Main Office Configuration for Survivable Remote Gateway 50
Avaya Communication Server 1000

7.5
NN43001-307, 08.02
August 2011

Notice

While reasonable efforts have been made to ensure that the information in this document is complete and accurate at the time of printing, Avaya assumes no liability for any errors. Avaya reserves the right to make changes and corrections to the information in this document without the obligation to notify any person or organization of such changes.

Documentation disclaimer

“Documentation” means information published by Avaya in varying mediums which may include product information, operating instructions and performance specifications that Avaya generally makes available to users of its products. Documentation does not include marketing materials. Avaya shall not be responsible for any modifications, additions, or deletions to the original published version of documentation unless such modifications, additions, or deletions were performed by Avaya. End User agrees to indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, subsequent modifications, additions or deletions to this documentation, to the extent made by End User.

Link disclaimer

Avaya is not responsible for the contents or reliability of any linked Web sites referenced within this site or documentation provided by Avaya. Avaya is not responsible for the accuracy of any information, statement or content provided on these sites and does not necessarily endorse the products, services, or information described or offered within them. Avaya does not guarantee that these links will work all the time and has no control over the availability of the linked pages.

Warranty

Avaya provides a limited warranty on its Hardware and Software (“Product(s)”). Refer to your sales agreement to establish the terms of the limited warranty. In addition, Avaya’s standard warranty language, as well as information regarding support for this Product while under warranty is available to Avaya customers and other parties through the Avaya Support Web site: http://support.avaya.com. Please note that if you acquired the Product(s) from an authorized Avaya reseller outside of the United States and Canada, the warranty is provided to you by said Avaya reseller and not by Avaya.

Licenses

THE SOFTWARE LICENSE TERMS AVAILABLE ON THE AVAYA WEBSITE, HTTP://SUPPORT.AVAYA.COM/LICENSEINFO/ ARE APPLICABLE TO ANYONE WHO DOWNLOADS, USES AND/OR INSTALLS AVAYA SOFTWARE, PURCHASED FROM AVAYA INC., ANY AVAYA AFFILIATE, OR AN AUTHORIZED AVAYA RESELLER (AS APPLICABLE) UNDER A COMMERCIAL AGREEMENT WITH AVAYA OR AN AUTHORIZED AVAYA RESELLER. UNLESS OTHERWISE AGREED TO BY AVAYA IN WRITING, AVAYA DOES NOT EXTEND THIS LICENSE IF THE SOFTWARE WAS OBTAINED FROM ANYONE OTHER THAN AVAYA, AN AVAYA AFFILIATE OR AN AVAYA AUTHORIZED RESELLER; AVAYA RESERVES THE RIGHT TO TAKE LEGAL ACTION AGAINST YOU AND ANYONE ELSE USING OR SELLING THE SOFTWARE WITHOUT A LICENSE. BY INSTALLING, DOWNLOADING OR USING THE SOFTWARE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE INSTALLING, DOWNLOADING OR USING THE SOFTWARE (HEREINAFTER REFERRED TO INTERCHANGEABLY AS “YOU” AND “END USER”), AGREE TO THESE TERMS AND CONDITIONS AND CREATE A BINDING CONTRACT BETWEEN YOU AND AVAYA INC. OR THE APPLICABLE AVAYA AFFILIATE (“AVAYA”).

Copyright

Except where expressly stated otherwise, no use should be made of materials on this site, the Documentation, Software, or Hardware provided by Avaya. All content on this site, the documentation and the Product provided by Avaya including the selection, arrangement and design of the content is owned either by Avaya or its licensors and is protected by copyright and other intellectual property laws including the sui generis rights relating to the protection of databases. You may not modify, copy, reproduce, republish, upload, post, transmit or distribute in any way any content, in whole or in part, including any code and software unless expressly authorized by Avaya. Unauthorized reproduction, transmission, dissemination, storage, and or use without the express written consent of Avaya can be a criminal, as well as a civil offense under the applicable law.

Third-party components

Certain software programs or portions thereof included in the Product may contain software distributed under third party agreements (“Third Party Components”), which may contain terms that expand or limit rights to use certain portions of the Product (“Third Party Terms”). Information regarding distributed Linux OS source code (for those Products that have distributed the Linux OS source code), and identifying the copyright holders of the Third Party Components and the Third Party Terms that apply to them is available on the Avaya Support Web site: http://support.avaya.com/Copyright.

Preventing Toll Fraud

“Toll fraud” is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf). Be aware that there can be a risk of Toll Fraud associated with your system and that, if Toll Fraud occurs, it can result in substantial additional charges for your telecommunications services.

Avaya Toll Fraud Intervention

If you suspect that you are being victimized by Toll Fraud and you need technical assistance or support, call Technical Service Center Toll Fraud Intervention Hotline at +1-800-643-2353 for the United States and Canada. For additional support telephone numbers, see the Avaya Support Web site: http://support.avaya.com. Suspected security vulnerabilities with Avaya products should be reported to Avaya by sending mail to: securityalerts@avaya.com.

Trademarks

The trademarks, logos and service marks (“Marks”) displayed in this site, the Documentation and Product(s) provided by Avaya are the registered or unregistered Marks of Avaya, its affiliates, or other third parties. Users are not permitted to use such Marks without prior written consent from Avaya or such third party which may own the Mark. Nothing contained in this site, the Documentation and Product(s) should be construed as granting, by implication, estoppel, or otherwise, any license or right in and to the Marks without the express written permission of Avaya or the applicable third party.

Avaya is a registered trademark of Avaya Inc.

All non-Avaya trademarks are the property of their respective owners, and “Linux” is a registered trademark of Linus Torvalds.

Downloading Documentation

For the most current versions of Documentation, see the Avaya Support Web site: http://support.avaya.com.

Contact Avaya Support

Avaya provides a telephone number for you to use to report problems or to ask questions about your Product. The support telephone number is 1-800-242-2121 in the United States. For additional support telephone numbers, see the Avaya Web site: http://support.avaya.com.

Contents

Chapter 1: New in this release

The following sections detail what is new in *Main Office Configuration Guide for SRG 50, NN43001–307* for Avaya Communication Server 1000 Release 7.5 and Avaya Survivable Remote Gateway 50 Release 6.0.

Features

There are no updates to the feature descriptions in this document.

Other

There are no other changes.

Revision history

August 2011	Standard 08.02. This document is up-issued to support the removal of content for outdated features, hardware, and system types.
November 2010	Standard 08.01. This document is up-issued to support Avaya CS 1000 Release 7.5 and Avaya SRG 50 Release 6.0.
September 2010	Standard 07.01. This document is up-issued to support Avaya CS 1000 Release 7.0 and Avaya SRG 50 Release 6.0.
June 2010	Standard 06.01. This document is up-issued to support CS 1000 Release 7.0.
August 2009	Standard 05.01. This document is up-issued to support CS 1000 Release 6.0 for SRG 50 Release 5.0.
May 2009	Standard 04.01. This document is up-issued to support CS 1000 Release 6.0.
July 2008	Standard 03.02. This document is up-issued to reflect changes in technical content. Sections relating to Bandwidth Management have been moved to *Converging the Data Network with VoIP Fundamentals, NN43001-260*.

December 2007	Standard 03.01. This document is up-issued to support CS 1000 Release 5.5 for SRG 50 Release 3.0.
November 2007	Standard 02.02. This document is up-issued to support CS 1000 Release 5.0 for SRG 50 Release 3.0. This document includes SIP Trunks configuration at the main office.
August 2007	Standard 02.01. This document is up-issued to support CS 1000 Release 5.0 for SRG 50 Release 3.0.
June 2007	Standard 01.02. This document is up-issued to remove the document confidential statement.
May 2007	Standard 01.01. This document is up-issued to support Communication Server 1000 Release 5.0. This document contains information previously contained in the following legacy document, now retired: (553-3001-207). This document is up-issued to include updated information due to CR Q01587820.
October 2006	Standard 3.00. This document is up-issued to support SRG 50 Release 2.0 for CS 1000 Release 4.5.
January 2006	Standard 2.00. This document is up-issued for CR Q01202736, with information on reconfiguring Call Server alarm notification levels if necessary when configuring Adaptive Network Bandwidth Management.
August 2005	Standard 1.00. This document is a new document to support Communication Server 1000 Release 4.5.

Chapter 2: Customer service

Visit the Avaya Web site to access the complete range of services and support that Avaya provides. Go to www.avaya.com or go to one of the pages listed in the following sections.

Navigation

Getting technical documentation

To download and print selected technical publications and release notes directly from the Internet, go to www.avaya.com/support.

Getting product training

Ongoing product training is available. For more information or to register, go to www.avaya.com/support. From this Web site, locate the Training link on the left-hand navigation pane.

Getting help from a distributor or reseller

If you purchased a service contract for your Avaya product from a distributor or authorized reseller, contact the technical support staff for that distributor or reseller for assistance.

Getting technical support from the Avaya Web site

The easiest and most effective way to get technical support for Avaya products is from the Avaya Technical Support Web site at www.avaya.com/support.

Chapter 3: Introduction

This chapter provides information about this document.

Subject

This document describes the software for Avaya CS 1000 and Avaya SRG 50 Release 6.0. Information in this document complements information found in documents in the Communication Server 1000 documentation suite. For information about how to configure the SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Intended audiences

This document is intended for individuals responsible for configuring the main office for Survivable Remote Gateway for organizations using CS 1000 systems.

Terminology

In this document, the following systems are referred to generically as system:

- Communication Server 1000E (CS 1000E)
- Communication Server 1000M (CS 1000M)
- Meridian 1

Documentation

The following technical publications are referenced in this document:

- *Avaya Converging the Data Network with VoIP Fundamentals, NN43001-260*
- *Avaya Electronic Switched Network Reference—Signaling and Transmission, NN43001-280*
- *Avaya Dialing Plans Reference, NN43001-283*
- *Avaya Signaling Server IP Line Applications Fundamentals, NN43001-125*
- *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*
- *Avaya Branch Office Installation and Commissioning, NN43001-314*
- *Avaya Software Input Output Reference-Administration, NN43001-611*
- *Avaya Emergency Service Access Fundamentals, NN43001-613*
- *Avaya Element Manager System Reference - Administration, NN43001-632*
- *Avaya ISDN Primary Rate Interface Fundamentals, NN43001-569*
- *Avaya Basic Network Feature Fundamentals, NN43001-579*
- *Avaya Communication Server 1000M and Meridian 1 Large System Planning and Engineering, NN43021-220*
- *Avaya Communication Server 1000E Planning and Engineering, NN43041-220*
- *Avaya Software Input Output Reference - Maintenance, NN43001-711*
- *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*
- *Avaya Survivable Remote Gateway 50 Local Features, NN40140-501*
- *Avaya Business Communications Manager 6.0 Configuration — Devices, NN40170-500*

Online

To access Avaya documentation online, click **Documentation**, under **Support** on the Avaya home page: www.avaya.com

Chapter 4: Description

Contents

This section contains information about the following topics:

Survivable Remote Gateway

The Survivable Remote Gateway (SRG) extends the desktop feature and user interface of the Avaya Communication Server 1000 to remote IP branch office users and gives them full access to the same applications as the main site. Avaya CallPilot, Contact Center Management Server (CCMS), and other central applications are shared by remote users to deliver state-of-the-art features and functionality to small remote offices.

Avaya SRG 50 Release 6.0 provides the following:

- Supports interoperability with Avaya CS 1000 Releases 5.0, 5.5, 6.0, and 7.0.
- Supports direct upgrades from SRG 50 Releases 2.0, 3.0, and 5.0 to SRG 50 Release 6.0.
- Supports an indirect upgrade from SRG 50 Release 1.0 to SRG 50 Release 6.0. Note that the SRG 50 Release 1.0 system must first be upgraded to Release 3.0, after which the system can be upgraded to Release 6.0.

SRG 50 Release 6.0 is released as an integrated, but key-coded feature component on the Avaya Business Communications Manager 6.0 software and hardware platforms. SRG 50

Release 6.0 is supported on the main BCM 50 unit and the BCM 50b (BRI) unit. It is not supported on other BCM hardware platforms such as 50a or BCM 50e systems.

The software supported at the SRG 50 Release 6.0 branch office is shown in the following table.

Table 1: Supported software at the SRG 50 Release 6.0 branch office

IP branch office solution	Survivable IP users	CS 1000 Call Server support	Feature description
SRG 50 Release 6.0	up to 80	CS 1000 Release 5.0 CS 1000 Release 5.5 CS 1000 Release 6.0 CS 1000 Release 7.0 CS 1000 Release 7.5	VoIP and Application Gateway Local Mode provides basic telephony features. Extends Avaya IP Deskphone support and survivable IP users to 80. Provides H.323 or SIP trunking. CS 1000 Release 6.0 and above supports enhanced firmware downloads using Secure FTP (SFTP).

The SRG 50 is implemented on a BCM 50/50b platform and is connected to a CS 1000 at the main office through Virtual Trunks over a reliable IP WAN access facility. This configuration allows the call processing for the IP phones at the SRG 50 site to be centralized at the main office. The Call Server at the main office provides the call processing for the IP phones registered to both the main office and branch offices. The SRG 50 provides call processing functionality to IP phones in local mode and to local analog devices. The SRG 50 supports business continuity and call failover through digital and analog trunk access to the local Public Switched Telephone Network (PSTN).

In order for devices in the CS 1000 network to access analog devices at the SRG 50 or to access the PSTN at the SRG 50, virtual trunks are used over the LAN/WAN.

If the main office fails to function, or if there is a network/WAN outage, the SRG 50 automatically switches to Local mode and provides basic telephony service to the phones located at the branch office. This enables the IP phones to survive an outage between the branch office and the main office.

To ensure proper operation of the SRG 50 solution it must be configured to support a common dialing plan with the CS 1000 main office. Any other configuration is not guaranteed to work reliably. Since the Call Server and the SRG 50 handle dialing slightly differently, ensure that any settings you use for the main office that need to interact with the SRG 50, can be accommodated by the SRG 50 call processing.

Main office hardware description

The main office must be one of the following systems:

- CS 1000E
- CS 1000M Cabinet
- CS 1000M Chassis
- CS 1000M HG
- CS 1000M SG
- CS 1000M MG

Throughout this document, references to CS 1000 systems encompass all CS 1000 system types.

The diagrams throughout this documentation show a CS 1000E main office. All of the systems appearing in the list perform identical main office functions as far as the SRG 50 is concerned. For information about the SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Signaling Server

The Signaling Server is required at the main office only. It provides the following functions:

- Terminal Proxy Server (TPS)

  The TPS provides a connection from the IP phones to the Call Server and a connection from a Virtual Trunk to the Call Server.

- H.323 Gateway (Virtual Trunk)
- SIP Gateway (Virtual Trunk)
- CS 1000 Element Manager Web Server and Network Routing Service (NRS)
- NRS, consisting of:
  - SIP Proxy and SIP Registrar
  - H.323 Gatekeeper
  - Network Connection Service (NCS)
- Personal Directory

A second Signaling Server can be used to provide redundancy in the case of a failure in the primary Signaling Server at the main office.

A similar function to the TPS is used at the SRG 50 when the IP phones are in Local mode.

The Signaling Server supports en bloc signaling which is standard on the Signaling Server.

For more information about the Signaling Server, see *Avaya Signaling Server IP Line Applications Fundamentals, NN43001-125*. For more information about H.323 and SIP, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

Network Routing Service

The Network Routing Service (NRS) application provides network-based routing, combining the following into a single application:

- H.323 Gatekeeper—provides central dialing plan management and routing for H.323-based endpoints and gateways.
- SIP Redirect Server NRS—provides central dialing plan management and routing for SIP-based endpoints and gateways. SIP Trunks are used for Voice packet traffic alone.
- NRS Database—stores the central dialing plan in XML format for the H.323 Gatekeeper, and the SIP Redirect Server. The H.323 Gatekeeper and the SIP Redirect Server accesses this common endpoint and gateway database.
- Network Connect Server (NCS)—used only for Media Gateway Controller (MGC) based MG 1000B, SRG 50, Geographic Redundancy, and Network-wide Virtual Office solutions. The NCS allows the Line TPS (LTPS) to query the NRS.
- NRS Manager web interface—the NRS provides its own web interface to configure the H.323 Gatekeeper, SIP Redirect Server, and the NCS.

The NRS application provides routing services to H.323 devices and SIP-compliant devices. The H.323 Gatekeeper can be configured to support H.323 routing services, while the SIP Redirect Server NRS can be configured to support SIP routing services. The H.323 Gatekeeper and the SIP Redirect Server NRS can reside on the same Signaling Server.

Each system in an IP Peer network must register to the NRS. The NRS software identifies the IP addresses of systems based on the network-wide numbering plan. NRS registration eliminates the need for manual configuration of IP addresses and numbering plan information at every site.

When configuring the NRS it is necessary to enable the NCS. Ensure that the check box “Network Connection Server enabled” is checked in the NRS configuration window of CS 1000 Element Manager.

For information about configuring the NRS, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

Supported IP phones

The following table shows the supported IP phones for each software release of SRG 50.

Table 2: IP phone support for SRG 50

IP phone	Release 5.0	Release 6.0
IP Phone 2001	Supported	Supported
IP Phone 2002	Supported	Supported
IP Phone 2004	Supported	Supported
2007 IP Deskphone	Supported	Supported
2033 IP Conference Phone	Supported	Supported
1210 IP Deskphone	Supported	Supported
1220 IP Deskphone	Supported	Supported
1230 IP Deskphone	Supported	Supported
2050 IP Softphone	Supported	Supported
1110 IP Deskphone	Supported	Supported
1120E IP Deskphone	Supported	Supported
1140E IP Deskphone	Supported	Supported
1150E IP Deskphone	Not supported	Not supported
Analog (500/2500-type) telephones	Supported	Supported
WLAN Handset 2210	Supported	Supported
WLAN Handset 2211	Supported	Supported
WLAN Handset 2212	Supported	Supported
6120 WLAN Handset	Supported	Supported
6140 WLAN Handset	Supported	Supported

Throughout this document, IP Phones and IP Deskphones are referred to collectively as IP phones.

Main office requirements

The branch office running SRG 50 Release 6.0 requires the following at the main office:

- Avaya CS 1000 hardware, running CS 1000 Release 5.0, 5.5, 6.0, or 7.0.
- Configure at least one of the following packages for IP Peer Networking:
  - H.323 Virtual Trunk (H323_VTRK) package 399
  - SIP Gateway and Converged Desktop Package (SIP) package 406
- The main office must have a software Service Level of 2 or higher to work with the branch office.
- Ensure that you have ordered enough IP user and Virtual Trunk licenses at the main office to support the required SRG 50 capacity at the branch office.

  The two different IP user licenses at the main office are:
  - Basic IP License for the IP Phone 2001, 2033 IP Conference Phone, 1110 IP Deskphone, and 1210 IP Deskphone
  - IP User License for the IP Phone 2002, IP Phone 2004, 2007 IP Deskphone, 1220 IP Deskphone, 1230 IP Deskphone, 1120E IP Deskphone, 1140E IP Deskphone, 2050 IP Softphone, 2210 WLAN Handset, 2211 WLAN Handset, 2212 WLAN Handset, 6120 WLAN Handset, and 6140 WLAN Handset

The main office requires the following software packages to support the specified Basic Network features. See *Avaya Basic Network Feature Fundamentals, NN43001-579* for more information about these features.

- Network Call Back Queuing (MCBQ) package 38. This package is required for SRG 50 IP phones to invoke any queuing feature or ringback when free.
- Network Speed Call (NSC) package 39. This package is required for SRG 50 IP phones to invoke the Network Speed Call feature.

The main office requires the following software packages to support the specified ISDN Primary Rate Interface features. See *Avaya ISDN Primary Rate Interface Fundamentals, NN43001-569* for more information about these features.

- Network Attendant Service (NAS) package 159. This package is required for analog (500/2500-type) telephones in the branch office to access attendant services when the attendant is configured on the main office.
- Network Message Services (NMS) package 175. This package is required for analog (500/2500-type) telephones in the branch office to share the voice mail system in the main office. For any configurations using centralized CallPilot on the main office with one or more branch offices in separate time zones, the NMS package is required at the main office for the branch IP phones.

Optional features to enhance SRG 50 functionality

- Network Alternate Route Selection (NARS) package 58. See *Avaya Basic Network Feature Fundamentals, NN43001-579*.
- Emergency Services Access (ESA) package 329. This package is optional; it is required only to receive 911/ESA features in North American and some Caribbean and Latin American (CALA) markets. See *Avaya Emergency Service Access Fundamentals, NN43001-613*.
- Virtual Office (VIRTUAL_OFFICE) package 382. This package is optional; it is required only for Virtual Office functionality.
- Network Signaling (NSIG) package 37. This package is optional for SRG 50 IP phones to access set-based Network Class of Service (NCOS) features.
- Adaptive Network Bandwidth Management package 407.
- Alternative Call Routing for Network Bandwidth Management.
- Geographic Redundancy support. (For example, enhanced survivability using the Alternate NRS for SIP trunking.)
- Calling Number/Calling Name information on incoming calls an digital and analog PSTN trunks.
- Music on Hold (MOH) for calls received over a PSTN trunk.
- Modem support.

For software and hardware requirements for SRG 50 , see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Normal Mode and Local Mode overview

Normal Mode and Local Mode overview provides a description of the following sections:

Normal Mode

IP phones that are physically located at the SRG 50 but are registered with the main office and are operating in Normal Mode. In Normal Mode, the main office provides centralized call processing to all applications transparently to all IP phones at the branch office. All IP phones at the branch office, in Normal Mode, are registered to the main office TPS and are controlled by the Call Server at the main office.

Users of the SRG 50 IP phones receive the features, applications, key layout, and tones of the main office Call Server. This provides feature and application transparency between the branch office and the main office.

During Normal Mode, the IP phones are controlled by the main office Call Server as shown in Figure 1: Normal Mode operation on page 20. The main office uses the zone data associated with the IP phone to define the numbering plan for geographically local calls and for emergency services calls. For example, a local IP phone call to the PSTN (local to the SRG 50) is actually handled at the main office and the call is routed back to the local SRG 50 using VoIP trunks. The case is similar while handling calls for emergency services. Therefore, the SRG 50 acts as VoIP–PSTN gateway during Normal Mode.

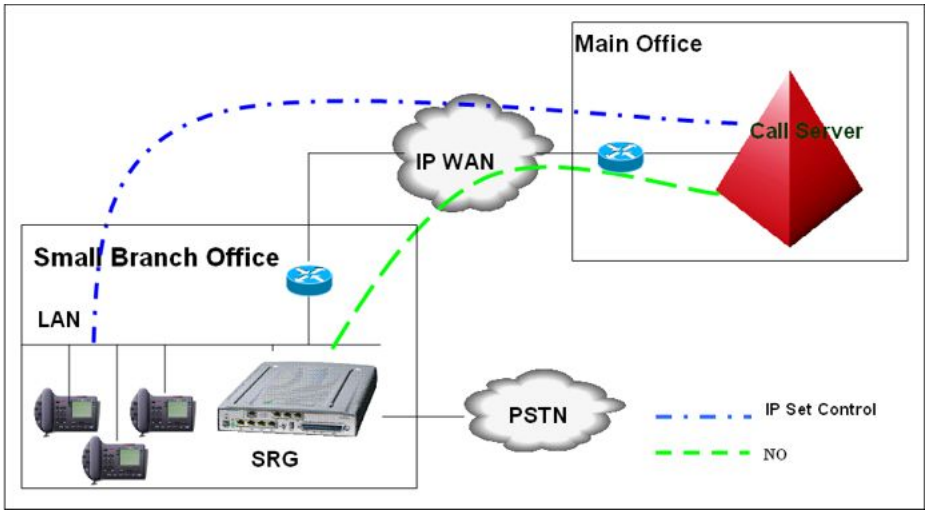

Figure 1: Normal Mode operation

For more information, see Normal Mode on page 45.

Local Mode

Users at the branch office can be in Local Mode for different reasons:

1. IP phone has just booted up.
2. IP phone cannot communicate to the main office because of a WAN failure or a failure of the main office components.
3. IP phone can be in Test Local Mode.

Important:

When a telephone or trunk in the main office calls an SRG 50 IP phone that has switched to Local Mode due to WAN failure, the call is treated according to the main office call redirection configuration (such as forwarding to voice mail or continuous ringback).

During Local Mode, the IP phones are controlled by the SRG 50 as shown in Figure 2: Local Mode operation on page 21. The IP phones are in Local Mode when the WAN connectivity is lost or when the IP phones fail to register correctly with the main office Call Server. The SRG 50 offers a limited set of basic features to the IP phones, which include access to the local PSTN, dialling emergency service numbers, and calling local extensions. For a detailed description of Local Mode features, see *Avaya Survivable Remote Gateway 50 Local Features, NN40140-501.*

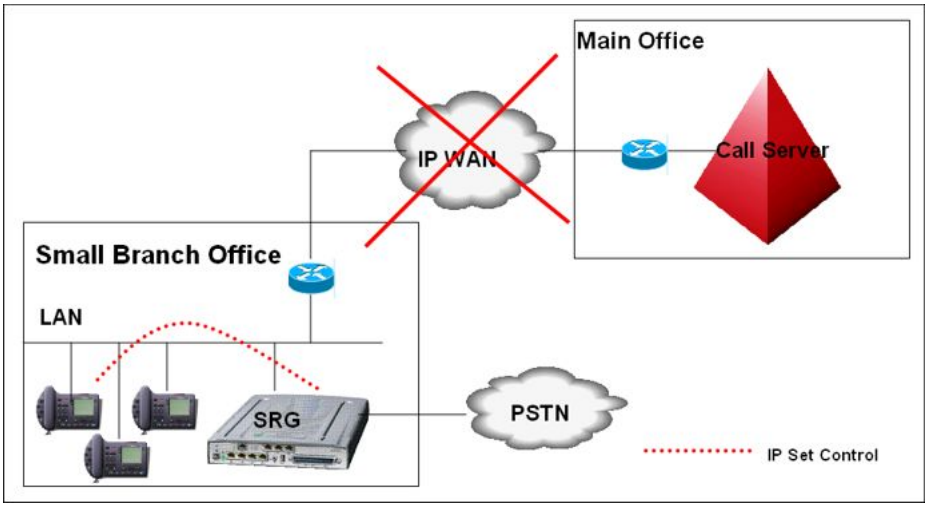

Figure 2: Local Mode operation

In the event that the IP phones at the branch office lose the connection to the main office CS 1000 call server for any reason (WAN failure, main office call server failure, main office Signaling Server failure), the SRG 50 reverts to Local Mode automatically. Essentially, when VoIP connectivity is lost, each IP phone loses its Reliable UDP (RUDP) connection with the main office Terminal Proxy Server (TPS). The IP phones at the branch office reboot and reregister to the SRG 50, placing them in Local Mode.

After this occurs, the IP phones displays an indication on the display area that the set is in Local Mode of operation. This display is configurable by installers to meet local language and usage norms.

In Local Mode, the IP users connected at the branch office are under the control of the SRG 50 call services. As such, the normal main office call server features are not available. The SRG 50 offers a basic feature set when in Local Mode which allows IP phones to continue to make and

receive calls internally within the branch office and over the provisioned local PSTN interfaces. Basic services, such as transfer, last number redial, and single key access through the PSTN to a centralized voice messaging system are supported. Local PSTN access and local Emergency Services access is also supported. No local applications or Business Communications Manager (BCM) features are supported in Local Mode operation.

Analog devices continue to be under the control of the SRG 50 system. It is the intent of Local Mode to provide continued access to the PSTN for critical calls and emergency services.

In Local Mode, since the SRG 50 handles all call processing, calls between two IP phones at the SRG 50 are handled locally as a simple station-to-station call. When an IP phone initiates a local PSTN call, the SRG 50 routes the call to a trunk that is connected to the local PSTN. Incoming DID calls are also handled by the SRG 50 and terminated on the appropriate IP phone.

In the event of a WAN failure, in Local Mode, the IP phones do not have access to the main office network over the VoIP trunks. If the appropriate alternate routes are configured, calls will be routed to the main office or other branch offices using the available PSTN trunks. Similar alternate routes can be configured for incoming PSTN calls which must be tandemed across the SRG 50. As another option, the incoming calls can be directed to a Prime DN (which typically is an IP phone maintained in Local Mode).

While in survival mode, the SRG 50 system continues to monitor for a main office CS 1000 heartbeat signal, and once detected, automatically redirects phones on an individual basis back to Normal Mode of operation. If a call is active, the SRG 50 waits until the call is completed before redirecting the phones; calls in progress are not interrupted. This switch-over occurs almost immediately once the SRG 50 determines that an individual phone can be redirected. This reinstates the CS 1000 normal user interface and feature set for the IP phone user, on a user by user basis. In addition to waiting for call completion, if firmware is being downloaded to an IP phone when the WAN comes up, the SRG 50 waits until the firmware download is complete and then redirects the IP phone.

The SRG 50 system implements the same interface used by the MG 1000B system to interact with the main office CS 1000 system. This allows the main office to identify attached clients and the local PSTN as branch office entities, enabling proper operation of dial plans and E911 access.

In Local Mode, devices that are physically located at the branch office, that are controlled by the local system and receive a basic telephony feature set, provide business continuity for the branch office during the WAN or system failure.

For more information, also see Local Mode on page 49.

For information about the features supported in Local Mode, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Survivability

SRG 50 is specifically designed to provide automatic survivability against WAN failure, main office Call Server failure, main office Signaling Server failure, and Gatekeeper failure.

SRG 50 supports the Geographic Redundancy feature. For further information about Geographic Redundancy, see *Avaya System Redundancy Fundamentals, NN43001-507*.

In the event of a WAN failure, the SRG 50 IP phones lose communication with the main office. This causes the SRG 50 IP phones to reset and register with the SRG 50. The IP phones then operate in Local Mode, providing basic telephony services delivered by the local SRG 50 system. For further information about services and features supported on the SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*. For a detailed description of Local Mode features, see *Avaya Survivable Remote Gateway 50 Local Features, NN40140-501*.

If the main office Call Server fails and call processing services are provided by an Alternate Call Server, the SRG 50 IP phones reset and reregister with the Alternate Call Server and receive call processing services from it. If no Alternate Call Server is available, the SRG 50 IP phones go to Local Mode while the SRG 50 attempts to find an Alternate Call Server by way of the NCS.

If the main office Signaling Server fails and an Alternate Signaling Server is available, the SRG 50 IP phones reset and reregister with the SRG 50. The SRG 50 will then query the NCS for the Alternate Signaling Server IP address. The SRG 50 will redirect the IP phone to the Alternate Signaling Server and continue to receive call processing services from the main office Call Server. If no Alternate Signaling Server is available, the SRG 50 IP phones reset and register with the SRG 50 in Local Mode.

When an IP phone at the SRG 50 first boots up, the IP phone attempts to communicate with the SRG 50. After communication with the SRG 50 is established, the SRG 50 redirects the IP phone to the main office. When the SRG 50 IP phone attempts to register with the main office, the SRG 50 first queries the Primary NCS for the main office Virtual Trunk node IP address to redirect the IP phone. If the Primary NCS is down or unreachable, the SRG 50 queries the Alternate NRS (H.323 Gatekeeper/SIP Redirect Server), if one is specified. If it receives a positive response, the SRG 50 IP phone is redirected to the specified main office. Otherwise, if neither a Primary or an Alternate NRS (H.323 Gatekeeper/SIP Redirect Server) is available, the SRG 50 IP phone remains in Local Mode, and receives call processing services from the SRG 50 until communication can be reestablished.

SRG 50 IP phones in Normal Mode remain registered with the main office if the Primary NCS fails and no Alternate NCS is available. They can call any main office telephone or IP phones in Normal Mode in other branch offices. However, they cannot call any SRG 50 analog (500/2500-type) telephones or any external numbers through the SRG 50 trunks because an H.323 Gatekeeper/SIP proxy server, which could route call properly in case of an NRS failure, is not available.

Recovery to Normal Mode

After communication is reestablished with the main office call server, all IP phones at the branch office that are in Local Mode automatically redirect and reregister to the main office and return to Normal Mode operation. IP phones that were busy at the time communication was reestablished complete the call in Local Mode, and then reregister with the main office after the call is complete.

Local Mode operation

When an SRG 50 IP phone is in Local Mode, the user has full access to the services configured at the SRG 50 (analog devices or analog or digital trunks) and to other IP phones registered to the SRG 50. In Local Mode, the IP phones can make local calls to other IP phones and other analog (500/2500-type) telephones at the branch office. They can also be used to make outgoing PSTN calls and receive incoming calls as usual. SRG 50 IP phones can access the main office IP phones or other branches by routing through the local PSTN.

Testing the phone in Local Mode

From Normal Mode, the branch user has the option of going to Local Mode manually using the Test Local Mode feature, or when the telephone is power-cycled. The test can be performed by the user at any time and does not require a password. This test is invoked from any IP phone at the branch office.

Avaya recommends testing Local Mode operation after changing the provisioning for a telephone on the SRG 50.

To ensure that users do not forget to resume Normal Mode operation, the SRG 50 redirects the telephone to the main office to return the telephone to Normal mode. This occurs if the telephone remains registered to the SRG 50 in Test Local Mode for ten minutes (default setting). Alternatively, the user can press the Quit key on the phone to return to Normal Mode.

For further information about Local Mode functionality for SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Virtual Trunks

In order for endpoints in the CS 1000 network to access endpoints in local mode at the SRG or to access the PSTN at the SRG, Virtual Trunks are used over the LAN/WAN.

Virtual Trunks are software components that provide the trunking features of the Meridian Customer-Defined Network (MCDN) feature set. Access to PSTN digital or analog trunks at the branch office occurs through the MCDN Virtual Trunk.

Virtual Trunks are sometimes referred to as SIP or H.323 Virtual Trunks. In the *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500* Virtual Trunks are referred to as IP Trunks.

For more information about Virtual Trunks, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

IP phone calls

When an IP phone calls another IP phone, each telephone receives the address of the other to exchange media directly between the telephones. When in Normal Mode, an SRG 50 IP phone calling a main office IP phone does not require any trunking to set up the call. However, LAN/WAN bandwidth is used to provide a media path for the call. For more information on Direct IP media path functionality, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

Bandwidth Management

For information about Bandwidth Management, see *Avaya Converging the Data Network with VoIP Fundamentals, NN43001-260*.

Capacity

Each CS 1000 main office can support up to 255 branch office SRGs. SRG 50 Release 2.0 and later supports up to 80 survivable IP users. However, since all IP phones register with the main office, the governing factor is the maximum number of IP phones that can be supported at the main office. This means the total number of IP phones in all offices can be no greater

than the capacity of the main office. See one of the following documents to determine the total number of phones your system can support:

- *Avaya Communication Server 1000E Planning and Engineering, NN43041-220*
- *Avaya Communication Server 1000M and Meridian 1 Large System Planning and Engineering, NN43021-220*

Virtual Trunks capacity

The SRG 50 capacity to support a number of simultaneous calls depends on the specific codec type used and the available bandwidth.

If both the intrazone and interzone codes are configured as Best Quality (G.711), the SRG 50 supports up to 24 Virtual Trunks (H.323 or SIP), otherwise, only 15 G.729 Virtual Trunks (H.323 or SIP) are supported.

In Normal Mode, the codec selection used is controlled by specific programming of the CS 1000.

In Local Mode, if the WAN has failed, Virtual Trunks between the SRG 50 and CS 1000 cannot be established. However, the SRG 50 will continue to convert calls from IP terminals for communication through the PSTN. Avaya recommends you use G.711 codec.

Branch office dialing plan

Since IP phone users can be located at a branch office equipped with an SRG 50, the routing of calls to the local gateway is important (especially when toll charges apply to calls made from the central Call Server that controls the telephone). The administrator can configure digit manipulation through zone attributes for IP phones to select a main office or branch office that provides PSTN access local to the destination of the call.

Calls from the PSTN to users within the network can be routed with the various ESN numbering plan configurations.

To access local PSTN resources, outgoing calls can be routed using ESN as well as zone parameters that enable digit insertion. The zone parameters force calls made by an SRG 50 user to be routed to the desired local PSTN facilities.

Important:

Outgoing calls can include local and, optionally, long distance calls.

Avaya recommends that the Branch User ID (BUID) be the same at the branch office as the DN at the main office. A BUID has a maximum of 15 digits. Under the recommended Coordinated Dialing Plan (CDP), the BUID can be an extension (for example, 4567). Under the Uniform Dialing Plan (UDP), the BUID is the user main office DN, the Location Code (LOC),

plus the Access Code (for example, 6 343-5555). The main office DN must be an ESN compliant DN. See ESN Access Codes on page 27.

The SRG 50 only supports only one dialing plan option at a time. CDP and UDP dialing plan options cannot be configured at the same time in the same system.

For more information about dialing plans and configuration, see Dialing Plan configuration on page 53.

ESN Access Codes

ESN data is configured with two Access Codes, called AC1 and AC2. AC1 normally applies to long distance calls, whether placed on or off the customer's private network (for example, dialing 6). AC2 normally applies to local calls (for example, 9). For more information, see *Avaya Electronic Switched Network Reference—Signaling and Transmission, NN43001-280*.

Music on Hold

For SRG 50 users in Normal Mode, the main office provides music to the user if Music on Hold is provisioned. The use of the G.729A/AB codec between the main office and the branch office can impact the music quality.

Important:
G.723 codec is not supported on SRG 50.

Branch office and SRG 50 terminology

Table 3: Branch office and SRG 50 terminology on page 27 lists configuration-related terms and contexts where branch office and SRG 50 terminology differ.

Table 3: Branch office and SRG 50 terminology

Term or context	Branch office	SRG 50
dialing plan	on-net/off-net dialing	Private/Public network dialing
routing	distant steering codes (DSC), Trunk steering codes (TSC), Local steering codes (LSC)	call routing, destination codes, line pool access codes
	Digit manipulation table	dial-out digits (routing)

Term or context	Branch office	SRG 50
alternate routing selection	Facility Restriction Level (FRL)	scheduled call routing
Type of number	CDP/UDP/TNDN	CDP/UDP/no equivalent
Numbering Plan ID	ISDN/Telephony (E.164), Private, Telephony (E.163), Telex, (F.69), Data (X.121), National Standard	Private
User ID	BUID	BUID
	bandwidth management zone	Zone ID
Trunks	public exchange	PSTN
	virtual trunk	IP trunk
access codes (SRG 50: destination codes)	7 = system trunk access 8 = Basic Alternate Route Selection (BARS)/Network Alternate Route Selection (NARS) 9 = public exchange access	7 = not assigned 8 = not assigned 9 = line pool A access code
	Network Class of Service (NCOS)	
telephone numbers (internal, not PSTN)	DN	DN

Limitations

For the SRG 50 Release 6.0 limitations, see *Avaya Survivable Remote Gateway Release 6.0 Release Notes*.

Chapter 5: Setting up the main office

Contents

This section contains the following topics:

Introduction

This section describes the following information required to configure the main office:

- SRG 50 information required by the main office
- Main office information required by the SRG 50
- Zone parameters
- IP phone passwords and parameters
- Branch office IP phone configuration

For more information on main office configuration, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

SRG 50 information required by the main office

The main office administrator must gather information about the SRG 50 system. The following information is required:

- an inventory of IP phones that will be installed on the SRG 50 so the administrator knows what type of telephone to assign to each main office terminal record
- information which allows the administrator to create an NCS (H.323 Gatekeeper or SIP Redirect Server) entry for the SRG 50
- if using advanced routing, such as tandem dialing between systems, local PSTN number for the SRG 50 and the internal SRG 50 routing codes that will allow the main office to connect to the SRG 50 and to tandem over the SRG 50 PSTN lines, is required

Use Table 4: SRG 50 information required for the main office configuration on page 30 to record the information before setting up the SRG 50 on the main office server.

Table 4: SRG 50 information required for the main office configuration

SRG 50 parameters	Information about this system
SRG 50 public IP address	
H.323 ID (required for requests to NCS) Each H.323 ID in the node should match SIP endpoint name for this system in pure SIP environment.	
List of types and number of IP phones Telephone types are hard-coded to the Terminal Numbers (TN) and the main office. Therefore, install the same type of IP phones to the coordinating record on the SRG 50.	
PSTN number to dial into the SRG 50 (in local mode)	
Destination codes (steering codes) to route the main office calls to the SRG 50 and out through the SRG 50 PSTN lines	
IP Ports that affect SRG 50 traffic with the main office and have been assigned firewall filters For further information on port configuration, see *Avaya Converging the Data Network with VoIP Fundamentals, NN43001-260* or *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.	

Main office information required by the SRG 50

The main office administrator must supply numerous main office settings to the SRG 50 installer so that the SRG 50 can be efficiently configured. In addition, the main office administrator needs to supply the following information:

- a list of the terminal record numbers (TN)
- a list of BUID (Prime DN)
- if using advanced routing, such as tandem dialing between systems, main office routing (steering) codes, are required

Use Table 5: Main office interoperation information on page 31 to record main office information required by the SRG 50.

Table 5: Main office interoperation information

Main office components	Information about this system
Main office IP network information:	
Main office call server type	S1000 (default)
Primary Network Connect Server IP address	
Alternate Network Connect Server IP address	
Network Connect Server port (The range is 0-65535.)	16500 (default)
Trunk/telephony preferred codecs and jitter buffers listed in order of preference	
NRS (H.323 Gatekeeper/SIP Redirect Server) requirements	
Indicate if the SRG 50 needs to manually assign ports with firewall filters.	
Heartbeat Protocol Port (The range is 1-65535.) Used to determine whether the TPS identified by the Network Connect Server is online. Also used to poll the primary NCS and alternate NCS.	16501 (default)
VoIP trunk access code Specifies the access coded used by the SRG 50 when it invokes the CFAC feature on redirect	

Main office components	Information about this system
Test Local Mode timer (The range is 2-10 minutes.)	10 minutes (default)
H.323 ID Used as part of the ARQ exchange with the Network Connect Server.	
Telephony programming:	
DN length, DN (TN) range	
Numbering Plan ID This parameter is written to the DRAM of the IP phone on redirect.	Private (default)
Type of number SRG 50 only supports CDP and UDP dialing plans. Avaya recommends that the SRG 50 use CDP. The SRG 50 supports only one dialing plan option at a time. CDP and UDP dialing plan options cannot be configured at the same time in the same system. This parameter is written to the DRAM of the IP phone on redirect.	
Node ID When the SRG 50 is down, the phones use S2 settings to register with the main office. This parameter is written to the EEPROM of the IP phone along with the Branch User ID (BUID) on redirect	
Virtual Private Network ID (VPNI)	
Zone ID and dialing string information requirements	
Main office dial-up number (for PSTN calls to the main office in Local Mode)	
Main office access code length Access code to reach the main office PSTN through VoIP trunks	
Zone dialing: • ZDP appended to SRG 50 IP phone PSTN dialing strings to redirect the call to SRG 50 PSTN • Any steering codes (destination codes) that must be mirrored by SRG 50 programming	

Main office components	Information about this system
IP phone configuration:	
MOTN/BUID list, including which type of IP phone is assigned to each number. Make note of the leading number, as SRG 50 uses this as the DN range for CDP dialing. If the DCP access code is more than one digit, the second digit number must also be used to further define the DN range.	
Main Office Terminal Number (MOTN) This parameter is provisionable and mandatory for an IP phone to be redirected. It represents the TN to be associated with the IP phone in the main office on redirect. SRG 50 writes this data to the DRAM of the set on redirect.	
Branch User ID (BUID) This parameter is provisionable and mandatory for an IP phone to be redirected. It represents the dialable DN to be associated with the IP phone in the main office on redirect. SRG 50 writes this data to the DRAM of the set on redirect.	
Main Office TPS (MOTPS) IP address This parameter is informational and is updated by SRG 50 on redirect. This is the TPS address returned by the Network Connect Server on successful ARQ.	
Firmware Version Current IP phone firmware version This parameter is informational and is updated by the main office (in the DRAM of the terminal) when a terminal is sent back to SRG 50 for firmware upgrade purposes. This specifies the desired firmware version of the main office.	
Is a VLAN configured on the network?	

Zone parameters

Zone parameters must be configured at both the main office Call Server and the SRG 50. The main office procedure is similar to an IP Peer Network configuration with the branch office-specific configuration outlined in this chapter.

Zone parameters are defined at the main office in LD 117 and are applied to IP phones in LD 11.

Use the following table to configure ESN and SRG 50 zones.

Configuring ESN and SRG 50 zones

Important:
Before and after an upgrade, perform a data dump (using LD 43 EDD or through Element Manager) on the Call Serve or on the MGC to back up existing data.

1. Configure the Home Location Code (HLOC) and the Virtual Private Network Identifier (VPNI).

   Table 6: Configure Customer Data Home Location Code and Virtual Private Network Identifier

Prompt	Response	Description
REQ:	CHG	Changing existing data
TYPE:	NET	ISDN and ESN Networking options
CUST		Customer number
	0-99	Range for Large Systems
…	…	…
CLID	YES	Allow Calling Line Identification option
-ENTRY	xx	CLID entry to be configured
--HLOC	100-9999999	Home Location code (ESN) (3-7 digits)
ISDN	YES	Integrated Services Digital Network
-VPNI	(0)-16383	Virtual Private Network Identifier for Bandwidth Management feature X = Disables feature 1-16383 = Enables feature <cr> = No Change

2. Configure the zone properties for IP Telephony bandwidth management. Use LD 117 or Element Manager. See *Avaya IP Peer Networking Installation and Commissioning (NN43001-313)*.

   The branch office zone number and zone bandwidth management parameters at the main office must match the corresponding branch office zone number and zone bandwidth management parameters at the branch office.

Important:

Zone 0, the default zone, must not be configured as a branch office zone. Network Bandwidth Management does not support zone 0. If zone 0 is configured as an branch office zone, the Bandwidth Management feature is not activated. Even though Avaya Communication Server 1000 supports up to 1000 branch office zones, the SRG 50 is limited to 255 zones and the zone must be in the range 1 to 255.

3. Define the zone parameters for the branch office. Use LD 117 or Element Manager. See *Avaya IP Peer Networking Installation and Commissioning (NN43001-313)*.

Table 7: LD 117 Define zone parameters for the branch office

Command	Description
`CHG ZBRN <Zone> <yes|no>`	
	Define a zone as a branch office zone.
`CHG ZDST <Zone> <yes|no> <StartMonth> <StartWeek> <StartDay> <StartHour> <EndMonth> <EndWeek> <EndDay> <EndHour>`	
	If the branch office observes Daylight Savings Time (DST), these parameters specify the start and end of DST. During DST, the clock automatically advances one hour forward.
`CHG ZTDF <Zone> <TimeDifferencefromMainOffice>`	
	Specified in minutes, the time difference between main office and branch office when both are not in DST.
`CHG ZDES <Zone> <ZoneDescription`	
	A name to render data display more meaningful.

4. Enable the features for the branch office zone in LD 11.

Table 8: LD 117 Enable features for an SRG 50 zone

Command	Description
ENL ZBR <zone> ALL	Enables features for branch office <zone>.

Configuring zone parameters using Avaya CS 1000 Element Manager

Use Element Manager to configure the branch office specific zone properties and time difference.

1. Select **IP Network > Zones** in Element Manager navigator.

The Zones window opens. See Figure 3: Zone List web page on page 36. The zone list is the main window used for zone configuration.

Figure 3: Zone List web page

2. Select the zone to be configured and configure the following properties.
    - Basic Property and Bandwidth Management (see Figure 4: Zone Basic Property and Bandwidth Management web page on page 37)
    - Time Difference and Daylight Saving Time Property (see Figure 5: Zone Time Difference and Daylight Saving Time web page on page 37)

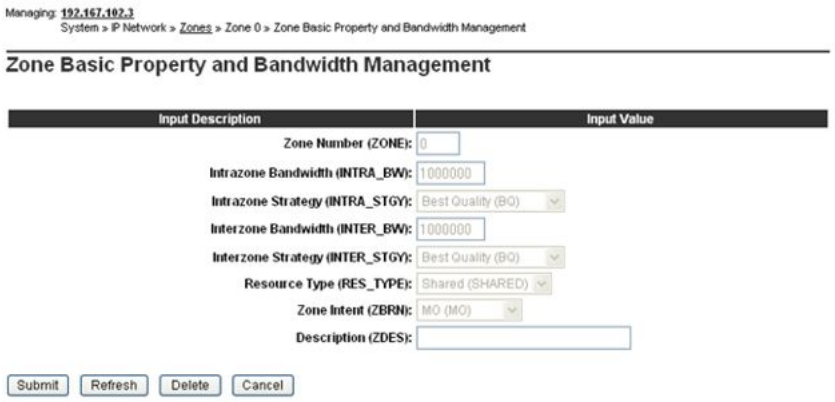

Figure 4: Zone Basic Property and Bandwidth Management web page

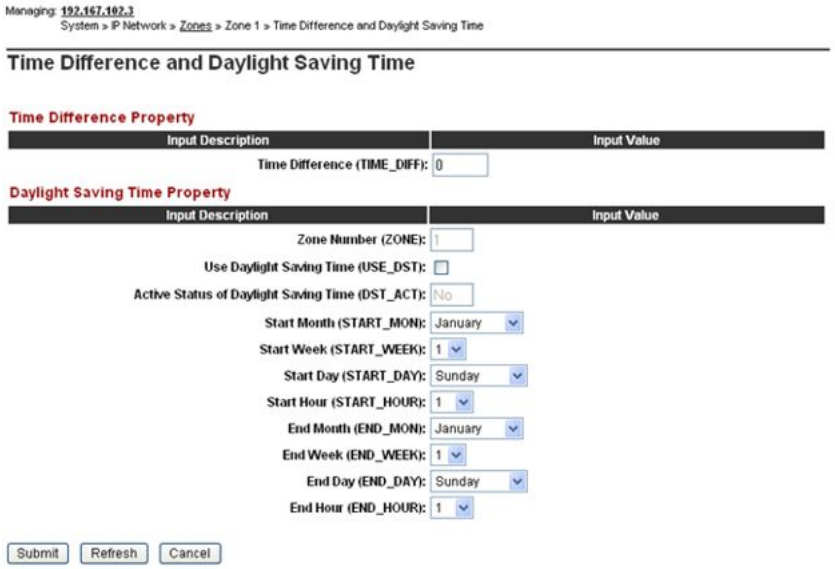

Figure 5: Zone Time Difference and Daylight Saving Time web page

Zone parameters must be configured on the main office and the branch office.

Branch office IP phone configuration at the main office

After the branch office zones and passwords are provisioned, provision the branch office IP phones at the main office. These can be provisioned using LD 11. See Configuring branch office IP phones at the main office using LD 11 on page 38.

Important:
There is no automatic data synchronization between the main office Call Server and SRG 50. The technician must provision the telephone on both the Call Server and the SRG 50.

Branch office IP phone configuration using LD 11

Use Configuring branch office IP phones at the main office using LD 11 on page 38 at the main office to configure branch office IP phones.

Configuring branch office IP phones at the main office using LD 11

1. Configure the branch office zones and dialing plan. See Configuring ESN and SRG 50 zones on page 34.
2. Configure the following telephone data in LD 11:
   - Terminal type
   - Customer Number
   - TN
   - Zone
   - Prime DN to correspond to BUID

Table 9: LD 11 Provision Branch User and SCPW at the main office

Prompt	Response	Description
REQ:	NEW CHG	Add new data, or change existing data.
TYPE:	a…a	Terminal type. Type **?** for a list of possible responses.
CUST	xx	Customer number as defined in LD 15.
ZONE	0-255	Zone number to which the IP phone belongs. The zone prompt applies only when the TYPE is 2001P2, 2002P2, 2004P2, 2050PC, 2007, 1110, 1120, 1140, 2210, 2211, 2212, 1210, 1220, 1230 Zone number is not checked against LD 117.
…	…	…
SCPW	xxxx	Station Control Password Must equal Station Control Password Length (SCPL) as defined in LD 15. Not prompted if SCPL = 0. Precede with X to delete.

SIP IP Trunks configuration at the main office

In order for the SRG 50 to act as a SIP endpoint and to use the SIP Trunks for call signaling with the CS 1000, you must configure SIP Trunks between the SRG 50 branch office and the main office.

Configuring SIP IP Trunks

1. From the Element Manager navigator, click IP Network > Nodes: Servers, Media Cards.

   The Node Configuration window appears.
2. Click the Edit button associated with the node to be updated.
3. Click the plus (+) sign beside Signaling Server Properties.
4. From the Enable IP Peer Gateway (Virtual Trunks TPS) list, select SIP only.
5. Enter the CS 1000 domain name in the SIP Domain Name field.
6. Enter the SIP Port number in the Local SIP TCP UDP Port to Listen to field.
7. Enter the Signaling Server name in the SIP Gateway Endpoint Name field. See Figure 6: SIP Trunk configuration in Element Manager on page 39.

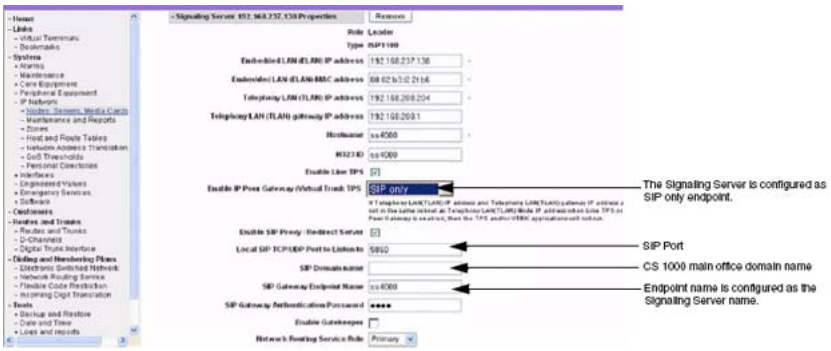

Figure 6: SIP Trunk configuration in Element Manager

8. Click Save and Transfer.

   The Save and Transfer window appears.
9. Click OK.
10. Log on to Network Routing Service (NRS) Manager.
11. Select the Configuration tab.
12. From the H.323 Support list, select H.323 not supported.
13. Select the Network Connection Server enabled check box. See Figure 7: SIP Trunk configuration in NRS on page 40.

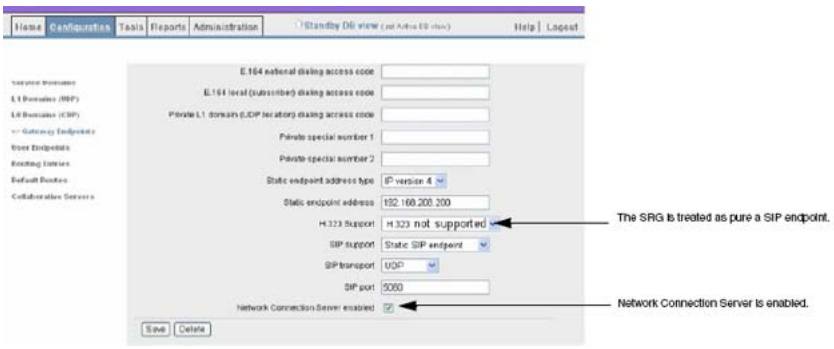

Figure 7: SIP Trunk configuration in NRS

14. Select Save.
15. Select Configuration > Gateway Endpoints.

    The Gateways Endpoints window appears.

    The SRG 50 registers as a static SIP endpoint. See Figure 8: Gateways Endpoints window in NRS on page 40.

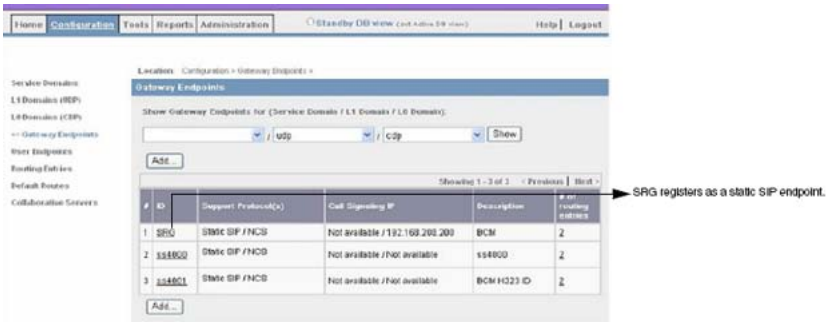

Figure 8: Gateways Endpoints window in NRS

Chapter 6: IP phone registration and redirection

Contents

This section contains information about the following topics:

IP phone registration

The IP phones must be registered on both the main office Call Server and on the SRG 50 to be properly configured in both Normal Mode and Local Mode. The registration also facilitates the creation of an instance of the IP phone on the SRG 50, which is kept alive in a standby mode such that the booting time for the IP phone in a WAN failure scenario is greatly reduced.

The complete registration process consists of two steps:

- The registration of the IP phone on the SRG 50.
- The registration of the IP phone on the main office.

Due to usage differences between Call Servers for the S1 and S2 parameters of the IP phone, the order of the registration can differ depending on the Call Server. However, this document covers only the Avaya Communication Server 1000 Call Server. For Avaya CS 1000, the SRG 50 is configured as S1 in the IP phones. Branch-based IP phones initially register with the local SRG 50. The IP phone can then be redirected to the main office, where they will register and receive Normal Mode features.

Regardless of the order of registration, once an IP phone is registered on the SRG 50 it must then be provisioned as being redirected to enable the logic, which detects the presence of the

main office Call Server for that type of IP phone. This logic is the means for subsequent redirection of the IP phone to the specified main office.

IP phone initial SRG 50 registration

When an IP phone first registers with the SRG 50, as the installer, you are prompted to enter the SRG 50 password followed by the Directory Number (DN) as outlined in the normal BCM IP phone manual installation procedures. See Figure 9: Password prompt screen on page 42 and Figure 10: DN prompt screen on page 43.

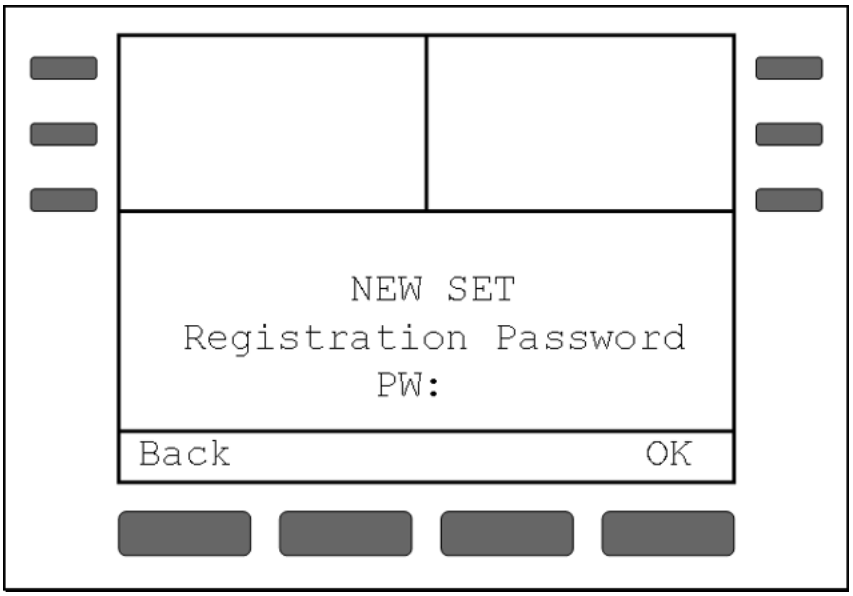

Figure 9: Password prompt screen

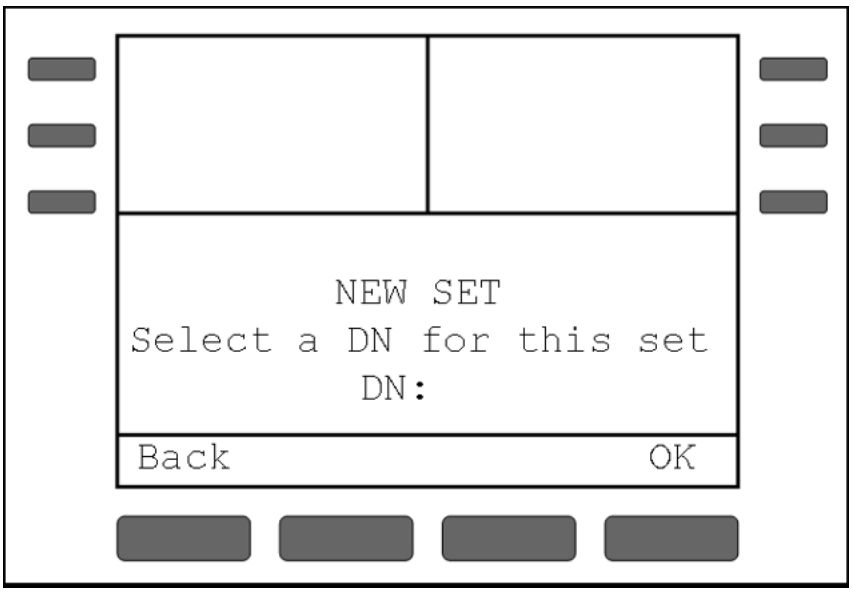

Figure 10: DN prompt screen

After the correct password and DN are entered, the IP phone registers with the SRG 50 and is in Local Mode. In the example shown in Figure 11: IP phone registered with SRG 50 on page 43, a DN of 345 is entered for the IP phone.

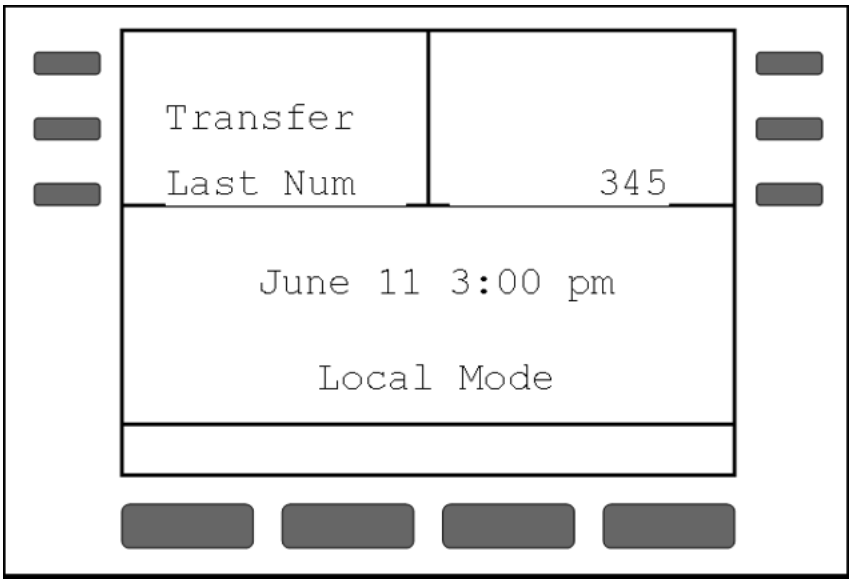

Figure 11: IP phone registered with SRG 50

The list of registered IP phones can be viewed in the Element Manager (under the SRG 50 > IP Terminal Details tab). This list displays differently based on the type of main office Call Server because the main office-specific fields are different depending on the Call Server type.

IP phone redirection to the main office

After an IP phone is registered on the SRG 50, you must provide the information for the redirection of a given IP phone to the main office. The information provided depends on the Call Server type and is information applied using the designated SRG 50 Element Manager interfaces. The SRG 50 Element Manager can be accessed locally or remotely using the remote access capabilities of the BCM 50 Release 5.0 platform. As a result, redirection of IP phones (after installation) can be done remotely without the need for physical contact with the IP phones.

After the redirection information is entered, the SRG 50 automatically redirects the IP phones to register with the main office, provided the main office Call Server is online and reachable from the SRG 50. The redirection method depends on the Call Server type.

If this redirection provisioning process is not performed, the corresponding IP phones will register to SRG 50 in Local Mode and no redirection process will be started.

CS 1000 redirection configuration

The IP address and port information for the Primary and Alternate Network Connect Servers (NCS) must be configured.

The SRG 50 uses the NCS to resolve the address of the main office TPS prior to redirecting the IP phones. The SRG 50 sends the Type of Number (TON), Numbering Plan Identification (NPI), and DN of the IP phone to the NCS. The NCS resolves the main office TPS using the dialing plan and DN supplied, and returns either the associated IP address of the main office TPS or an IP_UNKNOWN message. If the Primary NCS is unavailable after a retry period, the SRG 50 automatically queries the Alternate NCS. The SRG 50 stays with the Alternate NCS until it receives the Not Active Reason response and then it switches back to the Primary NCS.

The SRG 50 > IP Terminal Details tab shows the fields as indicated in Figure 12: IP phone entries in Element Manager on page 44. The following figure shows that the IP phone (associated with DN 345 on the SRG 50) has been redirected to a CS 1000 main office TN 61 31 with a BUID of 5678. The IP address of the TPS associated with this IP phone in the main office (MO TPS) is also shown.

DN	H/W ID	Status	F/W Version	MOTN	BUID	MO TPS
345	00123456	Normal Mode – Set Redirected	C502B41	61 31	5678	172.30.3..156

Figure 12: IP phone entries in Element Manager

Before redirecting the IP phone, the SRG 50 copies the main office installer password and other parameters such as the MOTN and BUID to the DRAM of the IP phone. The main office authenticates the IP phone registration by validating the installer password present in the

DRAM. You must ensure that the registration password configured in the SRG 50 matches the installer password configured at the main office.

The response received from the Network Connect Server contains the address information of the main office TPS that is designated to handle the registration of the IP phone. The SRG 50 then monitors the heartbeat of the main office TPS to make sure that it is available before redirecting the IP phone.

The redirected IP phone registers with the main office, provided that the information you entered is valid. The IP phones registered with the main office have different user interface (compared to the IP phones registered to the SRG 50).

IP phone redirection failures

The IP phone registration to the main office Call Server may fail due to improper configuration or lack of WAN connectivity. When a login failure occurs, the error code and description is shown in the status field for the IP phone in the IP Terminal Details tab within SRG 50 Element Manager. The IP phone remains registered with the SRG 50 in Local Mode after a login registration failure with the main office. The reasons for login failure vary based on Call Server type.

After the failure cause has been rectified, you can click the Redirect Set button to trigger the SRG 50 to again redirect the IP phones to register with the main office.

Any of the following cause CS 1000 redirection failures:

- The remote Call Server is unreachable.
- There is no endpoint configured for the user ID or branch user ID (BUID) – TN combination.
- A IP Phone 2002 is not allowed to register with IP Phone 2004 or 2050 IP Softphone TN or the IP phone type does not match MOTN set type.
- The user ID is registered and not idle.
- The user ID entry in the Gatekeeper database points back to the originating node.
- The NCS is unreachable (Primary or Alternate).

Normal Mode

In Normal Mode, the IP phones register with the main office. The IP phones at the branch office are under the control of the main office Call Server and these IP phone have access to all telephony services and features from the Call Server like any telephone directly connected to the main office.

In Normal Mode, the IP phones are also pseudo-registered with the local SRG 50. Prior to redirecting the IP phone to the main office Call Server, the SRG 50 sets up a Call Forward All Calls option for the IP phone to forward all incoming calls from the local PSTN using VoIP

trunks to the main office. The VoIP trunks can be either H.323 or SIP trunks. The use of these trunks is applicable to all MO Types supported. For CS 1000, the call forwarding is not optional and the number used for the call forward is the provisioned BUID.

When an IP phone at the branch office initiates a local call, the call is routed through a VoIP trunk on the main office to an IP trunk on the SRG 50 where it is further routed to the PSTN interface on the SRG 50. Emergency Services Access (ESA) calls are similarly routed to the SRG 50 PSTN. Incoming DID trunk calls to the IP phone at the branch office are forwarded (if configured as previously indicated) using the VoIP trunks to the main office, which will then terminate the call at the branch user. Similarly, calls from analog telephones connected to the SRG 50 to the branch IP phone are forwarded to main office Gatekeeper using VoIP trunks, which will then terminate the call at the branch users. Calls from the branch IP phone to the analog telephones at the SRG 50 are routed using virtual trunks to terminate at the analog telephone. In all these call scenarios, only signaling messages go through the IP trunk. The media path is set up directly between the branch IP phone and the voice gateway at the SRG 50. This means that these calls do not use any WAN bandwidth between the main office and the branch office once calls have been established.

When a branch user IP phone calls a main office IP phone (and vice versa), the call is a simple station-to-station call within the main office Call Server. Since the branch user IP phone is physically remote from the Call Server, the media path goes through the WAN connection between the main office and the SRG 50, and uses a certain WAN bandwidth as demanded by the codec used in the call.

Call Forward

The forwarding of incoming PSTN calls to the main office is key to utilizing the H.323/SIP-to-PSTN Gateway capability of the SRG 50 for inbound calls. The Call Forward feature for CS 1000 branch can be configured in the SRG 50 using either of the following two methods:

1. Target DN is determined based on the BUID/Main Office DN and VoIP Trunk Access Codes—The access code for the VoIP trunks is configured under SRG 50 > Main Office Settings in Element Manager. Before redirecting the IP phone to the main office, the SRG 50 process sends an ActivateCallForward (DN, TargetDN) message to the core. The SRG 50 process creates the target DN number by prefixing the VoIP trunk access code to the BUID/main office DN. When the IP phones comes back to the SRG 50, the SRG 50 process sends a DeactivateCallForward (DN) message to the core.
2. Target DN is configured explicitly for each IP phone—The Fwd All Call field is added for each IP phone, in the capabilities component in the generic BCM Element Manager. You can configure the target DN in this location. The target DN typically is the BUID/main office DN prefixed with VoIP trunk access code. Before redirecting the IP phone to the main office, the SRG 50 process sends an ActivateCallForward (DN) message to the core to activate the Fwd All Call feature for the IP phone DN. The target DN is not sent to the core because it is already configured under the Telephony section. Similarly, when the IP phone comes back to the SRG 50, the SRG 50 process sends a DeactivateCallForward (DN) message to the core to deactivate the Fwd All Call feature for the IP phone DN. The disadvantage of this

option is that you must configure the Target DN for each IP phone in addition to the BUID/main office DN.

External Attendant Support

The SRG 50 supports an external attendant by using the BCM Selective Line Redirection capability. With this capability a line can be redirected through a specified interface (such as a VoIP trunk) to a specified DN. There is no local auto attendant capability included with the SRG 50. If an attendant is located in the main office and the main office unreachable in the VoIP domain due to a WAN failure, the attendant is not reachable. Two methods are available for dealing with this situation:

- Specify a fallback (or Prime) DN in the SRG 50. Since this DN is likely to receive calls in a WAN failure scenario, it must be an IP phone which can transfer the calls to the desired party. If the IP phone is also a redirected IP phone, there is a period of time where inbound calls are not routable, until the IP phone fails back to the SRG 50 due to the WAN failure.
- Specify a fallback route over the PSTN to the main office Call Server, where vacant number handling can be applied (such as routing to Voice Mail).

Normal Mode call scenarios

Table 10: Call scenarios on page 47 summarizes the call scenarios for IP phones operating in Normal Mode.

Table 10: Call scenarios

Scenario	Type	Description
IP phone to IP phone	Originating or Terminating	• The main office handles the call. • The SRG 50 is not involved in the call.
IP phone to local non-IP terminal on SRG 50	Originating or Terminating	• The main office sets up the call using an IP trunk at the main office and an IP trunk at the SRG 50. • No media flow over the WAN.
IP phone to local PSTN	Originating	• The main office sets up the call using an IP trunk at the main office and an IP trunk at the SRG 50. • SRG 50 routes the call to the local PSTN interface. • No media flow over the WAN.

Scenario	Type	Description
	Terminating	• The inbound call is presented to the FTE representations of the IP phone on the SRG 50. The SRG 50 forwards the call to the designated DN using the IP trunk. • The main office sees the call origination and routes the call to the designated IP phone using an IP trunk at the main office. • No media flow over the WAN.
IP phone to other branch office or main office DN or remote PSTN	Originating or Terminating	• The main office handles the call. • The SRG 50 is not involved in the call.

Reverting from Normal Mode to Local Mode

In certain cases the IP phones (which are in Normal Mode) switch back to Local Mode operation. In Local Mode, the IP phones are under the control of the SRG 50 and have a limited set of features. The following sections describe the different cases where an IP phone reverts back to local mode.

- WAN failure on page 48
- Test Local Mode on page 48

WAN failure

When WAN connectivity is lost, each IP phone loses its Reliable UDP (RUDP) connection with the main office TPS. Each IP phone reboots and re-registers at the SRG 50. The IP phones remain under the control of the SRG 50 until WAN connectivity is confirmed. During this period, the IP phones are in Local Mode and have a limited set of features necessary for the phones to be survivable.

Test Local Mode

Test Local Mode is a method for placing an IP phone temporarily in Local Mode. This is the convenient way to confirm the provisioning of the IP phone on the SRG 50 for WAN failure, without resorting to WAN failure manually. Test Local Mode must be supported on all CS 1000 IP phones.

For CS 1000, the Test Local Mode option is available for testing survival functionality. The CS 1000 main office Call Server provides the Test Local Mode option and the user interface (UI) for selecting the mode. Once the Test Local Mode option is selected, the IP phone is redirected to the SRG 50 with the status field in the DRAM indicating Test Local Mode. The IP phone registers with the SRG 50 and remains in Local Mode under SRG 50 control until the user completes the survivability testing and presses the Stop key (the key with the octagon on it) to return back to Normal Mode or on expiry of the Test Local Mode timer.

An IP phone in Normal Mode can also be brought to Test Local Mode by selecting the Test Local Mode option when the Services key is pressed. You can configure the Test Local Mode timer through Element Manager and the timer can have values from 2 to 10 minutes.

Local Mode

The Local Mode provides survivability to the branch IP phones in case the WAN connection to the main office fails or the when IP phones fail to register correctly with the main office. In this mode, the IP phones are registered to the SRG 50 and receive call processing from the SRG 50. The SRG 50 provides a limited set of features that allow the IP phones to be usable during the period when they are not registered with the main office Call Server.

When a branch IP phone is registered to the SRG 50 due to power-up or loss of WAN connectivity, it is automatically redirected to the main office when connectivity is confirmed between the SRG 50 and main office and when the IP phone is not on a call. Automatic redirection requires no user intervention (login).

When the network connection between the main office and the SRG 50 is down, the main office Call Server has no access to the IP phones at the SRG 50. Calls to these IP phones are treated according to the main office redirection configuration, such as being redirected to the message centre or receiving ring no answer.

In Local Mode, the call processing for the IP phones is handled by the SRG 50. Whenever an IP phone re-registers with the SRG 50 in Local Mode, the Call Forward All Calls associated with the redirection, if enabled, is automatically cancelled. Calls between two IP phones in the local SRG 50 are handled locally as simple station-to-station call. When a Local Mode IP phone initiates a local trunk call, the call is processed by the SRG 50 and routed on to an appropriate trunk connected to local PSTN. Incoming DID calls are also handled by the SRG 50 and terminated on the appropriate IP phone.

In Local Mode, the IP phones do not have access to the main office network, and therefore, can only call other IP phones directly registered with the SRG 50. If alternate routes are available to the main office or other branch offices, then Local Mode IP phones can make calls to them.

Local Mode indication

The branch IP phone is identified as being in Local Mode by displaying the SRG 50 advertisement/logo banner . This indication is critical because the user must be aware that the IP phone has switched from Normal Mode to Local Mode and that the feature capabilities and operation are different. The display in Local Mode is different from the display presented by the main office Call Server. The default advertisement/logo text is Local Mode. The text can be customized at install time through the SRG 50 Element Manager.

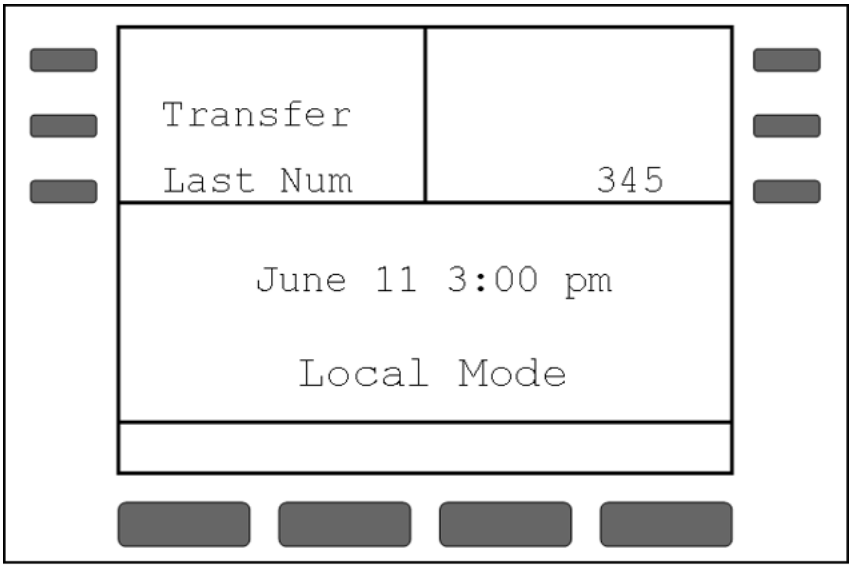

Figure 13: IP phone (registered with SRG 50) in Local Mode

Local Mode features

The SRG 50 supports the following features in Local Mode:

- Hold on page 51
- Transfer on page 51
- Call Forward No Answer/Busy on page 51
- Last Number Redial on page 51
- Inbox key on page 51

Hold

The Hold feature is provided using the Hold button key on the IP phone. The Hold functionality is the same as what is provided on the BCM platforms.

Transfer

The Transfer feature (BCM Feature *70) is provided using a dedicated key on the IP Phone 2002 and 2004. The Transfer feature is critical given that inbound call handling in Local Mode may be different than Normal Mode, increasing the likelihood of having to transfer an inbound call to the appropriate DN.

Call Forward No Answer/Busy

The Call Forward No Answer/Busy feature is configured using the SRG 50 Element Manager. The configure must be done for each DN. This feature is same as on the BCM platforms.

Last Number Redial

This feature is provided by a dedicated key on the IP Phone 2002 and 2004. This feature is the same as on the BCM platforms.

Inbox key

The Inbox key is enabled on the IP Phone 2002 and 2004. You must program this key to autodial the PSTN number for accessing the user’s voice mail at the main office Call Server.

The SRG 50 provides only a limited set of features in Local Mode. To limit access to undesirable features, the following keys are inoperative on the IP Phones:

- Navigation cluster (including the Copy key). The Exit key would be active during Test Local Mode. The key is used to Resume Normal Mode.
- Directory
- Outbox

- Services
- Expand
- Top two soft labelled keys (IP Phone 2004 only)
- Four context sensitive soft keys

Since the Feature key is disabled, features such as Hot Desking, Do Not Disturb, Page, Call Forward, Background Music, Call Park, Call Pickup, Speed Dial, and Conference are not available to the user. The Conference feature is not available for any analog interfaces like those connected across ATA modules, analog phones, and analog Polycom conference phones as well.

The display on the IP phones registered with the SRG 50 will also be different from the display provided by the BCM. The changes are as follows:

- The DN string is moved to the Line key in place of the soft labelled key Intercom display string, except on the IP Phone 2001.
- BCM/Norstar Display line 1 containing time/date, feature input prompts, dial pad digit echo and CLID information is redirected to the top line of the IP Phone 2004 main three line display. There is no change for the IP Phone 2002 because the line is already on the top.
- The four soft key labels are blanked out.
- The advertisement/logo banner (set in Element Manager) is redirected to the bottom line of the IP Phone 2001 and 2002, in place of the soft key label string.
- The advertisement/logo banner (set in Element Manager) is redirected to the bottom line of the IP Phone 2004 main three line display.

The SRG 50 Release 6.0 does not support local applications or the following services:

- LAN CTE (With the exception that a LAN CTE key code is enabled to provide support for a 3rd Party E.911 On Site Notification (OSN) Tool. This feature was introduced within SRG 50 Release 3.0)
- Multimedia Call Center
- IVR
- Console Services
- Voice Mail

Chapter 7: Dialing Plan configuration

Contents

This section contains the following topics:

Overview

This section provides an overview of dialing plan programming on the SRG 50 and the main office.

When a number is dialed, the Call Server determines whether the called number is internal or external to the branch office. If internal or off-net, the system terminates the call on the appropriate terminal. If external or on-net, the system routes the call using one of the supported dialing plans.

On-net dialing plan

The SRG 50 supports only one dialing plan option at a time. CDP and UDP dialing plan options cannot be configured at the same time in the same system.

The SRG 50 supports the following dialing plans:

- Coordinated Dialing Plan (CDP) – BUID is the same as the Directory Number (DN)
- Uniform Dialing Plan (UDP) – Location code is added to the DN for the BUID

Important:
Avaya recommends that the SRG 50 use CDP.

CDP Terminal Numbers (TN) can be activated on the other systems if the user moves and wants to retain their phone number. SRG 50 does not support Transferable Directory Numbers (TNDN) due to differences in dialing plans and the small range of DN available on the SRG 50.

For specific examples for CDP and UDP dialing plans, see Dialing plan examples on page 57.

Once the call is sent over the IP network, the call is routed to the SRG 50, which uses the NRS (H.323 Gatekeeper/SIP Redirect Server) to route the call. The NRS (H.323 Gatekeeper/SIP Redirect Server) translates the address form a telephone number to an IP address, and authorizes the call.

Specific dialing plan configuration is required for IP phones to properly select a main office or a branch office that provides access to the PSTN for the originating IP phone. A common configuration might be:

- SRG 50 users select the SRG 50 PSTN for local calls.
- Main office users select the main office PSTN for local calls.
- All users select either the main office or SRG 50 PSTN for long-distance calls to minimize toll charges.
- calls configured to minimize toll charges.

However, this configuration represents only one way that the dialing plan could be configured. PSTN calls can be routed according to the point of origin (main office or branch office) and/or the desired destination, and can select trunks at the main office, branch office, or other branch offices as required. Therefore, the user can route calls to gateways that minimize long-distance costs, minimize bandwidth usage, or meet other criteria.

Avaya recommends that customers use Coordinated Dialing Plan (CDP) between the main office and its branch offices since it enables all users, at the main office or the branch office, to call each other using just an extension number. CDP enables consistent dialing between the main office and SRG 50 IP phones and devices.

For more information, see *Avaya Dialing Plans Reference, NN43001-283*.

Off-net dialing plan

When dialing to the PSTN, the Call Server determines that the call destination is off-net by analyzing the digits that must be preconfigured at major Call Servers in the network.

If routed over a Virtual Trunk, a request is sent to the NRS to determine the location of public E.164 numbers. The NRS is configured with a list of potential alternate routes that can be used to reach a certain dialed number. Each route is configured with a unique route cost to determine the least-cost route.

The NRS replies with the address information for E.164 numbers. It also provides a list of alternative SIP or H.323 endpoints, sorted by cost. If a terminating endpoint resource is busy when a call attempt is made, the originating endpoint tries the next alternative. If no alternative is available over the IP network, the originating endpoint steps to the next entry on its route list, which could be a TIE or PSTN alternate route.

Dialing Plan Overview

Depending upon the type of dialing plan used in the network (Coordinated Dialing Plan [CDP], or Uniform Dialing Plan [UDP] or a combination of both) the general idea is to have all calls that are terminating at a branch office first dial a number that will get routed to the main office associated with that branch office. The main office recognizes this number as belonging to the branch office and appends a tandem prefix to this number using Digit Manipulation Index (DMI). The main office then routes the call to the branch office while accounting for the additional bandwidth used.

See Figure 14: A call between two branch offices tandems through the main office on page 56 for an example of a tandem call.

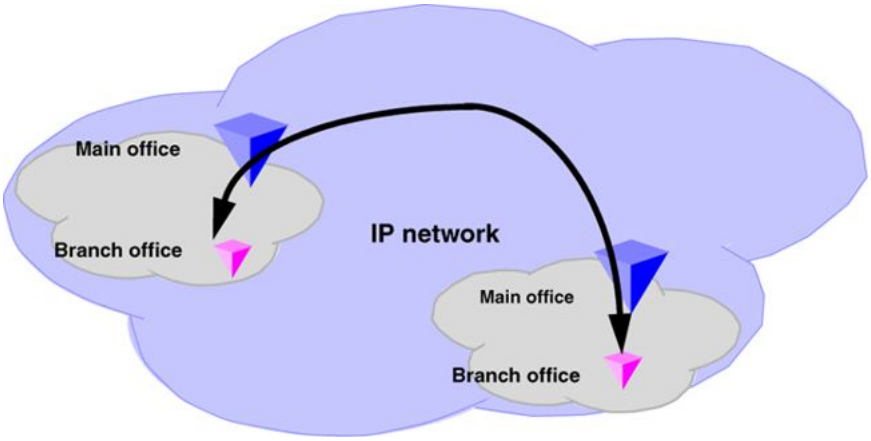

Figure 14: A call between two branch offices tandems through the main office

Figure 15: General legend on page 57 shows a general legend for the figures in the following section.

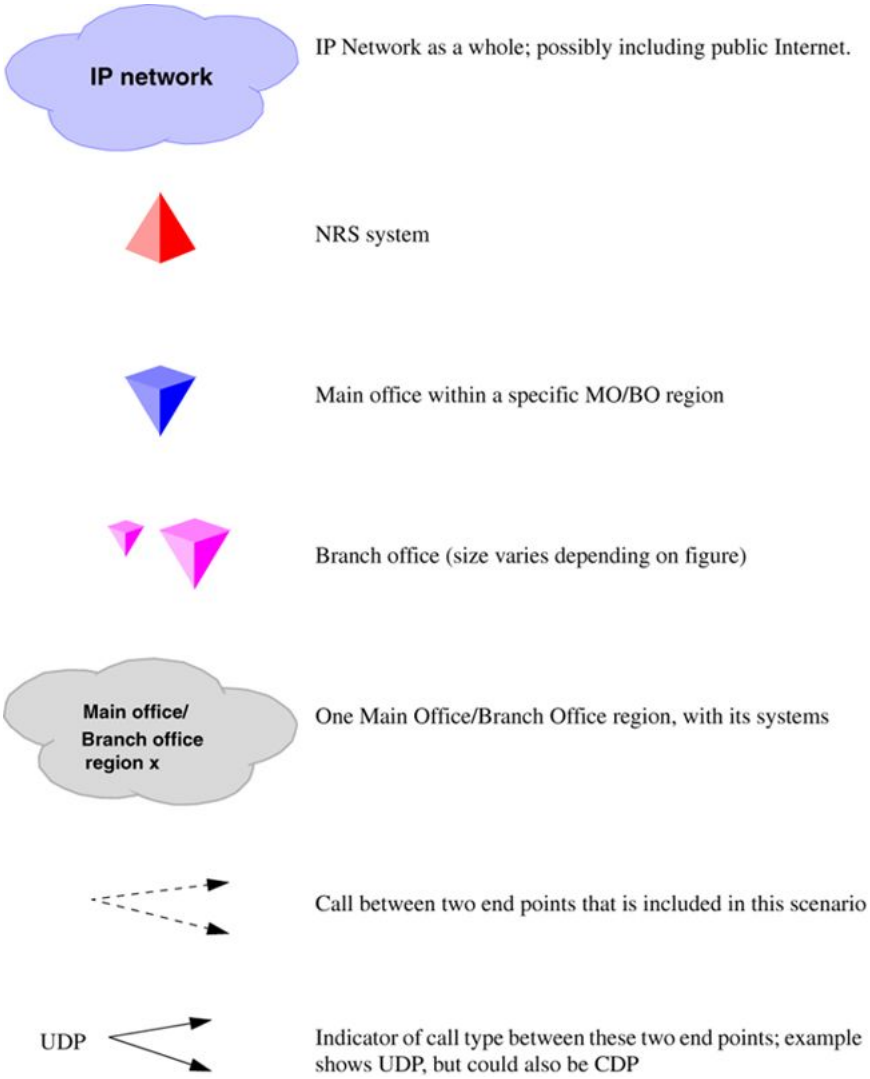

Figure 15: General legend

Dialing plan examples

This section describes the following dialing plans:

- Coordinated Dialing Plan (CDP)
- Uniform Dialing Plan (UDP)

Coordinated Dialing Plan

The following section provides three options for creating a CDP dialing configuration.

Overview

Dialing plans between the SRG 50 and the main office need to be coordinated to ensure seamless dialing between the systems. The option you choose will determine how the user dials the other system or the SRG 50 IP phones.

- Option 1: DN ranges in the main office and SRG 50 are unique, and DNs for SRG 50 IP phones are the same in both Normal and Local mode. This is the recommended configuration to support seamless dialing on both systems. See Option 1 on page 62.
- Option 2: DN ranges in the main office and SRG 50 overlap, and DNs for SRG 50 IP phones are the same in both Normal and Local mode. See Option 2 on page 67.
- Option 3: DN of SRG 50 IP phones and DN in the main office overlap in Normal Mode, but are unique in Local Mode. See Option 3 on page 72.

Call scenarios

Call scenarios fall into the following categories:

- Common call scenarios occur in all CDP calls, regardless of which option is used.
- Unique call scenarios occur only within certain CDP options.

This section describes the common call scenarios. The unique call scenarios are described with the configuration of the corresponding option, starting with Option 1 on page 62.

Normal Mode: Main office telephone calls an analog phone at the SRG 50

The call is routed through the NRS and handled by the SRG 50. Figure 16: Normal Mode: Main office telephone calls an analog phone at the SRG 50 on page 59 shows how the call proceeds.

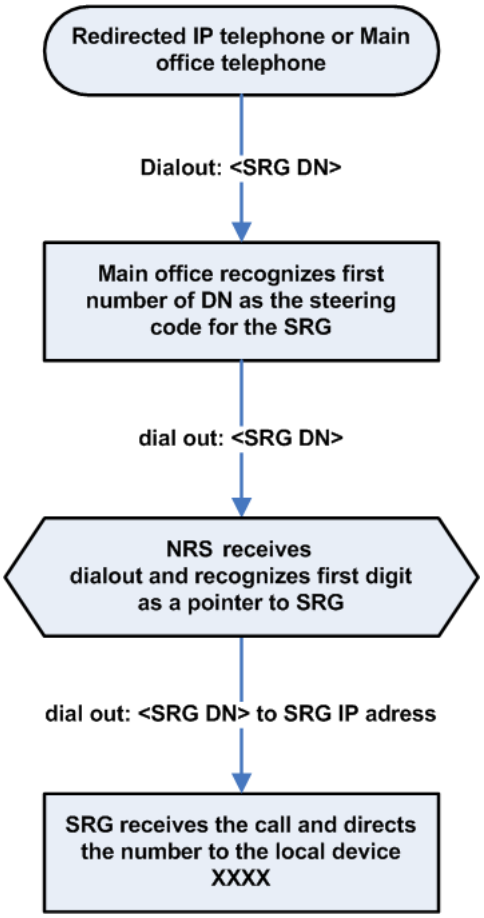

Figure 16: Normal Mode: Main office telephone calls an analog phone at the SRG 50

Normal Mode: Main office telephone calls a branch IP phone

The call is recognized as a main office number, and the call is directed to the SRG 50 IP phone using internal routing at the main office.

Normal Mode: Main office telephone makes a call over the PSTN through the SRG 50

Routing is configured so the destination code of the PSTN through the SRG 50 is at the start of the dialing string. Figure 17: Normal Mode: Main office telephone makes a call over the PSTN through the SRG 50 on page 60 shows how the call proceeds.

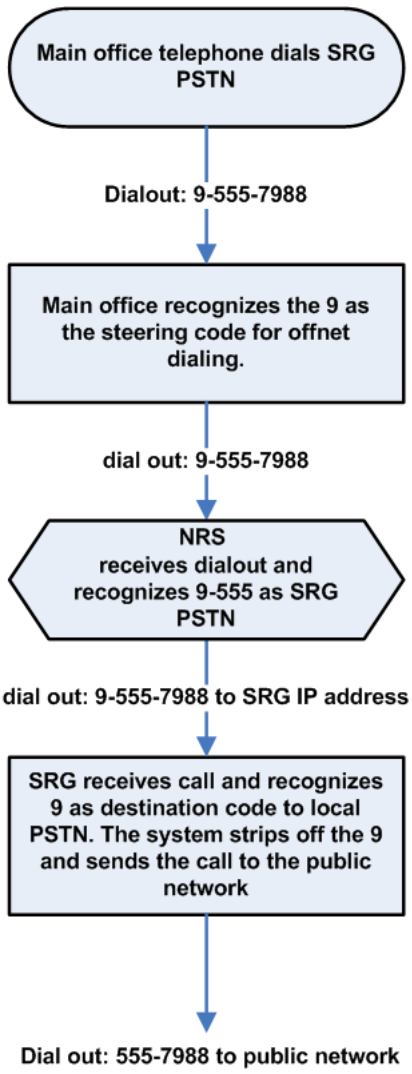

Figure 17: Normal Mode: Main office telephone makes a call over the PSTN through the SRG 50

Normal Mode: SRG 50 IP phone makes a call over the PSTN

Zone management at the main office recognizes that an SRG 50 IP phone in Normal Mode is dialing the PSTN. Figure 18: Normal Mode: SRG 50 IP phone makes a call over the PSTN on page 61 shows how the call proceeds.

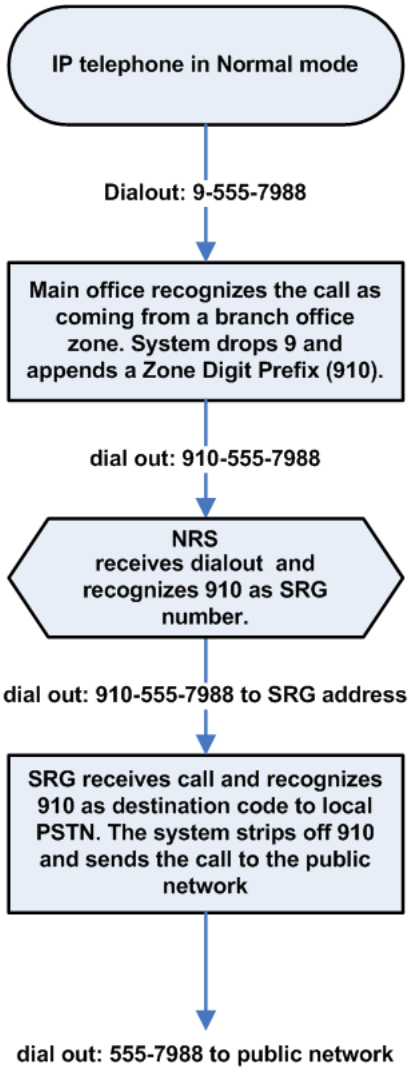

Figure 18: Normal Mode: SRG 50 IP phone makes a call over the PSTN

A telephone registered to the SRG 50 calls another telephone registered to the SRG 50

The SRG 50 routes the call internally.

Local Mode: SRG 50 telephone calls an SRG 50 IP phone

The call is handled by the SRG 50 and is sent directly to the SRG 50 IP phone.

Local Mode: SRG 50 telephone calls a main office telephone

In this case, the WAN or NRS is not accessible. Figure 19: Local Mode: SRG 50 telephone calls a main office telephone on page 62 shows how the call proceeds.

The user must have configured the fallback route appropriately. See the *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500* for further information.

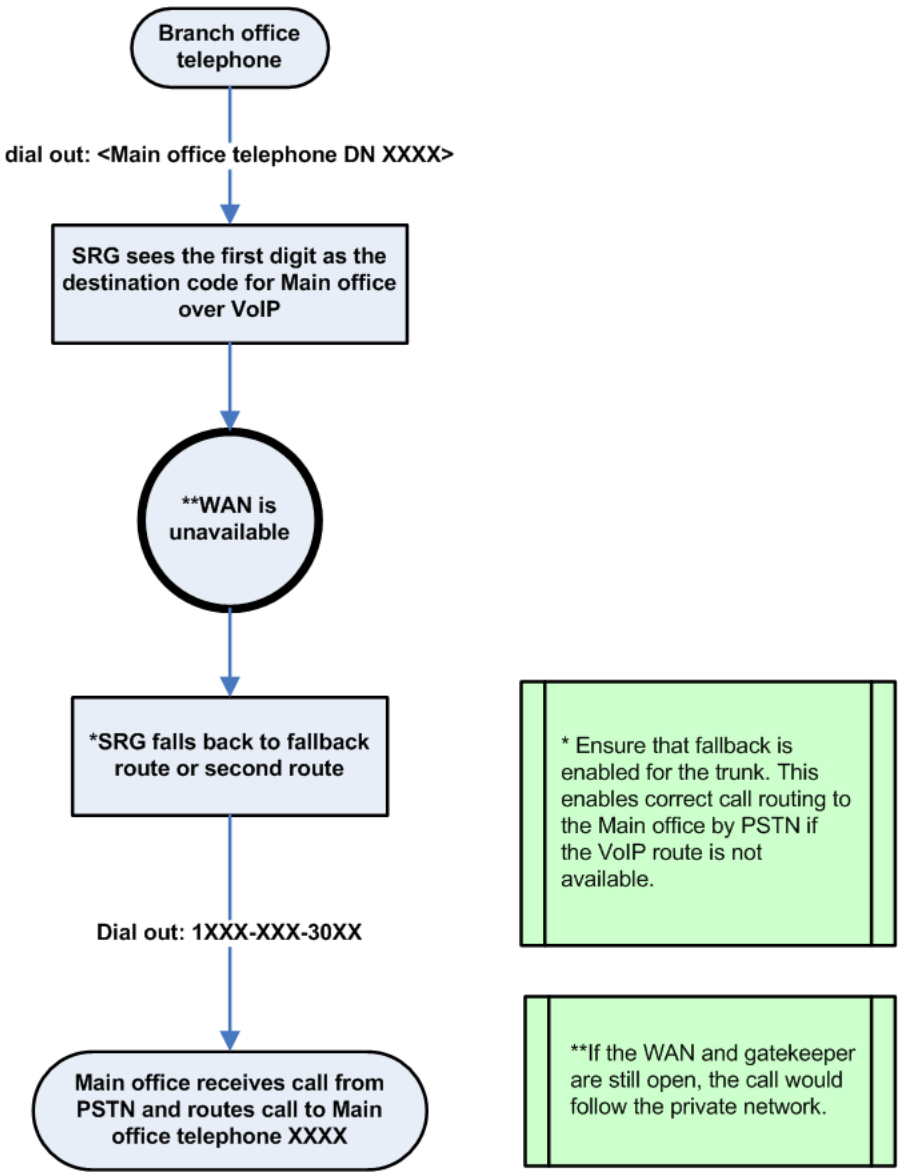

Figure 19: Local Mode: SRG 50 telephone calls a main office telephone

Local Mode: Main office telephone calls an SRG 50 IP phone

The call is treated according to main office redirection configuration, such as forwarding to voice mail or continuous ringback.

Option 1

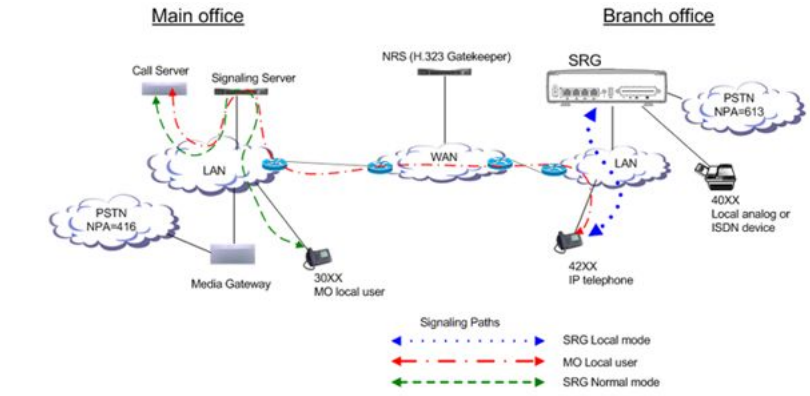
DN ranges in the main office and SRG 50 are unique; DNs for SRG 50 IP phone are the same in Normal and Local Mode

This is the recommended CDP configuration to offer seamless dialing.

In this configuration, the user dials the same DN for SRG 50 IP phones in either Normal or Local Mode. The DN for SRG 50 IP phones are configured to be the same on both the SRG 50 and main office. This allows seamless dialing from both the SRG 50 and main office. However, in this configuration, the DN range for telephones registered at the SRG 50 is unique from the DN range for telephones registered at the main office.

The advantage of this configuration is that the system manages the routing for the SRG 50 IP phones, so users in the SRG 50 and main office do not have to be aware of whether the SRG 50 is in Normal Mode.

See Figure 20: CDP Option 1 on page 63.



MO Call Server Configuration	Gatekeeper Configuration	SRG Configuration
DN: 30XX (zone 10)	CDP Domain "MO_BO_CDP"	DN: 42XX (BUID 42XX)
42XX (zone 15)(SRG)	30XX "MO"	40XX (local service)
CDP: yes	42XX "MO"	CDP: yes
DSC: 40XX	40XX "BO"	VoIP trunk access 3
ZDP (zone 15) 901	901 "BO"	*Dest. Code for VoIP: 30/34

Figure 20: CDP Option 1

Call scenarios

Common call scenarios for this CDP option are listed in Call scenarios on page 58. The following additional call scenarios are unique to this CDP option:

An SRG 50 analog telephone registered to the SRG 50 calls a telephone registered at the main office that can also be an SRG 50 IP phone in Normal Mode.

Figure 21: Calls to an SRG 50 IP phone and a main office IP phone registered to the main office on page 64 shows the WAN is up. An SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office (Normal Mode).

Figure 22: Calls to an SRG 50 analog phone, SRG 50 IP phone, and a main office IP phone on page 65 shows the WAN is down. An SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the SRG 50 (Local Mode).

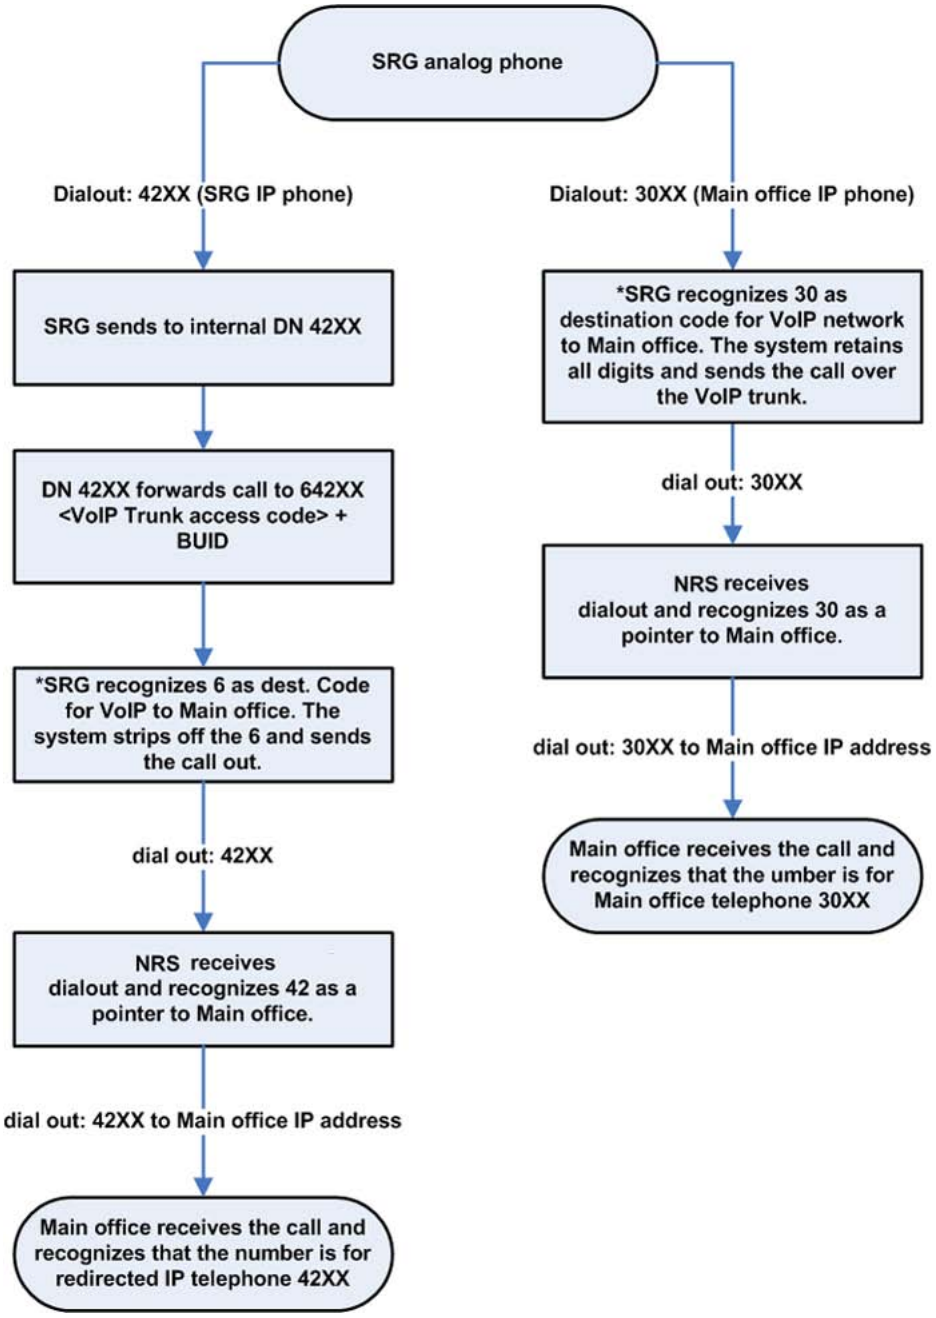


Figure 21: Calls to an SRG 50 IP phone and a main office IP phone registered to the main office

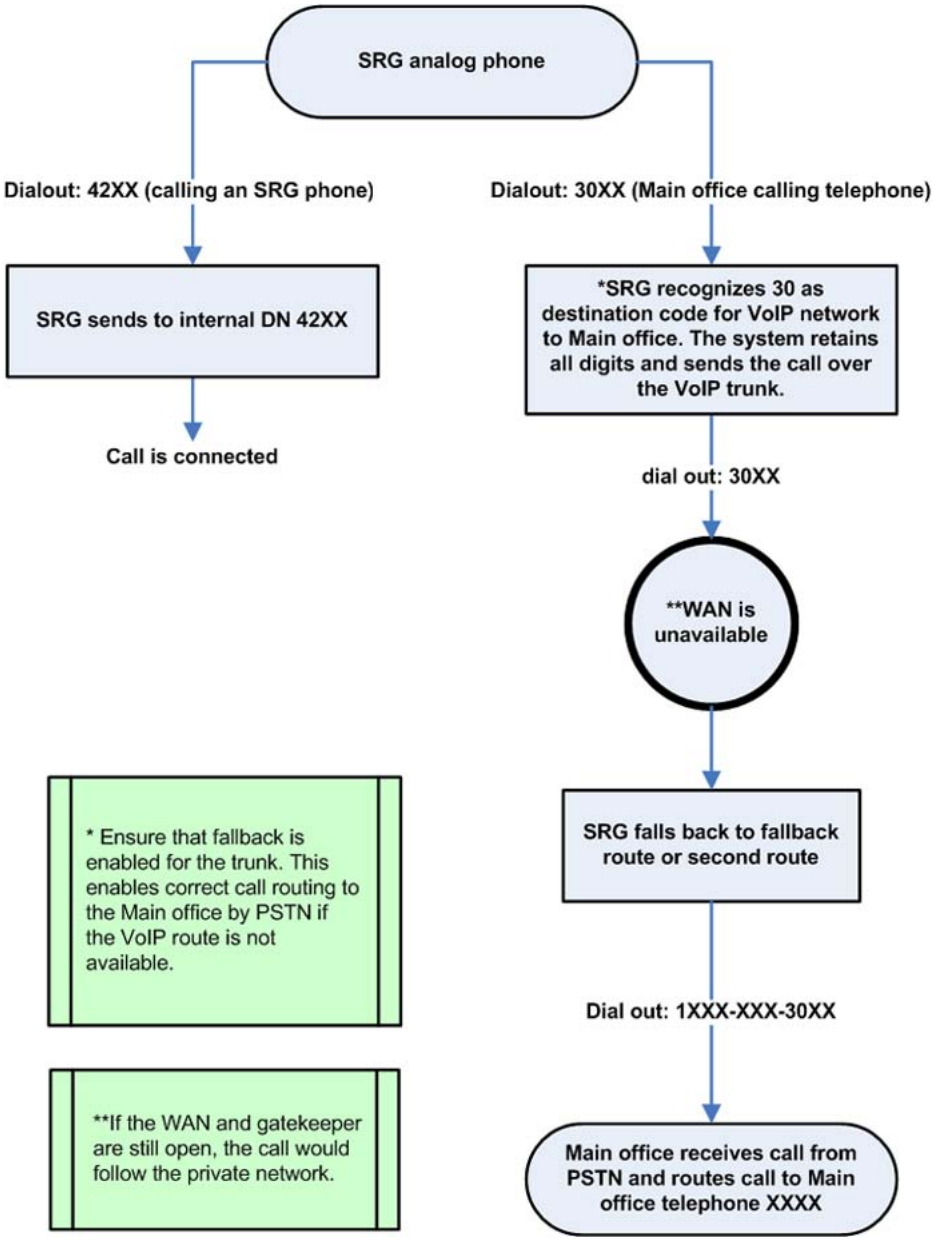

Figure 22: Calls to an SRG 50 analog phone, SRG 50 IP phone, and a main office IP phone

Configuration

To configure the main office:

- Configure the ESN Control Block for CDP in LD 86.

```
>LD 86
REQ NEW
CUST 0
FEAT ESN
CDP YES
MXSC 50
```

```
NCDP 4
DLTN YES
```

- Configure the CDP Distant Steering Code (DSC) in LD 87.

```
> LD 87
REQ NEW
CUST 0
FEAT CDP
TYPE DSC
DSC 50
FLEN 4
RLI 12
```

To configure the NRS (H.323 Gatekeeper/SIP Redirect Server):

- Create CDP Domain: MO_BO_CDP.
- Create H.323/SIP endpoints: MO, BO.
- Create Numbering Plan entries in CDP Domain:
  - Add 40 for endpoint BO.
  - Add 30 for endpoint MO.
  - Add 42 for endpoint MO.

For information about configuring H.323/SIP Redirect Server, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

To configure the SRG 50:

- Configure DN and BUID as the same number on each of the redirected IP phones. For example, DN/BUID = 42XX.
- Set the main office VoIP Trunk Access code to 3. For example, main office VoIP trunk access code = 3.
- Set the destination code for the VoIP trunk to 30 (retain all digits) or 34 (remove first digit). For example, BUID dialout = 342XX.

  The VoIP route destination codes 30 (no digits dropped) and 34 (1 digit dropped) route any call that starts with 30 or 34 out of the system over the VoIP trunk to the main office.

  The main office access code length is still 0.
- Assign the telephones registered to the SRG 50 (IP phones or analog [500/2500-type]) telephones to a different range, such as 40XX. See the NRS configuration above.

  The users in both the main office and the SRG 50 dial only the DN for all telephones in the main office and the SRG 50 in both Normal Mode and Local Mode.

For more information on configuring the main office and NRS, see *Avaya Branch Office Installation and Commissioning, NN43001-314* and *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*. For more information on configuring the SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Option 2

DN ranges in the main office and SRG 50 overlap; DNs for SRG 50 IP phones are the same in Normal and Local Mode

In this configuration, the SRG 50 DN overlap with the main office DN. However, since SRG 50 does not support Vacant Number Routing (VNR), a user registered to the SRG 50 must dial a destination code before the main office DN to call a main office telephone.

To call an SRG 50 IP phone in either Normal or Local Mode, SRG 50 and main office users need to dial only the DN for the SRG 50 IP phone. SRG 50 IP phone calls are forwarded with the main office Private Network ID/destination code appended to the BUID, which allows the call to flow to the VoIP trunks for the main office.

This configuration is not a true CDP dialing plan. A destination code is added by the system to properly direct the SRG 50 IP phone calls, since the start digits of the DN are not unique for SRG 50 and main office users. Users dialing a telephone registered at the main office must dial a destination code before the main office DN. This plan allows all systems on the network to appear to be available within a range of numbers.

Since the SRG 50 DN range is limited to about 200 DN, this configuration only works if SRG 50 dialing to the main office is limited to the redirected IP phones and to a small number of main office telephones, such as to a central attendant and voice mail lines.

See Figure 23: CDP Option 2 on page 67 shows this CDP option.

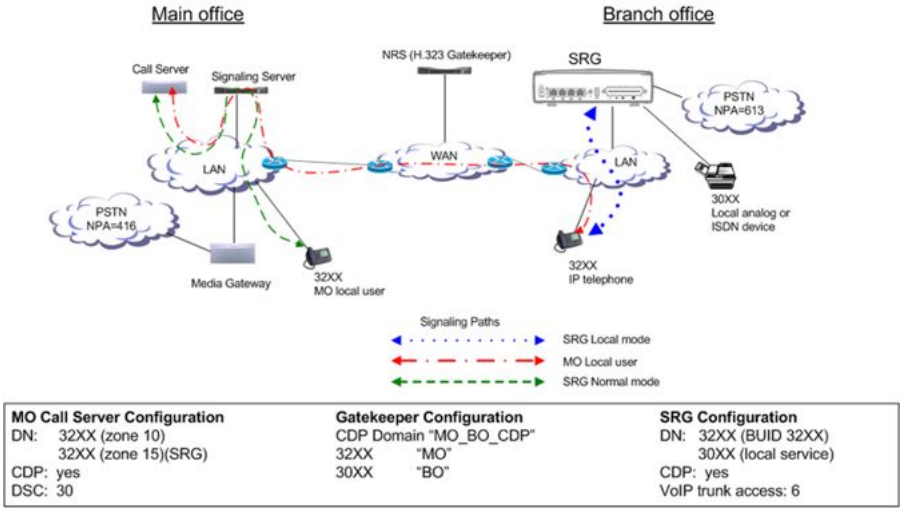

Figure 23: CDP Option 2

Call scenarios

Common call scenarios for this CDP option are listed in Call scenarios on page 58. The following additional call scenarios are unique to this CDP option:

- Normal Mode: An SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office.

  The WAN is up. SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main Office (Normal Mode). SeeFigure 24: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office on page 69.

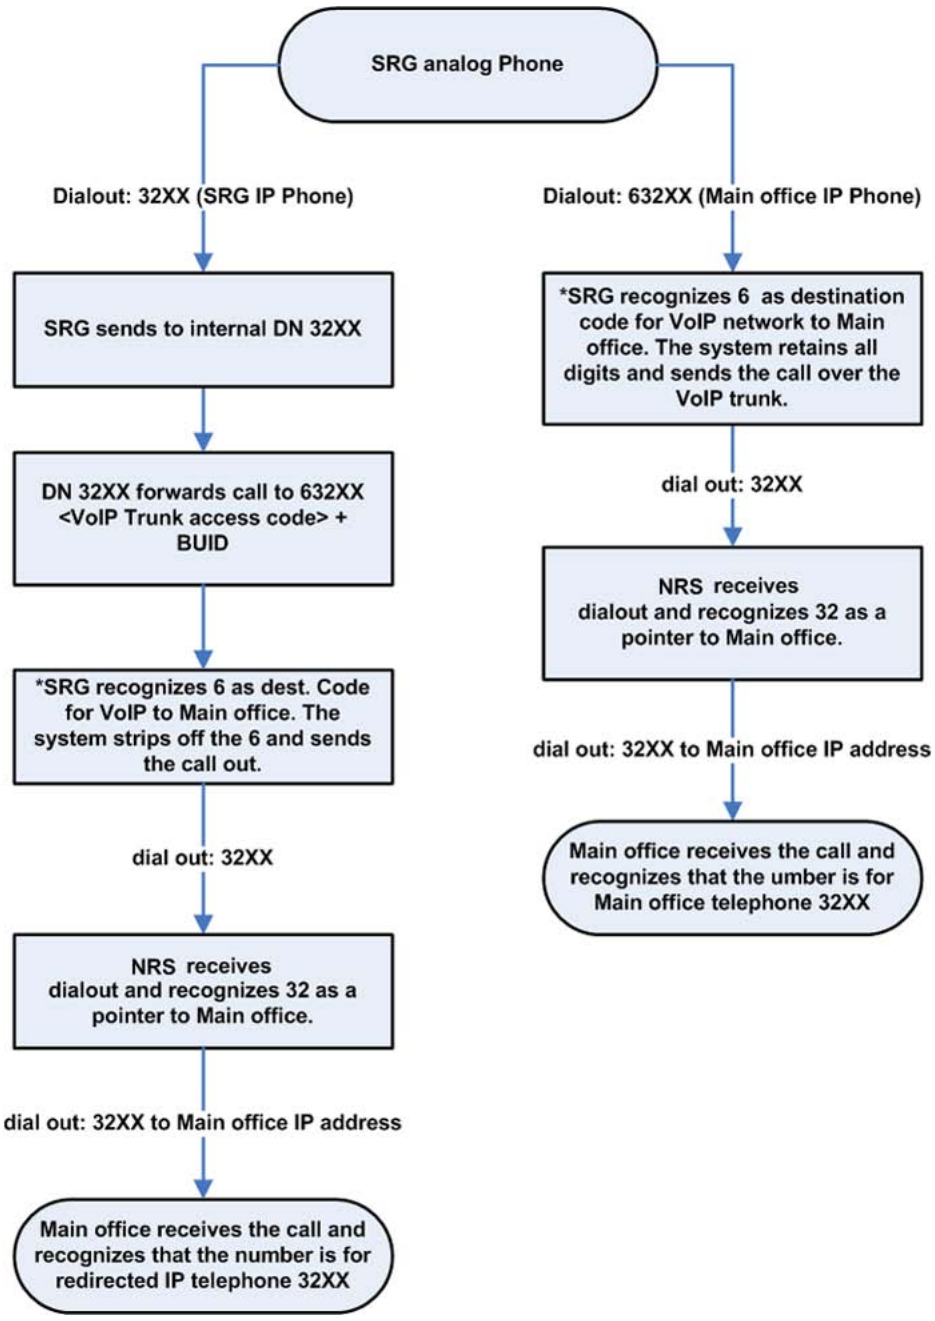

Figure 24: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office

- Local Mode: SRG 50 IP phones are registered to the SRG 50.

  In this scenario, the WAN and the NCS are working. However, the SRG 50 IP phones are redirected to the SRG 50 and are in Local Mode (Call Forward All Calls is inactive). The following occur:

  - Telephones registered at the SRG 50 dial local DNs (see the common call scenarios given in Call scenarios on page 58).

- SRG 50 calls to the main office use VoIP routing. The WAN is down. SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the SRG 50 (Local Mode) See Figure 25: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone on page 70.
- Main office calls to SRG 50 IP phones in Local Mode cannot complete because the NRS cannot resolve the numbering.

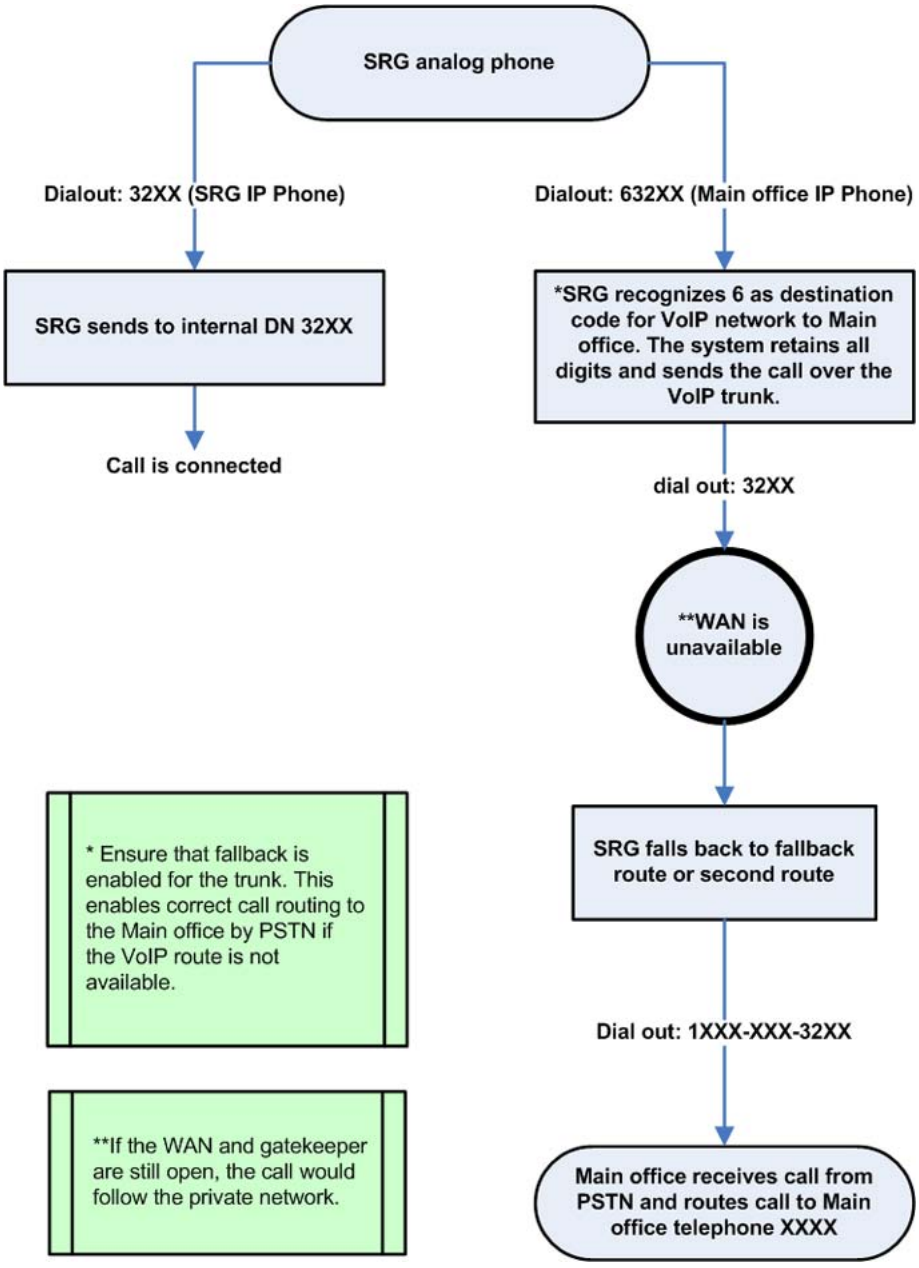

Figure 25: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone

Configuration

To configure the main office:

- Configure the ESN Control Block for CDP in LD 86.

```
> LD 86
REQ NEW
CUST 0
FEAT ESN
CDP YES
MXSC 50
NCDP 4
DLTN YES
```

- Configure the CDP Distant Steering Code (DSC) in LD 87.

```
> LD 87

To configure the NRS (H.323 Gatekeeper/SIP Redirect Server):

- Create CDP Domain: MO_BO_CDP.
- Create H.323 and SIP endpoints: MO, BO.
- Create Numbering Plan entries in CDP Domain:
    - Add 30 for endpoint BO.
    - Add 32 for endpoint MO.

For information about configuring H.323 Gatekeeper/SIP Redirect Server, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

To configure the SRG 50:

- Configure DN and BUID as the same number on each of the redirected IP phones. For example, DN/BUID = 32XX.
- Set the main office VoIP Trunk Access code to 6. For example, main office VoIP trunk access code = 6.
- Set the destination code for the VoIP trunk to 6, the same value as the access code. For example, BUID dialout = 632XX.

  The main office access code length is still 0.
- Assign the telephones registered to the SRG 50 (IP phones or analog [500/2500-type] telephones) to a different range, such as 30XX, than the telephones registered to the main office.

  SRG 50 users must dial the destination code before the DN when making a call to a telephone in the main office, whether they are in Normal or Local Mode. When calling another IP phone in the SRG 50, SRG 50 users dial only the DN, whether they are in

Normal or Local Mode. The main office uses VNR to route SRG 50 DN to the SRG 50 in both Normal and Local Mode.

For more information on configuring the main office and NRS, see *Avaya Branch Office Installation and Commissioning, NN43001-314* and *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*. For more information on configuring the SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Option 3

DNs of SRG 50 IP phones and DNs in the main office overlap in Normal Mode, but are unique in Local Mode

In this CDP configuration, each node on the network has unique leading digits that is included in the DN range. The unique leading digits indicate the private network code for the system.

This configuration allows seamless dialing for users registered at the SRG 50, but main office users must dial a different DN to call SRG 50 IP phones in Normal and Local mode. Therefore, SRG 50 IP phones have DNs and BUIDs that do not match.

In Figure 26: CDP Option 3 on page 73, the SRG 50 IP phones have a DN starting with 4 on the SRG 50 to accommodate the SRG 50 Private Network Code. On the main office, the SRG 50 IP phones are given a DN (BUID) starting with 3, the main office Private Network Code. The NRS is programmed to recognize that 3X numbers go to the main office and that 4X numbers go to the SRG 50.

In Normal mode, when a call is directed into the SRG 50, or from a telephone registered at the SRG 50, to the SRG 50 IP phone in Normal mode, the SRG 50 system translates the SRG 50 IP phone DN (4XXX) to the main office BUID (3XXX) so that the call can route correctly through the main office VoIP trunk. Users registered at the main office dial the main office DN (3XXX) for the SRG 50 IP phone.

In Local mode, the users registered to the SRG 50 still dial the SRG 50 IP phone DN (4XXX). The main office users can not call the SRG 50 IP phone by dialing the main office DN for the telephone (3XXX) because the NRS cannot route the call to the SRG 50. If the main office user dials the SRG 50 IP phone DN (4XXX), the call goes through.

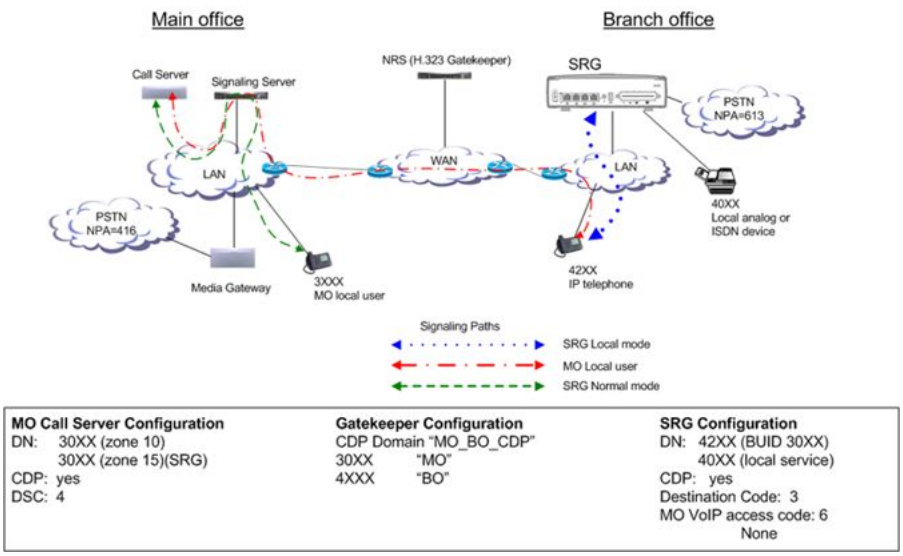

Figure 26: CDP Option 3

Call scenarios

Common call scenarios for this CDP option are listed in Call scenarios on page 58. The following additional call scenarios are unique to this CDP option:

Normal Mode: An SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office.

In this scenario, the telephone registered to the SRG 50 can either dial the SRG 50 DN or the main office DN for the SRG 50 IP phone. In Local Mode, the SRG 50 IP phone is reached only with the SRG 50 DN.

In Normal Mode, the display on the IP phone displays the main office DN (3xxx) for the IP phone. In Local Mode, the SRG 50 DN (4xxx) is displayed. The WAN is up: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office (Normal Mode).

Figure 27: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office on page 74 shows this scenario.

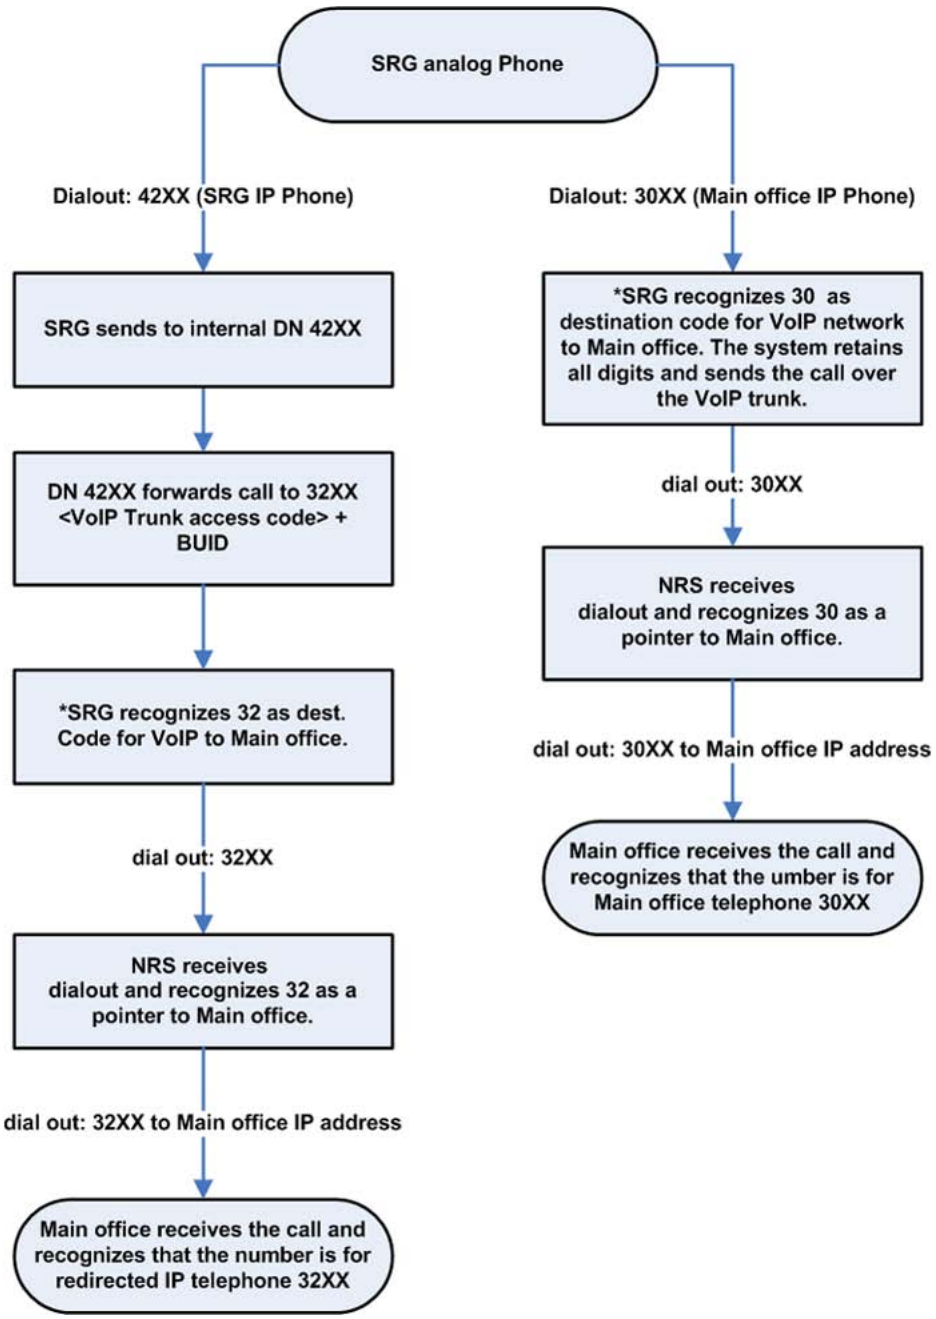

Figure 27: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office

- Local Mode: SRG 50 IP phones are registered at the SRG 50.

In this scenario, the WAN and the NCS are working. If the main office user dials the SRG 50 DN (42xx) to call the IP phone, the call goes through.

Configuration

To configure the main office:

- Configure the ESN Control Block for CDP in LD 86.

```
> LD 86
REQ NEW
CUST 0
FEAT ESN
CDP YES
MXSC 50
NCDP 4
DLTN YES
```

- Configure the CDP Distant Steering Code (DSC) in LD 87.

```
> LD 87
REQ NEW
CUST 0
FEAT CDP
TYPE DSC
DSC 4
FLEN 4
RLI 12
```

To configure the NRS (H.323 Gatekeeper/SIP Redirect Server):

- Create CDP Domain: MO_BO_CDP.
- Create H.323/SIP endpoints: MO, BO.
- Create Numbering Plan entries in CDP Domain:
    - Add 4 for endpoint BO.
    - Add 30 for endpoint MO.

For information about configuring H.323 Gatekeeper/SIP Redirect Server, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

To configure the SRG 50:

- Set the BUID to the same number that was assigned for the TN by the main office.
- Set the main office VoIP Trunk Access code to 0.
- Do not assign a value to the main office trunk access code field.

For more information on configuring the main office and NRS, see *Avaya Basic Network Feature Fundamentals, NN43001-579* and *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*. For more information on configuring the SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Uniform Dialing Plan

Overview

Figure 28: UDP using location codes on page 76 shows an example of a Uniform Dialing Plan (UDP) using location codes (Access Code + LOC + DN) configuration.

In this type of dialing plan, the DNs on the SRG 50 do not need to be different from the BUID, since the location code (LOC) defines the unique node characteristic. Therefore, in this example:

- The SRG 50 IP phone has DN 3002 and BUID 3002. (The system adds the routing code and LOC code to the BUID).
- The local telephone has a DN of 3101.
- The main office has a telephone configured as TN 3001.
- On the main office, the AC1 steering code for the SRG 50 is 6 and the LOC is 504.
- On the SRG 50, the destination code for the main is 6 and the LOC is 501.

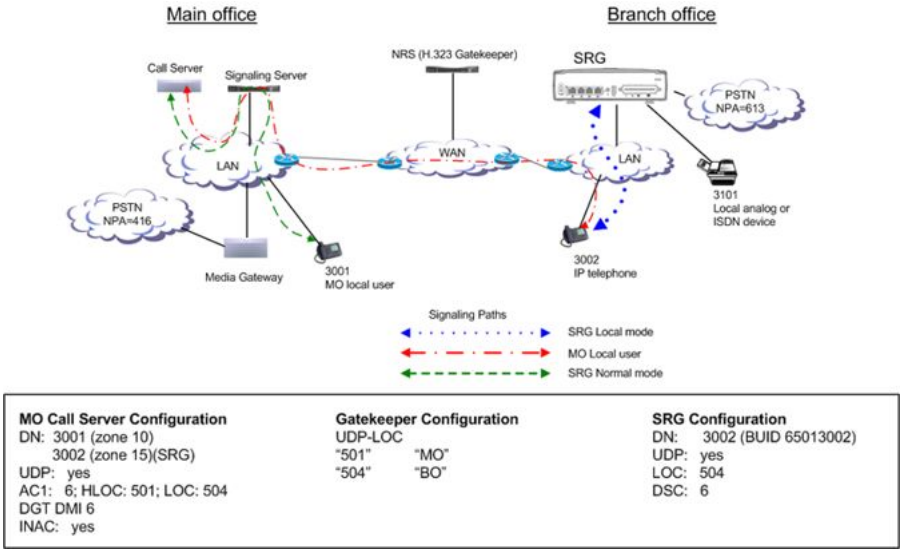

Figure 28: UDP using location codes

Call scenarios

This section describes how calls interact between the SRG 50 and main office with UDP.

Calling from main office to the SRG 50 and SRG 50 PSTN, in Normal mode

In this scenario, a telephone registered at the main office calls a telephone registered to the SRG 50, or makes a call over the PSTN through the SRG 50. Figure 29: Calling from the main office to the SRG 50 and SRG 50 PSTN, in Normal Mode on page 77 shows this scenario.

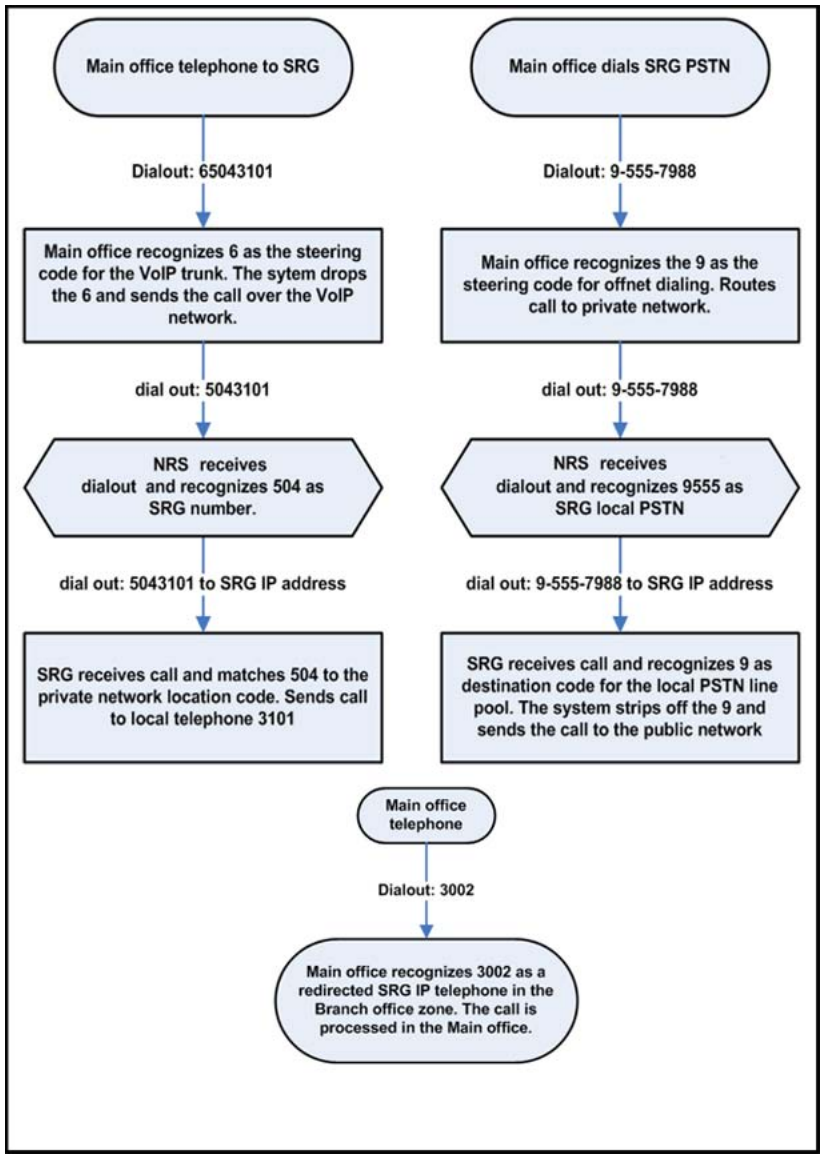

Figure 29: Calling from the main office to the SRG 50 and SRG 50 PSTN, in Normal Mode

Calling from the SRG 50 to the main office, in Normal Mode

In this scenario, a telephone registered at the SRG 50 calls an SRG 50 IP phone and a main office IP phone registered to the main office. The WAN is up. SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office (Normal Mode). Figure 30: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office on page 78shows this scenario.

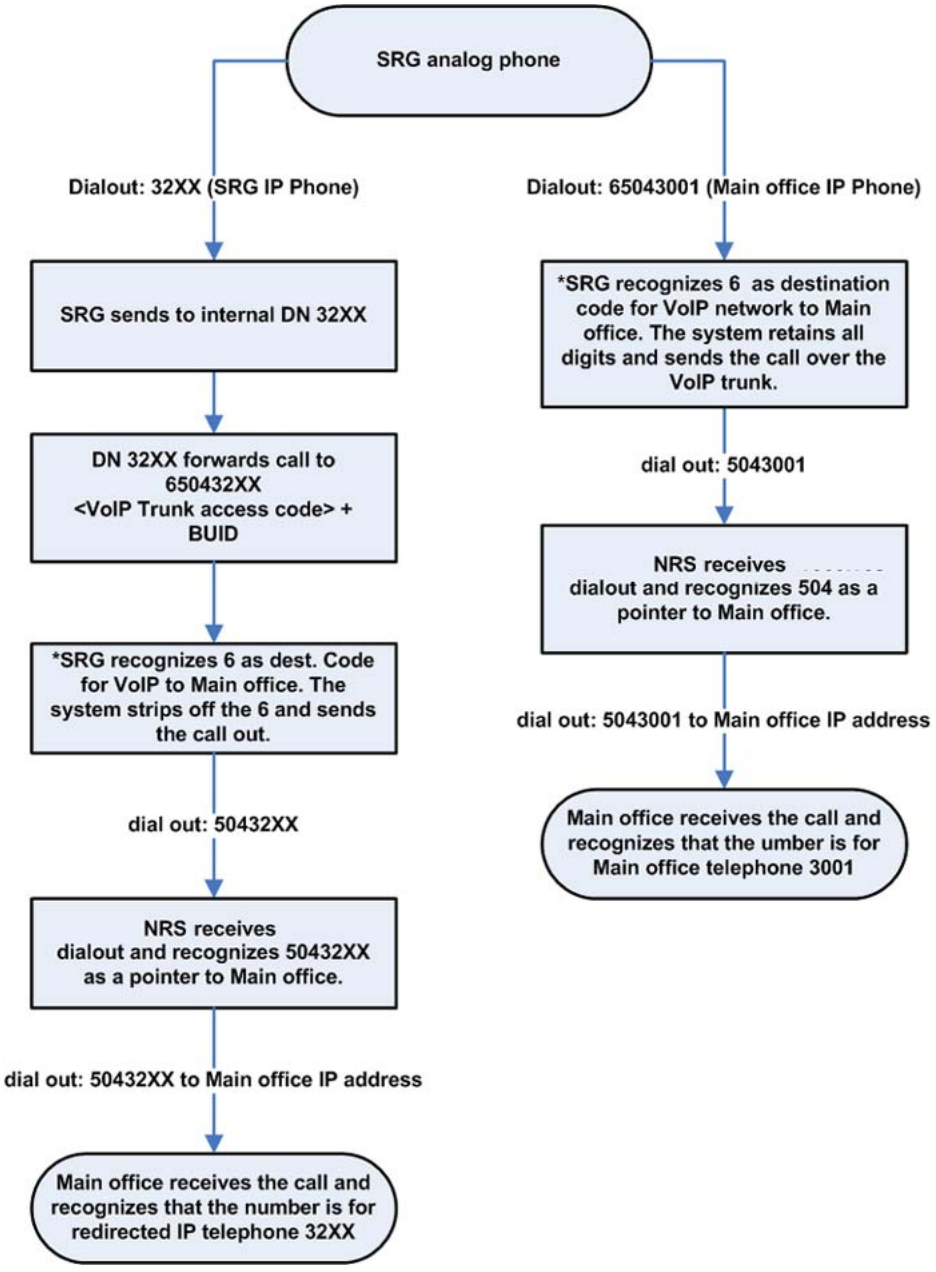

Figure 30: SRG 50 analog phone calls an SRG 50 IP phone and a main office IP phone registered to the main office

Calling in Local Mode

In this scenario, the IP phones at the SRG 50 are in Local Mode because the WAN is down. The SRG 50 IP phones are reregistered to the SRG 50 and call forward BUID is inactive on these telephones. These IP phones are registered at the SRG 50, and call forward BUID is inactive on these telephones.

The inset shows a main office call to SRG 50 telephones. The user must dial the SRG 50 DN for the IP phone (6002 instead of 3002). In this case, the user dialing is different in the following ways:

- DN 3001 can call DN 3002 by dialing 65043002, instead of 3002.
- DN 3101 can call DN 3002 by dialing 3002, instead of 65013002 dialed in Normal Mode.
- DN 3002 can call DN 3001 by dialing 65013001, instead of 3001 dialed in Normal Mode.
- DN 3002 can call DN 3101 by dialing 3101 instead of 65043101 dialed in Normal Mode.

The WAN is down. SRG 50 analog phone calls an IP phone and a main office IP phone registered to the SRG 50 (Local Mode). Figure 31: SRG 50 analog phone calls an IP phone and a main office IP phone registered to the SRG 50 on page 80 shows a call from the SRG 50 to an SRG 50 IP phone and a main office IP phone registered at the SRG 50.

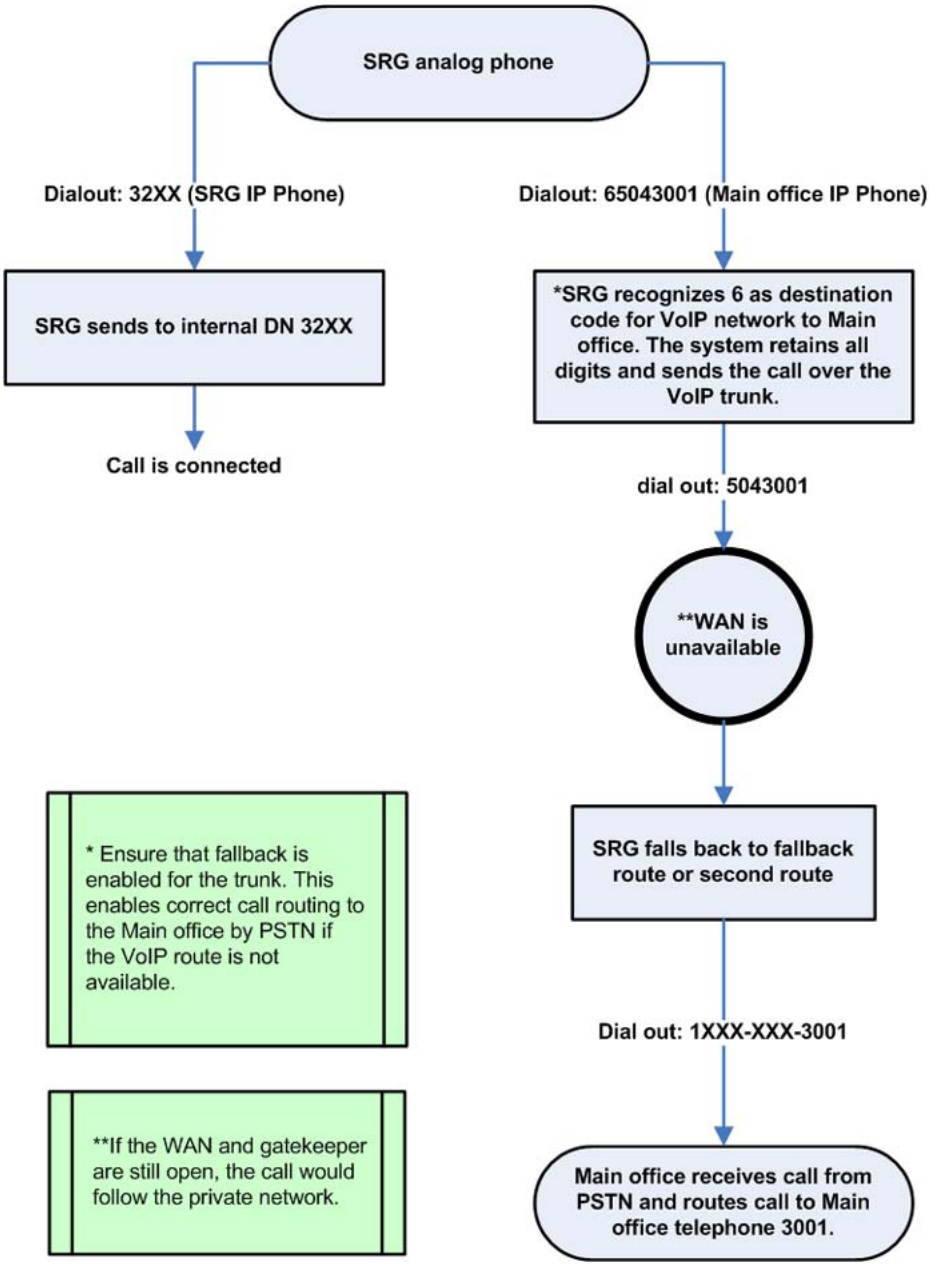

Figure 31: SRG 50 analog phone calls an IP phone and a main office IP phone registered to the SRG 50

Configuration examples

The following configurations are based on the examples provided in this section. For further information, see *Avaya Branch Office Installation and Commissioning, NN43001-314*.

To configure the main office:

- Configure the ESN Control Block for UDP in LD 86.

PCID H323
ISDN YES
MODE ISLD
DCH 12
IFC SL1
INAC YES
```

To configure the NRS (H.323 Gatekeeper/SIP Redirect Server):

- Create H.323/SIP endpoints: MO, BO.
- Create Numbering Plan entries:
  - Choose type UDP-LOC.
  - Add 504 for endpoint BO.
  - Add 501 for endpoint MO.

For information about configuring H.323 Gatekeeper/SIP Redirect Server, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

To configure the SRG 50:

- Create route and destination code to main office.
- In the main office screen:
  - Set the type of number to ESN LOC.
  - The VoIP trunk access code field is empty.
  - Set the main office Access Code Length to 1.

  You can also include the LOC as the dial out when you configure the route for the VoIP line pool. This allows users to dial fewer numbers. For example, if 501 is configured as the dialout, and 6 is the destination code, the user could dial 6+<main office DN>. Once the system identifies the route (VoIP trunks) and drops the 6, it adds the LOC in front of the DN and dials <LOC>+<DN>. In the case of redirected IP phones, the BUID is <destination code>+DN. The main office Access code length, in this circumstance, is set to 1.
- Dialing plan:
  - Set Type to UDP.
  - Set LOC to 504.
- Set the BUID on the IP phones to <VoIP trunk destination code> + <LOC> + <DN>.

For more information on configuring the main office and NRS, see *Avaya Branch Office Installation and Commissioning, NN43001-314* and *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*. For more information on configuring the SRG 50, see *Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Routing calls

SRG 50 user call to an SRG 50 PSTN

The SRG 50 user telephone is registered at the main office. The SRG 50 user telephones are physically located at the branch office, so routing of local PSTN calls back to the branch office is essential, even if they are registered with the main office.

Branch office behavior of the SRG 50 user telephones at the main office is configured by setting branch office zone characteristics through LD 117 at the main office.

SRG 50 PSTN to an SRG 50 telephone (DID call)

If the DN is valid and can terminate, call termination at the branch office is treated differently for IP phones and non-IP phones, as follows:

- IP phones—If the telephone is registered to the SRG 50 (Local Mode), the call is terminated locally. If the telephone is not registered to the SRG 50 (Normal Mode), the call is routed through a Virtual Trunk to the main office.
- Non-IP phones—Calls are terminated locally (within the branch office).

Network using Uniform Dialing Plan

The following section provides general network configuration for a network using UDP only.

Figure 32: Scenario 1: UDP throughout the network on page 84 shows two or more main offices with their branch offices, within a larger network. Callers within each main office/branch office region use UDP to place calls between systems. Callers also use UDP to place calls across the IP network to the other main office(s) and its (their) branch offices.

In a typical network, a full region uses a single Home Location Code (HLOC). However, it is also possible, where the number of users requires it, to have two or more codes, although using one for the main office and one for each branch office is unlikely at best.

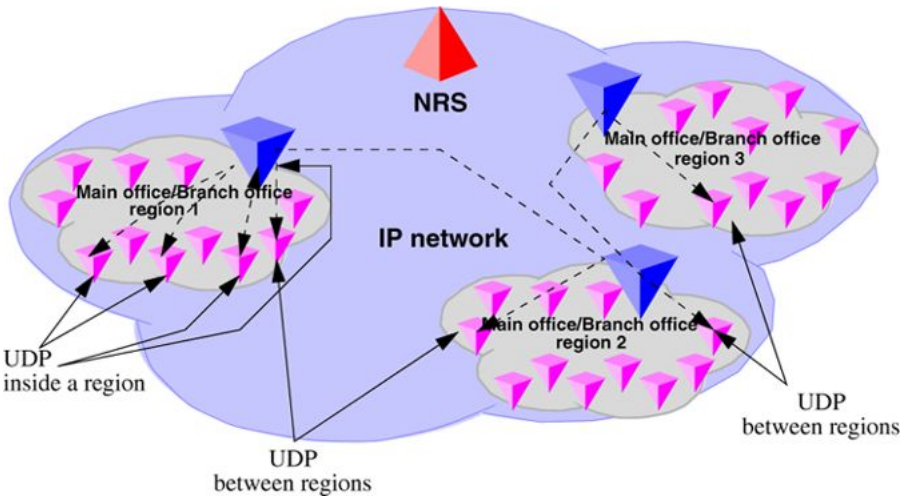

Figure 32: Scenario 1: UDP throughout the network

Common details

In general, if an HLOC is shared between two or more systems, the provisioning at the main office gets more complex, unless all branch offices share HLOC with the main office. That is, if the main office has two or more HLOC, and one or more of these (but not necessarily the same one) is used by every branch office, then provisioning is relatively straight forward.

Table 11: Configuration details for the general case on page 84 describes the network configuration and the steps that a call takes during its setup.

Table 11: Configuration details for the general case

Region	Call progress steps	Configuration detail and call progress during call setup
1, 2, 3		UDP used for all calls within the region.
1, 2, 3		UDP used for region to region calls.
1, 2, 3		Prefixes for branch offices for regular calls are required for all branch offices. May have additional prefixes for E-911 calls, if required, or may share prefixes.
1	1	All branch offices are provisioned at the NRS to route all outbound calls (from the branch office) through the main office. (NRS tandem configuration).
1	2	Main office sends all UDP calls to destinations that are not its own branch office to the NRS with unchanged dialled digits.

Region	Call progress steps	Configuration detail and call progress during call setup
1	3	Main office sends all UDP calls to destinations that are its own branch office to the NRS with a specific gateway prefix in front of the dialled digits.
1	4	All branch offices delete the prefix and any LOC codes, and terminate the calls. May be to a local set or to a trunk.
2,3		Similar call setup steps take places for calls within region 2 and 3.

Differences when every branch office HLOC is shared with the main office

Table 12: Provisioning details for this case on page 85 shows the configuration when the branch office HLOC is shared with the main office.

Table 12: Provisioning details for this case

Region	Provisioning detail
1	Provisioning on the main office requires parsing to only normal LOC identification and HLOC deletion.
1	LOC values that are on branch offices may be provisioned as extended LOC (> 3 digit codes).
1	The DMI for the branch office LOC inserts a gateway routing prefix in front of the number.
2,3	Similar configuration, as above, applies to regions 2 and 3.

Call between two branch offices associated with the same main office

The following scenarios describe calls between two branch offices that belong to the same main office. The different scenarios described below vary in the manner in which the HLOC is architected; branch offices have same HLOC as the main office, branch offices have a different HLOC than the main office, and so on.

Every branch office HLOC is shared with the main office

In the following example, the HLOC of all the branch offices and the HLOC of the main office are all the same. See Figure 33: Call flow for Scenario 1 - local call on page 86.

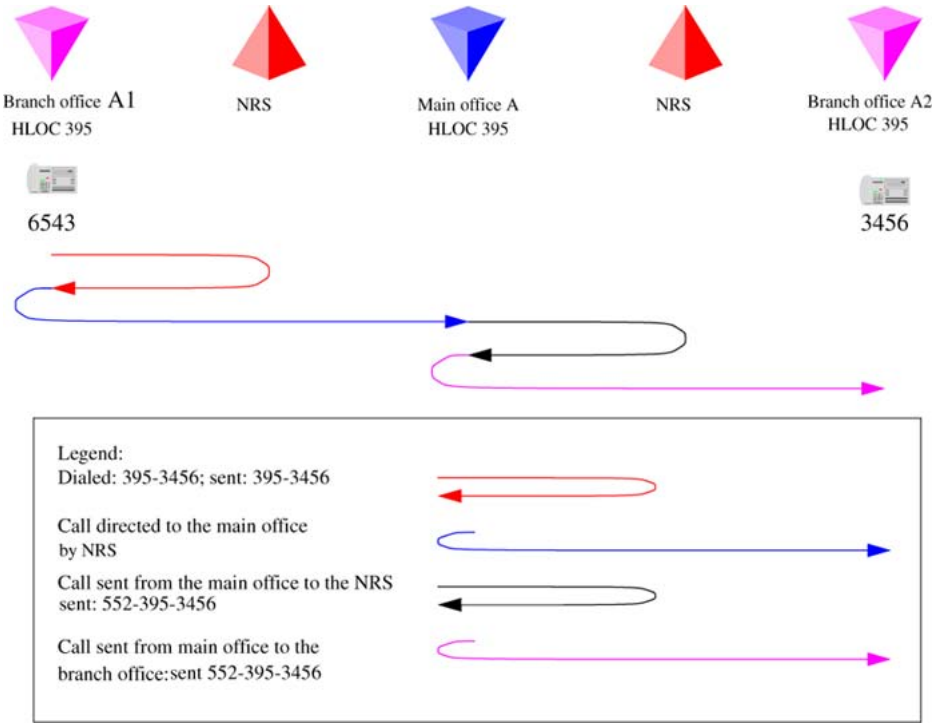

Figure 33: Call flow for Scenario 1 - local call

1. The branch office user dials 6-395-3456. The system transmits 395-3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 395-3456 to the main office.
3. The main office determines that this is LOC 39534, to another branch office, with gateway routing prefix 552. The system inserts the prefix and transmits 552-395-3456 to the NRS. The NRS checks its provisioning, and determines that all calls to prefix 552 are to be sent to branch office A2; it directs the call to the branch office.
4. The main office sends the call to 552-395-3456 to the branch office. The branch office deletes the prefix and the HLOC, and rings set 3456.

No branch office HLOC is shared with the main office, but can be shared with another branch office

In this example, the HLOC of the branch offices are the same but the HLOC of the main office is different. See Figure 34: Call flow for Scenario 1 - local call on page 87.

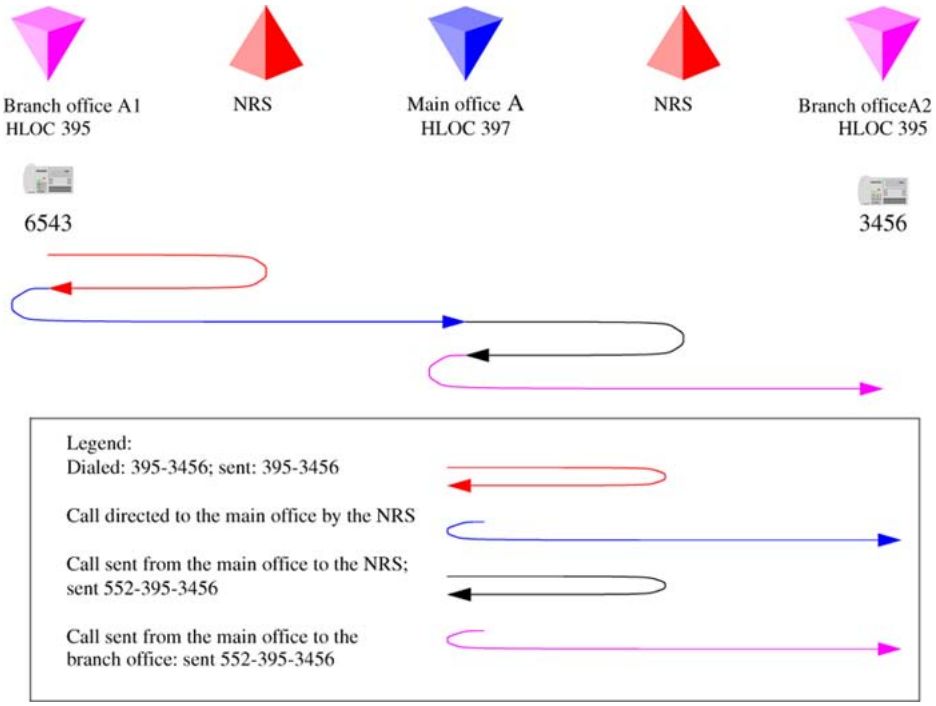

Figure 34: Call flow for Scenario 1 - local call

1. The branch office user dials 6-395-3456. The system transmits 395-3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 395-3456 to the main office.
3. The main office determines that this is LOC 39534 to another branch office, with gateway routing prefix 552. The system inserts the prefix and transmits 552-395-3456 to the NRS. The NRS checks its provisioning, and determines that all calls to prefix 552 are to be sent to branch office A2; it directs the call to the branch office.
4. The main office sends the call to 552-395-3456 to the branch office. The branch office deletes the prefix and the HLOC and rings set 3456.

No branch office HLOC is shared with the main office or another branch office

In this example, the HLOC is unique between all the branch offices and the main office. See Figure 35: Call flow for Scenario 1- local call on page 88.

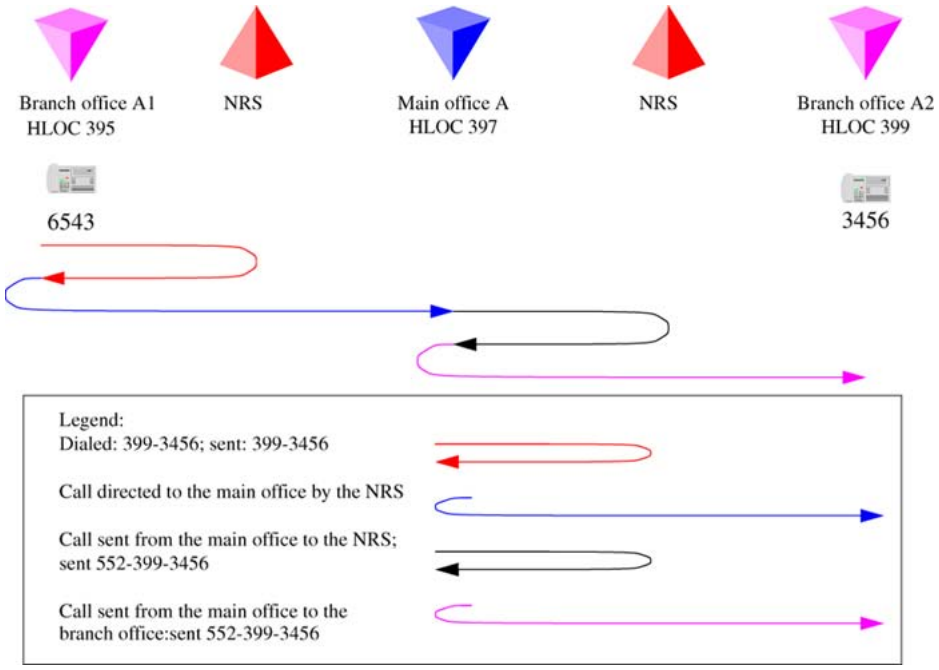

Figure 35: Call flow for Scenario 1- local call

1. The branch office user dials 6-395-3456. The system transmits 399-3456 to the branch office user dials 6-399-3456. NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 399-3456 to the main office.
3. The main office determines that this is to another branch office, with office prefix 552. The system inserts the prefix and transmits 552-399-3456 to the NRS. The NRS checks its provisioning, and determines that all calls to prefix 552 are to be sent to branch office A2; it directs the call to the branch office.
4. The main office sends the call to 552-399-3456 to the branch office. The branch office deletes the prefix and the HLOC, and rings set 3456.

Call between branch offices associated with different main office

The following scenarios describe calls between two branch offices that belong to different main offices. Note that the different scenarios described below vary in the manner in which the HLOC is architected; branch offices have same HLOC as the main office, branch offices have a different HLOC than the main office, and so on.

Every branch office HLOC is shared with the main office

Figure 36: Call to a remote branch office on the originator side on page 90 shows the first half of the call setup (the originator side is side A). In this example, the branch office and the main office share the same HLOC. Figure 37: Call to remote branch office on the destination side on page 91 shows the second half of the call (the terminating side is side B).

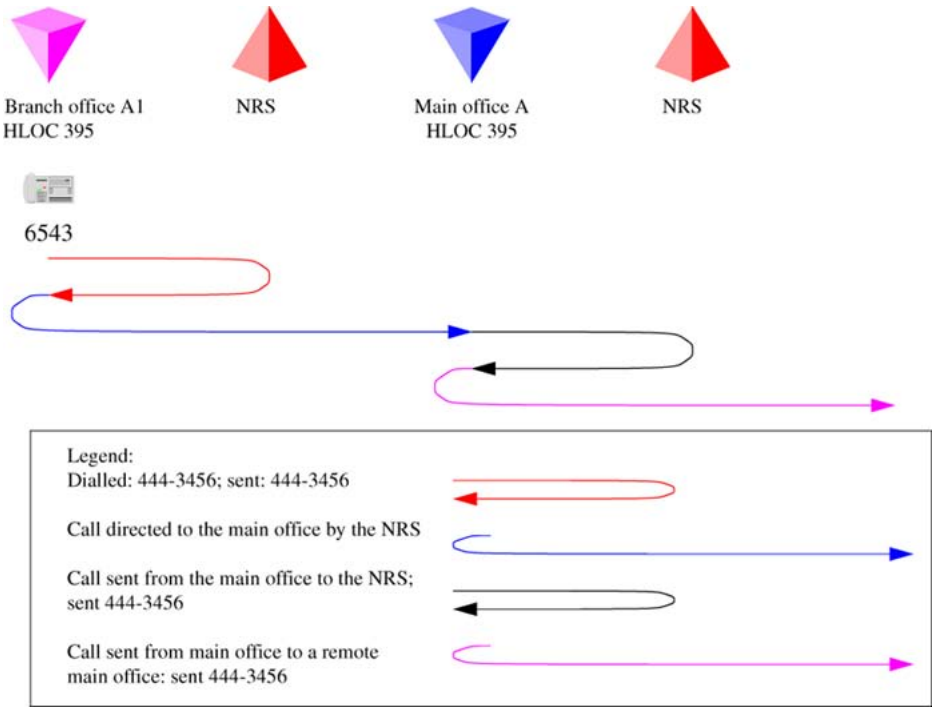

Figure 36: Call to a remote branch office on the originator side

1. The branch office user dials 6-444-3456. The system transmits 444-3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 444-3456 to the main office.
3. The main office determines that this is to another main office. The system transmits 444-3456 to the NRS. The NRS checks its provisioning, and determines that this call goes to main office B.

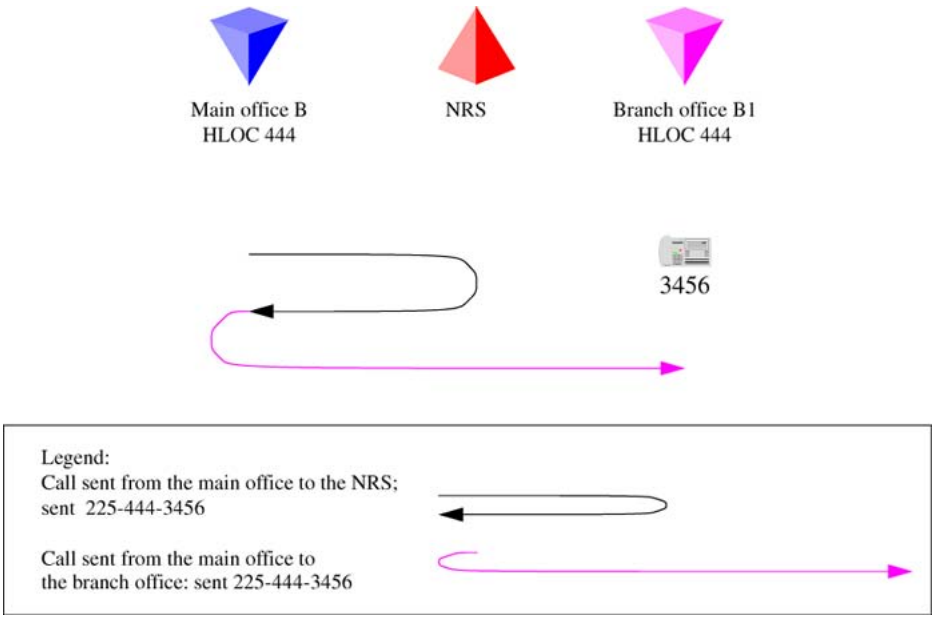

Figure 37: Call to remote branch office on the destination side

1. Main office B determines that this is to LOC 44434, which is a local branch office with prefix 225. The system transmits 225-444-3456 to the NRS. The NRS checks its provisioning, and determines that this call goes to branch office B1.
2. The main office sends the call to 225-444-3456 to the branch office. The branch office deletes the prefix, discovers the call is to its HLOC 444, deletes the HLOC, and rings set 3456.

No branch office HLOC is shared with the main office, but can be shared with another branch office

Figure 38: Call to remote branch office on the originator side on page 92shows the first half of the call (originator side of the call). Figure 39: Call to remote branch office on destination side on page 93shows the second half of the call (destination side of the call).

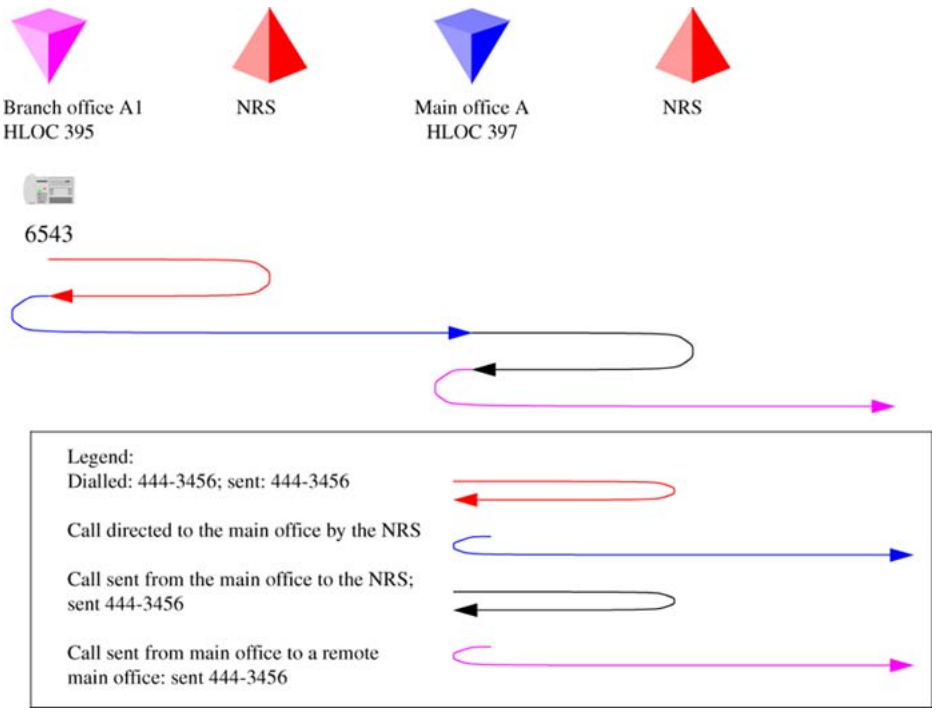

Figure 38: Call to remote branch office on the originator side

1. The branch office user dials 6-444-3456. The system transmits 444-3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 444-3456 to the main office.
3. The main office determines that this is to another main office. The system transmits 444-3456 to the NRS. The NRS checks its provisioning, and determines that this call goes to main office B.

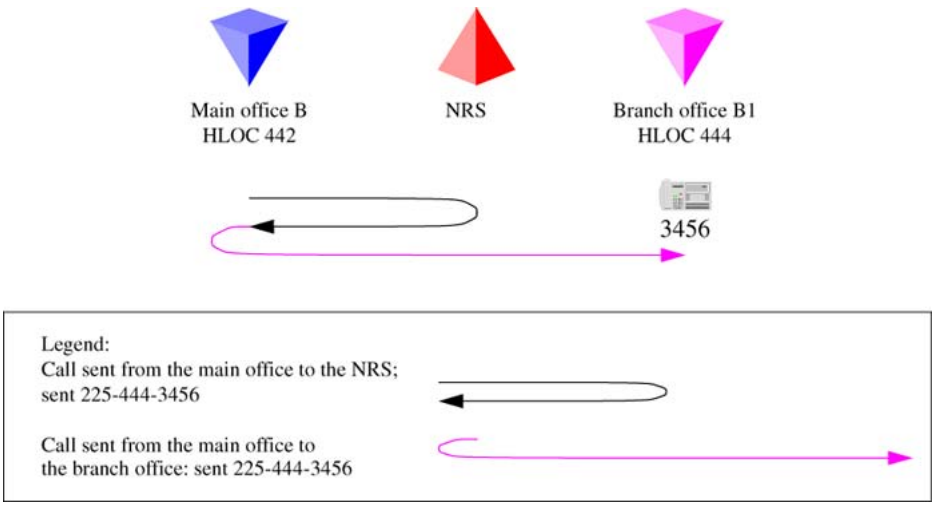

Figure 39: Call to remote branch office on destination side

1. Main office B determines that this LOC plus digits is to a local branch office with prefix 225. (If sharing this LOC with another branch office, the extended LOC is 44434.) The system transmits 225-444-3456 to the NRS. The NRS checks its provisioning, and determines that this call goes to branch office B1.
2. The main office sends the call to 225-444-3456 to the branch office. The branch office deletes the prefix, and the HLOC, and rings set 3456.

No branch office HLOC is shared with the main office or another branch office

The following example shows a call between two branch offices. In this example, the HLOC is unique between the main office and branch office. Figure 40: Call to remote branch office on the originator side on page 94shows the first half of the call (originator side of the call). In Figure 41: Call to remote branch office on destination side on page 95 shows the second half of the call (destination side of the call).

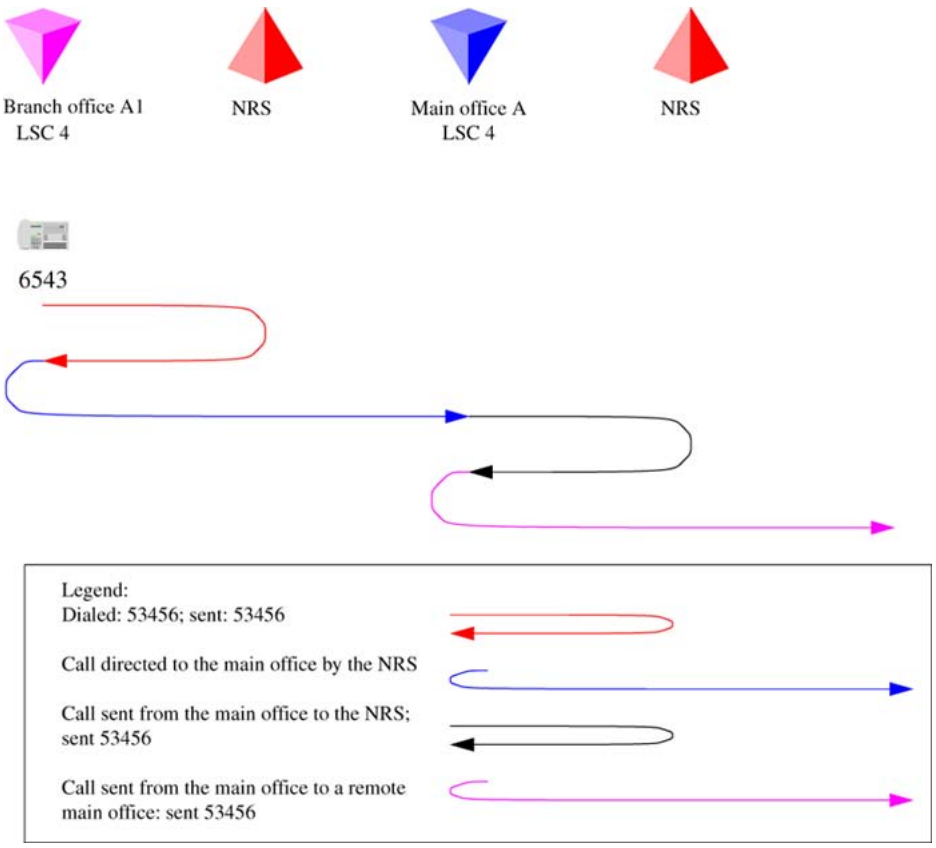

Figure 40: Call to remote branch office on the originator side

1. The branch office user dials 6-444-3456. The system transmits 444-3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 444-3456 to the main office.
3. The main office determines that this is to another main office. The system transmits 444-3456 to the NRS. NRS checks its provisioning, and determines that this call goes to main office B.

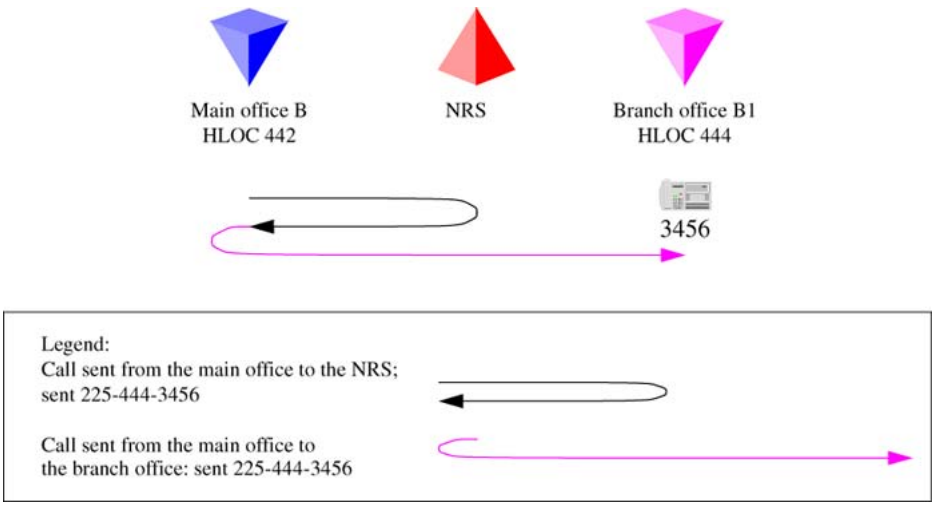

Figure 41: Call to remote branch office on destination side

1. Main office B determines that LOC 444 is to a local branch office with prefix 225. The system transmits 225-444-3456 to the NRS. The NRS checks its provisioning, and determines that this call goes to branch office B1.
2. The main office sends the call to 225-444-3456 to the branch office. The branch office deletes the prefix, discovers the call is to its HLOC, deletes the HLOC, and rings set 3456.

Summary of provisioning procedures for Tandem Bandwidth Management

Use Provisioning Tandem Bandwidth Management on page 97 to provision the network.

1. Enter the main office Gateway endpoint identifier in the Tandem Endpoint field for each branch office gateway configured on the NRS. This provides tandeming for outbound calls from a branch office through its main office. See 1 on page 97.
2. Plan the gateway routing prefixes, if not already done. At least one prefix is needed for each branch office, although any branch offices that have a prefix for ESA 911 calls does not necessarily require another. (These prefixes are Special Number [SPN] entries.) See 2 on page 98.
3. Provision the NRS to send all calls to a LOC without a gateway routing prefix to the main office of that LOC, or to the main office which provides service for the branch office using the LOC. See 3 on page 98.
4. Provision the NRS to send all calls to a LOC with a gateway routing prefix to the branch office directly. Using the gateway routing prefix and the Type of Number of SPN, the entries can be differentiated from the normal LOC easily. See 4 on page 98.

5. Provision the main office with the DGT table DMI to insert the prefixes and set the Type of Number correctly. Create RLB RLI entries to use these DMI for the VTRK route(s). One RLI for each branch office is the minimum requirement. Note that calls from remote systems will typically have the HLOC prefix, so this is defined here. See 5 on page 98.
6. Provision the main office with CDP DSC (mapped by the RLI into Location Codes) sufficient to uniquely identify all of its branch offices (using extended location codes, if required); use the RLI index defined for each branch office as the RLI value of the LOC definition. This is the route to the branch office. See 6 on page 99.
7. Provision the main office and branch office with a home location code (HLOC) or multiple codes to terminate all calls that should terminate on this system. See 7 on page 99.
8. Provision the main office to send all other LOC to the IP network without prefixes. These are going to a remote main office. See 8 on page 100.
9. Provision the branch office with a terminating RLI with a DMI to delete the LOC prefixes. See 9 on page 101.

Provisioning Example of Tandem Bandwidth Management

Figure 42: Provisioning example on page 97 shows an example of the network configuration.

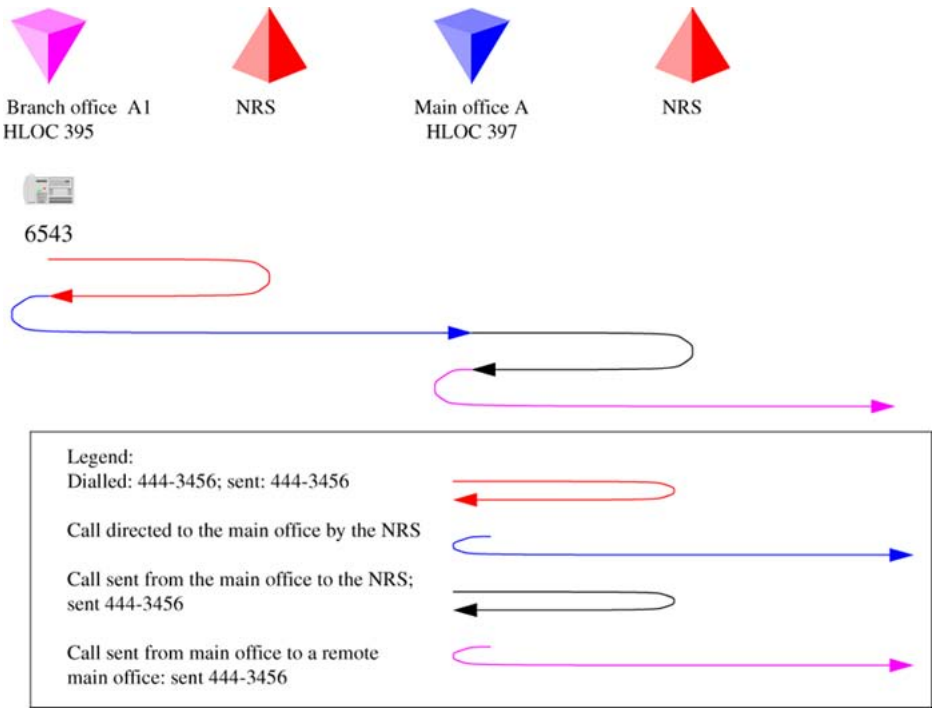

Figure 42: Provisioning example

Provisioning Tandem Bandwidth Management

1. Enter the main office Gateway endpoint identifier in the Tandem Endpoint field for each branch office GW configured on the NRS. This provides tandeming for outbound calls from a branch office through its main office.

   Figure 43: Tandem endpoint configuration in Element Manager on page 98 shows the tandem endpoint configuration in Element Manager.

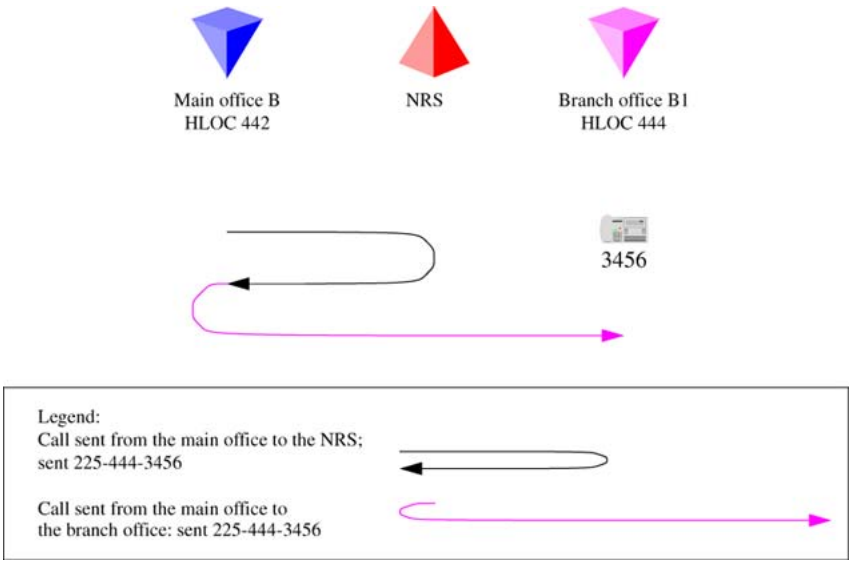

Figure 43: Tandem endpoint configuration in Element Manager

2. Plan the gateway routing prefixes. At least one prefix is needed for each branch office, although any branch offices that have a prefix for ESA 911 calls does not necessarily require another. (These prefixes will be SPN - Special Number - entries if you are using ESA 911. In the example these are LOC codes because network 911 is not being used.) In our example the Branch office prefixes are 741 (branch office B) and 742 (branch office A).
3. Provision the NRS to send all calls to a LOC without a gateway routing prefix to the main office of that LOC, or to the main office which provides service for the branch office using the LOC. In our example the NRS is provisioned with 841 (for main office B) and 842 (for main office A).
4. Provision the NRS to send all calls to a LOC with a gateway routing prefix to the branch office directly. Using the gateway routing prefix and the Type of Number as used (LOC or SPN), the entries can be differentiated from the normal LOC easily. In our example the NRS is provisioned with 741-841 at branch office B and 742-842 for branch office A.
5. Provision the main office with the DGT table DMI to insert the prefixes and set the Type of Number correctly. Create RLB RLI entries to use these DMI for the VTRK route(s). One RLI for each branch office will be the minimum requirement. Note that calls from remote systems will typically have the HLOC prefix, so this is defined here

   Table 13: Main office B DMI and RLI provisioning for calls in branch office B on page 98 lists main office B DMI and RLI provisioning.

Table 13: Main office B DMI and RLI provisioning for calls in branch office B

6. Provision the main office with CDP DSC (mapped by the RLI into Location Codes) sufficient to uniquely identify all of its branch offices (using extended location codes, if required); use the RLI index defined for each branch office as the RLI value of the LOC definition. This is the route to the branch office.

   Table 14: Main office B LOC provisioning for LOC 741 841 on page 99 lists main office B LOC provisioning.

Network using mixed Coordinated Dialing Plan and Uniform Dialing Plan

The following section provides general details of the network setup. The following shows an example of a mixed network configuration.

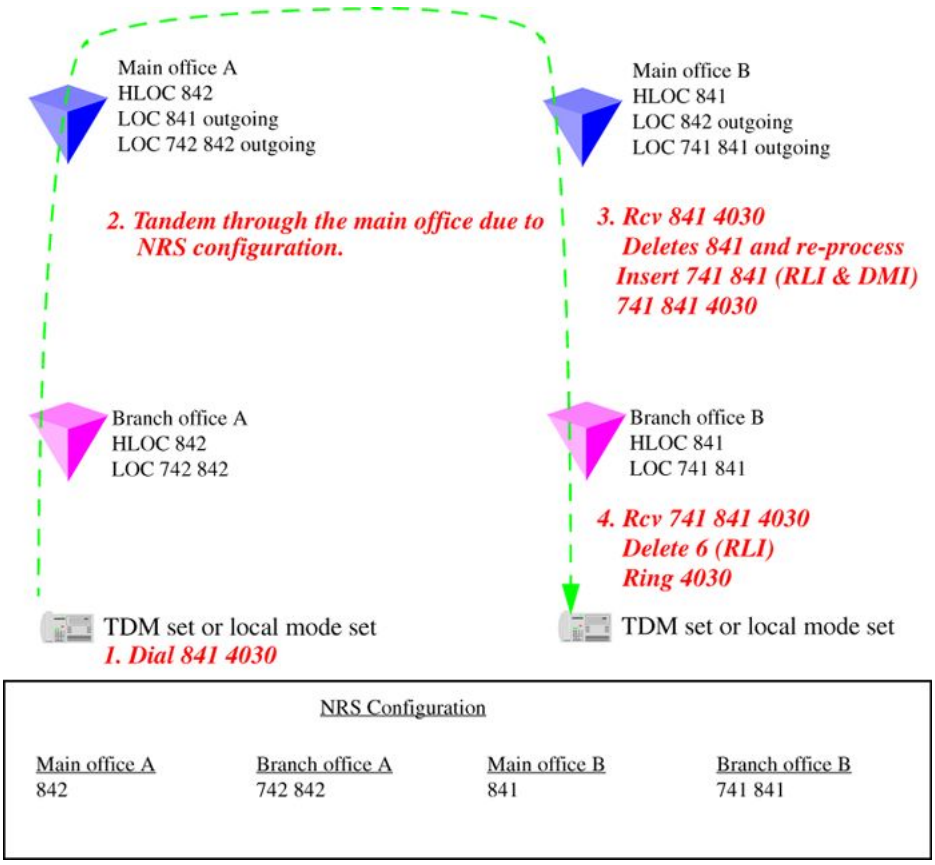

Figure 44: UDP between main offices and CDP inside the main office region

Table 19: Provisioning details for this case on page 102 lists provisioning details for a mixed network.

Table 19: Provisioning details for this case

Region	Provisioning detail
1, 2, 3	CDP used for all calls within the region.
1, 2, 3	UDP used for region to region calls.
1, 2, 3	Prefixes for branch offices for regular calls not required. May still have prefixes for E-911 calls, if required.
1	All branch offices are provisioned at the NRS to route all calls through the main office.
1	Main office sends all UDP calls to destinations that are not its own branch office to the NRS with unchanged dialled digits.
1	Main office sends all UDP calls to destinations that are its own branch office to the NRS after deleting the HLOC and converting to CDP.
2,3	Similar configuration, as above, applies to regions 2 and 3.

Call between two local branch offices

Figure 45: Local call dials CDP on page 103 shows the NRS Configuration web page in Element Manager.

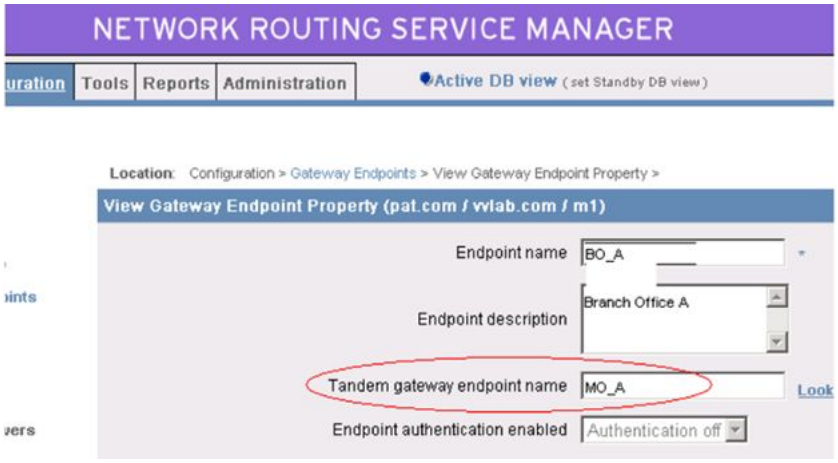

Figure 45: Local call dials CDP

1. The branch office user dials 3456 (CDP). The system transmits 3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 3456 to the main office.
3. The main office determines that this is to another branch office. The system transmits 3456 to the NRS. The NRS checks its provisioning, and determines that all calls to 3456 in this CDP domain are to be sent to branch office A2; it directs the call to the branch office.
4. The main office sends the call to 3456 to the branch office. The branch office rings set 3456.

Abnormal case - calls originating using UDP, but terminating using CDP

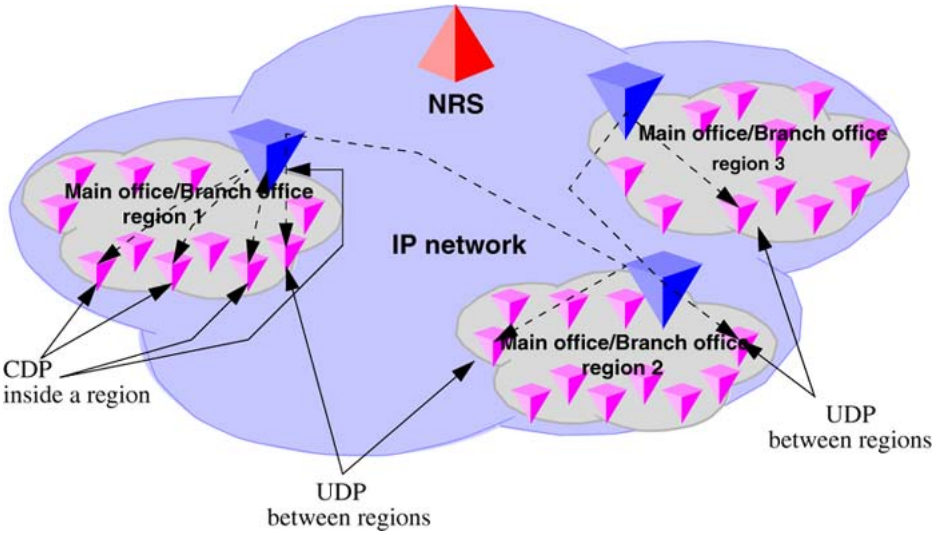

Figure 46: Call flow for Scenario 2 - local call dial UDP

1. The branch office user dials 6-395-3456. The system transmits 395-3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 395-3456 to the main office.
3. The main office determines that this is to another branch office, using CDP. The system deletes the HLOC and transmits 3456 to the NRS. The NRS checks its provisioning, and determines that all calls to 3456 from this CDP region are to be sent to branch office A2; it directs the call to the branch office.
4. The main office sends the call to 3456 to the branch office. The branch office rings set 3456.

Call between branch offices associated with different main offices

In the following diagram, the first half of the call is shown (the originator side of the call).

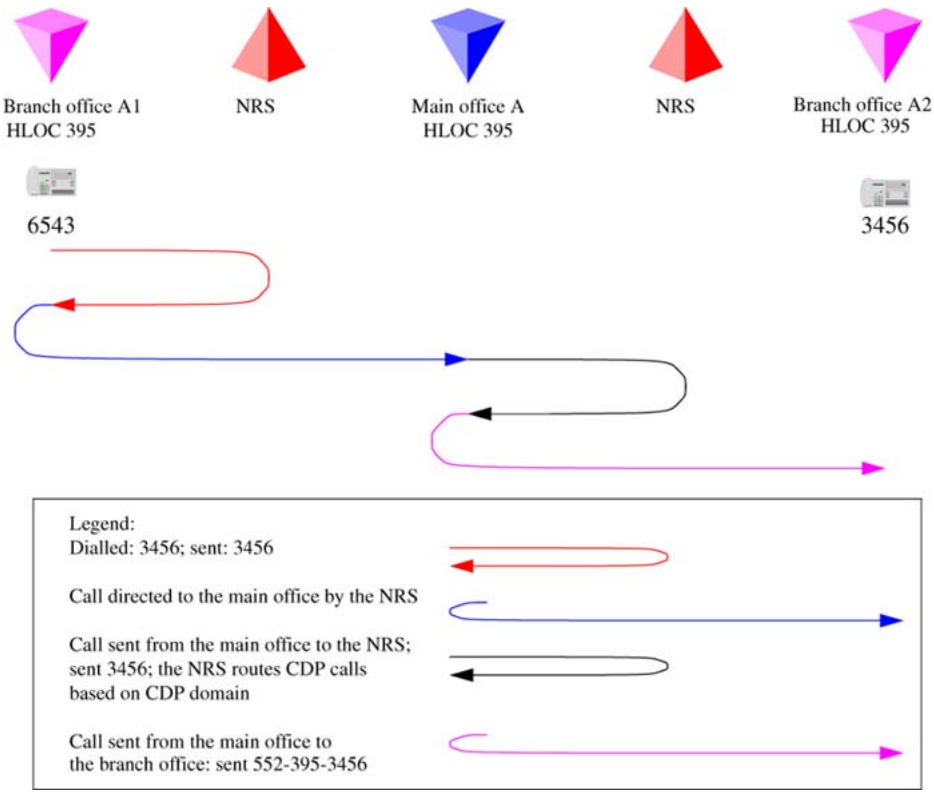

Figure 47: Call flow for Scenario 2 - local call to remote branch office (originator side)

1. The branch office user dials 6-444-3456. The system transmits 444-3456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 444-3456 to the main office. The main office determines that this is to another main office. The system transmits 444-3456 to the NRS. The NRS checks its provisioning, and determines that this call goes to main office B.

Figure 48: Call to remote branch office on the destination side on page 106 shows the second half of the call (destination side of the call).

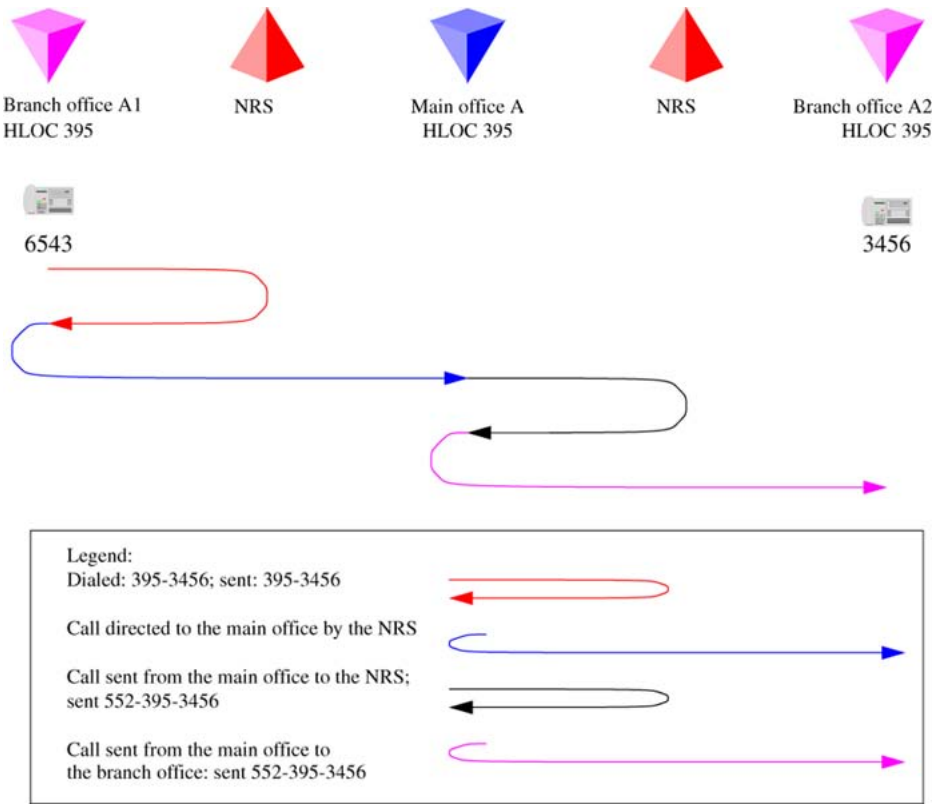

Figure 48: Call to remote branch office on the destination side

1. The main office B deletes the HLOC, and determines that this is to a local branch office. The system transmits 3456 to the NRS. The NRS checks its provisioning, and determines that for this CDP region this call goes to branch office B1.
2. The main office sends the call to 3456 to the branch office. The branch office rings set 3456.

Network using Coordinated Dialing Plan

The following section provides general details of network setup.

The following diagram shows a full CDP network configuration.

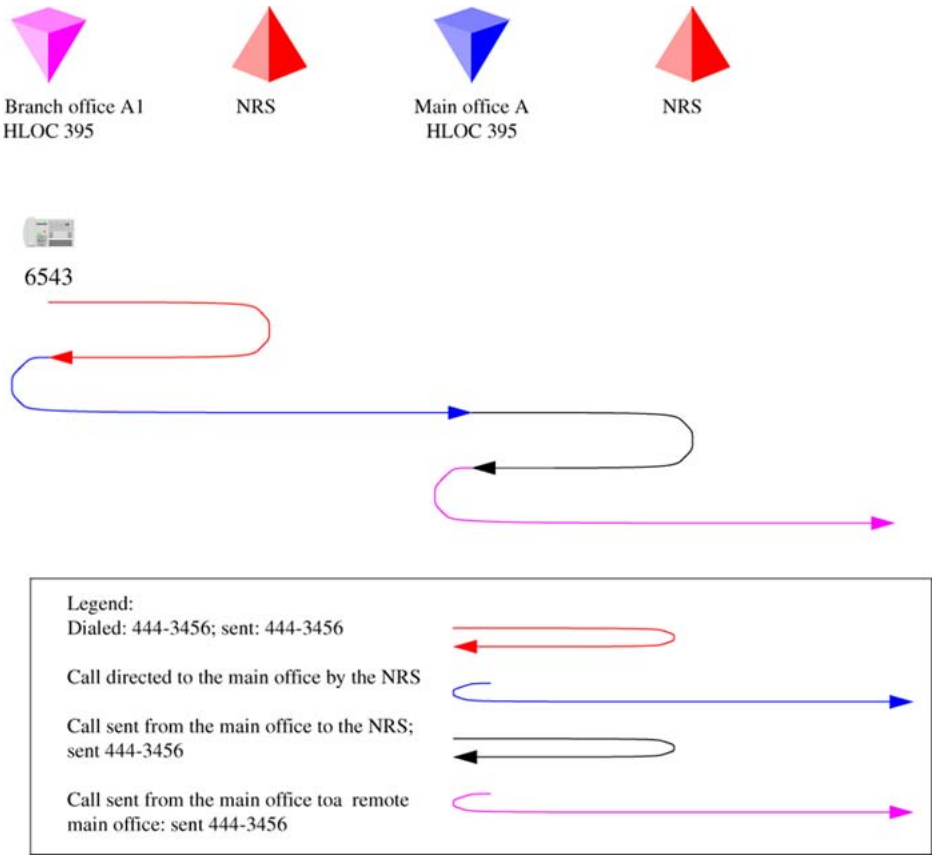

Figure 49: Full CDP network

The following table lists the provisioning details for a full CDP network.

Table 20: Provisioning details for this case

Region	Provisioning detail
1, 2, 3	CDP used for all calls within the region.
1, 2, 3	CDP used for region to region calls.
1, 2, 3	All CDP numbers must be sufficiently long to allow unique termination of the calls. That is, every main office/branch office region requires its own LSC to ensure that all numbers are unique.
1, 2, 3	Prefixes for branch offices for regular calls are required. May have additional prefixes for E-911 calls, if required, or may share prefixes.
1	All branch offices are provisioned at the NRS to route all calls through the main office.
1	Main office sends all CDP calls to destinations that are not its own branch office to the NRS with unchanged dialled digits.

Region	Provisioning detail
1	Main office sends all CDP calls to destinations that are its own branch office to the NRS with a specific gateway prefix in front of the dialled digits.
1	All branch offices delete the prefix and terminate the calls. May be to a local set or to a trunk.
2,3	Similar configuration, as above, applies to regions 2 and 3.

Call between two local branch offices

The following diagram shows the call flow of a call between two local branch offices.

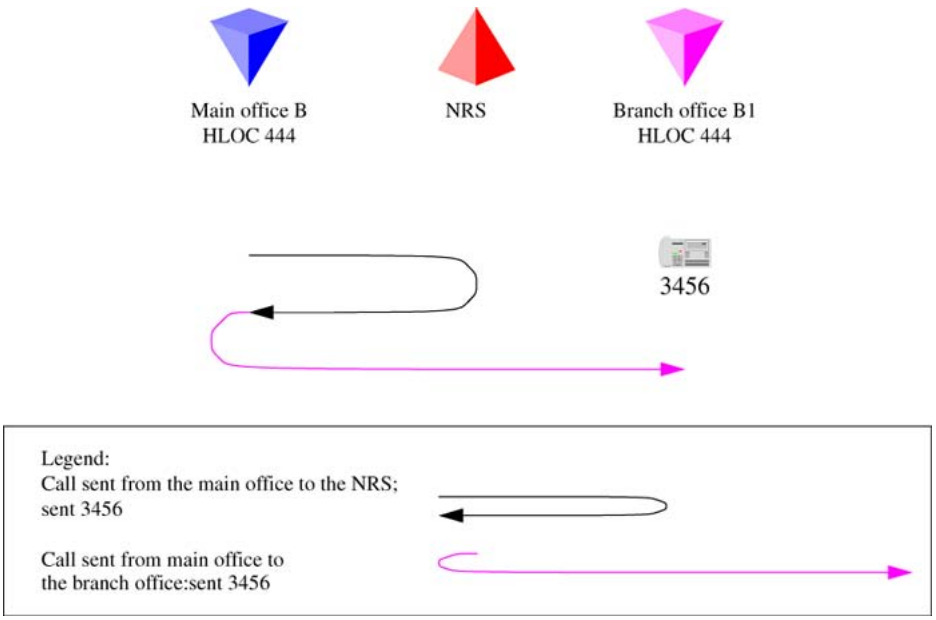

Figure 50: Call flow for Scenario 3 - local call

1. The branch office user dials 43456. The system transmits 43456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 43456 to the main office.
3. The main office determines that this is to another branch office, with office prefix 552. The system inserts the prefix and transmits 552-43456 to the NRS. The NRS checks its provisioning, and determines that all calls to prefix 552 are to be sent to branch office A2; it directs the call to the branch office.
4. The main office sends the call to 552-43456 to the branch office. The branch office deletes the prefix and LSC 4, and rings set 3456.

Call between branch offices associated with different main offices

In the following diagram, the first half of the call is shown (originator side of the call).

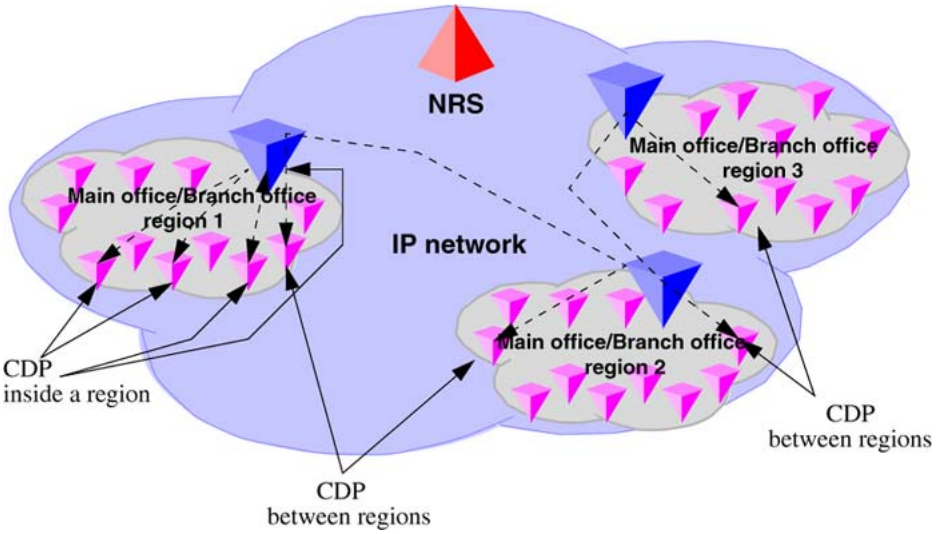

Figure 51: Call flow for Scenario 3 - calls to remote branch office (originator side)

1. The branch office user dials 53456. The system transmits 53456 to the NRS. The NRS checks its provisioning, and determines that all calls are to be sent to the main office; it directs the call to the main office.
2. The branch office sends the call to 53456 to the main office.
3. The main office determines that this is to another main office. The system transmits 53456 to the NRS. The NRS checks its provisioning, and determines that this call goes to main office B.

In the following diagram, the second half of the call is shown (destination side of the call).

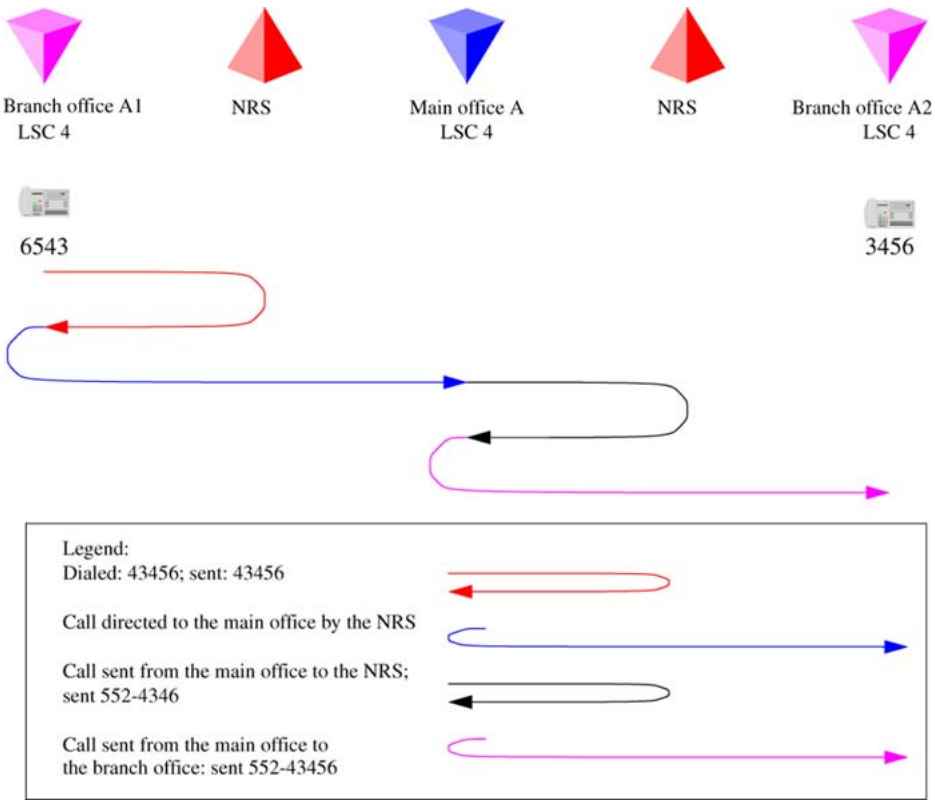

Figure 52: Call flow for Scenario 3- calls to remote branch office (destination side)

1. Main office B determines that this is to a local branch office with prefix 225. The system transmits 225-53456 to the NRS. The NRS checks its provisioning, and determines that this call goes to branch office B1.
2. The main office sends the call to 225-53456 to the branch office. The branch office deletes the prefix and LSC, and rings set 3456.

Chapter 8: Emergency Services configuration

Contents

This section contains the following topics:

Overview

Support for access to emergency services by branch users in Normal Mode is configured at the main office.

The key difference between the main office user and the branch user is the route selected for the emergency call. An emergency call must be handed off to the PSTN over a trunk at the central office that is geographically closest to the caller—this means that there is normally an emergency trunk in the main office, and one in each of the branch offices. An emergency call originating from an SRG 50 IP phone must route from the main office Call Server to the SRG 50 so that the call can be sent on the SRG 50 PSTN Trunks.

In Normal Mode, an IP phone must have a Virtual Trunk available and configured between the main office and branch office to complete an emergency services call.

Important:
Do not route ESA calls to a node that has no direct ESA trunks.

Avaya recommends using the Emergency Services Access (ESA) feature. This is the preferred method in North America, the Caribbean and Latin America (CALA), and in those countries that are members of the European Union (EU). ESA provides specific features and capabilities required by legislation in these jurisdictions.

The ESA feature provides the following advantages:

- recognizes special Emergency Service Directory Number (ESDN)
- overrides calling restrictions
- provides optional assignment of ESA CLID for each DN
- provides optional selection of a special emergency route
- provides optional routing digits (for NRS resolution)
- provides optional assignment of an Emergency Location Identification Number (ELIN)
- provides On Site Notification (OSN) through an external tool, which traps the emergency call event and records an alarm when an emergency calls are placed at the branch office

For more information about ESA, see *Avaya Emergency Service Access Fundamentals, NN43001-613*.

The main office Call Server forwards emergency services calls to the SRG 50 using a virtual trunk.

Emergency Services Access

The Emergency Services Access (ESA) configuration specifies the digit sequence (a DN) that the user dials to start an emergency call, known as the Emergency Services Directory Number (ESDN). There can only be one ESA configuration for each customer and thus only one ESDN for each customer, which means that all telephones on the same network must be in the same numbering plan.

With all sites using the same ESDN, a conflict occurs in the NRS because the same ESDN may need to route to different gateways. The conflict is resolved by using a routing digit for each site that the main office adds as it routes the call. The suggested routing digit is the ESN home location code of the SRG 50, or alternately, the Numbering Plan Area (NPA) code of the SRG 50 if there is not more than one Call Server in the NPA. Virtually any unique digit string (maximum 15 digits) can be used as a routing digit, because the call is sent to the NRS as a Private/Special Number (SPN). In the NRS, SPN have their own separate numbering plan.

The Automatic Number Identification (ANI) data sent to the Public Safety Answering Point (PSAP) identifies the location of the caller. In some constituencies, legislation requires one ANI (DID) for each fixed area, so the physical location of the emergency can be approximated based on the telephone number delivered to the PSAP. The ESA feature has a comprehensive scheme that can be used to convert an extension into an appropriate DID.

If the branch office is relatively small, it can be easier to use a single ANI number for the branch office. For more information on this command, see *Avaya Software Input Output Reference - Maintenance, NN43001-711*.

Routing Emergency Services Access (ESA) calls

Important:

Do not route ESA calls to a node that has no direct ESA trunks.

Ideally, route ESA calls directly over Central Office (CO) trunks to the Public Safety Answering Point (PSAP). In those cases where this routing is not possible, do not route ESA calls to nodes that have no direct ESA trunks.

The implications of routing calls to nodes without direct ESA trunks are as follows:

- At the node without the direct ESA trunks, the node cannot route the ESA call directly to the PSAP. Instead, that node must reroute the call to another node. This rerouting is an unnecessary use of resources.
- If the node is a CS 1000E node, the only tandem trunks are IP Peer trunks. There is no way to specify the appropriate rerouting digits (that is, Prepend Digits) to reroute the ESA call to another node with direct ESA trunks.

Therefore, if unable to route ESA calls directly to the PSAP, the next best practice is to route ESA calls to nodes with direct ESA trunks.

Emergency call routing

A Call Server can provide service to IP phones across multiple emergency jurisdictions. This can also occur with traditional non-IP equipment in the form of remote peripheral equipment (for example, Carrier Remote, Fiber Remote).

An emergency call should be handled by the designated means for the phone location (for example, local security desk or local PSAP). The emergency call should be routed to a service at the current location of the phone.

Configuring ESA for the branch office

For ESA, the main office Call Server forwards the call to the branch office for termination. Calls are redirected over a Virtual Trunk using the NRS. The NRS routes the calls using a special number, referred to in this section as the ESA Special Number.

ESA must be configured and tested on the main office Call Server and the SRG 50 to differentiate between emergency calls originating from IP phones at each location and calls originating on trunks, which refers to the forwarded emergency call that the SRG 50 receives from the main office for an IP phone in Normal Mode.

Use the following steps to configure ESA for emergency access at each location:

At the main office:

1. Determine the dialing plan (for example, numbering plan) for ESA calls.
2. Configure the main office emergency trunk (CAMA or PRI).

   For EMEA, the following trunks are supported:

   - BRIE (Basic Rate Interface–ETSI based)
   - PRI (Primary Rate Interface per EURO ISDN)
   - QSIG on PRI
   - DPNSS
   - IP tandem trunks on ISDN
3. Configure the Virtual Trunk at the main office.
4. Configure ESN at the main office.
5. Configure ESA at the main office.
6. Configure the SRG 50 zone on the main office.

   Configure a zone for each branch office which is used in conjunction with ESA parameters to route an emergency call to the SRG 50.
7. Test ESDN using a main office telephone.
8. Configure the SRG 50 emergency trunk (CAMA or PRI).
9. Configure the Virtual Trunk at the MG 1000B.
10. Configure ESN at the branch office.
11. Configure ESA at the branch office.
12. Configure the branch office zone on the branch office.

    The branch office zone is required for bandwidth management but does not require ESA parameters.
13. Configure the ESN SPN on the branch office.
14. Configure the NRS for the ESA Special Number used.
15. Test ESDN using an analog (500/2500-type) telephone located at the branch office.
16. Test ESDN using an SRG 50 IP phone in Normal Mode and in Local Mode.

At the SRG 50, or branch office:

1. Configure the SRG 50 emergency trunk (CAMA or PRI).
2. Configure the Virtual Trunk at the MG 1000B.
3. Configure ESN at the branch office.
4. Configure ESA at the branch office.
5. Configure the branch office zone on the branch office.

   The branch office zone is required for bandwidth management but does not require ESA parameters.
6. Configure the ESN SPN on the branch office.
7. Configure the NRS for the ESA Special Number used.
8. Test ESDN using an analog (500/2500-type) telephone located at the branch office.
9. Test ESDN using an SRG 50 IP phone in Normal Mode and in Local Mode.

Reregistering to minimally configured branch office

A branch user in Local Mode but who is not physically at the branch can get incorrect emergency service handling.

If the SRG 50 is not provisioned with knowledge of all the ERL in the enterprise, one of two scenarios occurs when an IP phone reregisters to the branch (either by VO ESA redirection or by fallback to Local Mode):

- If the local TN is provisioned as Manual Update, then the phone inherits the static location data. The static location data probably indicates basic ESA processing (LD 24) if this is a small branch.
- If the local TN is provisioned as Auto Update, then cached location data in the phone is rejected if undefined locally, and unknown location values (ERL = 0, ECL = 0, LocDesc = Unknown) are assigned. Unknown location indicates default (basic) emergency processing (LD 24), which is acceptable for a small branch. A system message is also generated to indicate that the phone location data was actually unknown and defaults were used, but emergency calls should be handled correctly.

Minimally configured branches (without LIS support) can be configured as manual update.

Routing configuration for ESA calls on SRG 50

Use the following steps to configure routing for ESA calls for the SRG 50:

Configuring routing for ESA calls

1. Build a destination code corresponding to the ESA SPN for the branch office.
2. Configure the destination code to absorb the leading digits for the SPN, leaving just the ESDN.
3. Configure the destination code to use a public route to the PSTN trunks.
4. Ensure the Remote access package (00 to 15 under Call Security) assigned to the VoIP trunks has the appropriate Line Pool Access/Bloc for PRI.
5. Ensure there is a Public Prefix of 911 with a length of 3 to match to outgoing digits. This eliminates any delay. As soon as the 3 digits are collected, the call is sent.

Determining the dialing plan for ESA calls

In many jurisdictions of the United States and Canada, the emergency number must be “911”. The call processor cannot have a DN that conflicts with these digits, but since “9” is often used for NARS AC2 (the local call Access Code), this is not usually a problem.

ESA for international deployment must support the standard emergency number 112 and any emergency numbers in use prior to the EU directive.

In general, ESA calls should leave the network through a trunk at the branch office where the originating telephone is located. To enable this, it is necessary for telephones at each branch office to supply a unique identifying prefix to the NRS when the ESA calls are being routed so that the NRS can select a distinct route for each branch office. This prefix can be configured with the zone data for the SRG 50 telephones. The provisioning of this prefix is an enhancement for branch office.

While a variety of numbering schemes are available, Avaya recommends that customers use 0 + the ESN location code of the SRG 50 + ESDN, where ESDN is:

- for North America and CALA—911
- for members of the European Union—112 and any other emergency numbers in use prior to the EU directive

This number, referred to here as the ESA Special Number, is configured as a special number (SPN) in the NRS so that the Virtual Trunk routes the call to the branch office.

Use Element Manager or the Command Line Interface for the following procedure. See *Avaya IP Peer Networking Installation and Commissioning, NN43001-313* for details.

Configuring the main office

1. Configure the main office emergency trunk (CAMA or PRI).

   Configure either analog CAMA or digital PRI to correctly signal the call identification.

ESA overrides all restrictions. Configure the trunk with restrictions so that other features cannot access the trunk.

2. Configure the Virtual Trunk using the procedure from *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

   The Virtual Trunk must be configured to enable emergency calls originating from SRG 50 IP phones registered at the main office to reach the branch office.

3. Configure ESN.

   ESA uses a route number rather than ESN route list index. However, ESN is required at the branch office.

4. Configure Emergency Services Access (ESA) in LD 24.

   Table 21: LD 24 Configure Emergency Services Access

Prompt	Response	Description
REQ:	NEW CHG	Add new data, or change existing data.
TYPE:	ESA	Emergency Services Access data block
CUST	xx	Customer number as defined in LD 15
ESDN	xxxx	Emergency Services DN (for example, 911). Up to four digits are accepted.
ESRT		ESA route number
	0-511 0-127	Range for Large Systems Range for MG 1000B
DDGT	x…x	Directing Digits (for CAMA Trunks) (for example, 1, 11, or 911). Up to four digits are accepted.
DFCL	x…x	Default ESA Calling Number. The input must be the following lengths: • On a system that is not FNP equipped, 8 or 11 digits are accepted if the first digit of the input is '1'; otherwise the input must be 7 or 10 digits. • On a system that is FNP equipped, up to 16 digits are allowed.
OSDN	x…x	On-Site Notification station DN. The input must be a valid single appearance internal DN.

You configure OSDN to alert the local security personnel about an emergency call in progress. Leave the ESA route number blank to make test calls without using any trunk resources. If the route number has been configured, remove it by entering “x”

at the prompt. Avaya recommends that the system administrator arrange a test call with the Public Services Access Point (PSAP).

5. Test ESDN using a main office telephone to confirm that main office calls exit the main office trunks. The ESA Configuration Audit feature provides CLID Verification (CLIDVER) reports that determine how an emergency call is routed, without actually routing the call. Use LD 20 to generate a CLIDVER report.

Table 22: LD 20 Generate a CLIDVER report

Prompt	Response	Description
REQ:	PRT	Print
TYPE	CLIDVER	CLID Verification
SORTBY	(DN) TN	The output/report is sorted based on this flag. If the response is DN, the overlay prompts the user to enter the DN, and the output is sorted by the DN. If the response is TN, the overlay prompts the user to enter the TN and the output is sorted by the TN.
ESA_ONLY	(YES) NO	Flag used to decide if the report should contain information for ESA call type only or for all call types. If the ESA package is restricted, this input prompt does not appear. The report contains non-ESA data only.
SHORT	(YES) NO	Flag used to decide if the output report should be a Short report of a Detail report.
TN		Terminal Number
	lscu	Format for Large System, where l = loop, s = shelf, c = card, and u = unit
CUST	xx	Customer number as defined in LD 15.

DN	x…x	Directory Number. If no value is entered, the report includes all supported Directory Numbers.
DATE	dd mmm yyy	Date
PAGE	(NO) YES	Data printed on a per page basis.
DES	d…d	Designator

For more information about CLIDVER reports, see *Avaya Emergency Service Access Fundamentals, NN43001-613*.

6. Configure the branch office zone on the main office.

    a. Configure the branch office zone ESA dialing information in LD 117.

    Table 23: LD 117 Configure branch office zone ESA route

Command	Description
CHG ZESA <Zone><ESA Route #><AC><ESA Prefix><ESA Locator>	Defines the ESA parameters for the branch office zone, where: • Zone = Zone number for the branch office. • ESA Route # = Virtual Trunk route to SRG 50. • AC = Access Code to add to dialed digits. If no AC is required, enter AC0 in place of AC1 or AC2. • ESA Prefix = Digit string added to start of ESDN. This is a unique prefix in the NRS. Avaya recommends that users use 0 + ESN location code of the branch office node. An example for location code 725 would be: 0725. • ESA Locator = Direct Inward Dial telephone number sent as part of ANI for use by the PSAP to locate the source of the call.

    b. Enable the branch office zone ESA in LD 117.

    ENL ZBR <Zone> ESA

7. Configure the ESA Special Number at the main office.

    Configure the ESA Special Number in the NRS. Using NRS, configure the ESA Special Number defined for the branch office zone. See *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

Avaya recommends that customers use “0” + the ESN Location code + ESDN. An example for location code 725 would be 0725911. The zero is recommended to prevent a collision in the ESN data with the HLOC entry.

8. Do the following:

   a. In LD 86, configure Emergency Service Access Digit Manipulation for AC + ESDN dialing to allow recognition of the ESDN even if AC1 or AC2 is used.

      Table 24: LD 86

Prompt	Response	Description
REQ	NEW CHG	Add, Change
CUST	xx	Customer number as defined in LD 15
FEAT	DGT	Digit Manipulation
…	…	…
DMI	1- 1999	Digit Manipulation Table numbers. **Important:** Do not use Digit Manipulation Table 0, as it results in the incorrect call termination treatment.

   b. Configure the system to trap the ESDN within the AC1 and AC2 translation tables to reprocess the ESDN locally.

      Table 25: LD 86 Configure the system to trap the ESDN and reprocess it locally

Prompt	Response	Description
REQ	NEW CHG	Add, Change
CUST	xx	Customer number as defined in LD 15
FEAT	RLB	Route List Block
…	…	…
RLI	xxx	Route List Index to be accessed
ENTR	xxx	Entry number for NARS/BARS Route List

Prompt	Response	Description
LTER	YES	Local Termination entry. This allows the AC + ESDN call to be recognized as an Emergency Services Access call.
DMI	1 - 1999	Digit Manipulation Table. Use the table configured in LD 86. This allows the digits after the AC to remain in the call register as a called number. **Important:** Do not use Digit Manipulation Table 0, as it results in the incorrect call termination treatment.

c. Configure Emergency Service Access call recognition for AC + ESDN dialing in LD 90.

Table 26: LD 90

Prompt	Response	Description
REQ	NEW CHG	Add, Change
CUST	xx	Customer number as defined in LD 15
FEAT	NET	Network translation tables
TRAN	aaa	
TYPE	SPN	
- SPN	911	AC + ESDN is recognized as an Emergency Service Access call.
	112	Use the number configured for ESDN.
- RLI	xxx	Route List Index. Use Route List Index configured in LD 86.

Configuring the branch office zone

1. Configure the branch office zone on the branch office.

   In the branch office, only the zone number and bandwidth/codec selection is configured.

   Use the same zone number between the branch office and main office. The main office configuration (Configuring the main office on page 116, step 6 on page 119)

provides the branch office zone characteristics (local time, local dialing, and ESA).

2. Configure the routing tables on the SRG 50.

   The SRG 50 must recognize the incoming digits on the Virtual Trunk and remove all but the ESDN. The call is routed to a local termination.

Emergency Services for Virtual Office

The E911 Virtual Office feature allows Virtual Office users, whether they are logged in or logged out of Virtual Office to place an emergency (E911) call to the correct Public Safety Answering Point (PSAP) for their geographical location.

The use of the terms Normal Mode and Local Mode apply to SRG 50 branch user only.

Emergency Services while logged in to Virtual Office

The E911 Virtual Office feature recognizes when a user dials an ESDN and it forces the Virtual Office IP phone to log out of Normal Mode (into Local Mode) in order to place the emergency call directly from the branch office location to the PSAP. When the IP phone is in Local Mode, if it is not engaged in a call, it is redirected back in Normal Mode after a 10-minute interval.

Emergency Services while logged out of Virtual Office

If 911 is dialed while logged out of Virtual Office the LTPS redirects the 911 call to the local 911 service (PSAP), not the remote Call Server 911 service. The Call Server is provisioned with Emergency Services Access Terminal Numbers (ESTN). The ESTN is used to register the IP phone with the Call Server. The logged out IP phone can make ESA calls only.

For more information on emergency services for Virtual Office, see *Avaya Emergency Service Access Fundamentals, NN43001-613* and *Avaya Branch Office Installation and Commissioning, NN43001-314*.

On-Site Notification

The ESA On-Site Notification (OSN) function notifies local security personnel when an emergency call occurs. When an emergency call is placed at the branch office, an external tool traps the notification and records an alarm. This applies to IP phones that the main office

returns in local mode when an emergency call is made, as well as locally connected analog (500/2500-type) telephones.

The OSN is enabled by a third-party tool that connects to the SRG 50 through a LAN CTE interface. A single LAN CTE interface must be enabled on the SRG 50 by applying an keycode. (The LAN CTE interface is enabled by default by the SRG 50 Release 6.0 Authorization keycode.) For more information, see*Avaya Survivable Remote Gateway 50 6.0 — Configuration Guide, NN40140-500*.

Configuring the NRS for ESA SPN

The NRS must be configured for the ESA Special Number (SPN). The NRS uses the ESA SPN to route the emergency call from the main office to the branch office.

Avaya recommends that a consistent pattern be followed for all ESA calls. For example, use 0 + ESN Location code of the branch office node + the ESDN. An example for location code 725 would be: 0725911. The zero is recommended to prevent a collision in the ESN data with the HLOC entry.

For more information, see *Avaya IP Peer Networking Installation and Commissioning, NN43001-313*.

Testing the ESDN number

Use Testing ESDN using an SRG 50 telephone on page 123 to test the ESDN number from any telephone in the branch office.

Testing ESDN using an SRG 50 telephone

1. For IP phones:
    a. Dial the ESDN on an SRG 50 IP phone in Local Mode.

       The calls must go out on the emergency trunk(s) in the branch office.

    b. Dial the ESDN on an SRG 50 IP phone in Normal Mode.

       The calls must tandem over the Virtual Trunk to the branch office and go out on the emergency trunk(s) in the branch office. The following configuration problems can occur:

       - The call can receive overflow tones. Use LD 96 to view the digits sent to the Virtual Trunk (ENL MSGO dch#).
       - If the digits look correct on the main office, the NRS might not be properly configured. If the NRS rejects the call, a diagnostic message is displayed on the NRS console.

- If the call makes it to the correct branch office (check that it is not going to the wrong node if the NRS is configured incorrectly), the branch office is probably rejecting it because it does not know the digit string.

2. For analog (500/2500-type) telephones, dial the ESDN on an SRG 50 analog (500/2500-type) telephone.

   The calls must go out on the emergency trunk(s) in the branch office.

Configuring ESA using Element Manager

To configure Emergency Services Access in Element Manager, see *Avaya Element Manager System Reference - Administration, NN43001-632*.

Emergency Service using Special Numbers (SPN)

Determining the dialing plan for emergency access calls is critical.

In many jurisdictions, the emergency number is a fixed number (for example, 112 or 999). The main office Call Server or SRG 50 cannot have a DN that conflicts with these digits.

Access to Emergency Service using SPN should be configured in the following circumstances:

- When the Emergency Service number at the branch office is different from that at the main office.
- When there is more than one number used for accessing Emergency Service; for example, when there are different numbers for Police, Fire, and Ambulance services.
- In markets where the ESA feature is not available (outside of North America, CALA, and EMEA).

To configure Emergency Service using SPN, follow the process outlined in Dialing Plan configuration on page 53. If SRG 50 PSTN access is correctly configured, Emergency Service from the branch office will already be present.

Branch office access to Emergency Service using SPN must be configured and tested at the main office Call Server and the SRG 50 to differentiate between emergency calls originating from IP phones at each location and emergency calls originating on trunks.

The special handling provided by ESA is not available in this scenario, such as OSN and zone-based routing.

For information on emergency services for Virtual Office, see *Avaya Emergency Service Access Fundamentals, NN43001-613*.

Chapter 9: Enhanced UNIStim Firmware Download

Contents

This section contains the following topics:

Description

This section applies to the main office and the following Avaya IP phones:

- IP Phone 2001
- IP Phone 2002
- IP Phone 2004
- 2007 IP Deskphone
- 1110 IP Deskphone
- 1120E IP Deskphone
- 1140E IP Deskphone
- 1210 IP Deskphone
- 1220 IP Deskphone
- 1230 IP Deskphone

This section does not apply to the 2050 IP Softphone, 2033 IP Conference Phone, or WLAN Handsets 2210/2211/2212/6120/6140.

Note:

This release supports only IP phones supporting the UFTP firmware download as commanded by a Call Server using the UNIStim protocol. IP phones that do not support the

UNIStim protocol must have their firmware version managed outside the context of the SRG 50.

The following list provides a summary of the enhance firmware download process:

- The main office has IP phones that are directly connected to it, as well as IP phones that are redirected to the main office through the SRG 50 branch office.
- Whenever new IP phone firmware is released and the same firmware version is intended to be loaded on all the IP phones connected to the main office. The firmware is loaded to the main office and umsUpgradeAll command is issued in the main office. (See Firmware upgrade on page 128.)
- The IP phones connected directly to the main office are downloaded with this firmware.
- The IP phones redirected through SRG 50 branch office are redirected to the branch office.
- Before redirection, the new firmware version to which the IP phone has to be upgraded is written in DRAM of the redirected IP phone.
- The SRG 50 system reads the firmware version and checks if it has it in its repository.
- If found, the firmware is downloaded to the IP phone or the firmware is sent (using FTP) from main office.

The redirected IP phones at the SRG 50 are under the control of the main office Call Server for the majority of the deployment (Normal Mode). Users of the SRG 50 IP phones receive the features, key layout, and tones of the main office Call Server. Therefore, the version of the IP phone firmware must align with the requirements of the CS 1000 main office Call Server. When an IP phone requires firmware upgrade, the CS 1000 uses the **`umsUpgradeAll`** command, or variant, to redirect the IP phone back to the SRG 50 for upgrading.

The SRG 50 allows the main office to facilitate deployment of its baseline IP phone firmware to the IP phones located in the branch office.

The main office indicates that the IP phone is being sent back for firmware upgrading, setting the state variable in the IP phone DRAM accordingly (including a string indicating the required firmware version). The SRG 50 does the following when an IP phone boots with the DRAM status indicating that a firmware upgrade is required:

- Reads the required firmware version string from the DRAM of the IP phone.
- Reads the current firmware version of the IP phone.
- Reads the firmware ID (FW_ID) from the IP phone. (This occurs when the IP phone boots and identifies the firmware platform of the IP phone.
- If the current version of the IP phone firmware matches the required version from the DRAM, the IP phone is redirected back to the main office.
- If the current version of the IP phone firmware does not match the required version from the DRAM, the hard drive is checked for a file corresponding to the required FW_ID. This file is named according to the FW_ID.

- If this file exists, it is parsed for its version.
- If the required file exists and is the required version, the IP phone is upgraded and redirected back to the main office.
- If the required file does not exist or its version is incorrect, the SRG 50 initiates an FTP session to the TPS IP address for that IP phone using a user ID and password. If an FTP session is already in progress, further firmware upgrade activity for this IP phone is suspended until the FTP transfer is completed. Here, the SRG 50 first invokes secure FTP to FTP the firmware, if this session is not successful, then conventional FTP is invoked. This supports the new security domain enforcements in CS 1000 release 6.0 or later. Since SRG 50 is oblivious to the Call Server release version, the SRG 50 attempts Secure FTP which will be successful if the Call Server is Release 6.0 (and above). The existing alarms for FTP sessions also apply for Secure FTP (SFTP). (SFTP and FTP are attempted three times each. For example, SFTP is attempted three times and upon failure, FTP is then attempted three times.)
- If the FTP session is successful, the following occurs:
  - The returned file is checked for its version.
  - If the version corresponds to the required version, all IP phones waiting for this version are upgraded and redirected back to the main office.
  - If the version is not correct, the IP phones waiting for the file are not upgraded and are simply redirected back to the main office.
  - At this point, the firmware file corresponding to the FW_ID exists on the hard drive of the SRG 50 such that any IP phones redirected back for firmware upgrade to this version are upgraded immediately and redirected back to the main office. This is important because all IP phones arriving for firmware upgrade after the first upgrade will not require additional FTP sessions unless their FW_ID is different.
- If the FTP session is fails, the following occurs:
  - The first attempt of FTP would be a Secure FTP. If it fails, the Call Server may not be CS 1000 Release 6.0 or greater and normal FTP is invoked.
  - If the session fails it could be due to lack of support for automatic FTP of firmware or it could be due to FTP being blocked by a firewall.
  - An alarm is raised indicating that the FTP (or SFTP) session has failed.
  - All IP phones waiting on the FTP session are redirected back to the main office without being upgraded.

For CS 1000 Release 4.5 and later, if the required firmware file does not exist on the SRG 50, or the version of the file is incorrect, the SRG 50 initiates an FTP session to the TPS for the IP phone to retrieve the required file. The SRG 50 upgrades the IP phone and redirects the IP phone back to the CS 1000.

For CS 1000 Release 4.0, ensure MPLR21148 is installed on the Signaling Server.

Firmware download does not occur when IP phones register to the TPS by a Virtual Office Login or branch office redirection to the main office. Instead, SRG 50 IP phones are redirected

back to the SRG 50 TPS for firmware files upgrade. This redirection occurs only if the umsUpgradeAll command is issued from the main office TPS, and the current firmware files are missing.

If an IP phone is in use when the umsUpgradeAll command is issued, the call is not interrupted. Its firmware version is checked against the main office TPS firmware policy, and if there is no match, the IP phone is flagged, then redirected to the MG 1000B TPS when the call is completed. The umsUpgradeAll command has no immediate impact on IP phones that are logged in or out by Virtual Office. However, the firmware files may be upgraded, if required, when the Virtual Office session is terminated.

For information on Enhanced UNIStim Firmware, see *Avaya Signaling Server IP Line Applications Fundamentals, NN43001-125*.

Firmware upgrade

The following naming convention is used to identify the different firmware version strings that must be checked during the course of firmware upgrade operation.

- Set FW version: The version of firmware currently loaded in the IP phone.
- File FW version: The version of the firmware present in the local file.
- DRAM FW version: The version of the firmware required by the main office. The main office writes this version to the DRAM of the IP phone. The main office also sets the redirect reason field in the DRAM to FW Upgrade before redirecting the IP phone for firmware upgrade.

The IP phone is upgraded when the Set FW version does not match the File FW version.

Use Upgrading firmware on page 128 to upgrade the firmware. For information about upgrading IP phone firmware, see *Avaya Signaling Server IP Line Applications Fundamentals, NN43001-125*.

Upgrading firmware

1. At the main office, upgrade the IP phone firmware on the Signaling Server. For instructions, see *Avaya Signaling Server IP Line Applications Fundamentals, NN43001-125*.
2. Issue the CLI command **`umsUpgradeAll`** at the main office. IP phones at the main office and branch office are upgraded as necessary.

Appendix A: Media redirection scenarios

In addition to basic call scenarios, Network Bandwidth Management also supports the following media redirection scenarios:

- Scenario 1: Codec switches correctly during media redirection. See Table 27: Codec switches correctly during media redirection on page 129.
- Scenario 2: Call transfer works correctly with IP phones:
  - Scenario 2.1: Call Transfer from an SRG 50 IP phone in Normal Mode to main office IP phone. See Table 28: Call transfer from SRG 50 IP phone in Normal Mode to main office IP phone on page 130.
  - Scenario 2.2: Call Transfer from main office IP phone to an SRG 50 IP phone in Normal Mode. See Table 29: Call transfer from main office IP phone to SRG 50 IP phone in Normal Mode on page 130.
- Scenario 3: Conference Call works correctly with a branch office:
  - Scenario 3.1: Conference call between branch office and main office, initiated by an SRG 50 IP phone in Normal Mode. See Table 30: Conference call between branch office and main office, initiated by SRG 50 IP phone in Normal Mode on page 130.
  - Scenario 3.2: Conference call between main office and branch office, initiated by main office IP phone. See Table 31: Conference call between main office and branch office, initiated by main office IP phone on page 131.

The zone table is examined using the commands in LD 117. See *Avaya Software Input Output Reference - Maintenance, NN43001-711* for more information on these commands.

In these scenarios, consult the zone table at the main office for accurate bandwidth usage information.

Table 27: Codec switches correctly during media redirection

Event	Result
1 An incoming Direct Inward Dial (DID) call to branch office uses IP Peer to reach the symposium controller Control Directory Number (CDN) in the main office.	The external caller hears music and announcements with a G.729 codec. Bandwidth usage in the main office indicates the call is an interzone call. The external caller is connected to an Automatic Call Distribution (ACD) agent with a G.711 codec. Bandwidth usage in the main office indicates the call is an intrazone call. The ACD agent is an SRG 50 IP phone registered to the main office.
2 The call is released.	The zone table indicates the bandwidth usage for the call is removed correctly on the main office Call Server and in the branch office.

Table 28: Call transfer from SRG 50 IP phone in Normal Mode to main office IP phone

	Event	Result
1	An SRG 50 TDM telephone calls an IP phone registered to the main office.	A speech path is established between the SRG 50 TDM telephone and the IP phone registered to the main office. The zone table indicates intrazone bandwidth usage.
2	The SRG 50 IP phone registered to the main office initiates a call transfer to a main office IP phone.	The SRG 50 TDM telephone is put on hold. A speech path is established between the SRG 50 IP phone registered to the main office and the main office IP phone. The zone table indicates interzone bandwidth usage.
3	The Call Transfer key on the SRG 50 IP phone registered to the main office is pressed to complete the call transfer.	A speech path is established between the SRG 50 TDM telephone and the main office IP phone. The zone table indicates interzone bandwidth usage.
4	The call is released.	The zone table indicates bandwidth usage for the call is unreserved correctly.

Table 29: Call transfer from main office IP phone to SRG 50 IP phone in Normal Mode

	Event	Result
1	An SRG 50 TDM telephone calls a main office IP phone.	A speech path is established between the SRG 50 TDM telephone and the main office IP phone. The zone table indicates interzone bandwidth usage.
2	The main office IP phone initiates a call transfer to an SRG 50 IP phone registered to the main office.	The SRG 50 TDM telephone is put on hold. A speech path is established between the main office IP phone and the SRG 50 IP phone registered to the main office. The zone table indicates interzone bandwidth usage.
3	The Call Transfer key on the main office IP phone is pressed to complete the call transfer.	A speech path is established between the IP phone registered to the main office and the SRG 50 TDM telephone. The zone table indicates intrazone bandwidth usage.
4	The call is released.	The zone table indicates bandwidth usage for the call is unreserved correctly.

Table 30: Conference call between branch office and main office, initiated by SRG 50 IP phone in Normal Mode

	Event	Result
1	An SRG 50 TDM telephone calls an SRG 50 IP phone registered to the main office.	A speech path is established between the SRG 50 TDM telephone and the SRG 50 IP phone registered to the main office. The zone table indicates intrazone bandwidth usage.

	Event	Result
2	The SRG 50 IP phone registered to the main office initiates a conference call to a main office IP phone.	The SRG 50 TDM telephone is put on hold. A speech path is established between the SRG 50 IP phone registered to the main office and the main office IP phone. The zone table indicates interzone bandwidth usage.
3	The Conference key on the SRG 50 IP phone registered to the main office is pressed to complete the conference call.	Speech paths are established among the SRG 50 TDM telephone, the SRG 50 IP phone registered to the main office, and the main office IP phone. The zone table indicates interzone and intrazone bandwidth usage.
4	The SRG 50 TDM telephone releases the call.	A speech path is established between the main office IP phone and the SRG 50 IP phone registered to the main office. The zone table indicates interzone bandwidth usage.
5	The call is released.	The zone table indicates bandwidth usage for the call is unreserved correctly.

Table 31: Conference call between main office and branch office, initiated by main office IP phone

	Event	Result
1	An SRG 50 TDM telephone calls a main office IP phone.	A speech path is established between the SRG 50 TDM telephone and the main office IP phone. The zone table indicates interzone bandwidth usage.
2	The main office IP phone initiates a conference call to an SRG 50 IP phone registered to the main office.	The SRG 50 TDM telephone is put on hold. A speech path is established between the main office IP phone and the SRG 50 IP phone registered to the main office. The zone table indicates interzone bandwidth usage.
3	The Conference key on the main office IP phone is pressed to complete the conference call.	Speech paths are established among the SRG 50 TDM telephone, the SRG 50 IP phone registered to the main office, and the main office IP phone. The zone table indicates interzone and intrazone bandwidth usage.
4	The SRG 50 TDM telephone releases the call.	A speech path is established between the SRG 50 IP phone registered to the main office and the main office IP phone. The zone table indicates interzone bandwidth usage.
5	The call is released.	The zone table indicates bandwidth usage for the call is unreserved correctly.

Glossary

Branch office

An SRG 50 that is remote from the main office. The SRG 50 provides telephony services using the main office servers (for Normal Mode) or local system services when the SRG 50 loses IP communication with the main office (Local Mode).

CDP

Coordinated Dialing Plan. Under the recommended Coordinated Dialing Plan, the Branch User ID can be an extension (for example, 4567). For more information about CDP, see *Avaya Dialing Plans Reference, NN43001-283*.

dialing plan

Each system uses a specific numbering configuration (dialing plan) that determines how calls will be handled over a private or public network.

DSP

Digital Signal Processing, which refers to manipulating analog information, such as sound or photographs that have been converted into a digital form. DSP also implies the use of a data compression technique.

When used as a noun, DSP stands for Digital Signaling Processor, a special type of coprocessor designed for performing the mathematics involved in DSP. Most DSP are programmable, which means that they can be used for manipulating different types of information, including sound, images, and video.

ESA

Emergency Services Access is a feature that places a customer in compliance with federal legislation that requires the Private 911 type of functionality provided by ESA. Please note, however, that the ESA feature is also generally useful for users who are not subject to legislation, and is broad enough to be used in different countries. For example, it will be appreciated by any customer who wants to route emergency calls in a special manner, or who wants to be notified when a telephone user makes an emergency call. It would also appeal to a customer who wishes to have ESA calls answered on-site,

on the business premises, rather than being forwarded to the Public Services Answering Point (PSAP). See *Avaya Emergency Service Access Fundamentals, NN43001-613* for complete information.

Gatekeeper

The Gatekeeper is a separate application on an IP network that directs IP traffic to all the systems on the network. Parameters for both the main office and SRG 50 must be assigned to all gatekeepers active on the network. If the Gatekeeper is down, the SRG 50 attempts to connect to the Alternate Gatekeeper, if there is one. If the Alternate Gatekeeper is

	down as well, or there is no Alternate Gatekeeper, the SRG 50 IP phones remain registered with the main office but calls cannot be sent to the SRG 50.
gateway	In networking, a combination of hardware and software that links two different types of networks. Gateways between e-mail systems, for example, enable users on different e-mail systems to exchange messages.
H.323	A standard approved by the International Telecommunication Union (ITU) that defines how audiovisual conferences data is transmitted across networks. In theory, H.323 enables users to participate in the same conference even though they are using different video conferencing applications. Although most video conferencing vendors have announced that their products conform to H.323, it is too early to say whether such adherence actually results in interoperability.
IP	Abbreviation of Internet Protocol, pronounced as two separate letters. IP specifies the format of packets, also called datagrams, and the addressing scheme. Most networks combine IP with a higher-level protocol called Transport Control Protocol (TCP), which establishes a virtual connection between a destination and a source. IP by itself is something like the postal system. It enables you to address a package and drop it in the system, but there's no direct link between you and the recipient. TCP/IP, on the other hand, establishes a connection between two hosts so that they can send messages back and forth for a period of time.
LAN	Local Area Network.
Local Mode	The SRG 50 is in Local Mode when: • The IP phones are first installed and not yet reregistered with the main office • The SRG 50 cannot communicate with the main office and the IP phones are reregistered with the SRG 50 • A user deliberately puts the IP phone in the Test Local Mode condition.
Main office	The Avaya CS 1000 system that has been programmed to accept redirection of the SRG 50 IP phones and provide call service for the SRG 50 in Normal Mode.
NCS	Network Connection Service. It provides a TPS interface to the NRS, allowing the TPS to query the NRS using the UNIStim protocol. It is required to support the main office, branch office, Virtual Office, and Geographic Redundancy features.

Normal Mode

The SRG 50 is in Normal Mode when the IP phones on the SRG 50 are correctly redirected to the main office Call Server.

NRS

Network Routing Service. The software application where all systems in the network are registered. The NRS consists of the H.323 Gatekeeper and the Network Connection Service (NCS).

PSTN

Public Switched Telephone Network. The international telephone system based on copper wires carrying analog voice data. This is in contrast to newer telephone networks based on digital technologies.

Telephone service carried by the PSTN is often called plain old telephone service (POTS).

QoS

Quality of Service, a networking term that specifies a guaranteed throughput level. One of the biggest advantages of ATM over competing technologies, such as Frame Relay and Fast Ethernet, is that ATM supports QoS levels. This enables ATM providers to guarantee to their customers that end-to-end latency does not exceed a specified level.

There are several methods to provide QoS, as follows:

- high bandwidth
- packet classification
- DiffServ
- IP fragmentation
- traffic shaping
- use of the platform's queuing mechanisms

routing

The process of selecting the correct path for packets transmitted between IP networks by using software-based algorithms. Each packet is processed by the algorithm to determine its destination.

SRG 50

Survivable Remote Gateway 50. This describes the equipment used to create an IP branch office with an Avaya CS 1000 system acting as the main office. The base system for SRG 50 is an Avaya Business Communications Manager running BCM 3.6 software.

TPS

Terminal Proxy Server. This server controls the connection of IP phones. It resides on the Signaling Server with an emergency backup on the Voice Gateway Media Card.

UDP

Uniform Dialing Plan. Each location within the network is assigned a Location Code, and each telephone has a Directory Number that is unique within the network. Under the UDP, the SRG 50 must include the location code in the Branch User ID (BUID).

VoIP	Voice over IP trunk. This IP pathway between two system IP voice gateways allows the system to exchange telephone calls over the Internet.
WAN	Wide Area Network. A computer network that spans a relatively large geographical area. Typically, a WAN consists of two or more local area networks (LAN). Computers connected to a wide area network are often connected through public networks, such as the telephone system. They can also be connected through leased lines or satellites. The largest WAN in existence is the Internet.
ZDP	Zone Digit Prefix. This is the number that the main office appends to a local SRG 50 PSTN call dialed from an SRG 50 IP phone in Normal Mode. This number differentiates the call from a main office PSTN call dialed by the main office telephones. The ZDP routes the call through VoIP trunk to the SRG 50.

Index
