NN43001-253

Nortel Communication Server 1000
Release: 7.0
Publication: NN43001-253
Document release date: 4 June 2010

Contents

New in this release

The following sections details what's new in *Spares Planning* Guide (NN43001-253) for Nortel Communication Server 1000 Release 7.0.

Navigation

Feature changes

There are no feature-related changes in Nortel Communication Server 1000 Release 7.0.

Other changes

Revision history

June 2010	Standard 04.01. This document is up-issued to support Communication Server 1000 Release 7.0.
September 2009	Standard 03.03. This document is up-issued to reflect changes to technical content. Table 4 "Failure rates - circuit cards" (page 21) contains an entry that provides a failure rate for MG XPEC cards.
May 2009	Standard 03.02. This document is up-issued to reflect changes to technical content.
May 2009	Standard 03.01. This document is up-issued to support Nortel Communication Server 1000 Release 6.0.
November 2008	Standard 02.06. This document is up-issued to add technical content under chapters Failure rates - power and cooling equipment and Converting NFT values to spares requirements.
August 2008	Standard 02.05. This document has been up-issued to support Communication Server Release 5.5.
July 2008	Standard 02.04. This document has been up-issued to support Communication Server Release 5.5.

December 2007	Standard 02.03. This document has been up-issued to support Communication Server Release 5.5.
June 2007	Standard 01.03. This document is up-issued to correct references to Release 4.5 and to add spares entries where available.
May 2007	Standard 01.02. This document is up-issued to support Communication Server 1000 Release 5.0. This document contains information previously contained in the following legacy document, now retired, Spares Planning (553-3001-153).
August 2005	Standard 18.00. This document is up-issued for Communication Server 1000 Release 4.5.
September 2004	Standard 17.00. This document is up-issued for Communication Server 1000 Release 4.0. Missing part numbers have been added, and terminal equipment updated with all IP Phones.
September 2003	Standard 16.00. This document is up-issued to support Succession 3.0 Software. This document is up-issued to include information for Succession 1000M and Meridian 1 Small Systems.
January 2002	Standard 15.00. This document is up-issued to support Meridian 1 Release 25.40 systems. This document is up-issued to include Call Processor Pentium (CP PII) and Fibre Network Fabric (FNF) for Option 81C.
April 2000	Standard 14.00. This is a global document and is up-issued for X11 Release 25.0x. Document changes include removal of: redundant content; references to equipment types except Options 11C, 51C, 61C, and 81C; and references to previous software releases.
June 1999	Standard 13.00. This document is reissued to include the NT5D03 Call Processor Card and minor edits. Changes to technical content are noted by revision bars in the margins.
October 1997	Standard 12.00. Changes are noted by revision bars in the margins.
August 1996	Standard 11.00. Changes to technical content are noted by revision bars in the margins.
August 1996	Standard 10.00. This document is reissued to include the Fiber Remote Multi-IPE units. Changes to technical content are noted by revision bars in the margins.
December 1995	Standard 9.00. This document is reissued to include the NT9D19 Call Processor Card and minor edits. Changes to technical content are noted by revision bars in the margins.
July 1995	Standard 8.00. This document is reissued to include international information to create a global NTP and Meridian 1 option 81C. Changes to technical content are noted by revision bars in the margins.
December 1994	Standard, 7.0. This document is reissued to include Small Systems Multi Disk Unit (SMDU), option 51C, and failure rate information updates. Changes to technical content are noted by revision bars in the margins.

April 1994	Standard 6.0. This document is reissued to include information on Meridian 1 system option 61C. New information and changes to technical content are noted by revision bars in the margins.
April 1993	Standard 5.0
December 1992	Standard 4.0. This document is reissued to include information on system option 81 and equipment required for compatibility with X11 release 18. New information and changes to technical content are noted by revision bars in the margins.
December 1991	Standard 3.0. This document is reissued to include technical content updates. Due to the extent of changes revision bars are omitted.
December 1990	Standard 2.0. Reissued to include MTBF information for station equipment.
January 1990	Standard 1.0.

Introduction

This document is a global document. Contact your system supplier or your Nortel representative to verify that the hardware and software described are supported in your area.

Subject

This document provides the information needed to calculate and plan for spare (replaceable) equipment. The document also contains failure rate information for the equipment.

Note on legacy products and releases

This technical document contains information about systems, components, and features that are compatible with CS 1000 Release 7.0 software. For more information on legacy products and releases, click the **Technical Documentation** link under **Support & Training** on the Nortel home page:

www.nortel.com

Applicable systems

This document applies to the following systems:

- Communication Server 1000M Single Group (CS 1000M SG)

- Communication Server 1000M Multi Group (CS 1000M MG)

- Communication Server 1000E (CS 1000E)

- Meridian 1 PBX 11C Chassis

- Meridian 1 PBX 11C Cabinet

- Meridian 1 PBX 61C

- Meridian 1 PBX 81C

    Note: When upgrading software, memory upgrades may be required on the Signaling Server, the Call Server, or both.

System migration

When particular Meridian 1systems are upgraded to run CS 1000 Release 4.5software and configured to include a Signaling Server, they become CS 1000Msystems. lists each Meridian 1 system that supports an upgrade path to a CS 1000Msystem.

Table 1
Meridian 1 systems to CS 1000M systems

This Meridian 1 system...	Maps to this CS 1000M system
Meridian 1 PBX 11C Chassis	CS 1000M Chassis
Meridian 1 PBX 11C Cabinet	CS 1000M Cabinet
Meridian 1 PBX 51C	CS 1000MHalf Group
Meridian 1 PBX 61C	CS 1000MSingle Group
Meridian 1 PBX 81	CS 1000MMulti Group
Meridian 1 PBX 81C	CS 1000MMulti Group

For more information, see one or more of the following NTPs:

- *Communication Server 1000M and Meridian 1 Small System Upgrade Procedures (NN430011-458)* ()

- *CS 1000M and Meridian 1 Large Systems Upgrades Overview (NN43021-458)* ()

- *Communication Server 1000S Upgrade Procedures (NN43031-458)* ()

- *Communication Server 1000E Upgrade Procedures (NN43041-458)* ()

Intended audience

This document is intended for individuals responsible for system administration.

Conventions

Terminology

In this document, the following systems are referred to generically as "system":

- Communication Server 1000S (CS 1000S)

- Communication Server 1000M (CS 1000M)

- Communication Server 1000E (CS 1000E)

- Meridian 1

The following systems are referred to generically as "Small System":

- Communication Server 1000M Chassis (CS 1000M Chassis)
- Communication Server 1000M Cabinet (CS 1000M Cabinet)
- Meridian 1 PBX 11C Chassis
- Meridian 1 PBX 11C Cabinet

The following systems are referred to generically as "Large System":
- Communication Server 1000M Half Group (CS 1000M HG)
- Communication Server 1000M Single Group (CS 1000M SG)
- Communication Server 1000M Multi Group (CS 1000M MG)
- Meridian 1 PBX 51C
- Meridian 1 PBX 61C
- Meridian 1 PBX 81
- Meridian 1 PBX 81C

Related information

This section lists information sources that relate to this document.

Spares planning

Contents

This section contains information on the following topics:

Introduction

Spares planning is used to determine desired inventory levels of spare (replaceable) items. Spares planning is used by repair houses and centralized depots in order to ensure that there is an adequate stock of replaceable items on hand.

Definitions and assumptions

Failure rate — Failure rate is the estimated number of failures for an item during one million (10^6) hours of operation. The only exception is to measurements for cabling or other items with low failure rates. Failure rates are also measured in Failures in Time (FIT) measurements. One FIT equals one billion (10^9) hours of operation.

Sparing interval — Sparing interval is the period of time that stocks of replaceable items should last without being replenished. This period is assumed to be one year following the installation of the system.

Stock confidence level — Stock confidence level is the allowed probability of not being out of stock when the sparing interval of one year is greater than 99.9 percent.

Card ambient temperature — Card ambient temperature is the average temperature of the air immediately surrounding the circuit card (usually higher than the ambient room temperature). Card failure rates in this document are based on a card ambient temperature of 40° C (104° F).

Turnaround time for repair — Equipment may be serviced at a repair house or at a centralized depot that serves sub-depots. The turnaround time for the return-to-stock of a failed item is about ten working days (240 hours) from a repair house. The turnaround time for the return-to-stock of a failed item is about two working days (48 hours) from a centralized depot.

Actual turnaround periods vary in the field. As the number of systems served increases, the percentage of replaceable items required in stock is reduced.

Population range — Population range is the quantity of each type of system in the area served by the depot.

Spare stock size — The quantity of spares for a given stock item depends on the sparing interval, stock confidence level, failure rate, turnaround time for repair, and population range.

Calculating spares requirements

Use Procedure 1 "Calculating spares requirements" (page 14) to calculate the number of spares required to stock a depot for a one-year sparing interval:

Procedure 1
Calculating spares requirements

Step	Action
1	Determine the number (N) of in-service specified circuit cards serviced by the depot.
2	Obtain the card failure rate (F) for the specified circuit card from the sections in this document. Card failure rates are expressed in terms of the number of failures per one million hours (10^6).
3	Determine turnaround time (T) in hours.
4	For repair house service, turnaround time is typically ten working days (240 hours). For centralized depot service, turnaround time is typically two working days (48 hours).
5	Calculate the NFT value by multiplying N x F x T.

6   Look up the number of spares required in Table 7 "Number of spares required" (page 35).

--End--

Example

A centralized depot services 10,000 NT8D02 Digital Line Cards. The failure rate for this card is 6.0 failures per 1 million hours. With a turnaround time of 48 hours:

$$NFT = 10,000 \; x \frac{6.0}{1,000,000} \; x \; 48 = 2.88$$

The number of spares required for an NFT value of 2.88 = 10.

Linux applications

Red Hat Linux 5 (update 1) supports Linux kernel version 2.6.18 and the following applications:

- Unified Communications Management (UCM)

- Nortel Simple Network Management Protocol (SNMP)

- Deployment Manager (DM)

- Signaling Server (SS)

- Network Routing Service (NRS)

- Call Server (CS)

- Session Initiation Protocol Line (SIPL)

- Element Manager (EM)

- Subscriber Manager (SubM)

For more information about the Linux applications, see *Linux Platform Base and Applications Installation and Commissioning* (NN43001-315).

Failure rates - system components

Contents

This section contains information on the following topics:

Overview

Failure rates are based on a circuit card ambient temperature of 40° C (104° F). This temperature is usually higher than the surrounding room temperature. Running the system at a lower temperature increases the life expectancy of components and improves overall system reliability.

Failure rates

Table 2 "Failure rates - system components" (page 17) gives the failure rates for system components. In this table, "N/A" indicates that the failure rate is not available at this time.

Table 2

Failure rates - circuit cards (cont'd.)

Order code	Description	Failure rate per 10^6 hrs
	–NT9D19CA	12.1
	–NT9D19HA	12.25

Note: NT4N43 includes CD ROM, Floppy disk, Hard disk and cable assembly.
MTBF for Hard disk: 700,000 hours
MTBF for Optical Drive CD ROM: 25000 Power On Hours (POH)
MTBF for Floppy Disk Drive: 30,000 POH

Failure rates - terminal equipment

Contents

This section contains information on the following topics:

"Overview" (page 29)

"Failure rates" (page 29)

Overview

Failure rates are based on a circuit cardambient temperature of 40° C (104° F). This temperature is usually higher than the surrounding room temperature. Running the system at a lower temperature increases the life expectancy of components and improves overall system reliability.

Failure rates

Table 5 "Failure rates - station equipment" (page 29) gives the failure rates for terminal equipment. In this table, "N/A" indicates that the failure rate is not available at this time.

Table 5
Failure rates - station equipment

Order code	Description	Failure rate per 10^6 hrs

Note: The battery pack is a consumable and lasts typically for 500 charge cycles before needing to be replaced.

Failure rates - cables

Contents

This section contains information on the following topics:

Overview

Failure rates are based on a circuit card ambient temperature of 40° C (104° F). This temperature is usually higher than the surrounding room temperature. Running the system at a lower temperature increases the life expectancy of components and improves overall system reliability.

Failure rates

There are many cables available from Nortel. The approximate failure rate for most cables, based on failures in time per billion hours (10^9), is 0.5. For a detailed listing of cables, see *Equipment Identification Reference (NN43001-254)* ().

Failure rates - miscellaneous components

Contents

This section contains information on the following topics:

Overview

Failure rates are based on a circuit card ambient temperature of 40° C (104° F). This temperature is usually higher than the surrounding room temperature. Running the system at a lower temperature increases the life expectancy of components and improves overall system reliability.

Failure rates

Table 6 "Failure rates - miscellaneous equipment" (page 33) gives the failure rates for miscellaneous equipment not included in other sections of this document. In this table, "N/A" indicates that the failure rate is not available at this time.

Table 6
Failure rates - miscellaneous equipment

Order code	Description	Failure rate per 10^6 hrs
NT5D52	Ethernet Adapter Card	< 7.5

Converting NFT values to spares requirements

Table 7 "Number of spares required" (page 35) translates NFT values, calculated in Procedure 1 "Calculating spares requirements" (page 14), to the number of spares required in stock.

Table 7
Number of spares required
