme
Values	Decimal (0..7)
Default	No default

ATTRIBUTE Dcl Vs LCo emissionPriority (epri)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the urgency with which packets on the path are emitted by the trunks on the route. The originating end of the connection selects the *emissionPriority. EmissionPriority* of zero indicates the highest emission priority, while two indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets of lower *emissionPriority* (or numerically higher).
Mib	Dcme
Values	Decimal (0..2)
Default	No default

ATTRIBUTE Dcl Vs LCo discardPriority (dpri)

Access	Read only
Description	This attribute indicates the importance of the packets on the path. The originating end of the connection sets *discardPriority.* One is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with lower *discardPriority*(numerically) are discarded after packets with a higher *discardPriority*(numerically).
Mib	Dcme
Values	Decimal (1..3)
Default	No default

ATTRIBUTE Dcl Vs LCo pathType (pType)

Access	Read only
Description	This attribute indicates whether the path for this PLC was determined automatically or by static provisioning. ***Normal*** *pathTypes* are selected automatically by Route Selector.The other *pathTypes* are both manual *pathTypes* where the operator must specify, through provisioning, a static route termed the *manualPath*. A manual *pathType* connection is nearly identical to a normal path type connection with the exception that the route is pre-provisioned. For a manual *pathType*, bandwidth reservations are respected along the path exactly as in a normal path. The last type, the ***forced*** *pathType*, is also a manual path but regardless of the bandwidth available the route is granted provided the trunks are operational and there are sufficient Logical Channels (LChs). The ***forced*** *pathType* could result in over committing the reserved bandwidth allowed on a trunk. A better way to achieve the effects of a ***forced*** *pathType* is to use a ***manual*** *pathType* with *setupPriority* = ***0*** and *holdingPriority* = ***0***. In this manner the path will reserve correct bandwidth and it will bump other paths if required while not being bumped itself.
Mib	Dcme

Copyright © 2006, Nortel Nortel Confidential

Values	normal manual forced
Default	No default

ATTRIBUTE Dcl Vs LCo retryCount (rcount)

Access	Read only
Description	This attribute is the count of the number of times the path chosen during route selection could not be instantiated. This count should be three or below if the network is performing adequately. A high value indicates that the route selection is often performed using an out-of-date view of available network bandwidth and/or topology. This attribute will only increase at the calling end of an un-segmented connection. The attribute should be ignored for segmented connections.This attribute is reset each time a path reconnects and stops counting when it reaches its maximum value.
Mib	Dcme
Values	Decimal (0..255)
Default	No default

ATTRIBUTE Dcl Vs LCo pathFailureCount (pfcount)

Access	Read only
Description	This attribute is the count of the number of times the path has successfully connected. It is set to zero the first time the path is up. If a path fails anytime after connecting this count will be incremented when the path is up again. Failed route requests do not count in this statistic. See *retryCount* above. This attribute stops counting at its maximum value.
Mib	Dcme
Values	Decimal (0..65535)
Default	No default

ATTRIBUTE Dcl Vs LCo reasonForNoRoute (rnr)

Access	Read only
Description	This attribute is the route selection's *reasonForNoRoute* and provides a brief reason for which a route was not selected. The reasons are essentially self-explanatory. Perhaps two reasons for no route require some explanation. The reason ***unknownRemoteNodeName*** is issued when the remote node name is not in the topological database. The reason ***plcAttributesNotMet*** is issued when there is no network connectivity at a level specified by the PLC attributes. This reason is also issued when there is no physical connectivity between two end nodes.

ATTRIBUTE Dcl Vs LCo lastTearDownReason

Access	Read only
Description	This attribute reflects the last tear down reason for a connection (LCo). In many cases this displays the reason for a momentary service interruption. This attribute applies to the last path failure only. If a path is no longer up, this may give an indication to the reason that the path has failed. In many cases an alarm will also be generated with more specific information. The following is a brief description of the reasons: ***none*** - This path has no information for the teardown this is typical of a path provisioned with no *remoteName* that has not been up. ***normalShutDown*** - This path has gone down due to normal call termination. ***insufficientTxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the transmit direction. ***insufficientRxLcOrBandwidth*** - At present there is either no available bandwidth or logical channel numbers available on one or more of the trunks for this path in the receive direction. ***trunkFailure***- A trunk on the path has failed or has gone down due to a provisioning change of a critical attribute. ***trunkCardFailure***- A trunk FP card has failed along the path. ***accessCardFailure***- The FP on which the peer access service was running has failed. ***operatorForced***- The path has terminated due to the operator locking a trunk along the path. ***lostLcnClash***- The path has terminated because the PA's at both ends of an intermediate trunk have allocated the same LC to different calls. When this happens both calls must go down and then try to come up again a fraction of a second later (effectively ensuring that they will now be assigned different LC's). It is normal to get the odd clash especially when the PA's usedLC is approaching the PA's maxLC. ***networkCongestion*** - The path has failed due to control information being

Copyright © 2006, Nortel Nortel Confidential

lost and not recoverable.
trunkNotFound - Occurs on a ***manual*** path usually. Check for trunks not up or names provisioned incorrectly.
farEndNotFound - The far end is not provisioned or is not up. Check remote Name.
wrongModuleReached - This may occur on a ***manual*** path. Check provisioning for correct trunk and service names. For a ***normal*** path, the network Topology may be changing check *remoteName*.
farEndBusy - The far end has been reached but it is busy. Check *remoteName* and remote end provisioning.
callLoopedBack - This LCo is provisioned to call itself. Re-provision since this is invalid.
unknownReason - The failure was not resolved.
farEndNotReady - The remote end was reached but the connection was refused due to the remote end not being enabled.
remoteNameMismatch - The remote end has alarmed and rejected this setup due to remoteName provisioning.
serviceTypeMismatch - The remote Service Type does not match this service type. Check provisioning.
reconnectFromFarEnd - The remote end re-established this connection. Check the remote end *lastTearDownReason* to determine the real reason.
bumped - Another call bumped this path from a trunk to get bandwidth (or an LC) which it required to come up. This other path had a higher *setupPriority* than this path's *holdingPriority* hence it was allowed to steal the bandwidth (or LC) from this path.
optimized - This call has been rerouted due to the optimization feature. The call is still active this just indicates why the path changed.
trunkOrFarEndDidNotSupportMode - This call was unable to complete because a mode required by the service was not supported by one of the trunks the route went through or by the far end service it connected to. Currently the only mode that this applies to is the map/mux mode on TRUNK PA ATM component. Map mode was required by the application (CES/FrAtm etc.) but was not available on the TRUNK PA ATM component through which the call was routed or the far end CES/FrAtm component did not specify the same mode.

ATTRIBUTE Dcl Vs LCo pathFailureAction

Access — Read only

Description — This attribute displays whether the application is set to tolerate momentary interruption of a path while a new path is selected. If ***disconnectConnection*** is displayed, the application is informed as soon as possible about a failure by disconnection. If the attribute displays ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a recoverable failure. If rerouting fails the application is informed of the failure.
With this option set to ***reRoutePath*** the LCo may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.

All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option will have the desired effect that the path is rerouted without complete disconnection at both ends

Mib — Dcme

Values — reRoutePath
disconnectConnection

Default — No default

ATTRIBUTE Dcl Vs LCo bumpPreference (bpref)

Access — Read only

Description — This attribute specifies when bumping will occur during route selection process. Bumping may occur when necessary or always. It will be necessary for a connection to bump if there is not enough resources for the connection to be established and these resources are occupied by a connection whose *setupPriority* is lower (numerically higher) than the connection's *setupPriority.* A connection may also always bump in order to obtain the best route.

Mib	Dcme
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	No default

ATTRIBUTE Dcl Vs LCo optimization (opt)

Access	Read only
Description	This attribute is used to specify whether this connection should attempt to optimize its path when requested by the routing PORS component. Every path is as optimal as it can be when it is established, but as network traffic patterns and configurations change this path may no longer be as optimal as it could be. The PORS connection manager on a module requests circuits to optimize at the optimization interval.

ATTRIBUTE Dcme preestablishedConnections (pCon)

Access	Read: All Write: All
Description	This attribute specifies the number of Logical Connections (LC) preestablished between each *DcmeLink* associated with this *Dcme* and its remote peer, that are established beyond those that are required to carry established connections. Those are the standby LCs to be used for the subsequent user speech or audio 3.1 kHz calls. This attribute should be set to the number of speech and audio 3.1 kHz calls expected in a typical burst of calls received from the ISC on one *DcmeLink*.
Mib	Dcme
Values	Decimal (1..30)
Default	5

ATTRIBUTE Dcme trmThreshold (tThresh)

Access	Read: All Write: All
Description	This attribute is used to determine when the *DcmeLink* may be unable to handle incoming calls from the ISC. If the Dcme fails to replenish the number of preestablished connections the “No trunk(s) available for 3.1 kHz audio or speech” TRM signal is sent to the ISC.
Mib	Dcme
Values	Decimal (0..30)
Default	1

ATTRIBUTE Dcme trmSignalChangeInterval (tScI)

Access	Read: All Write: All
Description	This attribute specifies a minimum time interval between TRM signal change from “No trunk(s) available for 3.1 kHz audio or speech” or “No 64 kbit/s capacity available” to “DCME normal” signal.
Mib	Dcme
Values	Decimal (10..300)
Units	seconds
Default	20

Copyright © 2006, Nortel
Nortel Confidential

ATTRIBUTE Dcme speechAlarmThreshold (sat)

Access	Read: All Write: All
Description	This attribute specifies how many normal speech calls can be rejected by one *dcmeLink* within the *alarmTimeInterval* time before a SET alarm is generated. This alarm is cleared when the number of rejected speech calls is less than *speechAlarmThreshold* in a subsequent interval. If the value is 0 the rejected speech calls are not monitored.
Mib	Dcme
Values	Decimal (0..1000)
Default	0

ATTRIBUTE Dcme audio3kHzAlarmThreshold (aat)

Access	Read: All Write: All
Description	This attribute specifies how many audio 3.1 kHz calls can be rejected by one *dcmeLink* within the *alarmTimeInterval* time before a SET alarm is generated. This alarm is cleared when the number of rejected audio 3.1 kHz calls is less than *audio3kHzAlarmThreshold* in a subsequent interval. If the value is 0 the rejected audio 3.1 kHz calls are not monitored.
Mib	Dcme
Values	Decimal (0..1000)
Default	0

ATTRIBUTE Dcme unrestricted64kAlarmThreshold (uat)

Access	Read: All Write: All
Description	This attribute specifies how many unrestricted 64 kbit/s calls can be rejected by one *dcmeLink* within the *alarmTimeInterval* time before a SET alarm is generated. This alarm is cleared when the number of rejected unrestricted 64 kbit/s calls is less than *unrestricted64kAlarmThreshold* in a subsequent interval. If the value is 0 the rejected unrestricted 64 kbit/s calls are not monitored.
Mib	Dcme
Values	Decimal (0..1000)
Default	0

ATTRIBUTE Dcme alarmTimeInterval (ati)

Access	Read: All Write: All

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time interval within which the rejected speech calls, audio 3.1 kHz calls, and unrestricted 64 kbit/s calls are monitored. It is used in the conjunction with the *speechAlarmThreshold*, *audio3kHzAlarmThreshold,* and *unrestricted64kAlarmThreshold* attributes.
Mib	Dcme
Values	Decimal (0..120)
Units	minutes
Default	5

ATTRIBUTE Dcme maxUnrestricted64kCalls (umax)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the maximum number of simultaneous dynamic unrestricted 64 kbit/s calls that can be established. A value of 0 means that no dynamic unrestricted 64 kbit/s calls can be established.
Mib	Dcme
Values	Decimal (0..420)
Default	420

ATTRIBUTE Dcme dcmeLinks (dLinks)

Access	Read: All Write: All
Description	This attribute specifies all of the *DcmeLink*s which are associated with this *Dcme*. There can be up to 14 *DcmeLinks* associated with one *Dcme*.
Mib	Dcme
List of	Link (Service, dcme)
List Size	14
Default	No default

GROUP Dcme OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Dcme

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dcme adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	Dcme
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Dcme operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	Dcme
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Dcme usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	Dcme
Values	idle active (activ) busy
Default	idle

GROUP Dcme Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Dcme* component.
Mib	Dcme

ATTRIBUTE Dcme activeDcmeLinks

Access	Read: All Write: Illegal
Description	This attribute indicates all of the *DcmeLink* components that are currently active and have registered with this *Dcme*.
Mib	Dcme
List of	The name of the component
List Size	14
Default	No default

GROUP Dcme Statistics (Stats)

Properties	Operational
Description	This group contains the statistics maintained by this *Dcme*.
Mib	Dcme

ATTRIBUTE Dcme trm64kNotAvailable

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times the TRM signal was changed to the “No 64 kbit/s capacity available” signal. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE Dcme trmSpeechNotAvailable

Access	Read: All Write: Illegal
Description	This attribute counts the total number of times the TRM signal was changed to the “No trunk(s) available for 3.1 kHz audio or speech” signal. This counter wraps to zero when it exceeds its maximum.
Mib	Dcme
Values	Decimal (0..4294967295)
Default	0

COMPONENT Dcme Profile

Groups	GROUP Dcme Profile LogicalConnectionOptions (LCOps) GROUP Dcme Profile FramerOptions (FrOps)
Scope	Application
Description	*Dcme/n DcmeProfile* This component defines the ISC interface characteristics of the *Dcme* component.
Mib	Dcme
Common Verbs	Help List Display

GROUP Dcme Profile LogicalConnectionOptions (LCOps)

Properties	Provisioned
Description	This group contains attributes used in setting up Switched Logical Connections (SLC) over the network using the Path Oriented Routing System (PORS) between two peer *DcmeLink* components.
Mib	Dcme

ATTRIBUTE Dcme Profile setupPriority (spri)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the priority at which a path is established. Zero is the highest priority and four is the lowest. When PORS establishes a path through the network, it uses the *setupPriority* attribute to determine its potential for bumping established paths to acquire their bandwidth. The

Copyright © 2006, Nortel
Nortel Confidential

	holdingPriority, a complementary attribute of this attribute, indicates the priority a path maintains once it is established. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	Dcme
Values	Decimal (0..4)
Default	2

ATTRIBUTE Dcme Profile holdingPriority (hpri)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the priority that a path holds once it is established. Zero is the highest priority and four is the lowest. A path's *holdingPriority* determines its likelihood of being bumped by a new path to acquire its bandwidth. The *setupPriority*, a complementary attribute, indicates the priority of a path at establishment time. A new path can bump an existing path if the new path's *setupPriority* is higher (numerically less) than the existing path's *holdingPriority*.
Mib	Dcme
Values	Decimal (0..4)
Default	2

ATTRIBUTE Dcme Profile bumpPreference (bpref)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies when bumping occurs in the route selection process. A connection with higher (numerically less) *setupPriority* may bump a connection with lower (numerically higher) *setupPriority* in order to acquire its bandwidth and be established. If *bumpPreference* is ***bumpWhenNecessary***, bumping occurs only when it is necessary. That is, a connection will bump another connection only if there is no other way for the connection to be established. If *bumpPreference* is ***bumpToObtainBestRoute,*** bumping occurs in order to use the best available route it may have.
Mib	Dcme
Values	bumpWhenNecessary bumpToObtainBestRoute
Default	bumpWhenNecessary

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dcme Profile **requiredTrafficType (rttyp)**

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the type of traffic transmitted over the path. There are eight possible traffic types, and the path can transmit only one of them. The originating end of the connection determines the type. The ***voice***, ***data*** and ***video*** traffic types are defined, and five other arbitrary traffic types can be defined by the network administration. This attribute is used in the route selection process to restrict the route to trunks that support this traffic type. The *supportedTrafficType* trunk attribute lists all the types of traffic allowed on the trunk. For example, if *requiredTrafficType* is specified as ***trafficType1,*** then only trunks that include ***trafficType1*** in *supportedTrafficType* will be candidates for this connection.
Mib	Dcme
Values	voice data video trafficType1 (tt1) trafficType2 (tt2) trafficType3 (tt3) trafficType4 (tt4) trafficType5 (tt5)
Default	voice

ATTRIBUTE Dcme Profile **permittedTrunkTypes (pttyp)**

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies up to eight types of trunks that can be used on the route. The ***terrestrial*** and ***satellite*** trunk types are defined, leaving six remaining arbitrary types that can be defined by the network administration. The trunk's type is indicated in the *trunkType* attribute of the Trunk component. When selecting a route, PORS chooses only trunks whose *trunkType*s are in the *permittedTrunkTypes* for the path.
Mib	Dcme
Set of	terrestrial satellite trunkType1 (tt1) trunkType2 (tt2) trunkType3 (tt3) trunkType4 (tt4) trunkType5 (tt5) trunkType6 (tt6)

Copyright © 2006, Nortel Nortel Confidential

Default	(terrestrial, satellite, trunkType1, trunkType2, trunkType3)

ATTRIBUTE Dcme Profile requiredSecurity (rsec)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the required minimum level of security of the trunks on the route. Zero represents the most secure and seven represents the least secure. The trunk's security is indicated by the *trunkSecurity* attribute of the Trunk component, and has values identical in range and meaning to the *requiredSecurity* attribute. PORS ensures that any route selected does not contain a trunk whose *trunkSecurity* attribute is numerically greater than the *requiredSecurity*.
Mib	Dcme
Values	Decimal (0..7)
Default	4

ATTRIBUTE Dcme Profile requiredCustomerParm (rcparm)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the allowed customer defined parameter of the trunks on the route. The value of *requiredCustomerParm* ranges from 0 to 7. The meaning of each value is specific to a particular network, thus allowing them to customize the use of their trunks. A complementary trunk attribute, *customerParameter*, also has a value from zero to seven. The route selection process does not consider trunks whose *customerParameter* is greater than the *requiredCustomerParameter* of the path.
Mib	Dcme
Values	Decimal (0..7)
Default	4

ATTRIBUTE Dcme Profile pathAttributeToMinimize (pamin)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether a route is selected on the basis of minimizing the cost or the delay. Each trunk has a cost and a delay metric associated with it. The cost of a selected route is the sum of the trunk cost metrics for all trunks included in the route. The delay of a selected route is the sum of the trunk delay metrics for all trunks included in the route.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dcme
Values	cost delay
Default	cost

ATTRIBUTE Dcme Profile maximumAcceptableCost (maxCost)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies an upper bound on the cost metric of a route, which is the sum of the cost metrics of all trunks on the route. The cost metric is the *trunkCost* attribute of the Trunk component. If for any trunk the *trunkCost* is larger than the *maximumAcceptableCost*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route cost is being compared with the *maximumAcceptableCost* attribute, and this is done for any minimization criterion. No route is selected if the cost metric of the shortest route is larger than the *maximumAcceptableCost*.
Mib	Dcme
Values	Decimal (0..65535)
Default	1280

ATTRIBUTE Dcme Profile maximumAcceptableDelay (maxDelay)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies an upper bound on the delay of a route, which is the sum of the delays of all trunks on the route. It should be provisioned with a reasonable maximum acceptable delay for the end to end one way delay of a 512-byte packet. During its staging, a trunk measures a *measuredRoundTripDelay*. This delay is divided by two and truncated to an integer number of milliseconds to provide a one way delay which is used to populate the delay in this trunk object in the topological database. The value includes emission, propagation, and queuing delays. A 512-byte packet is used to perform the measurement. If for any trunk the half of the trunk's *measuredRoundTripDelay* is larger than the *maximumAcceptableDelay*, then that trunk is not considered during the route selection. While a shortest route is being selected, the route delay is being compared with the *maximumAcceptableDelay* attribute, and this is done for any minimization criterion. No route is selected if the delay metric of the shortest route is larger than the *maximumAcceptableDelay*.
Mib	Dcme

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..100000)
Units	msec
Default	100000

ATTRIBUTE Dcme Profile emissionPriority (epri)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the urgency with which packets on the path are emitted by the trunks on the route. An *emissionPriority* of 0 indicates the highest emission priority, while 2 indicates the lowest emission priority. Packets with a higher *emissionPriority* (or numerically less) are serviced and sent out before the packets with a lower *emissionPriority* (or numerically higher).
Mib	Dcme
Values	Decimal (0..2)
Default	0

ATTRIBUTE Dcme Profile discardPriority (dpri)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the importance of the packets on the path. A *discardPriority* of 1 is used for paths carrying the most important traffic, and three is used for paths carrying the least important traffic. Packets with a numerically lower discard priority are discarded after packets with a numerically higher discard priority.
Mib	Dcme
Values	Decimal (1..3)
Default	1

ATTRIBUTE Dcme Profile pathFailureAction (pfa)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether the application can tolerate momentary interruption of a path while a new path is selected. If *pathFailureAction* is ***disconnectConnection***, the application is informed as soon as possible about a failure by disconnection. If *pathFailureAction* is ***reRoutePath***, the path may attempt an immediate reroute, provided the failure is a

Copyright © 2006, Nortel Nortel Confidential

recoverable failure. If rerouting fails, the application is informed of the failure.
If *pathFailureAction* is ***reRoutePath***, the *LCo* may wait up to 30 seconds before informing the service of complete disconnection in order to allow both ends to attempt to reconnect. Note that if PLC components are different at both ends only the calling end is allowed to reconnect.
All *pathTypes* respect this attribute. Also on a *manualPath* with both ends provisioned with independent paths (at least with respect to the failure) this option has the desired effect that the path is rerouted without complete disconnection at both ends.

Mib	Dcme
Values	reRoutePath disconnectConnection
Default	reRoutePath

ATTRIBUTE Dcme Profile optimization (opt)

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether this connection should attempt to optimize its path when requested by the *Rtg Pors* component. Every path is optimal when it is established, but as network traffic patterns and configurations change this path may no longer be optimal. The PORS connection manager on a module requests circuits to optimize at the *optimizationInterval*.
Mib	Dcme
Values	disabled enabled
Default	enabled

GROUP Dcme Profile FramerOptions (FrOps)

Properties	Provisioned
Description	This group contains attributes which define how audio data is carried across the network.
Mib	Dcme

ATTRIBUTE Dcme Profile voiceEncoding

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the encoding of voice traffic.

Copyright © 2006, Nortel Nortel Confidential

A *voiceEncoding* setting of ***g711G726*** specifies that either pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726 is used to encode voice traffic. The actual encoding performed depends on congestion in the network and the settings of *minVoiceG711G726Rate* and *maxVoiceG711G726Rate*. If *voiceEncoding* is ***g711G726***, the bit rate of voice traffic can change during a call due to congestion in the network. In this case, the minimum and maximum rates that can occur during a call are specified by *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* respectively. If *voiceEncoding* is ***g711G726***, *minVoiceG711G726Rate* is ***64*** and *maxVoiceG711G726Rate* is ***64***, G.711 (PCM) encoding is always performed on voice traffic on this channel and all voice traffic is carried uncompressed at 64 kbit/s.

A *voiceEncoding* setting of ***g728at16*** specifies that the Low Delay Coded Excited Linear Predictive Coder (LD-CELP) algorithm defined by ITU-T G.728 is always performed on voice traffic. If *voiceEncoding* is ***g728at16***, the bit rate of all voice traffic is fixed at 16 kbit/s. The *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* attributes do not apply if *voiceEncoding* is ***g728at16***.

A *voiceEncoding* setting of ***g729at8*** indicates that the Conjugated Structure Algebraic Code Excited Linear Predictive Coder (CS-ACELP) algorithm defined by ITU-T G.729 is always performed on voice traffic. If *voiceEncoding* is ***g729at8***, the bit rate of all voice traffic is fixed at 8 kbit/s. The *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* attributes do not apply if *voiceEncoding* is ***g729at8***.

Mib	Dcme
Values	g711G726 g728at16 g729at8
Default	g728at16

ATTRIBUTE Dcme Profile **maxVoiceG711G726Rate (maxVoiceBitRate)**

Access	Read and write
Criticality	Process
Description	This attribute specifies the maximum possible bit rate (minimum possible compression rate) during a voice call on this channel when *voiceEncoding* is ***g711G726***. It applies only to voice traffic, not modem or fax traffic. It also applies only if *voiceEncoding* is ***g711G726***. If *voiceEncoding* is ***g711G726***, the bit rate of voice traffic can change during a call due to congestion in the network. In this case, the minimum and maximum rates that can occur during a call are specified by *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* respectively. If *voiceEncoding* is ***g711G726***, *minVoiceG711G726Rate* is ***64*** and

Copyright © 2006, Nortel Nortel Confidential

maxVoiceG711G726Rate is ***64***, the G.711 (PCM) algorithm is always performed on voice traffic on this channel and all voice traffic is carried uncompressed at 64 kbit/s.

Mib	Dcme
Values	64 32 24
Units	kbit/s
Default	64

ATTRIBUTE Dcme Profile minVoiceG711G726Rate (minVoiceBitRate)

Access	Read and write
Criticality	Process
Description	This attribute specifies the minimum possible bit rate (maximum possible compression rate) during a voice call on this channel when *voiceEncoding* is ***g711G726***. It applies only to voice traffic, not modem or fax traffic. It also applies only if *voiceEncoding* is ***g711G726***. If *voiceEncoding* is ***g711G726***, the bit rate of voice traffic can change during a call due to congestion in the network. In this case, the minimum and maximum rates that can occur during a call are specified by *minVoiceG711G726Rate* and *maxVoiceG711G726Rate* respectively. If *voiceEncoding* is ***g711G726***, *minVoiceG711G726Rate* is ***64*** and *maxVoiceG711G726Rate* is ***64***, the G.711 (PCM) algorithm is always performed on voice traffic on this channel and all voice traffic is carried uncompressed at 64 kbit/s.
Mib	Dcme
Values	64 32 24
Units	kbit/s
Default	64

ATTRIBUTE Dcme Profile voiceTrafficOptimization

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies how to optimize voice traffic. If *voiceTrafficOptimization* is ***bandwidth***, voice traffic is optimized to preserve bandwidth. If *voiceTrafficOptimization* is ***delay***, voice traffic is optimized to minimize delay.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dcme
Values	bandwidth delay
Default	bandwidth

ATTRIBUTE Dcme Profile silenceSuppression

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies when silence suppression is performed. It applies to both voice and modem calls. If *silenceSuppression* is ***off***, silence suppression is never performed. If *silenceSuppression* is ***on***, silence suppression is always performed. If *silenceSuppression* is ***congested***, silence suppression is performed only when the network is congested. If *silenceSuppression* is ***slow***, silence suppression begins after 10 to 20 seconds without any detected speech or modem traffic. If *silenceSuppression* is ***slowAndCongested***, both the ***slow*** and ***congested*** options are applied.
Mib	Dcme
Values	off on congested slow slowAndCongested
Default	on

ATTRIBUTE Dcme Profile silenceSuppressionFactor

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies the expected savings (percent reduction) in required bandwidth if silence suppression is used. If silence suppression is used, the bandwidth required for the connection will be lower than if silence suppression is not used. However, the routing system will not be aware of the unused bandwidth unless that bandwidth is specified by this attribute. If the value specified for the expected savings is too low, then some bandwidth made available by the use of silence suppression will be wasted. If the value specified for the expected savings is too high, then some connections may fail to set up because the routing system will over-calculate the amount of bandwidth available. The effectiveness of silence suppression can be influenced by language related speech patterns.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dcme
Values	Decimal (0..60)
Units	%
Default	40

ATTRIBUTE Dcme Profile echoCancellation

Access	Read: All Write: All
Criticality	Process
Description	This attribute specifies whether echo cancellation is performed on calls using this profile as specified by ITU-T G.165. It applies mainly to voice traffic. Echo cancellation is usually (but not always) disabled during modem and fax calls. If *echoCancellation* is ***on***, the traffic that is echo cancelled is determined by ITU-T G.165.
Mib	Dcme
Values	off on
Default	off

ATTRIBUTE Dcme Profile modemFaxEncoding (faxEncoding)

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies how modem and fax traffic is encoded. Modem and fax traffic are identified by an in-band 2100 Hz tone. Prior to the detection of a 2100 Hz tone, all traffic is handled according to *voiceEncoding*. If *modemFaxEncoding* is ***useVoiceEncoding***, 2100 Hz tones are not detected on the channel. In this case, the channel does not differentiate between modem and fax traffic and voice traffic. All traffic is handled according to *voiceEncoding*. If *voiceEncoding* is ***g728at16*** or ***g729at8***, modem and fax calls will not work. If a 2100 Hz tone is detected and *modemFaxEncoding* is ***g711G726***, all subsequent traffic during a call is encoded using pulse code modulation (PCM) defined by ITU-T G.711 or adaptive differential pulse code modulation (ADPCM) defined by ITU-T G.726. When the 2100 Hz tone is detected, traffic is initially encoded at the rate specified by *maxModemFaxG711G726Rate*. For the duration of the call, the bit rate can change due to network congestion. In this case, the minimum and maximum rates that can occur during the call are specified by *minModemFaxG711G726Rate* and *maxModemFaxG711G726Rate* respectively.

Copyright © 2006, Nortel Nortel Confidential

If a 2100 Hz tone is detected and *modemFaxEncoding* is ***faxRelayG711G726***, encoding switches to G.711 or G.726 at the rate specified in *maxModemFaxG711G726Rate*, exactly as it does if *modemFaxEncoding* is ***g711G726***. Until a fax preamble is detected, the rate may fluctuate between *maxModemFaxG711G726Rate* and *minModemFaxG711G726Rate* due to network congestion, exactly as it does if *modemFaxEncoding* is ***g711G726***. If a fax preamble is detected, all subsequent traffic during a call is demodulated and sent through the network as cells at the base rate of the sending machine. Supported demodulation methods are V.29 (up to 9.6 kbit/s) and V.27 (up to 4.8 kbit/s). The modulation and demodulation of fax traffic is called “fax relay”.

If a 2100 Hz tone is detected and *modemFaxEncoding* is ***faxRelayOnly***, this channel does not wait for a fax preamble to switch to “fax relay”. Instead, “fax relay” is entered immediately. If *modemFaxEncoding* is ***faxRelayOnly***, modem calls do not work on this *Dcme*. Therefore, this setting is only appropriate if modem calls are not made on the channel.

The ***faxRelay*** feature is required to set *modemFaxEncoding* to ***faxRelayG711G726*** or ***faxRelayOnly***.

modemFaxEncoding must have the same value at both ends of a *Dcme.* If *modemFaxEncoding* is not provisioned with the same values at both ends of a *Dcme*, the *Dcme* will not be able to carry the modem and fax traffic successfully.

Mib — Dcme

useVoiceEncoding

Default — faxRelayOnly

ATTRIBUTE Dcme Profile maxModemFaxG711G726Rate (maxModemBitRate)

Access
Read: Passive
Write: Service

Criticality — Process

Description — This attribute specifies the maximum possible bit rate (minimum possible compression rate) during a modem call on this channel. It also specifies the maximum possible bit rate (minimum possible compression rate) during a fax call on this channel, but only if *faxEncoding* is ***g711G726***. *maxModemFaxG711G726Rate* always applies to modem traffic, and never applies to voice traffic. If *faxEncoding* is ***g711G726***, maxModemFaxG711G726Rate also applies to fax traffic. If *faxEncoding* is ***faxRelay***, *maxModemFaxG711G726Rate* does not apply to fax traffic. Rates can change during a call due to congestion in the network.

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the minimum possible bit rate (maximum possible compression rate) during a modem call on this channel. It also specifies the minimum possible bit rate (maximum possible compression rate) during a fax call on this channel, but only if *faxEncoding* is ***g711G726***. *minModemFaxG711G726Rate* always applies to modem traffic, and never applies to voice traffic. If *faxEncoding* is ***g711G726***, *minModemFaxG711G726Rate* also applies to fax traffic. If *faxEncoding* is ***faxRelay***, *minModemFaxG711G726Rate* does not apply to fax traffic. Rates can change during a call due to congestion in the network.
Mib	Dcme
Values	64 32
Units	kbit/s
Default	64

ATTRIBUTE Dcme Profile faxIdleSuppressionG711G726

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies whether fax idle suppression is performed on fax traffic on calls using this profile. It only applies to fax traffic, not voice or modem traffic. It also only applies if fax traffic is carried using G.711 or G.726.
Mib	Dcme
Values	off on
Default	off

Copyright © 2006, Nortel
Nortel Confidential

ATTRIBUTE Dcme Profile insertedOutputDelay

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the amount of added output delay used to compensate for cross network delay variations. It applies to voice, modem and fax traffic. It is required to add output delay so that the statistical variation in the transit time of cells crossing the network does not cause gaps in speech. Backbone networks where high priority traffic consumes a high percentage of trunk bandwidth will require a higher *insertedOutputDelay* to compensate for the greater cell delay variation (CDV).
Mib	Dcme
Values	5 15 22 30 35 40 45 50 75 100 125 150
Units	msec
Default	22

ATTRIBUTE Dcme Profile ingressAudioGain

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the gain in dB that is applied to data coming from outside the network before it is transferred across the network. It applies to voice, modem and fax traffic. For example, ingress gain is applied to audio data coming from a PBX. If *ingressAudioGain* is negative, a loss is applied. *ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in a network to ensure that the signal level from any point in the network to any other point is correct.
Mib	Dcme
Values	Signed (-12..12)

Copyright © 2006, Nortel Nortel Confidential

Units	dB
Default	0

ATTRIBUTE Dcme Profile **egressAudioGain**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the gain in dB that is applied to data leaving the network on this route. It applies to voice, modem and fax traffic. For example, egress gain is applied to audio data going to a PBX. If *egressAudioGain* is negative, a loss is applied. *ingressAudioGain* and *egressAudioGain* are used in loss planning, which is the configuration of the devices in the network to ensure that the signal level from any point in the network to any other point is correct.
Mib	Dcme
Values	Signed (-12..12)
Units	dB
Default	0

ATTRIBUTE Dcme Profile **speechHangoverTime**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the time after the end of speech before silence suppression starts. *It applies only to voice traffic.* *Higher values of speechHangoverTime reduce undesirable clipping but increase bandwidth usage.*
Mib	Dcme
Values	Decimal (10..500)
Units	msec
Default	150

ATTRIBUTE Dcme Profile **comfortNoiseCap**

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the maximum level at which comfort noise is generated. The *comfort noise* is limited by *comfortNoiseCap before*

Copyright © 2006, Nortel Nortel Confidential

egressAudioGain is applied. The default value of ***-40*** dBm0 equates to the maximum level of comfort noise available and effectively disables the *comfortNoiseCap*.

Mib — Dcme

Values — Signed (-78; -65; -60; -54; -52; -50; -48; -46; -44; -42; -40)

Units — dBm0

Default — -40

ATTRIBUTE Dcme Profile modemFaxSpeechDiscrim (fsd)

Access — Read: Passive
Write: Service

Criticality — Process

Description — This attribute specifies whether this *Dcme* differentiates between modem fax traffic and speech. If *modemFaxSpeechDiscrim* is ***on*** and a false 2100 Hz tone is detected, the VSs under this DCME revert to speech mode when speech is detected.

Mib — Dcme

Values — on
off

Default — on

ATTRIBUTE Dcme Profile v17EncodedAsG711G726

Access — Read and write

Criticality — Process

Description — This attribute specifies how services using this *Profile* negotiate with V.17 fax machines. This attribute is not used unless the ***modemFaxEncoding***, defined in this *Profile*, is ***faxRelayG711G726***

If *v17EncodedAsG711G726* is ***no,*** V.17 fax machines are instructed to use V.29 and V.29 fax traffic sent by fax machines is demodulated and encoded using fax relay.

If *v17EncodedAsG711G726* is ***yes***, V.17 fax machines are permitted to use V.17 and V.17 fax traffic sent by fax machines is encoded using G.711 or G.726. The actual encoding performed depends on the *minModemFaxG711G726Rate* and *maxModemFaxG711G726Rate*, available in this *Profile*.

Mib — Dcme

Values — no
yes

Default — no

ATTRIBUTE Dcme Profile dtmfRegeneration (detGen)

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the DTMF regeneration parameter used during negotiation with the remote end across the subnet. If *dtmfRegeneration* is ***on***, it is desired that DTMF tones received from the link are first converted to digits before being sent to the subnet. When a digit is received from the subnet, its respective DTMF tone is desired to be generated before being sent to the link. If *dtmfRegeneration* is ***off***, it is desired that DTMF tones are transported transparently as audio.
Mib	Dcme
Values	off on
Default	off

ATTRIBUTE Dcme Profile maxFaxRelayRate

Access	Read: Passive Write: Service
Criticality	Process
Description	This attribute specifies the maximum desired fax relay rate. This attribute only applies if *modemFaxEncoding* is ***faxRelayOnly*** or ***faxRelayG711G726***.
Mib	Dcme
Values	Decimal (2.4; 4.8; 7.2; 9.6; 12.0; 14.4)
Units	kbit/s
Default	14.4

Opt. Subcomp.	COMPONENT Dlep DS1 COMPONENT Dlep VoiceServicesProcessor (Vsp)
Common Verbs	Help List Display Add DELete

GROUP Dlep CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Dlep

ATTRIBUTE Dlep customerIdentifier (cid)

Access	Read and write

Copyright © 2006, Nortel

Nortel Confidential

Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	Dlep
Values	Decimal (0; 1..8191)
Default	0

GROUP Dlep Provisioned (Prov)

Access	Read only
Description	This attribute allows server-type applications to link themselves to the *Dlep* component, and be spared between the *mainLp* attribute and the *spareLp attribute*.
Mib	Dlep
List of	Link
List Size	256
Default	No default

GROUP Dlep OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Dlep

ATTRIBUTE Dlep adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting

Copyright © 2006, Nortel Nortel Confidential

down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Dlep
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Dlep operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Dlep
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Dlep usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Dlep
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Dlep availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

Copyright © 2006, Nortel Nortel Confidential

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Dlep
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Dlep proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

Copyright © 2006, Nortel Nortel Confidential

	The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.
Mib	Dlep
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE Dlep controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	Dlep
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE Dlep alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	Dlep
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Dlep standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

	The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Dlep
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE Dlep unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	Dlep
Values	false true
Default	false

GROUP Dlep Operational (Op)

Properties	Operational
Description	This group contains the operational attribute for the *DualLpEquipmentProtection* component.
Mib	Dlep

ATTRIBUTE Dlep activeLp

Access	Read only
Description	This attribute identifies which *Lp* is currently providing service..
Mib	Dlep

GROUP Dlep DS1 Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisioning data for a DS1 component.
Mib	Dlep

ATTRIBUTE Dlep DS1 lineType (lineType)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute defines the framing of the DS1 line. ***d4*** defines a framing pattern of 12 frames per multiframe. ***esf*** defines a framing pattern of 24 frames per multiframe. ***d4Cas*** defines a framing pattern of 12 frames per multiframe with channel associated signalling. ***esfCas*** defines a framing pattern of 24 frames per multiframe with channel associated signalling. ***unframed*** defines an unknown framing pattern for clear channels. For cell-based cards only the default option ***esf*** is permitted.
Mib	Dlep
Values	d4 esf d4Cas esfCas unframed
Default	esf

ATTRIBUTE Dlep DS1 zeroCoding (zeroCoding)

Access	Read and write
Criticality	Component
Description	This attribute defines the zero encoding on the DS1 line. ***bit7Stuffing*** sets bit 7 of every timeslot to a one to guarantee ones's density. This reduces the available bandwidth of the channel by 1/8. ***b8zs*** substitutes a pattern of bipolar violations if more than 7 zeros in a row are to be transported. ***ami*** specifies Alternate Mark Inversion, in which successive marks (ones) alternate between positive and negative polarity voltage signals, and spaces (zeros) are sent as a zero amplitude signal. When *zeroCoding* is set to ***ami*** and l*ineType* is set to ***d4***, it is recommended that *raiAlarmType* be set to ***SBit*** in order to avoid possible mimic RAI alarm. For cell-based cards, only the default value ***b8zs*** is permitted. The value *ami* should be used with caution. If the ones density of the traffic is not sufficiently high, the DS1 will lose clock synchronization.
Mib	Dlep
Values	bit7Stuffing b8zs ami
Default	b8zs

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dlep DS1 clockingSource (clockingSource)

Access	Read and write
Description	This attribute defines the source of the transmit clock for the DS1 line. When ***local*** is selected, the crystal on the port generates the clocking for the line. When ***line*** is selected, the port synchronizes to the clock from the facility. When ***module*** is selected, the ports clock synchronizes to the clock provided by the oscillator on the active CP. When ***otherPort*** is selected, the port synchronizes to the port with a clocking source of ***line***. When ***srtsMode*** is selected, the port transmit frequency depends on the SRTS (Synchronous Residual Time-Stamp) received over the ATM network. SRTS information is also generated sent over the ATM network. When ***adaptiveMode*** is selected, the port transmit frequency continually adapts to match the egress data received from the ATM network. A port with ***srtsMode*** or ***adaptiveMode*** must have a single *Chan* which may be linked only to an *Aal1Ces*.service with serviceType ***unstructured*** If the *NetworkSynchronization* component is present, the default value of this attribute is ***module***, otherwise it defaults to ***line***, except for the ***3pDS1Atm*** card, which it defaults to ***local***. On a ***3pDS1Atm*** card all ports must have the same value, and be either ***local*** or ***module***. ***otherPort*** is valid only on AAL1 cards. ***srtsMode*** is valid only on AAL1 and Multi-Service Access cards. ***adaptiveMode*** is valid only on Multi-Service Access cards. On ***4DS1Aal1*** cards either: all four ports' *clockingSource* values must be ***local*** OR all four ports' *clockingSource* values must be ***module*** OR one port's *clockingSource* value must be ***line*** and the other three must be ***otherPort***. A port can only have ***srtsMode*** selected if the other ports are ***module*** or ***srtsMode***.
Mib	Dlep
Values	local line module otherPort

Copyright © 2006, Nortel Nortel Confidential

srtsMode
adaptiveMode

Default — No default

ATTRIBUTE Dlep DS1 raiAlarmType (raiType)

Access — Read and write

Description

This attribute defines the method of sending a RAI (Remote Alarm Indication) alarm on a DS1 line.
When ***SBit*** is selected, RAI alarm is sent by setting the S bit in frame 12.
When ***Bit2*** is selected, RAI alarm is sent by setting bit 2 in all timeslots to 0.
When ***fdl*** is selected, RAI alarm is sent by a repeating pattern of 00 hex and FF hex on the FDL link.
Note that for *lineType* of ***d4***, only the SBit and the Bit2 methods are applicable. Whereas for *lineType* of ***esf***, only the Bit2 and the ***fdl*** methods are applicable.
SBit method is recommended if *lineType* is set to ***d4*** and *zeroCoding* is set to ***ami***. This will help to avoid potential mimic RAI alarm when 1's density is too low in the data transmitted.
For cell-based cards, only the default value ***fdl*** is permitted.

Mib — Dlep

Values
sBit
bit2
fdl

Default — fdl

ATTRIBUTE Dlep DS1 lineLength (lineLength)

Access — Read and write

Description

This attribute defines the line length (in feet) for equalization calculations for the DS1 line. The value ranges between 0-655. For ***8pDS1Atm*** cards the actual value used for equalization is rounded up to the nearest 110 feet; for all other card types the actual value used is rounded to the nearest 50 feet.

Mib — Dlep

Values — Decimal (0..655)

Default — 0

GROUP Dlep DS1 CustomerIdentifierData (CidData)

Properties — Provisioned

Description — This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dlep

ATTRIBUTE Dlep DS1 customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Copyright © 2006, Nortel Nortel Confidential

Description	Any miscellaneous text about the facility.
Mib	Dlep
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Dlep DS1 includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	Dlep
Values	no yes
Default	no

GROUP Dlep DS1 IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	Dlep

ATTRIBUTE Dlep DS1 ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	Dlep
Values	up down testing
Default	up

ATTRIBUTE Dlep DS1 ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	Dlep
Values	Decimal (1..65535)
Default	No default

GROUP Dlep DS1 OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	Dlep

ATTRIBUTE Dlep DS1 snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	Dlep
Values	up down testing
Default	up

GROUP Dlep DS1 OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Dlep

ATTRIBUTE Dlep DS1 adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value

Copyright © 2006, Nortel Nortel Confidential

is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Dlep
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE Dlep DS1 operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	Dlep
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE Dlep DS1 usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare

Copyright © 2006, Nortel Nortel Confidential

capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	Dlep
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Dlep DS1 availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is

Copyright © 2006, Nortel Nortel Confidential

degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	Dlep
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Dlep DS1 proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE Dlep DS1 controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: Dlep

ATTRIBUTE Dlep DS1 alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	Dlep
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE Dlep DS1 standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service

Copyright © 2006, Nortel Nortel Confidential

but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — Dlep

Values — hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default — notSet

ATTRIBUTE Dlep DS1 unknownStatus (osiUnknw)

Access — Read only

Description — This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib — Dlep

Values — false
true

Default — false

GROUP Dlep DS1 Operational (Oper)

Properties — Operational

Description

This group contains the common operational data for a component in a digital hierarchy interface.

Mib — Dlep

ATTRIBUTE Dlep DS1 losAlarm (losAlarm)

Access — Read only

Description

This attribute displays whether a LOS (Loss of Signal) alarm state has been entered. A LOS alarm is declared after LOS defects have been

Copyright © 2006, Nortel Nortel Confidential

observed and accumulated for a period of 2 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). A LOS defect is detected upon observing all zeros for 150 ms (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: upon observing 175 +/- 75 pulse positions with no pulses of either positive or negative polarity). If the LOS defects are intermittently occurring, the LOS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOS alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOS alarm state.
The LOS alarm state is cleared when LOS defects are absent for 10 seconds +/- 0.5 seconds.

Mib — Dlep

Values — on
off

Default — off

ATTRIBUTE Dlep DS1 rxAisAlarm (rxAisAlarm)

Access — Read only

Description

This attribute displays whether an AIS (Alarm Indication Signal) alarm state has been entered. The AIS Alarm state is entered when AIS defects have been observed and accumulated for 2.5 seconds +/- 0.5 seconds. An AIS defect is detected after having received less than 3 zeros in a 2048 bit period (for **8pDS1Atm** cards: when both an Out Of Frame condition exists and a 1's density of at least 99.9% is present for a time T, where 3 ms £ T £ 75 ms; for **8pE1Atm** cards: when both an Out Of Frame condition exists and fewer than three 0's have been received in 512 bit periods). If the AIS defects are intermittently occurring, the AIS defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** for the duration of an AIS alarm state.
The AIS alarm state is cleared when AIS defects are absent for 10 seconds +/- 0.5 seconds.

Mib — Dlep

Values — on
off

Default — off

ATTRIBUTE Dlep DS1 lofAlarm (lofAlarm)

Access — Read only

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute displays whether a LOF (Loss of Frame) alarm state has been entered. The LOF alarm state is entered when LOF defects (for DS1: 2 out of 5 framing bits in error; for E1: 3 consecutive frame alignment patterns in error) have been detected for 3 seconds +/- 0.5 seconds (for **3pDS1Atm**, **3pE1Atm**, **8pDS1Atm**, and **8pE1Atm** cards: 2.5 seconds +/- 0.5 seconds). If the LOF defects are intermittently occurring, the LOF defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The port goes into an operational state of ***disabled*** until the LOF alarm state is cleared. Also, an RAI alarm is transmitted to the far end for the duration of the LOF alarm state
The condition is cleared when framing has been achieved for 10 seconds +/- 0.5 seconds.

Mib: Dlep

Values: on
off

Default: off

ATTRIBUTE Dlep DS1 rxRaiAlarm (rxRaiAlarm)

Access: Read only

Description

This attribute displays whether an RAI (Remote Alarm Indication) alarm state has been entered. An RAI alarm state is entered when the RAI defect indicator has been observed and accumulated for 3.5 seconds +/- 0.5 seconds. For **3pDS1Atm**, and **8pDS1Atm** cards: alarm is declared immediately upon observing the defect is present, with no integration time. For **3pE1Atm**, and **8pE1Atm** cards: alarm state is entered when the RAI defect indicator has been observed and accumulated for 2.5 seconds +/- 0.5 seconds. If the RAI defects are intermittently occurring, the RAI defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle.
The RAI alarm state is cleared when the RAI defect indicator has been absent for 10 seconds +/- 0.5 seconds (for **3pDS1Atm**, and **8pDS1Atm** cards: alarm is cleared immediately upon observing the defect is absent, with no integration time).
The RAI alarm is usually an indication that the far end facility is unable to gain synchronization.

Mib: Dlep

Values: on
off

Default: off

GROUP Dlep DS1 Chan Provisioned (Prov)

Properties	Provisioned
Description	This group contains all of the provisional data for a *Channel* component.
Mib	Dlep

ATTRIBUTE Dlep DS1 Chan timeslots (ts)

Access	Read and write
Criticality	Component
Description	This attribute contains the list of timeslots that are used by the *Channel* component. Valid numbers are 1-24 for a *Channel* used by a *DS1* component, and 1-31 for a *Channel* used by an *E1* component. For the ***4pDS3Ch*** card, a timeslot value of ***none*** cannot be combined with other valid timeslot values. When ***none*** is selected, no timeslots are assigned and any service linked to the *Channel* does not function.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dlep
Set of	none 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
Default	No default

ATTRIBUTE Dlep DS1 Chan timeslotDataRate (dataRate)

Access	Read and write
Criticality	Component
Description	This attribute selects the data rate of the timeslots in a channel of a DS1 component. For E1, the data rate of the timeslots will always be 64kbit/s regardless of this attribute. When ***doNotOverride*** is selected for a channel on a DS1, the data rate of the channel's timeslots are dependant on the *zeroCoding* selection of the DS1 component. If the *zeroCoding* is ***B8ZS*** (where supported on the FP) or ***none***, the timeslot's data rate will be 64kbit/s. If the *zeroCoding* option is ***bit7Stuffing,*** the data rate of a timeslot will be 56kbit/s.

Copyright © 2006, Nortel Nortel Confidential

When ***56k*** is selected for a channel on a DS1, the least significant bit of each timeslot of this *Channel* will always be set to 1 and not used for data. The data rate for the timeslots of this channel is therefore restricted to 56kbit/s.

On the ***4pDS3Ch*** cards, the *zeroCoding* attribute is restricted to the value *none*, and so when the *timeslotDataRate* is set to ***doNotOverride***, the timeslot's data rate will be 64kbit/s. Timeslot data rate of ***56k*** is also available on this card.

On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***doNotOverride***.

One application of this attribute is to allow a DS1 line to support mixing channels that originate from lines that use different *zeroCoding* schemes.

Mib	Dlep
Values	56k doNotOverride
Default	doNotOverride

ATTRIBUTE Dlep DS1 Chan applicationFramerName

Access	Read and write
Description	This attribute defines the link to the software stack. It defines which application is running on top of this hardware component.
Mib	Dlep
Values	Link (Service, interfaceName)
Default	No default

GROUP Dlep DS1 Chan CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	Dlep

ATTRIBUTE Dlep DS1 Chan customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a

Copyright © 2006, Nortel Nortel Confidential

CID of 0.

Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID.

An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.

Mib	Dlep
Values	Decimal (0; 1..8191)
Default	0

ATTRIBUTE Dlep DS1 Chan usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dlep
Values	idle active (activ) busy
Default	idle

ATTRIBUTE Dlep DS1 Chan availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The

Copyright © 2006, Nortel Nortel Confidential

	operationalState is ***disabled***. The value ***logFull*** is not used. The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.
Mib	Dlep
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE Dlep DS1 Chan proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase.

Copyright © 2006, Nortel Nortel Confidential

If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE Dlep DS1 Chan controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

reservedForTest (rsrvd)
suspended (suspnd)

Default — No default

ATTRIBUTE Dlep DS1 Chan alarmStatus (osiAlarm)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

Copyright © 2006, Nortel Nortel Confidential

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — Dlep

Set of — underRepair (repair)
critical (crit)

minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE Dlep DS1 Chan **standbyStatus (osiStby)**

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

Copyright © 2006, Nortel Nortel Confidential

	The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	Dlep

ATTRIBUTE Dlep DS1 Chan commentText

Access	Read and write
Description	Any miscellaneous text about the facility.
Mib	Dlep
Values	String (0..60, ASCII)
Default	No default

ATTRIBUTE Dlep DS1 Chan includeAdminInfoInAlarm

Access	Read and write
Description	This attribute specifies that user defined text contained in *vendor* and *commentText* attributes of this *VendorInfo* instance will be appended to the comment text of any alarms, excluding hardware initialization alarms, for the associated interface port if this attribute is set to on.
Mib	Dlep
Values	no yes
Default	no

COMPONENT Dlep DS1 Chan Test (Test)

Groups	GROUP Dlep DS1 Chan Test OsiState (State) GROUP Dlep DS1 Chan Test Setup (Setup) GROUP Dlep DS1 Chan Test Results (Results)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	The *Test* component is configured to control a hardware facility test on a physical (*V3*5, *X21, DS1, E1, DS3, E3* etc.) or a logical port.
Mib	Dlep
Common Verbs	Help List Display

VERB START **Dlep DS1 Chan Test**

Impact	Service
Description	This command invokes a test on the hardware component. Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP **Dlep DS1 Chan Test**

Impact	Service
Description	This command stops a test running on the hardware component.

GROUP **Dlep DS1 Chan Test** **OsiState (State)**

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	Dlep

ATTRIBUTE **Dlep DS1 Chan Test** **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Dlep

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Dlep DS1 Chan Test **operationalState (osiOper)**

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Dlep

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Dlep DS1 Chan Test **usageState (osiUsage)**

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Dlep

Values — idle
active (activ)
busy

GROUP Dlep DS1 Chan Test **Setup (Setup)**

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	Dlep

ATTRIBUTE Dlep DS1 Chan Test **purpose (purpose)**

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Dlep
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Dlep DS1 Chan Test **type (type)**

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test. ***remoteLoop*** test loops back the remote modem (or CSU) and performs a bit error rate test. ***externalLoop*** test loops back the line to the far end. ***payloadLoop*** test only loops back the payload data received from the incoming line. ***remoteLoopThisTrib*** loops this particular tributary back at the far end, using services provided by the parent. ***v54RemoteLoop*** initiates a V.54 Remote Loopback test. ***pn127RemoteLoop*** initiates a PN127 Remote Loopback test. ***lineBIP8Error*** tests line BIP 8 error generation and detection (B2 byte inverted). ***sectionBIP8Error*** tests section BIP 8 error generation and detection (B1 byte inverted). ***pathBIP8Error*** tests path BIP 8 error generation and detection (B3 byte inverted). ***pathBIP2Error*** tests path BIP 2 error generation and detection (bit 1-2 of

Copyright © 2006, Nortel Nortel Confidential

V5 byte inverted).
Note that not all test types are not supported by all function processors.

pathBIP8Error
pathBIP2Error

Default: card

ATTRIBUTE Dlep DS1 Chan Test frmSize (size)

Access: Read and write

Description:
This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: Dlep

Values: Decimal (4..4096)

Units: bytes

Default: 1024

ATTRIBUTE Dlep DS1 Chan Test frmPatternType (fpt)

Access: Read and write

Description:
This attribute defines the type of data pattern generation to use. The following lists the available pattern types:
ccitt32kBitPattern is a pseudo-random sequence of 32 kbit.
ccitt8MBitPattern is a pseudo-random sequence of 8Mbit.
customizedPattern is the pattern defined in the ***customizedPattern*** attribute.

Mib: Dlep

Values:
ccitt32kBitPattern
ccitt8MBitPattern
customizedPattern

Copyright © 2006, Nortel
Nortel Confidential

Default	ccitt32kBitPattern

ATTRIBUTE Dlep DS1 Chan Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Dlep
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Dlep DS1 Chan Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Dlep
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Dlep DS1 Chan Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Dlep
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Dlep DS1 Chan Test duration

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Dlep
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Dlep DS1 Chan Test **Results (Results)**

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Dlep

ATTRIBUTE Dlep DS1 Chan Test **causeOfTermination**

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib Dlep

Values
testTimeExpired
stoppedByOperator
unknown
neverStarted
testRunning
hardwareReconfigured
loopCodeSyncFailed
patternSyncFailed
patternSyncLost

Default neverStarted

ATTRIBUTE Dlep DS1 Chan Test **bitsTx**

Access Read only

Description

This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.

Mib Dlep

Values Long Integer

Default No default

ATTRIBUTE Dlep DS1 Chan Test **bytesTx**

Access Read only

Description

This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.

Mib Dlep

Values Long Integer

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Dlep DS1 Chan Test **frmTx**

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep DS1 Chan Test **bitsRx**

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep DS1 Chan Test **bytesRx**

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep DS1 Chan Test **frmRx**

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Dlep

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Dlep DS1 Chan Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep DS1 Chan Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Dlep
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Dlep DS1 Chan Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an

Copyright © 2006, Nortel Nortel Confidential

externalLoop test. For a data test, it indicates time since test data was first transmitted.

Mib	Dlep
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Dlep DS1 Chan Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Dlep
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

COMPONENT Dlep DS1 Chan AtmCell (Cell)

Groups	GROUP Dlep DS1 Chan Cell Provisioned (Prov) GROUP Dlep DS1 Chan Cell Operational (Oper) GROUP Dlep DS1 Chan Cell Statistics (Stats)
Scope	Device
Description	The *AtmCell* component contains provisioning and operational attributes. The provisioning attributes are used to set the Loss of Cell Delineation (LCD) alarm activation delay and to turn cell payload scrambling on or off. The operational attributes are used to report about the quality of the ATM cells received by the interface and the cell capacity utilization. The *AtmCell* component appears under all port components running on ATM cards.
Mib	Dlep
Common Verbs	Help List Display Add DELete

GROUP Dlep DS1 Chan Cell Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioning attributes for the *AtmCell* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	Dlep

ATTRIBUTE Dlep DS1 Chan Cell **alarmActDelay (act)**

Access	Read and write
Description	This attribute specifies the time during which a Loss of Cell Delineation (LCD) defect should be observed before declaring an LCD alarm (alarm 70115501). When the *Cell* component is provisioned under the *Sonet* or *Sdh* component, this attribute defaults to 500 milliseconds. When it is provisioned under the *Laps* component, the default is 2000 milliseconds. This is necessary to ensure that the services bound to the *Sts* or *Vc4* component are not disrupted during short lived LCD defects caused by a line switchover. Setting this attribute to a lower value when the *Laps* component is provisioned may result in a temporary service outage when a line switchover occurs.
Mib	Dlep
Values	Decimal (0..2000)
Units	msec
Default	No default

ATTRIBUTE Dlep DS1 Chan Cell **scrambleCellPayload (scramble)**

Access	Read and write
Description	Cell scrambling, as defined by ITU-T Recommendation I.432., can provide a solution to the problem of transmission equipment which is sensitive to certain bit patterns in the ATM cell payload. This attribute controls whether or not the cell payload is scrambled. It defaults to ***off*** for *DS1* interfaces, and ***on*** for all other interfaces. Note that this setting must be the same at both ends of the link.
Mib	Dlep
Values	off on
Default	No default

ATTRIBUTE Dlep DS1 Chan Cell **correctSingleBitHeaderErrors**

Access	Read and write
Description	This attribute specifies whether the port corrects single bit errors detected in the headers of received cells. If single bit errors are corrected, the affected cells are passed up to the ATM layer according to normal operation. If single bit errors are not corrected, these errored cells are discarded by the physical layer. Note that cells containing multiple bit errors in their headers are always discarded.

Copyright © 2006, Nortel Nortel Confidential

Single bit HEC error correction must remain ***off*** for the following card types: 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 2pJ6MAtm, 3pDS3Atm, and 3pE3Atm.

Mib — Dlep

Values — off
on

Default — off

ATTRIBUTE Dlep DS1 Chan Cell **clearDelay (clear)**

Access — Read and write

Description

This attribute specifies the minimum elapsed time between the clearing of the Loss of Cell Delineation (LCD) defect and the port returning to service. The LCD defect should be absent for the entire period of elapsed time. This attribute value is specified in minutes. If the value of the *clearDelay* attribute is initially 0 (default), the time is actually about 10 seconds. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib — Dlep

Values — Decimal (0..60)

Units — minutes

Default — 0

ATTRIBUTE Dlep DS1 Chan Cell **hecSampleInterval (hSample)**

Access — Read and write

Description

This attribute specifies the sampling interval (in seconds) for errors associated with the *uncorrectableHeaderErrors* attribute. When the sum of errors counted by the *uncorrectableHeaderErrors* attribute over the interval time is greater than or equal to the provisioned *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. If the attribute *hecSampleInterval* is set to the default, 0, then the attribute *uncorrectableHeaderErrors* cannot be used to bring down the port. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Mib — Dlep

Values — Decimal (0..25)

Units — seconds

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE Dlep DS1 Chan Cell **hecErrorLimit (hLimit)**

Access	Read and write
Description	This attribute specifies the error threshold for a HEC error sampling interval beyond which a port is brought down. When the value of the *uncorrectableHeaderErrors* attribute accumulated over the provisioned value of the *hecSampleInterval* attribute is greater than or equal to the provisioned value of the *hecErrorLimit* attribute, the sample interval is considered errored. If the number of consecutive errored intervals reaches the limit established in the *hecErrorIntervalLimit* attribute, an LCD alarm is declared and the port is disabled. (Please note that a *hecErrorInterval* attribute value of 0 (default) disables the mechanism of using the value of the *uncorrectableHeaderErrors* attribute to disable a port.) This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.
Mib	Dlep
Values	Decimal (1..250000)
Default	No default

ATTRIBUTE Dlep DS1 Chan Cell **lcdStateDelay (delay)**

Access	Read and write
Description	This attribute specifies the time during which an Out of Cell Delineation (OCD) defect should be observed before moving to the Loss of Cell Delineation (LCD) defect state. The time is specified in milliseconds. The valid values are 1 to 50 milliseconds if the *AtmCell c*omponent is located under the *Ds1* or *E1* component, and 1 to 5 milliseconds if under a *Ds3* or *E3* component. This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

Units	msec
Default	No default

ATTRIBUTE Dlep DS1 Chan Cell **hecErrorIntervalLimit (hIntLimit)**

Access	Read and write
Description	This attribute counts the instances of the *hecSamplingInterval* attribute for all HEC errors (specified by the *uncorrectableHeaderError* attribute) before

Copyright © 2006, Nortel Nortel Confidential

an LCD alarm is generated. The alarm is only generated if the value of the *uncorrectableHeaderErrors* attribute in a given interval is greater than the value of the *hecErrorLimit* attribute. For example, if there are 20 HEC errors in 5 seconds, for three times in a row (the number of times in a row is represented by this attribute), an alarm is raised. If there are 24 HEC errors in the 5 seconds, and 14 in the next 5 seconds no alarm is generated because the number of HEC errors should also be more than 20 in the next instances.
This attribute is supported only on 3pDS1Atm, 8pDS1Atm, 3pE1Atm, 8pE1Atm, 3pDS3Atm, 3pE3Atm, 3pDS3Atm2, 3pE3Atm2, 12pDS3Atm, and 12pE3Atm.

GROUP Dlep DS1 Chan Cell **Operational (Oper)**

Properties Operational

Description

This group contains the common operational attributes for the *AtmCell* component.

Mib Dlep

ATTRIBUTE Dlep DS1 Chan Cell **lcdAlarm (lcd)**

Access Read only

Description

This attribute displays whether the Loss of Cell Delineation (LCD) failure alarm state has been entered. This state is entered when LCD defects have been observed and accumulated for a period of time specified through the *alarmActDelay* attribute.
In ATM cell direct mapping mode, an LCD defect occurs when Out of Cell Delineation (OCD) anomaly persists for *x* milliseconds, and disappears when the Out of Cell Delineation (OCD) is absent for *x* msec. An OCD anomaly occurs when 7 consecutive incorrect HECs have been detected. An OCD anomaly terminates when 6 consecutive correct HECs have been detected.
For an *AtmCell* component located under a *DS3* or *E3* component with *mapping* = ***PLCP***, the LCD defect is directly derived from the PLCP LOF defect.
If LCD defects are intermittently occurring, the LCD defect accumulator is decremented at a rate of 1/10 of the incrementing rate (alarm integration ratio of 1/10), with all measurements based on a 200 ms polling cycle
The component under which is located the *AtmCell* component goes into an operational state of ***disabled*** until the LCD alarm condition is cleared. The condition is cleared after the LCD defect has not been reported for a period of 10 seconds +/- 0.5 seconds.
The *lcdAlarm* attribute is always set to off when the parent of the *AtmCell*

Copyright © 2006, Nortel Nortel Confidential

component has been *locked* and left *offline*. This can also happen when the *Path* or *Channel* component has been suspended since its parent has been locked.

GROUP Dlep DS1 Chan Cell Statistics (Stats)

Properties Operational

Description

This group contains the statistics attribute for the *AtmCell* component. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.

Mib Dlep

ATTRIBUTE Dlep DS1 Chan Cell uncorrectableHeaderErrors (ucErr)

Access Read only

Description

This attribute indicates the number of uncorrectable ATM cell header errors that have been detected. Counting of *uncorrectableHeaderErrors* is inhibited when an Out of Cell Delineation (OCD) defect is present. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

Mib Dlep

Values Decimal (0..4294967295)

Default 0

ATTRIBUTE Dlep DS1 Chan Cell sevErroredSec (ses)

Access Read only

Description

This attribute indicates the total number of ATM Cell Severely Errored Seconds (SESs) that have been counted.

In direct mapping mode, an ATM Cell SES is declared for second intervals containing one or more Out of Cell Delineation (OCD) defects. An OCD defect occurs when seven consecutive incorrect HECs have been detected. An OCD defect terminates when six consecutive correct HECs have been detected.

If the *AtmCell* component is located under a *Ds3* or *E3* component where

Copyright © 2006, Nortel Nortel Confidential

	the *mapping* attribute is set to ***plcp***, an ATM Cell SES is declared for second intervals containing one or more PLCP LOF defects. Counting of *uncorrectableHeaderErrors* (*ucErr*) and *correctableHeaderErrors* (*cErr*) is inhibited when the OCD defect is present.

Description	This group contains all specific provisioning data for a *Tc* component.
Mib	Dlep

ATTRIBUTE Dlep DS1 Chan Tc replacementData (data)

Access	Read and write
Description	This attribute specifies the trunk conditioning data byte to be substituted into the *timeslots* defined by the *Chan* component under fault conditions. The attribute *replacementData* can be set to any two digit hexadecimal number. The following are recommended values: DS1 MUX Out Of Service Code = 0x1A E1 MUX Out Of Service Code = 0xFF On the ***4pDS3ChAal1*** card, the only allowed value for this attribute is ***0xFF***. On the ***4pOC3ChSmIr***, ***2pOC3ChSmIrVsp3*** and *2pVS* cards, the default value for this attribute is ***0x1A*** for DS1 and ***0xFF*** for E1. On all other cards the default value is ***0xFF***.
Mib	Dlep
Values	Hex (H.0..H.ff)
Units	Hex
Default	No default

ATTRIBUTE Dlep DS1 Chan Tc signalOneDuration (duration)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the time duration in seconds for which *signalOne* is substituted into the appropriate signaling bits, when a *lineType* that uses CAS has been defined. When *signalOneDuration* has expired *signalTwo* is substituted into the appropriate signaling bits. If *signalOneDuration* is set to zero then only *signalTwo* is substituted into the appropriate signaling bits during error conditions. The *signalOneDuration* attribute can be set to any integer value from 0 to 60 seconds.
Mib	Dlep
Values	Decimal (0..60)
Units	seconds
Default	0

ATTRIBUTE Dlep DS1 Chan Tc noServiceResponse (resp)

Access	Read and write
Description	This attribute specifies the Channel's egress response when it has no service provisioned, or the service provisioned is unavailable due to a near end failure. The following responses are available: ***autoConfigure*** - automatically configure the channels response. ***tc*** - transmit trunk conditioning on all timeslots provisioned in the egress direction. ***ais*** - transmit AIS in the egress direction. ***noResponse*** - no response is sent in the egress direction. A value of ***autoConfigure*** will result in TC being transmitted for all card types.
Mib	Dlep
Values	autoConfigure tc ais noResponse
Default	autoConfigure

ATTRIBUTE Dlep DS1 Chan Tc signalOne (sigOne)

Access	Read and write
Description	This attribute specifies the value to be substituted into the ABCD signaling bits for the *timeslots* defined by the *Chan* component under fault conditions. The value will be substituted for the duration provisioned in *signalOneDuration* when a *lineType* that uses CAS has been defined.

Copyright © 2006, Nortel Nortel Confidential

For a *lineType* of ***d4Cas*** (Super Frame), signaling bits C and D are required to equal bits A and B respectively.

VERB START Dlep DS1 Test

Impact Service

Description

This command invokes a test on the hardware component.
Note that some test types requires the parent component (the hardware component) to be locked (using the *Lock* command) before a test can be started.

VERB STOP Dlep DS1 Test

Impact Service

Description

This command stops a test running on the hardware component.

GROUP Dlep DS1 Test **OsiState (State)**

Properties Operational

Description This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib Dlep

ATTRIBUTE Dlep DS1 Test **adminState (osiAdmin)**

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — Dlep

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE Dlep DS1 Test operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — Dlep

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE Dlep DS1 Test usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — Dlep

Values — idle
active (activ)
busy

Default — idle

ATTRIBUTE Dlep DS1 Test frmSize (size)

Access	Read and write
Description	This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.
Mib	Dlep
Values	Decimal (4..4096)
Units	bytes
Default	1024

ATTRIBUTE Dlep DS1 Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Dlep
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dlep DS1 Test **customizedPattern (cp)**

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Dlep
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Dlep DS1 Test **dataStartDelay (dsd)**

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Dlep
Values	Decimal (0..1814400)
Units	seconds
Default	0

ATTRIBUTE Dlep DS1 Test **displayInterval (di)**

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Dlep
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Dlep DS1 Test **duration**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Dlep
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Dlep DS1 Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Dlep

ATTRIBUTE Dlep DS1 Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started. a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running. a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*. a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback. a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

Copyright © 2006, Nortel Nortel Confidential

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Default	No default

ATTRIBUTE Dlep DS1 Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Dlep

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE Dlep DS1 Test **erroredFrmRx**

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep DS1 Test **bitErrorRate**

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Dlep
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Dlep DS1 Test **elapsedTime**

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an

ATTRIBUTE Dlep Vsp Test usageState (osiUsage)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	Dlep
Values	idle active (activ) busy
Default	idle

GROUP Dlep Vsp Test Setup (Setup)

Properties	Operational
Description	This group contains all of the operational data for a *Test* component.
Mib	Dlep

ATTRIBUTE Dlep Vsp Test purpose (purpose)

Access	Read and write
Description	This attribute records the purpose of the test so that the test results can be associated and properly analyzed.
Mib	Dlep
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Dlep Vsp Test type (type)

Access	Read and write
Description	This attribute is the type of test to be run. The available test types include the following: ***card*** test sets up an internal loop on the board and runs a bit error rate test. ***manual*** test assumes the line is looped back externally and a bit error rate test is performed. ***localLoop*** test loops back the local modem and performs a bit error rate test.

Copyright © 2006, Nortel Nortel Confidential

remoteLoop test loops back the remote modem (or CSU) and performs a bit error rate test.
externalLoop test loops back the line to the far end.
payloadLoop test only loops back the payload data received from the incoming line.
remoteLoopThisTrib loops this particular tributary back at the far end, using services provided by the parent.
v54RemoteLoop initiates a V.54 Remote Loopback test.
pn127RemoteLoop initiates a PN127 Remote Loopback test.
lineBIP8Error tests line BIP 8 error generation and detection (B2 byte inverted).
sectionBIP8Error tests section BIP 8 error generation and detection (B1 byte inverted).
pathBIP8Error tests path BIP 8 error generation and detection (B3 byte inverted).
pathBIP2Error tests path BIP 2 error generation and detection (bit 1-2 of V5 byte inverted).
Note that not all test types are not supported by all function processors.

Default: card

ATTRIBUTE Dlep Vsp Test frmSize (size)

Access: Read and write

Description:

This attribute defines the size of the test data frames in number of bytes. This attribute is not applicable for ATM-based cards and is also ignored for MSA32 cards because the test does not generate any frame for this card type.

Mib: Dlep

Values: Decimal (4..4096)

Units: bytes

Default: 1024

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dlep Vsp Test frmPatternType (fpt)

Access	Read and write
Description	This attribute defines the type of data pattern generation to use. The following lists the available pattern types: ***ccitt32kBitPattern*** is a pseudo-random sequence of 32 kbit. ***ccitt8MBitPattern*** is a pseudo-random sequence of 8Mbit. ***customizedPattern*** is the pattern defined in the ***customizedPattern*** attribute.
Mib	Dlep
Values	ccitt32kBitPattern ccitt8MBitPattern customizedPattern
Default	ccitt32kBitPattern

ATTRIBUTE Dlep Vsp Test customizedPattern (cp)

Access	Read and write
Description	This attribute allows a customized 32 bit pattern to be defined for use in the test data frames. This attribute is used when the attribute *frmPatternType* is set to ***CustomizedPattern***. Note that a 55 hex pattern is an alternating 1 and 0 pattern.
Mib	Dlep
Values	Hex (H.0..H.ffffffff)
Units	Hex
Default	H.55555555

ATTRIBUTE Dlep Vsp Test dataStartDelay (dsd)

Access	Read and write
Description	This attribute specifies the time delay (in seconds) between when the test expects the loop to have been set up, to when the test data actually starts to be transmitted. This attribute is to accommodate some non-standard equipment that requires extra time for setting up a requested loop. This attribute is ignored when the test *type* is set to ***externalLoop***.
Mib	Dlep
Values	Decimal (0..1814400)
Units	seconds
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE Dlep Vsp Test displayInterval (di)

Access	Read and write
Description	This attribute defines the interval (in minutes) between which interim test results are to be displayed. Results are displayed at the operator console at which the test was started. When the test *type* is set to ***externalLoop***, this attribute is ignored. There will be no display of results if *displayInterval* is set to 0. This attribute can be changed anytime.
Mib	Dlep
Values	Decimal (0..30240)
Units	minutes
Default	5

ATTRIBUTE Dlep Vsp Test duration

Access	Read and write
Description	This attribute is the duration for which the test data will be transmitted. In the case of an ***externalLoop***, this is the time that the loop is in effect. Note that *dataStartDelay* does not apply to the ***externalLoop*** test type.
Mib	Dlep
Values	Decimal (0.00..30240.00)
Units	minutes
Default	1.00

GROUP Dlep Vsp Test Results (Results)

Properties	Operational
Description	This group contains all the statistics related attributes of the *Test* component.
Mib	Dlep

ATTRIBUTE Dlep Vsp Test causeOfTermination

Access	Read only
Description	This attribute indicates either the status of the test or the cause of the test's termination: a value of ***neverStarted*** indicates that the test has not yet been started. a value of ***testRunning*** indicates that the test has been started.

Copyright © 2006, Nortel Nortel Confidential

a value of ***stoppedByOperator*** indicates that the operator issued a stop command on a test that was running.

a value of ***testTimeExpired*** indicates that the test ran for the time specified by the test's *duration*.

a value of ***loopCodeSyncFailed*** indicates that the local end failed to synchronize to the loopCode pattern. The local end transmits the loopCode pattern to cause the remote end to apply a loopback, after which the local end should receive the loopCode pattern. The exact pattern used to request loopCode depends on the test *type*. This failure indicates a high rate of transmission errors, or that the remote end has failed to apply the loopback.

a value of ***patternSyncFailed*** indicates that the local end failed to synchronize to the *frmPatternType* test pattern, that should have been looped back at the remote end. This failure indicates a high rate of transmission errors or the absence of a loopback.

a value of ***patternSyncLost*** indicates that the local end gained and then lost synchronization to the returned *frmPatternType* test pattern. This failure indicates a sudden increase in transmission errors, frame slippage, or the removal of an existing loopback.

a value of ***unknown*** is set when a reason to terminate other than those listed here is encountered.

Note: The *causeOfTermination* attribute values of ***loopCodeSyncFailed***, ***patternSyncFailed*** and ***patternSyncLost*** are supported only on MSA cards. *Test* components located on other cards or under an *Ima* component on an MSA card will never terminate the test under the conditions described by these values.

Mib	Dlep
Values	testTimeExpired stoppedByOperator unknown neverStarted testRunning hardwareReconfigured loopCodeSyncFailed patternSyncFailed patternSyncLost
Default	neverStarted

ATTRIBUTE **Dlep Vsp Test** **bitsTx**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the bits sent during the test period. As long as the line speed of the hardware interface is less than 70 Mbit/s, this counter is not expected to reach the maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp Test bytesTx

Access	Read only
Description	This attribute counts the bytes sent during the test period. This counter is not expected to reach its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp Test frmTx

Access	Read only
Description	This attribute counts the frames sent during the test period. This counter is not expected to reach its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp Test bitsRx

Access	Read only
Description	This attribute counts the bits received during the test period. The counter wraps to zero when it exceeds the maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp Test bytesRx

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute counts the bytes received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp Test frmRx

Access	Read only
Description	This attribute counts the frames received during the test period. The counter wraps to zero when it exceeds its maximum value. This attribute is not applicable and is ignored for MSA32 cards because the test does not generate any frame.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp Test erroredFrmRx

Access	Read only
Description	This attribute is not displayed for ATM and MSA32 cards. For ATM cards, the physical layer drops all errored frames at the controller interface. For MSA32 cards, the test does not generate any frame. For all other card types, this attribute counts the errored frames received during the test period. The counter wraps to zero when it exceeds its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp Test bitErrorRate

Access	Read only
Description	This attribute is not displayed for ATM cards because the physical layer drops all errored frames at the controller interface. For MSA32 cards, this attribute indicates the link bit error rate, regardless of the *frameSize*, which is not supported For all other card types, this attribute is the calculated bit error rate on the

Copyright © 2006, Nortel Nortel Confidential

	link. Test data are generated and sent in frames of a preset size (*frameSize*). The *Test* component will try to estimate the number of bit errors in any errored frame which is identifiable. The statistics will be updated accordingly. A lost frame (may be due to an error on the flag sequence) will be discarded for the bit error rate calculation. The result is presented in the form of xEsyy, where x is the mantissa, syy is the exponent, for example 0E+00, 2E-09. Note that the *bitErrorRate* is an estimate only. For more reliable test results, the test should be done over a long period. Multiple tests would also improve the confidence level of the test results.
Mib	Dlep
Values	String (5, ASCII)
Default	No default

ATTRIBUTE Dlep Vsp Test elapsedTime

Access	Read only
Description	This attribute indicates the time elapsed since the test started for an ***externalLoop*** test. For a data test, it indicates time since test data was first transmitted.
Mib	Dlep
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

ATTRIBUTE Dlep Vsp Test timeRemaining

Access	Read only
Description	This attribute indicates the length of time remaining before the test stops according to the *duration* attribute.
Mib	Dlep
Values	Decimal (0.00..30240.00)
Units	minutes
Default	0.00

Default	No default

ATTRIBUTE Dlep Vsp GigE remoteFaultIndicationAlarm (remFaultAlarm)

Access	Read only
Description	This attribute indicates whether the remote fault indication alarm is ***on*** or ***off***.

Copyright © 2006, Nortel Nortel Confidential

	Possible values are: ***on*** - the alarm is set. ***off*** - the alarm is clear.
Mib	Dlep
Values	on off
Default	No default

GROUP Dlep Vsp GigE Eth1000Statistics (Stats)

Properties	Operational
Description	This group contains the statistics for the *VspEth1000BaseSX* component.
Mib	Dlep

ATTRIBUTE Dlep Vsp GigE framesTransmittedOk (frmTxOk)

Access	Read only
Description	This attribute counts the frames that were transmitted without errors. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE framesReceivedOk (frmRxOk)

Access	Read only
Description	This attribute counts the number of frames that were received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE octetsTransmittedOk (octetsTxOk)

Access	Read only
Description	This attribute counts the octets that were transmitted without errors. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE Dlep Vsp GigE octetsReceivedOk (octetsRxOk)

Access	Read only
Description	This attribute counts the octets that were received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE pauseFramesTransmitted (txPause)

Access	Read only
Description	This attribute counts the pause medium access controller control frames transmitted. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE pauseFramesReceived (rxPause)

Access	Read only
Description	This attribute counts the pause medium access controller control frames received. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE undersizeFrames (underFrm)

Access	Read only
Description	This attribute counts the frames that were received but were less than the minimum size (64 bytes). This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE framesTooLong (longFrm)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the frames that were received but were greater than the maximum size. The count includes frames which have a bad frame check sequence. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE frameCheckSequenceErrors (fcsErr)

Access	Read only
Description	This attribute counts the frames received that were an integral number of octets in length and did not pass the FCS check. This count does not include frames received that were too long or too short. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE symbolErrors (symErr)

Access	Read only
Description	This attribute counts the times a valid length frame was received and had at least one occurance of a data reception or symbol error. This counter increments once per valid Carrier Event as defined by the specification IEEE 802.3 - 2000 edition. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE broadcastFramesReceivedOk (bcastRxOk)

Access	Read only
Description	This attribute counts the valid broadcast frames received without errors. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

ATTRIBUTE Dlep Vsp GigE discardedFrames (discFrm)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the valid frames discarded because of a lack of resources available to receive them. This counter wraps to zero after it reaches its maximum value.
Mib	Dlep
Values	Long Integer
Default	No default

COMPONENT DpnGateway (DpnGate)

Instance	Decimal (0..65535)
Groups	GROUP DpnGate IfEntryProv (IfEntry) GROUP DpnGate Provisioned (Prov) GROUP DpnGate Overrides GROUP DpnGate OsiState (State) GROUP DpnGate OperationalStatus (OperStatus) GROUP DpnGate Operational (Oper) GROUP DpnGate Transport GROUP DpnGate Statistics (Stats)

COLLECTED STATS DpnGateway

Scope	Network
Description	*DpnGateway/n* The *DpnGateway* component provides a connection to a DPN-100 module. It controls a protocol stack associated with a logical port on a Functional Processor providing a connection to a DPN-100 UTP Trunk or Network Link. The underlying link protocol may be provided by either *Utp* or *FrAccess*. A maximum of 256 instances of *DpnGateway* may be provisioned on a module.

VERB LOCK DpnGate

Impact	Service
Description	*Lock [-force][-forever] <component name>* This verb will cause the specified component to no longer providing service and enter the OSI ***locked*** administrative state. In some cases, locking a component causes all its subcomponents to shut down also. **Options:** *-force* If this option is present, service to current clients is terminated and the ***locked*** state is entered immediately. Without this option, *Lock* behaves as described above. -forever If this option is present, then after service to current clients is terminated and the ***locked*** state is entered, an unlock command is required to get the service into the ***unlocked*** state. Without this option, the service automatically returns to the ***unlocked*** state after five minutes.

GROUP DpnGate **IfEntryProv (IfEntry)**

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	DpnTrunks

ATTRIBUTE DpnGate **ifAdminStatus (ifState)**

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	DpnTrunks
Values	up down testing
Default	up

ATTRIBUTE DpnGate **ifIndex (ifI)**

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	DpnTrunks
Values	Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP DpnGate Provisioned (Prov)

Properties	Provisioned
Description	This group of provisionable attributes provide parameters used by *DpnGateway* for staging.
Mib	DpnTrunks

ATTRIBUTE DpnGate expectedRemoteNamsId (expectedRemote)

Access	Read and write
Description	This attribute specifies the expected NAMS identifier of the module to which this *DpnGateway* is connected. The *DpnGateway* end points exchange their NAMS identifiers through the *DpnGateway*'s staging protocol. The staged value is validated and the *remoteValidationAction* will be executed for those values not matching the value supplied for this attribute. If this value is zero, then the comparison is always successful.
Mib	DpnTrunks
Values	Decimal (0..65535)
Default	0

ATTRIBUTE DpnGate remoteValidationAction (validation)

Access	Read and write
Description	This attribute specifies the action to be taken if there is a mismatch between the provisioned value and the value received from the remote end, in cases where the *expectedRemoteNamsId* is non-zero. If this attribute is provisioned to ***continue*** then upon an unsuccessful validation staging continues, otherwise, if ***disable*** is set then the *DpnGateway* does not continue to stage but, attempts to stage again after a one minute time out. All unsuccessful validation when *expectedRemoteNamsId* has been set result in the generation of an alarm.
Mib	DpnTrunks
Values	continue disable
Default	continue

ATTRIBUTE DpnGate linkType (type)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the type of network link. If this attribute is provisioned to ***dedicated*** then the link is a dedicated network link to a DPN module. If this attribute is provisioned to ***dialIn*** then the link is connected to the DPN module through a public telephone network, on a dial line.
Mib	DpnTrunks
Values	dedicated dialIn
Default	dedicated

GROUP DpnGate Overrides

Properties	Provisioned
Description	Theses attribute comprise the set of provisionable override parameters supported by both the *Trunk* and *DpnGateway* components. The attributes are used when reporting operational attributes (used for metric calculations) to the routing system.
Mib	DpnTrunks

ATTRIBUTE DpnGate overrideTransmitSpeed (ots)

Access	Read and write
Description	This is the overridden value of link speed (bit/s) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has not been provided and that only the measured value will be reported to the routing system. If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote.
Mib	DpnTrunks
Values	Decimal (0; 1000..4294967295)
Units	bit/s
Default	0

ATTRIBUTE DpnGate overrideRoundTripDelay (ortd)

Access	Read and write
Description	This is the overridden value of link delay (ms) that, if staged successfully with the remote, is reported to the routing system for metric calculations. A zero indicates that an override value has not been provided and that only the measured value will be reported to the routing system. If this value is changed on a *Trunk* or *DpnGateway* that is enabled, the LOCK and UNLOCK commands must be issued to the component to restage the override with the remote.
Mib	DpnTrunks

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0.0..1500.0)
Units	msec
Default	0.0

GROUP DpnGate OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	DpnTrunks

ATTRIBUTE DpnGate adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	DpnTrunks
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE DpnGate operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: DpnTrunks

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE DpnGate usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: DpnTrunks

Values:
idle
active (activ)
busy

Default: idle

ATTRIBUTE DpnGate availabilityStatus (osiAvail)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***inTest*** indicates that the resource is undergoing a test

Copyright © 2006, Nortel Nortel Confidential

procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Copyright © 2006, Nortel Nortel Confidential

Mib	DpnTrunks
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE DpnGate proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

Mib	DpnTrunks
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE DpnGate controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	DpnTrunks
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE DpnGate alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	DpnTrunks
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE DpnGate standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Mib	DpnTrunks
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE DpnGate unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	DpnTrunks
Values	false true
Default	false

GROUP DpnGate OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	DpnTrunks

ATTRIBUTE DpnGate snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	DpnTrunks
Values	up down testing
Default	up

GROUP DpnGate Operational (Oper)

Properties	Operational

Copyright © 2006, Nortel Nortel Confidential

Description	This group of attributes contain the operational information associated with this *DpnGateway* and the remote to which it has it staged.
Mib	DpnTrunks

ATTRIBUTE DpnGate remoteComponentName (remote)

Access	Read only
Description	This attribute indicates the Component Name of the remote DPN-100 UTP Trunk or Network Link supplied by the staging protocol. It is in the format *PM/n PE/n PI/n PO/n* where *PM* is the remote module NAMS identifier, *PE* is the remote module Processor Element that is staged with, *PI* is the remote module Peripheral Interface card associated with the *PE*, and *PO* is the remote module Port (physical or virtual) on the *PI* that the physical line is connected to.
Mib	DpnTrunks
Values	String (1..26, ASCII)
Default	No default

ATTRIBUTE DpnGate remoteNamsMnemonic (remoteNams)

Access	Read only
Description	This attribute indicates the NAMS Mnemonic of the remote DPN-100 Module supplied by the staging protocol. It can be used as a parameter to *Rtg Dpn* for displaying all *DpnGateway* that are connect to the same module.
Mib	DpnTrunks
Values	String (1..12, ASCII)
Default	No default

ATTRIBUTE DpnGate linkMode (mode)

Access	Read only
Description	This attribute indicates whether the *DpnGateway* is a ***Trunk*** connected to a DPN-100 RM or a ***NetworkLink*** connected to a DPN-100 AM.
Mib	DpnTrunks
Values	trunk networkLink unknown
Default	No default

ATTRIBUTE DpnGate activateReason (reason)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the reason the *DpnGateway* has been activated by the remote end. The value corresponds to the link type of the DPN end. It is always ***unknown*** until the link comes into service. If this attribute is set to ***dedicated***, the DPN is a dedicated network link. If this attribute is set to ***dnl***, the DPN end is a dial network link, meaning a network link which is connected through a dial-up service. If this attribute is set to ***dbnl***, the DPN end is dial backup network link, activated because the main network link is out of service. If this attribute is set to ***bwod***, the DPN end is a bandwidth on demand link, activated because extra bandwidth is required. If the attribute is set to ***unknown***, the link is either not currently in use, or the DPN end has an unrecognized link type.
Mib	DpnTrunks
Values	dedicated dnl dbnl dialIn bwod unknown
Default	unknown

GROUP DpnGate Transport

Properties	Operational
Description	This group of attributes contains the set of operational parameters measured and maintained by both the *Trunk* and *DpnGateway* components.
Mib	DpnTrunks

ATTRIBUTE DpnGate measuredSpeedToIf (spd)

Access	Read only
Description	This attribute indicates the current “transmittable” bandwidth of the underlying facility. For a *Trunk* with a *Unack* subcomponent, and a *DpnGateway* with a *Utp* subcomponent, if a serial port is used, the value is the measured transmit speed of the port; if a channelized port (E1/DS1) is used, the value is the measured transmit speed of the *Channel*. For a *Trunk* with an *AtmAccess* subcomponent, the value is calculated by converting the VCC transmit cell rate to an equivalent bit rate. The VCC transmit cell rate is determined based on the *vccReportingBw* attribute of the *Trunk AtmAccess* component. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***no***, the peak cell rate (PCR) of the VCC, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, is used. If *vccReportingBw* has a value of ***pcr*** and attribute *bwElastic* of *AtmAccess* has a value of ***yes***, the minimum of the PCR, defined in *txTrafficDescParm* of *AtmIf Vcc Vcd*, and the current cell rate (CCR) of the VCC is used. If *vccReportingBw* has a value of ***acr***, the best measurement of the actual cell rate (ACR) of the VCC is used, which is the minimum of

Copyright © 2006, Nortel Nortel Confidential

	the PCR, the CCR and the actual shaping rate (ASR). For a *Trunk* with an *MplsAccess* subcomponent, the value is the transmit bandwidth reserved on the MPLS transport *Lsp*. For a *DpnGateway* with a *FrAccess* subcomponent, the value indicates the *committedInformationRate* of *FrAccess FrMuxSetup*. A value of zero is displayed when the underlying facility is disabled or the current “transmittable” bandwidth is unknown.
Mib	DpnTrunks
Values	Decimal (0..4294967295)
Units	bit/s
Default	0

ATTRIBUTE DpnGate maxTxUnit (mtu)

Access	Read only
Description	This is the maximum transmission unit (byte size) that is supported by the *Trunk* or *DpnGateway* component. This size includes the data and routing headers. A value of zero indicates the MTU has not yet been determined.
Mib	DpnTrunks
Values	Decimal (0..65535)
Units	bytes
Default	0

ATTRIBUTE DpnGate measuredRoundTripDelay (rtd)

Access	Read only
Description	This attribute indicates the measured Round Trip Delay (msec) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. The value includes emission, propagation, and queuing delays. A 512 byte data packet is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown.
Mib	DpnTrunks
Values	Decimal (0.0..1500.0)
Units	msec
Default	0.0

GROUP DpnGate Statistics (Stats)

Properties	Operational
Description	This group of attributes contains statistics collected by the *DpnGateway* component.

Copyright © 2006, Nortel Nortel Confidential

Mib	DpnTrunks

ATTRIBUTE DpnGate pktFromIf (pkt)

Access	Read only
Description	This attribute counts the number of packets received from the remote module. This counter wraps around to zero when the maximum value is reached.
Mib	DpnTrunks
Values	Long Integer
Default	No default

ATTRIBUTE DpnGate trunkPktFromIf (trk)

Access	Read only
Description	This attribute counts the number of internal trunk protocol packets received from the remote module. These packets are forwarded to the *DpnGateway* component. This counter wraps around to zero when the maximum value is reached.
Mib	DpnTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE DpnGate trunkPktToIf (trkti)

Access	Read only
Description	This attribute counts the number of internal trunk protocol packets transmitted to the remote module. This counter wraps around to zero when the maximum value is reached.
Mib	DpnTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE DpnGate discardUnforward (disc)

Access	Read only
Description	This attribute counts the number of packets received from the remote module that have been discarded. This counter wraps around to zero when the maximum value is reached. Two main reasons that cause this counter to increment are: the remote protocol is not compatible to the local protocol stack or, the packet cannot be forwarded due to either a recent loss of connectivity or due to congestion.
Mib	DpnTrunks

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE DpnGate discardTrunkPktFromIf (discTrk)

Access	Read only
Description	This attribute counts the number of internal trunk protocol packets received from the remote module that have been discarded. This counter wraps around to zero when the maximum value is reached. The two main reasons that cause this counter to increment is if the DpnGateway is un-synchronized with DPN-100 and if the remote protocol is not the same version as the local protocol.
Mib	DpnTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE DpnGate stagingAttempts (statt)

Access	Read only
Description	This attribute counts the number of times that the staging protocol has attempted to stage with the remote module. This counter wraps around to zero when the maximum value is reached. The main reason for this counter to increment is that the local hardware is up but the local protocol cannot stage with the remote protocol due to a faulty connection. If the value is zero, then the local hardware has never enabled successfully.
Mib	DpnTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE DpnGate discardTrunkPktToIf (discTrkti)

Access	Read only
Description	This attribute counts the number of internal trunk protocol packets that have been discarded before being transmitted to the remote module. This counter wraps around to zero when the maximum value is reached. The main reason that causes this counter to increment is that the DpnGateway can not get sufficient resources to create an internal trunk protocol packet.
Mib	DpnTrunks
Values	Decimal (0..4294967295)
Default	No default

COLLECTED STATS DpnGateway

Description	The statistics record generated by the DpnGateway component.

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate remoteComponentName (remote)

Description	This attribute is the component name of the remote end which it has supplied through the *Trunk* or *DpnGateway* staging protocol.
Values	String (1..26, ASCII)

ATTRIBUTE DpnGate measuredSpeedToIfMax

Description	This is the maximum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for the whole interval or the measured speed is unknown.
Values	Decimal (0..4294967295)

ATTRIBUTE DpnGate measuredSpeedToIfMin

Description	This is the minimum measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled for any part of the interval or the measured speed is unknown.
Values	Decimal (0..4294967295)

ATTRIBUTE DpnGate measuredSpeedToIfCurrent

Description	This is the current measured transmit speed (bit/s) of the link. A value of zero is provided when the link is disabled or the measured speed is unknown.
Values	Decimal (0..4294967295)

ATTRIBUTE DpnGate measuredRoundTripDelayMax

Description	This is the maximum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for the whole interval or the delay is unknown.
Values	Decimal (0..1500)

ATTRIBUTE DpnGate measuredRoundTripDelayMin

Description	This is the minimum measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled for any part of the interval or the delay is unknown.
Values	Decimal (0..1500)

ATTRIBUTE DpnGate measuredRoundTripDelayCurrent

Description	This is the measured Round Trip Delay (ms) discovered with the remote through the *Trunk* and *DpnGateway* staging protocols. A value of zero is provided when the link is disabled or the delay is unknown.
Values	Decimal (0..1500)

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate fwdPktFromIf (fwdPkt)

Description	This attribute counts the number of forwarding packets received on the *Trunk* or *DpnGateway* in the last statistics collection interval.
Values	Long Integer

ATTRIBUTE DpnGate fwdDiscUnforwardFromIf (fwdDisc)

Description	This attribute counts the number of forwarding packets discarded by the *Trunk* or *DpnGateway* in the last statistics collection interval.
Values	Long Integer

ATTRIBUTE DpnGate fwdOctetFromIf (fwdOctet)

Description	This attribute counts the number of forwarding bytes received on the *Trunk* or *DpnGateway* in the last statistics collection interval.
Values	Long Integer

COMPONENT DpnGate Utp

Groups	GROUP DpnGate Utp Provisioned (Prov) GROUP DpnGate Utp OsiState (State) GROUP DpnGate Utp Operational (Op) GROUP DpnGate Utp Statistics (Stats)
Scope	Network
Description	*DpnGateway/n Utp* The *Utp* component provides the Utp Level2 link protocol, an acknowledged protocol that provides selective retransmission of frames. A *Framer* subcomponent is automatically added providing the underlying HDLC framing and associated hardware that the *Utp* component will use.
Mib	UtpDpnTrunks
Subcomponents	COMPONENT DpnGate Utp Framer
Common Verbs	Help List Display Add DELete

GROUP DpnGate Utp Provisioned (Prov)

Properties	Provisioned
Description	This group of provisionable attributes contains the parameters used by *Unacknowledged*, *Utp,* and *FrAccess* for monitoring link quality.
Mib	UtpDpnTrunks

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate Utp maximumErroredInterval

Access	Read and write
Description	This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *Unacknowledged, Utp,* or *FrAccess* component can be degraded. Once the error interval count exceeds the provisioned value, the *Unacknowledged*, *Utp,* or *FrAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled.
Mib	UtpDpnTrunks
Values	Decimal (0; 1..15)
Units	minutes
Default	0

ATTRIBUTE DpnGate Utp receiveErrorSensitivity

Access	Read and write
Description	This attribute is the allowable error rate beyond which the *Unacknowledged*, *Utp,* or *FrAccess* component can be degraded if it persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage of number of errored frames in the last interval per number of frames received in the last interval. The exception to this is a value of zero, which indicates that the mechanism is completely disabled. The configurable values are: 0 = the mechanism is completely disabled 1 = 1/(2**1) 2 = 1/(2**2) 3 = 1/(2**3) : 10 = 1/(2**10)
Mib	UtpDpnTrunks
Values	Decimal (0; 1..10)
Default	3

GROUP DpnGate Utp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Copyright © 2006, Nortel Nortel Confidential

Mib	UtpDpnTrunks

ATTRIBUTE DpnGate Utp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	UtpDpnTrunks
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE DpnGate Utp operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	UtpDpnTrunks
Values	enabled (ena) disabled (dis)

Copyright © 2006, Nortel Nortel Confidential

Default	disabled

ATTRIBUTE DpnGate Utp usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	UtpDpnTrunks
Values	idle active (activ) busy
Default	idle

ATTRIBUTE DpnGate Utp availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	UtpDpnTrunks
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE DpnGate Utp proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform

Copyright © 2006, Nortel Nortel Confidential

its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	UtpDpnTrunks
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE DpnGate Utp controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.

Copyright © 2006, Nortel Nortel Confidential

Mib	UtpDpnTrunks
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE DpnGate Utp alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	UtpDpnTrunks
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE DpnGate Utp standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	UtpDpnTrunks
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE DpnGate Utp **unknownStatus (osiUnknw)**

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	UtpDpnTrunks
Values	false true
Default	false

GROUP DpnGate Utp **Operational (Op)**

Properties	Operational
Description	This group of attributes contains the set of UTP operational parameters measured and maintained by this component.
Mib	UtpDpnTrunks

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate Utp roundTripDelay (rtd)

Access	Read only
Description	This is the measured Round Trip Delay (ms) discovered with the remote through the UTP staging protocol. The value includes emission, propagation, and queuing delays. A 2 byte control frame is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown.
Mib	UtpDpnTrunks
Values	Decimal (0..1500)
Units	msec
Default	No default

GROUP DpnGate Utp Statistics (Stats)

Properties	Operational
Description	This group of attributes contains the set of Utp frame counters collected by this component.
Mib	UtpDpnTrunks

ATTRIBUTE DpnGate Utp discardBadFromIf (discfi)

Access	Read only
Description	This attribute is the number of received frames discarded by the *Utp* component. UTP discards any received frame that is unknown to its protocol. This counter wraps around to zero when the maximum value is reached.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE DpnGate Utp discardExcessToIf (discti)

Access	Read only
Description	This attribute is the number of transmitted frames discarded by the *Utp* component. Transmitted frames are discarded if the wait for transmission queue is congested. This counter wraps around to zero when the maximum value is reached.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate Utp frmRexmtToIf (rexmt)

Access	Read only
Description	This attribute is the number of frames retransmitted by the *Utp* component. This counter wraps around to zero when the maximum value is reached.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE DpnGate Utp areYouThereModeEntries (ayt)

Access	Read only
Description	This attribute is the number of times the *Utp* component entered the AreYouThere mode. UTP enters this mode whenever the acknowledgment for the last transmitted frame has not been received within a certain time interval. In this mode UTP verifies that the remote end is still active. If so, it will retransmit all frames that were waiting to be acknowledged. This counter wraps around to zero when the maximum value is reached.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE DpnGate Utp windowClosures (closures)

Access	Read only
Description	This attribute is the number of times the *Utp* component closed its frame window. The frame window determines the maximum number of unacknowledged frames allowed. Typically, the frame window closes when the remote end cannot keep up with the frame arrival rate. This counter wraps around to zero when the maximum value is reached.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	No default

Description

Trunk/n Utp Framer

The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

GROUP DpnGate Utp Framer **Provisioned (Prov)**

Properties Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

Mib UtpDpnTrunks

ATTRIBUTE DpnGate Utp Framer **interfaceName**

Access Read and write

Criticality Process

Description

This attribute contains a hardware component name.

The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.

Mib UtpDpnTrunks

Values Link (Hardware, applicationFramerName)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP DpnGate Utp Framer **LinkOptions (Link)**

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	UtpDpnTrunks

ATTRIBUTE DpnGate Utp Framer **framingType**

Access	Read and write
Criticality	Process
Description	This attribute defines the type of framing on the link.
Mib	UtpDpnTrunks
Values	hdlc
Default	hdlc

ATTRIBUTE DpnGate Utp Framer **dataInversion**

Access	Read and write
Description	This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed. This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted.
Mib	UtpDpnTrunks
Values	off on
Default	off

ATTRIBUTE DpnGate Utp Framer **frameCrcType**

Access	Read and write
Description	This attribute defines the type of CRC used.

Copyright © 2006, Nortel Nortel Confidential

The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness.
NoCrc means that CRC is not used.

Mib: UtpDpnTrunks

Values:
crc16
crc32
noCrc

Default: crc16

ATTRIBUTE DpnGate Utp Framer **flagsBetweenFrames**

Access: Read and write

Description:

This attribute defines the number of flags that are inserted between frames sent to the link interface.

Mib: UtpDpnTrunks

Values: Decimal (1..16)

Default: 1

GROUP DpnGate Utp Framer **OsiState (State)**

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: UtpDpnTrunks

ATTRIBUTE DpnGate Utp Framer **adminState (osiAdmin)**

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — UtpDpnTrunks

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE DpnGate Utp Framer **operationalState (osiOper)**

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — UtpDpnTrunks

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE DpnGate Utp Framer **usageState (osiUsage)**

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — UtpDpnTrunks

Values — idle
active (activ)
busy

Default — idle

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate Utp Framer **overruns**

Access	Read only
Description	This attribute is the total number of frames received from the link for which overruns occurred.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate Utp Framer **underruns**

Access	Read only
Description	This attribute is the total number of frames transmitted to the link for which underruns occurred.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate Utp Framer **largeFrmErrors**

Access	Read only
Description	This attribute is the total number of frames received which were too large. The frame exceeded the maximumFrameLengthLimit provisioned attribute or it contained more than the 255 block hardware limit.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate Utp Framer **frmModeErrors**

Access	Read only
Description	This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode.
Mib	UtpDpnTrunks

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate Utp Framer **outOfSequenceFrm**

Access	Read only
Description	This attribute is the total number of out of sequence frames in interrupting mode that have been received from the link.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate Utp Framer **repeatedFrm**

Access	Read only
Description	This attribute is the total number of repeated frames (frames with the same sequence number) in interrupting mode that have been received from the link.
Mib	UtpDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate Utp Framer **frmToIf**

Access	Read only
Description	The number of frames transmitted to the link interface by Framer. Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component.
Mib	UtpDpnTrunks
Values	Long Integer
Default	No default

ATTRIBUTE DpnGate Utp Framer **frmFromIf**

ATTRIBUTE DpnGate Utp Framer **normPrioLinkUtilFromIf**

Access	Read only
Description	This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.
Mib	UtpDpnTrunks
Values	Decimal (0..100)
Units	%
Default	0

ATTRIBUTE DpnGate Utp Framer **highPrioLinkUtilFromIf**

Access	Read only
Description	This attribute is the utilization of the interrupting data traffic received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with a Transfer Priority (TP) of 11 and/or Emission Priority of 1. The utilization is the average for the last minute.
Mib	UtpDpnTrunks
Values	Decimal (0..100)
Units	%
Default	0

GROUP DpnGate Utp Framer **LinkUtilThreshold (UtilThreshold)**

Properties	Provisioned
Description	This group contains all of the provisioning data required to set the link utilization alarm thresholds. All thresholds are percentages which can take on any value in the range of 0% through 100%. The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor alarm threshold is less than the other thresholds and that the major alarm threshold is less than the critical alarm threshold.
Mib	UtpDpnTrunks

ATTRIBUTE DpnGate Utp Framer **minorLinkUtilAlarmThreshold (minor)**

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description

This attribute provides the threshold value which defines when a minor alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.
The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the minor alarm threshold is less than the other thresholds.

Mib: UtpDpnTrunks

Values: Decimal (0..100)

Units: %

Default: 75

ATTRIBUTE DpnGate Utp Framer **majorLinkUtilAlarmThreshold (major)**

Access: Read and write

Description

This attribute provides the threshold value which defines when a major alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued after a subsequent 3 minutes of utilization less than or equal to the given threshold.
The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the major alarm threshold is greater than the minor threshold and less than the critical threshold.

Mib: UtpDpnTrunks

Values: Decimal (0..100)

Units: %

Default: 85

ATTRIBUTE DpnGate Utp Framer **criticalLinkUtilAlarmThreshold (critical)**

Access: Read and write

Description

This attribute provides the threshold value which defines when a critical alarm would be issued, denoting a sustained total average link utilization. The total average link utilization is calculated based on the number of received bytes. The Set alarm is issued after 3 minutes of utilization greater than the given threshold. The corresponding Clear alarm is issued

Copyright © 2006, Nortel Nortel Confidential

after a subsequent 3 minutes of utilization less than or equal to the given threshold.
The value 100% is used to disable an individual threshold. For values other than 100%, a semantic check ensures that the critical alarm threshold is greater than the other thresholds.

Mib	UtpDpnTrunks
Values	Decimal (0..100)
Units	%
Default	95

ATTRIBUTE DpnGate Utp Framer **linkUtilAlarmStatus (status)**

Access	Read and write
Description	This attribute provides control of the generation of link utilization alarms. If the value is ***disabled***, none of the alarms are generated (this is equivalent to setting all of the thresholds to 100%). If the value is ***enabled***, the individual thresholds are handled.
Mib	UtpDpnTrunks
Values	enabled (ena) disabled (dis)
Default	disabled

COLLECTED STATS DpnGateway Utp Framer

Description	The statistics record generated by the DpnGateway Utp Framer component.

ATTRIBUTE DpnGate Utp Framer **rxBytes**

Description	This attribute provides the number of bytes received on the link by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE DpnGate Utp Framer **rxFrames**

Description	This attribute provides the number of frames received on the link interface by the Framer in the last collection interval.
Values	Long Integer

ATTRIBUTE DpnGate Utp Framer **txBytes**

Description	This attribute provides the number of bytes transmitted to the link by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate Utp Framer **txFrames**

Description	This attribute provides the number of frames transmitted to the link interface by the Framer in the last collection interval. This value could be zero if the application sends the frames directly to the link.
Values	Long Integer

ATTRIBUTE DpnGate Utp Framer **rxTotalLinkUtil**

Description	This attribute provides the average total link utilization computed based on the total number of bytes received on the link in the last collection interval.
Values	Decimal (0..100)

COMPONENT DpnGate **ForwardingStatistics (FwdStats)**

Groups	GROUP DpnGate FwdStats Operational (Oper)
Scope	Application
Description	*Trunk/n ForwardingStatistics* This is a dynamic subcomponent of a *Trunk* or *DpnGateway* which appears when packet forwarding traffic is used over the *Trunk* or *DpnGateway*. It contains statistics associated with packet forwarding traffic for *Trunks* and *DpnGateways*.
Mib	DpnTrunks
Common Verbs	Help List Display

GROUP DpnGate FwdStats **Operational (Oper)**

Properties	Operational
Description	This operational group counts the *Trunk* or *DpnGateway* packet forwarding traffic statistics for operator console display.
Mib	DpnTrunks

ATTRIBUTE DpnGate FwdStats **fwdPktFromIf (fwdPkt)**

Access	Read only
Description	This attribute counts the number of forwarding packets received by the *Trunk* or *DpnGateway*. This counter wraps around to zero when the maximum value is exceeded.
Mib	DpnTrunks
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE DpnGate FwdStats fwdDiscUnforwardFromIf (fwdDisc)

Access	Read only
Description	This attribute counts the number of forwarding packets discarded by the *Trunk* or *DpnGateway*. This counter wraps around to zero when the maximum value is exceeded.
Mib	DpnTrunks
Values	Long Integer
Default	No default

ATTRIBUTE DpnGate FwdStats fwdOctetFromIf (fwdOctet)

Access	Read only
Description	This attribute counts the number of forwarding bytes received by the *Trunk* or *DpnGateway*. This counter wraps around to zero when the maximum value is exceeded.
Mib	DpnTrunks
Values	Long Integer
Default	No default

COMPONENT DpnGate FrAccess

Groups	GROUP DpnGate FrAccess Provisioned (Prov) GROUP DpnGate FrAccess OsiState (State) GROUP DpnGate FrAccess Operational (Op) GROUP DpnGate FrAccess Statistics (Stats)
Scope	Network
Description	*DpnGate/n FrAccess* This component provides Layer 2 trunking protocol, to be used by *DpnGateway* running over *FrMux* frame relay interface.
Mib	FraDpnTrunks
Subcomponents	COMPONENT DpnGate FrAccess FrMuxSetup
Common Verbs	Help List Display Add DELete

GROUP DpnGate FrAccess Provisioned (Prov)

Properties	Provisioned
Description	This group of provisionable attributes contains the parameters used by *Unacknowledged*, *Utp,* and *FrAccess* for monitoring link quality.

Copyright © 2006, Nortel Nortel Confidential

Mib	FraDpnTrunks

ATTRIBUTE DpnGate FrAccess maximumErroredInterval

Access	Read and write
Description	This attribute specifies the interval time over which the error threshold (as specified by *receiveErrorSensitivity)* must be continuously exceeded before the *Unacknowledged, Utp,* or *FrAccess* component can be degraded. Once the error interval count exceeds the provisioned value, the *Unacknowledged*, *Utp,* or *FrAccess* component issues an alarm indicating that link quality has degraded, and it disables its parent component. The exception to this is a value of zero, the default, which indicates that the mechanism is completely disabled.
Mib	FraDpnTrunks
Values	Decimal (0; 1..15)
Units	minutes
Default	0

ATTRIBUTE DpnGate FrAccess receiveErrorSensitivity

Access	Read and write
Description	This attribute is the allowable error rate beyond which the *Unacknowledged*, *Utp,* or *FrAccess* component can be degraded if it persists for a duration longer than the *maximumErrorInterval*. The threshold is expressed as a percentage of number of errored frames in the last interval per number of frames received in the last interval. The exception to this is a value of zero, which indicates that the mechanism is completely disabled. The configurable values are: 0 = the mechanism is completely disabled 1 = 1/(2**1) 2 = 1/(2**2) 3 = 1/(2**3) : 10 = 1/(2**10)
Mib	FraDpnTrunks
Values	Decimal (0; 1..10)
Default	3

GROUP DpnGate FrAccess OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this

Copyright © 2006, Nortel Nortel Confidential

group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — FraDpnTrunks

ATTRIBUTE DpnGate FrAccess adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — FraDpnTrunks

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE DpnGate FrAccess operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib — FraDpnTrunks

Copyright © 2006, Nortel Nortel Confidential

Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE DpnGate FrAccess usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FraDpnTrunks
Values	idle active (activ) busy
Default	idle

ATTRIBUTE DpnGate FrAccess availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib — FraDpnTrunks

Set of
inTest
failed
dependency (depend)
powerOff (pwrOff)
offLine
offDuty
degraded (degrad)
notInstalled (notIn)
logFull
migrating

Default — No default

ATTRIBUTE DpnGate FrAccess proceduralStatus (osiProc)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	FraDpnTrunks
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE DpnGate FrAccess **controlStatus (osiCntrl)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

Copyright © 2006, Nortel Nortel Confidential

The value ***suspended*** indicates that the service has been administratively suspended.

Mib: FraDpnTrunks

Set of:
subjectToTest (subTst)
partOfServicesLocked (partLk)
reservedForTest (rsrvd)
suspended (suspnd)

Default: No default

ATTRIBUTE DpnGate FrAccess alarmStatus (osiAlarm)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib: FraDpnTrunks

Set of:
underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default: No default

ATTRIBUTE DpnGate FrAccess standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.
Mib	FraDpnTrunks
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE DpnGate FrAccess unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FraDpnTrunks
Values	false true
Default	false

Copyright © 2006, Nortel Nortel Confidential

GROUP DpnGate FrAccess Operational (Op)

Properties	Operational
Description	This group of attributes contains the set of LTP operational parameters measured and maintained by this component.
Mib	FraDpnTrunks

ATTRIBUTE DpnGate FrAccess roundTripDelay (rtd)

Access	Read only
Description	This is the measured Round Trip Delay (ms) discovered with the remote through the LTP staging protocol. The value includes emission, propagation, and queuing delays. A 2 byte control frame is used to perform the measurement. A value of zero is displayed when the link is disabled or the measured Round Trip Delay is unknown.
Mib	FraDpnTrunks
Values	Decimal (0..1500)
Units	msec
Default	No default

GROUP DpnGate FrAccess Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics for *FrAccess*.
Mib	FraDpnTrunks

ATTRIBUTE DpnGate FrAccess receivedBytesFromIf (rbfi)

Access	Read only
Description	This attribute counts the number of bytes received by *FrAccess* in information frames. When the maximum count is reached the count wraps to zero.
Mib	FraDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate FrAccess lostFramesFromIf (lfti)

Access	Read only
Description	This attribute counts the frames lost in the direction from interface, the loss of which is detected based on the sequence number mechanism. The

Copyright © 2006, Nortel Nortel Confidential

reason for a loss may be the congestion-related loss in the external frame relay network, or errors/congestion developing in the *FrMux* service. When *FrMux* statistics do not show errors/congestion developing internally in *FrMux*, then the losses visible through this statistic should be attributed to the external frame relay network. When the maximum count is reached the count wraps to zero.

Mib	FraDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate FrAccess discardBadFromIf (dbfi)

Access	Read only
Description	This attribute counts the number of frames discarded in the direction 'from interface', because they are unknown to the *FrAccess* protocol. When the maximum count is reached the count wraps to zero.
Mib	FraDpnTrunks
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE DpnGate FrAccess discardExcessToIf (deti)

Access	Read only
Description	This attribute counts the number of frames discarded in the direction 'to interface' because of congestion on the transmit queue. When the maximum count is reached the count wraps to zero.
Mib	FraDpnTrunks
Values	Decimal (0..4294967295)
Default	0

COMPONENT EM

Scope	Device
Description	*Em/string* This component represents the local node. An instance of the *EM* component class (with the local node name as its instance string) is automatically created as the root of the component hierarchy; that is, all of the top level components are its subcomponents. The local node name is provisioned as the *nodeName* attribute of the *ModuleData* component. An operator need not enter the *EM* component at the start of a component name; the local node is assumed by default. However, to specify some

Copyright © 2006, Nortel

Nortel Confidential

	other node, it must be entered. Similarly, on output, the local node name is suppressed.

VERB LOGOUT (LOGOFF)

Impact	Passive
Description	*Logout* This verb terminates a Local or Telnet Operator session. If the session was in provisioning mode, an *End Prov* command is effectively executed before the session terminates. The edit view is neither saved nor modified by logging out while in provisioning mode.

VERB ME

Impact	Passive
Description	*Me* This verb displays an FMIP, Local or Telnet Operator's component name and userid as well as other information.

VERB CANCEL

Impact	Passive
Description	*Cancel* This verb aborts the latest command, if possible.

VERB QUIT (EXIT)

Impact	Passive
Description	*Quit* This verb terminates a Local or Telnet Operator session, just like the *Logout* command does. If the session was in provisioning mode, an *End Prov* command is effectively executed before the session terminates. The edit view is neither saved nor modified by logging out while in provisioning mode.

VERB RESETLOCAL

Impact	System_admin
Description	Resetlocal This verb logs out a user currently using the local operator port on the CP. This command can be executed from a telnet session to force another user out of the local port.

COMPONENT EthernetTransportSystem (Ets)

Groups	GROUP Ets Provisioned (Prov) GROUP Ets Operational (Oper)
Scope	Network
Description	*EthernetTransportSystem* This component represents the Ethernet transport system. It is used to provide aggregation of one or more EVLS VLANs from one Ethernet interface to another Ethernet interface over a single ATM virtual circuit (VC). It can establish one or more ATM VCs to provide connectivity among multiple Ethernet interfaces, one ATM VC for each Ethernet interface pair. At least one *EvlsAtmTransport* subcomponent must exist under this component.
Mib	no_mib
Opt. Subcomp.	COMPONENT Ets EvlsAtmTransport (EAtmTrsp)
Common Verbs	Help List Display Add DELete

GROUP Ets Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *EthernetTransportSystem* component.
Mib	no_mib

ATTRIBUTE Ets nsapAddress (nsapAddr)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel

Nortel Confidential

Description	This attribute specifies a 40-digit ATM address in standard ISO NSAP format. This is the local address of the shelf for the *EthernetTransportSystem* component within the ATM routing database. If the default value is used, an internal NSAP address is generated using the value of the *ModuleData nodePrefix* attribute and the value of the End System Identifier (ESI) that is the assigned number for ETS. This internal NSAP address can be displayed using the *Ets activeNsapAddress* operational attribute.
Mib	no_mib
Values	String (40, AESANsapAddress)
Default	470000000000000000000000000000000000000000

GROUP Ets Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *EthernetTransportSystem* component.
Mib	no_mib

ATTRIBUTE Ets activeNsapAddress (actNsapAddr)

Access	Read only
Description	This attribute indicates the local NSAP address of the shelf for the *EthernetTransportSystem* component in the ATM network.
Mib	no_mib
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE Ets totalAdmittedConnections (tAdmConns)

Access	Read only
Description	This attribute indicates the total number of EVLS VLANs that are being aggregated by the Ethernet Transport System.
Mib	no_mib
Values	Decimal (0..32000)
Default	No default

ATTRIBUTE Ets connectionAttemptFailures (conFail)

Access	Read only
Description	This attribute counts the total number of EVLS VLANs that have requested admission, and have not been admitted.

Copyright © 2006, Nortel Nortel Confidential

When this count reaches the maximum, it wraps around to zero.

Mib	no_mib
Values	Decimal (0..4294967295)
Default	No default

COMPONENT Ets EvlsAtmTransport (EAtmTrsp)

Instance	Decimal (1..256)
Groups	GROUP Ets EAtmTrsp Provisioned (Prov) GROUP Ets EAtmTrsp OsiState (State) GROUP Ets EAtmTrsp OperationalStatus (OperStatus) GROUP Ets EAtmTrsp Operational (Oper)
Scope	Application
Description	*Ets EvlsAtmTransport/n* This component represents connectivity between a local Ethernet interface and either a far end Ethernet interface or a far end ATM UNI. It is responsible for aggregating one or more EVLS VLANs for the specified *LanApplication* instance and mapping these VLANs to a single shared ATM transport VC.
Mib	no_mib

Opt. Subcomp.	COMPONENT Ets EAtmTrsp EthernetOverAtmSpvc (Spvc)
Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP Ets EAtmTrsp Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisioned attributes for the *EvlsAtmTransport* component.
Mib	no_mib

ATTRIBUTE Ets EAtmTrsp lanApplication (lanApp)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the component name of the *LanApplication* component. It is used to ensure the transport of traffic, over this shared ATM transport VC, is to and from a single local Ethernet interface.
Mib	no_mib
Values	The name of the component
Default	No default

ATTRIBUTE Ets EAtmTrsp prefixNsapAddress (preNsapAddr)

Access	Read and write
Description	This attribute specifies the 40-digit NSAP of the far end Ethernet interface. The Ethernet Transport System searches for an *EvlsAtmTransport* component with a value of this attribute that matches exactly the *remoteAddress* of an EVC configured to use aggregation. The value of this attribute must be unique among all the *EvlsAtmTransport* components that share the same *lanApplication* value.
Mib	no_mib
Values	String (40, AESANsapAddress)
Default	No default

GROUP Ets EAtmTrsp OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	no_mib

ATTRIBUTE Ets EAtmTrsp adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

Copyright © 2006, Nortel Nortel Confidential

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib: no_mib

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE Ets EAtmTrsp operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib: no_mib

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE Ets EAtmTrsp usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib: no_mib

Values:
idle
active (activ)
busy

Default: idle

Copyright © 2006, Nortel Nortel Confidential

Scope	Network
Description	*Ets EAtmTrsp/x EthernetOverAtmSpvc/m* This component represents one of the SPVC endpoints of the ATM transport connection. This component can be dynamically created or provisioned. When this component is dynamically created, it implicitly indicates that a connection has been established and this SPVC is the called endpoint of the VCC. The *Spvc endPoint* operational attribute is used to indicate the called end. This dynamically created component does not exist when there is no connection. When this component is provisioned, it implies that this is the calling endpoint of the VCC. It does not imply that a connection is established. A provisioned *Spvc* component allows initiation of the setup request to the called end of the ATM transport connection

ATTRIBUTE Ets EAtmTrsp Spvc forceTagging (tagging)

Access	Read and write
Criticality	Component
Description	This attribute specifies whether force tagging of the CLP bit is enforced for cells of this connection. Force tagging can be enabled for permanent connections of any service category and on switched connections of UBR service category. A value of ***enabled*** means force tagging is enabled. When this option is selected, the CLP bit is set to 1 for all cells on the connection. A value of ***disabled*** means force tagging is disabled. When this option is selected, the CLP bit is unchanged for cells on the connection. For ***4pOC12SmIrAtm*** and ***16pOC3SmIrAtm*** cards, force tagging applies to cells in the receive direction. For all other cards, force tagging applies to cells in the transmit direction.
Mib	no_mib
Values	enabled disabled
Default	enabled

ATTRIBUTE Ets EAtmTrsp Spvc txQosClass (txQos)

Access	Read only
Description	This attribute indicates the quality of service for the calling to called direction for this connection. Class 0 is the unspecified QOS class; no objective is specified for the performance parameters.
Mib	no_mib

Mib	no_mib
Values	0
Default	No default

ATTRIBUTE Ets EAtmTrsp Spvc bearerClassBbc (bcBbc)

Access	Read only
Description	This attribute indicates the bearer capability for this connection. Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***cbr*** or ***vbr***), and timing requirements are user defined (that is, transparent to the network). When the value of this attribute is ***x***, the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.
Mib	no_mib
Values	x
Default	No default

ATTRIBUTE Ets EAtmTrsp Spvc transferCapabilityBbc (tcBbc)

Access	Read only
Description	This attribute indicates the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> 0: NoIndication, NoIndication 2: NoIndication, no 5: CBR, yes 9: VBR, yes The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data. The value NoIndication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing. The value yes for end-to-end timing indicates that end-to-end timing is required for the connection.

Copyright © 2006, Nortel Nortel Confidential

The value no for end-to-end timing indicates that end-to-end timing is not required for the connection.

indicated
notIndicated

Default: No default

ATTRIBUTE Ets EAtmTrsp Spvc txPacketWiseDiscard (txpd)

Access: Read only

Description: This attribute indicates the current set of packet-wise discard functions in effect in the transmit data direction at this connection point.

A value of ***ppd*** indicates that the Partial Packet Discard (PPD) function is in effect. PPD may be applied at an intermediate connecting point for a connection which is transporting frame traffic (AAL5 at the endpoint). PPD is controlled by provisioning for PVCs and SPVCs, and by call setup parameters in the AAL and Traffic Descriptor Information Elements.

A value of ***epd*** indicates that the Early Packet Discard (EPD) function is in effect at this connection point.

GROUP Ets EAtmTrsp Spvc **AtmSpvcInfo (SpvcInfo)**

Properties	Operational
Description	This group contains connection operational information for the *EthernetOverAtmSpvc* component.
Mib	no_mib

ATTRIBUTE Ets EAtmTrsp Spvc **totalBandwidth (tbw)**

Access	Read only
Description	This attribute indicates the total bandwidth of this SPVC connection in bits per second. If the *atmServiceCategory* of the SPVC is ***rt-vbr*** or ***nrt-vbr***, the value of this attribute is derived from the sustained cell rate (SCR) value of the SPVC. If the *atmServiceCategory* of the SPVC is ***ubr*** or ***cbr***, the value of this attribute is derived from the peak cell rate (PCR) value of the SPVC. Cell rate is converted to bits/s by multiplying by 424 bits/cell.
Mib	no_mib
Values	Long Integer
Units	bit/s
Default	No default

ATTRIBUTE Ets EAtmTrsp Spvc **availableBandwidth (abw)**

Access	Read only
Description	This attribute indicates the available bandwidth of this SPVC connection in bits per second. Available bandwidth is calculated by subtracting the total

Copyright © 2006, Nortel Nortel Confidential

sum of the bandwidth of VLANs using this SPVC transport from the *totalBandwidth* value. If the value of this attribute is positive, this SPVC is under-subscribed. If the value of this attribute is ***0*** and alarm 70724104 is cleared, this SPVC is subscribed to its maximum bandwidth. If the value of this attribute is ***0*** and alarm 70724104 is set, this SPVC is over-subscribed. When the SPVC is over-subscribed, traffic loss may occur.

ATTRIBUTE Ets EAtmTrsp Spvc Tm bearerClassBbc (bcBbc)

Access	Read and write
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the bearer capability. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability (BBC) attributes. The purpose of the BBC information element is to indicate a requested broadband connection-oriented bearer service to be provided by the network. The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both. Class ***x*** service is a connection-oriented ATM transport service where the AAL, *trafficType* (***vbr*** or ***cbr***) and timing requirements are user defined (that is, transparent to the network).When ***x*** is set the user is requesting an ATM only service from the network. In this case, the network shall not process any higher layer protocol.
Mib	no_mib
Values	x derivedFromServiceCategory
Default	derivedFromServiceCategory

ATTRIBUTE Ets EAtmTrsp Spvc Tm **transferCapabilityBbc (tcBbc)**

Access	Read and write
Criticality	Component
Description	This attribute specifies the transfer capability for this connection. Uni 3.0/ 3.1 traffic type and end-to-end timing parameters are mapped into this parameter as follows: <transferCapability: TrafficType, Timing> 0: NoIndication, NoIndication 2: NoIndication, no 5: CBR, yes 9: VBR, yes The CBR traffic type refers to traffic offered on services such as a constant bit rate video service or a circuit emulation. The VBR traffic type refers to traffic offered on services such as packetized audio and video, or data. The value no indication for traffic type is used if the user has not set the traffic type; similarly for end-to-end timing. The value yes for end-to-end timing indicates that end-to-end timing is required. The value no for end-to-end timing indicates that end-to-end timing is not required.

Copyright © 2006, Nortel Nortel Confidential

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

ATTRIBUTE Ets EAtmTrsp Spvc Tm bestEffort

Access: Read and write

Criticality: Component

Description: This attribute specifies the value of the best effort parameter in the ATM Traffic Descriptor Information Element. This attribute is only used for SPVC connections. It is one of the Broadband Bearer Capability attributes.

The value ***indicated*** implies that the quality of service for this connection is not guaranteed.

The value ***notIndicated*** implies that the quality of service for this connection is guaranteed.

The value ***derivedFromServiceCategory*** specifies that the actual value which is used for this connection is derived from the value of the *atmServiceCategory*. Either, this attribute must be set to ***derivedFromServiceCategory***, or the *atmServiceCategory* attribute must be set to ***derivedFromBBC***, but not both.

Mib: no_mib

Values:
indicated
notIndicated
derivedFromServiceCategory (derived)

Default: derivedFromServiceCategory

ATTRIBUTE Ets EAtmTrsp Spvc Tm txPacketWiseDiscard (txpd)

Access: Read and write

Criticality: Component

Description: This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the transmit data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic.

Copyright © 2006, Nortel Nortel Confidential

Packet-wise functions increase the “goodput” of the link. The transmit packet-wise functionsare Early Packet Discard (EPD) and Partial Packet Discard (PPD).

EPD allows the connection to discard an entire frame once the transmit queue has reached the EPD threshold. EPD increases the "goodput" of a link, since discarding an entire frame means that some queue capacity is guarded for some other frame which is already partially transmitted. All cells of the frame are discarded from the Beginning of Message (BOM) cell up to and including the End of Message (EOM) cell.

PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted.

For ***4pOC3MmAtm*** and ***4pOC3SmIrAtm*** cards, the packet-wise discard function includes PPD. PPD applies to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. PPD is controlled by this attribute. This attribute may safely be set to ***enabled*** for any connection (*Vcc* or *Vpc*) since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected.

For ***4pOC12SmIrAtm*** and ***16pOC3SmIrAtm*** cards, the packet-wise discard functions include PPD. PPD and applies to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded.

A value of ***enabled*** means packet-wise discard functions are applied to transmit traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to transmit traffic at this connection point.

At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the backward direction. When this attribute is set to ***disabled***, backward frame discard is not requested in the SPVC call setup.

The transmit packet-wise discard functions that are active are visible in the *Spvc txPacketWiseDiscard* operational attribute.

ATTRIBUTE Ets EAtmTrsp Spvc Tm **rxPacketWiseDiscard (rxpd)**

Access	Read and write
Criticality	Component
Description	This attribute specifies whether packet-wise discard functions are to be enabled or disabled in the receive data direction for this connection. Packet-wise discard functions apply to AAL5 frame traffic. Packet-wise functions increase the “goodput” of the link. The receive packet-wise function is Partial Packet Discard (PPD). PPD allows the connection to discard the remainder of a cell-forwarded AAL5 frame if one cell of this frame has been discarded, for example due to UPC. All cells are discarded up to but not including the EOM cell. The PPD function increases the “goodput” of the link, since cells which are only going to be discarded at the AAL5 reassembly point are not transmitted. For ***4pOC3MmAtm*** and ***4pOC3SmIrAtm*** cards, this attribute may safely be set to ***enabled*** for any connection since these FPs have the ability to automatically detect AAL5-segmented traffic on a connection, and only enable packet-wise discards if AAL5-segmented traffic is detected. For ***4pOC12SmIrAtm*** and ***16pOC3SmIrAtm*** cards, packet-wise discard functions include EPD and PPD. PPD and EPD apply to individual VCCs and VCCs within VPCs at all connection points, including tandem VPC connections. Packet-wise discard should only be enabled for connections carrying AAL5 segmentation traffic. Setting this attribute to ***enabled*** for any other traffic type may result in all traffic being discarded. A value of ***enabled*** means packet-wise discard functions are applied to receive traffic at this connection point. A value of ***disabled*** means packet-wise discard functions are not applied to receive traffic at this connection point. At a SPVC origin on a PNNI interface, a value of ***enabled*** specifies that frame discard is requested in the forward direction. When this attribute is set to ***disabled***, forward frame discard is not requested in the SPVC call setup. The receive packet-wise discard functions that are active are visible in the *Spvc rxPacketWiseDiscard* operational attribute.

ATTRIBUTE Ets EAtmTrsp Spvc Tm **trafficDescType (tdt)**

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Criticality	Component
Description	This attribute indicates the type of traffic management which is applied to the receive direction of this connection as defined in the ATM Forum. The *trafficDescType* determines the number and meaning of the parameters in the *trafficDescParm* attribute.
Mib	no_mib
Values	3 8 9
Default	3

ATTRIBUTE Ets EAtmTrsp Spvc Tm trafficDescParm (tdp)

Access	Read and write
Criticality	Component
Description	This attribute is a vector of five transmit traffic parameters whose mapping is defined by the traffic descriptor type. Parameters 4 and 5 are unused by the *EthernetTransportSystem*. The values of peak cell rate (PCR), sustained cell rate (SCR), and minimum cell rate (MCR) are expressed in cell/s. When the traffic descriptor type is 3, parameter 1 represents the PCR for CLP equal to 0 or 1 traffic; parameter 2 is unused. When the traffic descriptor type is 8, parameter 1 represents the PCR for CLP equal to 0 and 1 traffic; parameter 2 represents the SCR for CLP equal to 0 traffic with cell tagging. When the traffic descriptor type is 9, parameter 1 represents the PCR; parameter 2 is unused; parameter 3 represents the MCR.

GROUP FrAtm CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	FrameRelayAtm
Values	Decimal (0; 1..8191)
Default	0

GROUP FrAtm OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	FrameRelayAtm
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrAtm operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrameRelayAtm
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrAtm usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use.

Copyright © 2006, Nortel Nortel Confidential

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	FrameRelayAtm
Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrAtm availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	FrameRelayAtm
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE FrAtm proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib: FrameRelayAtm

Set of:
initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default: No default

ATTRIBUTE FrAtm controlStatus (osiCntrl)

Access: Read only

Description: If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

ATTRIBUTE FrAtm alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	FrameRelayAtm
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE FrAtm standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service

Copyright © 2006, Nortel Nortel Confidential

but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib: FrameRelayAtm

Values:
hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default: notSet

ATTRIBUTE FrAtm unknownStatus (osiUnknw)

Access: Read only

Description: This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib: FrameRelayAtm

Values:
false
true

Default: false

GROUP FrAtm Statistics (Stats)

Properties: Operational

Description: FrUni/n Statistics
This group contains the statistics about the operational behavior of the service at the interface level.

Mib: FrameRelayAtm

ATTRIBUTE FrAtm lastUnknownDlci (ludlc)

Access: Read only

Description: This attribute identifies the most recent DLCI which user frames were received on for which a DLCI has not been provisioned on the port.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	Decimal (0..1023)
Default	0

ATTRIBUTE FrAtm unknownDlciFramesFromIf (unknown)

Access	Read only
Description	This attribute contains a count of the number of frames received from the interface with an unknown DLCI (DLCI which is not provisioned). When the maximum is reached the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm invalidHeaderFramesFromIf (invalid)

Access	Read only
Description	This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is reached the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

GROUP FrAtm IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.

Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	FrameRelayAtm
Values	Decimal (1..65535)
Default	No default

GROUP FrAtm OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayAtm
Values	up down testing
Default	up

GROUP FrAtm EmissionPriorityQs

Properties	Provisioned
Description	This group contains the provisionable attribute to specify the number of Frame Relay egress emission priority queues to be used on that Frame Relay Interface and the provisionable attribute to determine whether emission queue size is doubled.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm numberOfEmissionQs

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the number of egress emission priority queues that will be used for that Frame Relay interface. For V.35, V.11, HSSI, E1, DS1, E3, DS3 or 8pDS1 the possible values are: ***2*** (in which case they are hardware queues), or ***4*** (in which case they are software queues). For DS1C, E1C or DS3C the possible values are ***2, 4*** (in all cases they are software queues). For 32 port Msa cards the possible values are ***2, 4*** (in all cases they are hardware queues). For 4pDS3Ch, 1pSTM1ChSmIr PQC6v2 (also known as PQC2) the possible values are ***2, 4*** (in all cases they are hardware queues). For 4pDS3Ch PQC12, setting this attribute has no effect on the number of egress emission priority queues, four hardware queues are always used.
Mib	FrameRelayAtm
Values	Decimal (2; 4)
Default	2

ATTRIBUTE FrAtm doubleEmissionQSize (deqs)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the emission queue's size is doubled for the frame relay interface and it is only supported on *frUni*. When *doubleEmissionQSize* is set to ***yes***, the default frame relay interface emission queue size is doubled. This will reduce packets loss, but latency will be increased as the queue length grows. When the attribute is set to ***no***, the default emission queues size will be used. When frame relay interface is linked to a virtual framer, the *doubleEmissionQSize* must be set to ***no***, or a semantic check error will occur. For V11, E1 and E1C cards, the possible values of the *doubleEmissionQSize* attribute are ***yes*** and ***no***. For other cards, *doubleEmissionQSize* must always be set to ***no***, or a semantic check error will occur.
Mib	FrameRelayAtm
Values	no yes

Copyright © 2006, Nortel Nortel Confidential

Default	no

GROUP FrAtm TrafficStatistics (TrafficStats)

Properties	Operational
Description	This operational group provides the traffic statistics of the service at the interface level. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm frmToIfByQueue

Access	Read only
Description	This attribute counts the frames transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority. The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Replication	Decimal (0..3)
Default	No default

ATTRIBUTE FrAtm octetToIfByQueue

Access	Read only
Description	This attribute counts the octets transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority. The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4.

GROUP FrAtm Framer LinkUtilization (Util)

COLLECTED STATS FrameRelayAtmInterface Framer

Scope: Application

Description:

FrUni/n Framer
FrNni/n Framer
FrAtm/n Framer
This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

GROUP FrAtm Framer Provisioned (Prov)

Properties: Provisioned

Description:

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

Mib: FrameRelayAtm

ATTRIBUTE FrAtm Framer interfaceName

Access: Read and write

Criticality: Process

Copyright © 2006, Nortel
Nortel Confidential

Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	FrameRelayAtm
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP FrAtm Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Framer dataInversion

Access	Read and write
Description	This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed. This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted. This attribute may only take its default value for non-MSA cards.
Mib	FrameRelayAtm
Values	off on
Default	off

ATTRIBUTE FrAtm Framer frameCrcType

Access	Read and write
Description	This attribute defines the type of CRC used.

Copyright © 2006, Nortel Nortel Confidential

The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness.
NoCrc means that CRC is not used.

This attribute may take only its default value for non-MSA cards.

Mib: FrameRelayAtm

Values:
crc16
crc32
noCrc

Default: crc16

ATTRIBUTE FrAtm Framer flagsBetweenFrames

Access: Read and write

Description:

This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.

Mib: FrameRelayAtm

Values: Decimal (1..16)

Default: 1

GROUP FrAtm Framer OsiState (State)

Properties: Operational

Description: This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib: FrameRelayAtm

ATTRIBUTE FrAtm Framer adminState (osiAdmin)

Access: Read only

Description: This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib	FrameRelayAtm
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrAtm Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayAtm
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrAtm Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayAtm
Values	idle active (activ) busy

Default	idle

GROUP FrAtm Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Framer aborts

Access	Read only
Description	This attribute is the total number of aborts received.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer crcErrors

Access	Read only
Description	This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer lrcErrors

Access	Read only
Description	This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer nonOctetErrors

Access	Read only
Description	This attribute is the total number of frames that were non octet aligned.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer overruns

Access	Read only
Description	This attribute is the total number of frames received from the link for which overruns occurred.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer underruns

Access	Read only
Description	This attribute is the total number of frames transmitted to the link for which underruns occurred.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer largeFrmErrors

Access	Read only
Description	This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer frmModeErrors

Access	Read only
Description	This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Framer frmToIf

Access	Read only
Description	The number of frames transmitted to the link interface by Framer. Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Framer frmFromIf

Access	Read only
Description	The number of frames received from the link interface by Framer.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Framer octetFromIf

Access	Read only
Description	The number of bytes received from the link interface by Framer.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Framer ingressFrameDiscards

Access	Read only
Description	This attribute is the total number of frames discarded at ingress PQC.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

GROUP FrAtm Framer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Framer normPrioLinkUtilToIf

Access	Read only
Description	This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.
Mib	FrameRelayAtm
Values	Decimal (0..100)
Units	%
Default	0

ATTRIBUTE FrAtm Framer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.
Mib	FrameRelayAtm

GROUP FrAtm Lmi ProtocolParameters (Parms)

Properties	Provisioned
Description	This group contains the provisionable attributes of the *LMI* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Lmi procedures (proc)

Access	Read and write
Criticality	Process
Description	This attribute selects the procedures to be used for the Local Management Interface. The following procedures are supported: ***none:*** no Local Management Interface procedures are running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures. The remaining attributes of this group are ignored. For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrUni* is set to ***none***, only ***none*** is permitted for the *procedures* attribute of this *Lmi* component. ***vendorForum***: Local Management Interface procedures from the Vendor Forum specification are supported on this interface. *DLCI 1023* is used for the LMI protocol. This value cannot be used if the side attribute is both. ***ansi***: Local Management Interface procedures from the ANSI specification are supported. *DLCI 0* is used for the LMI protocol. ***itu***: Local Management Interface procedures from the ITU-T specification are supported. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***. ***autoConfigure***: The interface determines automatically which Local Management Interface procedures to use. This value cannot be used if the side attribute is user. The procedures currently in use can be seen in the operational attribute *opProcedures*.
Mib	FrameRelayAtm
Values	none vendorForum ansi itu (ccitt) autoConfigure
Default	autoConfigure

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Lmi asyncStatusReport (asr)

Access	Read and write
Description	This attribute selects the use of asynchronous PVC status report procedures as specified in ANSI, CCITT, and Vendor Forum. This attribute can be set to ***on*** or ***off***. If *procedure*s is set to ***none***, this attribute is ignored.
Mib	FrameRelayAtm
Values	off on
Default	off

ATTRIBUTE FrAtm Lmi errorEventThreshold (n392)

Access	Read and write
Description	An event is defined as follows: (1) receipt of a STATUS ENQUIRY message; or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid contents of a LMI message; (3) invalid receive sequence number. This attribute specifies the number of error events which, if they occur within *eventCount* events, cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur. This attribute corresponds to the nN2 parameter described in the Vendor Forum Specification. It must be less than or equal to *eventCount*.
Mib	FrameRelayAtm
Values	Decimal (1..10)
Default	3

ATTRIBUTE FrAtm Lmi eventCount (n393)

Access	Read and write
Description	This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed. This attribute corresponds to the nN3 parameter described in the Vendor Forum Specification. It must be greater than or equal to *errorEventThreshold*.
Mib	FrameRelayAtm
Values	Decimal (1..10)

Copyright © 2006, Nortel Nortel Confidential

Default	4

ATTRIBUTE FrAtm Lmi checkPointTimer (t392)

Access	Read and write
Description	This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. This attribute corresponds to the nT2 parameter described in the Vendor Forum Specification. It must be less than *messageCountTimer*.
Mib	FrameRelayAtm
Values	Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30)
Units	seconds
Default	15

ATTRIBUTE FrAtm Lmi messageCountTimer (nt3)

Access	Read and write
Description	This attribute selects the time (in seconds) within which at most five (this is a fixed value and corresponds to maximum message count in VendorForum) STATUS ENQUIRY messages are expected. This attribute applies only when the *lmiProcedures* is set to ***vendorForum***. *messageCountTimer* must always be greater than *checkPointTimer*.
Mib	FrameRelayAtm
Values	Decimal (5; 10; 15; 20; 25; 30)
Units	seconds
Default	20

ATTRIBUTE FrAtm Lmi ignoreActiveBit (inab)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the Frame Relay LMI Active Bit (A-bit) has a bearing on the transfer of user data across this Frame Relay interface for both directions of traffic flow. When this attribute is set to ***yes***, the A-bit status of a user DLCI connection does not affect data transfer. When this attribute is set to ***no,*** data received from the local interface will be discarded if an A-bit =0 condition exists towards the local user. Data

Copyright © 2006, Nortel Nortel Confidential

	being sent to the local interface is discarded if an A-bit = 0 condition exists towards the subnet.
Mib	FrameRelayAtm
Values	no yes
Default	no

ATTRIBUTE FrAtm Lmi side

Access	Read and write
Criticality	Process
Description	This attribute can be set to ***user, network,*** or ***both***. When this attribute is set to ***user***, USP LMI procedures are running. When this attribute is set to ***network***, NSP LMI procedures are running. When this attribute is set to ***both***, USPNSP LMI procedures are running. When the value is ***both***, the *procedures* attribute must not be set to ***vendorForum***. Setting the value to ***user*** when the *procedures* attribute is set to ***autoConfigure*** is disallowed semantically.
Mib	FrameRelayAtm
Values	network user both
Default	network

ATTRIBUTE FrAtm Lmi pvcConfigParmsInFsr (pvcConfig)

Access	Read and write
Description	When this attribute is set to ***yes***, additional Q.933 information elements are included in the LMI Full Status message to facilitate CPE PVC parameter configuring. When set to ***yes***, the *Check Prov* command fails if the *Lmi side* is not set to ***network***. When set to ***yes***, *Check Prov* fails if the number of DLCIs on the *FrUni* is greater than 300. Vendor Forum LMI Extensions will only be enabled if this attribute is set to ***vendorForumExtensions*** and both of the following conditions are met: 1. The value of the *Lmi procedures* attribute is ***vendorForum*** 2. The value of the *Lmi side* attribute is ***network***

Copyright © 2006, Nortel Nortel Confidential

If either of these conditions are not met, Vendor Forum Extensions will not be enabled, and this attribute is ignored.

When Vendor Forum Extensions is enable the value of the *Dlci cirPresent* attribute will be included as the PVC Bandwidth in the LMI PVC Status IE.

If Vendor Forum Extensions is enable and the value of the *asyncStatusReport* is ***yes***, when a DLCI is deleted the Delete Bit will be set to 1 in the LMI PVC Status IE in the asyncronous status report.

If the service is not a *FrUni* this attribute is ignored.

Mib: FrameRelayAtm

Values:
no
yes
vendorForumExtensions

Default: no

ATTRIBUTE FrAtm Lmi pvcAlarmsReporting (pvcAlarms)

Access: Read and write

Description: This attribute specifies if alarms are generated when PVCs change state in the local network, an adjacent network or in remote networks.

When the value is ***internal***, PVCs operational status change in the local network are reported in alarms. When the value is ***external***, PVCs operational status change in an adjacent or remote networks are reported in alarms. When the value is ***both***, PVCs status change in local and adjacent or remote networks are reported in alarms. When the value is ***none***, no alarms are issued for PVCs status change.

There are four kinds of alarms controlled by the attribute.
Alarm 7007 200x reports PVCs that have lost connectivity in an adjacent or remote networks.
Alarm 7007 201x reports PVCs that have reached the data transfer state in an adjacent or remote networks.
Alarm 7007 202x reports PVCs that have lost connectivity in the local network.
Alarm 7007 203x reports PVCs that have reached the data transfer state in the local network.

Each alarm can report a maximum of 112 DLCIs. Up to nine alarms of the same kind may be required to report all PVCs that have changed state if all these PVCs have experienced the same condition at the *FrUni* interface.

Mib: FrameRelayAtm

Values:

GROUP FrAtm Lmi OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Lmi adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayAtm
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrAtm Lmi operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

Copyright © 2006, Nortel Nortel Confidential

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib	FrameRelayAtm
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrAtm Lmi usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayAtm
Values	idle active (activ) busy
Default	idle

GROUP FrAtm Lmi ProtocolStatusInfo (Psi)

Properties	Operational
Description	This group provides the protocol status of the Local Management Interface.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Lmi protocolStatus

Access	Read only
Description	This attribute indicates whether the LMI is in an error condition or whether the LMI procedures are behaving normally. When operating with no LMI protocol, this attribute is always set to ***normalCondition***. When operating with LMI procedures, this attribute is set to ***errorCondition*** after n392 of the last n393 events are in error. The consequence of an ***errorCondition*** is that all DLCIs on this interface will become inactive in both directions. The ***errorCondition*** is cleared and a ***normalCondition*** is indicated when

Copyright © 2006, Nortel Nortel Confidential

a sufficient number of events have occurred without error. In ANSI, this occurs when n393 consecutive good events take place.

If the *procedures* attribute is set to ***autoConfigure***, this attribute is set to ***configuring*** while adaptive LMI determines which LMI procedures are running on the link. A single LMI error event during auto configuration causes the attribute value to change to ***errorCondition***. If during ***configuring*** no LMI message is received, an LMI ***errorCondition*** is raised after n392 x t392 seconds.

Mib: FrameRelayAtm

Values:
errorCondition
normalCondition
configuring

Default: No default

ATTRIBUTE FrAtm Lmi opProcedures (opproc)

Access: Read only

Criticality: Process

Description

The *opProcedures* attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are supported:

none: Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures.

vendorForum: Local Management Interface procedures from the Vendor Forum specification are running on this interface. *DLCI 1023* is used for the LMI protocol.

ansi: Local Management Interface procedures from the ANSI specification are running. *DLCI 0* is used for the LMI protocol.

itu: Local Management Interface procedures from the ITU-T specification are running. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***.

unknown: Local Management Interface procedures have yet to be determined by Adaptive LMI.

Mib: FrameRelayAtm

ATTRIBUTE FrAtm Lmi fullStatusEnqFromIf (fsfi)

Access	Read only
Description	This attribute counts the number of Local Management Interface valid full status enquiry messages received from the external user device. When the maximum count is reached it wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi networkSideEventHistory (nsh)

Access	Read only
Description	This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is one of three possibilities, either a nT2/T392 timer expiry, receipt of a status enquiry message with bad sequence numbers, or when *lmiProcedures* is provisioned to vendorForum and we receive more than nN4 status enquiry messages within the provisioned *messageCountTimer* (nT3).
Mib	FrameRelayAtm
Values	String (1..10, ASCII)
Default	No default

ATTRIBUTE FrAtm Lmi protocolErrors (proto)

Access	Read only
Description	This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors*), timeout (*pollingVerifTimeouts*) and too many status enquiry messages received within the *messageCountTimer* (nT3) errors. The too many status enquiries error only applies when *lmiProcedures* is set to ***vendorForum***. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Lmi unexpectedIes (uie)

Access	Read only
Description	This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is not a protocol error. When the maximum count is reached, this counter wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi sequenceErrors (seq)

Access	Read only
Description	This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi unexpectedReports (ur)

Access	Read only
Description	This attribute counts the number of Local Management Interface frames received with an unknown or unexpected report type. An unexpected report type is not a protocol error. When the maximum count is reached the counter wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi pollingVerifTimeouts (tmo)

Access	Read only
Description	This attribute counts the number of *checkPointTImer* (t392) timer expiries occurring on the Local Management Interface. When the maximum count is reached the counter wraps to zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi keepAliveEnqToIf (kaeti)

Access	Read only
Description	This attribute counts the number of Local Management Interface keep alive enquiry status messages sent to the external user device for keep alive status. When the maximum count is reached it wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi fullStatusEnqToIf (fseti)

Access	Read only
Description	This attribute counts the number of Local Management Interface full status messages sent to the external user device in response to a status enquiry for keep alive or full status. When the maximum count is reached it wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi userSideEventHistory (ush)

Access	Read only
Description	This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The left most event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a nT1/T391 timer expiry or receipt of a status message with bad sequence numbers.
Mib	FrameRelayAtm
Values	String (1..10, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Lmi statusSequenceErrors (stseq)

Access	Read only
Description	This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status message with a receive sequence number not equal to the last send sequence number. When the maximum count is reached the counter wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Lmi noStatusReportCount (nsrc)

Access	Read only
Description	This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented in two cases: i) after a status enquiry is sent out and T391 timer expires without having a status report received. ii) an invalid status report is received. When the maximum count is reached it wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

GROUP FrAtm Lmi UspProtocolParameters (UspParms)

Properties	Provisioned
Description	This group contains the provisionable attributes of the Local Management Interface user side procedure.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Lmi fullStatusPollingCycles (n391)

Access	Read and write
Description	This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for a full PVC status report. A polling cycle is a Status Enquiry and Status Report exchange. This attribute is used only if the *side* attribute is either ***user*** or ***both***.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	Decimal (1..255)
Default	6

ATTRIBUTE FrAtm Lmi linkVerificationTimer (t391)

Access	Read and write
Description	This attribute specifies how frequently the Frame Relay UNI service should initiate a Status Enquiry for link integrity verification. It must be less than *checkPointTimer (t392)*. When the Lmi *side* is ***network***, this attribute is ignored.
Mib	FrameRelayAtm
Values	Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30)
Units	seconds
Default	10

COMPONENT FrAtm DataLinkConnectionIdentifier (Dlci)

Instance	Decimal (16..1007)
Groups	GROUP FrAtm Dlci OsiState (State) GROUP FrAtm Dlci ABitStatus (ABit) GROUP FrAtm Dlci ServiceParametersOp (SpOp) GROUP FrAtm Dlci Statistics (Stats) GROUP FrAtm Dlci CallData (CalId) GROUP FrAtm Dlci IntervalData (Int)
Scope	Application
Description	*FrAtm/n DataLinkConnectionIdentifier/n* This component represents a data link connection. The instance value defines the DLCI value for this connection. For example, *Dlci*/30 defines a logical connection with a DLCI of 30. For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component linked to this *FrAtm* is set to ***none***, no *Dlci* component is allowed under this *FrAtm*. The *Dlci* component is a subcomponent of *FrAtm*, and is responsible for

Common Verbs	Help List Display Add DELete LOCK Unlock

GROUP FrAtm Dlci OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: FrameRelayAtm

Values:
locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default: unlocked

ATTRIBUTE FrAtm Dlci operationalState (osiOper)

Access: Read only

Description: This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: FrameRelayAtm

Values:
enabled (ena)
disabled (dis)

Default: disabled

ATTRIBUTE FrAtm Dlci usageState (osiUsage)

Access: Read only

Description: This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib: FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrAtm Dlci availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components. The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	FrameRelayAtm
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE FrAtm Dlci proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE FrAtm Dlci controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	FrameRelayAtm
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE FrAtm Dlci alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	FrameRelayAtm
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE FrAtm Dlci standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity. The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE FrAtm Dlci unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FrameRelayAtm
Values	false true
Default	false

GROUP FrAtm Dlci ABitStatus (ABit)

Properties	Operational
Description	This group contains the A-Bit status information for this Data Link Connection Identifier.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci aBitStatusToIf (abti)

Access	Read only
Description	This attribute contains the most recent A-bit status sent to the interface. The A-bit status is part of the LMI protocol, and indicates the remote end's willingness to accept data from the local interface. When an inactive setting is sent out, the Frame Relay service will discard any data offered from the local interface. When an active setting is sent out, the Frame Relay service tries to process all data offered from the local interface.
Mib	FrameRelayAtm
Values	inactive active notApplicable
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Dlci aBitReasonToIf (abrti)

Access	Read only
Description	This attribute provides the reason (if any) for an inactive status to be sent to the interface. This reason is ***notApplicable*** for an active status.
Mib	FrameRelayAtm
Values	notApplicable remoteUserSignaled localLmiError remoteLmiError localLinkDown remoteLinkDown pvcDown
Default	No default

ATTRIBUTE FrAtm Dlci aBitStatusFromIf (abfi)

Access	Read only
Description	This attribute indicates the most recent A-Bit status received from the interface.
Mib	FrameRelayAtm
Values	inactive active notApplicable
Default	No default

ATTRIBUTE FrAtm Dlci aBitReasonFromIf (abrfi)

Access	Read only
Description	This attribute provides the reason (if any) for an inactive status to be sent to the subnet. The value is ***notApplicable*** when the *aBitStatusFromIf* attribute is ***active***. The value is ***remoteUserSignaled*** if the remote interface originating the A-Bit status detects that the virtual circuit is down at the remote network through the LMI protocol. The remote interface must be running network site LMI protocol for this A-Bit status reason to be sent. The value is ***localLmiError*** if the LMI protocol is down at this interface. The value is ***localLinkDown*** if the physical link is disabled at this interface. The value is ***pvcDown*** if no A-Bit status has been sent to this interface from the local network. The value is ***missingFromLmiReport*** if the remote interface did not provide a reason along with the inactive A-Bit status.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	notApplicable remoteUserSignaled localLmiError localLinkDown pvcDown missingFromLmiReport
Default	No default

GROUP FrAtm Dlci ServiceParametersOp (SpOp)

Properties	Operational
Description	This group contains service parameters for the *Dlci* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci maximumFrameSize (n203)

Access	Read only
Description	This attribute indicates the maximum number of octets which can be included in the information field. This definition does not include the FrameRelay header and CRC octets. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification.
Mib	FrameRelayAtm
Values	Decimal (1..8187)
Units	octets
Default	No default

ATTRIBUTE FrAtm Dlci rateEnforcement (re)

Access	Read only
Description	This attribute indicates whether rate enforcement is in effect for this user Data Link Connection on this *FrAtm* interface. When rate enforcement is on, Committed Information Rate (CIR) and DE=1 traffic will be measured and enforced. When rate enforcement is off, all frames from the user will be accepted and no modifications to the frame with respect to the DE bit will be made.
Mib	FrameRelayAtm
Values	off on
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Dlci committedInformationRate (cir)

Access	Read only
Description	This attribute indicates the committed information rate (CIR) in bits per second (bit/s) and represents the rate at which the network agrees to transfer information under normal conditions when *rateEnforcement* is ***on***. This rate is measured over a measurement interval (t). Changing the value of this attribute will result in a change to the required bandwidth of the ATM connection, and a service impact to this Dlci. This attribute is not applicable when *rateEnforcement* is ***off***.
Mib	FrameRelayAtm
Values	Decimal (0..50000000)
Units	bit/s
Default	No default

ATTRIBUTE FrAtm Dlci committedBurstSize (bc)

Access	Read only
Description	This attribute indicates the committed burst size (Bc) in bits and represents the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*) when rateEnforcement is ***on***. Data marked with DE=1 is not accounted for in committed burst size. Changing the value of this attribute will result in a change to the required bandwidth of the ATM connection, and a service impact to this Dlci. This attribute is not applicable when *rateEnforcement* is ***off***.
Mib	FrameRelayAtm
Values	Decimal (0..50000000)
Units	bits
Default	No default

ATTRIBUTE FrAtm Dlci excessBurstSize (be)

Access	Read only
Description	This attribute indicates the excess burst size (Be) in bits and represents the amount of uncommitted data that the network attempts to deliver over measurement interval (t) when *rateEnforcement* is ***on***. Data marked DE=1 by the user or by the network is accounted for here. Changing the value of this attribute will result in a change to the required bandwidth of the ATM connection, and a service impact to this Dlci.

Copyright © 2006, Nortel Nortel Confidential

	This attribute is not applicable ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayAtm
Values	Decimal (0..50000000)
Units	bits
Default	No default

ATTRIBUTE FrAtm Dlci measurementInterval (t)

Access	Read only
Description	This attribute indicates the time interval over which rates and burst sizes are measured. Changing the value of this attribute will result in a change to the required bandwidth of the ATM connection, and a service impact to this Dlci. This attribute is not applicable when *rateEnforcement* is ***off***.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE FrAtm Dlci emissionPriorityToIf (epToIf)

Access	Read only
Description	This attribute indicates the emission priority of frames sent to the interface. If the value of *FrAtm/n numberOfEmissionQs* is ***2***, set the value of this attribute to either ***0*** or ***1***; if the value of *FrAtm/n numberOfEmissionQs* is ***4***, set the value of this attribute to one of ***0, 1, 2, 3***.
Mib	FrameRelayAtm
Values	Decimal (0; 1; 2; 3)
Default	No default

ATTRIBUTE FrAtm Dlci dlciType (dlcty)

Access	Read only
Description	This attribute indicates the type of DLCI. A value of ***serviceInterworking*** indicates that a *FrAtm/n Dlci/n Siwf* component is present. A value of ***networkInterworking*** indicates that a *FrAtm/n Dlci/n Niwf* component is present.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	serviceInterworking networkInterworking
Default	No default

ATTRIBUTE FrAtm Dlci troubled (trb)

Access	Read only
Description	This attribute indicates whether or not the connection is in a troubled state. Connections may become troubled for the following reasons; if CAC failed to admit the call, or if one of the attributes *aBitStatusToIf*, *aBitStatusFromIf* goes inactive; otherwise it is set to no.
Mib	FrameRelayAtm
Values	no yes
Default	no

ATTRIBUTE FrAtm Dlci troubledReason (trbrc)

Access	Read only
Description	This attribute provides the reason (if any) for a troubled connection. A value of ***notApplicable*** indicates no current failures; either Connection Admission Control (CAC) is off, or call was admitted. A value of ***notAdmitted*** indicates the CAC algorithm fails to admit this connection. Check if there is a sufficient bandwidth allocation. A value of ***aBitInactive*** indicates that either the aBitStatusToIf or aBitStatusFromIf is inactive.
Mib	FrameRelayAtm
Values	notApplicable notAdmitted aBitInactive
Default	notApplicable

GROUP FrAtm Dlci Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics for the Frame Relay Data Link Connection Identifier.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Dlci frmToIf (fti)

Access	Read only
Description	This attribute counts the number of frames sent to the interface. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci fecnFrmToIf (fecnti)

Access	Read only
Description	This attribute counts the number of frames sent to the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discFrameAbit (discfab)

Access	Read only
Description	This attribute counts the number of frame discards at the Frame Relay Service, due to an inactive PVC status, in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discCongestedFromIf (discardcfi)

Access	Read only
Description	This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discDeCongestedFromIf (discarddecfi)

Access	Read only
Description	This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci errorShortFrmFromIf (shortfi)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frames received with 0 octets in the information field. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci errorLongFrmFromIf (longfi)

Access	Read only
Description	This attribute counts the number of frames received with number of octets in the information field greater than the subscribed maximum. When the maximum count is reached, the count wraps to zero. The hardware ignores frame lengths greater than the hardware receive buffer, and therefore does not includes them in this count.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci becnFrmSetByService (becnset)

Access	Read only
Description	This attribute counts the number of frames with BECN set by the Frame Relay service. It is incremented when the Frame Relay service sets BECN on a frame upon detecting local congestion. This count is incremented regardless of whether the frame already bears a set BECN bit since its use is to determine the place of congestion. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci bytesToIf (bti)

Access	Read only
Description	This attribute counts the number of bytes sent out the interface. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Dlci deBytesToIf (debti)

Access	Read only
Description	This attribute counts the number of bytes sent to the interface with the Discard Eligibility (DE) bit set. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discCongestedToIfBytes (discardctib)

Access	Read only
Description	This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discDeCongestedToIfBytes (discarddectib)

Access	Read only
Description	This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci bytesFromIf (bfi)

Access	Read only
Description	This attribute counts the number of bytes received from the interface. Bytes that are discarded by the interface due to framing errors (such as CRC errors for example) are not counted. However bytes that are discarded by the application due to rate enforcement or congestion are counted. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Dlci deBytesFromIf (debi)

Access	Read only
Description	This attribute counts the number of bytes received from the interface with the Discard Eligibility (DE) bit set. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci excessBytesFromIf (excessb)

Access	Read only
Description	This attribute counts the number of bytes received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discExcessFromIfBytes (discardebi)

Access	Read only
Description	This attribute counts the number of bytes which were discarded due to rate enforcement. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discByteAbit (discbab)

Access	Read only
Description	This attribute counts the bytes number of which were discarded due to the A-bit being turned off. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Dlci discCongestedFromIfBytes (discardcbib)

Access	Read only
Description	This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci discDeCongestedFromIfBytes (discarddecbib)

Access	Read only
Description	This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the interworking function. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci errorShortBytesFromIf (shortbi)

Access	Read only
Description	This attribute counts the number of bytes received with 0 octets in the information field. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Dlci errorLongBytesFromIf (longbi)

Access	Read only
Description	This attribute counts the number of bytes received when the number of octets in the information field is greater than the subscribed maximum. The hardware ignores bytes lengths greater than the hardware receive buffer and therefore does not include them in this count. When the maximum count is reached, the count wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)

Default	No default

GROUP FrAtm Dlci CallData (CallId)

Properties	Operational
Description	This group contains the operational values for the *FrAtm Dlci* call data. If the *accountingEnabled* attribute is ***no***, then this group except for *accountingEnabled* is not displayed.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci accountingEnabled

Access	Read only
Description	This attribute indicates whether accounting is enabled. To enable accounting, the *FrAtm Ca accountCollection* attribute must be non-empty and *FrAtm Dlci Sp accounting* attribute must be ***on***.
Mib	FrameRelayAtm
Values	no yes
Default	No default

ATTRIBUTE FrAtm Dlci accountingEnd

Access	Read only
Description	This attribute indicates whether this DLCI represents the called or calling end of the connection. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	callingEnd calledEnd
Default	No default

ATTRIBUTE FrAtm Dlci correlationTag

Access	Read only
Description	This attribute indicates the unique string which identifies this connection. The value of this operational attribute can be provisioned in the correlationTag attribute of either the Siwf Npvc, Siwf Spvc, or Niwf Spvc subcomponents. For the Siwf Spvc and Niwf Spvc cases, when the provisionable correlationTag is an empty string, then this attribute receives the value of a system- generated correlationTag. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. If the accountingEnabled attribute is no, then this attribute is not displayed.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	String (0..32, ASCII)
Default	""

GROUP FrAtm Dlci IntervalData (Int)

Properties	Operational
Description	This group contains the operational statistics for the *FrAtm Dlci* interval data.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci startTime

Access	Read only
Description	This attribute indicates the start time of this interval. A new interval is started each time an accounting record is generated and call at a setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrAtm Dlci totalIngressBytes (tib)

Access	Read only
Description	This attribute counts the total payload bytes in received from the link since the start of the interval. To calculate total valid payload bytes received from link, subtract *discardedBytes* from this attribute. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Dlci totalEgressBytes

Access	Read only
Description	This attribute counts the total payload bytes sent to the link since the start of the interval. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Dlci eirIngressBytes

Access	Read only
Description	This attribute counts the total valid payload bytes in frames with the Discard Eligibility (DE) bit set to 1 received from the link since the start of the interval. Subtract this attribute and *discardedBytes* from *totalIngressBytes* to calculate total valid payload bytes in frames received from the link, with the DE bit set to 0. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Dlci eirEgressBytes

Access	Read only
Description	This attribute counts the total valid payload bytes in frames with the Discard Eligibility (DE) bit set sent to the link since the start of the interval. Subtract the value of this attribute from *totalEgressBytes* to calculate total valid payload bytes in frames, with DE set to 0, sent to the link. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Dlci discardedBytes

Access	Read only
Description	This attribute counts the total payload bytes in invalid frames received from the link and discarded at the DLCI since the start of the interval. This count is a sum of octets in frames discarded due to: frames too long or too short; A-Bit off; or to rate enforcement. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm Dlci totalIngressFrames

Access	Read only
Description	This attribute counts the total number of frames received from the link since the start of the interval. To calculate the total valid number of frames received from the link, subtract *discardedFrames* from this attribute. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Dlci totalEgressFrames

Access	Read only
Description	This attribute counts the total number of frames sent to the link since the start of the interval. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Dlci eirIngressFrames

Access	Read only
Description	This attribute counts the number of valid frames with the Discard Eligibility (DE) bit set to 1 received from the link since the start of the interval. Subtract this attribute and *discardedFrames* from *totalIngressFrames* to calculate total valid frames received from the link, with the DE bit set to 0. The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated or at call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Dlci eirEgressFrames

Access	Read only
Description	This attribute counts the number of frames with the Discard Eligibility (DE) bit set sent to the link since the start of the interval. Subtract the value of this attribute from *totalEgressFrames* to calculate total frames, with DE set to 0, sent to the link.The start of the interval is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated call setup. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Dlci discardedFrames

Access	Read only
Description	This attribute counts the number of invalid frames received from the link and discarded at the DLCI. The count is reset to zero when an accounting record is generated or at call setup. The count is a sum of frames discarded due to: frames too long or too short; A-Bit is off; or rate enforcement. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrAtm Dlci elapsedDifference

Access	Read only
Description	This attribute indicates the elapsed time representing the of this interval data. It is the elapsed time in 0.1 second increments since the start of the interval. If the *accountingEnabled* attribute is ***no***, then this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	0

COMPONENT FrAtm Dlci ServiceParameters (Sp)

Groups	GROUP FrAtm Dlci Sp Provisioned (Prov)
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	*FrAtm/n Dlci/n ServiceParameters* This component is a subcomponent of *Dlci*. It contains the provisionable attributes for the parent *Dlci* component.
Mib	FrameRelayAtm
Common Verbs	Help List Display

GROUP FrAtm Dlci Sp Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes for the Data Link Connection Identifier. These attributes reflect the service parameters specific to this instance of DLCI. The congestion control attributes in this group are defined in T1.606 Addendum 1.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Sp maximumFrameSize (n203)

Access	Read and write
Description	This attribute specifies the maximum number of octets which may be included in the information field. The Frame Relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification.
Mib	FrameRelayAtm
Values	Decimal (1..8187)
Units	octets
Default	2100

ATTRIBUTE FrAtm Dlci Sp rateEnforcement (re)

Access	Read and write
Description	This attribute specifies whether rate enforcement is in effect for this user data link connection. When *rateEnforcement* is *on,* the *CIR* and *De=1* traffic will be measured and enforced. When *rateEnforcement* is *off*, all frames from the user are accepted and no modifications to the frame with respect to the *De* bit will be made.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	off on
Default	on

ATTRIBUTE FrAtm Dlci Sp committedInformationRate (cir)

Access	Read and write
Description	This attribute specifies the committed information rate (CIR). It represents the rate at which the network agrees to transfer information under normal conditions when rate enforcement is in effect. When rate enforcement is not in effect, this attribute is ignored. Determination of the actual CIR is based on *committedInformationRate*, *committedBurstSize* and a measurement interval. The measurement interval is determined internally when *committedInformationRate* has a non-zero value. Otherwise, it is based on *measurementInterval* which must be explicitly provisioned. Note: The *committedBurstSize* must have a value of 0 when rate enforcement is in effect and *committedInformationRate* has a value of 0.
Mib	FrameRelayAtm
Values	Decimal (0..50000000)
Units	bit/s
Default	64000

ATTRIBUTE FrAtm Dlci Sp committedBurstSize (bc)

Access	Read and write
Description	This attribute specifies the committed burst size (Bc). It represents the amount of data that a network agrees to transfer under normal conditions over a measurement interval when rate enforcement is in effect. Data marked DE=1 is not accounted for in the committed burst size. When rate enforcement is not in effect, this attribute is ignored. Note: The *committedInformationRate* must have a value of 0 when rate enforcement is in effect and *committedBurstSize* has a value of 0.
Mib	FrameRelayAtm
Values	Decimal (0..50000000)
Units	bits
Default	64000

ATTRIBUTE FrAtm Dlci Sp excessBurstSize (be)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the excess burst size (Be). It represents the amount of uncommitted data that the network will attempt to deliver over a measurement interval when rate enforcement is in effect. Data marked DE=1 by the user or by the network is accounted for here. *committedInformationRate*, *committedBurstSize*, and *excessBurstSize* cannot all be zero when rate enforcement is in effect.
Mib	FrameRelayAtm
Values	Decimal (0..50000000)
Units	bits
Default	0

ATTRIBUTE FrAtm Dlci Sp measurementInterval (t)

Access	Read and write
Description	This attribute specifies the time interval over which rates and burst sizes are measured when rate enforcement is in effect. When rate enforcement is in effect and both *committedInformationRate* and *committedBurstSize* have values of zero, this attribute must have a non-zero value. When rate enforcement is not in effect or when *committedInformationRate* and *committedBurstSize* have non-zero values, this attribute is ignored. When *committedInformationRate* and *committedBurstSize* have non-zero values, the time interval is internally calculated. In this situation, *measurementInterval* is ignored, and it does not represent the time interval.
Mib	FrameRelayAtm
Values	Decimal (0..25500)
Units	msec
Default	0

ATTRIBUTE FrAtm Dlci Sp accounting (ac)

Access	Read and write
Description	This attribute allows the operator to control accounting for this DLCI. To enable accounting data collection and record generation, the value of this attribute must be ***on*** and at least one of the *accountCollection* reasons in the *FrAtm Ca* component must be set.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	off on
Default	off

GROUP FrAtm Dlci Siwf ConnectionOp (ConnOp)

Properties	Operational
Description	This group contains operational attributes for the ATM connection.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Siwf discardPriority (dp)

Access	Read only
Description	This attribute indicates the discard priority of frames sent to and received from the ATM connection. When *discardPriority* is ***dp3*** the frames belonging to this connection will be discarded first when the *FrAtm/n Dlci/n Siwf* and the ATM End-Point experience congestion. When *discardPriority* is ***dp2*** the frames belonging to this connection will be discarded after all the ***dp3*** priority frames are discarded when the *FrAtm/n*

Copyright © 2006, Nortel Nortel Confidential

Dlci/n Siwf and the ATM End-Point experience congestion.

When *discardPriority* is ***dp1*** the frames belonging to this connection will be discarded after all the ***dp2*** and ***dp3*** priority frames are discarded when the *FrAtm/n Dlci/n Siwf* and the ATM End-Point experience congestion.

Mib — FrameRelayAtm

Values
dp1
dp2
dp3

Default — No default

ATTRIBUTE FrAtm Dlci Siwf atmServiceCategory (sc)

Access — Read only

Description — This attribute indicates the ATM service category that is used for this connection. This attribute is only displayed for SPVCs.

Mib — FrameRelayAtm

Values
ubr
cbr
rtVbr
nrtVbr
notApplicable

Default — No default

ATTRIBUTE FrAtm Dlci Siwf trafficParmConvPolicy (tpcp)

Access — Read only

Description — This attribute indicates the traffic parameter conversion policy that is being used for this connection.

For Npvcs, this attribute is not displayed.

Policy ***3*** characterizes the traffic in the following way:
- ATM traffic descriptor type 6 is selected
- ATM service category rtVbr and nrtVbr supported only
- PCR0+1 is based on AR
- SCR0+1 is based on CIR and EIR
- MBS0+1 is based on Bc, Be, CIR, EIR and AR
- Takes into account that the instantaneous rate of the frame relay stream can be above CIR and up to the AR.

Policy ***4*** characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer.
- PCR0+1 is based on AR
- SCR0 is based on CIR

Copyright © 2006, Nortel Nortel Confidential

- MBS0 is based on Bc, CIR, and AR
- There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR.

Policy ***5*** characterizes the traffic in the following way:
- ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer
- ATM service category rtVbr and nrtVbr supported only
- PCR0+1 is based on CIR and EIR
- SCR0 is based on the CIR
- MBS0 is based on the CIR
- The maximum PCR is no longer based on the AR but rather on the CIR and EIR or CIR.

Policy ***6*** characterizes the traffic in the following way:
- ATM traffic descriptor type 3 is selected
- ATM service category ubr, cbr, rtVbr and nrtVbr supported only
- PCR0+1 is based only on CIR.

Default: No default

ATTRIBUTE FrAtm Dlci Siwf avgFrameSize (afs)

Access: Read only

Description: This attribute indicates the average frame size that is used for this connection as part of the traffic parameter conversion policy. Average frame size is not applicable for Npvcs, and therefore it is not displayed.

Mib: FrameRelayAtm

Values: Decimal (0..8187)

Units: bytes

Default: No default

ATTRIBUTE FrAtm Dlci Siwf remoteAddress (raddr)

Access: Read only

Description: This attribute indicates the remote address (native E.164, native X.121 or NSAP) for this connection. This attribute is only displayed for SPVCs.

Mib: FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	String (1..44, NativeAESANsapAddress)
Default	No default

ATTRIBUTE FrAtm Dlci Siwf remoteConnectionIdentifier (rci)

Access	Read only
Description	This attribute indicates the remote connection identifier. This identifier is either a remote *Atm Vpi.Vci* logical channel number or a remote *Frame Relay Dlci* logical channel number. The remote *Atm Vpi.Vci* logical channel number is displayed as "***Vpi.Vci***". and the remote *Frame Relay Dlci* logical channel number is displayed as "***0.remoteDlci***". For NPVCs, this attribute is not displayed.
Mib	FrameRelayAtm
Values	Integer Sequence (0..255; 0..16128)
Default	No default

GROUP FrAtm Dlci Siwf ServiceDescriptorsOp (SdOp)

Properties	Operational
Description	This group contains operational information for a *Siwf* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Siwf mode

Access	Read only
Description	This attribute indicates the mode of interoperability between the Frame Relay and ATM connections regarding upper layer protocol encapsulations. A value of ***translationMode*** indicates that the interworking function performs translation between RFC 1490 and RFC 1483 encapsulated headers, including routed protocol translation, bridged protocol translation, and connection oriented protocol translation (except for RFC 1490 connection oriented protocol without RFC 1490 header, which is done in *speTranslationMode*). A value of ***transparentMode*** indicates that the interworking function forwards data without altering the upper layer user protocol encapsulation. Transparent mode is selected when the upper layer user protocol encapsulation methods are compatible between terminal equipments. A value of ***speTranslationMode*** indicates that the interworking function performs single protocol translation between RFC 1490 with no header and RFC 1483 encapsulated packets.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	translationMode transparentMode speTranslationMode
Default	No default

ATTRIBUTE FrAtm Dlci Siwf **deToClpMapping (detclp)**

Access	Read only
Description	This attribute indicates the type of DE to CLP mapping that is performed in the Frame Relay to ATM direction. A value of ***preserve*** indicates that the DE field in a Q.922 core frame is copied to the ATM CLP field of every cell containing the information of that frame. A value of ***always0*** indicates that the CLP field of every generated ATM cell is always 0. A value of ***always1*** indicates that the CLP field of every generated ATM cell is always1.
Mib	FrameRelayAtm
Values	always0 always1 preserve
Default	No default

ATTRIBUTE FrAtm Dlci Siwf **clpToDeMapping (clptde)**

Access	Read only
Description	This attribute indicates the type of CLP to DE mapping that is performed in the ATM to Frame Relay direction. A value of ***preserve*** indicates that the DE field of the Q.922 Core frame is set when one or more ATM cells belonging to an AAL5 frame have their CLP field set. A value of ***always0*** indicates that the DE field of the Q.922 Core frame is always set to 0. A value of ***always1*** indicates that the DE field of the Q.922 Core frame is always set to 1.
Mib	FrameRelayAtm
Values	always0 always1 preserve

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrAtm Dlci Siwf fecnToEfciMapping (fecntefci)

Access	Read only
Description	This attribute indicates the type of FECN to EFCI mapping that is performed in the Frame Relay to ATM direction. A value of ***preserve*** indicates that the FECN field in a Q.922 Core frame is copied directly to the ATM EFCI field of every cell. A value of ***always0*** indicates that the EFCI field in every ATM cell generated is set to 0.
Mib	FrameRelayAtm
Values	always0 preserve
Default	No default

ATTRIBUTE FrAtm Dlci Siwf crToUuMapping (crtuu)

Access	Read only
Description	This attribute indicates the type of CR to UU mapping that is performed in the Frame Relay to ATM direction. A value of ***preserve*** indicates that the proprietary and CR bits are mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. The proprietary bits are used for rate enforcement and rate adaption but are unused according to the FRF8 standard. A value of ***standardFRF8*** indicates that only the CR bit is mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. This is in accordance with the FRF8 standard. This option is provided to avoid equipment inter-working issues with the proprietary use of the unused bits of the CPCS-UU field for rate enforcement and rate adaption.
Mib	FrameRelayAtm
Values	standardFRF8 preserve
Default	preserve

ATTRIBUTE FrAtm Dlci Siwf transferPriority (tp)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the transfer priority used to establish the connection. For Npvcs, the value is ***notApplicable***.

ATTRIBUTE FrAtm Dlci Siwf peakCellRate01 (pcr01)

Access	Read only
Description	This attribute indicates the Peak Cell Rate (PCR) of the ATM VCC to which this interworking function is linked for all cells (with CLP=0 and CLP=1). The *pcr01* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*. For NPVCs, this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE FrAtm Dlci Siwf sustainedCellRate0 (scr0)

Access	Read only
Description	This attribute indicates the Sustained Cell Rate (SCR) of the ATM VCC to which this interworking function is linked for high priority cells (with CLP=0).

Copyright © 2006, Nortel Nortel Confidential

	The *scr0* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping.* For NPVCs, this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE FrAtm Dlci Siwf sustainedCellRate01 (scr01)

Access	Read only
Description	This attribute indicates the Sustained Cell Rate (SCR) of the ATM VCC that to which this interworking function is linked for all cells (with CLP=0 and CLP=1). The *scr01* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*. For NPVCs, this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE FrAtm Dlci Siwf maximumBurstSize0 (mbs0)

Access	Read only
Description	This attribute indicates the Maximum Burst Size (MBS) of the ATM VCC to which this interworking function is linked for high priority cells (with CLP=0). The *mbs0* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping*. For NPVCs, this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE FrAtm Dlci Siwf maximumBurstSize01 (mbs01)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the Maximum Burst Size (MBS) of the ATM VCC to which this interworking function is linked for all cells (with CLP=0 and CLP=1). The *mbs01* is derived from the remote end traffic parameters using the conversion policy of the *transferPriorityMapping.* For NPVCs, this attribute is not displayed.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	cell/s
Default	No default

ATTRIBUTE FrAtm Dlci Siwf equivalentBitRate (ebr)

Access	Read only
Description	This attribute indicates the access reserved bandwidth for this FR-ATM connection when CAC is on. If a connection is subscribed to CIR only or CIR plus EIR service, the EBR reserved is CIR. If a connection is subscribed to EIR only service, the EBR reserved is 0.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE FrAtm Dlci Siwf type (typ)

Access	Read only
Description	This attribute indicates if the component provisioned is a calling or called end. If the value is ***master***, the *Dlci Siwf Spvc* component is provisioned as a calling end and is responsible for originating the call to set up the ATM VCC. If the value is ***slave***, this *Dlci Siwf* component is provisioned as a called end and is responsible for terminating call setup requests from the remote end. This attribute is not displayed for NPVCs.
Mib	FrameRelayAtm
Values	master slave notApplicable
Default	No default

ATTRIBUTE FrAtm Dlci Siwf vccClearCause (vclc)

Copyright © 2006, Nortel Nortel Confidential

Access	Read only
Description	This attribute indicates the last received clear cause message from the network. This attribute is not displayed for NPVCs. Please refer to ATM User-Network Interface Specification for possible clear causes.
Mib	FrameRelayAtm
Values	Decimal (0..255)
Default	No default

ATTRIBUTE FrAtm Dlci Siwf vccCauseDiag (vcdg)

Access	Read only
Description	This attribute indicates the diagnostic value of the last release message received from the network. This attribute is not displayed for NPVCs. Please refer to ATM User-Network Interface Specification for possible diagnostic values.
Mib	FrameRelayAtm
Values	String (1..8, Hex)
Default	No default

GROUP FrAtm Dlci Siwf Statistics (Stats)

Properties	Operational
Description	This group contains statistics for the *Siwf* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Siwf unknown1490Frames (unknown1490)

Access	Read only
Description	This attribute counts the number of frames received from the interface that have a frame header that is not recognized by the RFC 1490. When the maximum count is reached, it wraps to zero.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)

Common Verbs	Help List Display Add DELete

GROUP FrAtm Dlci Siwf Sd Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the parent *Siwf* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Siwf Sd mode

Access	Read and write
Description	This attribute specifies the mode of interoperability between the Frame Relay and ATM connections regarding upper layer protocol encapsulations. When ***translationMode*** is selected, the interworking function performs

Copyright © 2006, Nortel Nortel Confidential

translations between RFC 1490 and RFC 1483 encapsulated headers, including routed protocol translation, bridged protocol translation, and connection oriented protocol translation (except for RFC 1490 connection oriented protocol without RFC 1490 header, which is done in *speTranslationMode*).

A value of ***transparentMode*** indicates that the interworking function forwards data without altering the upper layer user protocol encapsulation. Transparent mode is selected when the upper layer user protocol encapsulation methods are compatible between terminal equipments.

A value of ***speTranslationMode*** indicates that the interworking function performs single protocol translation between RFC 1490 with no header and RFC 1483 encapsulated packets.

The default value is ***sameAsInterface,*** which means as defined in ***FrAtm/ n Ca sdMode.***

Mib — FrameRelayAtm

Values

transparentMode
speTranslationMode
sameAsInterface

Default — sameAsInterface

ATTRIBUTE FrAtm Dlci Siwf Sd deToClpMapping (detclp)

Access — Read and write

Description — This attribute specifies the DE to CLP mapping that is performed in the Frame Relay to ATM direction.

When ***preserve*** is selected, the DE field in the Q.922 core frame is mapped to the ATM CLP field of every cell generated by the segmentation process of the AAL5 PDU containing the information of that frame.

When ***always0*** is selected, the CLP field of every ATM cell generated by the segmentation process of the AAL5 PDU containing the information of that frame is always set to 0.

When ***always1*** is selected, the CLP field of every ATM cell generated by the segmentation process of the AAL5 PDU containing the information of that frame is always set to 1.

ATTRIBUTE FrAtm Dlci Siwf Sd **clpToDeMapping (clpToDe)**

Access	Read and write
Description	This attribute specifies the type of CLP to DE mapping that is performed in the ATM to Frame Relay to direction. When ***preserve*** is selected, the DE field of the Q.922 Core frame is set when one or more ATM cells belonging to an AAL5 frame have their CLP field set. When ***always0*** is selected, the DE field of the Q.922 Core frame is always set to 0. When ***always1*** is selected, the DE field of the Q.922 Core frame is always set to 1.
Mib	FrameRelayAtm
Values	always0 always1 preserve sameAsInterface
Default	sameAsInterface

ATTRIBUTE FrAtm Dlci Siwf Sd **fecnToEfciMapping (fecntefci)**

Access	Read and write
Description	This attribute specifies the type of FECN to EFCI mapping that is performed in the Frame Relay to ATM direction. When ***preserve*** is selected, the FECN field in the Q.922 Core frame is mapped directly to the ATM EFCI field of every cell generated by the AAL5 segmentation process. When ***always0*** is selected, the EFCI field in every ATM cell generated is set to 0.
Mib	FrameRelayAtm
Values	always0 preserve sameAsInterface
Default	sameAsInterface

ATTRIBUTE FrAtm Dlci Siwf Sd **crToUuMapping (crtuu)**

Access	Read and write
Description	This attribute indicates the type of CR to UU mapping that is performed in the Frame Relay to ATM direction. A value of ***preserve*** indicates that the proprietary and CR bits are mapped

Copyright © 2006, Nortel Nortel Confidential

to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. The proprietary bits are used for rate enforcement and rate adaption but are unused according to the FRF8 standard.

A value of ***standardFRF8*** indicates that only the CR bit is mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. This is in accordance with the FRF8 standard. This option is provided to avoid equipment inter-working issues with the proprietary use of the unused bits of the CPCS-UU field for rate enforcement and rate adaption.

Mib	FrameRelayAtm
Values	standardFRF8 preserve sameAsInterface
Default	sameAsInterface

Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Siwf SPvc remoteAddress (raddr)

Access	Read and write
Description	This attribute specifies the remote address of the SPVC. It is represented as a prefix NPI string and a sequence of up to 15 digits to specify either a native (E.164 or X.121) address format or Atm End System Address(AESA) in ISO NSAP format. For example: native E.164 = “e.upto15digits” native X.121 = “x.upto14digits” NSAP E.164 ATM address = “n.upto15digits.ESI.SEL” NSAP address = “40 hexadecimal digits”
Mib	FrameRelayAtm
Values	String (1..44, ASCII)
Default	No default

ATTRIBUTE FrAtm Dlci Siwf SPvc remoteConnectionIdentifier (rci)

Access	Read and write
Description	This attribute specifies the remote connection identifier. The identifier is either a remote *Atm Vpi.Vci* logical channel number assignment or a remote *Frame Relay Dlci* logical channel number assignment. The remote *Atm Vpi.Vci* logical channel number is input as “***Vpi.Vci***” and the remote *Frame Relay Dlci* logical channel number is input as “***0.remoteDlci***”.
Mib	FrameRelayAtm
Values	Integer Sequence (0..255; 0..16128)

ATTRIBUTE FrAtm Dlci Siwf SPvc correlationTag

Access	Read and write
Description	This attribute specifies the unique string, set by the operator, which identifies the call for accounting purposes. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. If the value of accountingEnabled is no, this attribute has no effect. This attribute is also visible in the FrAtm Dlci component when accounting is enabled. When this attribute is an empty string, the operational correlationTag attribute in the FrAtm Dlci component receives the value of a system-generated correlationTag.
Mib	FrameRelayAtm
Values	String (0..32, ASCII)
Default	""

COMPONENT FrAtm Dlci Siwf SPvc RerouteOverride (RerOv)

Groups	GROUP FrAtm Dlci Siwf SPvc RerOv Provisioned (Prov)
Scope	Device
Description	*FrAtm/n Dlci/x Siwf RerouteOverride* This component represents the ability to override rerouting capability subscription options on a per connection basis for provisioned SPVC and SPVP connections. The addition of this component and changes to the attributes contained in this component are critical to the parent SPVC or SPVP. However, the deletion of this component is not a critical change for the connection. If this component is deleted, the connection remains active with the last provisioned subscription options. Subscription is lost when the connection goes down and re-establishes.

VERB OPTIMIZE FrAtm Dlci Siwf SPvc RerOv

Impact	Service
Description	*OPTimize FrAtm/n Dlci/x Siwf RerOv* This command triggers path optimization for the connection segment. If the interface is already processing a path optimization request, then the *Optimize* command is cancelled. Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP FrAtm Dlci Siwf SPvc RerOv **Provisioned (Prov)**

Properties	Provisioned
Description	This group contains the provisionable attributes related to rerouting subscription options for provisioned connections.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Siwf SPvc RerOv **protocol**

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by the connection segment. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsInterface***: The requested rerouting protocols are specified by the *protocol* attribute under the *Reroute Ov* component for the interface. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***localEbr***: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned with the EBR feature. ***ebrOnly***: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

ATTRIBUTE FrAtm Dlci Siwf SPvc RerOv **localConnectionRecoverySubscr (lRecSub)**

Access Read and write

Description This attribute specifies whether the connection segment requests subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either local domain rerouting node or a DTL originator.

If the connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local connection recovery subscription.

If the connection segment requests ***localEbr***, this attribute controls the local connection recovery subscription. Only one will be granted.

One of the following values can be specified:
sameAsInterface: The subscription rule is determined by the *localConnectionRecoverySubscr* attribute under the *Reroute Ov* component for the interface. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segment requests subscription to local connection recovery, otherwise the connection segment does not request subscription.
yes: The connection segment requests subscription to local connection recovery.
no: The connection segment does not request subscription to local connection recovery.

ATTRIBUTE FrAtm Dlci Siwf QoS emissionPriorityToIf (epToIf)

Access	Read and write
Description	This attribute specifies the emission priority of frames sent to the *FrAtm* interface. Frames in a higher priority queue, represented by a numerically higher number, will be sent before frames in a lower priority queue. The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *emissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *emissionPriorityToIf* values of ***1, 2,*** and ***3*** are mapped to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *emissionPriorityToIf* values are directly assigned to the emission priority queues. A value of ***deriveFromTp*** specifies that the emission priority is to be extracted from the *Mod Frs AtmNet Tpm/n* component using the *transferPriority* attribute. A value of ***sameAsInterface*** specifies that the emission priority is to be extracted from the *FrAtm Ca* component using the *niwfEmissionPriorityToIf* attribute.

ATTRIBUTE FrAtm Dlci Niwf deToClpMapping (detclp)

Access	Read only
Description	This attribute indicates the type of DE to CLP mapping that is performed in the Frame Relay to ATM direction. A value of ***preserve*** indicates that the DE field in the Q.922 core frame copies to the CLP field of every ATM cell containing the frame. A value of ***always0*** indicates that the CLP field of every ATM cell is always set to 0. A value of ***always1*** indicates that the CLP field of every ATM cell is always set to 1.
Mib	FrameRelayAtm
Values	always0 always1 preserve
Default	No default

ATTRIBUTE FrAtm Dlci Niwf clpToDeMapping (clptde)

Access	Read only
Description	This attribute indicates the type of CLP to DE mapping that is performed in the ATM to Frame Relay direction. A value of ***preserve*** indicates that the DE field of the Q.922 core frame is set when one or more ATM cells belonging to the frame has its CLP field set, or when the DE field of the FR-SSCS PDU is set. A value of ***transparent*** indicates that the DE field of the Q.922 core frame copies directly from the DE field of the FR-SSCS PDU.
Mib	FrameRelayAtm
Values	preserve transparent
Default	No default

ATTRIBUTE FrAtm Dlci Niwf transferPriority (tp)

Access	Read only
Description	This attribute indicates the transfer priority in use for a specific connection. This is the transfer priority that the local Frame Relay network uses for this connection to an ATM network. In the Frame Relay to ATM direction, the *tp* selects the FRF.5 End Point which multiplexes the frames. In the ATM to Frame Relay direction, the *tp* selects the default *FrAtm* emission priority queue to be used by this *Dlci*.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..15)
Default	No default

ATTRIBUTE FrAtm Dlci Niwf atmServiceCategory (asc)

Access	Read only
Description	This attribute indicates the ATM service category that was mapped for this connection. A value of ***scNotAvailable*** indicates that *atmServiceCategory* is not yet available for this connection.
Mib	FrameRelayAtm
Values	ubr cbr rtVbr nrtVbr scNotAvailable
Default	No default

ATTRIBUTE FrAtm Dlci Niwf trafficParmConvPolicy (tpcp)

Access	Read only
Description	This attribute indicates the traffic parameter conversion policy that is used for this connection. Policy ***3*** characterizes the traffic in the following way: - ATM traffic descriptor type 6 is selected. - PCR(0+1) is based on the ATM link rate. - SCR(0+1) is based on the CIR and EIR. - MB(0+1) is based on Bc, Be, CIR, EIR and AR. - Takes into account that the instantaneous rate of the frame relay stream can be above CIR and up to the AR. Policy ***4*** characterizes the traffic in the following way: - ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer. - PCR(0+1) is based on AR. - SCR(0) is based on the CIR. - MBS(0) is based on Bc, CIR, and AR. - There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR. Policy ***5*** characterizes the traffic in the following way: - ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by UPC traffic policer. - PCR(0+1) is based on the CIR and EIR. - SCR(0) is based on the CIR.

Copyright © 2006, Nortel Nortel Confidential

- MBS(0) is based on the CIR.
- The maximum PCR is no longer based on the AR but rather on the CIR and EIR.

Policy ***6*** characterizes the traffic in the following way:
- ATM traffic descriptor type 3 is selected.
- PCR(0+1) is based only on the CIR

policyNotAvailable indicates that the *trafficParmConvPolicy* is not yet available for this connection.

Mib	FrameRelayAtm
Values	policyNotAvailable 3 4 5 6
Default	No default

ATTRIBUTE FrAtm Dlci Niwf **avgFrameSize (afs)**

Access	Read only
Description	This attribute indicates the average frame size that was used for this connection as part of the traffic parameter conversion policy. A value of zero indicates that the *avgFrameSize* is not yet available for this connection.
Mib	FrameRelayAtm
Values	Decimal (0..8187)
Units	bytes
Default	No default

ATTRIBUTE FrAtm Dlci Niwf **equivalentBitRate (ebr)**

Access	Read only
Description	This attribute indicates the access reserved bandwidth for this FR-ATM connection when CAC is on. If a connection is subcribed to CIR only or CIR plus EIR service, the EBR reserved is CIR. If a connection is subcribed to EIR only service, the EBR reserved is 0.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Units	bit/s
Default	No default

ATTRIBUTE FrAtm Dlci Niwf **atmDlci**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute displays the DLCI logical channel used inside the ATM VCC. A null value indicates that the *atmDlci* is not yet available for this connection.
Mib	FrameRelayAtm
Values	String (0..40, ASCII)
Default	No default

ATTRIBUTE FrAtm Dlci Niwf assignedBandwidthPool (asgBwPool)

Access	Read only
Description	This attribute specifies the bandwidth pool which is used by this *Dlci*.

ATTRIBUTE FrAtm Dlci Niwf Spvc remoteAddress (raddr)

Access	Read and write
Description	This attribute specifies the remote address of the SPVC. It is represented as a prefix NPI string and a sequence of up to 15 digits to specify either a native E.164 or native X.121 address format. For example, native E.164 = “e.upto15digits”.
Mib	FrameRelayAtm
Values	String (3..17, ASCII)
Default	No default

ATTRIBUTE FrAtm Dlci Niwf Spvc remoteDlci

Access	Read and write
Description	This attribute specifies the remote connection identifier. This identifier is the DLCI logical channel number assignment used inside the ATM pipe.
Mib	FrameRelayAtm
Values	Decimal (16..1007; 1022)
Default	1022

ATTRIBUTE FrAtm Dlci Niwf Spvc correlationTag

Access	Read and write
Description	This attribute specifies aunique string, set by the operator, which identifies the call for accounting purposes. Downstream processing uses this attribute to correlate accounting records issued at different nodes in the network. Normally, the attribute is provisioned with the same value at both ends of the connection. If the value of accountingEnabled is no, this attribute has no effect. This attribute is also visible in the FrAtm Dlci component when accounting is enabled. When this attribute is an empty string, the operational correlationTag attribute in the FrAtm Dlci component receives the value of a system-generated correlationTag.
Mib	FrameRelayAtm
Values	String (0..32, ASCII)
Default	""

Properties	Provisioned
Description	This group contains the provisionable quality of service attributes for the *Qos* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Dlci Niwf QoS emissionPriorityToIf (epToIf)

Access	Read and write
Description	This attribute specifies the emission priority of frames sent to the *FrAtm* interface. Frames in a higher priority queue, depicted by a numerically higher number, are sent before frames in a lower priority queue. The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *emissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *emissionPriorityToIf* values of ***1, 2,*** and ***3*** map to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *emissionPriorityToIf* values are directly assigned to the emission priority queues. A value of ***deriveFromTp*** specifies that the emission priority is to be extracted from the *Mod Frs AtmNet Tpm/n* component using the *transferPriority* attribute. A value of ***sameAsInterface*** specifies that the emission priority is extracts from the *FrAtm Ca* component using the *niwfEmissionPriorityToIf* attribute.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayAtm
Values	0 1 2 3 deriveFromTp sameAsInterface
Default	sameAsInterface

ATTRIBUTE FrAtm Dlci Niwf QoS transferPriority (tp)

Access	Read and write
Description	This attribute specifies the transfer priority of frames sent to the ATM connection. In the Frame Relay to ATM direction, the *tp* selects the FRF.5 End Point which multiplexes the frames. In the ATM to Frame Relay direction, the *tp* selects the default *FrAtm* emission priority queue to be used by this DLCI. A value of ***sameAsInterface*** specifies that the emission priority is to be extracted from the *FrAtm Ca* component using the *niwfTransferPriority* attribute.
Mib	FrameRelayAtm
Values	0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 sameAsInterface

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described

Copyright © 2006, Nortel Nortel Confidential

here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib — FrameRelayAtm

ATTRIBUTE FrAtm VFramer adminState (osiAdmin)

Access — Read only

Description — This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — FrameRelayAtm

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE FrAtm VFramer operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — FrameRelayAtm

Values — enabled (ena)
disabled (dis)

Default — disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm VFramer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayAtm
Values	idle active (activ) busy
Default	idle

GROUP FrAtm VFramer **Statistics (Stats)**

Properties	Operational
Description	This group contains the operational statistics data for a *VirtualFramer* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm VFramer **frmToOtherVFramer**

Access	Read only
Description	This attribute counts the frames transmitted to the *otherVirtualFramer*.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm VFramer **frmFromOtherVFramer**

Access	Read only
Description	This attribute counts the frames received from the *otherVirtualFramer*.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm VFramer **octetFromOtherVFramer**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the octets received from the *otherVirtualFramer*.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

ATTRIBUTE FrAtm VFramer discFrmFromOtherVFramer (discFrmFromOvf)

Access	Read only
Description	This attribute counts the discarded frames from the *otherVirtualFramer*. Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP.
Mib	FrameRelayAtm
Values	Long Integer
Default	No default

COMPONENT FrAtm Address (Addr)

Groups	GROUP FrAtm Addr Provisioned (Prov) GROUP FrAtm Addr FrAtmAddrOp (addrOp)
Scope	Application
Description	*FrAtm/n Address* The *Addr* component contains the address for a *FrAtm* interface that supports native E.164 or X.121.
Mib	FrameRelayAtm
Common Verbs	Help List Display Add DELete

GROUP FrAtm Addr Provisioned (Prov)

Properties	Provisioned
Description	This group specifies the address of the *FrAtm* Interface.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Addr address (addr)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute contains digits which form the unique identifier of the customer. It is the equivalent of the telephone number in the telephone network (either native E.164 or X.121 address formats, or Atm End System Address(AESA) in ISO NSAP format). For example, E.164 prefix “e.613722”, X.121 prefix “x.302”, NSAP “45000441812460730F000000000020480D200100”.
Mib	FrameRelayAtm
Values	String (1..44, ASCII)
Default	No default

GROUP FrAtm Addr FrAtmAddrOp (addrOp)

Properties	Operational
Description	This group display the address of the *FrAtm* Interface.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Addr myAddress (myAddr)

Access	Read only
Description	This attribute displays the parent FRATM component’s address in the ISO NSAP format.
Mib	FrameRelayAtm
Values	String (40, ASCII)
Default	No default

COMPONENT FrAtm ConnectionAdministrator (Ca)

Groups	GROUP FrAtm Ca Provisioned (Prov) GROUP FrAtm Ca ServiceDescriptor (Sd) GROUP FrAtm Ca NetworkingDescriptor (Nd) GROUP FrAtm Ca InterfaceQualityOfService (IfQoS) GROUP FrAtm Ca Operational (Op) GROUP FrAtm Ca AccountingOptions
Scope	Application
Description	*FrAtm/n ConnectionAdministrator* The *Ca* component allows common subscription options applicable to interworking with ATM networking to be specified by the network operator on a *FrAtm* interface. The values defined under the *Ca* component interface defaults are used for the majority of the connections. For exception cases, the interface defaults specified in the *Ca* component can

Copyright © 2006, Nortel Nortel Confidential

be overridden on a per connection basis by provisioning *FrAtm Dlci Siwf Qos* or *FrAtm Dlci Niwf Qos* components.

Mib	FrameRelayAtm
Opt. Subcomp.	COMPONENT FrAtm Ca TransferPriorityMapping (Tpm)
Common Verbs	Help List Display

GROUP FrAtm Ca Provisioned (Prov)

Properties	Provisioned
Description	This attribute group contains the common provisionable attributes of the *Ca* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Ca callAdmissionControl (cac)

Access	Read and write
Criticality	Process
Description	This attribute specifies the control to turn on Call Admission Control (CAC). The default value for CAC is off.
Mib	FrameRelayAtm
Values	off on
Default	off

ATTRIBUTE FrAtm Ca overrideLinkRate (ovLinkRate)

Access	Read and write
Criticality	Process
Description	This attribute allows the link rate to be overridden for this interface. This allows the user to specify a value other than the actual physical link rate computed when a *Framer* component is provisioned. In the absence of a *Framer* component, or when a *VirtualFramer* component is provisioned, this value needs to be explictly set to provide an equivalent link rate. This attribute provides control on the amount of bandwidth available for performing CAC. This attribute also provides the requested amount of bandwidth that is negotiated across an ATM network for traffic conversion polices 3 and 4, since these policies are a function of the access rate.
Mib	FrameRelayAtm
Values	Decimal (0..520000000)

Copyright © 2006, Nortel Nortel Confidential

Units	bit/s
Default	0

ATTRIBUTE FrAtm Ca bandwidthPool (bwPool)

Access	Read and write
Criticality	Process
Description	Port capacity is partitioned into 16 pools (pool 0 through pool 15). This attribute specifies the percentage of port capacity that is allowed for each pool. The percentage for each pool ranges from 0% to 1000%. It allows for under or over subscription of the port. Under subscription occurs when the sum of the percentage assigned to the 16 pools is less than 100%. Over subscription occurs when the sum of the percentage for the 16 pools exceeds 100%. The sum of the percentage assigned to the 16 pools cannot exceed 1000%. The default is full sharing of port capacity without pre-set partitions between transfer priorities.
Mib	FrameRelayAtm
Vector of	Decimal (0..1000)
Units	%
Index	Decimal (0..15)
Default	(100, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0)

GROUP FrAtm Ca ServiceDescriptor (Sd)

Properties	Provisioned
Description	This group contains provisionable service interworking attributes for the *FrAtm* component. The attributes defined in this group provide the defaults for all the connections on the *FrAtm* interface.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Ca sdMode

Access	Read and write
Criticality	Process
Description	This attribute specifies the mode of interoperability between the Frame Relay and ATM connections regarding upper layer protocol encapsulations. This is used as the default for all the connections on the interface. When ***translationMode*** is selected, the interworking function performs translations between RFC1490 and RFC1483 encapsulated headers. This includes routed protocol translation, bridged protocol translation, and connection oriented protocol translation (except for RFC 1490 connection

Copyright © 2006, Nortel Nortel Confidential

oriented protocol without RFC 1490 header, which is done in *speTranslationMode*).

A value of ***transparentMode*** indicates that the interworking function is forwarding data without altering the upper layer user protocol encapsulation. Use transparent mode when the upper layer user protocol encapsulation methods are compatible between terminal equipments.

A value of ***speTranslationMode*** indicates that the interworking function performs single protocol translation between RFC1490 with no header and RFC1483 encapsulated packets.

Mib	FrameRelayAtm
Values	translationMode transparentMode speTranslationMode
Default	translationMode

ATTRIBUTE FrAtm Ca sdDeToClpMapping (sdetclp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the DE to CLP mapping that is performed in the Frame Relay to ATM direction. This is used as the default for all the connections on the interface. When ***preserve*** is selected, the DE field in a Q.922 core frame copies to the ATM CLP field of every cell containing the information of that frame. When ***always0*** is selected, the CLP field of every generated ATM cell is always 0. When ***always1*** is selected, the CLP field of every generated ATM cell is always 1.
Mib	FrameRelayAtm
Values	always0 always1 preserve
Default	preserve

ATTRIBUTE FrAtm Ca sdClpToDeMapping (sclpToDe)

Access	Read and write
Criticality	Process

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute specifies the type of CLP to DE mapping that is performed in the ATM to Frame Relay direction. When ***preserve*** is selected, the DE field of the Q.922 core frame is set when one or more ATM cells belonging to an AAL5 frame has its CLP field set. When ***always0*** is selected, the DE field of the Q.922 core frame is always set to 0. When ***always1*** is selected, the DE field of the Q.922 core frame is always set to 1.
Mib	FrameRelayAtm
Values	always0 always1 preserve
Default	preserve

ATTRIBUTE FrAtm Ca sdFecnToEfciMapping (sfecntefci)

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of FECN to EFCI mapping that is performed in the Frame Relay to ATM direction. When ***preserve*** is selected, the FECN field in the Q.922 Core frame maps directly to the ATM EFCI field of every cell generated by the AAL5 segmentation process. When ***always0*** is selected, the EFCI field in every ATM cell generated is set to 0.
Mib	FrameRelayAtm
Values	always0 preserve
Default	preserve

ATTRIBUTE FrAtm Ca sdCrToUuMapping (scrtuu)

Access	Read and write
Criticality	Process
Description	This attribute indicates the type of CR to UU mapping that is performed in the Frame Relay to ATM direction. A value of ***preserve*** indicates that the proprietary and CR bits are mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation

Copyright © 2006, Nortel Nortel Confidential

process. The proprietary bits are used for rate enforcement and rate adaption but are unused according to the FRF8 standard.

A value of ***standardFRF8*** indicates that only the CR bit is mapped to the CPCS-UU field of the last cell generated by the AAL5 segmentation process. This is in accordance with the FRF8 standard. This option is provided to avoid equipment inter-working issues with the proprietary use of the unused bits of the CPCS-UU field for rate enforcement and rate adaption.

Mib	FrameRelayAtm
Values	standardFRF8 preserve
Default	preserve

GROUP FrAtm Ca NetworkingDescriptor (Nd)

Properties	Provisioned
Description	This group contains the default provisionable networking attributes for the *FrAtm* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Ca ndDeToClpMapping (ndetclp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of DE to CLP mapping to be performed in the Frame Relay to ATM direction. When ***preserve*** is selected, the DE field in the Q.922 core frame copies to the CLP field of every ATM cell containing the frame. When ***always0*** is selected, the CLP field of every ATM cell is always set to 0. When ***always1*** is selected, the CLP field of every ATM cell is always set to 1.
Mib	FrameRelayAtm
Values	always0 always1 preserve
Default	preserve

ATTRIBUTE FrAtm Ca ndClpToDeMapping (nclptde)

Access	Read and write
Criticality	Process
Description	This attribute specifies the type of CLP to DE mapping to be performed in the ATM to Frame Relay direction.

Copyright © 2006, Nortel Nortel Confidential

When ***preserve*** is selected, the DE field of the Q.922 core frame is set when one or more ATM cells belonging to the frame has its CLP field set, or when the DE field of the FR-SSCS PDU is set.
When ***transparent*** is selected, the DE field of the Q.922 core frame copies directly from the DE field of the FR-SSCS PDU.

Values:
preserve
transparent

Default: preserve

GROUP FrAtm Ca InterfaceQualityOfService (IfQoS)

Properties: Provisioned

Description: This attribute group contains the provisionable quality of service attributes for the parent *FrAtm* interface.

Mib: FrameRelayAtm

ATTRIBUTE FrAtm Ca siwfEmissionPriorityToIf (sEpToIf)

Access: Read and write

Criticality: Process

Description: This attribute specifies the emission priority of frames sent to this *FrAtm* interface from its service interworking functions. Frames in a higher priority queue, designated by a numerically higher number, are sent before frames in a lower priority queue.
The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *siwfEmissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *siwfEmissionPriorityToIf* values of ***1***, ***2*** or ***3*** map to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *siwfEmissionPriorityToIf* values directly map to the emission priority queues.
A value of ***deriveFromTp*** specifies that the emission priority is extracted from the *Mod Frs AtmNet Tpm/n* component using the *siwfTransferPriority* attribute.
The *siwfEmissionPriorityToIf* can also be overridden on a per connection basis by setting the *emissionPriorityToIf* attribute in the *FrAtm Dlci Siwf Qos* component.

ATTRIBUTE FrAtm Ca siwfTransferPriority (stp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the transfer priority of frames sent to and received from the ATM connection, through the service interworking functions of this interface. In the Frame Relay to ATM direction, the *stp* selects the ATM service category of the connection. In the ATM to Frame Relay direction, the s*tp* selects the *FrAtm* emission priority queue. The *siwfTransferPriority* can also be overridden on a per connection basis by setting the *transferPriority* atribute in the *FrAtm Dlci Siwf Qos* component.
Mib	FrameRelayAtm
Values	Decimal (0..15)
Default	0

ATTRIBUTE FrAtm Ca niwfEmissionPriorityToIf (nEpToIf)

Access	Read and write
Criticality	Process
Description	This attribute specifies the emission priority of frames sent to this *FrAtm* interface from its network interworking functions. Frames in a higher priority queue are sent before frames in a lower priority queue. The value of this attribute is interpreted according to the value of the provisionable attribute *numberOfEmissionQs* under the parent *FrAtm* component. If the *numberOfEmissionQs* attribute is set to ***2***, *niwfEmissionPriorityToIf* value of ***0*** maps to emission priority queue 0 representing a lower priority queue, and *niwfEmissionPriorityToIf* values of ***1, 2*** or ***3*** map to emission priority queue 1 representing the highest priority queue. If the *numberOfEmissionQs* is set to ***4***, the *emissionPrioToIf* values directly assign to the emission priority queues. A value of ***deriveFromTp*** specifies that the emission priority is extracted from the *Mod Frs AtmNet Tpm/n* component using the *niwfTransferPriority* attribute. The *niwfEmissionPriorityToIf* can also be overridden on a per connection basis by setting the *emissionPriorityToIf* atribute in the *FrAtm Dlci Niwf Qos* component.

Default	deriveFromTp

ATTRIBUTE FrAtm Ca niwfTransferPriority (ntp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the transfer priority of frames sent to and received from the ATM connection, through the network interworking functions of this interface. In the Frame Relay to ATM direction, the *ntp* selects the *Frf5EndPoint* which multiplexes the frames. In the ATM to Frame Relay direction, the *ntp* selects the default *FrAtm* emission priority queue. The *niwfTransferPriority* can also be overridden on a per connection basis by setting the *transferPriority* atribute in the *FrAtm Dlci Niwf Qos* component.
Mib	FrameRelayAtm
Values	Decimal (0..15)
Default	0

GROUP FrAtm Ca Operational (Op)

Properties	Operational
Description	This attribute group contains the operational status of the *Ca* component.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Ca linkRate (linkRate)

Access	Read only
Description	This attribute indicates the link rate. If the provisionable attribute, *overrideLinkRate*, under the *Ca* component is 0, then the link rate reported is the actual link rate of the port or channel. Otherwise, the link rate reported is the *overrideLinkRate* provisioned under the *Ca* component.

ATTRIBUTE FrAtm Ca Tpm trafficParmConvPolicy (tpcp)

Copyright © 2006, Nortel
Nortel Confidential

Access	Read and write
Criticality	Process
Description	This attribute specifies the traffic parameter conversion policy to use for a specific transfer priority for specifying equivalent bandwidth rate at the *FrAtm* interface. Policy 3 characterizes the traffic in the following way: - ATM traffic descriptor type 6 is selected - ATM service category rtVbr and nrtVbr supported only - PCR0+1 is based on AR - SCR0+1 is based on CIR and EIR - MBS0+1 is based on Bc, Be, CIR, EIR and AR - Takes into account that the instantaneous rate of the Frame Relay stream can be above CIR and up to the AR. Policy 4 characterizes the traffic in the following way: - ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by the UPC traffic policer. - PCR0+1 is based on AR - ATM service category rtVbr and nrtVbr supported only - SCR0 is based on CIR - MBS0 is based on Bc, CIR, and AR - There is no direct characterization of EIR. The allowed EIR can be derived using the difference between the AR and CIR. Policy 5 characterizes the traffic in the following way: - ATM traffic descriptor type 7 or 8 is selected. Type 7 is chosen when non-conforming cells are to be discarded and type 8 when non-conforming cells are tagged by the UPC traffic policer. - ATM service category rtVbr and nrtVbr supported only - PCR0+1 is based on CIR for descriptor type 7 - PCR0+1 is based on CIR and EIR for descriptor type 8 - SCR0 is based on CIR - MBS0 is based on Bc, CIR, and AR - The maximum PCR is no longer based on the AR but rather on the CIR and EIR or CIR Policy 6 characterizes the traffic in the following way: - ATM traffic descriptor type 3 is selected - ATM service category ubr, cbr, rtVbr and nrtVbr supported only - PCR0+1 is based only on CIR. The default value ***sameAsModule*** implies the *trafficParmConversionPolicy* of *Mod Frs AtmNet Tpm/n* is as defined as *Mod Frs AtmNet Tpm/n*.

COMPONENT FrAtm Reroute

Groups	GROUP FrAtm Reroute LocalOperational (LOper) GROUP FrAtm Reroute GlobalOperational (GOper) GROUP FrAtm Reroute Statistics (Stats)
Scope	Device
Description	*FrAtm/n Reroute* This component represents the rerouting capabilities of the FrAtm interface. If this component is provisioned, the *Artg Pnni* component must already exist. The addition or deletion of this component, or changes to its provisionable attributes, does not affect existing connections.
Mib	FrameRelayAtm
Subcomponents	COMPONENT FrAtm Reroute Ov
Common Verbs	Help List Display Add DELete

Copyright © 2006, Nortel Nortel Confidential

VERB OPTIMIZE FrAtm Reroute

Impact	Service
Description	*Optimize [-all]FrAtm/n Reroute* This command triggers path optimization for the connection segments managed by the *Reroute* component. By default, only connection segments which are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection. The *-all* option causes all connection segments subscribed to path optimization to be considered. Using the *Optimize* command results in service disruptions when connection segments are moved to a better path. Care should be exercised when using this command. It is recommended that the command be used during maintenance windows.

GROUP FrAtm Reroute **LocalOperational (LOper)**

Properties	Operational
Description	This group contains the operational attributes that indicate the local rerouting activities at the interface level.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Reroute **localSubscribedConnections (lsub)**

Access	Read only
Description	This attribute counts the connection segments that are subscribed to one or more local rerouting capabilities. Note that a given connection segment is subscribed to either local rerouting capabilities, not both.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)

Default	No default

ATTRIBUTE FrAtm Reroute globalIneligibleRecoveredCon (girc)

Access	Read only
Description	This attribute counts the connections that have been recovered by global and EBR rerouting but are not eligible for global or EBR path optimization. The value decreases as counted connections are released.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Reroute globalLastRrCauseCode (grrcc)

Access	Read only
Description	This attribute indicates the value of the last global or EBR rerouting cause code received at this interface.
Mib	FrameRelayAtm
Values	Decimal (0..255)
Default	No default

ATTRIBUTE FrAtm Reroute globalPathsOptimized (gPathsOpt)

Access	Read only
Description	This attribute counts the paths that were successfully optimized by global and EBR rerouting during the last optimization pass at this interface. Successfully optimized paths are paths that switched to a better route. The value is reset to zero at the beginning of each optimization pass.
Mib	FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	No default

GROUP FrAtm Reroute Statistics (Stats)

Properties	Operational
Description	This group contains the rerouting statistics for the interface.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Reroute totalLocalConnectionRecoveries (tLConRec)

Access	Read only
Description	This attribute counts successful local connection recovery attempts. The counter wraps to zero when the maximum value is exceeded.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Reroute totalLocalFailedRecoveries (lFailedRec)

Access	Read only
Description	This attribute counts failed local connection recovery attempts. A connection recovery attempt fails if a rerouting connection segment can not be established. The counter wraps to zero when the maximum value is exceeded.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

ATTRIBUTE FrAtm Reroute totalLocalPathOptimizations (tLPathOpt)

Access	Read only
Description	This attribute counts successful local path optimization attempts. A successful path optimization attempt results in a switch to a better route. The counter wraps to zero when the maximum value is exceeded.
Mib	FrameRelayAtm
Values	Decimal (0..4294967295)
Default	No default

GROUP FrAtm Reroute Ov Provisioned (Prov)

Properties	Provisioned
Description	This group contains the common provisionable attributes for rerouting capabilities at the ATM signaling interface.
Mib	FrameRelayAtm

ATTRIBUTE FrAtm Reroute Ov protocol

Access	Read and write
Description	This attribute specifies the rerouting protocols that are requested by connection segments on the interface, for which this node is the first rerouting node. This attribute has no effect on connection segments for which this node is not the first rerouting node. A subset of the requested protocols is granted by the last rendezvous node, according to its software level and provisioning. One of the following values can be specified: ***sameAsARtgPnniReroute***: The requested rerouting protocols are specified by the *Artg Pnni Reroute protocol* attribute. ***localGlobal***: Local and global rerouting protocols are requested. Local and global rerouting are granted if the DTL terminator is provisioned with the Rerouting feature. ***localOnly***: Local rerouting is requested. This value guarantees interoperability with other vendors' equipment running the ATM Forum "Domain Based Rerouting" protocol. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***globalOnly***: Global rerouting is requested. Global rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. ***localEbr***: Local and EBR rerouting protocols are requested. Local rerouting is granted if the DTL terminator is provisioned with the Rerouting feature. Alternatively, EBR is granted if the DTL terminator is provisioned

Copyright © 2006, Nortel Nortel Confidential

with the EBR feature.
ebrOnly: EBR is requested. EBR is granted if the DTL terminator is provisioned with the EBR feature.

Values
localGlobal
localOnly
globalOnly
localEbr
ebrOnly
sameAsARtgPnniReroute (sameAs)

Default — sameAsARtgPnniReroute

ATTRIBUTE FrAtm Reroute Ov numOptAttempts

Access — Read and write

Description — This attribute specifies the number of path optimizations attempted before declaring a recovered connection segment to be optimally routed. Following a connection recovery, each manual and automatic path optimization will attempt to optimize the connection segment. When a path is found with a better optimization metric than the best known value, or the number of optimization attempts is exhausted, the current optimization metric is declared to be the new optimal metric for the connection segment. Subsequent path optimizations will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***0***, the optimization metric of a connection segment following connection recovery is declared to be the new optimal metric, and no connection recovery alarm is issued. A subsequent path optimization will not attempt to optimize the connection segment unless all subscribed connection segments are eligible for path optimization.

If the value is set to ***sameAsARtgPnniReroute***, the value of the *ARtg Pnni Reroute numOptAttempts* attribute is used.

Mib — FrameRelayAtm

Values
Decimal (0..15)
sameAsARtgPnniReroute (sameAs)

Default — sameAs

ATTRIBUTE FrAtm Reroute Ov moduleOptimizationConnections

Access — Read and write

Description — This attribute specifies which connection segments on the interface will be considered by a module optimization pass as controlled by the *ARtg Pnni Reroute* component.

One of the following values can be specified:

Copyright © 2006, Nortel Nortel Confidential

sameAsARtgPnniReroute: The connection segments to be considered by a module optimization pass are specified by the *Artg Pnni Reroute moduleOptimization* attribute.
none: No connection segments are considered for path optimization.
recoveredOnly: Only connection segments that are using a path with a greater optimization metric than the best known value are considered for path optimization. The best known optimization metric value for the connection segment is indicated by the *localOptimalMetricValue* attribute under the *RerouteInfo* component for the connection
allSubscribed: All connection segments subscribed to path optimization are considered.

Mib: FrameRelayAtm

Values:
none
recoveredOnly
allSubscribed
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

ATTRIBUTE FrAtm Reroute Ov switchoverMechanism

Access: Read and write

Description: This attribute specifies the mechanism used for switchover of a rerouted connection segment.

One of the following values can be specified:
sameAsARtgPnniReroute: The switchover mechanism is specified by the *ARtg Pnni Reroute switchoverMechanism* attribute.
standard: The mechanism described in the ATM Forum “Domain based Rerouting” specification is used for switchover. This value ensures interoperability with other vendors’ equipment running ATM Forum “Domain based Rerouting”.
rcl: The Reduced Cell Loss mechanism is used for switchover. RCL is a value-added Nortel Networks extension to the standard mechanism, allowing for faster switchover time.

Mib: FrameRelayAtm

Values:
standard
rcl
sameAsARtgPnniReroute (sameAs)

Default: sameAsARtgPnniReroute

GROUP FrAtm Reroute Ov LocalProvisioned (LProv)

Properties: Provisioned

Description: This group contains the provisionable attributes for EBR and local rerouting protocols for the *FrAtm* interface.

Mib: FrameRelayAtm

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrAtm Reroute Ov localConnectionRecoverySubscr (lConRec)

Access	Read and write
Description	This attribute specifies whether the connection segments on this interface request subscription to local connection recovery. This attribute only affects connection segments that request the local rerouting protocols. This attribute affects connection segments for a node that is either a local domain rerouting node or a DTL originator. If a connection segment requests ***localGlobal*** or ***localOnly*** protocols, this attribute controls local connection recovery subscription. If a connection segment requests ***localEbr***, this attribute controls the local connection recovery subscription. Only one will be granted. One of the following values can be specified: ***sameAsARtgPnniReroute***: The subscription rule is determined by the *Artg Pnni Reroute localConnectionRecoverySubscr* attribute. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segments request subscription to local connection recovery, otherwise, the connection segments do not request subscription. ***yes:*** The connection segments request subscription to local connection recovery. ***no***: The connection segments do not request subscription to local connection recovery.
Mib	FrameRelayAtm
Values	no yes sameAsARtgPnniReroute (follow)

GROUP FrAtm Reroute Ov GlobalProvisioned (GProv)

Properties — Provisioned

Description — This group contains the provisionable attributes for the global rerouting protocol for the *FrAtm* interface.

Mib — FrameRelayAtm

ATTRIBUTE FrAtm Reroute Ov globalConnectionRecoverySubscr (gConRec)

Access — Read and write

Description — This attribute specifies whether the connection segments on this interface request subscription to global or EBR connection recovery. This attribute only affects connection segments that request the global or EBR rerouting protocols. This attribute only affects connection segments for a node that is a DTL originator.

If a connection segment requests ***ebrOnly***, this attribute controls EBR connection recovery subscription.

If a connection segment requests ***localEbr***, this attribute controls the EBR connection recovery subscription. Only one will be granted.

One of the following values can be specified:
sameAsARtgPnniReroute: The subscription rule is determined by the *Artg Pnni Reroute globalConnectionRecoverySubscr* attribute. If the attribute specifies the ***sourceSpvcSpvp*** value, the connection segments request subscription to global or EBR connection recovery, otherwise, the connection segments do not request subscription.
yes: The connection segments request subscription to global or EBR connection recovery.
no: The connection segments do not request subscription to global or EBR connection recovery.

GROUP FrDte CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	FrameRelayDte

ATTRIBUTE FrDte customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	FrameRelayDte
Values	Decimal (0; 1..8191)
Default	0

GROUP FrDte IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	FrameRelayDte

ATTRIBUTE FrDte ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayDte
Values	up down testing

Copyright © 2006, Nortel Nortel Confidential

Default	up

ATTRIBUTE FrDte ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	FrameRelayDte
Values	Decimal (1..65535)
Default	No default

GROUP FrDte Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *FrDte* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte acceptUndefinedDlci (aud)

Access	Read and write
Description	This parameter allows previously undefined Data Link Connection Identifiers (DLCIs) to be dynamically accepted in the default remote group. If set to ***enabled***, undefined DLCIs will be accepted, if ***disabled***, they will not.
Mib	FrameRelayDte
Values	enabled disabled
Default	enabled

GROUP FrDte OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayDte

ATTRIBUTE FrDte adminState (osiAdmin)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayDte
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrDte operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayDte
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrDte usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

Copyright © 2006, Nortel Nortel Confidential

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib — FrameRelayDte

Values
idle
active (activ)
busy

Default — idle

GROUP FrDte OperationalStatus (OperStatus)

Properties — Operational

Description — This group includes the Operational Status attribute. This attribute defines the current operational state of this component.

Mib — FrameRelayDte

ATTRIBUTE FrDte snmpOperStatus

Access — Read only

Description — The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.

Mib — FrameRelayDte

Values
up
down
testing

Default — up

GROUP FrDte Operational (Oper)

Properties — Operational

Description — This group contains the operational attributes for the *FrDte* component.

Mib — FrameRelayDte

ATTRIBUTE FrDte linkOperState (lstate)

Access — Read only

Description — This attribute describes the operational state of the Link Control protocol. If the interface to the physical link hardware is inactive, the *linkOperState* is in the ***down*** state.

The ***polling*** state only occurs when the Local Management Interface (LMI) is enabled and the physical link is active. The ***polling*** state indicates LMI is polling for its peer. Once communication is established the

Copyright © 2006, Nortel Nortel Confidential

linkOperState will transition to the ***active*** state.

If the *procedure* attribute of the *Lmi* component is set to ***none***, *linkOperState* will transition to the ***active*** state once the physical link becomes active.

Mib	FrameRelayDte
Values	active down polling
Default	down

GROUP FrDte FrErrEntry (Err)

Properties	Operational
Description	This group contains the SNMP frErrEntry attributes for the *FrDte* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte errType (etype)

Access	Read only
Description	The type of error that was last seen on this interface. The error types are as follows: ***receiveShort***: This error indicates a received frame was discarded because it was less than four octets long or it was missing the Organizationally Unique Identifier (OUI) for a SNAP header. ***receiveLong***: This error indicates a received frame was discarded because it was longer than expected. This error is currently not used on this interface. ***illegalDlci***: This error indicates that a received frame was discarded because it's Q.922 address was not two octets in length. This error could also indicate that a frame was discarded because it was received on a DLCI reserved for LMI which had not been provisioned active. ***dlcmiProtoErr***: This error indicates an LMI frame was received with contents formatted incorrectly. ***dlcmiUnknownIe***: This error indicates that an LMI frame was received which contained an unsupported Information Element (IE) type ***dlcmiSequenceErr***: This error indicates that an LMI frame was received whose Keep Alive Sequence was incorrect. ***dlcmiUnknownRpt***: This error indicates that an LMI frame was received which contained a Report-type Information Element with an invalid type of

Copyright © 2006, Nortel Nortel Confidential

report.

noErrorSinceReset: This error type indicates that there has not been an error since the interface has been reset.

unknownError: This error type contains the cumulation of receive frame errors that did not fit one of the MIB error descriptions above. These errors include those counted by the following attributes:

ulpUnknownProtocol - A received frame was discarded because the Upper Level Protocol (ULP) encapsulation used was unsupported.

badFc - A received frame was discarded because the frame control character was incorrect.

defragSequenceErrors - A fragment was received that was discarded due to an out of sequence error detection.

Mib	FrameRelayDte
Values	unknownError receiveShort receiveLong illegalDlci dlcmiProtoErr dlcmiUnknownIe dlcmiSequenceErr dlcmiUnknownRpt noErrorSinceReset
Default	noErrorSinceReset

ATTRIBUTE FrDte errData (edata)

Access	Read only
Description	An octet string containing the first part of the frame in which an error was last detected.
Mib	FrameRelayDte
Values	String (64, Hex)
Default	No default

ATTRIBUTE FrDte errTime (etime)

Access	Read only
Description	The time at which the last error was detected and recorded in *errType*.
Mib	FrameRelayDte
Values	Time (DHMS)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrDte errDiscards (ed)

Access	Read only
Description	Number of inbound frames dropped because of format errors or because the virtual circuit was not known. Format errors, in this case, are any errors which would prevent the system from recognizing the DLCI and placing the error in the discard category. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte errFaults (ef)

Access	Read only
Description	This attribute counts the number of times LMI has taken down the interface. When the *procedure* attribute of the *Lmi* component is set to ***none***, this counter will not be incremented. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte errFaultTime (eftime)

Access	Read only
Description	The last time the *errFaults* counter was incremented.
Mib	FrameRelayDte
Values	Time (DHMS)
Default	No default

GROUP FrDte ErrorStatistics (ErrStats)

Properties	Operational
Description	This group contains error counters for the *FrDte*.
Mib	FrameRelayDte

ATTRIBUTE FrDte xmitDiscardPvcDown

Access	Read only
Description	This attribute counts the transmitted frames discarded because the DLCI of a component positioned in a hierarchical fashion above it (for example,

Copyright © 2006, Nortel Nortel Confidential

	it's remote group or the *FrDte* component) was administratively disabled. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte xmitDiscardLmiInactive

Access	Read only
Description	Count of transmitted frames discarded because the Local Management Interface (LMI) was not yet active (i.e. LMI was still in the polling state). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte xmitDiscardFramerDown

Access	Read only
Description	Count of transmitted frames discarded because the *framer* component was down. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte xmitDiscardPvcInactive

Access	Read only
Description	Count of transmitted frames discarded because the Local Management Interface (LMI) had inactivated or invalidated the DLCI. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte xmitDiscardCirExceeded

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	Count of transmitted frames discarded because CIR was enabled on a DLCI without a *HibernationQueue* subcomponent and the traffic exceeded the combined Committed and Excess Burst thresholds. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte recvDiscardPvcDown

Access	Read only
Description	This attribute counts received frames discarded because the DLCI of a component positioned in a hierarchical fashion above it (for example its remote group or the *FrDte* component) was administratively disabled. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte recvDiscardLmiInactive

Access	Read only
Description	Count of received frames discarded because the Local Management Interface (LMI) was not yet active (i.e. LMI was still in the polling state). This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte recvDiscardPvcInactive

Access	Read only
Description	Count of received frames discarded because the Local Management Interface (LMI) had inactivated or invalidated the DLCI. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrDte badFc

Access	Read only
Description	Count of received frames discarded because the frame control character was incorrect. This may indicate that the other side of the link is configured for a different link level protocol. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte ulpUnknownProtocol

Access	Read only
Description	Count of received frames discarded because the Upper Level Protocol (ULP) encapsulation used was unsupported. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte defragSequenceErrors

Access	Read only
Description	Count of fragments received which were discarded due to out of sequence error detection. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte receiveShort

Access	Read only
Description	Count of received frames (including LMI frames) discarded because they were less than four octets long or they were missing the Organizationally Unique Identifier (OUI) for a SNAP header. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte illegalDlci

Access	Read only
Description	Count of received frames discarded because their Q.922 address was not two octets in length. This count also includes frames discarded because they were received on a DLCI reserved for LMI that had not been provisioned active. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte dlcmiProtoErr

Access	Read only
Description	Count of received LMI frames whose contents were formatted incorrectly. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte dlcmiUnknownIe

Access	Read only
Description	Count of received LMI frames which contained an unsupported Information Element (IE) type. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte dlcmiSequenceErr

Access	Read only
Description	Count of received LMI frames whose Keep Alive Sequence was incorrect. This counter will wrap around to 0 when it exceeds its maximum count.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte dlcmiUnknownRpt

Access	Read only
Description	Count of received LMI frames which contained a Report-type Information Element with an invalid type of report. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

COMPONENT FrDte Framer

Groups	GROUP FrDte Framer Provisioned (Prov) GROUP FrDte Framer OsiState (State) GROUP FrDte Framer Statistics (Stats) GROUP FrDte Framer LinkUtilization (Util)
Scope	Application
Description	*FrDte/n Framer* The *Framer* component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface. The *Framer* component provides provisional attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisional attribute which binds the application component to a specific hardware component. The *Framer* component contains operational attributes for link interface

Copyright © 2006, Nortel Nortel Confidential

datapath statistics (such as frame counts and aborts).

Mib	FrameRelayDte
Common Verbs	Help List Display Add DELete

GROUP FrDte Framer Provisioned (Prov)

Properties	Provisioned
Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisional *Framer* groups.
Mib	FrameRelayDte

ATTRIBUTE FrDte Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	FrameRelayDte
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP FrDte Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayDte

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrDte Framer **adminState (osiAdmin)**

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayDte
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrDte Framer **operationalState (osiOper)**

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayDte
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrDte Framer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	FrameRelayDte
Values	idle active (activ) busy
Default	idle

GROUP FrDte Framer **Statistics (Stats)**

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	FrameRelayDte

ATTRIBUTE FrDte Framer **frmToIf**

Access	Read only
Description	This attribute counts the number of frames transmitted to the link interface by Framer. Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer **frmFromIf**

Access	Read only
Description	This attribute counts the number of frames received from the link interface by Framer.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer **aborts**

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the total number of aborts received.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer crcErrors

Access	Read only
Description	This attribute counts the total number of frames with CRC errors.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer lrcErrors

Access	Read only
Description	This attribute counts the total number of frames with LRC errors.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer nonOctetErrors

Access	Read only
Description	This attribute counts the total number of frames that were non octet aligned.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer overruns

Access	Read only
Description	This attribute counts the total number of frames received from the link for which overruns occurred.
Mib	FrameRelayDte

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer underruns

Access	Read only
Description	This attribute counts the total number of frames transmitted to the link for which underruns occurred.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Framer largeFrmErrors

Access	Read only
Description	This attribute counts the total number of frames received which were too large. The frame exceeded the maximumFrameLengthLimit provisioned attribute or it contained more than the 255 block hardware limit.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

GROUP FrDte Framer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	FrameRelayDte

ATTRIBUTE FrDte Framer normPrioLinkUtilToIf

Access	Read only
Description	This attribute is the utilization of the normal priority data sent to the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute.
Mib	FrameRelayDte
Values	Decimal (0..100)
Units	%
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrDte Framer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute is the utilization of the normal priority data received from the link as a percentage of the available bandwidth on the link. The utilization is the average for the last minute.
Mib	FrameRelayDte
Values	Decimal (0..100)
Units	%
Default	0

COMPONENT FrDte LinkManagementInterface (Lmi)

Groups	GROUP FrDte Lmi Provisioned (Prov) GROUP FrDte Lmi Operational (Oper)
Scope	Application
Description	*FrDte/n Lmi* This component defines parameters for implementing the Local Management Interface (LMI) protocol for the *FrDte* interface.
Mib	FrameRelayDte
Common Verbs	Help List Display

GROUP FrDte Lmi Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisioned attributes for the *Lmi* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte Lmi procedures (proc)

Access	Read and write
Description	This attribute selects the Local Management Interface (LMI) protocol to be used on the interface. This attribute is equivalent to the SNMP variable frDlcmiState. The ***vendorForum*** LMI protocol automatically implies that the DLCI used by the protocol is 1023. The ***ansi*** (T1.617 Annex D) and ***ccitt*** (Q.933 Annex A) LMI protocols use DLCI 0. If ***none*** is selected, no LMI procedures will run on the interface.
Mib	FrameRelayDte
Values	none vendorForum

	ansi ccitt
Default	ccitt

ATTRIBUTE FrDte Lmi pollingInterval (polli)

Access	Read and write
Description	This is the number of seconds between successive status enquiry messages. This field corresponds to the parameter T391 described in the ANSI T1.617-1991 Annex D.
Mib	FrameRelayDte
Values	Decimal (5..30)
Units	seconds
Default	10

ATTRIBUTE FrDte Lmi fullEnquiryInterval (n391)

Access	Read and write
Description	The count of status polls before a full status enquiry message is issued. Every nth poll will request a full status. This field corresponds to the parameter N391 described in the ANSI T1.617-1991 Annex D.
Mib	FrameRelayDte
Values	Decimal (1..255)
Default	6

ATTRIBUTE FrDte Lmi errorThreshold (n392)

Access	Read and write
Description	The number of errors detected within the monitored events window before declaring the link non-functional. This field corresponds to the parameter N392 described in the ANSI T1.617-1991 Annex D.
Mib	FrameRelayDte
Values	Decimal (1..10)
Default	3

ATTRIBUTE FrDte Lmi monitoredEvents (n393)

Access	Read and write
Description	The number of status polling intervals over which the *errorThreshold* is counted This is used to determine if the *errorThreshold* is exceeded. This field corresponds to the parameter N393 described in the ANSI T1.617-1991 Annex D.
Mib	FrameRelayDte

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..10)

Properties	Provisioned
Description	This group contains the provisioned attributes for a virtual circuit. These attributes represent the default settings for the resulting *Dlci* components and can be operationally changed using the corresponding attributes under the *Dlci* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte DynDlciDefs **rowStatus**

Access	Read and write
Description	This attribute is used to manage the status of a *StDlci* component. Set to ***active*** to enable the *StDlci* component. Set to ***notInService*** to disable the *StDlci* component. Set to ***createAndGo*** (SNMP only) to create a new *StDlci* component. Set to ***destroy*** (SNMP only) to delete an existing *StDlci* component.
Mib	FrameRelayDte
Values	active notInService
Default	active

ATTRIBUTE FrDte DynDlciDefs **rateEnforcement (re)**

Access	Read and write
Description	This attribute specifies whether the CIR attributes *committedInformationRate*, *committedBurst*, and *excessBurst* are used to define rate enforcement on this user DLCI. If *rateEnforcement* is ***enabled***, and the combined Committed and Excess burst thresholds are exceeded, the frame in violation will be discarded immediately if a *HibernationQueue* subcomponent is not provisioned under the *StDlci* component. If a *HibernationQueue* is provisioned, the frame will be placed on the *HibernationQueue* at time of violation and transmission will be attempted later after the point at which the burst thresholds will no longer be exceeded. Setting all the CIR attributes to zero has the same affect as setting this attribute to ***disabled***.
Mib	FrameRelayDte
Values	enabled disabled
Default	disabled

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrDte DynDlciDefs **committedInformationRate (cir)**

Access	Read and write
Description	The average number of bits to be transferred per second over the DLCI to the DCE. When this attribute is set to zero, the link speed will be used instead.
Mib	FrameRelayDte
Values	Decimal (0..50000000)
Units	bit/s
Default	64000

ATTRIBUTE FrDte DynDlciDefs **committedBurst (bc)**

Access	Read and write
Description	The committed burst size (in bits) to which the DLCI wants to subscribe.
Mib	FrameRelayDte
Values	Decimal (0..50000000)
Units	bits
Default	64000

ATTRIBUTE FrDte DynDlciDefs **excessBurst (be)**

Access	Read and write
Description	The excess burst size (in bits) to which the DLCI wants to subscribe.
Mib	FrameRelayDte
Values	Decimal (0..50000000)
Units	bits
Default	0

ATTRIBUTE FrDte DynDlciDefs **excessBurstAction (beAction)**

Access	Read and write
Description	This attribute specifies the action taken when the *committedBurst* size has been exceeded on the DLCI but the *excessBurst* size has not. If the attribute is set to ***setDeBit***, the Discard Eligibility bit in the Frame Relay header will be turned on. If the attribute is set to ***none***, no action will be taken.
Mib	FrameRelayDte
Values	none setDeBit

Copyright © 2006, Nortel Nortel Confidential

Default	none

ATTRIBUTE FrDte DynDlciDefs ipCos

Access	Read and write
Criticality	Component
Description	This attribute specifies the connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and accounting. Connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers. If an IP packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is based on either the Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet. DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component. Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component. Modifying this attribute will reset the Frame Relay connection. If the Frame Relay connection is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.
Mib	FrameRelayDte
Values	Decimal (0..3)
Default	0

Description	This attribute specifies the connection class of the Frame Relay connection. This value is used to distinguish the connection from others for the purpose of IP forwarding and accounting. Connection class values vary in range from ***0*** to ***3*** allowing up to four connections to be distinguished on each next hop between routers. If an IP packet is forwarded by a *ProtocolPort* or *Interface* configured to use more than one Frame Relay connection, then one of the connections is selected for transmitting the packet. The selection is based on either the Differentiated Services Code Point (DSCP) field of the IP packet or the Class of Service (CoS) assigned to the packet. DSCP based selection of the outgoing connection is explained in the description of the *DifferentiatedServicesDomain* component. Class of Service (CoS) based selection of the outgoing connection is explained in the description of the *Vr Ip CosPolicyGroup* component. Modifying this attribute will reset the Frame Relay connection. If the Frame Relay connection is used by a *VirtualRouter ProtocolPort* and the *VirtualRouter* does not have a *DifferentiatedServicesDomain* subcomponent, then *ipCos* also specifies the initial Class of Service (CoS) value assigned to an IP packet received on the Frame Relay connection. See the description of *Vr Ip CosPolicyGroup* for more information.
Mib	FrameRelayDte
Values	Decimal (0..3)
Default	0

GROUP FrDte StDlci RemoteGroupLink (RgLink)

Properties	Provisioned
Description	This group provides the link between a *Dlci* and a *remoteGroup*.
Mib	FrameRelayDte

ATTRIBUTE FrDte StDlci linkToRemoteGroup (ltrg)

Access	Read and write
Criticality	Component
Description	This attribute associates a *StDlci* component with a *Rg* component. Provisioned *StDlci* components must be linked to a *Rg* component which is under the same *FrDte* component.
Mib	FrameRelayDte
Values	Link (Service, linkToFrDteDlci)
Default	No default

GROUP FrDte StDlci IpIfLink

Properties	Provisioned
Description	This group contains the link between this component and an *IpLogicalInterface* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte StDlci linkToIpLogicalInterface (ipIf)

Access	Read and write
Description	This attribute specifies the IP logical interface, *Vr/m Pp/n IpPort LogicalIf/ipAddress*, that this connection is associated with. When set, the value of this attribute must be consistent with the *linkToProtocolPort* attribute value of the associated *RemoteGroup* component. That is, they must both point to the same *ProtocolPort* component.
Mib	FrameRelayDte
Values	Link (Service, linkToMediaConnection)
Default	No default

COMPONENT FrDte StDlci HibernationQueue (Hq)

Groups	GROUP FrDte StDlci Hq Provisioned (Prov) GROUP FrDte StDlci Hq Statistics (Stats) GROUP FrDte StDlci Hq TotalStatistics (TStats) GROUP FrDte StDlci Hq CurrentStatistics (CStats) GROUP FrDte StDlci Hq ThresholdStatistics (ThrStats)

Copyright © 2006, Nortel Nortel Confidential

Scope	Application
Description	*FrDte/n StDlci/n Hq* This component provides a Hibernation Queue capability for a *Dlci* component which has been provisioned with CIR enforcement enabled. The *HibernationQueue* provides priority placement of frames on the queue, Time To Live (TTL) discarding of frames from the queue, and queue statistics.
Mib	FrameRelayDteExt
Common Verbs	Help List Display Add DELete

GROUP FrDte StDlci Hq Provisioned (Prov)

Properties	Provisioned
Description	This group contains the Link Emission Queue provisioned attributes.
Mib	FrameRelayDteExt

ATTRIBUTE FrDte StDlci Hq maxPackets (maxP)

Access	Read and write
Description	This attribute specifies the maximum number of packets allowed in the *Leq* before being discarded. If this attribute is set to zero then the maximum number of packets is calculated from the transmit data rate. This calculated value is placed in *queuePktThreshold*.
Mib	FrameRelayDteExt
Values	Decimal (0..2048)
Default	0

ATTRIBUTE FrDte StDlci Hq maxMsecData (maxData)

Access	Read and write
Description	This attribute specifies the maximum number of “Milliseconds worth of data” allowed in the *Leq* before packets are discarded. The *queueByteThreshold* will be calculated from this attribute, based on the transmit data rate.
Mib	FrameRelayDteExt
Values	Decimal (100..60000)
Default	10000

ATTRIBUTE FrDte StDlci Hq maxPercentMulticast (mpm)

Copyright © 2006, Nortel Nortel Confidential

Access	Read and write
Description	This attribute specifies the maximum percentage of multicast packets allowed in the *Leq,* based on *queuePktThreshold*, before being discarded. The calculated value will be placed in *queueMulticastThreshold*.
Mib	FrameRelayDteExt
Values	Decimal (1..100)
Default	50

ATTRIBUTE FrDte StDlci Hq timeToLive (ttl)

Access	Read and write
Description	This attribute specifies the “Milliseconds Time To Live” of packets in the *Leq*. If the *timeToLive* of a packet expires, it will be discarded.
Mib	FrameRelayDteExt
Values	Decimal (100..60000)
Units	msec
Default	10000

GROUP FrDte StDlci Hq Statistics (Stats)

Properties	Operational
Description	This group contains *HibernationQueue* general statistics.
Mib	FrameRelayDteExt

ATTRIBUTE FrDte StDlci Hq timedOutPkt (topkt)

Access	Read only
Description	This attribute counts the number of packets that have been discarded due to exceeding the *timeToLive*. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDteExt
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte StDlci Hq queuePurgeDiscards (qpd)

Access	Read only
Description	This attribute counts the total number of packets discarded by a queue purge which occurs when the *Dlci* goes down. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDteExt

Common Verbs	Help List Display LOCK Unlock

VERB Clear FrDte Dlci

Impact	Service
Description	*Clear FrDte/n Dlci/n* The *Clear* verb allows the user the ability to delete a *Dlci* component of *creationType* ***dynamic***.

Copyright © 2006, Nortel Nortel Confidential

GROUP FrDte Dlci OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayDte

ATTRIBUTE FrDte Dlci adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayDte
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrDte Dlci operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayDte
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrDte Dlci usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayDte
Values	idle active (activ) busy
Default	idle

GROUP FrDte Dlci Operational (Oper)

Properties	Operational
Description	This group contains the operational attributes for the *Dlci* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte Dlci dlciState

Access	Read only
Description	This attribute reflects the current operational circuit state of the *Dlci*. The state ***active*** indicates that the circuit is up and ***inactive*** that the circuit is down. The state ***invalid*** means the circuit has been deleted by the DCE (via *Lmi*).
Mib	FrameRelayDte
Values	invalid active inactive
Default	inactive

ATTRIBUTE FrDte Dlci lastTimeChange

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The last time *dlciState* changed state.
Mib	FrameRelayDte
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrDte Dlci sentFrames

Access	Read only
Description	Number of frames transmitted across the interface. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Dlci sentOctets

Access	Read only
Description	The number of octets sent from this virtual circuit since it was created. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Dlci receivedFrames (recvFrames)

Access	Read only
Description	Number of frames received across the interface. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Dlci receivedOctets (recvOctets)

Access	Read only
Description	The number of octets sent from this virtual circuit since it was created. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrDte Dlci receivedFECNs (recvFecn)

Access	Read only
Description	Number of frames with the FECN bit set received from the network. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Dlci receivedBECNs (recvBecn)

Access	Read only
Description	Number of frames with the BECN bit set received from the network. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Dlci discardedFrames (discards)

Access	Read only
Description	The number of inbound frames dropped because of format errors, or because the VC was inactive. This counter will wrap around to 0 when it exceeds its maximum count.
Mib	FrameRelayDte
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrDte Dlci creationType (type)

Access	Read only
Description	This indicates whether the virtual circuit was manually created (static), or dynamically created (dynamic) via the data link control management interface.
Mib	FrameRelayDte
Values	static dynamic
Default	No default

ATTRIBUTE FrDte Dlci creationTime

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	The time when the circuit was created, whether by the Data Link Connection Management Interface or by an SNMP set request.
Mib	FrameRelayDte
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrDte Dlci rateEnforcement (re)

Access	Read and write
Description	This attribute specifies whether the CIR attributes *committedInformationRate*, *committedBurst*, and *excessBurst* are used to define rate enforcement on this user DLCI. If *rateEnforcement* is ***enabled***, and the combined Committed and Excess burst thresholds are exceeded, the frame in violation will be discarded immediately if a *HibernationQueue* subcomponent is not provisioned under the *StDlci* component (static entries only). If a *HibernationQueue* is provisioned, the frame will be placed on the *HibernationQueue* at time of violation and transmission will be attempted later after the point at which the burst thresholds will no longer be exceeded. Setting all the CIR attributes to zero has the same affect as setting this attribute to ***disabled***. Setting this attribute will operationally override the corresponding provisional value on static entries.
Mib	FrameRelayDte
Values	enabled disabled
Default	disabled

ATTRIBUTE FrDte Dlci committedInformationRate (cir)

Access	Read and write
Description	The average number of bits to be transferred per second over the DLCI to the DCE. When this attribute is set to zero, the link speed will be used instead. Setting this attribute will operationally override the corresponding provisional value on static entries.
Mib	FrameRelayDte
Values	Decimal (0..48000000)
Units	bit/s
Default	64000

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrDte Dlci committedBurst (bc)

Access	Read and write
Description	The committed burst size (in bits) to which the DLCI wants to subscribe. Setting this attribute will operationally override the corresponding provisional value on static entries.
Mib	FrameRelayDte
Values	Decimal (0..2048000)
Units	bits
Default	64000

ATTRIBUTE FrDte Dlci excessBurst (be)

Access	Read and write
Description	The excess burst size (in bits) to which the DLCI wants to subscribe. Setting this attribute will operationally override the corresponding provisional value on static entries.
Mib	FrameRelayDte
Values	Decimal (0..2048000)
Units	bits
Default	0

ATTRIBUTE FrDte Dlci excessBurstAction (beAction)

Access	Read and write
Description	This attribute specifies the action taken when the *committedBurst* size has been exceeded on the *Dlci* but the *excessBurst* size has not. If the attribute is set to ***setDeBit***, the Discard Eligibility bit in the Frame Relay header will be turned on. If the attribute is set to ***none***, no action will be taken. Setting this attribute will operationally override the corresponding provisional value on static entries.
Mib	FrameRelayDte
Values	none setDeBit
Default	none

COMPONENT FrDte VirtualFramer (VFramer)

Groups	GROUP FrDte VFramer Provisioned (Prov) GROUP FrDte VFramer OsiState (State) GROUP FrDte VFramer Statistics (Stats)
Scope	Application
Description	*FrUni/n VirtualFramer* *FrDte/n VirtualFramer* The *VirtualFramer* component binds two services together to provide data transfer between them. It is mutually exclusive from *Framer* component.
Mib	FrameRelayDte
Common Verbs	Help List Display Add DELete

GROUP FrDte VFramer Provisioned (Prov)

Properties	Provisioned
Description	This group contains provisionable attributes for the *VirtualFramer* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte VFramer otherVirtualFramer (ovf)

Access	Read and write
Criticality	Process
Description	This attribute specifies the other *VirtualFramer* to which the service is linked, for example, *FrUni/n VirtualFramer*, *FrDte/n VirtualFramer.*
Mib	FrameRelayDte
Values	Link (Service, otherVirtualFramer)
Default	No default

ATTRIBUTE FrDte VFramer logicalProcessor (lp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the logical processor on which the service component will reside.
Mib	FrameRelayDte
Values	Link (Hardware, linkToApplications)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP FrDte VFramer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayDte

ATTRIBUTE FrDte VFramer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayDte
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrDte VFramer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or

Copyright © 2006, Nortel Nortel Confidential

	with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayDte
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrDte VFramer **usageState (osiUsage)**

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayDte
Values	idle active (activ) busy
Default	idle

GROUP FrDte VFramer **Statistics (Stats)**

Properties	Operational
Description	This group contains the operational statistics data for a *VirtualFramer* component.
Mib	FrameRelayDte

ATTRIBUTE FrDte VFramer **frmToOtherVFramer**

Access	Read only
Description	This attribute counts the frames transmitted to the *otherVirtualFramer*.
Mib	FrameRelayDte
Values	Long Integer
Default	No default

ATTRIBUTE FrDte VFramer **frmFromOtherVFramer**

Access	Read only
Description	This attribute counts the frames received from the *otherVirtualFramer*.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayDte
Values	Long Integer
Default	No default

ATTRIBUTE FrDte VFramer octetFromOtherVFramer

Access	Read only
Description	This attribute counts the octets received from the *otherVirtualFramer*.
Mib	FrameRelayDte
Values	Long Integer
Default	No default

ATTRIBUTE FrDte VFramer discFrmFromOtherVFramer (discFrmFromOvf)

Access	Read only
Description	This attribute counts the discarded frames from the *otherVirtualFramer*. Incrementing of this counter indicates that some incoming traffic cannot be handled by the FP.
Mib	FrameRelayDte
Values	Long Integer
Default	No default

COMPONENT FrDte DirectConnection (Dconn)

Groups	GROUP FrDte Dconn DirectFrUniConnData (DirData)
Scope	Application
Description	*FrDte/n DirectConnection* This component defines the parameter for implementing the IP over Frame Relay Direct Connection for the *FrameRelayDte* interface. The Direct Connection is only supported on the Nortel Networks Multiservice Switch 7000 MSA32 cards as well as the Nortel Networks Multiservice Switch 15000 4-port DS3 Channelised and 1-port STM1 Channelised cards. Before a Direct Connection can be established, the provisioning check for this component validates that the following conditions are present: - *FrameRelayDte* (*FrDte*) is provisioned with a Virtual Framer. - *FrameRelayUni* (*FrUni*) to which the Direct Connection will be establish is provisioned with a Framer. - *FrDte* and *FrUni* link by the Direct Connection are on the same. Logical Processor, and they are provisioned on a Nortel Networks Multiservice Switch 7000 MSA card. - accounting on the *FrUni* connected to the *FrDte* via the Virtual Framer is set to **off**.

Copyright © 2006, Nortel Nortel Confidential

- *Lmi* on the *FrUni* and *FrDte* connected via the Virtual Framer is off.
- all *Dlci*'s instances on the *FrUni*'s in the IP over Frame Relay setup match, and the provisioned PVC's do not connect to any other *FrUni* than the *FrUni*'s in IP over Frame Relay setup.

COMPONENT FrameRelayIpServer (FrIpServer)

Instance	Decimal (1..1024)
Groups	GROUP FrIpServer CustomerIdentifierData (CidData) GROUP FrIpServer IfEntryProv (IfEntry) GROUP FrIpServer Provisioned (Prov) GROUP FrIpServer Operational (Oper) GROUP FrIpServer OperationalStatus (OperStatus) GROUP FrIpServer OsiState (State)
Scope	Application
Description	*FrameRelayIpServer/n* This component represents a server that distributes traffic between an IP protocol port and multiple Frame Relay interfaces. The *FrIpServer* receives all datagrams destined for the subnet specified at the *ProtocolPort* and forwards each to the appropriate Frame Relay interface. An instance of this component should be provisioned for each *LogicalProcessor* having BNX DLCIs and for each subnet on which BNX DLCIs are located.
Mib	FrameRelayIp
Dyn. Subcomp.	COMPONENT FrIpServer IpAddress (IpAddr)
Common Verbs	Help List Display Add DELete

GROUP FrIpServer CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	FrameRelayIp

Copyright © 2006, Nortel

Nortel Confidential

ATTRIBUTE FrIpServer customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component. Values 1 to 8191 inclusive (equivalent to "basic CIDs" in DPN) may be assigned to specific customers.
Mib	FrameRelayIp
Values	Decimal (0; 1..8191)
Default	0

GROUP FrIpServer IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	FrameRelayIp

ATTRIBUTE FrIpServer ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayIp
Values	up down testing
Default	up

ATTRIBUTE FrIpServer ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component

Copyright © 2006, Nortel Nortel Confidential

Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	FrameRelayIp
Values	Decimal (1..65535)
Default	No default

GROUP FrIpServer Provisioned (Prov)

Properties	Provisioned
Description	This group contains all attributes that can be provisioned to define a *FrIpServer* instance.
Mib	FrameRelayIp

ATTRIBUTE FrIpServer logicalProcessor (lp)

Access	Read and write
Criticality	Process
Description	This attribute specifies the *LogicalProcessor* where the *FrIpServer* is located.
Mib	FrameRelayIp
Values	Link (Hardware, linkToApplications)
Default	No default

ATTRIBUTE FrIpServer linkToProtocolPort (lToPp)

Access	Read and write
Criticality	Component
Description	This attribute specifies the *ProtocolPort* to which the *FrIpServer* instance is linked. The *ProtocolPort* must have only an *IpPort* subcomponent which has exactly one logical interface.
Mib	FrameRelayIp
Values	Link (Service, linkToMedia)
Default	No default

GROUP FrIpServer Operational (Oper)

Properties	Operational
Description	This group contains operational attributes specific to the *FrIpServer* component.
Mib	FrameRelayIp

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrIpServer datagramsFromPp (dataFrPP)

Access	Read only
Description	This attribute counts the datagrams received from the *ProtocolPort*, including those counted in *unknownIpAddrErr*. Counter wraps to zero when the maximum value is exceeded.
Mib	FrameRelayIp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrIpServer lastUnknownIpAddress (lastUnkwnAddr)

Access	Read only
Description	This attribute indicates the destination IP address of the last datagram that was dropped because none of the interfaces specified in *linkToFrameRelayApps* have a matching IP address.
Mib	FrameRelayIp
Values	IP address
Default	No default

ATTRIBUTE FrIpServer unknownIpAddressErr (unkwnAddrErr)

Access	Read only
Description	This attribute counts the datagrams dropped by the *FrIpServer* because none of the interfaces specified in *linkToFrameRelayApps* have a matching IP address. The destination address from most recent dropped datagram is counted and saved in *lastUnknownIpAddress*. Counter wraps to zero when the maximum value is exceeded.
Mib	FrameRelayIp
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrIpServer invalidIpHeaderVersion (iiphv)

Access	Read only
Description	This attribute counts the datagrams dropped because the version in IP header was invalid.
Mib	FrameRelayIp
Values	Decimal (0..429496729)
Default	0

Copyright © 2006, Nortel Nortel Confidential

GROUP FrIpServer OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	FrameRelayIp

ATTRIBUTE FrIpServer snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayIp
Values	up down testing
Default	up

GROUP FrIpServer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayIp

ATTRIBUTE FrIpServer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

	permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayIp
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrIpServer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayIp
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrIpServer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayIp
Values	idle active (activ) busy
Default	idle

Default	disabled

ATTRIBUTE FrMux usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrameRelayMux
Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrMux availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	FrameRelayMux
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE FrMux proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform

Copyright © 2006, Nortel Nortel Confidential

its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***.

The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***.

The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib — FrameRelayMux

Set of — initializationRequired (initRq)
notInitialized (notInit)
initializing (init)
reporting (report)
terminating (term)

Default — No default

ATTRIBUTE FrMux controlStatus (osiCntrl)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics.

The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***.

The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***.

The value ***suspended*** indicates that the service has been administratively suspended.

Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE FrMux alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***. The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***. The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.
Mib	FrameRelayMux
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE FrMux standbyStatus (osiStby)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	FrameRelayMux
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE FrMux unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FrameRelayMux
Values	false true
Default	false

GROUP FrMux Statistics (Stats)

Properties	Operational
Description	This group contains the statistics about the operational behavior of the *FrMux* at the interface level.
Mib	FrameRelayMux

ATTRIBUTE FrMux lastUnknownDlci (ludlc)

Access	Read only
Description	This attribute identifies the most recent DLCI which user frames were received on, for which a *Dlci* has not been provisioned on the interface.
Mib	FrameRelayMux
Values	Decimal (0..1023)
Default	0

ATTRIBUTE FrMux unknownDlciFramesFromIf (unknown)

Access	Read only
Description	This attribute counts frames received from the interface with an unknown DLCI (*Dlci* which is not provisioned). When the maximum is reached the count wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux invalidHeaderFramesFromIf (invalid)

Access	Read only
Description	This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is reached the count wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux timeFramerCongested (timeCong)

Access	Read only
Description	This attribute accumulates the time (in msec) during which *Framer* congestion has been observed in the direction towards the interface. The overload causing this statistic to increase may be caused by oversubscription. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Units	msec

GROUP FrMux Framer OsiState (State)
GROUP FrMux Framer Statistics (Stats)
GROUP FrMux Framer LinkUtilization (Util)

COLLECTED STATS FrMux Framer

Scope Application

Description
FrUni/n Framer
FrNni/n Framer
FrAtm/n Framer
This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

GROUP FrMux Framer Provisioned (Prov)

Properties Provisioned

Description

This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.

Mib FrameRelayMux

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrMux Framer **interfaceName**

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	FrameRelayMux
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP FrMux Framer **LinkOptions (Link)**

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	FrameRelayMux

ATTRIBUTE FrMux Framer **dataInversion**

Access	Read and write
Description	This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed. This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted. This attribute may only take its default value for non-MSA cards.
Mib	FrameRelayMux
Values	off on
Default	off

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrMux Framer frameCrcType

Access	Read and write
Description	This attribute defines the type of CRC used. The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used. This attribute may take only its default value for non-MSA cards.
Mib	FrameRelayMux
Values	crc16 crc32 noCrc
Default	crc16

ATTRIBUTE FrMux Framer flagsBetweenFrames

Access	Read and write
Description	This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.
Mib	FrameRelayMux
Values	Decimal (1..16)
Default	1

GROUP FrMux Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayMux

ATTRIBUTE FrMux Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively

Copyright © 2006, Nortel Nortel Confidential

prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

Mib — FrameRelayMux

Values — locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default — unlocked

ATTRIBUTE FrMux Framer operationalState (osiOper)

Access — Read only

Description — This attribute indicates the OSI Operational State of the component.

The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service.

The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.

Mib — FrameRelayMux

Values — enabled (ena)
disabled (dis)

Default — disabled

ATTRIBUTE FrMux Framer usageState (osiUsage)

Access — Read only

Description — This attribute indicates the OSI Usage State of the component.

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	FrameRelayMux
Values	idle active (activ) busy
Default	idle

GROUP FrMux Framer Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics data for a Framer component.
Mib	FrameRelayMux

ATTRIBUTE FrMux Framer aborts

Access	Read only
Description	This attribute is the total number of aborts received.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Framer crcErrors

Access	Read only
Description	This attribute is the total number of frames with CRC errors, occurring in the receive direction from the link.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Framer lrcErrors

Access	Read only
Description	This attribute is the total number of frames with LRC errors, occurring in the Tx link prior to transmission onto the link.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrMux Framer nonOctetErrors

Access	Read only
Description	This attribute is the total number of frames that were non octet aligned.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Framer overruns

Access	Read only
Description	This attribute is the total number of frames received from the link for which overruns occurred.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Framer underruns

Access	Read only
Description	This attribute is the total number of frames transmitted to the link for which underruns occurred.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Framer largeFrmErrors

Access	Read only
Description	This attribute is the total number of frames received which were too large. The frame exceeded the *maximumFrameLengthLimit* provisioned attribute or it contained more than the 255 block hardware limit.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Framer frmModeErrors

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute is the total number of frames detected with framing mode errors. A *framingModeError* is flagged when frames are inconsistent with the specified *framingType*, that is when interrupting frames are used while running in hdlc mode.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Framer frmToIf

Access	Read only
Description	The number of frames transmitted to the link interface by Framer. Note: This does not include the number of frames transmitted directly to the hardware queue, thus bypassing the Framer component.
Mib	FrameRelayMux
Values	Long Integer
Default	No default

ATTRIBUTE FrMux Framer frmFromIf

Access	Read only
Description	The number of frames received from the link interface by Framer.
Mib	FrameRelayMux
Values	Long Integer
Default	No default

ATTRIBUTE FrMux Framer octetFromIf

Access	Read only
Description	The number of bytes received from the link interface by Framer.
Mib	FrameRelayMux
Values	Long Integer
Default	No default

ATTRIBUTE FrMux Framer ingressFrameDiscards

Access	Read only
Description	This attribute is the total number of frames discarded at ingress PQC.
Mib	FrameRelayMux

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

GROUP FrMux Framer LinkUtilization (Util)

Properties	Operational
Description	This group contains the link utilization operational data for a Framer component.
Mib	FrameRelayMux

ATTRIBUTE FrMux Framer normPrioLinkUtilToIf

Access	Read only
Description	This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) sent to the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.
Mib	FrameRelayMux
Values	Decimal (0..100)
Units	%
Default	0

ATTRIBUTE FrMux Framer normPrioLinkUtilFromIf

Access	Read only
Description	This attribute is the utilization of the normal and high priority data traffic (interruptible traffic) received from the link as a percentage of the available bandwidth on the link. Note that this includes traffic with Transfer Priorities (TP) of 0, 6 and 9 and/or Emission Priority of 2 and 3. The utilization is the average for the last minute.

GROUP FrMux Lmi Provisioned (Prov)

Properties	Provisioned
Description	This group contains the provisionable attributes of the Local Management Interface component of the *FrMux.* The Local Management Interface of the *FrMux* is always User Side Procedure of the User Network Interface (USP-UNI).
Mib	FrameRelayMux

ATTRIBUTE FrMux Lmi procedures (proc)

Access	Read and write
Criticality	Process
Description	This attribute selects the procedures to be used for the Local Management Interface. The following are the supported procedures: ***none***: No Local Management Interface procedure is active. ***vendorForum***:Local Management Interface procedure according to the Vendor Forum specification is active. DLCI 1023 is used for the LMI protocol. ***ansi***: Local Management Interface procedure according to the ANSI specification is active. DLCI 0 is used for the LMI protocol. ***ccitt***: Local Management Interface procedure according to the CCITT specification is active. DLCI 0 is used for the LMI protocol.
Mib	FrameRelayMux
Values	none vendorForum ansi ccitt
Default	ccitt

ATTRIBUTE FrMux Lmi linkVerificationTimer (t391)

Access	Read and write
Description	This attribute specifies the time interval (in seconds) at which the *FrMux* sends Status Enquiry messages to the interface. Exchange of Status Enquiry and Status Report messages constitutes a polling cycle, so this attribute may also be interpreted as time interval at which the *FrMux* initiates polling cycles. It must be less than *checkPointTimer (t392)* configured at the other end of the Frame Relay interface. This attribute corresponds to t391 of the ANSI and CCITT specifications, and nT1 of the Vendor Forum specification.
Mib	FrameRelayMux
Values	Decimal (5; 10; 15; 20; 25; 30)

Copyright © 2006, Nortel Nortel Confidential

Units	seconds
Default	10

ATTRIBUTE FrMux Lmi fullStatusPollingCycles (n391)

Access	Read and write
Description	This attribute specifies every which polling cycle the *FrMux* sends a full STATUS ENQUIRY to the interface. Every *fullStatusPollingCycles* polling cycles the *FrMux* sends a full STATUS ENQUIRY. In all other cycles of a sequence of *fullStatusPollingCycles* polling cycles the *FrMux* sends a keep alive STATUS ENQUIRY. This attribute corresponds to n391 of the ANSI and CCITT specifications and nN1 of the Vendor Forum specification.
Mib	FrameRelayMux
Values	Decimal (1..255)
Default	6

ATTRIBUTE FrMux Lmi errorEventThreshold (n392)

Access	Read and write
Description	This attribute specifies the number of error events which, if they occur within *eventCount* events, will cause a protocol error condition (*protocolStatus* = ***errorCondition***). The error condition is cleared after *eventCount* sequential correct events occur (*protocolStatus* = ***normalCondition***). An event is one of the following: (1) expiry of the linkVerificationTimer (t391), (2) reception of a STATUS message. An error event is one of the following: (1)non-receipt of the STATUS message in t391 seconds, (2)invalid STATUS message, (3) invalid sequence number. This attribute corresponds to n392 of the ANSI and CCITT specifications and nN2 of the Vendor Forum Specification. This attribute must be less than or equal to *eventCount*.
Mib	FrameRelayMux
Values	Decimal (1..10)
Default	3

ATTRIBUTE FrMux Lmi eventCount (n393)

Access	Read and write
Description	This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed.

Copyright © 2006, Nortel Nortel Confidential

This attribute corresponds to n392 of the ANSI and CCITT specifications and nN3 of the Vendor Forum Specification.

This attribute must be greater than or equal to *errorEventThreshold*.

Mib	FrameRelayMux
Values	Decimal (1..10)
Default	4

GROUP FrMux Lmi OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayMux

ATTRIBUTE FrMux Lmi adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayMux
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrMux Lmi operationalState (osiOper)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayMux
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrMux Lmi usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayMux
Values	idle active (activ) busy
Default	idle

GROUP FrMux Lmi ProtocolStatusInfo (Psi)

Properties	Operational
Description	This group provides the protocol status of the Local Management Interface of this *FrMux*.
Mib	FrameRelayMux

ATTRIBUTE FrMux Lmi protocolStatus

Access	Read only
Description	This attribute indicates whether the *Lmi* is in an error condition or whether the protocol is behaving normally. When operating with no LMI protocol

Copyright © 2006, Nortel Nortel Confidential

(*procedures* = ***none***), this attribute will always be set to ***normalCondition***. When operating with an LMI protocol (procedures set to one of ***venforForum***, ***ansi***, ***ccitt***), this attribute is set to ***errorCondition*** when *errorEventThreshold* of the last *eventCount* events are in error.
The error condition is cleared when *eventCount* consecutive good events take place.
The consequence of an error condition is that all *Dlci*'s on this interface become disabled and there is no data flow in either direction.

Description	This attribute counts the frames received from the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Dlci discCongestedFromIf (disccfi)

Access	Read only
Description	This attribute counts the number of frames discarded in the receive direction due to local congestion. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayMux

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Dlci discCongestedFromIfBytes (disccfib)

Access	Read only
Description	This attribute counts the number of bytes discarded in the receive direction due to local congestion. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Dlci discDeCongestedFromIf (discdecfi)

Access	Read only
Description	This attribute counts the number of discard eligible (DE=1) frames discarded in the receive direction due to local congestion. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Dlci discDeCongestedFromIfBytes (discdecfib)

Access	Read only
Description	This attribute counts the number of bytes of discard eligible (DE=1) traffic discarded in the receive direction due to local congestion. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrMux Dlci errorShortFrmFromIf (shortfi)

Access	Read only
Description	This attribute counts the frames received with 0 octets in the information field. When the count reaches maximum it wraps to zero.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE FrMux Dlci errorLongFrmFromIf (longfi)

Access	Read only
Description	This attribute counts the frames received with number of octets in the information field greater than the maximum frame size provisioned in the component pointed to by the *applicationName.* When the count reaches maximum it wraps to zero. Frames whose lengths are greater than the hardware receive buffer are discarded by the *Framer* and are therefore not included in this count.
Mib	FrameRelayMux
Values	Decimal (0..4294967295)
Default	0

COMPONENT FrameRelayNni (FrNni)

Instance	Decimal (1..4294967295)
Groups	GROUP FrNni CustomerIdentifierData (CidData) GROUP FrNni OsiState (State) GROUP FrNni Statistics (Stats) GROUP FrNni IfEntryProv (IfEntry) GROUP FrNni OperationalStatus (OperStatus) GROUP FrNni EmissionPriorityQs GROUP FrNni TrafficStatistics (TrafficStats)
Scope	Application
Description	*FrameRelayNni/n* This component defines an instance of the Frame Relay Network-to-Network Interface (NNI) service. This service allows two networks to be interconnected using the Frame Relay protocol. The component instance value n is a unique positive integer within a module. The *FrNni* interface must have either a *Framer* or a *VirtualFramer* subcomponent. As a default,

Copyright © 2006, Nortel

Nortel Confidential

a *Framer* is created whenever the *FrNni* is added. Users who need a *VirtualFramer* should delete the *Framer* and then add the *VirtualFramer*.

GROUP FrNni CustomerIdentifierData (CidData)

Properties	Provisioned
Description	This group contains the attribute for a component's Customer Identifier (CID). Refer to the attribute description for a detailed explanation of CIDs.
Mib	FrameRelayNni

ATTRIBUTE FrNni customerIdentifier (cid)

Access	Read and write
Description	This attribute holds the Customer Identifier (CID). Every component has a CID. If a component has a *cid* attribute, the component's CID is the provisioned value of that attribute; otherwise the component inherits the CID of its parent. The top-level component has a CID of 0. Every operator session also has a CID, which is the CID provisioned for the operator's user ID. An operator will see only the stream data for components having a matching CID. Also, the operator will be allowed to issue commands for only those components which have a matching CID. An operator CID of 0 is used to identify the Network Manager (referred to as "NetMan" in DPN). This CID matches the CID of any component.

Copyright © 2006, Nortel Nortel Confidential

Values 1 to 8191 inclusive (equivalent to “basic CIDs” in DPN) may be assigned to specific customers.

Mib FrameRelayNni

Values Decimal (0; 1..8191)

Default 0

GROUP FrNni OsiState (State)

Properties Operational

Description This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.

Mib FrameRelayNni

ATTRIBUTE FrNni adminState (osiAdmin)

Access Read only

Description This attribute indicates the OSI Administrative State of the component.

The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***.

The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib FrameRelayNni

Values locked (lck)
unlocked (unlck)
shuttingDown (shut)

Default unlocked

ATTRIBUTE FrNni operationalState (osiOper)

Access Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrameRelayNni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrNni usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrameRelayNni
Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrNni availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present.

The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***.

The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***.

The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***.

The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***.

The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***.

The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Copyright © 2006, Nortel Nortel Confidential

Default	No default

ATTRIBUTE FrNni proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***. The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

ATTRIBUTE FrNni controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	FrameRelayNni
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE FrNni alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

Copyright © 2006, Nortel Nortel Confidential

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib — FrameRelayNni

Set of — underRepair (repair)
critical (crit)
major
minor
alarmOutstanding (outst)

Default — No default

ATTRIBUTE FrNni standbyStatus (osiStby)

Access — Read only

Description — If supported by the component, this attribute indicates the OSI Standby status of the component.

The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable.

The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up.

The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib	FrameRelayNni
Values	hotStandby (hot) coldStandby (cold) providingService (serv) notSet (nSet)
Default	notSet

ATTRIBUTE FrNni unknownStatus (osiUnknw)

Access	Read only
Description	This attribute indicates the OSI Unknown status of the component. The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate. The value ***true*** indicates that the actual state of the component is not known for sure.
Mib	FrameRelayNni
Values	false true
Default	false

GROUP FrNni Statistics (Stats)

Properties	Operational
Description	This group contains the statistics about the operational behavior of the service at the interface level.
Mib	FrameRelayNni

ATTRIBUTE FrNni lastUnknownDlci (ludlc)

Access	Read only
Description	This attribute identifies the most recent DLCI which user frames were received on for which a DLCI has not been provisioned on the port.
Mib	FrameRelayNni
Values	Decimal (0..1023)
Default	0

ATTRIBUTE FrNni unknownDlciFramesFromIf (unknown)

Access	Read only
Description	This attribute contains a count of the number of frames received from the interface with an unknown DLCI (DLCI which is not provisioned). When the maximum is exceeded the count wraps to zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni invalidHeaderFramesFromIf (invalid)

Access	Read only
Description	This attribute counts the number of frames received from the interface with an invalid header format. When the maximum is exceeded the count wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

GROUP FrNni IfEntryProv (IfEntry)

Properties	Provisioned
Description	This group contains the provisionable attributes for the ifEntry.
Mib	FrameRelayNni

ATTRIBUTE FrNni ifAdminStatus (ifState)

Access	Read and write
Description	The desired state of the interface. The ***up*** state indicates the interface is operational. The ***down*** state indicates the interface is not operational. The ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayNni
Values	up down testing
Default	up

ATTRIBUTE FrNni ifIndex (ifI)

Access	Read: Passive Write: Debug
Criticality	Component
Description	This is the index for the IfEntry. Its value is automatically initialized during the provisioning process.
Mib	FrameRelayNni
Values	Decimal (1..65535)

Copyright © 2006, Nortel Nortel Confidential

Default	No default

GROUP FrNni OperationalStatus (OperStatus)

Properties	Operational
Description	This group includes the Operational Status attribute. This attribute defines the current operational state of this component.
Mib	FrameRelayNni

ATTRIBUTE FrNni snmpOperStatus

Access	Read only
Description	The current state of the interface. The ***up*** state indicates the interface is operational and capable of forwarding packets. The ***down*** state indicates the interface is not operational, thus unable to forward packets. ***testing*** state indicates that no operational packets can be passed.
Mib	FrameRelayNni
Values	up down testing
Default	up

GROUP FrNni EmissionPriorityQs

Properties	Provisioned
Description	This group contains the provisionable attribute to specify the number of Frame Relay egress emission priority queues to be used on that Frame Relay Interface and the provisionable attribute to determine whether emission queue size is doubled.
Mib	FrameRelayNni

ATTRIBUTE FrNni numberOfEmissionQs

Access	Read and write
Criticality	Process
Description	This attribute specifies the number of egress emission priority queues that will be used for that Frame Relay interface. For V.35, V.11, HSSI, E1, DS1, E3, DS3 or 8pDS1 the possible values are: ***2*** (in which case they are hardware queues), or ***4*** (in which case they are software queues). For DS1C, E1C or DS3C the possible values are ***2, 4*** (in all cases they are software queues). For 32 port Msa cards the possible values are ***2, 4*** (in all cases they are hardware queues).

Copyright © 2006, Nortel Nortel Confidential

	For 4pDS3Ch, 1pSTM1ChSmIr PQC6v2 (also known as PQC2) the possible values are ***2, 4*** (in all cases they are hardware queues). For 4pDS3Ch PQC12, setting this attribute has no effect on the number of egress emission priority queues, four hardware queues are always used.
Mib	FrameRelayNni
Values	Decimal (2; 4)
Default	2

ATTRIBUTE FrNni doubleEmissionQSize (deqs)

Access	Read and write
Criticality	Process
Description	This attribute specifies if the emission queue's size is doubled for the frame relay interface and it is only supported on *frUni*. When *doubleEmissionQSize* is set to ***yes***, the default frame relay interface emission queue size is doubled. This will reduce packets loss, but latency will be increased as the queue length grows. When the attribute is set to ***no***, the default emission queues size will be used. When frame relay interface is linked to a virtual framer, the *doubleEmissionQSize* must be set to ***no***, or a semantic check error will occur. For V11, E1 and E1C cards, the possible values of the *doubleEmissionQSize* attribute are ***yes*** and ***no***. For other cards, *doubleEmissionQSize* must always be set to ***no***, or a semantic check error will occur.
Mib	FrameRelayNni
Values	no yes
Default	no

GROUP FrNni TrafficStatistics (TrafficStats)

Properties	Operational
Description	This operational group provides the traffic statistics of the service at the interface level. Each attribute type is a non-negative integer which monotonically increases until it reaches a maximum value, at which point it wraps around and starts increasing again from zero.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni frmToIfByQueue

Access	Read only
Description	This attribute counts the frames transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority. The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Replication	Decimal (0..3)
Default	No default

ATTRIBUTE FrNni octetToIfByQueue

Access	Read only
Description	This attribute counts the octets transmitted to the interface through each of the egress queues. The number of queues is determined by the attribute *numberOfEmissionQs*. Egress queue 0 has the lowest priority, and egress queue 3 has the highest priority. The attribute is displayed only on SBIC cards when *numberOfEmissionQs* is 4.

COMPONENT FrNni DataNetworkAddress (Dna)

Groups	GROUP FrNni Dna Address GROUP FrNni Dna OutgoingOptions GROUP FrNni Dna CallOptions
Scope	Application

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains a superset of all attributes which may apply to a VC. Particular applications will typically offer only a subset of these attributes by providing a definition of their own DNA subcomponent.
Mib	FrameRelayNni
Opt. Subcomp.	COMPONENT FrNni Dna HuntGroupMember (HgM)
Common Verbs	Help List Display

GROUP FrNni Dna Address

Properties	Provisioned
Description	This group contains attributes common to all DNAs. Every DNA used in the network is defined with this group of 2 attributes.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dna numberingPlanIndicator (npi)

Access	Read and write
Criticality	Process
Description	This attribute indicates the Numbering Plan Indicator (NPI) of the DNA that is entered. Address may belong to X.121 or E.164 plans. X.121 is used in packet switched data networks.
Mib	FrameRelayNni
Values	x121 e164
Default	x121

ATTRIBUTE FrNni Dna dataNetworkAddress (dna)

Access	Read and write
Criticality	Process
Description	This attribute indicates the customer's unique identifier. It is the equivalent of the telephone number in the telephone network.
Mib	FrameRelayNni
Values	BCD (1..15)
Default	No default

GROUP FrNni Dna OutgoingOptions

Properties	Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group defines DNA call options for calls made from the interface. These options are not used for calls arriving to the interface represented by this *DNA*.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dna outDefaultPriority (odf)

Access	Read and write
Description	This attribute indicates the default priority of outgoing calls from the DTE to the network. It can be overridden by the *discardPriority* under *DLCI Direct Call* subcomponent. This option can be also included in X.25 signaling, in such case it will be overruled.
Mib	FrameRelayNni
Values	normal high
Default	normal

ATTRIBUTE FrNni Dna outDefaultPathReliability (opr)

Access	Read and write
Description	This attribute specifies the default class of routing for reliability routing for all outgoing calls (from the DTE to the network) using this particular DNA. The chosen default class of routing applies to all outgoing calls established using this DNA, and applies to the packets travelling in both directions on all outgoing calls (local to remote, and remote to local). For incoming calls, the default class of routing is chosen by the calling party (as opposed to DPN, where either end of the call can choose the default routing class). This attribute, if set to a value of *normal*, indicates that the default class of routing is normal reliability routing. If set to a value of *high*, then the default class of routing is high reliability routing. High reliability is the standard choice for most DPN and Nortel Networks Multiservice Switch services. It usually indicates that packets are overflowed or retransmitted at various routing levels. Typically high reliability results in duplication and disordering of packets in the network when errors are detected or during link congestion. However, the VC handles the duplication and disordering to ensure that packets are delivered to the DTE properly. For the Frame Relay service, duplication of packets is not desired, in which case, normal reliability may be chosen as the preferred class of routing.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

Values	normal high
Default	normal

ATTRIBUTE FrNni Dna defaultTransferPriority (dtp)

Access	Read and write
Description	This attribute specifies the default transfer priority for all outgoing calls using this particular *DNA*. It can be overridden by the *transferPriority* provisioned in the *Dlci DirectCall* sub-component. The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 levels from 0 to 15. Each transfer priority n, where n indicates the transfer priority index, contains a default setting for routing class of service (multimedia, delay or throughput) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required. The default *defaultTransferPriority* is ***0***.
Mib	FrameRelayNni
Values	0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
Default	0

ATTRIBUTE FrNni Dna transferPriorityOverRide (tpor)

Access	Read and write

Copyright © 2006, Nortel Nortel Confidential

Description	When this attribute is set to ***yes*** in the call request, the called end will use the calling end provisioning data on transfer priority to override its own provisioning data. If it is set ***no***, the called end will use its own provisioning data on transfer priority. This attribute is not applicable for Frame Relay SVCs. For more information about transfer priority, please refer to the previous attribute *defaultTransferPriority*. The default of *transferPriorityOverRide* is ***yes***.
Mib	FrameRelayNni
Values	yes no
Default	yes

GROUP FrNni Dna CallOptions

Properties	Provisioned
Description	This group defines additional all options for not related to direction of the call.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dna accountClass (acl)

Access	Read and write
Description	This attribute specifies the accounting class which is reserved for network operations usage. Its value is returned in the accounting record in the local and remote service type attributes. Use of this attribute is decided by network operator. This attribute is returned by the local VC in the accounting record for all calls that are set up using this particular DNA.
Mib	FrameRelayNni
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrNni Dna accountCollection (aco)

Access	Read and write
Description	This attribute indicates that accounting records are to be collected by the network for the various reasons: billing, test, study, auditing. The last of the parameters, force, indicates that accounting records are to be collected irrespective of other collection reasons. The force option is available for X.75 Gateways only. If none of these reasons are set, then accounting will be suppressed. To set a specific accounting collection reason, the reason is entered and

Copyright © 2006, Nortel Nortel Confidential

	the corresponding bit in the structure is set to a value of 1. To turn off a specific accounting collection reason, the reason is entered preceded with the '~' character, and the corresponding bit in the structure is set to a value of 0. The bit placement for the accounting collection reasons is as follows: Bit 0 - Bill Bit 1 - Test Bit 2 - Study Bit 3 - Audit Bit 4 - Force
Mib	FrameRelayNni
Set of	bill test study audit force
Default	(bill)

ATTRIBUTE FrNni Dna serviceExchange (sre)

Access	Read and write
Description	This attribute is an arbitrary number, Data Service Exchange, as entered by the network operator and reported in accounting record. It is converted into an internal 8-bit integer value for use in the accounting record as well as in various X.25 and X.75 Tariff utilities.
Mib	FrameRelayNni
Values	Decimal (0..255)
Default	0

ATTRIBUTE FrNni Dna egressAccounting (ega)

Access	Read and write
Description	This attribute specifies if egress accounting is enabled by the frame relay service. If egress accounting is disabled, only segment counts are collected by the VC. No frame relay counts appear in the accounting records for the frame relay service. If egress accounting is enabled, the accounting records for the frame relay service will contain frame relay specific counts.
Mib	FrameRelayNni
Values	yes no
Default	no

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Dna dataPath (dpa)

Access	Read and write
Description	This attribute specifies the data path to be used by Virtual Circuits on this interface. If the connection has a *DirectCall* component then the value can be overridden by the *dataPath* attribute of the *DirectCall* component. This value applies to the connection after data transfer state is reached. All the data and control traffic will be sent using this data path. If the provisioned *dataPath* is not available the connection is not established. The value of the *dataPath* is signaled by both ends of the connection. If this value is not the same at both ends ***dprsOnly*** is used for the duration of the connection. A virtual circuit connection is always established using ***dprsOnly*** even if this attribute is provisioned as some other value. ***dprsOnly*** - dynamic packet routing system is used ***dprsMcsOnly*** - DPRS Multiservice Cut-Through Switching path is used. ***dprsMcsFirst*** - DPRS Multiservice Cut-Through Switching path is used if it is available. If it is not available ***dprsOnly*** is used.
Mib	FrameRelayNni
Values	dprsOnly dprsMcsOnly dprsMcsFirst
Default	dprsOnly

Values	Signed (-16777216..16777215)
Units	bit/s
Default	No default

ATTRIBUTE FrNni Dna HgM availableDlcis (adl)

Access	Read only
Description	This attribute indicates the number of DLCIs available for SVCs on the interface associated with this DNA. If this value reaches 0, an AMP with zero availability is sent to the hunt group server(s). Both this attribute and the *availableAggregateCir* attribute must be non zero for this DNA to receive calls on the hunt group.
Mib	FrameRelayNni
Values	Decimal (0..4096)
Default	No default

ATTRIBUTE FrNni Dna HgM maximumAvailableAggregateCir (mcir)

Access	Read only
Description	This attribute indicates the maximum available bandwidth for this hunt group member. This value represents the total sum of the sixteen egress bandwidth pools. It is the sum of the sixteen indices of the *FrNni Ca egressBandwidthPool* attribute multiplied by the link speed.
Mib	FrameRelayNni
Values	Long Integer
Units	bit/s
Default	No default

ATTRIBUTE FrNni Dna HgM availableAggregateCir (acir)

Access	Read only
Description	This attribute indicates the current total available bandwidth reported to the hunt group server in the Availability Message Packet (AMP). This value represents the sum of the sixteen currently available egress bandwidth pools. It is the sum of the sixteen indices of the *FrNni Ca egressPoolAvailableBandwidth* attribute. It increments when a connection is released. It decrements when a connection is accepted. Both this attribute and the *availableDlcis* attribute must be non zero for this interface to receive calls on a hunt group.

COLLECTED STATS FrameRelayNni Framer

Scope Application

Description
FrUni/n Framer
FrNni/n Framer
FrAtm/n Framer
This component controls link layer framing for application components sending and receiving data on a link interface. It is also through *Framer*, that an application component is associated with a specific hardware link interface.

The *Framer* component provides provisionable attributes related to datapath aspects of the hardware interface (such as crc and frame length) rather than interface specific attributes (such as modem leads and clocking) which are associated with specific hardware components (such as *V35/n* or *DS1/n*). The *Framer* component also provides a provisionable attribute which binds the application component to a specific hardware component.

The *Framer* component contains operational attributes for link interface datapath statistics (such as frame counts and aborts).

GROUP FrNni Framer Provisioned (Prov)

Properties Provisioned

Copyright © 2006, Nortel Nortel Confidential

Description	This group contains the base provisioning data for the *Framer* component. Application or hardware interface specific provisioning data is contained in other provisionable *Framer* groups.
Mib	FrameRelayNni

ATTRIBUTE FrNni Framer interfaceName

Access	Read and write
Criticality	Process
Description	This attribute contains a hardware component name. The attribute associates the application with a specific link. This defines the module processor on which *Framer*'s parent component (as well as *Framer* itself) will run.
Mib	FrameRelayNni
Values	Link (Hardware, applicationFramerName)
Default	No default

GROUP FrNni Framer LinkOptions (Link)

Properties	Provisioned
Description	This group contains attributes defining the framing of data on the link interface.
Mib	FrameRelayNni

ATTRIBUTE FrNni Framer dataInversion

Access	Read and write
Description	This attribute determines whether data bits are to be inverted (1 to 0 and 0 to 1) before transmission of frames to the interface. If the value of this attribute is On, the incoming data bits will also be inverted when frames are received from the link before being processed. This option is typically used in ***hdlc*** framing mode when inversion is used to guarantee 1's density. Note that aborts (in ***hdlc*** and ***interrupting*** modes) are corrupted when data is inverted. This attribute may only take its default value for non-MSA cards.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

Values	off on
Default	off

ATTRIBUTE FrNni Framer frameCrcType

Access	Read and write
Description	This attribute defines the type of CRC used. The CRC value calculated is appended to the end of the frames transmitted to the link. The CRC value is removed from the end of frames received from the link and checked for correctness. NoCrc means that CRC is not used. This attribute may take only its default value for non-MSA cards.
Mib	FrameRelayNni
Values	crc16 crc32 noCrc
Default	crc16

ATTRIBUTE FrNni Framer flagsBetweenFrames

Access	Read and write
Description	This attribute defines the number of flags that are inserted between frames sent to the link interface. The flagBetweenFrames can be set to only 1, 2, 4, 8 or 16 for 4pDS3Ch FrameRelay FP.
Mib	FrameRelayNni
Values	Decimal (1..16)
Default	1

GROUP FrNni Framer OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes. The descriptions generically indicate what each state attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Framer adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command was issued against the component and it is in the process of shutting down. The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.
Mib	FrameRelayNni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrNni Framer operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayNni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrNni Framer usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component.

Copyright © 2006, Nortel Nortel Confidential

The value ***idle*** indicates that the component is not currently in use.

The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users.

The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Mib	FrameRelayNni
Values	idle active (activ) busy
Default	idle

GROUP FrNni Framer Statistics (Stats)

ATTRIBUTE FrNni Lmi asyncStatusReport (asr)

Access	Read and write
Description	This attribute selects the use of asynchronous PVC status report procedures as specified in ANSI and CCITT specification.
Mib	FrameRelayNni
Values	off on
Default	off

ATTRIBUTE FrNni Lmi errorEventThreshold (n392)

Access	Read and write
Description	For the network-side-procedure, an event is defined as follows: (1) receipt of a STATUS ENQUIRY message, or (2) expiration of timer T392. An error event is (1) nonreceipt of STATUS ENQUIRY in T392 seconds; (2) invalid format of a LMI message; (3) invalid receive sequence number. For the user-side-procedure, an event is defined as a polling cycle or a status enquiry and status report exchange. An error event is (1) non-receipt of a STATUS within the polling cycle, or (2) invalid format of a LMI message, or (3) invalid sequence number This attribute specifies the number of error events which, if they occur within *eventCount* events, will cause a protocol error condition. The condition is cleared after *eventCount* sequential correct events occur. It must be less than or equal to *eventCount* (n393)
Mib	FrameRelayNni
Values	Decimal (1..10)
Default	3

ATTRIBUTE FrNni Lmi eventCount (n393)

Access	Read and write
Description	This attribute specifies the number of contiguous events within which no more than *eventErrorThreshold* error events are allowed. It must be greater than or equal to *errorEventThreshold* (n392).
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (1..10)
Default	4

ATTRIBUTE FrNni Lmi checkPointTimer (t392)

Access	Read and write
Description	This attribute selects the time (in seconds) within which a STATUS ENQUIRY message is expected. It must be greater than *linkVerificationTimer (t391).*
Mib	FrameRelayNni
Values	Decimal (1; 2; 3; 4; 5; 10; 15; 20; 25; 30)
Units	seconds
Default	15

ATTRIBUTE FrNni Lmi ignoreActiveBit (inab)

Access	Read and write
Criticality	Process
Description	This attribute specifies whether the Frame Relay LMI Active Bit (A-bit) has a bearing on the transfer of user data across this Frame Relay interface for both directions of traffic flow. When this attribute is set to ***yes***, the A-bit status of a user DLCI connection does not affect data transfer. When this attribute is set to ***no,*** data received from the local interface is discarded if an A-bit =0 condition exists towards the local user. Data being sent to the local interface is discarded if an A-bit = 0 condition exists towards the local user.
Mib	FrameRelayNni
Values	no yes
Default	no

ATTRIBUTE FrNni Lmi pvcAlarmsReporting (pvcAlarms)

Access	Read and write
Description	This attribute specifies if alarms are generated when PVCs change state in the local network, an adjacent network or in remote networks. When the value is ***internal***, PVCs operational status change in the local network are reported in alarms. When the value is ***external***, PVCs operational status change in an adjacent or remote networks are reported

Copyright © 2006, Nortel Nortel Confidential

in alarms. When the value is ***both***, PVCs status change in local and adjacent or remote networks are reported in alarms. When the value is ***none***, no alarms are issued for PVCs status change.

There are four kinds of alarms controlled by the attribute.
Alarm 7007 200x reports PVCs that have lost connectivity in an adjacent or remote networks.
Alarm 7007 201x reports PVCs that have reached the data transfer state in an adjacent or remote networks.
Alarm 7007 202x reports PVCs that have lost connectivity in the local network.
Alarm 7007 203x reports PVCs that have reached the data transfer state in the local network.

Each alarm can report a maximum of 112 DLCIs. Up to nine alarms of the same kind may be required to report all PVCs that have changed state if all these PVCs have experienced the same condition at the *FrNni* interface.

ATTRIBUTE FrNni Lmi operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***.
Mib	FrameRelayNni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrNni Lmi usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.
Mib	FrameRelayNni
Values	idle active (activ) busy
Default	idle

GROUP FrNni Lmi ProtocolStatusInfo (Psi)

Properties	Operational
Description	This group provides the protocol status of the Local Management Interface.
Mib	FrameRelayNni

ATTRIBUTE FrNni Lmi protocolStatus

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute indicates whether the LMI is in an error condition or whether the LMI procedures are behaving normally. When operating with no LMI protocol, this attribute is always set to ***normalCondition***. When operating with LMI procedures, this attribute is set to ***errorCondition*** after n392 of the last n393 events are in error. The consequence of an ***errorCondition*** is that all DLCIs on this interface will become inactive in both directions. The ***errorCondition*** is lifted and a ***normalCondition*** is indicated when a sufficient number of events have occurred without error. In ANSI, this occurs when n393 consecutive good events take place. If the *procedures* attribute is set to ***autoConfigure***, this attribute is se to ***configuring*** while adaptive LMI determines which LMI procedures are running on the link. A single LMI error event during auto configuration causes the attribute value to change to ***errorCondition***. If during ***configuring*** no LMI message is received, an LMI ***errorCondition*** is raised after n392 x t392 seconds.
Mib	FrameRelayNni
Values	errorCondition normalCondition configuring
Default	No default

ATTRIBUTE FrNni Lmi opProcedures (opproc)

Access	Read only
Criticality	Process
Description	This attribute indicates the procedures being used for the Local Management Interface. This attribute should be ignored if *protocolStatus* is not ***normalCondition***. The following procedures are supported: ***none***: Local Management Interface procedures are not running on this interface. This accommodates Frame Relay user equipment that has not implemented any LMI procedures. ***ansi***: Local Management Interface procedures from the ANSI specification are running. *DLCI 0* is used for the LMI protocol. ***itu***: Local Management Interface procedures from the ITU-T specification are running. *DLCI 0* is used for the LMI protocol. Was previously ***ccitt***. ***unknown***: Local Management Interface procedures have yet to be determined by Adaptive LMI.
Mib	FrameRelayNni
Values	none ansi

	itu unknown
Default	No default

GROUP FrNni Lmi Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics for the Frame Relay NNI Local Management Interface.
Mib	FrameRelayNni

ATTRIBUTE FrNni Lmi keepAliveStatusTolf (kasti)

Access	Read only
Description	This attribute counts the number of Local Management Interface keep alive status messages sent to the external network in response to a status enquiry for keep alive status. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi fullStatusTolf (fsti)

Access	Read only
Description	This attribute counts the number of Local Management Interface full status messages sent to the external network in response to a status enquiry for keep alive or full status. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi keepAliveStatusEnqFromIf (kafi)

Access	Read only
Description	This attribute counts the number of Local Management Interface valid keep alive status enquiry messages received from the external network. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayNni

Copyright © 2006, Nortel Nortel Confidential

Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi fullStatusEnqFromIf (fsfi)

Access	Read only
Description	This attribute counts the number of Local Management Interface valid full status enquiry messages received from the external network. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi networkSideEventHistory (nsh)

Access	Read only
Description	This attribute displays the Local Management Interface network side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status enquiry message. An error event is either a nT2/T392 timer expiry or receipt of a status enquiry with bad sequence numbers.
Mib	FrameRelayNni
Values	String (1..10, ASCII)
Default	No default

ATTRIBUTE FrNni Lmi userSideEventHistory (ush)

Access	Read only
Description	This attribute displays the Local Management Interface user side procedure event history in order of occurrence. An event is represented by a single symbol. A '+' symbol indicates a good event. An 'X' symbol indicates a protocol error event. The leftmost event is the most recent to occur. The provisioned *eventCount* (nN3/N393) dictates the maximum number of events displayed. A good event is triggered by receipt of a valid status message. An error event is either a nT1/T391 timer expiry or receipt of a status message with bad sequence numbers.
Mib	FrameRelayNni
Values	String (1..10, ASCII)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Lmi protocolErrors (proto)

Access	Read only
Description	This attribute counts the number of Local Management Interface protocol errors. It is the sum of the sequence (*sequenceErrors* and *statusSequenceErrors*) and timeout (*pollingVerifTimeouts* and *noStatusReportCount*) errors. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi unexpectedIes (uie)

Access	Read only
Description	This attribute counts the number of Local Management Interface frames received with an Information Element identifier that is unknown or unexpected. An unexpected Information Element is not a protocol error. When the maximum count is exceeded, this counter wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi sequenceErrors (seq)

Access	Read only
Description	This attribute counts the number of Local Management Interface Status Enquiry message sequence errors. A sequence error is receipt of a Status Enquiry message with a receive sequence number not equal to the last send sequence number. When the maximum count is exceeded the counter wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi statusSequenceErrors (stseq)

Access	Read only
Description	This attribute counts the number of Local Management Interface Status message sequence errors. A sequence error is receipt of a Status

Copyright © 2006, Nortel Nortel Confidential

	message with a receive sequence number not equal to the last send sequence number. When the maximum count is exceeded the counter wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi unexpectedReports (ur)

Access	Read only
Description	This attribute counts the number of Local Management Interface frames received with an unknown or unexpected report type. An unexpected report type is not a protocol error. When the maximum count is exceeded the counter wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi pollingVerifTimeouts (tmo)

Access	Read only
Description	This attribute counts the number of checkPointTImer (t392) timer expiries occurring on the Local Management Interface. When the maximum count is exceeded the counter wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Lmi noStatusReportCount (nsrc)

Access	Read only
Description	This attribute counts the number of times when no status report or an invalid status report comes from the external network. This attribute is incremented in two cases: i) after a status enquiry is sent out and T391 timer expires without having a status report received. ii) an invalid status report is received. When the maximum count is exceeded it wraps to zero.
Mib	FrameRelayNni

Values	Decimal (0..4294967295)
Default	0

COMPONENT FrNni DataLinkConnectionIdentifier (Dlci)

Instance	Decimal (16..1007)
Groups	GROUP FrNni Dlci OsiState (State) GROUP FrNni Dlci ABitStatus (Abit) GROUP FrNni Dlci ServiceParametersOp (SpOp) GROUP FrNni Dlci Statistics (Stats) GROUP FrNni Dlci IntervalData (Int) GROUP FrNni Dlci CallData (Calld)
Scope	Application
Description	*FrNni/n DataLinkConnectionIdentifier/n* This component represents a Data Link Connection Identifier. It is responsible for the Frame Relay U-plane (User-plane) protocol for the specified instance. There can be many instances of *Dlci* for each *FrNni*. The instance value is used to identify the logical connection, multiplexed within the physical channel, with which a frame is associated. All frames carried within a particular physical channel and having the same DLCI value are associated with the same logical connection. A DLCI instance can be a permanent virtual circuit (PVC) or switched permanent virtual circuit (P-SPVC) added through provisioning, or a switched virtual circuit (SVC) or S-SPVC which is created dynamically through signaling. The *lock* and *unlock* commands apply to permanent DLCIs. The *clear* command applies to switched DLCIs. For the ***4pDS3Ch*** card, when the *timeslot* of the *channel* component

Copyright © 2006, Nortel Nortel Confidential

linked to this *FrNni* is set to ***none***, no *Dlci* component is allowed under this *FrNni*.

Common Verbs	Help List Display Add DELete LOCK Unlock

VERB CLEAR FrNni Dlci

Impact	Service
Description	This command is used to clear a Frame Relay switched (SVC or S-SPVC) connection.

GROUP FrNni Dlci OsiState (State)

Properties	Operational
Description	This group contains the three OSI State attributes and the six OSI Status attributes. The descriptions generically indicate what each attribute implies about the component. Note that not all the values and state combinations described here are supported by every component which reuses this group. For component-specific information and the valid state combinations, refer to the appropriate NTP.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dlci adminState (osiAdmin)

Access	Read only
Description	This attribute indicates the OSI Administrative State of the component. The value ***locked*** indicates that the component is administratively prohibited from providing services for its users. A *Lock -force* or *Lock* command has been previously issued for this component. When the value is ***locked***, the value of *usageState* must be ***idle***. The value ***shuttingDown*** indicates that the component is administratively permitted to provide service to its existing users only. A *Lock* command

Copyright © 2006, Nortel Nortel Confidential

was issued against the component and it is in the process of shutting down.

The value ***unlocked*** indicates that the component is administratively permitted to provide services for its users. To enter this state, issue an *Unlock* command to this component.

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	FrameRelayNni
Values	locked (lck) unlocked (unlck) shuttingDown (shut)
Default	unlocked

ATTRIBUTE FrNni DIci operationalState (osiOper)

Access	Read only
Description	This attribute indicates the OSI Operational State of the component. The value ***enabled*** indicates that the component is available for operation. Note that if *adminState* is ***locked***, it would still not be providing service. The value ***disabled*** indicates that the component is not available for operation. For example, something is wrong with the component itself, or with another component on which this one depends. If the value is ***disabled***, the *usageState* must be ***idle***. The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.
Mib	FrameRelayNni
Values	enabled (ena) disabled (dis)
Default	disabled

ATTRIBUTE FrNni DIci usageState (osiUsage)

Access	Read only
Description	This attribute indicates the OSI Usage State of the component. The value ***idle*** indicates that the component is not currently in use. The value ***active*** indicates that the component is in use and has spare capacity to provide for additional users. The value ***busy*** indicates that the component is in use and has no spare operating capacity for additional users at this time.

Copyright © 2006, Nortel Nortel Confidential

The OSI Status attributes, if supported by the component, may provide more details, qualifying the state of the component.

Mib	FrameRelayNni
Values	idle active (activ) busy
Default	idle

ATTRIBUTE FrNni DIci availabilityStatus (osiAvail)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Availability status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***inTest*** indicates that the resource is undergoing a test procedure. If *adminState* is ***locked*** or ***shuttingDown***, the normal users are precluded from using the resource and *controlStatus* is ***reservedForTest***. Tests that do not exclude additional users can be present in any operational or administrative state but the ***reservedForTest*** condition should not be present. The value ***failed*** indicates that the component has an internal fault that prevents it from operating. The *operationalState* is ***disabled***. The value ***dependency*** indicates that the component cannot operate because some other resource on which it depends is unavailable. The *operationalState* is ***disabled***. The value ***powerOff*** indicates the resource requires power to be applied and it is not powered on. The *operationalState* is ***disabled***. The value ***offLine*** indicates the resource requires a routine operation (either manual, automatic, or both) to be performed to place it on-line and make it available for use. The *operationalState* is ***disabled***. The value ***offDuty*** indicates the resource is inactive in accordance with a predetermined time schedule. In the absence of other disabling conditions, the *operationalState* is ***enabled*** or ***disabled***. The value ***degraded*** indicates the service provided by the component is degraded in some way, such as in speed or operating capacity. Usually, the resource remains available for service. The *operationalState* is almost always ***enabled***. There is one exception where an *operationalState* of ***disabled*** is used in conjunction with ***degraded*** for a component which

Copyright © 2006, Nortel Nortel Confidential

represents a rolled up view of a set of other components.

The value ***notInstalled*** indicates the resource is not present. The *operationalState* is ***disabled***.

The value ***logFull*** is not used.

The value ***migrating*** indicates that a software migration activation is in progress, making the component unavailable for other activities until the migration is complete.

Mib	FrameRelayNni
Set of	inTest failed dependency (depend) powerOff (pwrOff) offLine offDuty degraded (degrad) notInstalled (notIn) logFull migrating
Default	No default

ATTRIBUTE FrNni DIci proceduralStatus (osiProc)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Procedural status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***initializationRequired*** indicates (for a resource which doesn't initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* is ***disabled***. The value ***notInitialized*** indicates (for a resource which does initialize autonomously) that initialization is required before it can perform its normal functions, and this procedure has not been initiated. The *operationalState* may be ***enabled*** or ***disabled***. The value ***initializing*** indicates that initialization has been initiated but is not yet complete. The *operationalState* may be ***enabled*** or ***disabled***. The value ***reporting*** indicates the resource has completed some processing operation and is notifying the results. The *operationalState* is ***enabled***.

Copyright © 2006, Nortel Nortel Confidential

The value ***terminating*** indicates the component is in a termination phase. If the resource doesn't reinitialize autonomously, *operationalState* is ***disabled***; otherwise it is ***enabled*** or ***disabled***.

Mib	FrameRelayNni
Set of	initializationRequired (initRq) notInitialized (notInit) initializing (init) reporting (report) terminating (term)
Default	No default

ATTRIBUTE FrNni DIci controlStatus (osiCntrl)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Control status of the component. Note that, even though it is defined as a multi-valued set, at most one value is shown to the user. When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present. The value ***subjectToTest*** indicates the resource is available but tests may be conducted simultaneously at unpredictable times, which may cause it to exhibit unusual characteristics. The value ***partOfServicesLocked*** indicates that part of the service is restricted from users of a resource. The *adminState* is ***unlocked***. The value ***reservedForTest*** indicates that the component is administratively unavailable because it is undergoing a test procedure. The *adminState* is ***locked***. The value ***suspended*** indicates that the service has been administratively suspended.
Mib	FrameRelayNni
Set of	subjectToTest (subTst) partOfServicesLocked (partLk) reservedForTest (rsrvd) suspended (suspnd)
Default	No default

ATTRIBUTE FrNni DIci alarmStatus (osiAlarm)

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Alarm status of the component. Note that, even though it is defined as a multi-

Copyright © 2006, Nortel Nortel Confidential

valued set, at most one value is shown to the user.

When no values are in the set, this indicates that either the attribute is not supported or that none of the status conditions described below is present.

The value ***underRepair*** indicates the component is currently being repaired. The *operationalState* is ***enabled*** or ***disabled***.

The value ***critical*** indicates one or more critical alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***major*** indicates one or more major alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***minor*** indicates one or more minor alarms are outstanding against the component. Other, less severe, alarms may also be outstanding. The *operationalState* is ***enabled*** or ***disabled***.

The value ***alarmOutstanding*** generically indicates that an alarm of some severity is outstanding against the component.

Mib	FrameRelayNni
Set of	underRepair (repair) critical (crit) major minor alarmOutstanding (outst)
Default	No default

ATTRIBUTE FrNni Dlci **standbyStatus (osiStby)**

Access	Read only
Description	If supported by the component, this attribute indicates the OSI Standby status of the component. The value ***notSet*** indicates that either the attribute is not supported or that none of the status conditions described below is present. Note that this is a non-standard value, used because the original specification indicated this attribute was set-valued and thus, did not provide a value to indicate that none of the other three are applicable. The value ***hotStandby*** indicates that the resource is not providing service but will be immediately able to take over the role of the resource to be backed up, without initialization activity, and containing the same information as the resource to be backed up. The value ***coldStandby*** indicates the resource is a backup for another resource but will not be immediately able to take over the role of the

Copyright © 2006, Nortel Nortel Confidential

backed up resource and will require some initialization activity.

The value ***providingService*** indicates that this component, as a backup resource, is currently backing up another resource.

Mib — FrameRelayNni

Values — hotStandby (hot)
coldStandby (cold)
providingService (serv)
notSet (nSet)

Default — notSet

ATTRIBUTE FrNni Dlci unknownStatus (osiUnknw)

Access — Read only

Description — This attribute indicates the OSI Unknown status of the component.

The value ***false*** indicates that all of the other OSI State and Status attribute values can be considered accurate.

The value ***true*** indicates that the actual state of the component is not known for sure.

Mib — FrameRelayNni

Values — false
true

Default — false

GROUP FrNni Dlci ABitStatus (Abit)

Properties — Operational

Description — This group contains the A-Bit status information for this Data Link Connection Identifier.

Mib — FrameRelayNni

ATTRIBUTE FrNni Dlci aBitStatusTolf (abti)

Access — Read only

Description — This attribute is the most recent A-bit status sent to the interface. The A-bit status is part of the LMI protocol, and indicates willingness to accept data from the local interface.

inactive - the Frame Relay service discards all data offered from the local interface.

active - the Frame Relay service tries to process all data offered from the local interface.

Copyright © 2006, Nortel Nortel Confidential

notApplicable - the DLCI is switched, so this attribute is ignored.

Mib	FrameRelayNni
Values	inactive active notApplicable
Default	inactive

ATTRIBUTE FrNni Dlci aBitReasonToIf (abrti)

Access	Read only
Description	This attribute provides the reason (if any) for an ***inactive*** status to be sent to the interface. This reason is ***notApplicable*** for an ***active*** status.
Mib	FrameRelayNni
Values	notApplicable remoteUserSignaled localLmiError remoteLmiError localLinkDown remoteLinkDown pvcSpvcDown userNotAuthorized resourceNotAvailable dlciCollisionAtNni
Default	notApplicable

ATTRIBUTE FrNni Dlci aBitStatusFromIf (abfi)

Access	Read only
Description	This attribute is the most recent A-Bit status received from the interface. ***inactive*** - the Frame Relay service informs the remote DLCI not to send user data to this interface. ***active*** - the Frame Relay service informs the remote DLCI that it is okay to send user data to this interface. ***notApplicable*** - the DLCI is switched, so this attribute is ignored.
Mib	FrameRelayNni
Values	inactive active notApplicable
Default	inactive

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Dlci aBitReasonFromIf (abrfi)

Access	Read only
Description	This attribute provides the reason (if any) for an ***inactive*** status to be sent to the subnet. This reason is ***notApplicable*** for an ***active*** status.
Mib	FrameRelayNni
Values	notApplicable remoteUserSignaled localLmiError localLinkDown missingFromLmiReport
Default	notApplicable

ATTRIBUTE FrNni Dlci loopbackState

Access	Read only
Description	This attribute has the value ***on*** when the DLCI is in loopback mode and ***off*** otherwise. The loopback command verbs *start* and *stop* are used to initiate and terminate the loopback mode for a DLCI. While *loopbackState* is ***on***, the local LMI will report to the interface the A-bit status as active. Also an active A-bit signal will be reliably propagated across the subnet to the remote DLCI.
Mib	FrameRelayNni
Values	off on
Default	off

GROUP FrNni Dlci ServiceParametersOp (SpOp)

Properties	Operational
Description	This group defines the service and traffic parameters specific to this instance of DLCI. In the case of permanent (PVC and P-SPVC) DLCIs, the values of attributes with the exception of the *measurementInterval* reflect the provisioning under the *FrNni Dlci Sp* component. In the case of switched (SVC and S-SPVC) DLCIs, the values of attributes reflect the service parameter negotiations between what is provisioned under the *FrNni Sig* component and the signaled parameters.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dlci maximumFrameSize (n203)

Access	Read only
Description	This attribute indicates the maximum number of octets which may be included in the information field. The frame relay header and CRC octets are not included in this definition. This attribute corresponds to the dN1 parameter described in the Vendor Forum Specification.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayNni
Values	Decimal (1..8187)
Units	octets
Default	No default

ATTRIBUTE FrNni Dlci committedInformationRate (cir)

Access	Read only
Description	This attribute indicates the committed information rate (CIR) in bits per second (bit/s). When *rateEnforcement* is set to ***on***, *cir* is the rate at which the network agrees to transfer information under normal conditions. This rate is measured over a measurement interval (*t*) that is determined internally based on CIR and the committed burst size (Bc). An exception to this occurs when CIR is provisioned to be zero, in which case the measurement interval (*t*) must be provisioned explicitly. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayNni
Values	Decimal (0..2048000)
Units	bit/s
Default	No default

ATTRIBUTE FrNni Dlci committedBurstSize (bc)

Access	Read only
Description	This attribute indicates the committed burst size (Bc) in bits. *bc* is the amount of data that a network agrees to transfer under normal conditions over a measurement interval (*t*). Data marked DE=1 is not accounted for in Bc. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayNni
Values	Decimal (0..2048000)
Units	bits
Default	No default

ATTRIBUTE FrNni Dlci excessBurstSize (be)

Access	Read only
Description	This attribute indicates the excess burst size (Be) in bits. Be is the amount of uncommitted data that the network will attempt to deliver over measurement interval T. Data marked DE=1 by the user or by the network is accounted for here.

Copyright © 2006, Nortel Nortel Confidential

	This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayNni
Values	Decimal (0..2048000)
Units	bits
Default	No default

ATTRIBUTE FrNni DIci measurementInterval (t)

Access	Read only
Description	This attribute indicates the time interval (in milliseconds) over which rates and burst sizes are measured. This attribute should be ignored when *rateEnforcement* is ***off***.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	msec
Default	No default

ATTRIBUTE FrNni DIci accounting (ac)

Access	Read only
Description	This attribute indicates whether accounting data collection and record generation is turned on at this DLCI. For accounting data collection and record generation to be turned on, the ***accountingOn*** bit and at least one of the ***accountCollection*** bits in the ***DataNetworkAddress*** component must be set to on.
Mib	FrameRelayNni
Values	off on
Default	No default

ATTRIBUTE FrNni DIci emissionPriorityToIf (epToIf)

Access	Read only
Description	This attribute indicates the emission priority of frames sent to the interface. A larger value denotes a higher priority.
Mib	FrameRelayNni
Values	Decimal (0; 1; 2; 3)
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni DIci transferPriorityToNetwork (tpToNwk)

Access	Read only
Description	This attribute indicates the priority at which data is transferred to the network. The transfer priority is a preference configured for an application according to its delay-sensitivity requirement. Frames with higher transfer priority are served by the network before the frames with lower priority. The transfer priority standard is defined to have 16 indices from 0 to 15. Each transfer priority n, where n specifies the transfer priority index, contains a default setting for routing class of service (***multimedia***, ***delay***, or ***throughput***) and frame relay egress queue (depending on the number of supported egress queues on the remote end interface) specified by the *routingClassOfServic*e and *emissionPriority* attributes provisioned in the *Mod Frs DprsNet Tpm/n* component. The default mapping can be altered by a user if required.
Mib	FrameRelayNni
Values	Decimal (0..15)
Default	No default

ATTRIBUTE FrNni DIci transferPriorityFromNetwork (tpFromNwk)

Access	Read only

Default	No default

ATTRIBUTE FrNni Dlci correlationTag (ctag)

Access	Read only
Description	This attribute indicates the unique string which identifies this connection. The value of this attribute is provisioned under the *correlationTag* attribute under *Service Parameters* subcomponent. If required for correlation purposes, the attribute is provisioned with the same value at both endpoints of the connection. An empty string value for this attribute indicates that the user either does not want to use the correlation tag functionality, or wants the correlation tag string to be an empty string. This attribute can be used for off-switch data correlation purposes. Downstream processing uses this attribute to correlate data records (accounting etc.) issued at different nodes in the network. In accounting, the value of this attribute appears as the *circuitId* (circuit identifier) for the endpoint. There is no system-generated value for the correlationTag. Therefore, this attribute does not appear for SVC DLCIs.
Mib	FrameRelayNni
Values	String (0..32, ASCII)
Default	""

GROUP FrNni Dlci Statistics (Stats)

Properties	Operational
Description	This group contains the operational statistics for the Frame Relay Data Link Connection Identifier. When the DLCI is in local loopback mode, the DLCI statistics do not increment.
Mib	FrameRelayNni

ATTRIBUTE FrNni Dlci frmToIf (fti)

Access	Read only
Description	This attribute counts the frames sent out the interface. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni DIci fecnFrmToIf (fecnti)

Access	Read only
Description	This attribute counts the frames sent to the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni DIci becnFrmToIf (becnti)

Access	Read only
Description	This attribute counts the frames sent to the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni DIci bciToSubnet (bcits)

Access	Read only
Description	This attribute counts the frames sent into the local network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni DIci deFrmToIf (deti)

Access	Read only
Description	This attribute counts the frames sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni DIci discCongestedToIf (discardcti)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discDeCongestedToIf (discarddecti)

Access	Read only
Description	This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion in the direction toward the interface. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci frmFromIf (ffi)

Access	Read only
Description	This attribute counts the frames received from the interface. It includes the frames that are discarded due to error or excess. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci fecnFrmFromIf (fecnfi)

Access	Read only
Description	This attribute counts the frames received from the interface with the Forward Explicit Congestion Notification (FECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci becnFrmFromIf (becnfi)

Access	Read only

Description	This attribute counts the frames received from the interface with the Backward Explicit Congestion Notification (BECN) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci fciFromSubnet (fcifs)

Access	Read only
Description	This attribute counts the frames received from the network with the Forward Congestion Indication (FCI) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci bciFromSubnet (bcifsb)

Access	Read only
Description	This attribute counts the frames received from the network with the Backward Congestion Indication (BCI) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci deFrmFromIf (defi)

Access	Read only
Description	This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci excessFrmFromIf (excess)

Access	Read only
Description	This attribute counts the frames received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero.

Copyright © 2006, Nortel Nortel Confidential

Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discExcessFromIf (discardefi)

Access	Read only
Description	This attribute counts the frames which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discFrameAbit (discfab)

Access	Read only
Description	This attribute counts the number of frame discards at the Frame Relay Service, due to an inactive PVC status, in the direction toward the local network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discCongestedFromIf (discardcfi)

Access	Read only
Description	This attribute counts the number of frame discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discDeCongestedFromIf (discarddecfi)

Access	Read only
Description	This attribute counts the number of discarded frames, with the Discard Eligibility (DE) bit set, at the Frame Relay service, due to local congestion, in the direction toward the local network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)

Default	0

ATTRIBUTE FrNni Dlci errorShortFrmFromIf (shortfi)

Access	Read only
Description	This attribute counts the frames received with 0 octets in the information field. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci errorLongFrmFromIf (longfi)

Access	Read only
Description	This attribute counts the frames received with number of octets in the information field greater than the subscribed maximum. When the count reaches maximum it wraps to zero. Frames whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci becnFrmSetByService (becnset)

Access	Read only
Description	This attribute counts the number of frames with BECN set by the Frame Relay service. It is incremented whenever the Frame Relay service sets BECN on a frame upon detecting local congestion. This count is incremented regardless of whether the frame already bears a set BECN bit since its use is to determine the place of congestion. When the count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci bytesToIf (bti)

Access	Read only
Description	This attribute counts the bytes sent out the interface. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)

Copyright © 2006, Nortel Nortel Confidential

Default	0

ATTRIBUTE FrNni DlciI deBytesToIf (debti)

Access	Read only
Description	This attribute counts the bytes sent to the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni DlciI discCongestedToIfBytes (discardctib)

Access	Read only
Description	This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the link. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni DlciI discDeCongestedToIfBytes (discarddectib)

Access	Read only
Description	This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the link. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni DlciI bytesFromIf (bfi)

Access	Read only
Description	This attribute counts the number of bytes received from the interface. Bytes that are discarded by the interface due to framing errors (such as CRC errors for example) are not counted. However bytes that are discarded by the application due to rate enforcement or congestion are counted. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Dlci deBytesFromIf (debi)

Access	Read only
Description	This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit set. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci excessBytesFromIf (excessb)

Access	Read only
Description	This attribute counts the bytes received from the interface with the Discard Eligibility (DE) bit clear, but subsequently set by the network due to rate enforcement. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discExcessFromIfBytes (discardebi)

Access	Read only
Description	This attribute counts the bytes which were discarded due to rate enforcement. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discByteAbit (discbab)

Access	Read only
Description	This attribute counts the bytes which were discarded due to aBit turned off.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discCongestedFromIfBytes (discardcbib)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of byte discards at the Frame Relay service due to local congestion in the direction toward the network. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci discDeCongestedFromIfBytes (discarddecbib)

Access	Read only
Description	This attribute counts the number of discard eligible (DE=1) byte discards at the Frame Relay service due to local congestion in the direction toward the network. When the maximum count is reached the count wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci errorShortBytesFromIf (shortbi)

Access	Read only
Description	This attribute counts the bytes received with 0 octets in the information field. When the count reaches maximum it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci errorLongBytesFromIf (longbi)

Access	Read only
Description	This attribute counts the bytes received with number of octets in the information field greater than the subscribed maximum. When the count reaches maximum it wraps to zero. Bytes whose lengths are greater than the hardware receive buffer are ignored by the hardware and are therefore not included in this count.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci rateAdaptReduct (rar)

Access	Read only

Copyright © 2006, Nortel Nortel Confidential

Description	This attribute counts the number of rate reductions due to rate adaptation. Rate adaptation causes the allowed rate to be reduced in steps. After each reduction, a period of time is awaited before further action is taken. At the end of this period, the allowed rate is further reduced if congestion is still prevalent. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci rateAdaptReductPeriod (rarp)

Access	Read only
Description	This attribute provides a cumulative count of the amount of time that rate adaptation procedures have been in effect. When this count reaches maximum, it wraps to zero.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	msec
Default	0

ATTRIBUTE FrNni Dlci cirPresent

Access	Read only
Description	This attribute provides the actual Committed Information Rate (CIR) enforced for this DLCI. This number is in units of 800 bit/s, since that is the internal resolution of rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned CIR for the DLCI. But when Rate Adaptation is active, then this number will vary to represent the actual Allowed CIR at the moment that this attribute is collected.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	bit/s
Default	0

ATTRIBUTE FrNni Dlci eirPresent

Access	Read only
Description	This attribute provides the actual Excess Information Rate (EIR) enforced for this DLCI. This number is in units of 800 bit/s, since that is the internal resolution of rate enforcement. If *rateEnforcement* is **off**, then this number does not have meaning. Normally, this attribute matches the provisioned EIR for the DLCI. But when Rate Adaptation is active, then this number will

Copyright © 2006, Nortel Nortel Confidential

vary to represent the actual Allowed EIR at the moment that this attribute is collected.

Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Units	bit/s
Default	0

GROUP FrNni Dlci IntervalData (Int)

Properties	Operational
Description	This group contains the operational statistics for the Frame Relay Data Link Connection Identifier interval data (accounting data).
Mib	FrameRelayNni

ATTRIBUTE FrNni Dlci startTime

Access	Read only
Description	This attribute indicates the start time of this interval period. If *Vc* spans 12 hour time or time of day change *startTime* reflects new time as recorded at 12 hour periods or time of day changes. A new interval period is started each time an accounting record is generated.
Mib	FrameRelayNni
Values	Time (DHMS)
Default	No default

ATTRIBUTE FrNni Dlci totalIngressBytes (tib)

Access	Read only
Description	This attribute counts the total bytes received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

ATTRIBUTE FrNni Dlci totalEgressBytes

Access	Read only
Description	This attribute counts the total bytes sent to the interface since the start of the interval period. The start of the interval period is captured in the

Copyright © 2006, Nortel Nortel Confidential

	startTime attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

ATTRIBUTE FrNni Dlci eirIngressBytes

Access	Read only
Description	This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the subnet since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

ATTRIBUTE FrNni Dlci eirEgressBytes

Access	Read only
Description	This attribute counts the total bytes with the Discard Eligibility (DE) bit set sent to the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

ATTRIBUTE FrNni Dlci discardedBytes

Access	Read only
Description	This attribute counts the total bytes in invalid frames received from the interface and discarded at the DLCI since the start of the interval period. This count is a sum of octets in frames discarded due to the number of octets in the information field greater than the subscribed maximum or equal to 0, due to aBit turned off, or due to rate enforcement. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayNni
Values	Long Integer
Default	No default

Copyright © 2006, Nortel Nortel Confidential

ATTRIBUTE FrNni Dlci totalIngressSegFrm

Access	Read only
Description	If the value of the *unitsCounted* attribute in *moduleData* component is ***segments***, this attribute counts the total number of segments in frames received from the interface since the start of the interval period. If the value of the *unitsCounted* attribute in *moduleData* component is ***frames***, this attribute counts the total number of frames received from the interface since the start of the interval period. The start of the interval period is captured in the *startTime* attribute. The count is reset to zero when an accounting record is generated.
Mib	FrameRelayNni
Values	Decimal (0..4294967295)
Default	0

ATTRIBUTE FrNni Dlci totalEgressSegFrm

Access	Read only
