| Collection interval or interval | Time interval for which MG9K either periodically or upon request from application such as OMC, generates performance data.                                                                                                                                                                                               |
| Collection time period          | This is the time period shown in Performance browser. User is allowed to select one or more collection intervals from this time period and can request to collect history data for those many number of past intervals. Based on the Sample collection interval, Collection intervals are shown within this time period. |
| EM                              | Element Manager                                                                                                                                                                                                                                                                                                          |
| Internal (logical) frame number | Frame number, which is unique within a MG9K                                                                                                                                                                                                                                                                              |
| MG9K                            | Media Gateway 9000                                                                                                                                                                                                                                                                                                       |

| Term                           | Description                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIB                            | Management Information Block.<br><br>RFC-driven MIBs are standard MIBs defined in RFC. Enterprise MIB is one written by Nortel.                           |
| Office (External) frame number | Frame number, which is unique within an office                                                                                                            |
| OM                             | Operational Measurement                                                                                                                                   |
| OMC                            | OM Collector                                                                                                                                              |
| Performance Browser            | It is a component of MG9K EM. It collects performance data (both previous and current) from MG9K through SNMP interface and shows them in tabular format. |
| PV                             | Product Verification                                                                                                                                      |
| Sample Interval                | The interval which the MG collects and stores OM information in its MIBs. Interval to be 5 or 15 minutes                                                  |
| Summary Interval               | An aggregation of sample intervals calculated at the MG. This interval is expected to be 30 (6x5) or 1.                                                   |

Description: Log report OMC300 indicates that OM Collector failed to collect OM file from MG9K during a particular collection interval.

### 2.3.1.3 Field descriptions

Table 1: Field descriptions

| Field            | Value             | Description                                                                                           |
|------------------|-------------------|-------------------------------------------------------------------------------------------------------|
| event type       | TBL               | Describes event type                                                                                  |
| event id         | string            | Log name. In this case, it is OMC300                                                                  |
| Location         | NE Number-NE Name | Gives a complete location of the originator                                                           |
| Notification Id  | Alarm if          |                                                                                                       |
| State            | string            | Indicates state of alarm. Can be one of {not acknowledged, acknowledged, cleared}                     |
| Category         | string            | Indicates type of fault. In this case it is "Communication Alarm"                                     |
| Cause            | string            | Cause of failure: In this case it is "Communications Subsystem Failure"                               |
| Time             |                   | Date/Time indicating when the condition occurred                                                      |
| Component Id     | string            | Indicates the type of equipment having the fault.                                                     |
| Specific Problem | string            | Indicates the specific problem that caused the fault                                                  |
| Description      | string            | Provides specific text for the fault.<br><br>In this case, it consists of Frame location information. |

### 2.3.1.4 Action

Check the following

- whether MG9K is traffic overloaded.

### 2.3.1.5 Associated Operational Measurements or Performance Measurements

None

### 2.3.1.6 Additional information

Following is a list of reasons for the generation of the log report OMC300.

- MG9K is traffic overloaded
- Disk may be full. Hence, the OM Collector is not able to store the downloaded OM file.
- Gateway user id and password mentioned may be wrong
- OM file details mentioned in the SFTP request may be wrong

## 2.3.2 Log Title/Log ID: OMC300

### 2.3.2.1 Formats

MSH10\_I06BE OMC300 APR23 08:50:10 5176 INFO OM Collection failed  
Alarm Cleared

Location: 1-RM9K (Act)

Description: OM collection failed alarm cleared.

### 2.3.2.2 Explanation

Description: Log report OMC300 indicates that OM Collector could restart collecting OM file from MG9K, for which it had problem.

### 2.3.2.3 Field descriptions

Table 2: Field descriptions

| Field       | Value             | Description                                 |
|-------------|-------------------|---------------------------------------------|
| event type  | INFO              | Describes event type                        |
| event id    | string            | Log name. In this case, it is OMC300        |
| Location    | NE Number-NE Name | Gives a complete location of the originator |
| Description | string            | Provides specific text for the fault        |

### 2.3.2.4 Action

This log report requires no action.

### 2.3.2.5 Associated Operational Measurements or Performance Measurements

None

### 2.3.2.6 Additional information

None

## 2.4 Alarms

### 2.4.1 Integrated Element Manager GUI Fields

## **3: Configuration for A00007213**

### **3.1 Hardware and Software Requirements**

None

### **3.2 Initial Configuration**

NA

### **3.3 Office/Subnet parameters (OP/SP) (CM & SESM)**

NA

## 3.4 Upgrade Considerations

### 3.4.1 Element Management Upgrade

#### 3.4.1.1 Element Management Upgrade from SN07 to SN08

Here are the steps to upgrade MG9K Manager software from SN07 to SN08.

1. Stop SN07 OM Collector (Refer to note #1 in this section).
2. Uninstall SN07 OM Collector package
3. Install SN08 EM package (Note that, user is not allowed to install SN08 EM server package if SN07.x OMC package exists)
4. Install SN08 OMC.
5. Start SN08 MG9KEM

All the MG9Ks in a subnet are configured with same collection intervals. SN07 MG9K support 15 minutes Collection interval. Hence, Collection interval is not allowed to be set to anything other than 15 minutes until all MG9Ks are upgraded to SN08.

Note #1: SN07 OMC keeps CSV files in /data/oms/1. If SN08OMC is also configured to keep CSV files in /data/oms/1, then we will have problem if SN07 OMC is also left running, since both would try to write CSV file into the same directory. To avoid this problem, step #1 shall be performed before step #5.

#### 3.4.2.2 Element Management Upgrade from SN06.x to SN08

Here are the steps to upgrade MG9K Manager software from SN06/SN06.2 to SN08.

1. Start SN08 MG9KEM
2. Consider one SN06.x NE at a time. Before performing step #3, delete the NE from SN06.2 OMC (Refer to note #1 and #2)
3. When the NE is upgraded to SN08 software, enable OM collection for SN06.2 NEs in SN08 MG9KEM.
4. Repeat step #2 and #3 for each NE.

Note #1: The reason for performing step #2 after step #1 is as follows. After step #1, older NEs would be upgraded to SN08. If there are more older NEs, then this would take relatively more time. If we remove all the NEs from SN06.x OMC immediately after step #1, then we would lose OM data for the period wherein older NEs are upgraded to SN08.

Note #2: The reason for performing step #2 before step #3 is as follows. SN08 NE support SFTP and SN06.2 OMC supports only FTP. If NE still exists in

SN06.2 OMC even after NE is upgraded to SN08 (i.e, step #3), then data collection would fail.

### 3.4.2 Downgrade impact

#### 3.4.2.1 Element Management Upgrade from SN08 to SN07/SN06.x

When collection interval is 5/30 minutes, if a NE is downgraded to older release, then disable OM collection for the downgraded NE. With this, OMC does not collect data for the downgraded NE. The reason is that, downgraded NE can not collect at 5/30 minutes.

## 3.5 Data schema (DS) (CM, MIBS, RDB)

### 3.5.1 New/modified tables, MIBs, or Database Schema

Table 4 New or modified tables

| Table/MIB name       | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------------|--------------------------|------------------------------------|
| OFFICE_WIDE_DEFAULTS | Changed                  | Unchanged                          |

### 3.5.2 Table/MIB/Remote Database Schema information

#### 3.5.2.1 Name: OFFICE\_WIDE\_DEFAULTS

Office wide defaults Database table.

##### 3.5.2.1.1 Functional description

One more entry is made in this existing database table to store Collection intervals.

##### Impact on existing functionality of enabling/disabling of OM collection:

When OM Collection is enabled or disabled for a NE through GUI, the database variable OMCSTATUS in the database table NODE\_ATTRIBUTES will be set to enabled.

While a pre SN08 NE is discovered, current collection interval (which is configured at EM) will be checked. If it is 5/30 minutes, the database variable OMCSTATUS will be set to disabled. In turn, OM collection will be disabled from next collection cycle.

##### Impact on discovery of NE:

While a SN08 NE is discovered, current collection interval (which is configured at EM) will be pushed to the NE. In case the push fails, discovery would still continue. The mismatch will be rectified when NE is audited next time.

### 3.5.2.1.2 Usage sequence and implications (CM Only)

None

### 3.5.2.1.3 Size

**Table 5 Table size**

| Abbreviated table name | Minimum tuples             | Maximum tuples                          | Information on memory                 |
|------------------------|----------------------------|-----------------------------------------|---------------------------------------|
| OFFICE_WIDE_DEFAULTS   | Same as current table size | One more entry than current table size. | Memory requirement is less than 1 KB. |

### 3.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for OFFICE\_WIDE\_DEFAULTS

**Table 6 Table field descriptions**

| Field          | New or Changed | Subfield or refinement | Entry                                    | Explanation and action |
|----------------|----------------|------------------------|------------------------------------------|------------------------|
| DFLT_NAME      | Changed        | NA                     | New value "Collection_Interval" is added |                        |
| DFLT_SUBSYSTEM | Changed        | NA                     | OMC                                      |                        |
| DFLT_VALUE     | Changed        | NA                     | Default value is "15 Minutes"            |                        |

### 3.5.2.1.5 Datafill example

None

### 3.5.2.1.6 Table release history update

One more entry is made in the table OFFICE\_WIDE\_DEFAULTS, to store the Collection intervals. This entry is made either during major release upgrade or during SN08 MR upgrade.

### 3.5.2.1.7 Supplementary information

The Collection interval value stored in the table OFFICE\_WIDE\_DEFAULTS is applicable for all the NEs present in the subnet.

### 3.5.2.1.8 Translation verification and other tools

None

### 3.6 Service Orders (SO) (CM & SESM)

NA

### 3.7 Software optionality control (SOC)

NA

### 3.8 Element Management

#### 3.8.1 New/modified GUIs

Table 7 New or modified GUIs

| GUI name                       | NEW, CHANGED, or DELETED |
|--------------------------------|--------------------------|
| Configure Collection Interval  | New                      |
| Performance Statistics Browser | Changed                  |

#### 3.8.2 GUI information

##### 3.8.2.1 GUI name: Configure Collection Interval

###### 3.8.2.1.1 Functional description

This new GUI is introduced under the submenu option MG9KEM Subnet view ->Performance. This GUI allows users to configure Sample and Summary intervals uniformly for all SN08 MG9Ks in a Subnet. If there are no MG9Ks in a subnet, the configured collection interval will just be stored in database.

Sample and Summary intervals are specified in terms of minutes. In SN08, the user is allowed to select following combinations of Sample and Summary intervals.

- Sample interval of 5 minutes and Summary interval of 30 minutes. This is shown as “5/30 minutes” in the GUI.
- Sample interval of 15 minutes and no Summary interval. This is shown as “15 minutes” in the GUI.

If there are mix of pre SN08 and SN08 MG9Ks in the subnet, then only the “15 minutes” is shown in the GUI.

If Collection intervals are not configured from the GUI “Configure Collection Interval”, they will have the default value “15 minutes”.

###### Impact on existing functionality of enabling/disabling of OM collection:

OM collection can be enabled for a MG9K through the “OMCollection” check box provided in the existing GUIs, “MG900 Provisioning”, “NE Properties”.

Refer to A00003531 CN for more details. In association with this existing capability of enabling OM collection, the GUI “Configure Collection Interval” affects OM collection as follows.

- When OMC is running, if OM collection is enabled for a MG9K, OMC will start collecting OM data at the Collection intervals.
- If collection interval is 5/30 minutes, the OMC checkbox is disabled for pre-SN08 NEs.

Impact on working of OMC and Performance Browser:

Whenever Collection intervals are changed, Performance browser and OM Collector behave as follows.

- OM Collector will start collecting OMs at new collection intervals, starting from next collection interval.
- After Collection interval is changed, if User tries to collect performance data, Performance browser will collect OMs at new Sample collection interval.

### 3.8.2.1.2 GUI usage and implications

None

### 3.8.2.1.3 GUI size

**Table 8 New or modified GUIs**

| Abbreviated GUI name          | Minimum instances | Maximum instances | Information on memory |
|-------------------------------|-------------------|-------------------|-----------------------|
| Configure Collection Interval | 1                 | 1                 | TBD                   |

### 3.8.2.1.4 GUI fields

The following table lists fields for GUI “Configure Collection Interval”.

**Table 9 GUI field descriptions**

| Field               | New or Changed | Subfield | Entry                                                                              | Explanation and action                                                                                                                                                                                                                                                                                                    | Associated MIB entry                                                                                                                                                          |
|---------------------|----------------|----------|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**3.8.2.1.5 Usage example**

The following example shows the GUI “Configure Collection Intervals“, when the value “5/30 minutes” is selected.

**3.8.2.1.6 GUI release history update**

A new GUI “Configure Collection Interval” is introduced in order to configure Sample and Summary intervals uniformly for all the MG9Ks in a Subnet.

### 3.8.2.1.7 Context sensitive launching information

None

### 3.8.2.1.8 Supplementary information

When MG9KEM changes Collection interval, any data collected by OM Collector and/or Performance browser till the end of current collection interval after MG9KEM changes collection intervals, may not be accurate. Following paragraphs explains the reason for this.

Example #1:

Let us consider that, MG9KEM changes the collection intervals say from 15 to 5/30 minutes, at 9:06 AM. In this scenario, MG9KEM and OM Collector will switch over starting from next collection interval time as explained below.

- OM Collector will collect new Sample interval (i.e, 5 min in this example) starting from 9:10 AM and Summary interval starting from 9:30 AM.

- Performance browser will changeover immediately. i.e, it will show Collection time period in terms of new Sample collection interval.

However, MG9K changes over to new collection interval at end of current collection interval (i.e., at 9:15 AM in the scenario explained above). Also, MG9K flushes its history performance data at 9:15 AM.

Because of this behavior difference between MG9K and MG9KEM PM components (i.e., performance browser and OM Collector), any data collected by OM Collector and/or Performance browser till and including 9:15 AM, may not be accurate.

Example #2:

Let us consider that, MG9KEM changes the collection intervals say from 5/30 to 15 minutes, at 9:06 AM. In this scenario, MG9KEM and OM Collector will switch over starting from next collection interval time as explained below.

- OM Collector will collect new Sample interval (i.e, 15 min in this example) starting from 9:15 AM.

- Performance browser will changeover immediately. i.e, it will show Collection time period in terms of new Sample collection interval.

However, MG9K changes over to new collection interval at end of current collection interval (i.e., at 9:10 AM in the scenario explained above). Also, MG9K flushes its history performance data at 9:10 AM.

Because of this behavior difference between MG9K and MG9KEM PM components (i.e., performance browser and OM Collector), any data collected

by OM Collector and/or Performance browser till and including 9:15 AM, may not be accurate.

### 3.8.2.2 GUI name: Performance Statistics Browser

#### 3.8.2.2.1 Functional description

Two date range fields “From” and “To” are shown on Performance browser. Today, these two fields show date either in steps of 15 minutes or in steps of 1 day. Apart from 15 minutes and 1 day, in SN08, these two fields show date in steps of 5 minutes also.

#### 3.8.2.2.2 GUI usage and implications

None

#### 3.8.2.2.3 GUI size

**Table 10 New or modified GUIs**

| Abbreviated GUI name           | Minimum instances | Maximum instances       | Information on memory |
|--------------------------------|-------------------|-------------------------|-----------------------|
| Performance Statistics Browser | 1                 | One per GUI workstation | No change             |

#### 3.8.2.2.4 GUI fields

The following table lists fields for GUI “Configure Collection Intervals”.

**Table 11 GUI field descriptions**

| Field | New or Changed | Subfield | Entry                                    | Explanation and action                                                                                           | Associated MIB entry |
|-------|----------------|----------|------------------------------------------|------------------------------------------------------------------------------------------------------------------|----------------------|
| From  | Changed        | NA       | Data ranges are based on Sample interval | Date range shown corresponds to last 96 sample intervals. Size of each interval is equal to the Sample interval. | None                 |
| To    | Changed        | NA       | Data ranges are based on Sample interval | Date range shown corresponds to 96 sample intervals. Size of each interval is equal to the Sample interval.      | None                 |

#### 3.8.2.2.5 Usage example

The following example shows the GUI “Configure Collection Interval“, when the value “15 minutes” is selected.

### 3.8.2.2.6 GUI release history update

The date range fields present in Performance browser are based on the sample interval.

**4: Performance Management for A00007213****4.1 Performance management strategy**

In SN08, OM Collector is integrated with MG9KEM server. So, OM Collector is started, stopped and configured along with MG9KEM server.

Today, there is considerable latency between the time OM data is generated at GW and the time it is available at north-bound interfaces of MG9KEM. In order to reduce this latency, OM Collector sends a CORBA notification when it generates CSV files. It also sends a CORBA notification when it fails to generate CSV files. Note that, these notification are raised one per MG9K per collection interval.

OM Collector raise a minor alarm when it fail to collect OM file from MG9K and clears the alarm when it could again collect OM file from MG9K. Note that these alarms are generated one per MG9K per collection interval.

## 4.2 Performance management tools and utilities

Following are the two configurations which are related to OM data.

- Enabling/disabling OM collection for a MG9K: OM collection can be enabled for a MG9K through a check box provided in the existing GUIs, “MG900 Provisioning”, “NE Properties”. OM collector collects OM data for a MG9K, if OM collection is enabled. Refer to A00003531 CN for more details.
- Configuration of Collection intervals: This is done through the GUI “Configure Collection Interval”.

When OMC is running, if OM collection is enabled for a MG9K, OMC will start collecting OM data at the Collection intervals.

### Impact of “Configuration of Collection Interval”:

Whenever Collection intervals are changed, Performance browser and OM Collector behave as follows.

- OM Collector will start collecting OMs at new collection intervals, starting from next collection interval.
- After Collection interval is changed, if User tries to collect performance data, Performance browser will collect OMs at new Sample collection interval.

When MG9KEM changes Collection interval, any data collected by OM Collector and/or Performance browser till the end of current collection interval after MG9KEM changes collection intervals, may not be accurate. Refer to section 12.4.2.1.8 in A00007213 CN for more details.

### 4.2.1 OM Collector configuration scripts

OM Collector is integrated with MG9KEM server. So, OM Collector is started, stopped and configured along with MG9KEM server. Following is CLUI changes;

- The scripts which were present under the directory /opt/nortel/omcltr\_07/bin/ are no more available in SN08. Instead, user need to use the scripts available under the directory /opt/nortel/mg9ksrv\_08/bin for the same purpose.
- Directory for CSV file is configurable. It can be configured through one of the scripts, “/opt/nortel/mg9ksrv\_08/bin/mg9kconfig.sh”,

“/opt/nortel/mg9ksrv\_08/bin/mg9kserver config”. Note that, the default CSV collection directory /data/oms/1 is registered for rotation. However, OMC does not do this registration. If CSV collection directory is configured to directory other than /data/oms/1, User of OMC has to register the CSV collection directory for rotation. In SN08, this capability is intended to be used for designer testing.

## **4.3 Performance Measurements (PM), Operational Measurements (OM), and stats**

### **4.3.1 PM, OM, and stats format**

In SN08, following information elements are changed,

- Collection Interval: Periodic collection interval may be configured to a combination of Sample and Summary intervals. In SN08, “5/30 Minutes” and “15 Minutes” are supported.
- OSS delivery (and interface) or Local only: OM Collector sends appropriate CORBA notification whenever it succeeds or fails to generate CSV file
- OSS Collection Interval: As and when CSV file is generated, OM Collector sends a CORBA notification. OSS can use appropriate mechanism to collect CSV file as and when it receives this notification.
- File Name: Directory wherein CSV are generated, are configurable in SN08.

### **4.3.2 Performance File (CSV, SSV, XML) Format**

There is no change in SN08.

### **4.3.3 OM Group template (applies only to DMS)**

NA

# SN08 Feature Deltas

***Product = MG 9000***

## **A00007263--LCI for Gigabit Ethernet**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

This feature will make the necessary modifications to the LCI software to support the new Gigabit Ethernet Network Interface for MG9K.

The LCI modifications (without affecting the existing functionalities of the SCO/SCI cards) for the new SCG (Super Core GigabitEthernet) card are as follows:

- 1** Card maintenance of the SCG card – which would be same as the existing SCO/SCI cards' Card-Maintenance
- 2** Carrier maintenance – where the new GigE link can be:
  - Provisioned – also includes the ability to request for auto-negotiation
  - Controlled – the admin and config state of the links can be controlled
  - Status can be viewed – the alarm(s) on the links will be displayed
  - Perform OOS (Out of Service) test and monitor Link-Integrity
  - Have Link Protection – to be able to set the working (preferred) and non-working (non-preferred) links and also enable/disable link-reversion

- 3 Connection side changes -- VLAN – to be able to provision (set the VLAN ids.), shape (set the peak rate) and also prioritize the different types of VLANs (OAMP, Bearer, Call-Control and for the fixed IP addresses of the SCG cards) from the connections button on the LCI.
- 4 Miscellaneous –
  - Dynamic updating of the alarm severities at the N.E and Net.Carrier links on LCI.
  - Update the following terms as applicable to GigE:
    - ‘Carrier’ will be changed to ‘Link’
    - ‘APS’ will be changed to ‘Protection’
    - ‘Net.Carrier’ will be changed to ‘Net.Link’

**Note:** The following sub-sections explain the above modifications. Most of them contain screen-shots that are self-explanatory. Texts are added to explain the screens wherever necessary. They are not in any particular order.

### 1.2.1 Solution type selection

Since the SCO/SCI had support for both VoAAL1 and VoIP, the solution type selection was required when we login to LCI. Now, for SCG, it goes directly into VoIP as this is the only solution type supported on SCG cards. So the following screen will not appear in LCI for SCG cards.

### 1.2.2 Change the terms

The term 'Net. Carrier' applies to SONET & SDH for SCO/SCI cards. But for SCG cards, this will be changed to 'Net. Link' as shown in the screen below:

The menu items when you click on the DCC card will contain 'Link' instead of 'Carrier' as shown in the screen below:

When the mouse is moved over the DCC card, the text that displays the information in yellow displays 'Active Link' instead of 'Active Carm.' as shown in the screen below.

When the link is locked a lock symbol is displayed on the DCC card and when the mouse is pointed on the card, the text 'Link locked' is displayed instead of 'Carm. Locked' as shown in the screen below:

The sub-menu option 'APS' under 'Carrier' on the DCC card will be changed to 'Protection' as shown in the screen below:

### 1.2.3 GigE Provisioning

The GigE provisioning screen will be as shown below. More details on each of the fields will be provided in the DSUM document.

### 1.2.6 2.2.6GigE Test

The GigE Test page that is used for running the OOS test as well as to monitor link-integrity looks as below:

First the user needs to select the Protection-Group (which would have been configured in the protection-controls page).

Then, for the selected protection group the following can be done:

- Run the OOS test by clicking on the “Run OOS Test” button. After the test, the result will be displayed to the user.
- Setting the frequency, loss-rate and the Monitoring enable/disable by clicking on the SUBMIT button.
- Read the values previously set for the fields Frequency, Loss-rate and Monitoring Enabled/Disabled by clicking on the QUERY button. Note that this will not be able to get the result of the OOS Test.

### 1.2.7 GigE Protection

The GigE Protection contains 2 sub-menus - Controls and Status.

The Bearer Connection screen will look as below:

The screenshot shows a web browser window titled "MG 9000 - Microsoft Internet Explorer". The page header includes the Nortel Networks logo, navigation links for "N.E." and "Net. Link", and a "Voice over IP" section with "Connections" and "Maintenance" buttons. The main content area, titled "Bearer Connection", contains a form with the following fields:

|                            |                      |                |                      |
|----------------------------|----------------------|----------------|----------------------|
| Default Gateway (optional) | <input type="text"/> | VLAN ID        | <input type="text"/> |
| Heartbeat Ping IP          | <input type="text"/> | VLAN Peak rate | <input type="text"/> |
| Bearer IP                  | <input type="text"/> | VLAN Priority  | <input type="text"/> |
| Subnet Mask                | <input type="text"/> |                |                      |

At the bottom of the form are "Submit" and "Query" buttons. The browser's status bar at the bottom shows "Done" and "My Computer".

The DCC Unit Addresses screen will look as below:

The screenshot shows a web browser window titled "MG 9000 - Microsoft Internet Explorer". The page has a dark blue header with the Nortel Networks logo on the left. In the center of the header are two links: "N.E." and "Net. Link", each with a small orange square icon below it. On the right of the header is the text "Voice over IP" above two buttons: "Connections" and "Maintenance". The main content area has a dark blue background with the title "DCC Unit Addresses" in white. Below the title, there are two columns of input fields. The left column contains: "Slot10 IP Address", "Slot10 Subnet Mask", "Slot11 IP Address", and "Slot11 Subnet Mask". The right column contains: "VLAN ID", "VLAN Peak rate", and "VLAN Priority" (which is a dropdown menu). At the bottom of the form area are two buttons: "Submit" and "Query". The browser's status bar at the bottom shows "Done" on the left and "My Computer" on the right.

### 1.3 Hardware Requirements or Dependencies

There will be a new SCG card that replaces the SCO/SCI cards on the DCC slots of the MG9K to provide GigE network interface.

The existing standard LCI setup holds true to support this feature – Windows-based-PC or Sun-workstation to connect to the SCG card on the MG9K

### 1.4 Software Requirements or Dependencies

Currently supported browsers will be supported for this feature too: Netscape 7+ on Win2K, Internet Explorer 5.5+, Netscape 4.7+ on Solaris/HPUX

### 1.5 Limitations and restrictions

No new limitations/restrictions will be imposed on LCI as a result of this feature.

## 1.6 Interactions

LCI subsystem will interact with other gateway subsystems as it currently does in the existing architecture. The LCI client to server interaction will also be the same way as it currently exists.

## 1.7 Glossary

AAL1 – ATM Adaptation Layer

ABI – Access Bridge Interface

APS – Automatic Protection Switching

ATM – Asynchronous Transfer Mode

BDP – Business Decision Point

BITS – Building Integrated Timing Supply

CAF - Content Access Form

ClockSync – Clock Synchronization

DCC – Data Control Card

DID – Design Intent Document

DS1 – Digital Signal level 1

GigE – Gigabit Ethernet

HAL – Hardware Abstraction Layer

ICAF –Integrated CAF

IMA – Inverse Multiplexing over ATM

IP – Internet Protocol

ITP – Internet Telephony Processor

ITX – Internet Telephony Extender

LAN – Local Area Network

LCI – Local Craft Interface

MG9K – Media Gateway 9000

MTU – Max Transfer Unit

OAMP – Operation, Administration, Maintenance, Performance

PING – IP Tool/Utility used to find out if a network host is alive or not

POR – Plan of Record

Ref/Sig – Reference/Signal

RFI – Remote Fault Indicator

Rx - Receiver

SC – Super Core

SCG – Super Core GigE

SCI – Super Core IMA

SCO – Super Core OC3

SN08 – Succession Networks Release 08

SSU – Synchronization Supply Unit

TRACEROUTE – IP Tool/Utility used to print the route a packet takes to the network host

Tx - Transmission

VLAN – Virtual LAN

VOIP – Voice over IP

# SN08 Feature Deltas

***Product = MG 9000***

## **A00007293--VLAN for Gigabit Ethernet**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

On a GigE MG9K, VLANs are used to aggregate similar IP traffic. There are four VLANs configured on the MG9K via the LCI. The four VLANs are OAM, CallControl, Bearer, and Unit. The OAM VLAN is used for SNMP, loading, ssh, etc. The CallControl VLAN is used by ITPs and ABIs for H.248 and XPM messaging. The Bearer VLAN carries all ITP and ABI bearer traffic. The Unit VLAN is used to perform GigE link integrity tests to the edge router and the mate SCG card.

In addition there are five new IP addresses required on a GigE MG9K. They are

- two static unit addresses that are assigned to a SCG card
- one floating SCG Call Control address used for ARP
- one floating SCG Bearer address used for ARP
- one floating inactive OAM address.

The figure below illustrates the relationship of the VLANs and IP addresses described above.

## 2.1 Data schema (DS) (CM, MIBS, RDB)

### 2.1.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

| Table/MIB name   | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|------------------|--------------------------|------------------------------------|
| nnGLinkVlanTable | NEW                      | n/a                                |

### 2.1.2 Table/MIB/Remote Database Schema information

#### 2.1.2.1 Name: nnGLinkVlanTable

##### 2.1.2.1.1 Functional description

MIB table nnGLinkVlanTable is used to create, modify, and delete VLANs on the MG9K. There is one entry for each VLAN. The table is indexed by a unique VLAN ID defined by the user.

##### 2.1.2.1.2 Fields/OIDs

The following table lists fields/OIDs for an entry in the nnGLinkVlanTable.

Table 4: VLAN Entry

| Field           | Type             | Description                                             |
|-----------------|------------------|---------------------------------------------------------|
| nnGLinkVlanId   | INTEGER          | Index into the VLAN table.                              |
| nnGLinkVlanName | SnmpAdmin-String | 20 character string                                     |
| nnGLinkVlanType | INTEGER          | byPort or byIpSubnet; in SN08 all VLANs are byIpSubnet. |

| Field                          | Type                  | Description                                                                                               |
|--------------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------|
| nnGLinkVLanPortMember1         | InterfaceIndex-OrZero | IfIndex of a port associated with this VLAN. A value of 0 indicates no port association with this member. |
| nnGLinkVLanPortMember2         | InterfaceIndex-OrZero |                                                                                                           |
| nnGLinkVLanPortMember3         | InterfaceIndex-OrZero |                                                                                                           |
| nnGLinkVLanPortMember4         | InterfaceIndex-OrZero |                                                                                                           |
| nnGLinkVLanPortMember5         | InterfaceIndex-OrZero |                                                                                                           |
| nnGLinkVLanPortMember6         | InterfaceIndex-OrZero |                                                                                                           |
| nnGLinkVLanPortMember7         | InterfaceIndex-OrZero |                                                                                                           |
| nnGLinkVLanPortMember8         | InterfaceIndex-OrZero |                                                                                                           |
| nnGLinkVLanPrimarySubnetAddr   | IpAddress             | The SCG IP address for this VLAN.                                                                         |
| nnGLinkVLanPrimarySubnetMask   | IpAddress             | Corresponding primary subnet mask for the primary IP address.                                             |
| nnGLinkVLanSecondarySubnetAddr | IpAddress             | This is provided for extensibility purposes.                                                              |
| nnGLinkVLanSecondarySubnetMask | IpAddress             | This is provided for extensibility purposes.                                                              |
| nnGLinkVLanUserPriority        | INTEGER               | Specified VLAN priority as defined in 802.1 Q; range is 0 - 7.                                            |
| nnGLinkVLanPeakRate            | Unsigned32            | Peak rate at which the packets on this VLAN will be sent to the destination port.                         |
| nnGLinkVLanRowStatus           | RowStatus             |                                                                                                           |

### 3: Performance for A00007293

### 3.1 Performance management strategy

The MG9K Element Manager provides access to per VLAN statistics. The statistics may be queried for their current value or on a historical basis. This data may be used to identify high traffic periods or used for troubleshooting purposes to verify packet transmission/reception during a specific time period.

### 3.2 Performance management tools and utilities

Access to the OMs is provided using the Performance Statistics Browser on the MG9K EM.

### 3.3 Performance Measurements (PM), Operational Measurements (OM), and stats

New OMs available on a per VLAN basis are listed below. These may be obtained from the SMON MIB table smonVlanIdStatsTable.

- smonVlanIdStatsTotalPkts - total incoming packets
- smonVlanIdStatsTotalHCPkts - total outgoing packets
- smonVlanIdStatsTotalOctets - total incoming octets
- smonVlanIdStatsTotalHCOctets - total outgoing octets

#### 3.3.1 PM, OM, and stats format

**Table 5: VLAN OMs**

| Field                        | Syntax    | Unit        |
|------------------------------|-----------|-------------|
| smonVlanIdStatsTotalPkts     | Counter32 | Total Count |
| smonVlanIdStatsTotalHCPkts   | Counter32 | Total Count |
| smonVlanIdStatsTotalOctets   | Counter32 | Total Count |
| smonVlanIdStatsTotalHCOctets | Counter32 | Total Count |

## ***Product = MG 9000***

### **A00007415--MG9K EM Internodal ESA**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

Inter Nodal ESA will provide the ability to make calls while in ESA between MG9K nodes. In doing so, the Telco's will also be provided the ability to provision a "Community of Interest" which defines which MG9K nodes can make ESA calls between one another. A community must have access to a LAN Switch (i.e. Passport 15K or equivalent) in order for Inter Nodal ESA calls to complete.

If an MG9K does not have access to a LAN Switch, it will operate in the pre-SN08 manner of routing calls between VMGs within a single MG9K node. Also, although a Community of Interest is defined, each node must be in ESA for it to participate in the community. Nodes are not forced to enter ESA.

The current implementation of ESA only allows calls between Virtual Media Gateways (VMG) within the same MG9K node. This feature will expand ESA's ability to make calls between a limited number of MG9K nodes termed a "Community of Interest". However, as with previous ESA releases, calls can only be made between VMGs that are in ESA.

#### **1.3 Hardware Requirements or Dependencies**

This feature will apply to all supported hardware platforms, per SN08 succession server platform foundation software specification.

#### **1.4 Software Requirements or Dependencies**

This MG9K EM feature is dependent on the corresponding SN08 MG9K feature for internodal ESA - A00006894.

#### **1.5 Limitations and restrictions**

- Up to 32 communities of interest are supported.
- Each community can contain up to 15 nodes.
- A given node can only belong in one community.

## 1.8 Glossary

| Term | Description             |
|------|-------------------------|
| EM   | Element Manager         |
| COI  | Community of Interest   |
| ESA  | Emergency Standalone    |
| VMG  | Virtual Media Gateway   |
| PVR  | Passport Virtual Router |
| MG9K | Media Gateway 9000      |

## 2: Fault Management for A00007415

### 2.1 Fault management strategy

The standard MG9k EM Fault Management strategy will apply to the faults for MG9kEM Internodal ESA. Alarms will be displayed by the MG9K EM Alarm

Browser, logged in NT standard format to the SSPFS CUST logs, and forwarded to the northbound OSS.

## 2.2 Fault management tools and utilities

The Alarm Browser - reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date, time, the NE Id, the generating resource information, the severity and the probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

The Log Adaptor - generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number that contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

## 2.3 Logs and Alarms

Two new alarms (ESA304 (nnEsaCoiFault) and ESA312 (EM generated)) will be added. The new alarm will be displayed at the Alarm Browser at the subnet as well as the well as the alarm browser for each corresponding network element. A log is also generated. Both are NE level alarms.

### 2.3.1 Explanation

#### 2.3.1.1 ESA304 (nnEsaCoiFault)

Title: nnEsaCoiFault

Name: ESA

Description: This log is generated by the EM in response to a trap from the MG9000 (nnEsaCoiFault). The MG9000 sends this trap when it detects communication problems to other nodes in the same community of interest.

Severity: Major

Event type: ESA community of interest

#### 2.3.1.2 ESA312 (Internodal Esa Provisioning Fault)

Title: Esa Provisioning Fault

Name: ESA

Description: This log is generated by the EM when a failure occurs whilst trying to provision internodal community of interest data for a given NE.

Severity: Major

Event type: Internodal ESA Provisioning failure

### 2.3.2 Format

The Log Delivery application for this feature generates logs in the Number 2 Switch Control Center (SCC2) format and the NT standard (STD) format explained in the PLOA\_SLOA\_LOG\_ALARMS DID.

#### 2.3.2.1 ESA304 (nnESAFault)

\*\*\*ESA304 Tue Jul 09 14:50:26 EDT 2005 TBL

NE Number: 8 NE Name: co8

State: not acknowledged

Type: Equipment

Cause: Equipment malfunction

Time: Jul 09 14:50:26:616 2005

Severity: Major

Description: Failed to ping members of community of interest

#### 2.3.2.2 ESA312 (Esa Provisioning Failure)

\*\*\*ESA312 Tue Jul 09 14:50:26 EDT 2005 TBL

NE Number: 8 NE Name: co8

State: not acknowledged

Type: Processing Error

Cause: Configuration Or Customization Error

Time: Jul 09 14:50:26:616 2005

Severity: Major

Description: Internodal ESA provisioning failure

### 2.3.3 Field descriptions

#### 2.3.3.1 ESA304 (nnEsaCoiFault)

**Table 1 Field descriptions ESA304**

| Field                 | Value                       | Description                                                                                                                                                                                               |
|-----------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| office identification | String                      | Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters.                                                                                  |
| alarm                 | ***, **, *, or blank        | Indicates the alarm type of the log report. ***=critical, **=major, *=minor, blank = no alarms/warning                                                                                                    |
| threshold             | + or blank                  | Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.                                                                |
| report identification | AAAA nnn                    | Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem.<br><br>For this log AAAA=MGC and nnn=600. |
| day                   | String                      | Identifies the day of the week.                                                                                                                                                                           |
| mmmmdd                | January-December<br>(01-31) | Identifies the month and date the report generates.                                                                                                                                                       |
| hh:mm:ss              | 00-23<br>00-59<br>00-59     | Identifies the hour, the minute, and the second the report generates.                                                                                                                                     |
| zone                  | PST, EST, MST, CST, AST     | Identifies the time zone.                                                                                                                                                                                 |
| yyyy                  | 0000-9999                   | Year                                                                                                                                                                                                      |
| ssdd                  | 0000-9999                   | Defines a different sequence number for each log report generated.                                                                                                                                        |

**Table 1 Field descriptions ESA304**

| Field               | Value          | Description                                                                                         |

| nnUemgAlarmSeverity | String         | Major                                                                                               |
| Description         | string         | Failed to ping members of community of interest                                                     |

### 2.3.3.2 ESA312 (Internodal ESA Provisioning Fault)

**Table 2 Field descriptions ESA304**

| Field                 | Value                | Description                                                                                                              |
|-----------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------|
| office identification | String               | Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters. |
| alarm                 | ***, **, *, or blank | Indicates the alarm type of the log report.<br>***=critical, **=major, *=minor, blank = no alarms/warning                |

**Table 2 Field descriptions ESA304**

| Field                 | Value                       | Description                                                                                                                                                                                                |
|-----------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| threshold             | + or blank                  | Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.                                                                 |
| report identification | AAAA nnn                    | Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem.<br><br>For this log AAAA= MGC and nnn=600. |
| day                   | String                      | Identifies the day of the week.                                                                                                                                                                            |
| mmmmdd                | January-December<br>(01-31) | Identifies the month and date the report generates.                                                                                                                                                        |
| hh:mm:ss              | 00-23<br>00-59<br>00-59     | Identifies the hour, the minute, and the second the report generates.                                                                                                                                      |
| zone                  | PST, EST, MST, CST, AST     | Identifies the time zone.                                                                                                                                                                                  |
| yyyy                  | 0000-9999                   | Year                                                                                                                                                                                                       |
| ssdd                  | 0000-9999                   | Defines a different sequence number for each log report generated.                                                                                                                                         |
| event type            | TBL, INFO, etc              | Trouble, Service Summary, State Change, Information, Threshold and Expert.<br><br>TBL for this log.                                                                                                        |
| event id              | String                      | The Log Title.                                                                                                                                                                                             |
| NE Number             | integer                     | Number of the NE                                                                                                                                                                                           |
| NE Name               | string                      | Name of the NE                                                                                                                                                                                             |

**Table 2 Field descriptions ESA304**

| Field               | Value       | Description                                                                                |
|---------------------|-------------|--------------------------------------------------------------------------------------------|
| Fault Type          | string      | The type of the fault:<br><br>Processing Error                                             |
| nnUemgEventTime     | DateandTime | The Date and Time the event occurred in the following format: day mmmdd hh:mm:ss zone yyyy |
| nnUemgAlarmSeverity | String      | Major                                                                                      |
| Description         | string      | Internodal ESA provisioning failure                                                        |

### 2.3.4 Action

ESA304 (nnEsaCoiFault):

Check failure cause in alarm or log text and perform corrective action This will typically require network route troubleshooting. The MG9000 will clear the alarm autonomously once the root cause is fixed.

ESA312 (Internodal ESA provisioning failure):

Check failure log in the alarm or log text (most common is communication failure between the MG9000 EM and the MG9000). Once the root cause is fixed the alarm can be cleared by running and audit on the affected NE, or hitting “Apply” button on the Internodal ESA configuration GUI.

### 2.3.5 Associated Operational Measurements or Performance Measurements

None.

## 3: Configuration for A00007415

### 3.1 Hardware and Software Requirements

SN08 or a later software load for both the MG9000 and the Element manager. Passport Virtual Router (PVR).

### 3.2 Initial Configuration

This document assumes that the reader is familiar with Emergency Stand-Alone (ESA). ESA allows intra-nodal calls to complete when the MG is cutoff from the call server. Prior to SN08 only intra-nodal ESA was supported. With the introduction of this feature, inter-nodal ESA is now supported as of SN08.

Internodal ESA allows groupings of MG nodes into “communities of interest” (COI). All nodes in a community can communicate with each other during ESA, allowing calls to complete inside the community during ESA.

The Passport Virtual Router must be configured before Internodal ESA will function. The Passport settings are located on the NE Properties GUI on the EM. Each node in the community must be configured with PVR settings before the community is established.

The customer should first determine how the nodes will be grouped together into communities. In addition each MG will need to be configured with a new ESA IP address. This IP address should be chosen from an available IP address from the call control subnet (the same subnet used for the VMG configuration). No “default” communities are provided so each community must be manually configured by the customer in order for inter-nodal ESA to function.

The high-level steps for adding a community of interest are as follows:

- 1 Load the MG9K, MG9KEM, and PVR with the required software.
- 2 Launch the MG9K Element Manager.
- 3 Select a node to be added to the community and configure the PVR settings from the NE Properties screen. Repeat for each node.
- 4 Select Configure Internodal ESA from the Configuration Menu.
- 5 Set the ESA IP address of the nodes that are being placed into communities.
- 6 Create a new community of interest.
- 7 Add the desired nodes to the community of interest.
- 8 Click the Apply button.
- 9 Repeat for each community of interest.

### 3.3 Upgrade Considerations

None

#### 3.3.1 Dump and Restore (CM)

#### 3.3.2 Element Management Upgrade

#### 3.3.3 Downgrade impact

Prior to SN08, intra-nodal ESA was not supported. Therefore, if an MG9K is in a community and is downgraded to SN08 from SN08 an error message will

be generated and the user will not be able to downgrade until the node is removed from its community.

### 3.4 Data schema (DS) (CM, MIBS, RDB)

#### 3.4.1 New/modified tables, MIBs, or Database Schema

| Table/MIB name        | NEW/CHANGED/ or DELETED/ | Table Control (NEW/OLD/UNCHANGED) |
|-----------------------|--------------------------|-----------------------------------|
| nnCommunityOfInterest | NEW mib                  |                                   |

#### 3.4.2 Table/MIB/Remote Database Schema information

N/A

### 3.5 Element Management

#### 3.5.1 New/modified GUIs

| GUI name                     | NEW, CHANGED, or DELETED |
|------------------------------|--------------------------|
| Internodal ESA Configuration | NEW                      |

#### 3.5.2 GUI information

The new GUI will allow the customer to configure communities of interest. A screenshot is provided below for reference only - the screen is subject to change.

**Figure 1 Community Of Interest Configuration GUI**

### 3.5.2.1 GUI name: COI Configuration

#### Community of Interest Configuration

##### 3.5.2.1.1 Functional description

The purpose of the COI Configuration GUI is to allow the customer to manage Internodal ESA Communities of Interest. The GUI is accessed from the main subnet view window under the “Configuration” menu item. The GUI layout contains three main list windows:

- The Communities Of Interest list contains a list of all currently defined communities. When you click on an item in this list the “Nodes In Community” list changes. The number of communities is limited to 32.
- The “Nodes In Community” list displays all the nodes that are currently in the selected community of interest. The number of nodes in a community is limited to 15.
- The “Available Nodes” list displays all nodes that are available to be added to a community (they do not currently belong to a community). Only nodes that are ESA enabled will be displayed in this list.

The Create and Delete buttons allow the user to create and delete COI names. COI names are limited to 20 characters and can only contain the characters 'a' - 'z', 'A' - 'Z', and underscore.

The Add Node button allows the user to add nodes from the available list to the COI node list. Before a node is added the ESA IP address must be set.

The Delete Node button allows the user to remove nodes from the selected community. The currently selected node in the "Nodes In Community" list will be removed from the list and it will appear in the "Available Nodes" list.

The ESA IP Address field in the "Nodes in Community" list and "Available Nodes" list is editable. The other fields in the lists are not editable. The IP Address field must be configured before a node is added to the community. When the user presses enter or clicks in another window or button, the IP address will be validated and saved in the database. The IP address must be "well-formed" and unique in the system.

The Apply Changes button allows the user to apply changes to the Community. The button is disabled until there are changes to commit. When the user makes changes to a community the button is disabled. If the user tries to leave the GUI or click on another community name, the user will be prompted to save or discard changes.

When the user presses Apply, a status window will display the status of NEs that are being updated. The status window will scroll as NEs are successfully updated or if there are any failures. A configuration alarm will be generated if there are any configuration failures. However, if the user exits the GUI and returns to the GUI, there is no way to determine if there were any previous failures, but the alarm will continue to be displayed in the alarm manager until the configuration is successful. If there is a failure, the user can trigger an audit to re-configure the COI or the user can press the "Reconfigure" button on the GUI. The "Reconfigure" button will cause the currently selected COI data to be sent to all affected nodes.

The Refresh button allows the user to completely refresh the GUI with data from the database.

#### **3.5.2.1.2 GUI usage and implications**

The GUIs must be configured in the following sequence. This sequence is for adding a new community of interest.

- 1 Configure MG9K nodes to support ESA, configuring VMGs, etc.
- 2 Bring up the COI Configuration GUI.
- 3 Click the Create button to create a new COI name.
- 4 In the "Available Nodes" list, select a node to be added to the community.

- 5 Set the ESA IP address of the node and press enter.
- 6 Click the Add Node button.
- 7 Repeat until all desired nodes are added to the community.
- 8 Press the Apply Changes button.

A NE cannot be deleted if it is in a community of interest. An error message will be generated if the user attempts to delete an NE that is configured in a community.

### 3.5.2.1.3 GUI size

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory    |
|----------------------|-------------------|-------------------|--------------------------|
| COI Configuration    | 0                 | 1                 | fixed memory allocation. |

### 3.5.2.1.4 GUI fields

The following table lists fields for the GUI or pull down menu <abbreviated name of GUI>.

**Table 1 GUI field descriptions**

| Field          | New or Changed | Subfield | Entry                                                                                                                                           | Explanation and action                                                                         | Associated MIB entry |
|----------------|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|----------------------|
| ESA IP Address | New            | no       | Valid, Unique IP Address                                                                                                                        | The initial value is blank. The field must be filled in before a node is added to a community. |                      |
| COI Name       | New            | no       | Community of Interest Name. Up to 20 characters (a-z, A-Z, and underscore). COI names not case sensitive. So "COI1" and "coi1" cannot co-exist. |                                                                                                |                      |

### 3.5.2.1.5 Usage example

The following example shows sample datafill or menu selection for the GUI Community of Interest:

See the above image.

### 3.6 Configuration Walkthrough

Before initial configuration of inter-nodal ESA begins, the MG9K nodes must be configured to support ESA (see feature A00002020 for more details on configuring intra-nodal ESA). The customer should also determine how the nodes will be grouped into communities, i.e. which nodes go into which community of interest. In addition, each MG9K that supports inter-nodal ESA will need to be configured with an ESA IP address. This IP address should be chosen from an available IP address from the call control subnet. This is the subnet of IP addresses used for VMG configuration. No “default” communities are provided so each community must be manually configured by the customer in order for intra-nodal ESA to function.

The high-level steps for adding a community of interest are as follows:

- 1 Load both the MG9K and MG9KEM with required software.
- 2 Launch the MG9K Element Manager from a web browser.
- 3 Select Configure Internodal ESA from the main menu.
- 4 Set the ESA IP address of the nodes that are being placed into communities.
- 5 Create a new community of interest.
- 6 Add desired nodes to the community of interest.
- 7 Click Apply Changes button.
- 8 Repeat for each community of interest.

When the user presses Apply a status window will display the status of NEs that are being updated. The status window will scroll as NEs are successfully updated or if there are any failures. A configuration alarm will be generated if there are any configuration failures. However, if the user exits the GUI and returns to the GUI, there is no way to determine if there were any previous failures, but the alarm will continue to be displayed in the alarm manager until the configuration is successful. If there is a failure, the user can trigger an audit to re-configure the COI or the user can press the “Reconfigure” button on the GUI. The “Reconfigure” button will cause the currently selected COI data to be sent to all affected nodes.

***Product = MG 9000***

### **A00008387--GLC-32 AB Card Support**

## ***Functional Description***

### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

### **1.2 Description**

This feature enhances the MG9KEM to provide the following capabilities:

- GLC-32 AB card (PEC NY53AB) support

Prior to this feature, MG9KEM and MG9K gateways only support the GLC-32 AA card (PEC NY53AA). With the combination of this feature and the matching SN08 gateway feature, both GLC cards, NY53AA and NY53AB are supported in SN08.

- Allowing bulk provisioning GLC card's line service types

This feature provides the capability for the user to bulk provision all the line circuits on a GLC card to the same service type. This option is only enabled when the card is deprovisioned.

- Card replacement support for GLC and WLC cards

With the combination of this feature and the matching SN08 gateway feature, card replacement between GLC AA and GLC AB cards and WLC and GLC cards can be performed without deprovisioning the card.

### **1.3 Hardware Requirements or Dependencies**

This feature provides support for the NY53AB board with V2.1 or higher Infineon chipset.

### **1.4 Software Requirements or Dependencies**

The capabilities provided by this feature require the SN08 gateway load.

### **1.5 Limitations and restrictions**

1. SN08 gateway is required to support the NY53AB GLC card.
2. Once the NY53AB GLC card(s) are installed on a SN08 gateway, any gateway downgrade to pre-SN08 loads will render the NY53AB GLC card non-functional. The NY53AB GLC cards should be deprovisioned and removed prior to the downgrade attempt.
3. Since WLC card only supports the "potsLoopStart" line service type, when replacing a GLC card with a WLC, any EBS/pPhone or potsGroundStart lines on the GLC card MUST be decommissioned prior to the card replacement attempt; failed to do so will result in lost of service to these

lines. Once the GLC card is replaced with a WLC, all line circuits on the card will assume the line service type of “potsLoopStart”.

4. The WLC and GLC card replacement is only supported with the SN08 gateway.

## 1.1 Interactions

## 1.2 Glossary

| Term | Description      |
|------|------------------|
| GLC  | Global Line Card |
| WLC  | World Line Card  |

## *Configuration for A00008387*

### 2.1 Hardware and Software Requirements

Standard Media Gateway 9000 Element Manager (MG9000 EM) configuration.

### 2.2 Initial Configuration

Standard Media Gateway 9000 Element Manager (MG9000 EM) configuration.

### 2.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

### 2.4 Upgrade Considerations

#### 2.4.1 Dump and Restore (CM)

#### 2.4.2 Element Management Upgrade

#### 2.4.3 Downgrade impact

SN08 gateway is required to support the NY53AB GLC card. Once the NY53AB GLC card(s) are installed on a SN08 gateway, any gateway downgrade to pre-SN08 loads will render the NY53AB GLC card non-functional. The NY53AB GLC cards should be deprovisioned and removed prior to the downgrade attempt.

SN06.2 gateway loads do not support pPhone and potsGroundStart line service types for GLC cards. When downgrading to the SN06.2 gateway load, if pPhone and postGroundStart lines are provisioned on the GLC cards, they will have to be deprovisioned prior to the downgrade attempt.

The WLC and GLC card replacement is only supported with the SN08 gateway.

## 2.5 Data schema (DS) (CM, MIBS, RDB)

##### 2.8.2.1.1 Functional description

This is an existing view that shows the Line Coefficients available for the GLC circuits.

##### 2.8.2.1.2 GUI usage and implications

This is an existing view that shows the Line Coefficients available for the GLC circuits. This GUI is updated to display the Line Coefficient information in a table format. The usage for this GUI has not changed.

##### 2.8.2.1.3 GUI fields

**Table 3 GUI field descriptions**

| Field        | New or Changed | Subfield | Entry | Explanation and action                               | Associated MIB entry |
|--------------|----------------|----------|-------|------------------------------------------------------|----------------------|
| Name         | changed        |          |       | Name of the Coefficient                              |                      |
| Index        | changed        |          |       | Coefficient Index                                    |                      |
| PEC          | new            |          |       | GLC Card PEC (NY53AA or NY53AB)                      |                      |
| Country Info | new            |          |       | Country the coefficient is intended for              |                      |
| CRAM         | new            |          |       | cRAM info from the GLC card                          |                      |
| Vinetic Ver. | new            |          |       | Vinetic version from the GLC card                    |                      |
| Loop Info    | new            |          |       | loop status                                          |                      |
| Metering     | new            |          |       | with or without Metering                             |                      |
| Svc Type     | new            |          |       | service type the coefficient is for                  |                      |
| Default      | new            |          |       | is or is not the default coefficient for the country |                      |

**2.8.2.1.4 Usage example**

From the GLC Card View pulldown menu, select “Coefficient Table Manager...” to launch the GUI.

Here is an example of the GUI:

NE: 18 Line Coefficient Table

MG9000

| Name          | Index | PEC    | Country Info | CRAM | Vinetic Ver. | Loop Info          | Metering | Svc Type | Default |
|---------------|-------|--------|--------------|------|--------------|--------------------|----------|----------|---------|
| PPHONE_LL     | 90    | NY53AA | Global       | 0    | 0x2484       | LongLoop           | false    | pPhone   | true    |

| POTS_LL_LV    | 9     | NY53AA | Mexico       | 0    | 0x2484       | LongLoopLowVoltage | false    | pots     | false   |
| PPHONE_LL     | 95    | NY53AB | Global       | 0    | 0x1490       | LongLoop           | false    | pPhone   | true    |
| PPHONE_LL_LV  | 96    | NY53AB | Global       | 0    | 0x1490       | LongLoopLowVoltage | false    | pPhone   | false   |
| POTS_LL       | 31    | NY53AB | NorthAmerica | 0    | 0x1490       | ShortLoop          | false    | pots     | true    |
| POTS_LL       | 32    | NY53AB | NorthAmerica | 0    | 0x1490       | LongLoop           | false    | pots     | false   |
| POTS_LL_LV    | 33    | NY53AB | NorthAmerica | 0    | 0x1490       | LongLoopLowVoltage | false    | pots     | false   |
| POTS_SL       | 50    | NY53AB | Russia       | 0    | 0x1490       | ShortLoop          | false    | pots     | true    |
| POTS_LL       | 51    | NY53AB | Russia       | 0    | 0x1490       | LongLoop           | false    | pots     | false   |
| POTS_LL_LV    | 52    | NY53AB | Russia       | 0    | 0x1490       | LongLoopLowVoltage | false    | pots     | false   |

Add Delete Refresh

### 2.8.2.1.5 GUI release history update

### 2.8.2.1.6 Context sensitive launching information

This GUI is only accessible through the GLC Card View pulldown menu.

### 2.8.2.1.7 Supplementary information

## 2.8.3 GUI information

### 2.8.3.1 GUI name: BulkProvSvceTypesView

#### 2.8.3.1.1 Functional description

This is a new view. This view can be used to bulk provision all the line circuits on a GLC card to the same service type.

#### 2.8.3.1.2 GUI usage and implications

This view can be used to bulk provision all the line circuits on a GLC card to the same service type. This GUI is only enabled when the card is deprovisioned.

#### 2.8.3.1.3 GUI fields

**Table 4 GUI field descriptions**

| Field        | New or Changed | Subfield | Entry | Explanation and action                                                                     | Associated MIB entry |
|--------------|----------------|----------|-------|--------------------------------------------------------------------------------------------|----------------------|
| Service Type | new            |          |       | This is a selection field, the options are:<br>potsLoopStart, pPhone<br>or potsGroundStart |                      |

**2.8.3.1.4 Usage example**

From the GLC Card View, offline and deprovision the card. Once the card is deprovisioned, select “Provision Bulk Line Service Types...” from the card’s pulldown menu to launch the GUI. Select the desired service type from the new GUI then press “Apply” to provision this service type for all the circuits on the card.

Here is an example of the GUI:

#### 2.8.3.1.5 GUI release history update

#### 2.8.3.1.6 Context sensitive launching information

This GUI is only accessible through the GLC Card View pulldown menu when the card is deprovisioned.

#### 2.8.3.1.7 Supplementary information

## 2.8.4 CLUI Interface

## 2.9 User interface changes

N/A

## 2.10 OSSGate Interface Changes

N/A

## 2.11 Security

Only users in the *emsmtc*, *emsrw* or *emsadm* groups are authorized to bulk provision the GLC card's line service types.

## 2.12 Configuration Walkthrough

# *Product = Network Patch Manager (NPM)*

## A00006901--Missing Patches

### *Functional Description*

### 1.1 Applicable Solution(s)

PT-IP, UA-IP, IAC

### 1.2 Description

This feature, Missing Patches, is a feature that addresses several items. The main purpose of this feature is to aid the customer in getting and applying patches to his office in a timely and routine fashion. This feature also address items that will aid the user/customer in maintaining data over an upgrade as well as adding some clean up mechanisms that the user/customer can implement. The following is a list of items that this feature will provide:

- The ability to perform PFRS (Patch File Receipt System) capabilities on demand from the NPM User Interfaces.
- A new PFRS GenReport (pfrsGenReport) task will be available to the user from the Network Patch Manager User Interfaces. This task will allow the user to create an INFORM list that will be automatically dropped off at the customers patch drop off box.

- A new PFRS GetPatch (pfrsGetPatch) task will be available to the user from the Network Patch Manager User Interfaces. This task will go to the customers/users patch drop off box and get the patches that have been newly downloaded and add them to the NPM database.
- A new PFRSGETPATCH\_FAIL Major alarm and log will be raised in the event that the PfrsGetPatch Task does not executed successfully. The alarm can only be cleared after a successful execution of the Pfrs-GetPatch Task.
- A new PFRSGENREPORT\_FAIL Major alarm and log will be raised in the event that the PfrsGenReport Task does not executed successfully. The alarm can only be cleared after a successful execution of the PfrsGenReport Task.
- This feature also creates two new system plans for the PFRS functions; one plan will contain the PfrsGetPatch task and the other plan will contain the PfrsGenReport task. Each plan can be scheduled through the NPM Scheduler. This allows flexibility for the customer to schedule and execute PFRS functions according to when each site needs to execute them.
- This feature provides a mechanism that can be accessed from the NPM User Interface that will allow the user to delete patches from the “patch drop off” box. If this function is set in the NPM, the NPM will delete the patches after the PFRS GetPatch function has been executed.
- An automatic audit of a device immediately after a reload. This will provide immediate information back to the user/customer about the device and if patches need to be re-applied.
- This feature adds a new alarm for R-status or released patches; REL\_GEN\_NOT\_APP. This alarm will have a priority of Major.
- The current alarm for GEN patches: GEN\_NOT\_APP will continue to have a priority of NO\_ALARM for all GEN patches.
- This feature also addresses issues with retaining information over upgrades of the NPM and this is responsible for adding the following functions to the NPM. The user will no longer have the ability to change System Defined Reports, Tasks, Sets and Alarms. Users will only be able to modify the execution time and enabled status for System Defined Plans. The user will still have the ability to view the defi-

inition of these items via a new “View” button that will be provided on the NPM GUI. The user will still have the ability to create and modify their own reports, plans, tasks, sets and alarms.

- This feature adds a new system plan to the NPM scheduler that will automatically delete reports out of the /data/npm/reports directory. The user will be able to specify the frequency that the reports are deleted through the NPM Scheduler. A default value of thirty days will be set initially in the NPM.
- This feature provides an enhancement to the NPM GUI which will improve overall usability. A process monitor will be added which will provide a visual indicator to the user that a submitted request is in progress. This monitor will be specific to each instance of the NPM GUI and will not indicate activity of multiple GUIs.
- This feature will enhance the NPM GUI Maintenance window. A new refine or filter button will be available which will allow the user to quickly determine which patch(es) are applicable to which device(s) and vice versa.
- This feature will provide the CM CLI to each NPM GUI window. This will provide clarification when the user is performing patching operations on multiple offices.

### **1.3 Hardware Requirements or Dependencies**

None.

### **1.4 Software Requirements or Dependencies**

None.

### **1.5 Limitations and restrictions**

This feature cannot be patched back to earlier releases due to NPM database changes that must occur with this feature.

### **1.6 Interactions**

None.

## 1.7 Glossary

| Term | Description                 |
|------|-----------------------------|
| NPM  | Network Patch Manager       |
| PFRS | Patch File Receipt System   |
| GUI  | Graphical User Interface    |
| CLUI | Command Line User Interface |

## 2: Fault Management for A00006901

### 2.1 Fault management strategy

This feature moves the PatchFile Receipt System access from the SSPFS TOOL into the Network Patch Manger (NPM). This feature also addresses the difference between R-status patches and V-status patches. The addition of this software into the NPM warrants the addition of three new alarms:

- REL\_GEN\_NOT\_APP
- PFRSGETPATCH
- PFRSGENREPORT

### 2.2 Fault management strategy

No additional tools are implemented by this feature. Customer alarms for this feature are generated via the existing alarm software in the Network Patch Manager.

### 2.3 ALARMS

#### 2.3.1 REL\_GEN\_NOT\_APP Alarm

- **Alarm Format:**

\*\* NPM360 SEP21 11:23:55 1100 INFO Alarm Raised

Alarm REL\_GEN\_NOT\_APP has been raised.

Alarm Description: Released patches not applied.

- **Severity:** Major
- **Cause:** A patch that has a status of R has been validated but not applied.

- **Duration:** The alarm will continue to alarm until all the R status patches have been applied.
- **Action:** Apply all R status patches.

### 2.3.2 PFRSGENREPORT Alarm

- **Alarm Format:**

\*\* NPM360 SEP21 11:23:55 1100 INFO Alarm Raised

Alarm PFRSGENREPORT has been raised.

Alarm Description: PFRS GENREPORT task has failed.

- **Severity:** Major
- **Cause:** PFRS GENREPORT failed to execute.
- **Duration:** The alarm will continue to alarm until the next successful execution of the PFRS GENREPORT task.
- **Action:** Fix the error and execute the task again.

### 2.3.3 PFRSGETPATCH

- **Alarm Format:**

\*\* NPM360 SEP21 11:23:55 1100 INFO Alarm Raised

Alarm PFRSGETPATCH has been raised.

Alarm Description: PFRS GETPATCH task has failed.

- **Severity:** Major
- **Cause:** PFRS GETPATCH failed to execute.
- **Duration:** The alarm will continue to alarm until the next successful execution of the PFRS GETPATCH task.
- **Action:** Fix the error and execute the task again.

## 2.4 Related documentation

## 3: Configuration for A00006901

## 3.1 Hardware and Software Requirements

This feature requires an SN08 Network Patch Manager (NPM) and the SN08 SSPFS platform.

## 3.2 Network Patch Manager Server

### 3.2.1 Initial Configuration

#### 3.2.1.1 Upgrade

One of the functions of this feature is to save System and User defined information in the NPM database from one release to the next starting with SN08.

Therefore, the procedure for upgrades from an SN08 NPM and beyond retains the *user* and *system* defined information for tasks, set, alarms, reports and plans over an upgrade. If the user is upgrading from a pre-SN08 to SN08 the information in the database is un-initialized as it has always been.

If the user is going from SN08 to SN08 or above, the NPM now retains system and user defined data for tasks, sets, and plans.

If the user wishes to initialize the NPM database after the SN08 (and beyond) package has been installed; the user must exit the CLI tool after the NPM configuration and re-enter the CLI tool. The user must make their way back into the NPM configuration, only this time the user will choose “CreateDB”. Once this has finished executing, the NPM database will be initialized and all user defined data will be erased.

#### 3.2.1.2 PFRS

In SN07 the configuration of PFRS was moved to the CLI tool. Although the tool offered the user the ability to set up, and execute a PFRS GENREPORT and a PFRS GETPATCH either on demand or through a scheduler, the user needed to have root access to the SSPFS platform to utilize these commands.

This feature moves this information from the CLI tool into the NPM GUI and CLUI. Access for this functionality is the same as it is for all the other NPM maintenance commands; EMSADM.

The user may now set up the PFRS drop box information via a preferences window in the NPM GUI and via a preferences command in the NPM CLUI.

The user may also execute a PFRS GENREPORT and a PFRS GETPATCH on demand though the NPM by executing either one of two NPM system pre-defined tasks; PFRSGENREPORT and PFRSGETPATCH.

Both of these tasks are available in the Maintenance GUI panel or can be executed as part of the existing runtask command in NPM CLUI.

This feature also provides new functionality for the PFRS user. The user can now decide if they would like the NPM to “clean up” or delete patches from the drop box that have been transferred to the NPM after the PFRSGETPATCH task has been executed.

#### **3.2.1.2.1 PFRS Scheduling**

These two tasks can also be scheduled through the NPM Scheduler either via a user defined plan or via the provided NPM system plans; GETPATCH and GETREPORT. Although neither of the plans are defaulted to enabled; the default execution time for GETREPORT is at 9:00 am and the default execution time for GETPATCH is 11:00 pm.

It is recommended that the GETREPORT plan be scheduled to execute before the GETPATCH plan. Both plans should be executed before the NPM System plan.

#### **3.2.1.3 Delete Reports**

Delete Reports is a new NPM system defined task. This task is used to delete reports that have been created and left in the /data/npm/reports directory. Reports that are left in this directory are created when a user schedules reports to execute through the NPM Scheduler.

#### **3.2.1.4 Automatic audit of MG9K and GWC devices after reload**

This feature changes the 20 minute audit after an MG9K or GWC device reload to be immediately. This will provide immediate information back to the user/customer about the device load and if patches need to be re-applied.

### **3.3 Network Element Patch Manager GUI/CLUI**

#### **3.3.1 New/modified GUIs**

The NPM GUI has been modified to include a new “View” button on specific NPM GUI panels and a new PatchFile Retrieval Preferences tab as part of the Preferences GUI. The following table will identify the names of each panel that has been modified as a result of this feature because of these specific items and others that will be described later in this document.

**Table 1 New or modified GUIs**

| <b>GUI name</b>                | <b>NEW, CHANGED, or DELETED</b> |
|--------------------------------|---------------------------------|
| Maintenance - Task List        | CHANGED                         |
| Maintenance - Maintenance Task | CHANGED                         |
| Reports - Report List          | CHANGED                         |
| Alarms - Alarm List            | CHANGED                         |
| Plans - Plan List              | CHANGED                         |

**Table 1 New or modified GUIs**

| GUI name                                         | NEW, CHANGED, or DELETED |
|--------------------------------------------------|--------------------------|
| Preferences - PatchFile Retrieval<br>Preferences | NEW                      |

### 3.3.2 GUI information

In addition to the GUI/CLUI items that have been added as a result of the NPM Server, this feature provides the following new features specific to the NPM GUI:

- System defined information in the NPM GUI can now only be viewed and cannot be edited.
- a new refine or filter button will be available which will allow the user to quickly determine which patch(es) are applicable to which device(s) and vice versa.
- a process monitor has been added which will provide a visual indicator to the user that a submitted request is in progress. This monitor will be specific to each instance of the NPM GUI and will not indicate activity of multiple GUIs.
- the CM CLI will appear on each NPM GUI window. This will provide clarification when the user is performing patching operations on multiple offices.

Figure 1 GUI name: Maintenance - Task List

Notice the three new system defined tasks and the new “View” button on the bottom of the panel. System defined tasks can only be viewed.

Figure 2 GUI name: Reports - Reports List

Notice the new “View” button on the bottom of the panel. System defined reports can only be viewed.

Figure 3 GUI name: Alarm - Alarm List

Notice the new “View” button on the bottom of the panel. System defined reports can only be viewed.

Figure 4 GUI name: Plan - Plan List

Notice the three new system defined plans that can be enabled and scheduled.

**Figure 5 GUI name: Preferences - PatchFile Retrieval Preferences**

Preferences CM CLI: RTPX

User Preferences Patch File Retrieval Preferences

These settings apply to the system and will effect all users.

Drop Box IP/Hostname:

Drop Box User ID:

Drop Box Password:

☐ Delete Patch Files from Drop Box after Retrieval

Reset

OK Cancel

This PatchFile Receipt Preference window allows the user to setup the drop off box information for the PatchFile Receipt System. The IP/Hostname, and user id will be verified and a warning message will be sent back to the user if the information cannot be verified. However, the information will still get put into and stored in the NPM database, since the user/customer may not have this remote drop off box configured at the time this information is input. If the information is still incorrect at execution time of either PFRSGENREPORT or PFRSGETPATCH task, an error will occur and an alarm will be set. This information can also be set through the NPM CLUI and will execute in the same manner.

Figure 6 GUI name: PFRS TASK with preferences

Notice the PFRS Preferences pop up window. This window is provided for each the PFRSGENREPORT and the PFRSGETPATCH task. This provides another option for the user to set up and execute either of these two tasks from the NPM GUI.

Figure 7 GUI name: Delete Task View

A new pop up window has been provided for tasks that do not contain either patches or devices. This pop up window provides the user a description of the task.

Figure 8 GUI name: Maintenance Task

Notice the new Refine Devices and Refine Patches buttons. These buttons narrow down either the devices or the patches for specific chosen patch or device.

### 3.3.3 CLUI Interface

The NPM CLUI provides the same functionality for the new PFRS access and task access as the GUI does. The following figures illustrate the commands in the NPM CLUI.

**Figure 9 NPM CLUI Command Examples**

```
npm>pfrsview

Retrieving PFRS settings...

Current PFRS Settings

Setting PFRS preferences done
```

## Baseline information

This chapter provides information on all Logs/faults, and on all operational measurements (OMs). Some information appears in NE-specific Appendices to this document. Those appendices are referenced in the text of this chapter where appropriate.

### Logs/Faults information

A log report is a record of a message that your system generates whenever a significant event has occurred in the switch or one of its peripherals. Log reports include status and activity reports, as well as reports on hardware or software faults, test results, changes in state, and other events or conditions likely to affect the performance of the switch. Either a system action or a manual action can generate a log report.

**Note:** Some of the element managers use a graphical user interface (GUI), so they display faults on the workstation monitor screen rather than generating log reports.

Alarms are generated by the system when problems or conditions are detected that can change the performance or working state of a network or network element. Daily operation of the network requires monitoring for alarms and checking that functions continue without interruption. Alarms provide notification that a system hardware or software-related event has occurred.

### Using Syslog

In SN06 an alternative is introduced to log/fault delivery from each separate element management system. Syslog can be used to aggregate some of the individual fault/log streams into the SCC2/NT STD stream on the CS 2000 Core Manager/SDM.

The network will be using syslog in several ways:

- Alarms/Faults - custlog stream - Many element managers and network elements, including SDM Platform, CS 2000 SAM21 Manager, STORM, CS 2000 GWC Manager, UAS Manager, MDM (for MG15000, previously PVG), and some CS 2000 Management Tools applications, use syslog as one mechanism for notify other systems of fault events. One consumer of those fault events is the SCC2/NT STD log converter provided on the CS2000 Core Manager/SDM. The SCC2/NT STD log converter will

collect events from those sources via the custlog format and merge those events into the SCC2/NT STD stream with the CS2000 Core fault events.

- **Audit trail** - The network is also using syslog to capture the user audit trail our network elements and element managers. The audit trail contains a history of significant user and OSS activity. Syslog is the only protocol which will contain the audit trail.
- **Security log** - The network is also using syslog to capture the security logs from our network elements and element managers. The security log contains both success and failure history of authentication and authorization activities. This stream will also contain security related events from IPSec/KCE and other key negotiation systems. Syslog is the only protocol which will contain the security log stream.
- **Debug log** - some components use syslog for diagnostic and debug information used by the Nortel support personnel. This stream is not exported beyond the EMSs and is not configured or documented for end user or customer access.

### **Alarm reporting for DMS and SPM-based equipment**

The alarm reporting system integrates event detection and alarm notification functions. An alarm becomes active when reduced service, reliability, or a test condition occurs in the network or network element. The alarm remains active until a system event or activity performed by operating company personnel clears the alarm condition. The alarm system includes audible notification and visual display through warning lights and the MAP terminal. Many alarms generate automatic logs reports when raised or cleared.

For DMS and SPM-based equipment, the MAP terminal displays alarm codes in the banner and the subsystem status summary field (SSSF). The alarm banner displays alarm codes that indicate the effect of the alarm event on the network or network element. The SSSF displays alarm codes that indicate equipment faults of system states.

### **Log Delivery Service application**

The Log Delivery Service application collects logs generated by the Communications Server 2000 (CS2000) and from the CS2000 Core Manager log stream, formats these logs, and can deliver them as a single stream to the downstream Operational Support Systems (OSS).

The CS2000 log feed includes logs for itself and all peripherals managed by it, such as: MG 4000, IW-SPM, DPT-SPM and SPM. Logs are generated locally on the CS2000 Core Manager for its own faults and status changes and are merged with the CS2000 feed. The Log Delivery Service application provides log reports in ASCII text format at a single interface for inbound or outbound TCP/IP connections.

**Log formats**

The Log Delivery service provides reports in either Switching Control Center 2 (SCC2) or Standard (STD) format. Some of the high-level differences between SCC2 format logs and STD format logs are as follows:

- SCC2 has no CS2000 identifier as found in the top left hand corner of the STD log. This field is datafilled on the CS2000 in table OFCVAR, tuple LOG\_OFFICE\_ID.
- SCC2 logs do not contain the date in the header on which the log was generated.
- SCC2 logs only give the minutes past the hour in which the log was generated, while the STD log gives the hour, minutes, and seconds.
- A critical severity log is represented by \*C in SCC2 format, and by \*\*\* in STD format.
- If applicable, the SCC2 log will have the name of the component and/or peripheral generating the log in the log header.
- When ECORE\_FORMAT (table OFCVAR on the CS2K) is enabled, SCC2 formatted logs display the optional parameter NodeName on a new line immediately following the header. This new line is not indented and has the following format: Log from node <NodeName>.
- SCC2 headers (having less information) are less likely to have the Equipment Identifier field found in some logs wrapped to the next line. (See NT STD format definition section below).

See the following example to see the difference in the formats, using a CARR811 log.

**Standard format:**

```
ASN06SWITCH * CARR811 FEB24 00:45:05 3320 TBL CARRIER SPM 39
  CKT: 63 CarrName: SPM39_STS1P_1_VT15P_1_DS1P_28
  Carrier: STS1P 1 VT15P 28 DS1P 1
  UAS-N Threshold Crossing Alert: 10
  Accumulation Interval: 0:00:10 Period: 15 minutes
  Location: SPM 39 Type: SMG4 Fabric: ATM
```

**SCC2 format:**

```
ASN06SWITCH * CARR811 FEB24 00:45:05 3320 TBL CARRIER SPM 39
  CKT: 63 CarrName: SPM39_STS1P_1_VT15P_1_DS1P_28
  Carrier: STS1P 1 VT15P 28 DS1P 1
  UAS-N Threshold Crossing Alert: 10
  Accumulation Interval: 0:00:10 Period: 15 minutes
  Location: SPM 39 Type: SMG4 Fabric: ATM
```

## NT Standard log format and definitions

NT Standard log format:

```
<SOL><LogOfficeId>_<NodeName>_<POA><Threshold><LogName><ReportNumber>_<DateIndicator>_<TimeIndicator>_<SequenceNumber>_<EventType>_<EventLabel>_<EquipmentIdentifier><EOLine><LOG BODY><EOLine><EOLog>
```

where:

- The < and > denote the beginning and end of a field.
- Bold text denotes optional fields that may or may not be there.
- \_ denotes a space delimiter between fields.
- <SOL> = Start of Log delimiter - default is 0A0D in hexadecimal for NT STD and SCC2. (Line Feed followed by Carriage Return).
- <EOLine> = End of Line delimiter - default is 0A0D in hexadecimal for NT STD and SCC2. (Line Feed followed by Carriage Return).
- <LOG BODY><EOLine> = This sequence represents 0 to n lines of text in the log body each ending with EOLine - usually each line begins following an indentation of 8 spaces.
- <EOLog> = End of Log delimiter - default (in hexadecimal) is 200A0D0A0D00 for NT STD and 0A190A0D for SCC2

### Office Identifier <LogOfficeId>:

Field Length/Format: variable length (1 to 12 characters)

Field Value(s): typically an 11-character Office CLI name

Comment: This field's value corresponds to what is datafilled in your switch's table OFCVAR, tuple LOG\_OFFICE\_ID. A maximum of 12 characters can be datafilled into the LOG\_OFFICE\_ID tuple. Normally though, the value of this tuple in customer sites matches that of the Office CLI name. The Office CLI name has a standard length of 11 characters. In the switch it is datafilled in table OFCENG, tuple OFFICE\_CLI\_NAME. (So OFFICE\_CLI\_NAME and LOG\_OFFICE\_ID would be datafilled the same). In a log sent downstream to an OSS, the Office Identifier field will be seen by the OSS as 1 word with no spaces. No padding of spaces will occur with this field to make it 12 characters. i.e. If the log\_office\_id value is 6 characters in length, the space following the field will be the delimiter to the next field.

### Node Name:

Field Length/Format: fixed length (8 characters)

Field Value(s): Node name that is left justified within the 8 character field. Padding of spaces will occur to ensure 8 character length.

Comment: This optional field is generally not recommended for implementa-

tion. The value of the field is often “CM” which has low value and the extra 9 characters (8 + space) increases the length of the header. A longer header may result in line wrapping of the Equipment Identifier field which is present in some logs. A wrapped header is difficult for OSSs to accommodate.

**Alarm Level Indicator / Priority of Action (POA) / Severity:**

Field Length/Format: fixed length (3 characters)

Field Values: '\*\*\*' or '\*\*' or '\*' or ' ' (Note the right justification of the \*s).

**Threshold:**

Field Length/Format: 1 character field (Note: there are no space delimiters before/after)

Field Value(s): A + sign if the log is thresholded. A space if the log is not thresholded.

**Log Name/Report Name/Log Prefix:**

Field Length/Format: fixed length (4 characters)

Field Value(s): The log name is right justified within the 4 character field. Padding of spaces will occur at the beginning for names less than 4 characters. E.g. 'CARR' or ' SPM'. Note that the Log Name and the Report Number are considered a single entity. i.e. The SPM300 log.

**Report Number:**

Field Length/Format: fixed length (3 characters)

Field Value(s): The number will always be 3 digits. i.e. 100 to 999.

**Date Indicator:**

Field Length/Format: fixed length (5 characters); MMMDD where MMM is JAN through to DEC and DD is 01 through to 31

Field Value(s): E.g. DEC04

**Time Indicator:**

Field Length/Format: fixed length (8 characters); HH:MM:SS where HH is 00 through 23, MM is 00 through 59, and SS is 00 through 59

Field Value(s): E.g.: 20:39:13 or 00:00:00 or 23:59:59

**Sequence Number:**

Field Length/Format: fixed length (4 characters); NNNN where the range is 0000 through 9999

Field Value(s): E.g. 0000 or 2358 or 9999. Once 9999 is reached, the number will go back to 0000. In SDM, STD\_OLD and SCC2\_OLD formats should increment the sequence number by 1 and SCC2/STD formats increment the sequence number in the same fashion as the CS2K does. In IEMS, SCC2/STD formats increment the sequence number by 1.

**Event Type:**

Field Length/Format: fixed length (4 characters);

Field Value(s): Left justified text with spaces at the end to pad to 4 character length. Examples: 'INFO', 'TBL ', 'FLT ', 'OFFL', 'SYSB', ' ', and so on.

**Event Label:**

Field Length/Format: variable length of characters; can contain more than 1 word separated by spaces

Field Value(s): E.g.: “SDM BASE MAINTENANCE”, or “CARRIER”.

**Equipment Identifier:** (last field to be considered part of the header)

Field Length/Format: fixed length (4 characters) node type, followed by a space, followed by a numeric node number

Field Value(s): Node type portion is left justified and padded with spaces at the right if less than 4 characters. The node number portion is left justified. E.g. 'SPM 0', 'LIU7 43', 'SPM 71'.

Comment: This field is not found in all logs and should be considered rare. Known log types where this field is present are CARR and in some PM logs.

**Log Body:** (Not part of header. It follows the header).

Field Length/Format: Text in the log body usually follows an indentation of 8 spaces. Each line of text is variable in length.

Field Value(s): Can be anything but each unique log should typically always get sent out the door in the same format.

**Notes**

- Not all logs have an Equipment Identifier at the end of the header. There is no list of logs that have an Equipment Identifier and it would be an exhaustive task to determine all of which they are. Known log types that make use of the Equipment Identifier are CARR and PM. Since the Event Label can be any number of words separated by spaces, there is no obvious delimiter between the Event Label and the Equipment Identifier beyond the space that will be present. There are a couple things OSSs can do with this: take the Event Label and Equipment Identifier as just 1 string of

characters OR try to extract the Equipment Identifier out of the header independently of the Event Label. Note that the latter may not always be necessary because the body of the log may mention the Node as well. The presence of the Equipment Identifier in logs appears to be very rare and appears to be an old legacy thing that was done but isn't common practice anymore.

- For logs originating from the CS2000/XA-Core/DMS, Event Types and Event Labels for specific logs can be determined on the switch using the 'logutil' tool. In logutil, the 'listreps' and 'listroute' commands can be used to view that information. Note that the presence of a log in the tool's output list of logs does not mean that the log is actually active code where an OSS will see it downstream. Some are benign logs or development not yet completed that are sometimes listed there.

#### Example

```
LOGUTIL:
>listreps spm
Log Rep.      Event                               Suppressed/
Name No. Class Type  Event Label Thresholded Syslog
-----
  SPM  650    0    PASS
  SPM  651    0    FAIL
  SPM  300    0    TBL   Device Fault Report
  SPM  331    0    TBL   Failed Device Pro...
  ....
  SPM  709    0    INFO  SPM ISDNPROT DDM ...
  SPM  710    0    INFO  SPM ISDNPROT DDM ...
XX report(s) printed
>listroute report spm 710
REPORT  SPM 710 (SPM ISDNPROT DDM Audit) IS CLASS 0
ADDED:
DELETED:
```

- An actual SDM log sample file or feed should be analyzed for determination of a log's character by character format information. For determining things such as how many carriage returns there are between logs, or where spaces are, this is crucial. Note that a log header for a specific log very rarely changes in going from one software release to the next. The only fields that could change is the Severity, Event Type, Event Label and presence of an Equipment Identifier. Changes would be as a result of a feature change or resolve an issue with those fields' values.

### Audio Codes Media Server (AMS)--available logs/faults

The following table lists the AMS logs available. The MS2010 server is for IP networks and uses the AudioCode TP-1610 card. For detailed information on logs, refer to NN10275-909, *Fault Management Log Reference*.

#### AMS Logs/Faults available

| Log/Fault | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| AMS300    | ac Board Resetting Cleared only by a acBoardEvBoardStarted trap; or ac Board Fatal Error |
| AMS301    | ac Board Configuration Error                                                             |
| AMS302    | ac Board Temperature Alarm                                                               |
| AMS303    | ac Feature Key Error                                                                     |
| AMS304    | ac Board Call Resources Alarm                                                            |
| AMS305    | ac Board Controller Failure Alarm                                                        |
| AMS306    | ac Board Ethernet Link Alarm                                                             |
| AMS307    | ac Board Overload Alarm                                                                  |
| AMS308    | ac Active Alarm Table Overflow                                                           |
| AMS500    | ac Board Event Board Started. This trap is a signal to clear the active alarm table.     |
| AMS501    | cgw Administrative State Change                                                          |

### Audio Provisioning Server (APS)--available logs/faults

The following table lists the APS logs available. For detailed information on logs, refer to NN10275-909, *Fault Management Log Reference*.

#### APS Logs/Faults available

| Log/Fault | Description                                 |
|-----------|---------------------------------------------|
| APS398    | Indicates a raised alarm in the APS device. |
| APS399    | Indicates an alarm clear in the APS device. |

### Compact Call Agent (CCA)--available logs/faults

The following table lists the Compact Call Agent (formerly Call Agent (CA)) Logs/Faults available. These logs were also previously referred to as 3PC. For detailed information on logs, refer to NN10275-909, *Fault Management Log Reference*.

Compact Call Agent supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled "IEMS Functionality."

For details on the SDM protocol/format, refer to FCAPS documentation NN10023-111.

### CCA Logs/Faults available

| Log/Fault                                                                                                                                              | Description                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Network Element: Call Agent</b> For details on these Logs/Faults, refer to the Fault section of documentation related to Compact CS2K, NN10023-911. |                                                                                                                                                                                  |
| CCA300                                                                                                                                                 | Response to a minor, major, or critical alarm; indicates that free space in RAM is low. Severity is determined by the amount of free space remaining.                            |
| CCA301                                                                                                                                                 | Response to a minor, major, or critical alarm; indicates one or more time segments has exceeded the threshold. Severity is determined by the number of time segments affected.   |
| CCA302                                                                                                                                                 | Response to a minor, major, or critical alarm; indicates that free space on the root file system is low. Severity is determined by the amount of free space remaining.           |
| CCA303                                                                                                                                                 | Response to minor, major, or critical alarm; indicates that one or more software processes have terminated abnormally. Severity is determined by the number of process affected. |
| CCA304                                                                                                                                                 | Response to a minor, major, or critical alarm; indicates that one or more Network File Systems is inaccessible. Severity is determined by the number of systems affected.        |
| CCA305                                                                                                                                                 | Response to a minor, major, or critical alarm; indicates that time synch is lost to one or more NTP servers. Severity is determined by the number of servers affected.           |
| CCA309                                                                                                                                                 | Response to a major or critical alarm; may be a PCI bus fault, an ECC memory fault, or a parity error. A critical alarm requires card replacement.                               |
| CCA315                                                                                                                                                 | SOS application simplex                                                                                                                                                          |
| CCA316                                                                                                                                                 | SOS application is out-of-service                                                                                                                                                |
| CCA322                                                                                                                                                 | Image test failed                                                                                                                                                                |

| CCA375                                                                                                                                                 | One unit has a different CPU type than the other                                                                                                                                 |
| CCA380                                                                                                                                                 | One unit has a different committed patch file version than the other                                                                                                             |
| CCA600                                                                                                                                                 | Indicates the alarm referenced in log CCA300 has been cleared.                                                                                                                   |
| CCA601                                                                                                                                                 | Indicates the alarm referenced in log CCA301 has been cleared.                                                                                                                   |
| CCA602                                                                                                                                                 | Indicates the alarm referenced in log CCA302 has been cleared.                                                                                                                   |
| CCA603                                                                                                                                                 | Indicates the alarm referenced in log CCA303 has been cleared.                                                                                                                   |

**CCA Logs/Faults available**

| Log/Fault | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| CCA604    | Indicates the alarm referenced in log CCA304 has been cleared.                                        |
| CCA605    | Indicates the alarm referenced in log CCA305 has been cleared.                                        |
| CCA609    | Indicates the alarm referenced in log CCA309 has been cleared.                                        |
| CCA615    | Alarm referenced in CCA315 has been cleared                                                           |
| CCA616    | Alarm referenced in CCA316 has been cleared                                                           |
| CCA620    | Image test started                                                                                    |
| CCA621    | Image test finished                                                                                   |
| CCA631    | Able to communicate via ethernet/fiber                                                                |
| CCA635    | Ethernet interface ok                                                                                 |
| CCA636    | Able to communicate to the network                                                                    |
| CCA651    | Indicates the alarm referenced in log CCA351 is cleared and duplex operation is restored.             |
| CCA655    | Indicates the alarm referenced in log CCA355 is cleared.                                              |
| CCA660    | Response to a minor alarm; indicates that a REx test has started.                                     |
| CCA661    | REx test finished                                                                                     |
| CCA663    | REx test rejected                                                                                     |
| CCA665    | Alarm referenced in CCA365 has been cleared                                                           |
| CCA670    | Swact failover started                                                                                |
| CCA671    | Swact failover finished                                                                               |
| CCA675    | Alarm referenced in CCA375 has been cleared                                                           |
| CCA680    | Alarm referenced in CCA380 has been cleared                                                           |
| CCA685    | An INFO log which indicates that the CCA disabled OSPF in the local ERS8600 (formerly Passport 8600). |
| CCA686    | An INFO log which indicates that the CCA enabled OSPF in the local ERS8600 (formerly Passport 8600).  |

**CS2K Management Tools (CMT)--available logs/faults**

The following table lists the CS2000 Management Tools logs available. CS2K supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled "IEMS Functionality." For details on these

logs, refer to the Fault Management section of CS2K Management Tools, NN10325-900 and to NN10275-909, *Fault Management Log Reference*.

### CS2K Management Tools Logs/Faults available

| Log/Fault                         | Description                                                                                                                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMT300                            | Critical. Data is mismatched between the SESM server and the Core. The SESM audit, CS2K Data Integrity Audit, has 10 unresolved problems. To view and correct the problems, open the audit problem report from the Audit System found under the SESM Maintenance menu item. |
| CMT301                            | Critical. The GWC element manager cannot download data to GWC on recovery so the process has terminated early, and the GWC remains out of service. To clear, determine and remedy the cause of the data download failure.                                                   |
| CMT302                            | SNMP Timeout. Critical. SNMP poller cannot communicate to the network device due to an SNMP timeout.                                                                                                                                                                        |
| CMT303                            | A Critical automatically generated log upon the raising/clearing of a CMT alarm.                                                                                                                                                                                            |
| CMT399                            | Indicates a cleared alarm in the CMT device                                                                                                                                                                                                                                 |
| CMT500                            | Generated by the SESM alarm system to indicate the system is initializing.                                                                                                                                                                                                  |
| CMT501                            | Generated by the SESM alarm system upon shutdown.                                                                                                                                                                                                                           |
| CMT502                            | Generated by the SESM alarm system to inform northbound alarm clients that alarm notifications cannot be generated. This log will be sent via the SSPFS syslog feed to the customer log.                                                                                    |
| CMT600                            | Generated when an RMGC overflow condition is detected. This log is propagated to the IEMS under the "other" category.                                                                                                                                                       |
| Alarm log for Corrupt Certificate | The log lists additional detail for the Corrupt Certificate alarm.                                                                                                                                                                                                          |
| Alarm log for Changed Certificate | The log lists additional detail for the Changed Certificate alarm.                                                                                                                                                                                                          |
| Corrupt Certificate               | Minor alarm, raised when a syntax error is recognized in a Certificate or a disallowed combination of fields is present.                                                                                                                                                    |
| Duplicate Certificate             | Minor alarm, raised when more than one Certificate with the same name is detected in the Nortel or Third Party certificate directories.                                                                                                                                     |
| Delete Certificate                | Minor alarm, raised if a Certificate file is removed that has GWs associated with it.                                                                                                                                                                                       |
| Certificate Changed               | Minor alarm, raised when an existing profile is changed and one or more of the fields that are changed are not allowed.                                                                                                                                                     |

**CS2K Management Tools Logs/Faults available**

| Log/Fault                   | Description                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Missing Certificate         | Minor alarm, raised when a Nortel Certificate has been removed from the Nortel directory or changed to a different name. |
| No Available Call Server IP | A Critical alarm, raised if the SESM cannot get any available C-Side IP address from the Core.                           |

**SAM21--available logs/faults**

The following table lists the SAM21 Logs/Faults available. The Shelf Controller Unit (SCU) raises alarms on behalf of itself or on behalf of the cards in the I/O slots, power sleds, fan sleds and power supply. Therefore, the alarm IDs for some of the alarms will have the same label, but the slot location that is included in the body of the alarm will indicate the actual card that is having problem. Alarms with the label IPOA are the alarms raised by the SCU with the PMC ATM card.

SAM21 supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled "IEMS Functionality." For details on the logs/faults themselves, refer to the Fault Management section of SAM21 FCAPS documentation NN10089-911 and NN10275-909, *Fault Management Log Reference*.

| Log/Fault                                                                 | Description                                                                                                                                                  |
|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BootServerUnavailable                                                     | Indicates that the boot server cannot be reached. Severity may vary.                                                                                         |
| ATM Overrun Date                                                          | Indicates the date of the last overrun.                                                                                                                      |
| CPU load high                                                             | Major. The One minute load average is greater than 20.<br>Critical. The five minute load average is above 15, or the fifteen minute load average is above 7. |
| Disk usage high                                                           | Major. Total free space on the root file system has fallen below 10%.<br>Critical. Total free space on the root file system has fallen below 5%.             |
| Large number of processes abnormally terminated                           | Major. More than 4 zombie processes in system.<br>Critical. More than 15 zombie processes in system.                                                         |
| Loss of Communications: Serial Connection 1 (2) is down                   | Minor. The upper (lower) serial cable connection is down.                                                                                                    |
| Loss of Communications: Mate Ethernet is down                             | Major. This shelf controller cannot ping its mate through the ethernet interface.                                                                            |
| Loss of Communications: Remote network is down.                           | Major. This shelf controller cannot ping the SDM, but can ping its mate.                                                                                     |
| Loss of Communications: Mate Ethernet, Serial Connection 1 (2) is down.   | Major. Both the lower (upper) serial cable and the mate's Ethernet are not connected.                                                                        |
| Loss of Communications: Remote network, Serial connection 1 (2) is down.  | Major. This shelf controller cannot ping the SDM, but can ping its mate. The upper (lower) serial cable connection is down.                                  |
| Loss of Communications: Serial Connection 1, Serial Connection 2 is down. | Major. Both serial cable connections are down.                                                                                                               |
| Loss of Communications: Local Ethernet interface is down.                 | Critical. Shelf cannot ping its mate or the SDM through the Ethernet interface.                                                                              |

**SAM21 Logs/Faults available**

| Log/Fault                                                                               | Description                                                                                                                                                              |
|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Loss of Communications: Local Ethernet interface, Serial Connection 1 (2) is down       | Critical. Shelf cannot ping its mate or the SDM through the Ethernet interface. The upper (lower) serial cable connection is down.                                       |
| Loss of Communications: Mate Ethernet, Serial Connection 1, Serial Connection 2 is down | Critical. This shelf controller cannot ping its mate through the Ethernet interface. Both serial cable connections are down. No synching of state changes are occurring. |
| Loss of Communications: All Communications Paths Down                                   | Critical. The shelf cannot see out at all.                                                                                                                               |
| Memory usage high                                                                       | Major. Total free memory has fallen below 15%.<br>Critical. Total free memory has fallen below 10%.                                                                      |
| NFSMountsDown                                                                           | Raised for any mounts that remain down after the check and attempt to re-mount.                                                                                          |
| Power supply in Sled 1/2/3 has been removed.                                            | Major. Most likely the whole sled has been removed.                                                                                                                      |
| Power supply in Sled 1/2/3 is down.                                                     | Critical. The power supply in that sled has failed.                                                                                                                      |
| Fan in Sled 1/2/3 has been removed                                                      | Major. Fan has been removed from the sled, or the entire sled has been removed.                                                                                          |
| Fan in Sled 1/2/3 is down                                                               | Critical. Fan has failed.                                                                                                                                                |
| Power Feed 1/2 is down.                                                                 | Critical. Either the feed has failed, or the cable has been removed.                                                                                                     |
| Mate Shelf Controller Down. Operating in Simplex Mode.                                  | The inactive SC has been delatched, or Mama on the active SC has not received a ping from the inactive SC in 20 seconds.                                                 |
| Temperature in Sled 1/2/3 is High                                                       | Major. Temperature in the sled has reached about 40 degrees.                                                                                                             |
| Temperature in Sled 1/2/3 is High.                                                      | Critical. Temperature in sled has reached about 50 degrees.                                                                                                              |

**SAM21 Logs/Faults available**

| Log/Fault                                            | Description                                                                                                                                                                   |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extension Bridge in Slot 15/16 is Down/Up.           | Critical. Depending on the actual text, one or both of the Extension Bridges has been detached and/or removed.                                                                |
| Diagnostic Failed at test case.                      | Major. A diagnostic test was run, and the board failed at least one of the tests.                                                                                             |
| Diagnostic Failed due to SWACT                       | Major. A diagnostic test was interrupted by a SWACT.                                                                                                                          |
| Diagnostic Failed, xxxxxx                            | Major. The diagnostic failed due to the reason stated. (There are 11 possible statements.)                                                                                    |
| Firmware Flashing could not connect to the board.    | Critical. Either there is another process currently attached to the board, or the bus is too busy to allow the request. Auto Flash is now turned off on the SC for this slot. |
| Firmware Flashing failed at down-loading firmware    | Critical. The firmware file does not exist on the SDM or has incorrect parameters.                                                                                            |
| Firmware Flashing failed at validating firmware      | Critical. The firmware file is corrupt on the SDM, or there was an error in the transfer.                                                                                     |
| Firmware Flashing failed at backing up the firmware. | Critical. The copy operation from one bank to the other failed. Possible bad memory.                                                                                          |
| Firmware Flashing failed flash                       | Critical. Could not connect to the board after the flash.                                                                                                                     |
| Provision failed: process ended abnormally.          | Critical. Provisioning of the board failed due to some system problem. System may have been abnormally busy.                                                                  |
| Provision failed, could not connect to board.        |                                                                                                                                                                               |
| Provision failed to set application type.            |                                                                                                                                                                               |
| UnderlyingResourceUnavailable                        | A minor alarm when it indicates that an application card is locked and is not available, but a major alarm when it indicates that an application card is being autorecovered. |

**CS2000--available logs/faults**

The following table lists the CS 2000 Logs/Faults available.

CS 2000 supports SCC2 or NT STD formatted logs through SDM

functionality, or it can be supported through IEMS. The SDM would remain the CS2000 Core Manager but can forward the CS2000 logs to IEMS instead of directly to the OSS. For details on the IEMS interface, refer to the chapter in this document titled “IEMS Functionality.” For details on the logs/faults themselves, refer to the Fault Management section of CS 2000 FCAPS documentation, NN10083-911. For information on XA-Core logs and faults, refer to NTP 297-8991-810, *XA-Core Reference Manual* and NN10275-909, *Fault Management Log Reference*.

#### CS2000 Logs/Faults available

| Log/Fault                              | Description                                                                                                                                                                          |                                                                                                                                                                                   |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Network Element: CS2000 XA-Core</b> |                                                                                                                                                                                      |                                                                                                                                                                                   |
| ABI messaging alarms                   | Links down                                                                                                                                                                           | ABI external messaging alarm Links Down - Alarm Set (or Alarm cleared).                                                                                                           |

| EMJS671   | Log for Successful transfer job Attempts.                                                                                                                                                                                                                                                                                                                                                                                                     |
| EMJS672   | Log for partial/complete failure of transfer job attempts.                                                                                                                                                                                                                                                                                                                                                                                    |
| EMJS840   | Threshold raise alarm.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| EMJS841   | Threshold clear Alarm.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| EMSS logs | EMSS300 Produced when ever the client side PAM + RADIUS SPI is unable to communicate with the server-side RADIUS Interface.                                                                                                                                                                                                                                                                                                                   |
|           | EMSS301 Produced when ever a serious problem is detected by the RADIUS Server in the process of handling a given authentication request. Problems that fall into this category are unexpected exceptions thrown by RADIUS Server plug-ins (as a result perhaps of improper RADIUS server setup/configuration or a critical RADIUS server dependency being unavailable). Recovery Action: Check the status of Sun IS and restart if necessary. |
|           | EMSS302 Produced when the radius server policy plugin detects no single-sign-on token is available indicating there is a problem with the Sun Identity Server or that it is in fact not running.                                                                                                                                                                                                                                              |
|           | EMSS303 Indicates a communication failure with the PAM+Radius group daemon. This log indicates that the pam_radius_auth cannot establish or maintain a communications session with the group daemon on the client machine.                                                                                                                                                                                                                    |
|           | EMSS304 Produced when the pam_mkhomedir module invokes the script mkhomedir but the script does not return within the timeout time (default 30 seconds).                                                                                                                                                                                                                                                                                      |
|           | EMSS305 Produced when ever the client side PAM+ RADIUS SPI is unable to communicate with the server-side RADIUS Interface.                                                                                                                                                                                                                                                                                                                    |
|           | EMSS306 Produced when ever the client side PAM+ RADIUS SPI is unable to communicate with the server-side RADIUS Interface.                                                                                                                                                                                                                                                                                                                    |
|           | EMSS307 Produced when ever the client side PAM+ RADIUS SPI is unable to communicate with the server-side RADIUS Interface.                                                                                                                                                                                                                                                                                                                    |
|           | EMSS308 Produced when ever the client side Pam + RADIUS SPI is unable to communicate with the server-side RADIUS Interface.                                                                                                                                                                                                                                                                                                                   |
|           | EMSS309 Produced when ever the client side PAM+ RADIUS SPI is unable to communicate with the server-side RADIUS Interface.                                                                                                                                                                                                                                                                                                                    |
|           | EMSS310 Produced when ever the client side PAM+ RADIUS SPI is unable to communicate with the server-side RADIUS Interface.                                                                                                                                                                                                                                                                                                                    |

**CS2000 Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EMSS311   | Produced when ever the client side PAM+ RADIUS SPI is unable to read information for required to communicate with the configured RADIUS server(s) from the /etc/raddb/server file |
| EMSS312   | Produced when ever the pam_mkhomedir module tries to get the user information from NSSwitch by using getpwnam and fails.                                                          |
| EMSS313   | Produced when ever the radius server health monitor detects the radius process is not functional.                                                                                 |
| EMSS314   | Produced when ever the identity server health monitor detects the identity server process is not functional.                                                                      |
| EMSS315   | Produced when ever the PAM login servlet health monitor detects the PAM login servlet is not functional.                                                                          |
| EMSS316   | Produced when ever the pam_mkhomedir module checks the ownership of the script and the script is not owned by the user root.                                                      |
| EMSS317   | Produced when ever the pam_mkhomedir module tries to get the script and the script is not there.                                                                                  |
| EMSS318   | Produced when ever the pam_mkhomedir module tries to check the euid of the current process and finds the euid is not root.                                                        |
| EMSS319   | Produced when ever the module tries to get the configuration file and the file is not there.                                                                                      |
| EMSS320   | Produced when ever the module tries to read the contents of the configuration file but fails.                                                                                     |
| EMSS321   | Produced when ever the module tries to get the auth url but the url got is null.                                                                                                  |
| EMSS322   | Produced when ever the module is timed out during the authentication. The default timeout is 30 seconds.                                                                          |
| EMSS323   | Produced when ever the module tries to get the configuration file and the file is not there.                                                                                      |
| EMSS324   | Produced when ever the module tries to read the contents of the configuration file but fails.                                                                                     |
| EMSS325   | Produced when ever the module tries to get the auth url but the url got is null.                                                                                                  |
| EMSS326   | Produced when ever the module is timed out during the validation. The default timeout is 30 seconds.                                                                              |
| EMSS327   | Produced when ever the script has an error to access the directory or files.                                                                                                      |
| EMSS330   | Produced when ever the module failed to initialize single sign on facility. SSO tokens will not be generated.                                                                     |
| EMSS331   | Produced when ever the module could not authenticate user due to unhandled internal error.                                                                                        |
| EMSS332   | Produced when ever there is no single-sign-on token available after authentication.                                                                                               |

**CS2000 Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EMSS333   | Produced when ever the module could not generate single-use tokens due to unhandled internal error.                                                                                                |
| EMSS334   | Produced when ever the module could not read user's unix profile due to unhandled internal error.                                                                                                  |
| EMSS351   | Produced when ever an exception is caught while making request to the servlet.                                                                                                                     |
| EMSS352   | Produced when ever the module failed to authenticate.                                                                                                                                              |
| EMSS353   | Produced when ever there is an error processing response from the servlet.                                                                                                                         |
| EMSS354   | Produced when ever the module failed to attempt to access the shadow database by user with uid <uid>.                                                                                              |
| EMSS360   | Produced when ever the module failed to initialize SAML.                                                                                                                                           |
| EMSS361   | Produced when ever the module failed to process the configuration file.                                                                                                                            |
| EMSS362   | Produced when ever the module failed to configure log4cpp.                                                                                                                                         |
| EMSS363   | Produced when ever the module failed to read the "password_file" property from the configuration file.                                                                                             |
| EMSS364   | Produced when ever the module failed to find the configuration file.                                                                                                                               |
| EMSS600   | An INFO log produced when ever the PAM Radius daemon modifies the /etc/passwd or /etc/group files.                                                                                                 |
| EMSS601   | An INFO log produced when ever there are successful or failed authentication requests of the authentication module.                                                                                |
| EMSS602   | An INFO log produced when there are successful or failed PAM SPI events from PAM + Plug-Ins.                                                                                                       |
| EMSS603   | An INFO log that indicates a SunOne Identity Server Single Sign On (SSO) token activity for a token create event. Sensitive token information is not included in these logs.                       |
| EMSS604   | An INFO log that indicates a SunOne Identity Server Single Sign On (SSO) token activity for a token destroy event. Sensitive token information is not included in these logs.                      |
| EMSS605   | An INFO log that indicates a SunOne Identity Server Single Sign On (SSO) token activity for a token timeout event. Sensitive token information is not included in these logs.                      |
| EXT log   | EXT108 Generated upon raising and clearing of EXT alarm HIGH_MEM_BLOCKING.                                                                                                                         |
| EXT alarm | HIGH_MEM_BLOCKING Appears at the MAPCI EXT alarm banner when there is a high memory blocking level detected in the system. Correlates to XACP300 log when raised, and to XACP500 log when cleared. |
| FPS log   | FPS100 Generated when the FPS counter of a subscriber is loaded.                                                                                                                                   |

**CS2000 Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GAME logs | GAME101 Created if the RSPTMOUT OM count is greater than zero. The log is created during the RSPTMOUT OM transfer period and records the RSPTMOUT OM count value.                                        |
|           | GAME102 Created if RSPTMOUT OM count becomes equal to the office parm T1_TIMER _EXPIRY_MSG_SUPPRESS threshold value.                                                                                     |
| IAA logs  | IAA314 Generated whenever an IAA module fails to initialize. The reason text field may contain one of 7 possible strings.                                                                                |
|           | IAA342 Generated whenever an IAA module cannot communicate with other IAA modules, i.e., EMDA.                                                                                                           |
|           | IAA343 Generated when a PCEM processing error occurs. The reason text field may contain one of 6 possible strings.                                                                                       |
|           | IAA344 Generated when an IAA module cannot create an audit entry.                                                                                                                                        |
|           | IAA345 Generated when an IAA module detects a configuration problem. The reason text field may contain one of 2 possible strings.                                                                        |
|           | IAA346 Generated when an IAA cannot communicate to the downstream RKS pair or DF. The reason text field may contain one of 4 possible strings.                                                           |
|           | IAA347 Generated when an IAA module detects a problem when trying to manage its filesystem storage.                                                                                                      |
|           | IAA641 Generated when an IAA module goes into service.                                                                                                                                                   |
|           | IAA646 Generated when communications between the IAA and the downstream RKS pair or DF has been restored.                                                                                                |
|           | IAA701 Generated when the data being process by the IAA is corrupted.                                                                                                                                    |
| IEMS logs | IEMS398 Raise Log for a Loss of Communication with the EMS/NE                                                                                                                                            |
|           | IEMS399 Clear Log for regain of Communication with the EMS/NE                                                                                                                                            |
|           | IEMS601 Traps From Unknown Device Log                                                                                                                                                                    |
|           | IEMS602 Unknown Traps from Known Device Log                                                                                                                                                              |
|           | IEMS603 Missed Notifications Log                                                                                                                                                                         |
|           | IEMS604 Clear Events without raise (Only for clear notifications that doesn't have log name and log number).                                                                                             |
|           | IEMS605 Log for Manually Cleared Alarms by the user in IEMS GUI                                                                                                                                          |
|           | IEMS606 Log generated by DBCleanUpPolicy. Threshold crossed log. Log for Data clean up                                                                                                                   |
|           | IEMS607 Automatic Clear alarms by IEMS during resynchronization of alarms.                                                                                                                               |
|           | IEMS608 Generated when an alarm in IEMS has been cleared automatically due to an aging policy coming due. In SN08, by default the ERS8600 (formerly Passport 8600) has a 7 day aging policy implemented. |

**CS2000 Logs/Faults available**

| Log/Fault                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IEMS Sec-<br>urity logs                                 | IEMS609      Generated by IEMS when it clears the entire active alarm list for a managed component. Generally this might happen for SNMP managed devices when they send a cold start trap. OSSs can use this log as an indicator that IEMS no longer considers the alarms against that component valid and has removed them. The OSS may wish to consider clearing the trouble tickets against that managed component.                                          |
|                                                         | IEMS610      Generated by IEMS when the /data disk partition of the SSPFS platform in which it resides exceeds 80% utilization and the disk space cleanup job detects it. When detected, IEMS will attempt to bring /data under 80% utilization by removing OM report directories under /data/oms. Sub-directories will be removed as required and will start with the oldest first (that named 7), then 6 and end with 2. The 1 directory will not be removed. |
|                                                         | Generated for any unauthorized configuration access attempts of measurement collection jobs.                                                                                                                                                                                                                                                                                                                                                                    |
|                                                         | Generated for any unauthorized configuration access attempts of measurement transfer jobs.                                                                                                                                                                                                                                                                                                                                                                      |

| Log/Fault         | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOST108           | Generated when the buffer (containing an outgoing message) is reclaimed by a system audit. The message is deemed to be stale as the buffer has not been accessed for a long period of time.                                                                                                                                                                                    |
| LOST109           | Generated when a message that originated from the CM is rebounded back to the CM for additional processing because a node intermediate along the path was unable to deliver the message to the final destination. The failure code instructs the CM to attempt to re-route the message over an alternate path but all alternatives have been previously tried without success. |
| LOST110           | Generated when Call Processing gets a failure indication on attempting to output a message).                                                                                                                                                                                                                                                                                   |
| LOST111           | Generated when an incoming message cannot be delivered. The specific failure reason is displayed in the log.                                                                                                                                                                                                                                                                   |
| LOST112           | Generated when an outgoing message fails sanity checks on length or an incoming message fails sanity checks on length.                                                                                                                                                                                                                                                         |
| LOST113           | Generated when the needed software resources are again available. The log displays the number of discarded events during the period of exhausted resources                                                                                                                                                                                                                     |
| LOST114           | Generated when an incoming (BFP) message cannot be forwarded to Call Processing due to message buffer exhaustion. This is similar to the more generic LOST102 log                                                                                                                                                                                                              |
| LOST115           | Generated when the (BFP) buffer (containing an incoming message) is reclaimed by a system audit. The message is deemed to be stale as the buffer has not been accessed for a long period of time. This is similar to the more generic LOST108 log.                                                                                                                             |
| LOST116           | Generated when an outgoing message encounters a failure. The specific failure reason is displayed in the log                                                                                                                                                                                                                                                                   |
| LOST117           | Generated when an outgoing message encounters a failure. The specific failure reason is displayed in the log.                                                                                                                                                                                                                                                                  |
| Media Proxy alarm | Media Proxy Communications Failure<br>Severity varies, based on the number of media proxies that are out of service as compared to the number of media proxies provisioned checked on a 5-minute polling period.<br>Critical - Over 50% of media proxies disabled.<br>Major - Over 20% of media proxies disabled.<br>Minor - Any media proxies disabled.                       |
| NGSS logs         | NGSS700<br>Indicates when a SIPT CS2CS call is rejected because it would exceed the LIMIT setting of the CS2B0008 SOC.                                                                                                                                                                                                                                                         |
|                   | NGSS701<br>Generated when a CS2AS call is rejected because it would exceed the LIMIT setting of the CS2B0009 SOC. The SIPT call is not allowed to complete through the NGSS. The CS2ASOV register in OM group NGSSOM is pegged.                                                                                                                                                |

| SIP Gate-<br>way Applica-<br>tion CallP<br>Alarms | Database Access Alarm | (Critical) occurs when the CallP application tries to access the database and it fails due to a loss of connectivity between the database and the CallP application. Correlates with the 310 log.                                                                                                                                                                                                                                                              |
|                                                   | ACL Trouble Alarm     | Raised when incoming SIP messages are dropped due to Access Control List enforcements. The severity of the alarm is based on the number of packets dropped in last 15-minute time interval. Correlates with the SIPC750 log.                                                                                                                                                                                                                                   |
| SIPC logs                                         | SIPC301               | A critical log that is generated when the SIP Gateway Call Processing Application will not receive any incoming SIP messages due to Access Control List being enabled and no valid entries in the Remote SIP server or ACL list.                                                                                                                                                                                                                               |
|                                                   | SIPC310               | “SIP CallP No Database Connection” is associated with the generation of the Critical alarm due to a loss of connectivity between the database and the CallP application. The same log number is used for “SIP CallP Database Connection Established” when the connection that caused the first SIPC 310 log is re-established and the alarm is cleared.                                                                                                        |
|                                                   | SIPC650               | An informational log that is generated when the CallP application goes to get data from the database for a particular table and no data is found.                                                                                                                                                                                                                                                                                                              |
|                                                   | SIPC750               | Generated when the SIP Gateway Call Processing Application drops incoming SIP messages due to Access Control List restrictions. A Minor, Major, or Critical log is generated based on the number of SIP messages dropped in the last 15 minutes.                                                                                                                                                                                                               |
| SIPGW log                                         | SIPGW700              | An INFO log that contains one of 34 possible log messages related to SIP call processing.                                                                                                                                                                                                                                                                                                                                                                      |
| SIPM logs                                         | SIPM300               | A Trouble log which is generated any time the SIP Gateway Application Maintenance software encounters an unexpected condition.                                                                                                                                                                                                                                                                                                                                 |
|                                                   | SIPM301               | A Trouble log which is generated any time the SIP Gateway Maintenance Trouble Alarm is raised or lowered.                                                                                                                                                                                                                                                                                                                                                      |
|                                                   | SIPM302               | A Trouble log which is generated any time the SIP Gateway Maintenance Sync Trouble Alarm is raised or lowered. This occurs when the SIP Gateway application state gets out of sync, or gets back in sync in a duplex Session Server configuration.                                                                                                                                                                                                             |
|                                                   | SIPM500               | An INFO log which is generated any time the SIP Gateway Application maintenance state changes.                                                                                                                                                                                                                                                                                                                                                                 |
| SIPS logs                                         | SIPS300               | Generated during the alarming of dropped connection requests (due to either the threshold being crossed for throttling connections, or due to attempting to use TLS when TLS is not enabled). The severity of the alarm indicates the threshold that was crossed, 10 dropped connection requests in a minute for a MINOR, 50 dropped requests for a MAJOR, and 100 dropped requests (or more) for a critical. The alarm is raised for a minimum of 30 minutes. |

| Log/Fault | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIPS301   | Generated during authentication failure events. The alarmd process log indicates the level of trouble (CRIT indicates a very serious problem, MINOR may be transient or the beginning of a series of authentication failures).                                                                                                                                                                                                                                                                                        |
| SIPS302   | Generated as a result of the alarm process check to ensure the Local Server certificate continues to be valid. The expiration date contained in the certificate is checked on a daily basis, and when the expiration of the certificate will occur within 31 days (MINOR), 15 days (MAJOR), or 5 days (CRIT), the alarm is raised, with this log. For certificates that have already expired, the CRIT alarm and log is generated, and authentication failures will be output for any connections that are attempted. |
| SIPS305   | Generated during the initialization of the Call Processing application (i.e. during the unlock). If one of these critical logs comes out, it means that there is a problem with the initialization, and the application is unable to start.                                                                                                                                                                                                                                                                           |
| SIPS600   | Generated during the connection set up of the Call Processing application. When the 'monitor OMs' log comes out, ensure that the threshold levels set for connection throttling are reasonable for the size of the office. If the 'TLS is not enabled' message comes out, ensure that the initialization of the call processing application worked correctly.                                                                                                                                                         |
| SIPS601   | Generated during authentication failure events. This INFO log indicates the reason for the authentication failures.                                                                                                                                                                                                                                                                                                                                                                                                   |
| SIPS604   | Generated during the initialization of the Call Processing application (i.e. during the unlock). This log indicates when the current local certificate will expire.                                                                                                                                                                                                                                                                                                                                                   |
| SIPS605   | Generated during the initialization of the Call Processing application (i.e. during the unlock). This log indicates that TLS has been enabled. Expect a SIPS604 log along with this log.                                                                                                                                                                                                                                                                                                                              |
| SIPS606   | Generated when there is a problem importing the trusted certificate provisioned via the web interface in the database.                                                                                                                                                                                                                                                                                                                                                                                                |
| SPFS logs | SPFS 310 is generated for the following reasons:                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|           | <ul style="list-style-type: none"> <li>when the CPU load Average threshold is exceeded, or when the related Major or Minor alarm is cleared.</li> <li>when the Swap Space usage threshold is exceeded, or when the related Critical or Major alarm is cleared.</li> <li>when the Memory usage threshold is exceeded, or when the related Major or Minor alarm is cleared.</li> </ul>                                                                                                                                  |
|           | SPFS 350 is generated when the File System is not mounted, the File System usage threshold is exceeded, a File System read/write failed, or when the related Critical, Major or Minor alarm is cleared.                                                                                                                                                                                                                                                                                                               |
|           | SPFS350 A Trouble log which is generated any time the SIP Gateway Maintenance Trouble Alarm is raised or lowered.                                                                                                                                                                                                                                                                                                                                                                                                     |

| TOPS logs  | <p>TOPS131 Generated when problems occur in the call flow for the activity TOPS Wireless Automated Directory Assistance Call (ADACC) with Release.</p> <p>TOPS615 An INFO log to indicate the operator teams and the number of positions in each team with auto-compression turned on.</p> <p>AUD690 Generated when a TOPS calls ends unexpectedly with an IS41TOPS extension block attached.</p>                                                                                                                                                                                                                                                 |
| TRK logs   | <p>TRK101 Percentage of busy trunks in a trunk group exceeded the threshold value for a minor alarm.</p> <p>TRK102 Major alarm threshold reached or exceeded.</p> <p>TRK103 Number of trunks in a trunk group exceeded threshold value for a critical alarm.</p> <p>TRK104 Percentage of busy trunks dropped below a threshold value.</p>                                                                                                                                                                                                                                                                                                         |

**CS2000 Logs/Faults available**

| Log/Fault | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRK110    | Trunk state change to SysB (system busy) LO (Lockout) from CPB (call processing busy).                                                                               |
| TRK112    | Request to take trunk off the lockout (LO) list and RTS (return to service) initiated by a manual request from the LTP MAP display level or by a system request.     |
| TRK122    | Both planes of the trunk equipment have lost accuracy detected by central control (CC).                                                                              |
| TRK123    | Peripheral processor (PP) has sent a wrong message to central control.                                                                                               |
| TRK138    | Call routed for treatment after system was call processing busy (CPB).                                                                                               |
| TRK151    | Blue Box Fraud (BBF) detection activated.                                                                                                                            |
| TRK152    | Blue Box Fraud (BBF) detection deactivated.                                                                                                                          |
| TRK153    | Blue Box Fraud (BBF) call detected.                                                                                                                                  |
| TRK154    | Blue Box Fraud (BBF) call disconnected to identify calling and called parties.                                                                                       |
| TRK155    | Emergency Service Bureau (ESB) originating the call is off-hook longer than the time designated in customer table TRKGRP.                                            |
| TRK164    | External call routed through local office to a distant office that has requested calling line identification (CLI).                                                  |
| TRK251    | UCS: trouble with an invalid authcode.                                                                                                                               |
| TRK255    | UCS: trouble with database.                                                                                                                                          |
| TRK257    | UCS: trouble translating a partition number to STS due to an invalid partition.                                                                                      |
| TRK258    | UCS: trouble translating STS to partition number, due to an invalid STS.                                                                                             |
| TRK355    | Trunk idle queue sanity trouble or rebuild.                                                                                                                          |
| TRK420    | UCS: invalid authcode.                                                                                                                                               |
| TRK424    | First call processing threshold error; failed diagnostic test; and call processing error threshold appears again within 15 minutes of the diagnostic test.           |
| TRKT logs | These logs are only generated if OFCVAR office parameter GENERATE_TRKT_LOGS is activated. Otherwise, TRK138 logs are generated with an appropriate treatment reason. |
| TRKT200   | ANI Database Failure.                                                                                                                                                |
| TRKT201   | ANI Account Status Not Allowed.                                                                                                                                      |
| TRKT202   | ANI Acct Recently Disallowed.                                                                                                                                        |
| TRKT203   | Calling Card Invalid                                                                                                                                                 |
| TRKT204   | Calling Card Time-out                                                                                                                                                |

| USNBD logs | UNB300 Reports problems with USNBD shared resources used by PCES.                                                                                 |
|            | UNB302 Reports problems with USNBD processes used by PCES                                                                                         |
|            | UNB304 Reports success and failure of surveillance activation and deactivation, and problems with surveillance activation.                        |
|            | UNB305 Reports problems that affect PCES administration data and reports all user creations and deletions.                                        |
| XAC logs   | XAC300 Low Shared Memory (SM) condition. Accompanied by LowSM alarm.                                                                              |
|            | XAC302 Low Processor Element (PE) condition. Accompanied by LowPE alarm.                                                                          |
|            | XAC303 MScomm (Message Switch Communication) problem. Accompanied by MScomm alarm.                                                                |
|            | XAC304 TOD (Time of Day clock) problem. Accompanied by TOD alarm.                                                                                 |
|            | XAC305 RTIF (Reset Terminal Interface) problem. Accompanied by RTIF alarm.                                                                        |
|            | XAC306 Disk problem. Accompanied by DISK alarm.                                                                                                   |
|            | XAC307 Tape problem. Accompanied by TAPE alarm.                                                                                                   |
|            | XAC308 Image Test failure. Accompanied by Image alarm.                                                                                            |
|            | XAC309 Loss of communication between the AMDI packet and any MG4000.                                                                              |
|            | XAC310 Card manual busy.                                                                                                                          |
|            | XAC312 IOP fault. Accompanied by IOPflt alarm. Modified in SN08 to display the new CMIC and RTIF port device and CMIC and RTIF packets and links. |
|            | XAC312 IOP fault. Accompanied by IOPflt alarm.                                                                                                    |
|            | XAC320 Cardlist Report.                                                                                                                           |
|            | XAC321 WgSlot (Shelf Audit Failure - Card Configuration). Accompanied by WgSlot alarm.                                                            |
|            | XAC322 PETrbl. Accompanied by PETrbl alarm.                                                                                                       |

**CS2000 Logs/Faults available**

| Log/Fault | Description                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XAC323    | SMTrbl. Accompanied by SMTrbl alarm.                                                                                                                                |
| XAC324    | IOTrbl. Accompanied by IOTrbl alarm.                                                                                                                                |
| XAC325    | RIBKEY detected. Accompanied by RIBKey alarm.                                                                                                                       |
| XAC326    | MS Link configuration mismatch.                                                                                                                                     |
| XAC327    | WgSlot (Card inserted into wrong slot). Accompanied by WgSlot alarm.                                                                                                |
| XAC329    | Loss of communication with XA-Core or loss of Ethernet link redundancy. Associated with the following OM groups: XETHRMJU, XETHRCRU, XETHR, XETHRPRT, and XETHRLNK. |
| XAC330    | FW version mismatch. Accompanied by FWvers alarm.                                                                                                                   |
| XAC333    | FW loading failure.                                                                                                                                                 |
| XAC335    | Unknown CO-3 packet fault. Accompanied by AMDI alarm.                                                                                                               |
| XAC337    | Raised when the Baseln alarm is first raised, or the Baseln alarm is still raised and the non-baseline component list changes.                                      |
| XAC400    | XA-Core summary report.                                                                                                                                             |
| XAC413    | REx schedule failure. Accompanied by RExSch alarm.                                                                                                                  |
| XAC415    | Routine exercise report. SN08 adds "not at baseline" as a reason for not running the SREx test.                                                                     |
| XAC600    | LowSM condition cleared.                                                                                                                                            |
| XAC601    | MemLim condition cleared.                                                                                                                                           |
| XAC602    | LowPE condition cleared.                                                                                                                                            |
| XAC603    | MScomm alarm cleared.                                                                                                                                               |
| XAC604    | TOD alarm cleared.                                                                                                                                                  |
| XAC605    | RTIF alarm cleared.                                                                                                                                                 |
| XAC606    | DISK alarm cleared.                                                                                                                                                 |
| XAC607    | Tape alarm cleared.                                                                                                                                                 |
| XAC608    | Image alarm cleared.                                                                                                                                                |
| XAC609    | AMDI link condition cleared.                                                                                                                                        |
| XAC610    | Card returned to service. Modified in SN08 to display the new CMIC and RTIF port device and CMIC and RTIF packets and links.                                        |
| XAC612    | IOP alarm cleared.                                                                                                                                                  |
| XAC613    | REx schedule report.                                                                                                                                                |
| XAC614    | XATrap alarm cleared.                                                                                                                                               |
| XAC615    | REx started.                                                                                                                                                        |

| XACP logs | XACP300 Generated every minute that the EXT alarm HIGH_MEM_BLOCKING is active.                                                                                                                                                                                                                                                                           |
|           | XACP500 Generated once when the memory blocking level has returned to normal.                                                                                                                                                                                                                                                                            |
|           | XACP600 Summarizes the minute-by-minute memory blocking level; generated once every 15 minutes. If all 15 minutes had normal blocking levels, the log has only one line of output stating that all 15 minutes had normal blocking levels. If at least one minute out of 15 reported high blocking levels, the log output reports each minute separately. |

| XAUD logs | XAUD395, 397, 400, 401, 430, 432, 432, 434, 500, 501, 708, 709, 714, 715, 723, 724, 725, 979, 980, 981, 982, 977, 978 | These call processing resource dump logs are generated whenever a call processing resource is recovered by the audit process running on the XA-Core. The only difference in the logs is the amount of data dumped. In SN08, the location and number of bits used to represent the extension block's format code in the header (within the hex dump of the log) has changed for all extension block logs. The only noticeable difference to the customer will be the number following the XAUD string in the log title. |
| XNET logs | XNET600                                                                                                               | Connection between nodes has been replaced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|           | XNET605                                                                                                               | The bearer networks of the two parties in a connection attempt are not permitted to inter-connect, based on datafill in table NET2NET.                                                                                                                                                                                                                                                                                                                                                                                 |
|           | XNET606                                                                                                               | Indicates a software or provisioning problem in the switch, in that an appropriate bearer network could not be determined through provisioned data for a particular party in a connection attempt.                                                                                                                                                                                                                                                                                                                     |
|           | XNET607                                                                                                               | Indicates that an IW SPM interworking bridge was not available for the connection request, either because of a bridge exhaust condition, or a bridge is not available.                                                                                                                                                                                                                                                                                                                                                 |
| XPKT log  | XPKT340                                                                                                               | Reports a variety of Gateway, Gateway Controller, and DPTMA resource problems, including failed anchor attempts.                                                                                                                                                                                                                                                                                                                                                                                                       |

**GWC--available logs/faults**

The following table lists the GWC Logs/Faults available.

GWC supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled "IEMS Functionality." For details on the logs/faults themselves, refer to the Fault Management section of GWC FCAPS

documentation, NN10090-911 and NN10275-909, *Fault Management Log Reference*.

#### GWC Logs/Faults available

| Log/Fault                                                                                                                                                                                                                                 | Description                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Network Element: GWC (PGC load)</b>                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                |
| The PM180, 181, 185, and 177 faults are first sent to the core and are then sent northbound from the CS2000 Core Manager in SCC2 format. The remaining faults are sent from the GWC to the GWC EM and are then sent northbound via CORBA. |                                                                                                                                                                                                                                                                                                |
| PM180                                                                                                                                                                                                                                     | Indicates a software error (SWERR) has occurred.                                                                                                                                                                                                                                               |
| PM181                                                                                                                                                                                                                                     | Generates for a variety of GWC-to-core-related communications issues. Modified in SN08 to indicate that the ABI of an ABI-hosted XPM is attempting to or successfully exit(s) ESA.                                                                                                             |
| PM185                                                                                                                                                                                                                                     | Indicates that the GWC has trapped.                                                                                                                                                                                                                                                            |
| PM777                                                                                                                                                                                                                                     | Indicates a hardware fault. Reason text identifies the suspected hardware.                                                                                                                                                                                                                     |
| The remaining faults are sent from the GWC to the GWC EM and are then sent northbound via CORBA. The following alarms are generated by the GWC, except for the first one generated by the alarm browser.                                  |                                                                                                                                                                                                                                                                                                |
| SNMP Timeout                                                                                                                                                                                                                              | Critical; indicates a communications subsystem failure.                                                                                                                                                                                                                                        |
| Test                                                                                                                                                                                                                                      | Minor; a test alarm generated from the pmdebug interface.                                                                                                                                                                                                                                      |
| Active unit disabled                                                                                                                                                                                                                      | Critical; indicates a unit is out of service and not available.                                                                                                                                                                                                                                |
| Standby unit disabled                                                                                                                                                                                                                     | Critical; indicates a unit is out of service and not available.                                                                                                                                                                                                                                |
| Core communication lost                                                                                                                                                                                                                   | Major if active unit; Minor if inactive unit. No response received to Core heartbeat.                                                                                                                                                                                                          |
| Mate unit communication lost                                                                                                                                                                                                              | Minor; no response received to mate heartbeat.                                                                                                                                                                                                                                                 |
| Gateway communication lost                                                                                                                                                                                                                | A gateway has stopped responding to heartbeat.                                                                                                                                                                                                                                                 |
| EM communication lost                                                                                                                                                                                                                     | Major. No response received for Persistent Data Verification SNMP Trap; EM not responding. Problem may be "EM not present, provisioned data loaded from local flash," OR "EM audit indicates provisioned inservice data is old, need manual intervention to recover." Cleared with a busy RTS. |
| FLASH error                                                                                                                                                                                                                               | Minor. Error in writing Flash; erase of Flash sector failed. Cleared with hardware replacement.                                                                                                                                                                                                |
| FLASH life span exceeded                                                                                                                                                                                                                  | Minor. The number of writes to FLASH has exceeded the recommended/intended limit.                                                                                                                                                                                                              |

**GWC Logs/Faults available**

| Log/Fault             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security_SA_capacity  | Minor or Major. Security Association alarms are nearing capacity. Cleared by the security alarms application which monitors the resource level and cleared the alarm when the alarm condition as been cleared on the GWC. Currently alarms are only managed on the active GWC unit (i.e., data is not mirrored to the inactive unit), and for this reason during a SWACT alarms are automatically cleared on the unit dropping activity.            |
| Security_SA_fail      | Major. The number of Security Association alarms has exceeded the threshold. Cleared by the security alarms application which monitors the resource level and cleared the alarm when the alarm condition as been cleared on the GWC. Currently alarms are only managed on the active GWC unit (i.e., data is not mirrored to the inactive unit), and for this reason during a SWACT alarms are automatically cleared on the unit dropping activity. |
| Recovery alarm        | A GWC recovery process has terminated early, and the GWC remains out of service.                                                                                                                                                                                                                                                                                                                                                                    |
| DQOSMTC_DQoSLinkLoss  | A DQoS/COPS connection failure has occurred. Cleared by DCCNXMGR (via DCALARM) when the connection is reestablished or the connection is deleted via provisioning.                                                                                                                                                                                                                                                                                  |
| Datasync alarm        | The GWC does not contain the latest provisioned data. This alarm may be raised by the GWC EM noting the problem and sending a message to the GWC to raise the alarm.                                                                                                                                                                                                                                                                                |
| Unit Out of Service   | Critical if active unit; minor if inactive unit. The GWC Profile failed to validate, probably because no profile is available to activate. Cleared with a GWC reload.                                                                                                                                                                                                                                                                               |
| QOS error log         | If the QCA detects an event or an error, a syslog message is generated and a non-QoS record is written to the output stream (file).                                                                                                                                                                                                                                                                                                                 |
| QOS connection alarm  | An alarm is generated whenever a message cannot be sent to the server. The alarm is cleared as soon as the QoS report application is able to send QoS reports to the server.                                                                                                                                                                                                                                                                        |
| <b>GWC Alarm Logs</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| GWC300                | Active unit disabled. Critical; indicates a unit is out of service and not available.                                                                                                                                                                                                                                                                                                                                                               |
| GWC301                | Standby unit disabled. Indicates a unit is out of service and not available. Minor if the unit is ManB, but Major if the unit is SysB.                                                                                                                                                                                                                                                                                                              |
| GWC302                | Core communication lost. Major if active unit; Minor if inactive unit. No response received to Core heartbeat.                                                                                                                                                                                                                                                                                                                                      |
| GWC303                | Mate unit communication lost. Minor; no response received to mate heartbeat.                                                                                                                                                                                                                                                                                                                                                                        |
| GWC304                | Gateway communication lost. A gateway has stopped responding to heartbeat. This log is triggered only for gateways that have 64 or more endpoints.                                                                                                                                                                                                                                                                                                  |
| GWC305                | This is a test alarm generated from pmdebug interface. Severity level changed in SN06; can have a severity level of critical, major, minor or warning.                                                                                                                                                                                                                                                                                              |
| GWC306                | DQOSMTC_DQoSLinkLoss. A DQoS/COPS connection failure has occurred. Cleared by DCCNXMGR (via DCALARM) when the connection is reestablished or the connection is deleted via provisioning                                                                                                                                                                                                                                                             |

**GWC Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GWC307    | EM communication lost. Major. No response received for Persistent Data Verification SNMP Trap; EM not responding. Problem may be "EM not present, provisioned data loaded from local flash," OR "EM audit indicates provisioned inservice data is old, need manual intervention to recover." Cleared with a busy RTS.<br><br>Datsync alarm The GWC does not contain the latest provisioned data. This alarm may be raised by the GWC EM noting the problem and sending a message to the GWC to raise the alarm. |
| GWC308    | FLASH error Minor. Error in writing Flash; erase of Flash sector failed. Cleared with hardware replacement.                                                                                                                                                                                                                                                                                                                                                                                                     |
| GWC309    | Security_SA_capacity. Minor or Major. Security.Association alarms are nearing capacity. Cleared by the security alarms application which monitors the resource level and clears the alarm when the alarm condition has been cleared on the GWC. Currently alarms are only managed on the active GWC unit (i.e., data is not mirrored to the inactive unit), and for this reason during a SWACT alarms are automatically cleared on the unit dropping activity.                                                  |
| GWC310    | Security_SA_fail. Major. The number of Security Association alarms has exceeded the threshold. Cleared by the security alarms application which monitors the resource level and cleared the alarm when the alarm condition as been cleared on the GWC. Currently alarms are only managed on the active GWC unit (i.e., data is not mirrored to the inactive unit), and for this reason during a SWACT alarms are automatically cleared on the unit dropping activity.                                           |
| GWC311    | Provisioned GWC Profile not yet activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| GWC312    | QOS connection alarm. An alarm is generated whenever a message cannot be sent to the server. The alarm is cleared as soon as the QoS report application is able to send QoS reports to the server.                                                                                                                                                                                                                                                                                                              |
| GWC313    | Major. RMGC can't process all coming requests. RMGC can't process all coming requests. It is in the processing error category. The probable cause is the resource at or nearing capacity.                                                                                                                                                                                                                                                                                                                       |
| GWC314    | Raised in connection with a Location Id Reporting connection failure alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| GWC398    | SNMP Timeout Critical; indicates a communications sub0system failure.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| GWC399    | Is the clear log for all GWC alarms and for CMT alarms. This log is triggered only for gateways that have 64 or more endpoints.                                                                                                                                                                                                                                                                                                                                                                                 |
| GWC501    | Unable to maintain connection to remote gateway of 64 or fewer endpoints.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| GWC502    | Connection to remote gateway restored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| GWC503    | Connection drop initiated by remote gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                   | authentication server unreachable                                                                                                                                                    |
|                   | logout (by request, force out, or idle timeout)                                                                                                                                      |
|                   | local account login                                                                                                                                                                  |
|                   | local password change/reset                                                                                                                                                          |
|                   | GWC restart                                                                                                                                                                          |
|                   | GWC reload                                                                                                                                                                           |

**SPM--available logs/faults**

The following table lists the SPM family Logs/Faults available.

The SPM family supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled “IEMS Functionality.” For details on the logs/faults themselves, refer to the Fault Management section of the appropriate SPM FCAPS documentation and NN10275-909, *Fault Management Log Reference*.

- SPM: NN10075-911
- DPT-SPM: NN10079-911 (IP)
- IW-SPM: NN10077-911 (IP)

**General SPM Logs/Faults available**

| Log/Fault                                  | Description                                                                                       |
|--------------------------------------------|---------------------------------------------------------------------------------------------------|
| <b>Network Element: SPM (all variants)</b> |                                                                                                   |
| ATM300                                     | Generated when a Loss of Cell Delineation (LCD) alarm condition is raised on an SPM with ATM RMs. |
| ATM500                                     | The system's ATM ILMI status has changed.                                                         |

**General SPM Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATM501    | The system's ATM signaling status has changed.                                                                                                                                                                                                           |
| ATM600    | The ATM framework has gained a registered ATM address.                                                                                                                                                                                                   |
| ATM601    | The ATM framework has been de-registered by the ATM network.                                                                                                                                                                                             |
| ATM604    | System software cannot recover the ATM Framework (ATM RM will be busied and RTS'ed)                                                                                                                                                                      |
| ATM605    | ATM overload event.                                                                                                                                                                                                                                      |
| ATM606    | ATM service failure.                                                                                                                                                                                                                                     |
| ATM800    | A trouble log that indicates possible degradation of service related to ATM Performance Monitoring thresholds.                                                                                                                                           |
| ATMBCN    | This alarm is raised when the ATM framework cannot support bearer connections. The alarm causes the SPM to show at the PM portion of the alarm banner as "SPM *C*." This alarm complements the ATMFWD alarm currently displayed beneath the APPL banner. |
| BITS300   | A clock sync critical alarm has been raised for one of these: MTIE Performance, Alarm Indication Signal, Loss of Signal, or Out of Frame. Correlates with BITS600.                                                                                       |
| BITS301   | A clock sync non-critical alarm has been raised for one of these: Timing Link Degradation, Bipolar Violation, or Cyclic Redundancy Check. Correlates with BITS601.                                                                                       |
| BITS500   | BITS link state change capturing old/new states and reason for change (including degradation of carrier (LOS, LOF)).                                                                                                                                     |
| BITS600   | BITS Fault Report Cleared; critical alarm from BITS300 is cleared.                                                                                                                                                                                       |
| BITS601   | BITS Fault Report cleared; non-critical alarm from BITS301 is cleared.                                                                                                                                                                                   |
| BITS610   | Reference Quality Change to a new SSM state.                                                                                                                                                                                                             |
| BITS612   | BITS Reference Switch; indicates the reason for the reference switch.                                                                                                                                                                                    |
| C7UP109   | A CQ state change has occurred.                                                                                                                                                                                                                          |
| C7UP113   | Indicates ISUP maintenance trouble.                                                                                                                                                                                                                      |
| C7UP114   | Generated for an ISUP alert.                                                                                                                                                                                                                             |
| C7UP120   | An invalid range field exists.                                                                                                                                                                                                                           |
| C7UP130   | The HOP counter has expired.                                                                                                                                                                                                                             |
| C7UP301   | The HC value is not sufficient.                                                                                                                                                                                                                          |
| CARR300   | A carrier failure event cleared. Correlates to alarms AIS, APSAM, APSCHMM, APSIC, APSMM, BERSD, BERSF, LOF, LOP, LOS, PLM, RAI, RFI, SIMPLEX, TIM. Correlates with CARR310.                                                                              |
| CARR310   | A carrier failure event has occurred. Correlates to alarms AIS, APSFC, APSFEPLF, APSLCK, APSMAN, BERSD, BERSF, LOF, LOP, LOS, PLM, RAI, RFI, SIMPLEX, TIM.                                                                                               |
| CARR315   | A trouble log that includes the actual fault description text sent by the MG9K.                                                                                                                                                                          |
| CARR330   | A protection switch has occurred. A previously inactive carrier in the protection group takes over as the active carrier.                                                                                                                                |

**General SPM Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CARR331   | A protection switch was attempted but failed.                                                                                                                                                                 |
| CARR340   | The inactive carriers in a protection group have changed state in such a way that they cannot carry traffic. The protection group is now running in simplex mode.                                             |
| CARR341   | Both carriers have become available and normal protection switching can occur.                                                                                                                                |
| CARR500   | A carrier changes to an in service (InSv) state from manual busy (ManB) or system busy (SysB). Correlates to a MANB and SYSB alarm. Correlates with CARR511.                                                  |
| CARR501   | A carrier changes to central-side busy (CBsy) from ManB or SysB. Correlates to a MANB and SYSB alarm.                                                                                                         |
| CARR510   | A carrier changes to ManB from InSv, SysB, or CBsy. Correlates to a MANB and SYSB alarm.                                                                                                                      |
| CARR511   | Carrier state change to SysB from InSv or CBsy. Correlates to a SYSB alarm.                                                                                                                                   |
| CARR512   | OC3 carrier state change to CBsy from InSv, ManB, or SysB. Correlates to a MANB and SYSB alarm.                                                                                                               |
| CARR800   | Threshold crossing alert (TCA) for a metered performance parameter has been cleared.                                                                                                                          |
| CARR801   | Indicates that maintenance limits have been re-set.                                                                                                                                                           |
| CARR810   | TCA event for metered performance parameter has occurred. Correlates with CARR800.                                                                                                                            |
| CARR811   | TCA event for non-metered performance parameter has occurred. Also applies to STS-1 carrier on MG4000.                                                                                                        |
| DPTM500   | The state of DPT Terminals changed to IDL state from any other state.                                                                                                                                         |
| DPTM501   | The state of DPT Terminals changed to SYSB state from any other state.                                                                                                                                        |
| DPTM502   | The state of DPT Terminals changed to MANB state from any other state.                                                                                                                                        |
| DPTM503   | The state of DPT Terminals changed to PMB state from any other state.                                                                                                                                         |
| DPTM504   | The state of DPT Terminals changed to INB state from any other state.                                                                                                                                         |
| DPTM700   | Bulk downloading or dynamic update of DPT data failed, so there is a data mismatch in the CM and node. Correlates with DPTM701.                                                                               |
| DPTM701   | The DDM audit process cleared a DPT data mismatch between the core and the node.                                                                                                                              |
| DPTM702   | Indicates a call is rejected because the DPT SOC limit is reached.                                                                                                                                            |
| DPTM800   | Office-wide DPT terminal usage exceeds the level 1 threshold of 70%. Logs DPT800-803 are associated with OM group DPTOFC, registers DPUSAG and DPUSAG2; and OM group DPTNODE, registers DPTUSAG and DPTUSAG2. |
| DPTM801   | Office-wide DPT terminal usage drops below the level 1 threshold of 70%.                                                                                                                                      |
| DPTM802   | Office-wide DPT terminal usage exceeds the level 2 threshold of 90%.                                                                                                                                          |
| DPTM803   | Office-wide DPT terminal usage drops below the level 2 threshold of 85%.                                                                                                                                      |
| EAD115    | Problems with performance data collection associated with an OSS.                                                                                                                                             |
| EAD116    | Problems with the collection of MG 4000 performance data.                                                                                                                                                     |

**General SPM Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENET308   | ISTb state occurs or is cleared on a PSLINK. Correlates to an ISTB alarm. Associated with OM group ENLKERR.                                                                            |
| ENET311   | The SPM ATM node is SYSB, and a network error has caused it to be isolated from the ENET links or the MS ports. Correlates to a SYSBNA alarm.                                          |
| IOAU112   | Information log related to changes in System REX controller operation or schedule.                                                                                                     |
| IWBM500   | One of the following is out of service: C-side link, STS3cP carrier, ATM network state, or the ATM address state for the IW bridge software.                                           |
| IWBM501   | The out-of-service item in IWBM500 has returned to service.                                                                                                                            |
| IWBM502   | Indicates that a BSY command is being requested for a set of IW SPM bridge terminals.                                                                                                  |
| IWBM503   | Indicates that an RTS command is being requested for a set of IW SPM bridge terminals.                                                                                                 |
| IWBM504   | Indicates that an OFFL command is being requested for a set of IW SPM bridge terminals.                                                                                                |
| IWBM505   | Indicates that a FRLS command is being requested for a set of IW SPM bridge terminals.                                                                                                 |
| IWBM600   | The IW bridge receives an invalid terminal ID during an attempt to free a bridge causing a connectivity mismatch. An INFO log.                                                         |
| IWBM601   | Automatic system audit finds a problem and performs a corresponding action. An INFO log.                                                                                               |
| IWBM602   | No IDL bridges are available. An INFO log.                                                                                                                                             |
| IWBM603   | An IWBM audit is being performed. An INFO log.                                                                                                                                         |
| IWBM700   | A maintenance action is being performed. An INFO log.                                                                                                                                  |
| IWBM800   | Number of available IW bridges exceeds the first threshold (70%) when attempting to retrieve an IW-bridge ID from the IW bridge manager.                                               |
| IWBM801   | Number of available IW bridges falls to less than 65% of bridges in the pool in use. This log always occurs after IWBM 800.                                                            |
| IWBM802   | Number of available IW bridges exceeds the second threshold (90%) when attempting to retrieve an IW-bridge ID from the IW bridge manager.                                              |
| IWBM803   | Number of available IW bridges falls to less than 85% of bridges in the pool in use. This log always occurs after IWBM 802.                                                            |
| Link300   | A transport resource fault indicating a mis-connected DS512 link.                                                                                                                      |
| NODE300   | The integrated node maintenance (INM) generates this log when a trouble condition is present with the node. The log indicates INM recovery actions when the node state is system busy. |
| NODE302   | Reports a software alarm.                                                                                                                                                              |
| NODE303   | Generated to report the Wrong Application Data on the SPM.                                                                                                                             |
| NODE326   | Generated to report a hardware fault on the SPM.                                                                                                                                       |
| NODE500   | System node state change. Correlates to a SYSB alarm.                                                                                                                                  |
| NODE600   | An INFO log to notify of a system recovery action.                                                                                                                                     |

**General SPM Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NODE601   | An INFO log that provides system status notification.                                                                                                                                                                                                                                                                                                                       |
| NODE602   | Indicates the reason for CEM state transition, generated only when the CEM state transitions from Insv to Istb or Insv to Sysb.                                                                                                                                                                                                                                             |
| PM231     | Indicates that a PM failed to acknowledge an audit request to add or delete a channel connection.                                                                                                                                                                                                                                                                           |
| PM232     | Indicates that a PM operation from an audit request to add or delete a channel connection has succeeded.                                                                                                                                                                                                                                                                    |
| PM233     | Indicates that a PM operation from an audit request to add or delete a channel connection has failed. The request is from Special Connection Table Control Facility (SPECCONN) to add or delete a channel connection. The subsystem generates the modified log when the operation to update to the correct status fails for two consecutive audit cycles.                   |
| PM234     | Indicates that a PM failed to acknowledge an audit request to add or delete a channel connection.                                                                                                                                                                                                                                                                           |
| PM236     | Generated when the system finds integrity, does not find integrity, or loses integrity. Displayed when one of the following scenarios occurs: the system makes a special connection; integrity was lost or not found; or the SPECCONN audit acted on a special connection that has the status of NO_IINTEG.                                                                 |
| PRSM400   | A DPT SPM ATM loadfile containing DPT SPM ATM PRSU fixes has been datafilled in table PMLOADS.                                                                                                                                                                                                                                                                              |
| SOC802    | A warning log that the current configuration of the number of DPT ports is not authorized by Nortel, due to a conflict between the SOC limit and the setting of office parameter DPT_MAX_PORTS.                                                                                                                                                                             |
| SPM300    | A device fault has occurred. Correlates to a MANB, PROTFAIL, SYSB, and NOSPARE alarm.                                                                                                                                                                                                                                                                                       |
| SPM300    | A device fault has occurred. Correlates to a MANB, PROTFAIL, SYSB, and NOSPARE alarm. SN08 adds a new text reason showing that it is generated when a STS3L carrier experiences an RFI alarm. SN08 adds the aestivate/status of the unit/device. SN08 adds next text "Device Fault Report" due to being triggered via resource exhaustion/overload conditions on the ATMRM. |
| SPM301    | SPARTS patching log. An SPM patch is missing after an RTS occurred. Correlates to the PATCHFAIL, VCXO70, and VCXO90 alarms.                                                                                                                                                                                                                                                 |
| SPM310    | The CM has received performance data from the DPT SPM ATM as a result of the DPT SPM ATM-based automatic monitoring process.                                                                                                                                                                                                                                                |
| SPM311    | A software exception report (SWER) has occurred, OR one of the BITS links is out-of-service. Correlates to an LOR alarm.                                                                                                                                                                                                                                                    |
| SPM312    | A TBL trap has occurred on the CEM.                                                                                                                                                                                                                                                                                                                                         |
| SPM313    | A fault has been recorded in the Module Information Memory (MIM) of the SPM.                                                                                                                                                                                                                                                                                                |
| SPM314    | A generic IMC fault report to indicate a change in IMC status.                                                                                                                                                                                                                                                                                                              |
| SPM330    | The two CEMs have either come into datasync or have gone out of datasync. Correlates to an ISTB alarm.                                                                                                                                                                                                                                                                      |

**General SPM Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPM331    | A device had a protection switch failure. Modified to place IP RM in the circuit pack field. Correlates to a MANB, PROTFAIL, SYSB, ISTB, and NOSPARE alarm.                                             |
| SPM332    | The synchronization reference source was switched by manual action, switched by system action, or lost the last synchronization reference in the OC-3 protection group.                                 |
| SPM333    | Indicates an SPM Rex test failure.                                                                                                                                                                      |
| SPM334    | An alternate synchronization source is not available and the timing configuration no longer conforms to SONET specifications. Correlates to a CLKOOS alarm.                                             |
| SPM335    | A device had a protection switch failure.                                                                                                                                                               |
| SPM336    | The clock oscillator tuning range has reached 90% of the maximum range. Correlates to a VCXO90 alarm.                                                                                                   |
| SPM337    | SPM has entered Holdover. Correlates with SPM637.                                                                                                                                                       |
| SPM338    | SPM has been in Holdover over 24Hours. Correlates with SPM638.                                                                                                                                          |
| SPM339    | The clock oscillator tuning range has reached 70% of the maximum range. Correlates to a VCXO70 alarm.                                                                                                   |
| SPM340    | A CM warm switch of activity (SWACT) failed.                                                                                                                                                            |
| SPM341    | A SyncRM has entered into 3E Holdover state due to a clock mode change. Correlates with SPM641.                                                                                                         |
| SPM342    | A SyncRM has entered into 3E Holdover 24 State. Correlates with SPM642.                                                                                                                                 |
| SPM344    | The SyncRM Loss of BITS Redundancy (LOR) alarm has been set. Correlates with SPM644.                                                                                                                    |
| SPM350    | There is the potential for resource exhaustion of a particular resource type. Correlates to the COTLOW, DTMFLOW, MFLOW, TONESLOW, and ECANLOW alarms. The log also generates when the alarm is cleared. |
| SPM352    | Both of the Sync RMs are in holdover, so the SPM has entered Stratum 3E Holdover. Alarm ST3EHLDOVR is raised. Correlates with SPM652.                                                                   |
| SPM353    | Both of the Sync RMs are in holdover for 24 hours, so the SPM has entered Stratum 3E Holdover24. Alarm ST3EHLDOVR24 is raised. Correlates with SPM653.                                                  |
| SPM354    | Both of the Sync RMs are out-of-service, so the SPM has entered SMC holdover. Alarm SMCHLDOVR is raised. Correlates with SPM654.                                                                        |
| SPM355    | Both of the Sync RMs are out-of-service for 24 hours, so the SPM has entered SMC holdover24. Alarm SMCHLDOVR24 is raised. Correlates with SPM655.                                                       |
| SPM356    | One of the Sync RMs is out-of-service, so the SPM has lost clock unit redundancy. Alarm SPMLOCR is raised. Correlates with SPM656.                                                                      |
| SPM358    | A tuple change from EXTERNAL to LINE, or from LINE to EXTERNAL, is performed, and the SPM clock reference change failed. Correlates with SPM658.                                                        |
| SPM370    | A log report of an SPM health monitor event. Connection errors have been corrected by the DLC Audit. Correlates with SPM670, the clearing log.                                                          |

**General SPM Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPM399    | Generated whenever an SPM enters or leaves an overload condition. SN08 adds next text "SPM Overload Report" due to being triggered via resource exhaustion/overload conditions on the ATMRRM.                                       |
| SPM500    | A SyncRM device state change has occurred with new state and reason for change (e.g. SYSB, MANB). Modified to place IP RM in the circuit pack field. Correlates to a MANB, PROTFAIL, SYSB, and ISTB alarm.                          |
| SPM605    | Indicates that a particular resource RM protection group is excluded by the SPMRESALIGN tool, without align RMID-PWID values.                                                                                                       |
| SPM610    | Generated whenever an SPM node SSM value changes.                                                                                                                                                                                   |
| SPM611    | A reference node switch has occurred.                                                                                                                                                                                               |
| SPM630    | A device protection switch (i.e. clock unit switch) has occurred. Modified to place IP RM in the circuit pack field. Correlates to a MANB, SYSB, and ISTB alarm.                                                                    |
| SPM632    | Generated when the REX test on the SPM is successful.                                                                                                                                                                               |
| SPM633    | Generated when the REX test has started on an SPM node.                                                                                                                                                                             |
| SPM637    | The clock mode has changed from Holdover to Sync. Correlates with the HLDOVR alarm.                                                                                                                                                 |
| SPM638    | The SPM recovers from the 24-hour Holdover state; the clock mode changes from Holdover to Sync. Correlates to the HLDOVR24 alarm.                                                                                                   |
| SPM641    | A SyncRM has exited 3E Holdover state.                                                                                                                                                                                              |
| SPM642    | A SyncRM has exited 3E Holdover 24 state.                                                                                                                                                                                           |
| SPM644    | The SyncRM Loss of BITS Redundancy (LOR) alarm has been cleared.                                                                                                                                                                    |
| SPM645    | Link Protocol & Messaging Interface Controller (LPMIC) Event Report. This log is generated on every CEM and transported to the core. The log is generated periodically and whenever the number of events crosses a threshold value. |
| SPM650    | A successful in-service loading procedure has occurred. Modified to place IP RM in the circuit pack field.                                                                                                                          |
| SPM651    | An in-service loading procedure has failed. Modified to place IP RM in the circuit pack field.                                                                                                                                      |
| SPM652    | SPM has exited Stratum 3E Holdover. Alarm ST3EHLDOVR is cleared.                                                                                                                                                                    |
| SPM653    | SPM has exited Stratum 3E Holdover24. Alarm ST3EHLDOVR24 is cleared.                                                                                                                                                                |
| SPM654    | SPM has exited SMC Holdover. Alarm SMCHLDOVR is cleared.                                                                                                                                                                            |
| SPM655    | SPM has exited SMC Holdover24. Alarm SMCHLDOVR24 is cleared.                                                                                                                                                                        |
| SPM656    | SPM loss of clock unit redundancy cleared. Alarm SPMLOCR is cleared.                                                                                                                                                                |
| SPM657    | Input timing signals degradation cleared. Alarm SPMTLD is cleared.                                                                                                                                                                  |
| SPM658    | A PM timing mode change has occurred with explicit reason (e.g. line to external due to manual request).                                                                                                                            |

**General SPM Logs/Faults available**

| Log/Fault   | Description                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPM660      | A continuous performance-monitored trunk member was involved in an answered echo canceller call. This log reports the performance data.                                                                                                                                                                                                 |
| SPM661      | A continuous monitoring ON/OFF command or an SPMECMON AUTO command has successfully completed.                                                                                                                                                                                                                                          |
| SPM670      | An INFO log to report that the health monitor "CallCount PTS no setup fault" has been cleared. Correlates with SPM370, the raise log.                                                                                                                                                                                                   |
| SPM680      | Indicates low MBM Application Buffers.                                                                                                                                                                                                                                                                                                  |
| SPM682      | Indicates CEM manual reset.                                                                                                                                                                                                                                                                                                             |
| SPM683      | Indicates the reason for CEM swact.                                                                                                                                                                                                                                                                                                     |
| SPM684      | Indicates that the erase flash command has initiated, is completed, has failed, or has been rejected. SN08 adds the aestivate/status of the unit/device.                                                                                                                                                                                |
| SPM701      | A DDM audit has successfully updated an SPM subgroup.                                                                                                                                                                                                                                                                                   |
| SPM702      | A DDM dynamic update has failed for an SPM subgroup.                                                                                                                                                                                                                                                                                    |
| SPM703      | A DDM audit has updated an SPM trunk member in a with a data entry for a trunk that failed to be added during a dynamic update.                                                                                                                                                                                                         |
| SPM704      | A DDM dynamic update has failed for an SPM trunk member.                                                                                                                                                                                                                                                                                |
| SPM705      | A trunk has been set to a lockout (LO) or SysB state. Correlates to SPM706.                                                                                                                                                                                                                                                             |
| SPM706      | A trunk has returned to service from a LO state.                                                                                                                                                                                                                                                                                        |
| SPM707      | A dynamic update has failed for the ISDNPARM table.                                                                                                                                                                                                                                                                                     |
| SPM708      | The DDM audit has updated the ISDNPARM table.                                                                                                                                                                                                                                                                                           |
| SPM709      | A dynamic update has failed for the ISDNPROT table.                                                                                                                                                                                                                                                                                     |
| SPM710      | The DDM audit has updated the ISDNPROT table.                                                                                                                                                                                                                                                                                           |
| SPRF670     | Generated every 15 minutes by the SPMACT tool. The logs are a compilation of the tool's results. Each line of the log corresponds to a performance measurement taken every minute by the tool.                                                                                                                                          |
| SPRF671     | Generated every 15 minutes by the SPUSAGE tool to summarize samples taken every minute of the call-processing events that occur in the SPM.                                                                                                                                                                                             |
| VOIP800 Log | This log is generated for any of the following reasons: <ul style="list-style-type: none"> <li>- Cyclical Redundancy Check Error- Broadcast Packets</li> <li>- Undersize Packets- Jitter</li> <li>- Oversize Packets- Latency</li> <li>- Fragments- Lost Packets</li> <li>- Jabber- Decoder Under run</li> <li>- Drop Events</li> </ul> |
| XAC329      | Enhanced to provide more detailed reason text description for a number of failure scenarios in IRM, including a link state change. A customized text string is added for each IRM error code to help determine the causes resulting from link failure events.                                                                           |

**General SPM Logs/Faults available**

| Log/Fault                | Description                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sync RM alarms</b>    |                                                                                                                                                                                                          |
| LOS                      | Sync RM cannot detect a signal from the BITS timing link. Cleared when a signal is detected.                                                                                                             |
| OOF                      | Sync RM cannot detect a DS1 frame for a given BITS timing link. Cleared when a DS1 frame is detected.                                                                                                    |
| AIS                      | Sync RM detects an AIS on an incoming BITS timing reference signal from BITS, or crossover from alternate SPM reference node. Cleared when incoming BITS timing reference signal does not have an alarm. |
| MTIE2                    | MTIE performance for input signal exceeds the GR-253 requirement mask threshold, indicating an unusable signal. Cleared when MTIE is below GR-253 requirement mask threshold.                            |
| TLD                      | MTIE performance for input signal exceeds the GR-253 requirement mask threshold, indicating a degraded signal. Cleared when the MTIE Level 1 degradation disappears from timing reference.               |
| BPV                      | Incoming signal has BPV alarm, indicating a degraded signal. Cleared when BPV disappears from timing reference.                                                                                          |
| CRC                      | SyncRM detects a CRC from incoming signal, indicating a degraded signal. Cleared when the CRC disappears from the timing reference.                                                                      |
| LOR                      | SyncRM cannot detect the DS1 frame from BITS timing links or signal from Mate SyncRM, indicating that redundancy is lost. Cleared when a DS1 frame is detected.                                          |
| HLDOVR                   | SyncRM has gone into the holdover mode because both BITS timing links were lost. Cleared when SyncRM exits holdover mode.                                                                                |
| Bearer connections alarm | An alarm for bearer connections is added to the list of alarms in table MNNODE.                                                                                                                          |

**Stormia (STM)-available logs/faults**

The following table lists the STM logs available. STM logs will only be present in the HLR market. For detailed information on logs, refer to NN10275-909, *Fault Management Log Reference*.

**STM logs available**

|        |                                             |
|--------|---------------------------------------------|
| STM398 | Indicates a raised alarm in an STM device.  |
| STM399 | Indicates a cleared alarm in an STM device. |

**MG4000-available logs/faults**

The following table lists the MG4000 logs available. MG 4000 supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this

document titled “IEMS Functionality.” For detailed information on logs, refer to NN10275-909, *Fault Management Log Reference*.

#### MG4000 logs available

|          |                                                      |
|----------|------------------------------------------------------|
| MG4I 300 | Media Integrity Failure                              |
| MG4I 301 | GigE Audit Failure                                   |
| MG4I 320 | Counter overflow in the Operational Measurement pegs |
| MG4I 501 | SCTP Core Connection State Change                    |
| MG4I 502 | SCTP Peer Connection State Change                    |

#### MG9000--available logs/faults

The following table lists the MG 9000 Faults available.

MG 9000 supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled “IEMS Functionality.” For details on the logs/faults themselves, refer to the Fault Management section of MG 9000 FCAPS documentation, NN10074-911 and NN10275-909, *Fault Management Log Reference*.

#### MG 9000 Faults available

| Network Element: MG 9000 |                                                                                                                                                                                                                                                                                     |

|        |                                                                                                                                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BW304  | An overall cell queue congestion alarm has occurred when overall atm cell queue is at least 90% full, or the alarm has been cleared. Correlates with Warning alarm bwSwitchFabricTotalFault.                                                                                  |
| BW305  | A CBR cell queue congestion alarm has occurred or been cleared. To occur, atm cell queue for this service type is at least 90% full. Correlates with Warning alarm bwSwitchFabricCbrFault.                                                                                    |
| BW306  | An RT-VBR cell queue congestion alarm has occurred or been cleared. To occur, atm cell queue for this service type is at least 90% full. Correlates with Warning alarm bwSwitchFabricRtVbrFault.                                                                              |
| BW307  | An NRT-VBR cell queue congestion alarm has occurred or been cleared. To occur, atm cell queue for this service type is at least 90% full. Correlates with Warning alarm bwSwitchFabricNrtVbrFault.                                                                            |
| BW308  | A UBR cell queue congestion alarm has occurred or been cleared. To occur, atm cell queue for this service type is at least 90% full. Correlates with Warning alarm bwSwitchFabricUbrFault.                                                                                    |
| BW309  | A UBR-plus cell queue congestion alarm has occurred or been cleared. To occur, atm cell queue for this service type is at least 90% full. Correlates with Warning alarm bwSwitchFabricUbrPlusFault.                                                                           |
| BW310  | A control channel cell queue congestion alarm has occurred or been cleared. To occur, atm cell queue for this service type is at least 90% full. Correlates with Warning alarm bwSwitchFabricControlFault.                                                                    |
| BW311  | Reserved bandwidth dedicated to ABI lines connections on the network interface has exceeded the Bandwidth Congestion Threshold with respect to the amount of bandwidth configured the network interface for switched lines. Correlates with Warning alarm bwResBandwAbiFault. |
| CES305 | No cells are being received from the ATM network. Correlates with Major alarm cesLossOfCell.                                                                                                                                                                                  |
| ESA300 | Communication between GWC and GW is lost. Entered ESA mode. Correlates with Critical alarm Entered ESA.                                                                                                                                                                       |
| ESA302 | This log corresponds to the nnESADownloadFault.                                                                                                                                                                                                                               |
| ESA304 | Generated by the EM in response to a Major alarm from the MG9000 (nnEsaColFault) trap. The MG9000 sends this trap when it detects communication problems to other nodes in the same community of interest.                                                                    |
| ESA312 | Generated by the EM when a failure occurs while trying to provision internodal community of interest data for a given NE (Major alarm).                                                                                                                                       |
| ESA601 | ESA601 is generated from alarm nnESAFault. This alarm was added in Gateway to notify the data inconsistency when MG 9000 finds internal ESA data mapping inconsistency after the ESA data downloading is completed.                                                           |
| ESA602 | ESA602 is generated from alarm nnESARetrieveFault, an alarm generated by the EM for ESA Data Retrieval failure.                                                                                                                                                               |

|                                     | GIGE312 Indicates a Communications Subsystem Failure, GARP failure.                                                                                                |
|                                     | GIGE313 Indicates a Communications Subsystem Failure, link integrity failure.                                                                                      |
|                                     | GIGE314 Indicates a Communications Subsystem Failure, autonegotiation failure.                                                                                     |
|                                     | GIGE315 Indicates a Communications Subsystem Failure, non-preferred link is active.                                                                                |
| HW Mismatch alarm                   | The Hardware Mismatch alarm indicates an incorrect replacement card has been installed.                                                                            |
| QoS alarms                          | New QoS alarms are generated when any of four configured threshold parameters are exceeded. The alarm browser (at the VMG level) is extended to view these alarms. |
| Provisioning failure logs           | If an operation fails when provisioning Tone, Class, or Physical Ringing data, a customer log is generated.                                                        |
| "Authorization Failed" Security Log | Generated when a user attempts to perform an unauthorized action.                                                                                                  |
| MG9K Server Log                     | A warning log generated when the MG9K server is either starting up or shutting down.                                                                               |
| MGCA301                             | Loss of signal fault has occurred or been cleared. Correlates with Critical alarm LOS (on OC3) or Minor alarm los (on DS1).                                        |
| MGCA302                             | Alarm indication signal fault has occurred or been cleared. Correlates with Critical alarm AIS (on OC3) or Minor alarm ais (on DS1).                               |
| MGCA303                             | Loss of frame fault has occurred or been cleared. Correlates with Critical alarm LOF (on OC3) or Minor alarm lof (on DS1).                                         |
| MGCA304                             | Remote alarm indication. Correlates with Minor alarm RAI (on DS1).                                                                                                 |
| MGCA305                             | Bit error rate signal fault has occurred or been cleared. Correlates with Critical alarm bit error ratio signal default (BERSF) (on OC3).                          |
| MGCA306                             | Bit error rate signal degraded fault has occurred or been cleared. Correlates with Major alarm bit error ratio signal default (BERSD) (on OC3).                    |
| MGCA307                             | Remote defect indication fault has occurred or been cleared. Correlates with Minor alarm remote defect indication (RDI) (on OC3).                                  |
| MGCA308                             | Path label mismatch fault has occurred or been cleared. Correlates with Minor alarm alarm path label mismatch (PLM) (on OC3).                                      |
| MGCA309                             | Loss of pointer fault has occurred or been cleared. Correlates with Minor alarm loss of pointer (LOP) (on OC3).                                                    |
| MGCA310                             | An unequipped fault has occurred or been cleared. Correlates with Minor alarm UNEQ (on OC3).                                                                       |
| MGCA311                             | Loss of cell delineation fault has occurred or been cleared (supported in EM only). Correlates with alarm LOD.                                                     |
| MGCA312                             | IMA link- Loss of IMA Frame. Correlates with Minor alarm imaLinkLif.                                                                                               |
| MGCA313                             | IMA link- Loss of delayed synchronization. Correlates with Minor alarm imaLinkLods.                                                                                |

**MG 9000 Faults available**

|         |                                                                                                                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MGCA314 | IMA link- Remote failure indication. Correlates with Minor alarm imaLinkRfi.                                                                                                                                                                             |
| MGCA315 | IMA link- Transmit misconnect. Correlates with Minor alarm imaLinkTxMisConnect.                                                                                                                                                                          |
| MGCA316 | IMA link- receive misconnect. Correlates with Minor alarm imaLinkRxMisConnect.                                                                                                                                                                           |
| MGCA317 | IMA link- transmit fault. Correlates with Minor alarm imaLinkTxFault.                                                                                                                                                                                    |
| MGCA318 | IMA link- receive fault. Correlates with Minor alarm imaLinkRxFault.                                                                                                                                                                                     |
| MGCA319 | IMA link- transmit unusable far end. Correlates with Minor alarm imaLinkTxUnusableFe.                                                                                                                                                                    |
| MGCA320 | IMA link- receive unusable far end. Correlates with Minor alarm imaLinkRxUnusableFe.                                                                                                                                                                     |
| MGCA321 | IMA group startup far end. Correlates with Major alarm imaGroupStartupFe.                                                                                                                                                                                |
| MGCA322 | IMA group configuration abort. Correlates with Critical alarm imaGroupCfgAbort.                                                                                                                                                                          |
| MGCA323 | IMA group configuration abort far end. Correlates with Major alarm imaGroupCfgAbortFe.                                                                                                                                                                   |
| MGCA324 | IMA group insufficient links. Correlates with Critical alarm imaGroupInsuffLinks.                                                                                                                                                                        |
| MGCA325 | IMA group insufficient links far end. Correlates with Major alarm imaGroupInsuffLinksFe.                                                                                                                                                                 |
| MGCA326 | IMA group blocked far end. Correlates with Minor alarm imaGroupBlockedFe.                                                                                                                                                                                |
| MGCA327 | IMA group timing synchronization. Correlates with Major alarm imaGroupTimingSynch.                                                                                                                                                                       |
| MGCA328 | ABI Loss of Clock on DS512 optical link. Correlates with Critical alarm abiLossOfClock.                                                                                                                                                                  |
| MGCA329 | ABI Loss of Frame on DS512 optical link. Correlates with Critical alarm abiLossOfFrame.                                                                                                                                                                  |
| MGCA330 | ABI Loss of Signal (low light level) on DS512 optical link. Correlates with Critical alarm abiLowLightLevel.                                                                                                                                             |
| MGCA331 | ABI Channel parity error on DS512 optical link. Correlates with Minor alarm abiChannelParityError.                                                                                                                                                       |
| MGCA332 | SDH Path Trace Identifier Mismatch Alarm (only applies to SDH and not SONET). The Path Trace Identifier being seen by the OC3 card at the carrier Path level does not match what has been provisioned for that carrier. Correlates with Minor alarm tim. |
| MGCA333 | AlarmIndicationSignal (ds3ais) generates log MGCA333 when an AlarmIndicationSignal fault is received from the Gateway.                                                                                                                                   |
| MGCA334 | LossofFrame (ds3lof) generates log MGCA334 when a LossOfFrame fault is received from the Gateway.                                                                                                                                                        |
| MGCA335 | RemoteAlarmIndication (ds3rai) generates log MGCA335 when a RemoteAlarmIndication fault is received from the Gateway.                                                                                                                                    |
| MGEM300 | Generated when MG9000 EM is not able to make connection to the Element Manager Database. Correlates with Major alarm EmDbUnavailable.                                                                                                                    |
| MGEM301 | In SN06, the NE301 log name changed toMGEM301. Generated when the MG 9000 Manager loses SNMP communication with the MG 9000. Correlates with Critical alarm CommsLostToNE.                                                                               |

**MG 9000 Faults available**

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MGEM302 | In SN06, NE302 log name changed to MGEM302. The MG9000 Manager has added an ne MG9000 and tries to discover the NE. It will check the MG9000 EM IP address provisioned at the MG9000 and if it is incorrect will raise this alarm. Correlates with Major alarm invalidEMIPAddress.                                                                                                                                                                                                                                                                                                                                                                    |
| MGEM303 | In SN06, the NE303 log name changed to MGEM303. The description of t his log is restored faults: "Faults seen while active." Diagnostics will not clear restored faults. The card with the restored faults may not be in the same state it was in before the restart that caused the faults to be restored. The MG9000 sends too many alarms within a 5 second window. When this happens the MG9000 Manager will request this particular MG9000 stop sending Alarms and display this particular alarm. This condition will clear when the number of alarm within 5 sec falls below a set number. Correlates with Critical alarm AlarmsBeingThrottled. |
| MGEM704 | Indicates that an attempt to correct the database has failed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MGEM705 | Indicates that the Database is unavailable and correction failed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MGEM714 | Raised each time the MG9K Upgrade Tool is executed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NE300   | In SN06, the NE300 log (corresponding to all NorNode Faults) split into several logs (grouped according to the clearing procedures). Log NE300 should only be generated if the GW is running on pre-SN06 loads and the MGEM is running on SN06+ loads. It is purely for backward compatibility.                                                                                                                                                                                                                                                                                                                                                       |
| NE301   | The NE301 log (Critical) is generated when an incorrect replacement card has been installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| NE302   | The NE302 log indicates software faults of any severity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| NE303   | The NE303 log indicates restored faults: "Faults seen while active." Diagnostics will not clear restored faults. The card with the restored faults may not be in the same state it was in before the restart that caused the faults to be restored.                                                                                                                                                                                                                                                                                                                                                                                                   |
| NE304   | The NE304 log indicates faults that are ambiguous with regard to the card that is causing the fault. Usually, the alarm on card A indicates that there is a problem on card A, card B, or the link in between card A and B.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| NE305   | The NE305 log indicates serial device faults of any severity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NE306   | The NE306 log indicates GLAN-related faults of any severity. The GLAN hub is located on the active ITP in the shelf where the fault appears.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| NE307   | The NE307 log indicates ABI faults of any severity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NE308   | The NE308 log indicates inband messaging faults of any severity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NE309   | The NE309 log indicates clock sync faults of any severity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| NE310   | The NE310 log indicates unused hardware faults of any severity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NE311   | The NE311 log indicates time of day faults of any severity - attempts to access the provisioned time server have failed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| NE312   | The NE312 log indicates cable faults of any severity -- one of the cables to the ITPs has been connected in an unsupported way.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**MG 9000 Faults available**

|         |                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NE313   | The NE313 log indicates an activity cable fault of any severity; the activity control cable is a small cable on the front of the ABI cards that is used for activity determination.                          |
| NE314   | The NE314 log indicates backplane faults of any severity; the carriers between the two DCC cards cannot communicate.                                                                                         |
| NE315   | The NE315 log indicates bandwidth fault of any severity; some of the carriers are not providing bandwidth.                                                                                                   |
| NE316   | The NE316 log indicates line alarms of any severity.                                                                                                                                                         |
| NE317   | The NE317 log indicates shelf faults of any severity.                                                                                                                                                        |
| NE318   | The NE318 log indicates proxy alarms of any severity; the card referred to in the alarm text (description) is not communicating.                                                                             |
| NE319   | The NE319 log indicates MTA alarms of any severity.                                                                                                                                                          |
| NE320   | The NE320 log indicates data audit faults of any severity; data audit required.                                                                                                                              |
| NE609   | A software image log generated whenever a user executes an image request.                                                                                                                                    |
| OMC300  | Indicates that the OM Collector failed to collect OM files from the MG9K during a particular collection interval. Also indicates that the OM Collector is able to restart collecting OM files from the MG9K. |
| OVLD808 | (Critical) Indicates that an external messaging link has closed and cannot send/receive message.                                                                                                             |
| OVLD809 | (Major) Indicates that the message loss is high enough such that the message link is in a degraded service state.                                                                                            |
| OVLD810 | (Minor) Indicates message retransmissions are high enough that system is starting to see performance degradation.                                                                                            |
| SHLF301 | SIC talk battery A alarm occurs. Correlates with Critical alarm shelfTalkBatteryA.                                                                                                                           |
| SHLF302 | SIC talk battery B alarm occurs. Correlates with Critical alarm shelfTalkBatteryB.                                                                                                                           |
| SHLF303 | SIC signal battery A alarm occurs. Correlates with Major alarm shelfSignalBatteryA.                                                                                                                          |
| SHLF304 | SIC signal battery B alarm occurs. Correlates with Major alarm shelfSignalBatteryB.                                                                                                                          |
| SHLF305 | SIC signal battery A fuse alarm occurs. Correlates with Major alarm shelfSignalBatteryAfuse.                                                                                                                 |
| SHLF306 | SIC signal battery B fuse alarm occurs. Correlates with Major alarm shelfSignalBatteryBfuse.                                                                                                                 |
| SHLF307 | SIC shelf fail LED alarm occurs. Correlates with alarm shelfFailLED.                                                                                                                                         |
| SHLF308 | BIP signal battery A1 alarm occurs. Correlates with Major alarm bipSignalBatteryA1.                                                                                                                          |
| SHLF309 | BIP signal battery A2alarm occurs. Correlates with Major alarm bipSignalBatteryA2.                                                                                                                           |
| SHLF310 | SIC talk battery B1 alarm occurs. Correlates with Major alarm bipSignalBatteryB1.                                                                                                                            |
| SHLF311 | BIP signal battery B2 alarm occurs. Correlates with Major alarm bipSignalBatteryB2.                                                                                                                          |
| SHLF312 | BIP talk battery A alarm occurs. Correlates with Minor alarm bipTalkBatteryA.                                                                                                                                |

**MG 9000 Faults available**

|         |                                                                                                     |
|---------|-----------------------------------------------------------------------------------------------------|
| SHLF313 | BIP talk battery B alarm occurs. Correlates with Minor alarm bipTalkBatteryB.                       |
| SHLF314 | BIP filter A fail alarm occurs. Correlates with Minor alarm bipFilterA.                             |
| SHLF315 | BIP filter B fail alarm occurs. Correlates with Minor alarm bipFilterB.                             |
| SHLF316 | BIP scan point 1 is activated. Correlates with alarm bipScanPoint1.                                 |
| SHLF317 | BIP scan point 2 is activated. Correlates with alarm bipScanPoint2.                                 |
| SHLF318 | BIP scan point 3 is activated. Correlates with alarm bipScanPoint3.                                 |
| SHLF319 | BIP scan point 4 is activated. Correlates with alarm bipScanPoint4.                                 |
| SHLF320 | BIP scan point 5 is activated. Correlates with alarm bipScanPoint5.                                 |
| SHLF321 | BIP scan point 6 is activated. Correlates with alarm bipScanPoint6.                                 |
| SHLF322 | BIP scan point 7 is activated. Correlates with alarm bipScanPoint7.                                 |
| SHLF323 | BIP scan point 8 is activated. Correlates with alarm bipScanPoint8.                                 |
| SHLF324 | BIP scan point 9 is activated. Correlates with alarm bipScanPoint9.                                 |
| SHLF325 | BIP scan point 10 is activated. Correlates with alarm bipScanPoint10.                               |
| SHLF326 | BIP scan point 11 is activated. Correlates with alarm bipScanPoint11.                               |
| SHLF327 | Talk Battery A1 Power Feed. Correlates with Major alarm bipTalkBatteryA1.                           |
| SHLF328 | Talk Battery A Power Feed. Correlates with Major alarm bipTalkBatteryA2.                            |
| SHLF329 | Talk Battery B1 Power Feed. Correlates with Major alarm bipTalkBatteryB1.                           |
| SHLF330 | Talk Battery B2 Power Feed. Correlates with Major alarm bipTalkBatteryB2.                           |
| SHLF331 | BIP circuit breaker fan alarm occurs (EM only). Correlates with Minor alarm bipFanBreaker.          |
| SHLF332 | BIP environmental control unit 0 temperature alarm occurs. Correlates with Minor alarm bipEcuTemp0. |
| SHLF333 | BIP environmental control unit 1 temperature alarm occurs. Correlates with Minor alarm bipEcuTemp1. |
| SHLF334 | BIP environmental control unit 0 fan alarm occurs. Correlates with Minor alarm bipEcuFan0.          |
| SHLF335 | BIP environmental control unit 1 fan alarm occurs. Correlates with Minor alarm bipEcuFan1.          |
| SHLF336 | BIP remote alarm cut off alarm occurs. Correlates with alarm bipRemoteAlarmcutoff.                  |
| SHLF337 | BIP local alarm cut off alarm occurs. Correlates with alarm bipLocalAlarmcutoff.                    |
| SHLF338 | BIP ABS fuse fail alarm occurs. Correlates with Major alarm bipAbsFusefail.                         |
| SHLF339 | BIP ABS battery power supply alarm occurs. Correlates with Critical alarm bipAbsPowerSupply.        |
| SHLF340 | BIP shelf circuit breaker trip alarm occurs. Correlates with Major alarm bipShfBreakerTrip.         |
| SHLF341 | Presence of BIP's Current-Sense Card A. Correlates with Major alarm bipCsApresence.                 |

**MG 9000 Faults available**

|         |                                                                                                                                                      |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHLF342 | Presence of BIP's Current-Sense Card B. Correlates with Major alarm bipCsBpresence.                                                                  |
| SHLF343 | Presence of BIP's Alarm Relay Card. Correlates with Major alarm bipAlmRelayPresence.                                                                 |
| SHLF344 | Current-Sense Card A Shelf 0 High Threshold exceeded. Correlates with Minor bipCSAshf0HighThres alarm.                                               |
| SHLF345 | Current-Sense Card A Shelf 1 High Threshold exceeded. Correlates with Minor bipCSAshf1HighThres alarm.                                               |
| SHLF346 | Current-Sense Card A Shelf 2 High Threshold exceeded. Correlates with Minor bipCSAshf2HighThres alarm.                                               |
| SHLF347 | Current-Sense Card A Shelf 3 High Threshold exceeded. Correlates with Minor bipCSAshf3HighThres alarm.                                               |
| SHLF348 | Current-Sense Card B Shelf 0 High Threshold exceeded. Correlates with Minor bipCSBshf0HighThres alarm.                                               |
| SHLF349 | Current-Sense Card B Shelf 1 High Threshold exceeded. Correlates with Minor bipCSBshf1HighThres alarm.                                               |
| SHLF350 | Current-Sense Card B Shelf 2 High Threshold exceeded. Correlates with Minor bipCSBshf2HighThres alarm.                                               |
| SHLF351 | Current-Sense Card B Shelf 3 High Threshold exceeded. Correlates with Minor bipCSBshf3HighThres alarm.                                               |
| SHLF352 | Current High Temperature Threshold exceeded. Correlates with Minor bipTempHighThres alarm.                                                           |
| SHLF353 | Current-Sense Card A Shelf 0 Low Threshold exceeded. Correlates with Minor bipCSAshf0LowThres alarm.                                                 |
| SHLF354 | Current-Sense Card A Shelf 1 Low Threshold exceeded. Correlates with Minor bipCSAshf1LowThres alarm.                                                 |
| SHLF355 | Current-Sense Card A Shelf 2 Low Threshold exceeded. Correlates with Minor bipCSAshf2LowThres alarm.                                                 |
| SHLF356 | Current-Sense Card A Shelf 3 Low Threshold exceeded. Correlates with Minor bipCSAshf3LowThres alarm.                                                 |
| SHLF357 | Current-Sense Card B Shelf 0 Low Threshold exceeded. Correlates with Minor bipCSBshf0LowThres alarm. Correlates with Minor bipCSBshf1LowThres alarm. |
| SHLF358 | Current-Sense Card B Shelf 1 Low Threshold exceeded. Correlates with Minor bipCSBshf1LowThres alarm.                                                 |
| SHLF359 | Current-Sense Card B Shelf 2 Low Threshold exceeded. Correlates with Minor bipCSBshf2LowThres alarm.                                                 |
| SHLF360 | Current-Sense Card B Shelf 3 Low Threshold exceeded. Correlates with Minor bipCSBshf3LowThres alarm.                                                 |
| SHLF361 | Current Low Temperature Threshold exceeded. Correlates with Minor bipTempLowThres alarm.                                                             |
| SHLF362 | Status of the Signal Battery Fuse. Correlates with Major bipSignalBatteryFuse alarm.                                                                 |

**MG 9000 Faults available**

|         |                                                                                 |
|---------|---------------------------------------------------------------------------------|
| SHLF363 | Status of Talk Battery A Fuse. Correlates with Major bipTalkBatteryAFuse alarm. |
| SHLF364 | Status of Talk Battery B Fuse. Correlates with Major bipTalkBatteryBFuse alarm. |
| SHLF365 | Status of Cooling Unit 0 Fuse. Correlates with Minor bipEcuFuse0 alarm.         |
| SHLF366 | Status of Cooling Unit 1 Fuse. Correlates with Minor bipEcuFuse1 alarm.         |
| SHLF367 | Status of the End-Aisle Fuse. Correlates with Minor bipEndAisleFuse alarm.      |
| SHLF368 | BIP Signal Distribution Point 1. Correlates with bipSignalDistribution1 alarm.  |
| SHLF369 | BIP Signal Distribution Point 2. Correlates with bipSignalDistribution2 alarm.  |
| SHLF370 | BIP Signal Distribution Point 3. Correlates with bipSignalDistribution3 alarm.  |
| SHLF371 | BIP Signal Distribution Point 4. Correlates with bipSignalDistribution4 alarm.  |
| SHLF372 | BIP Visual Critical. Correlates with bipVisualCritical alarm.                   |
| SHLF373 | BIP Visual Major. Correlates with bipVisual Major alarm.                        |
| SHLF374 | BIP Visual Minor. Correlates with bipVisualMinor alarm.                         |
| SHLF375 | BIP Audible Critical. Correlates with bipAudibleCritical alarm.                 |
| SHLF376 | BIP Audible Major. Correlates with bipAudibleMajor alarm.                       |
| SHLF377 | BIP Audible Minor. Correlates with bipAudibleMinor alarm.                       |
| SHLF378 | BIP Alarm CutOff LED. Correlates with bipAlarmCutOffLED alarm.                  |
| SHLF379 | BIP Talk Battery A Fail LED. Correlates with bipTalkBatteryFailALED alarm.      |
| SHLF380 | BIP Talk Battery B Fail LED. Correlates with bipTalkBatteryFailBLED alarm.      |
| SHLF381 | BIP Critical LED Bank. Correlates with bipCriticalLEDbank alarm.                |
| SHLF382 | BIP Major LED Bank. Correlates with bipMajorLEDbank alarm.                      |
| SHLF383 | BIP Minor LED Bank. Correlates with bipMinorLEDbank alarm.                      |
| SHLF384 | BIP Environmental Control Unit 0 LED. Correlates with bipEcu1LED alarm.         |
| SHLF385 | BIP Environmental Control Unit 1 LED. Correlates with bipEcu2LED alarm.         |
| SHLF386 | BIP Alarm Processor Card Fail LED. Correlates with bipAlarmFailedLED alarm.     |
| SHLF387 | BIP Aisle Alarm. Correlates with bipAisleAlarm alarm.                           |
| SHLF388 | BIP Frame Alarm. Correlates with bipFrameFail alarm.                            |
| SHLF389 | Presence of BIP's Alarm Relay Card LED. Correlates with bipAlmRelayLed alarm.   |
| SHLF390 | Status of Current-Sense Card A LED. Correlates with bipCsAled alarm.            |
| SHLF391 | Status of Current-Sense Card B LED. Correlates with bipCsBled alarm.            |
| SHLF392 | Generated when a shelfCompatibility fault is received from the MG9kEM server.   |
| SHLF393 | Generated when a cardDiscovery fault is received from the MG9kEM server.        |

**MG 9000 Faults available**

|         |                                                                                                                                                                                                                                                         |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHLF501 | A catch-all INFO log for all shelf events. Changed in SN06 to show a Severity of Indeterminate, which means no priority has been assigned to the related BIP event. If a severity had been datafilled, then SHLF383 would generate instead of SHLF 501. |
| SWLN301 | Line in Fault occurred or is cleared. Correlates with Minor lineFault alarm.                                                                                                                                                                            |
| SWLN302 | Hazardous Voltage line fault occurred or is cleared. Correlates with Minor alarm lineProtectionFault.                                                                                                                                                   |
| SWLN303 | Line in Babbling state line fault occurred or is cleared. Correlates with Minor alarm lineBabbleState.                                                                                                                                                  |
| VC301   | Minor: atmVcl Alarm indication signal. Correlates with Minor alarm vclTpAis.                                                                                                                                                                            |
| VC302   | Minor: atmVcl Remote Detection Indicator. Correlates with Minor alarm vclTpRdi.                                                                                                                                                                         |
| VC303   | Minor: loss of continuity, vcl. Correlates with Minor alarm vclLoc.                                                                                                                                                                                     |
| VC304   | Minor: atmVcc Alarm indication signal. Correlates with Minor alarm vccTpAis.                                                                                                                                                                            |
| VC305   | Minor: atmVcc Remote Detection Indicator. Correlates with Minor alarm mvccTpRdi.                                                                                                                                                                        |
| VC306   | Minor: loss of continuity, vcc. Correlates with Minor alarm vccLoc.                                                                                                                                                                                     |
| VC307   | Minor: loss of cell delineation on If (only on the EM). Correlates with alarm atmLcd.                                                                                                                                                                   |
| VMG300  | Generated when Root Termination goes out of service (Communication between Gateway and GWC is lost and ESA is not enabled). Correlates with Critical alarm VMG OOS.                                                                                     |
| VMG301  | QoS Alarm that is generated when the number of bad call reaches a certain threshold.                                                                                                                                                                    |
| VMG302  | QoS Alarm that is generated when the number of Packet Loss reaches a certain threshold.                                                                                                                                                                 |
| VMG303  | QoS Alarm that is generated when IP message Jitter reaches a certain threshold.                                                                                                                                                                         |
| VMG304  | QoS Alarm that is generated when IP message Latency reaches a certain threshold.                                                                                                                                                                        |
| VMG322  | Generated when a vMGAdminStatusOutOfService fault is received from the MG9kEM server (Warning).                                                                                                                                                         |
| VMG323  | Generated when a cardLocked fault is received from the MG9kEM server (Warning).                                                                                                                                                                         |
| VMG324  | Generated when a cardDisabled fault is received from the MG9kEM server (Warning).                                                                                                                                                                       |
| VMG325  | Generated when a cardInitializing fault is received from the MG9kEM server (Warning).                                                                                                                                                                   |
| VMG328  | Generated when a lineMtceNotReady fault is received from the MG9kEM server (Critical).                                                                                                                                                                  |
| VMG329  | Generated when a MegacoMtceNotReady fault is received from the MG9kEM server (Critical).                                                                                                                                                                |
| VMG373  | Generated when a GWCUnreachable fault is received from the MG9kEM server (Critical).                                                                                                                                                                    |
| VMG374  | Generated when a noReplyFromGWC fault is received from the MG9kEM server.                                                                                                                                                                               |
| VMG376  | Generated when an aal1BearerSubsystem OnPairNotReady fault is received from the MG9kEM server.                                                                                                                                                          |

|                                          |                                                                                                                        |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| VMG377                                   | Generated when an ipBearerSubsystem OnPairNotReady fault is received from the MG9kEM server.                           |
| VMG600                                   | Indicates that termination data was successfully provisioned in all appropriate areas except for the database.         |
| VMG601                                   | Indicates that an attempt to correct termination data in the database has passed.                                      |
| VMG Admin State is OOS                   | Generated when a vMGAdminStatusOutOfService fault is received from the MG9kEM server (Warning). Relates to log VMG322. |
| VMG Initializing                         | Generated when a cardInitializing fault is received from the MG9kEM server (Warning). Relates to log VMG325.           |
| VMG OOS-card locked                      | Generated when a cardLocked fault is received from the MG9kEM server (Warning). Relates to log VMG323.                 |
| VMG OOS-card disabled                    | Generated when a cardDisabled fault is received from the MG9kEM server (Warning). Relates to log VMG324.               |
| VMG OOS- Line Maintenance is not Ready   | Generated when a lineMtceNotReady fault is received from the MG9kEM server (Critical). Relates to log VMG328.          |
| VMG OOS- Megaco Maintenance is not Ready | Generated when a MegacoMtceNotReady fault is received from the MG9kEM server (Critical). Relates to log VMG329.        |
| VMG OOS- GWC is not reachable            | Generated when a GWCUnreachable fault is received from the MG9kEM server (Critical). Relates to log VMG373.            |
| VMG OOS- no reply from GWC               | Generated when a noReplyFromGWC fault is received from the MG9kEM server. Relates to log VMG374.                       |
| VMG OOS- AAL1 bearer subsystem not ready | Generated when an aal1BearerSubsystem OnPairNotReady fault is received from the MG9kEM server. Relates to log VMG376.  |
| VMG OOS- IP bearer subsystem not ready   | Generated when an ipBearerSubsystem OnPairNotReady fault is received from the MG9kEM server. Relates to log VMG377.    |
| XDSL301                                  | Generated when a loss of signal - local modem fault occurs. Correlates with Minor alarm losATUC.                       |
| XDSL302                                  | Generated when a loss of frame - local modem fault occurs. Correlates with Minor alarm lofATUC.                        |
| XDSL303                                  | Generated when a loss of power - local modem fault occurs. Correlates with Critical alarm lprATUC.                     |
| XDSL304                                  | Generated when a loss of link - local modem fault occurs. Correlates with Minor alarm loIATUC.                         |
| XDSL305                                  | Generated when a loss of signal - remote modem fault occurs. Correlates with Minor alarm losATUR.                      |
| XDSL306                                  | Generated when a loss of frame - remote modem fault occurs. Correlates with Minor alarm lofATUR.                       |

| XDSL309                                                  | Generated when a no modem present fault occurs. Correlates with Minor alarm aturNotPresent.                                                                                    |
| XDSL310                                                  | Generated when a local modem clock failure occurs. Correlates with Critical alarm noClock.                                                                                     |
| XDSL311                                                  | Generated when a protocol error occurs. Correlates with Critical alarm handshakeFail.                                                                                          |
| XDSL312                                                  | Generated when a configuration error occurs. Correlates with Critical alarm linkMismatch.                                                                                      |
| XDSL313                                                  | Generated when an ATM traffic dropped at WAC upstream fault occurs. Correlates with Critical alarm vpiNonzero.                                                                 |
| XDSL314                                                  | Generated when a loss of sync of ATM cells - upstream fault occurs. Correlates with Critical alarm lcdIATUC.                                                                   |
| XDSL315                                                  | Generated when a loss of sync of ATM cells - downstream fault occurs. Correlates with Critical alarm lcdIATUR.                                                                 |
| XDSL316                                                  | Generated when a local modem Critical failure - not responding, in Kernel mode, download failure, or message corrupted fault occurs. Correlates with Critical alarm failIATUC. |
| XDSL317                                                  | Generated when a general hardware fault indication - circuit fault occurs. Correlates with Critical alarm circuitHardwareFault.                                                |
| xDSL600                                                  | ATUCs transmit rate has changed (RADSL mode only).                                                                                                                             |
| xDSL601                                                  | ATUC initialization failed.                                                                                                                                                    |
| xDSL602                                                  | ATURs transmit rate has changed (RADSL mode only).                                                                                                                             |
| xDSL800                                                  | Loss of Framing 15-minute interval threshold reached.                                                                                                                          |
| xDSL801                                                  | Loss of Signal 15-minute interval threshold reached.                                                                                                                           |
| xDSL802                                                  | Loss of Power 15-minute interval threshold reached.                                                                                                                            |
| xDSL803                                                  | Errored Second 15-minute interval threshold reached.                                                                                                                           |
| xDSL805                                                  | Loss of Framing 15-minute interval threshold reached.                                                                                                                          |
| xDSL806                                                  | Loss of Signal 15-minute interval threshold reached.                                                                                                                           |
| xDSL807                                                  | Loss of Power 15-minute interval threshold reached.                                                                                                                            |
| xDSL808                                                  | Errored Second 15-minute interval threshold reached.                                                                                                                           |
| xDSL809                                                  | A DSL Interface exceeds the specified threshold on a given performance measurement.                                                                                            |
| The following items describe the MG9K Clock Sync alarms. |                                                                                                                                                                                |
| Loss of Phase Lock                                       | Minor: Phase PLD [altera 7064b] detected a minimum phase difference greater than eight nano seconds.                                                                           |

**MG 9000 Faults available**

|                          |                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Loss of Frame Pulse Lock | Minor: Frame pulse alignment did not get established with the active card -- it should occur in the inactive card only                                                                                                                                                                                                                 |
| Loss of My Clock         | Minor: The high and low levels of the SYNC PLL clock are not toggling.                                                                                                                                                                                                                                                                 |
| Loss of Mate Clock       | Minor: The high and Low levels of the mate clock are not toggling.                                                                                                                                                                                                                                                                     |
| Loss of Clock Output     | Major: Phase PLD reference clock oscillator not toggling.                                                                                                                                                                                                                                                                              |
| Single Reference Failure | Minor: Single monitored reference source has been lost.                                                                                                                                                                                                                                                                                |
| All Reference Failure    | Major: Absolute and Delta reference source signals have been lost.                                                                                                                                                                                                                                                                     |
| Single Sync Unit Failure | Major: Stratum 3 unit on ITP failed.                                                                                                                                                                                                                                                                                                   |
| Clock Stability          | Clock mode can be Acquiring, Acquired, Hold Over, or Free Run.                                                                                                                                                                                                                                                                         |
| DACV alarms              | DACV at Rail is a Major alarm to indicate the ITP clock circuitry has attempted to acquire sync and has traversed the frequency range to the extreme end of its capture range..<br><br>DACV Out of Range is a Major alarm to indicate that the ITP 's DACV clock circuitry is in an invalid condition and the values are out of range. |
| Signal LOS               | Minor: Single/All source reference occurred due to loss of signal.                                                                                                                                                                                                                                                                     |
| Signal LOF               | Minor: Single/All source(s) reference occurred due to out of frame.                                                                                                                                                                                                                                                                    |
| No Signal                | Minor: Sync source reference selected does not provide a signal.                                                                                                                                                                                                                                                                       |
| MG9K alarms              | Unable to communicate with RADIUS Server.<br><br>Secure link Down with GWC.<br><br>Packet Discard (depends on the threshold set).<br><br>Overload Controls--these alarms will now also apply to the ABI & ITP Card as well as the DCC Card.                                                                                            |
| MG9K Threshold logs      | SAD: Discard Policy, or Lookup failed.<br><br>IKE: Main mode failed, or Mismatched PSK, or Quick mode failed, or Proposal mismatch, or NULL ESP & authentication = null, or en/decryption failures, or Packet discarded, or decryption errors, or Auth errors.<br><br>IPSec Security: Decryption error or Authentication error.        |
| MG9K security alarms     | Non-responsive RADIUS Server<br><br>Expired Links to Security Peers<br><br>Replayed Packet threshold                                                                                                                                                                                                                                   |

**MG 9000 Faults available**

|                       |                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                       | Packet Discard threshold                                                                                                                |
| MG9K                  | IKE negotiation errors                                                                                                                  |
| security              | IP packet authentication failures                                                                                                       |
| events logs           | Packet discard                                                                                                                          |
|                       | Replayed packets                                                                                                                        |
| IPSec Syslog messages | There is a wide variety of IKE failure messages generated to syslog. Refer to feature A00005561 in this document for the complete list. |

**NPM--available logs/faults**

The following table lists the Network Patch Manager (NPM) Logs/Faults available.

NPM supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled "IEMS Functionality." For details on the logs, refer to the Fault section of the FCAPS documentation on CS 2000 Management Tools, NN10325-900 and NN10275-909, *Fault Management Log Reference*.

**NPM Logs/Faults available**

| Log/Fault                                     | Description                                                                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Network Element: Network Patch Manager</b> |                                                                                                                                    |
| NPM360                                        | Reports that an alarm has been raised.                                                                                             |
| NPM370                                        | Reports when an alarm has been cleared.                                                                                            |
| NPM400                                        | Reports the results of attempted apply, remove, and audit commands.                                                                |
| NPM600                                        | Reports when the NPM server has been started, either by reboot or manually.                                                        |
| NPM601                                        | File failure; reports general problems that could be service affecting. The log contains lines of trouble information text.        |
| NPM603                                        | There are problems between the database and the device during a device audit.                                                      |
| NPM605                                        | General trouble log; reports general problems that could be service affecting. The log contains lines of trouble information text. |
| NPM610                                        | Provides information related to the execution of a task.                                                                           |
| NPM660                                        | Reports problems when a plan fails to execute.                                                                                     |
| NPM680                                        | Reports problems when a plan is automatically executed.                                                                            |
| <b>NPM System Alarms</b>                      |                                                                                                                                    |
| Alarm name                                    | Description                                                                                                                        |
| ACT_NOT_APP                                   | Activated patch not applied to all applicable devices.                                                                             |
| ACT_NOT_ACT                                   | Active patch applied to all applicable devices but not activated in all devices.                                                   |

**NPM Logs/Faults available**

| Log/Fault        | Description                                                                             |
|------------------|-----------------------------------------------------------------------------------------|
| DEBUG_APP        | Debug patches applied. Minor.                                                           |
| DISABLED_APPLIED | Applied patches that can be enabled, but are disabled. Major.                           |
| DNR_NOT_APP      | Do Not Remove (DNR) patches not applied. Critical.                                      |
| EMG_NOT_APP      | Emergency patches not applied. Critical.                                                |
| ENABLED_REMOVED  | Patches which can be enabled but are not enabled. Major.                                |
| GEN_NOT_APP      | General patches not applied. (No severity)                                              |
| LTD_NOT_APP      | Limited patches not applied. (No severity)                                              |
| OBS_NOT_REMOVED  | Obsolete patches not removed. Major.                                                    |
| OBE_NOT_REMOVED  | Obsolete emergency patches not removed. Critical.                                       |
| REMOVED_PATCHES  | Removed patches when are not category OBS, OBE, or DBG. (No severity)                   |
| PATCH_ONHOLD     | Patches on hold. Minor.                                                                 |
| DEVICE_ONHOLD    | Devices on hold. Minor.                                                                 |
| REL_GEN_NOT_APP  | A Major alarm raised when a released patch has not been applied. Relates to log NPM360. |
| PFRSGETPATCH     | A Major alarm raised when the PFRS GENREPORT task has failed. Relates to log NPM360.    |
| PFRSGENREPORT    | A Major alarm raised when the PFRS GETPATCH task has failed. Relates to log NPM360.     |

**CS2000 Core Manager--available logs/faults**

The following table lists the CS2000 Core Manager Logs/Faults available. The CS 2000 Core Manager supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the section in this document titled “IEMS Functionality.” For details on the faults themselves, refer to the Fault Management section of CS 2000 FCAPS documentation, NN10082-911 and NN10275-909, *Fault Management Log Reference*.

**CS2000 Core Manager Logs/Faults available**

| Log/Fault                                   | Description                                                           |
|---------------------------------------------|-----------------------------------------------------------------------|
| <b>Network Element: CS2000 Core Manager</b> | For details on previously existing Logs/Faults, refer to NN10082-911. |
| CBM upgrade log                             | The CBM upgrade log is generated for any CBM upgrade failure.         |
| SDM267                                      | Indicates a change in the condition of a CBM link                     |

**CS2000 Core Manager Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDM300    | The connection from the CS2000 Core Manager to the CM or operating company LAN server(s) is down.                                                                                                                                                                                                                         |
| SDM301    | The maintenance system detects the logical volume mirroring status.                                                                                                                                                                                                                                                       |
| SDM302    | Use of a system resource exceeds the threshold. Associated with log SDM602.                                                                                                                                                                                                                                               |
| SDM303    | A process has failed more than 3 times in a day, or some other application fault has occurred. Reports an application alarm condition where action is required. Associated with log SDM603 which indicates a clearing of the alarm. CR Q00537118 and CR Q00600912 also impact this log for consistent formatting changes. |
| SDM304    | Log Delivery application has failed to reconnect to a device.                                                                                                                                                                                                                                                             |
| SDM305    | A problem exists with DTH commissioning. The log indicates which device and suggests a recommended action. Associated with a Minor alarm.                                                                                                                                                                                 |
| SDM306    | Table access software versions on the CM side and the SDM side are not compatible. Associated with a Minor alarm.                                                                                                                                                                                                         |
| SDM307    | Indicates trouble with the SDMCi. The connection to the CM was lost more than 3 times. Check the telnet port.                                                                                                                                                                                                             |
| SDM308    | An I-tape or S-tape backup has failed.                                                                                                                                                                                                                                                                                    |
| SDM309    | Fault detected on HW device or user took HW device OOS.                                                                                                                                                                                                                                                                   |
| SDM310    | System found a pending transaction at startup time. Check the audit log to find out which command was involved. Rollback of the transaction was successful. Use the SDMdbAdmin tool to sync CM and SDM again. Associated with a Minor alarm.                                                                              |
| SDM311    | System found a pending transaction at startup time. Check the audit log to find out which command was involved. Rollback of the transaction was NOT successful. Use the SDMdbAdmin tool to sync CM and SDM again. Associated with a Major alarm.                                                                          |
| SDM312    | Postprocessing of a command failed. The transaction was rolled back. Use the SDMdbAdmin tool to sync CM and SDM again. Associated with a Minor alarm.                                                                                                                                                                     |
| SDM313    | Postprocessing of a command failed. The transaction was rolled back. Use the SDMdbAdmin tool to sync CM and SDM again. Associated with a Major alarm.                                                                                                                                                                     |
| SDM314    | Indicates two SDM link connections are physically crossed. Associated with Major alarm "Crossed Link."                                                                                                                                                                                                                    |
| SDM315    | Corruption of file detected during data dictionary download.                                                                                                                                                                                                                                                              |
| SDM317    | DCE subsystem has detected a problem.                                                                                                                                                                                                                                                                                     |
| SDM318    | OM report failed to complete within one report interval. Associated with a Major alarm.                                                                                                                                                                                                                                   |
| SDM321    | Reports that a split-system upgrade is in progress. Associated with a Minor alarm.                                                                                                                                                                                                                                        |
| SDM325    | The connection to a network management component in a given domain has been lost. Log reports may be lost as a result.                                                                                                                                                                                                    |
| SDM328    | Indicates that the signal on receive/ transmit fibre to OC3 card is faulty or not present. Associated with Major alarm OC3 Card Fault.                                                                                                                                                                                    |

**CS2000 Core Manager Logs/Faults available**

| Log/Fault | Description                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDM329    | Indicates a probable link equipment malfunction. Associated with Minor alarm Minor Link Fault.                                                                                                                                                                                                 |
| SDM332    | Indicates the status of an unsuccessful SDM system audit. An INFO log.                                                                                                                                                                                                                         |
| SDM336    | Indicates that a response to CBM 800 heartbeat is not received from the core. Associated with major alarm Core Heartbeat                                                                                                                                                                       |
| SDM337    | Indicates that the patch failed signature checking.                                                                                                                                                                                                                                            |
| SDM500    | The SDM node control process has restarted.                                                                                                                                                                                                                                                    |
| SDM501    | The node control process updated SDM run state to INSV.                                                                                                                                                                                                                                        |
| SDM502    | The node control process updated SDM run state to MANB. Logs SDM502-505 are included in the CS2000 Core Manager Log Delivery stream, but do not appear on the RMI.                                                                                                                             |
| SDM503    | The node control process updated SDM run state to SYSB.                                                                                                                                                                                                                                        |
| SDM504    | The node control process updated SDM run state to ISTB.                                                                                                                                                                                                                                        |
| SDM505    | The node control process updated SDM run state to OFFL from MANB.                                                                                                                                                                                                                              |
| SDM550    | An SDM Node Status Change has occurred. Modified in SN06 so that the log occurs in only one type of format and it no longer reports application state change events of OffL, ManB, and process starts.                                                                                         |
| SDM600    | An SDM maintenance connection has been re-established.                                                                                                                                                                                                                                         |
| SDM601    | Logical volume mirroring is re-established.                                                                                                                                                                                                                                                    |
| SDM602    | A system resource is below the threshold.                                                                                                                                                                                                                                                      |
| SDM603    | The SDM303 alarm has been cleared. Or a state change has occurred that does not require manual intervention to clear. With SN06, this log now reports application state change events of OffL, ManB, and process starts. CR Q00600912 also impacts this log for consistent formatting changes. |
| SDM604    | CM had too little time to format log(s) and log(s) is/are lost.                                                                                                                                                                                                                                |
| SDM607    | Internal CS 2000 Core Manager log; indicates when a process controller starts or restarts a process. The system does not send SDM607 to the OSS. You can see the SDM607 report from the remote maintenance interface (RMI), when logged onto the CS 2000 Core Manager.                         |
| SDM608    | I-tape or S-tape process has completed.                                                                                                                                                                                                                                                        |
| SDM609    | A hardware device has returned to the INSV state.                                                                                                                                                                                                                                              |
| SDM614    | Reports that the crossed link alarm associated with SDM314 is cleared.                                                                                                                                                                                                                         |
| SDM615    | Log Thresholding is in effect for logs managed by exception application. Exception reports may be inaccurate                                                                                                                                                                                   |
| SDM616    | An unauthorized connection attempt is detected by the Log Delivery application. The connection is refused.                                                                                                                                                                                     |
| SDM617    | A DCE problem has been cleared.                                                                                                                                                                                                                                                                |
| SDM618    | Logical volume /var is 98 percent full. Log files in /var/adm have been deleted.                                                                                                                                                                                                               |

**CS2000 Core Manager Logs/Faults available**

| Log/Fault                      | Description                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDM619                         | OM Access Service detected a corrupt OM group during an OM schema download.                                                                                                                                                                                                                                                                                                      |
| SDM620                         | Reports current system performance data at set times.                                                                                                                                                                                                                                                                                                                            |
| SDM621                         | The split-system upgrade is finished.                                                                                                                                                                                                                                                                                                                                            |
| SDM622                         | Max file size reached for a file device handled by GDD.                                                                                                                                                                                                                                                                                                                          |
| SDM625                         | The connection to a Network Management component in a given domain has been re-established.                                                                                                                                                                                                                                                                                      |
| SDM626                         | An info log generated whenever the OMDD application starts and it detects that the tuple number option has been changed since the last time the application was launched. The log is used to inform the OSS of the state change, which inherently signifies a change in the OMDD CSV files. The log will indicate the new (current) state as being either ACTIVATED or DISABLED. |
| SDM630                         | Indicates the SDM REX Test start and complete time. An INFO log.                                                                                                                                                                                                                                                                                                                 |
| SDM632                         | Indicates the status of a successful SDM system audit. An INFO log.                                                                                                                                                                                                                                                                                                              |
| SDM633                         | A CBM info log that indicates a change in the condition of a CBM link.                                                                                                                                                                                                                                                                                                           |
| SDM634                         | Indicates that the OC3 Card Fault alarm raised with SDM328 has been cleared.                                                                                                                                                                                                                                                                                                     |
| SDM635                         | Indicates that the Minor Link Fault alarm raised with SDM329 has been cleared.                                                                                                                                                                                                                                                                                                   |
| SDM636                         | Indicates that the heartbeat alarm raised with SDM336 has been cleared.                                                                                                                                                                                                                                                                                                          |
| SDM637                         | Indicates that patch check status is cleared by the user.                                                                                                                                                                                                                                                                                                                        |
| SDM650                         | Link maintenance requests a report on a failed link maintenance action.                                                                                                                                                                                                                                                                                                          |

| SDMB620               | A backup-related problem has been resolved.                                                                                                                                                                                                            |
| SDMB621               | A new backup file is being started.                                                                                                                                                                                                                    |
| SDMB625               | Recovery has started on a backup file.                                                                                                                                                                                                                 |
| SDMB650               | The billing application is restarting one or more processes.                                                                                                                                                                                           |
| SDMB655               | Indicates file state changes and disk utilization, OR disk utilization has dropped below a threshold, OR the billing application cannot move a file to the closeSentProcessed directory.                                                               |
| SDMB665               | A software problem on the CM prevents the downloading (synch) of FLEXCDR data at the SDM.                                                                                                                                                              |
| SDMB675               | An information log that identifies a event related to the transfer of billing files. An event may be a normal operation, a problem, or the resolution of a problem related to SDMB375.                                                                 |
| SDMB680               | Information not related to the file system or creating links needs to be communicated to the customer.                                                                                                                                                 |
| SDMB690               | Indicates that an SBAIF alarm and the fault that caused it have cleared.                                                                                                                                                                               |
| SDMB691               | Generates when a problem occurs with the scheduled transfer of billing files and when that fault clears. It also generates when a file transfer schedule is manually deactivated or deleted.                                                           |
| SDMB820               | A backup has hit a threshold.                                                                                                                                                                                                                          |
| SDM security log      | An Authentication and Authorization Security Syslog, generated when a security event occurs on a SDM.                                                                                                                                                  |
| SDM patch check alarm | This minor alarm is generated under the "sdmmtc sys" level, raised upon a patch signature check failure.                                                                                                                                               |

## ERS8600 (formerly Passport 8600)--available traps/faults

ERS8600 (formerly Passport 8600) supports SCC2 format through the IEMS interface. For details on the IEMS interface, refer to the chapter in this document titled "IEMS Functionality." The following table lists the Passport 8600 traps available.

### ERS8600 (formerly Passport 8600) Traps available

| Trap Name                                                                                                                                                       | Description                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <b>Network Element: ERS8600 (formerly Passport 8600)</b>                                                                                                        |                                                     |
| Faults from the ERS8600 (formerly Passport 8600) are provided via an SNMP Northbound interface that is provided on the ERS8600 (formerly Passport 8600) itself. |                                                     |
| risingAlarm                                                                                                                                                     | Minor, correlates with PP310.                       |
| fallingAlarm                                                                                                                                                    | Cleared, correlates with PP311.                     |
| Default Trap                                                                                                                                                    | Indeterminate, correlates with PP312.               |
| coldStart                                                                                                                                                       | Cleared, correlates with PP313.                     |
| warmStart                                                                                                                                                       | Cleared, correlates with PP315.                     |
| linkDown                                                                                                                                                        | Major, correlates with PP317.                       |
| linkUp                                                                                                                                                          | Cleared, correlates with PP318.                     |
| authenticationFailure                                                                                                                                           | Warning, correlates with PP319.                     |
| rcnChasPowerSupplyDown                                                                                                                                          | Critical, correlates with PP322.                    |
| rcnChasPowerSupplyUp                                                                                                                                            | Cleared, correlates with PP323.                     |
| rcnChasFanDown                                                                                                                                                  | Critical, correlates with PP324.                    |
| rcnChasFanUp                                                                                                                                                    | Cleared, correlates with PP325.                     |
| rcn2kCardDown                                                                                                                                                   | Major, correlates with PP326.                       |
| rcn2kCardUp                                                                                                                                                     | Cleared, correlates with PP327.                     |
| rcn2kTemperature                                                                                                                                                | Critical, correlates with PP328.                    |
| rcnErrorNotification                                                                                                                                            | Warning, Major, Critical, correlates with PP329.    |
| rcnLinkOscillation                                                                                                                                              | Major, correlates with PP330.                       |
| rcnMacViolation                                                                                                                                                 | Warning, correlates with PP331.                     |
| rcnSonetTrap                                                                                                                                                    | Warning, correlates with PP332.                     |
| rcnStpNewRoot                                                                                                                                                   | Warning, correlates with PP333.                     |
| rcnStpTopologyChange                                                                                                                                            | Warning, correlates with PP334.                     |
| rcnStpTCN                                                                                                                                                       | Warning, correlates with PP335.                     |
| rcn2kAtmPvcLinkStateChange                                                                                                                                      | Indeterminate, Minor, Major, correlates with PP336. |
| rcnSmltIstLinkUp                                                                                                                                                | Cleared correlates with PP337.                      |
| rcnSmltIstLinkDown                                                                                                                                              | Major, correlates with PP338.                       |
| rcnSmltLinkUp                                                                                                                                                   | Cleared, correlates with PP339.                     |

**ERS8600 (formerly Passport 8600) Traps available**

| Trap Name                | Description                              |
|--------------------------|------------------------------------------|
| rcnSmltLinkDown          | Major, correlates with PP340.            |
| rcnPasswordChange        | Warning, correlates with PP341.          |
| rcnPcmciaCardRemoved     | Warning, correlates with PP342.          |
| rcnSmartCpldTimerFired   | Major, correlates with PP343.            |
| rcnCardCpldNotUpDate     | Warning, correlates with PP344.          |
| rcnIgapLogFileFull       | Major, correlates with PP345.            |
| rcnCpLimitShutDown       | Major, correlates with PP346.            |
| rcnSshServerEnabled      | Cleared, correlates with PP347.          |
| rcnSshServerDisabled     | Major, correlates with PP348.            |
| rcnSshSessionLogin       | Cleared, correlates with PP349.          |
| rcnSshSessionLogout      | Major, correlates with PP350.            |
| rcnSshUnauthorizedAccess | Major, correlates with PP351.            |
| rcnHaCpuState            | Warning, correlates with PP352.          |
| rcnInsufficientMemory    | Warning, correlates with PP353.          |
| rcnSaveConfigAction      | Minor, correlates with PP354.            |
| rcnLoopDetectOnPort      | Warning correlates with PP355.           |
| vrrpTrapStateTransition  | Warning, correlates with PP356.          |
| rcnEmError               | Warning, correlates with PP357.          |
| ospfVirtIfStateChange    | Warning, Cleared, correlates with PP358. |
| ospfNbrStateChange       | Warning, Cleared, correlates with PP359. |
| ospfVirtNbrStateChange   | Minor, Cleared, correlates with PP360.   |
| ospfIfConfigError        | Major, correlates with PP361.            |
| ospfVirtIfConfigError    | Major, correlates with PP362.            |
| ospfIfAuthFailure        | Major, correlates with PP363.            |
| ospfVirtIfAuthFailure    | Major, correlates with PP364.            |
| ospfIfStateChange        | Warning, Cleared, correlates with PP365. |
| rcnCardDown              | Major, correlates with PP366.            |
| rcnCardUp                | Cleared, correlates with PP367.          |
| rcnbgpEstablished        | Cleared, correlates with PP368.          |
| rcnbgpBackwardTransition | Cleared, correlates with PP369.          |
| rcnAggLinkUp             | Cleared, correlates with PP370.          |
| rcnAggLinkDown           | Cleared, correlates with PP371.          |
| rcnIcmpNewGroupMember    | Cleared, correlates with PP372.          |
| rcnIcmpLossGroupMember   | Cleared, correlates with PP373.          |
| rcnIcmpNewQuerier        | Cleared, correlates with PP374.          |
| rcnIcmpQuerierChange     | Cleared, correlates with PP375.          |

**ERS8600 (formerly Passport 8600) Traps available**

| Trap Name                                                          | Description                                                                                                                                                                             |
|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rcnDvmrpIfStateChange                                              | Cleared, correlates with PP376                                                                                                                                                          |
| rcnDvmrpNewNbrChange                                               | Cleared, correlates with PP377.                                                                                                                                                         |
| rcnDvmrpNbrLossChange                                              | Cleared, correlates with PP378.                                                                                                                                                         |
| rcnFdbProtectViolation                                             | Cleared, correlates with PP379.                                                                                                                                                         |
| rcnLogMsgControl                                                   | Cleared, correlates with PP380.                                                                                                                                                         |
| rcnSaveConfigFile                                                  | Cleared, correlates with PP381.                                                                                                                                                         |
| rcnDNSRequestResponse                                              | Cleared, correlates with PP382.                                                                                                                                                         |
| pingProbeFailed                                                    | Cleared, correlates with PP383.                                                                                                                                                         |
| pingTestFailed                                                     | Cleared, correlates with PP384.                                                                                                                                                         |
| pingTestCompleted                                                  | Cleared, correlates with PP385.                                                                                                                                                         |
| traceRoutePathChange                                               | Cleared, correlates with PP386.                                                                                                                                                         |
| traceRouteTestFailed                                               | Cleared, correlates with PP387.                                                                                                                                                         |
| traceRouteTestComplete                                             | Cleared, correlates with PP388.                                                                                                                                                         |
| UDPEapSessionEndTrap                                               | Cleared, correlates with PP389.                                                                                                                                                         |
| UDPEapSessionStartTrap                                             | Cleared, correlates with PP390.                                                                                                                                                         |
| Trap raised by<br>idi_PP8600.pol to indicate<br>Device-Rediscovery | This trap indicates that a device re-discovery has been initiated.                                                                                                                      |
| OSPF v2 trap                                                       | This trap indicates a variable ospfAddressLessIf (var(2)) takes the value 0 on interfaces with IP addresses and the corresponding value of ifIndex for interfaces having no IP address. |

See the design description of feature A00002920, which supports and generates ERS8600 (formerly Passport 8600) logs that are received by the PLS application. The design description of this feature is in the Feature Deltas section of the SN06.2 OSS Guide.

**MG15000 (previously PVG) Logs/Faults**

For Logs/Faults available for MG15000 (previously PVG), refer to NTP NN10600-500 *Nortel Networks Multiservice Switch 6400/7400/15000/20000 Alarms Reference*

**Multiservice Data Manager logs/faults**

For logs and faults information for the Multiservice Data Manager (MDM), refer to the following documents: 241-6001-501, *MDM Proxy Alarms Reference Guide*, and 241-6001-011, *MDM Advisor User Guide*.

## QCA Logs/Faults

The following table lists the QCA Faults/Alarms available. QCA supports SCC2 or NT STD formatted logs through SDM functionality, or it can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled “IEMS Functionality.” For details on the logs, refer to the Fault section of the FCAPS documentation on CS 2000, NN10083-911 and NN10275-909, *Fault Management Log Reference*.

### QCA Logs/Faults

| Log/Fault | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QCA201    | Warning. Qca.properties not available at QCA start-up, or other problems related to properties/qca.properties.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| QCA202    | No priority. Old file retention directory (today-x) is being removed, OR file found in active directory when QCA started.                                                                                                                                                                                                                                                                                                                                                                                                                |
| QCA203    | QCA cannot be stopped. The qca.properties file may be missing, the system cannot determine the QCA port number.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| QCA300    | No priority. File handler or server socket could not be started.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| QCA301    | Minor or Major. Minor: QoS Record received with Unsupported Length or Unsupported Version. Major: 10 sequential QoS Records received with Unsupported Length or Version.                                                                                                                                                                                                                                                                                                                                                                 |
| QCA302    | No priority. Out of sequence QoS record received, OR problem processing binary QoS record.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| QCA305    | No priority. Connection to client is closed. In SN08, priority is changed to None, and reason for generation is changed to when the connection to client is closed.                                                                                                                                                                                                                                                                                                                                                                      |
| QCA310    | Minor, Major, or Critical. Minor: disk space is below the minimum threshold. Major: Disk space is below 500Mb. Critical: disk space is below 100 Mb.                                                                                                                                                                                                                                                                                                                                                                                     |
| QCA315    | No priority, or Warning. Generated for one of many possible file writing or file access problems. For the Warning level, it means that a request to get a new file name has failed, or the QCA has failed to write the footer information to the active file while attempting to close. Other reasons, for example, might be: could not get new file to write records; file <fileName> is corrupted or removed; could not write to the activefile; active file exists but cannot write records to it. In some cases, QCA will shut down. |
| QCA322    | No priority. New GWC connection received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| QCA399    | No priority. Clear log for QCA301 or QCA310.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## RTP Media Portal Logs/Faults

The following table lists the RTP Media Portal Faults/Alarms available. RTP Media Portal can be supported through IEMS. For details on the IEMS interface, refer to the chapter in this document titled “IEMS Functionality.”

For details on the logs, refer to NN10383-900, *Fault Management Alarm and Log Reference* and NN10035-111, *MCS5200 RTP Media Portal Basics*.

#### RTP Media Portal Logs/Faults

| Log/Fault | Description                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RTP101    | Critical. Raised from alarm "Blade Out of Service." Occurs when Managed IP or MCP Service network difficulties (communication problems) are encountered when attempting to communicate with the Media Blade specified by BladeName.                                                                                                                                |
| RTP102    | Critical or Major. Raised from alarm "RTP Media Portal Out of Service." Occurs when timer activated event checks availability of Media Blades that are currently configured or when a OutOfServiceAlarm is raised.                                                                                                                                                 |
| RTP103    | Critical. Raised from alarm "Best Blade Selection." Occurs during session setup when the host attempts to determine which media blade should handle the session.                                                                                                                                                                                                   |
| RTP104    | Critical, Major, or Minor. Raised from alarm "Port Usage." Occurs when timer activated event checks to see what percentage of the configured Managed IP Network ports are in use. Alarm severity is based on the percentages configured for the parameters: "Minor Port Usage Alarm Level," "Major Port Usage Alarm Level," and "Critical Port Usage Alarm Level." |
| RTP105    | Major. Raised from alarm "Host Interface Failure." Occurs when a timer activated event checks the status of host network interfaces.                                                                                                                                                                                                                               |

#### UAS--available logs/faults

UAS faults are sent from the UAS to the UAS EM and are then sent northbound via CORBA. UAS alarm information can also be viewed from the alarm browser that resides with the CS2000 Management Tools. For details on the CORBA protocol/format and the logs, refer to the Fault Management section of UAS FCAPS documentation, NN10073-911 and NN10275-909, *Fault Management Log Reference*.

Refer to the New and Changed section of this document to see if there are SN08 changes in UAS logs and faults.

#### UAS Logs/Faults available

| Network Element: UAS                                                                                                                                                                                  |             |                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-----------------------------------------------------------------------------------------------------|
| UAS faults are sent from the UAS to the UAS EM and are then sent northbound via CORBA. UAS alarm information can also be viewed from the alarm browser that resides with the CS2000 Management Tools. |             |                                                                                                     |
| Fault                                                                                                                                                                                                 | Description | For details on these Logs/Faults, refer to the Fault section of documentation for UAS, NN10073-911. |
| ATM Alarms                                                                                                                                                                                            | AS001       | An ATM interface card is missing from the slot.                                                     |
|                                                                                                                                                                                                       | AS002       | There is a different ATM card module inserted in the chassis slot.                                  |
|                                                                                                                                                                                                       | AS003       | The ATM card has detected an H.110 bus failure.                                                     |
|                                                                                                                                                                                                       | AP001       | The ATM interface port has had a loss of connectivity.                                              |

**UAS Logs/Faults available****Ethernet Interface Alarms**

EI\_LINK\_DOWN; Critical. "Callp was unable to initialize interface to hardware. Check configuration." Clear with a reboot.

88065 EI\_LINK\_DOWN; Critical. "Link on host network interface is down."  
(366)

**Call Agent Connection Alarms**

8193 (301) THREAD\_DEATH\_ALARM; Critical. Either the "incoming" or "outgoing" messaging thread is unable to restart because of some undetermined problem. Clears at the next startup of call processing application.

8194 (302) UDP\_INIT\_FAIL\_ALARM; Critical. This alarm can be raised for various reasons during initialization. The audio server is unable to communicate with the call server. The condition clears at the next startup of the call processing application. Possible reasons and corrective actions follow:

MGC IP address is not datafilled because the uas.conf file either does not exist, is unreadable, or is missing an entry for "CallAgentIPAddress." Fix the configuration file.

MGC IP address is not valid because the call agent IP address obtained from the config file is not valid. Fix the IP address in the config file.

Bad return code from WSASStartup because an attempt was made to initialize the Windows socket library, but failed due to a version mismatch. Report the full text of the alarm to the support group.

WinSock version is not 1.1 as expected because an attempt was made to initialize the Windows socket library, but failed due to a version mismatch. Report the full text of the alarm to the support group.

Unable to create socket; an attempt was made to create a UDP communications socket, but failed. Report the full text of the alarm to the support group.

Unable to bind client name to socket; an attempt was made to bind the communications socket to the port specified in the uas.conf configuration file. Another callp program may already be running. Make sure that another callp program is not running.

Unable to connect to call agent socket; an attempt was made to associate the communications socket with the address of the call agent, but failed. Report the full text of the alarm to the support group.

8195 (800) SOCKET\_ERROR\_ALARM; Warning. UDP Socket errors are being detected.

8196 (801) RETRANS\_ALARM Warning, Retransmissions are being detected.

8197 (802) EXCEED\_MAX\_RETRANS\_ALARM; Warning, Call\_Agent\_Connection, The number of retransmissions has now exceeded the maximum number of retransmissions.

**System Alarms**

6154 (379) NODE\_NO\_CARDS\_INSTALLED; Critical. "There are no NMS cards installed."

**Call Engine Alarms** -- associated with call processing or maintenance state machines.

**UAS Logs/Faults available**

- 12290 (303) CALLP\_THREAD\_NOT\_RESTARTED; Major. The call processing software thread associated with <endpointId> died due to an unhandled software error, and was not restarted because it died too quickly after the previous start. Escalate this issue to Nortel support, providing any other logs that might have occurred. Clears at the next startup of the call processing application.
- 12291 (304) CALLP\_CFG\_INVALID; Critical. The resource configuration for endpointId in C:\uas\etc\rm.resources is not valid. Correct the configuration for endpointId in the rm.resources file, and restart the call processing application. Clears at the next startup of the call processing application.
- 12295 (305) AUDIO\_VFSDIR\_NOT\_SET; Critical. The environment variable VFSDIR is not set to the home directory of the VFS hierarchy. Verify that the VFS software is correctly installed. Clears at the next startup of the call processing application.
- 12296 (306) CALLP\_CONFIG\_PROB; Critical. A serious configuration problem has been detected. The Audio Server is unable to initialize. A configuration file is probably in error. Look for an error log to determine the exact cause of the problem. Clears at the next startup of the call processing application.
- 12297 (307) CALLP\_NO\_CARDS\_AVAILABLE Call\_Engine There are no NMS cards available for use.
- 12298 (308) CALLP\_AUDIO\_RESYNC\_FAILURE Call\_Engine Failed to communicate with aliasServer. Check audio installation and aliasServer.

**AG4000 Service-level Alarms** -- conditions that affect the service-level functionality of the AG4000 card in an ATM system.

- 14337 (315) AG\_GENERIC\_ALARM; Major. An attempt was made to load software onto the card and to start the card but failed. Stop the applications, reseal the card and then restart the applications. If the problem persists, contact the Nortel support group. Clears when the applications are restarted and the operation succeeds.
- 14338 (315) AG\_SURPRISE\_EXTRACTION Improper extraction of AG4000 card in slot <x> of the SAM 16 chassis.
- 14339 (316) AG\_CARD\_DISABLED AG4000 card in slot <x> disabled until next application restart of the UAS.

**NodeMtc Alarms** -- generated by the callp application if the NMS CT daemon and NMS Clock Fallback Manager services fail to stop or start successfully.

- 20481 (322) CTDAEMON\_SERVICE\_FAILURE; Critical. Either the NMS CT daemon service is not installed as a service, or it is in a service state where it cannot accept start and stop service requests. Make sure that the NMS CT daemon service is installed. Stop, uninstall and re-install the service if need be. Clears once the NMS CT daemon service has been successfully started or stopped.

**UAS Logs/Faults available**

20482 (323) CFBM\_SERVICE\_FAILURE; Critical. When the NMS CT daemon service is started, it should automatically start the NMS Clock Fallback Manager service (The NMS Clock Fallback Manager service is not automatically stopping the NMS CT daemon service.). If the NMS Clock Fallback Manager service is not automatically started for some reason, either the NMS Clock Fallback Manager service is not installed as a service for it to be started or stopped, or it is in a service state where it cannot accept start and stop service requests. Make sure that the NMS Clock Fallback Manager service is installed. Stop, uninstall and re-install the service if need be. Clears once the NMS Clock Fallback Manager service has been successfully started or stopped.

20483 (324) SERVICE\_FAILURE NodeMtc The <x> service could not be \_\_\_\_\_.

**ConfigMgr Alarms**

26625 CM\_CONFIG\_ERROR; Critical. This alarm can be raised for various reasons during initialization. A serious configuration problem has been detected. The Audio Server is unable to initialize. A configuration file is probably in error. Look for an error log to determine the exact cause of the problem. The condition clears after the configuration problem is fixed. Possible reasons and corrective actions follow:

The specified configuration template files are missing from c:\uas\cfg\templates. Restore the missing files.

The specified configuration file is missing. Restore the missing file.

ConfigMgr was unable to update the uas\_pending.conf file. The file may have had incorrect permissions, or the disk is full. Check file permissions. Check to see if the disk is full.

ConfigMgr attempted to create a kernel object but encountered an error. Contact the support group.

ConfigMgr was unable to copy a file. The file may have had incorrect permissions, or the disk is full. Look at logs to determine which file caused the problem. Check file permissions. Check to see if the disk is full.

ConfigMgr could not automatically determine how many AG cards there are in the system. The number of AG cards could not be determined. Ensure that the NMS locate utility is present and is working properly.

ConfigMgr could not update the uas.conf file with the number of AG cards. Check file permissions. Check to see if the disk is full.

A configuration parameter is missing or has an invalid value. Look at logs to determine which configuration parameters are missing.

ConfigMgr attempted to operate on a kernel object but encountered an error. Contact the support group.

**CG6000 Service-level Alarms**

**UAS Logs/Faults available**

|                |                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 30721          | CG_GENERIC_ALARM; Major. An attempt was made to load software onto the card and to start the card. The attempt failed. Stop the applications, reseal the card and then restart the applications. If the problem persists, contact the Nortel support group. Clears when the applications are restarted and the operation succeeds. |
| 30722<br>(318) | CG_ETHERNET_CONN_ALARM Critical, CG6000%d failed ethernet connection(s) on CG6000 card in slot%d.                                                                                                                                                                                                                                  |
| 30723<br>(319) | CG_SURPRISE_EXTRACTION Major, CG6000 Improper extraction of CG6000 card in slot%d.                                                                                                                                                                                                                                                 |
| 30724<br>(320) | CG_CARD_DISABLED Major, CG6000 card in slot%d disabled until next application restart.                                                                                                                                                                                                                                             |
| 30725<br>(321) | CG_CLOCKING_ALARM Major, CG6000 primary clock source is%s and secondary clock source is%s in slot%d.                                                                                                                                                                                                                               |

**ATM Service Alarms**--The ATM\_MISSING\_CARD alarm and ATM\_MISMATCH\_CARD alarm are raised in situations where provisioned VCs exist for a given ATM Card in a given slot, and that card has either been removed, is inoperable, or has been replaced with another ATM card.

|       |                                                                                                                                                                                                                                                                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 34817 | ATM_MISSING_CARD; Critical. Either the ATM card has been pulled or it has experienced a catastrophic failure and is unable to register with the cPCI chassis. A working ATM card must be inserted into the slot. Alternatively, all the VCs may be deleted which are associated with the missing card. Clears at the next start of the call processing application. |
| 34818 | ATM_MISMATCH_CARD; Critical. The ATM card has been replaced with a different model ATM card. Place the correct ATM card back in the slot which originally contained the S007 card. Alternatively, all the VCs may be deleted which are associated with the mismatched card. Clears at the next start of the call processing application.                            |

**ATM Port Alarms**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 34913          | ATM_PORT_LOC; Critical. The fiber connecting the ATM port to the network has either been unplugged or damaged. Plug the fiber back in, or replace it if it was damaged. Clears when the signal on the fiber is back to normal.                                                                                                                                                                                                                               |
| 34819<br>(328) | ATM_H110_FAILURE Critical ATM_Service The ATM card detected an H.110 bus failure. This alarm may be caused by a bad AG driving the H.110 bus clock or more than one card is trying to drive the clock on the bus. Clears at the next start of the call processing application.                                                                                                                                                                               |
| 34820<br>(329) | ATM_OUTDATED_FIRMWARE Major ATM_Service The ATM card in slot %d has outdated firmware ver.:%s recommended version:%s. Please run the ATMFirmware command to upgrade the firmware. This alarm is seen if the ATM card has outdated firmware. Clears at the next start of the call processing application, after the firmware has been upgraded.                                                                                                               |
| 34821<br>(330) | ATM_FIRMWARE_NON_UPGRADABLE Major ATM_Service The ATM card in slot %d has outdated firmware ver.:%s. This firmware needs to be manually updated. Please load the card with a firmware version which is 2.1.0 or later. This alarm is seen when the firmware on the ATM card is outdated and can not be automatically upgraded. A newer firmware load needs to be transfer to the card manually. Clears at the next start of the call processing application. |

**UAS Logs/Faults available**

34822 (331) ATM\_HW\_API\_TOO\_MANY\_FAILURES Critical ATM\_Service The number of consecutive API calls failures to the ATM card in slot %d, has exceeded the threshold of %d. The card is being taken out of service. Clears at the next start of the call processing application.

**Carrier Alarms**

40961 CARRIER\_CLR\_ALARM. Indicates that a carrier alarm cleared.

40962 CARRIER\_RAISE\_ALARM; Critical. One of these carrier alarms is raised: RAI, AIS, LOF, LOS, E1 LOMFS, or E1 16 AIS. Based on the different alarm types, check T1/E1 carrier for the cause. Clears when the CARRIER\_CLR\_ALARM event is received.

**Activity Manager Alarms**

53249 (336) AM\_COLD\_START\_NOT\_SENT\_CEM Activity\_Manager.

53250 (337) AM\_COLD\_START\_NOT\_SENT\_SWACT Activity\_Manager.

53251 (338) AM\_SWACT\_FAILURE Critical Activity\_Manager.

53252 (339) AM\_ERM\_FAILURE Critical Activity\_Manager.

53253 (340) AM\_ED\_SOCK\_FAILURE Major Activity\_Manager.

53254 (341) AM\_CONFIG\_ERROR\_NOFILE Minor Activity\_Manager.

53255 (342) AM\_DATAFILE\_ERROR\_NOFILE Critical Activity\_Manager.

**Power Supply, Disk, and Fan Maintenance Alarms**

61441 (345) COOLING\_SYSTEM\_RAISE\_ALARM; Major/Critical. In the case of a cooling fault, this is due to a high temperature at air intake to the chassis. In the case of a Cooling alarm, it is due to an extremely high temperature at air intake to the chassis. Check air flow and cooling equipment. Clears upon receipt of a GlobalServer Equipment fault tag with a 'cleared' alarm condition.

59393 (344) POWER\_SUPPLY\_RAISE\_ALARM; Major. HA Monitor received a Power Supply Fault Tag, and informed the PsFanMtc subsystem. This could be due to a faulty power supply system in the chassis that has gone down. Clears upon receipt of a Power Supply Fault tag with the "Power Good" bit set.

59393 POWER\_SUPPLY\_RAISE\_ALARM; Major. HA Monitor received a Fan Fault Tag, and informed the PsFanMtc subsystem. This could be due to a faulty fan in the chassis that has gone down. Clears upon receipt of a Fan Fault tag with the "Fan Fault" bit unset.

63489 (346) DISKDRIVE\_RAISE\_ALARM Critical Hard\_Disk ALARM: Problem detected on Domain %s %s disk drive, chassis peripheral %d, due to %s.

**I/O Card Base-level Alarms**

65537 (309) CD\_SURPRISE\_SLOT\_POWER\_OFF; Major. A surprise power off on a slot can be caused by a chassis hardware problem or by a software error. The problem may clear up after a reboot. Stop the applications and perform a reboot. If the problem does not clear up, then you may be able to workaround the problem by moving the card to another slot. Refer to the appropriate card maintenance and configuration procedures. The alarm clears when power is restored to the slot.

**UAS Logs/Faults available**

- 65538 (310) CD\_SURPRISE\_CARD\_EXTRACTION; Major. A card was improperly extracted from the specified slot. The applications will need to be restarted. Perform these actions: 1) stop the applications 2) reinsert the card 3) restart the applications. The alarm clears when the card is reinserted and the applications are restarted.
- 65539 (311) CD\_LOAD\_SCRIPT\_FAILURE; Major. An attempt was made to load firmware onto the card in the specified slot. Stop the applications, reseal the card, and restart the applications. If the problem persists, then contact the Nortel support group. If resealing the card fixes the problem, then the alarm will clear when the applications are restarted.
- 65540 (312) CD\_SLOT\_VERIFY\_SCRIPT\_FAILURE; Major. An attempt was made to verify that the card contains the correct firmware version. Stop the applications, reseal the card, and restart the applications. If the problem persists, then contact the Nortel support group. If resealing the card fixes the problem, then the alarm will clear when the applications are restarted.
- 65541 (313) CD\_GENERIC\_CARD\_ALARM; Major. A problem occurred with the card in the specified slot. A brief description of the problem is supplied. No action required; no clear condition.

**Shelf Controller Alarms**

- 67585 (309) SC\_SURPRISE\_SLOT\_POWER\_OFF Major Shelf Controller Surprise power off on slot %d.
- 67586 (310) SC\_SURPRISE\_CARD\_EXTRACTION Major Shelf Controller Surprise card extraction on.
- 67587 (311) SC\_LOAD\_SCRIPT\_FAILURE Major Shelf Controller Firmware load script failure on card in slot %d.
- 67588 (312) SC\_SLOT\_VERIFY\_SCRIPT\_FAILURE Major Shelf Controller Verify script failure on card in slot %d.
- 67589 (313) SC\_GENERIC\_CARD\_ALARM Major Shelf Controller Problem with card in slot %d:

**Hot Swap Controller Alarms**

- 69633 (309) HS\_SURPRISE\_SLOT\_POWER\_OFF Major Hot Swap Controller Surprise power off on slot %d.
- 69634 (310) HS\_SURPRISE\_CARD\_EXTRACTION Major Hot Swap Controller Surprise card extraction on slot %d.
- 69635 (311) HS\_LOAD\_SCRIPT\_FAILURE Major Hot Swap Controller Firmware load script failure on card in slot %d.
- 69636 (312) HS\_SLOT\_VERIFY\_SCRIPT\_FAILURE Major Hot Swap Controller Verify script failure on card in slot %d.
- 69637 (313) HS\_GENERIC\_CARD\_ALARM Major Hot Swap Controller Problem with card in slot %d:

**SCSI Controller Base-level Alarms**

**UAS Logs/Faults available**

- 71681 (309) SS\_SURPRISE\_SLOT\_POWER\_OFF; Major. A surprise power off on a slot can be caused by a chassis hardware problem or by a software error. The problem may clear up after a reboot. Stop the applications and perform a reboot. If the problem does not clear up, then you may be able to workaround the problem by moving the card to another slot. Refer to the appropriate card maintenance and configuration procedures. The alarm clears when power is restored to the slot.
- 71682 (310) SS\_SURPRISE\_CARD\_EXTRACTION; Major. A card was improperly extracted from the specified slot. The applications will need to be restarted. Perform these actions: 1) stop the applications 2) reinsert the card 3) restart the applications. The alarm clears when the card is reinserted and the applications are restarted.
- 71683 (311) SS\_LOAD\_SCRIPT\_FAILURE Major SCSI\_Controller Firmware load script failure on card in slot %d.
- 71684 (312) SS\_SLOT\_VERIFY\_SCRIPT\_FAILURE Major SCSI\_Controller Verify script failure on card in slot %d.
- 71685 (313) SS\_GENERIC\_CARD\_ALARM Major SCSI\_Controller Problem with card in slot %d:

**Chassis Even Manager Alarms**

- 75783 (311) SS\_LOAD\_SCRIPT\_FAILURE Major SCSI\_Controller Firmware load script failure on card in slot %d.
- 75784 (312) SS\_SLOT\_VERIFY\_SCRIPT\_FAILURE Major SCSI\_Controller Verify script failure on card in slot %d.
- 75785 (313) SS\_GENERIC\_CARD\_ALARM Major SCSI\_Controller Problem with card in slot %d:

**Local Resource Manager Alarms**

- 81921 (350) LRM\_CPU\_C Critical, LocalResourceManager cpu\_overload\_critical, The CPU is overloaded, critical alarm.
- 81922 (351) LRM\_CPU\_M Major, LocalResourceManager cpu\_overload\_major, The CPU is overloaded major alarm.
- 81923 (352) LRM\_MEM\_C Critical, LocalResourceManager, mem\_usage\_high\_critical, Memory usage is high.
- 81924 (353) LRM\_MEM\_M Major, LocalResourceManager mem\_usage\_high\_major, Memory usage is high
- 81925 (354) LRM\_DISK\_C Critical, LocalResourceManager disk\_usage\_critical, Disk usage is high.
- 81926 (355) LRM\_DISK\_M Major, LocalResourceManager disk\_usage\_major, Disk usage is high but less severe than critical where space is exhausted.
- 81927 (356) LRM\_CONFIG\_FILE\_ERR Minor, LocalResourceManager, lrm\_config\_fileerror

**Program Manager Alarms**

- 83971 (357) c\_FAILED\_MALLOC Critical ProgramManager.
- 83974 (358) c\_BAD\_PARSE Critical ProgramManager.
- 83987 (359) c\_BAD\_FORK Critical ProgramManager.

**UAS Logs/Faults available**

83989 (360) c\_BAD\_EXEC Critical ProgramManager.  
 83998 (361) c\_CRIT\_DEATH Critical ProgramManager.  
 83999 (362) c\_MAX\_RETRIES Critical ProgramManager  
 84000 (363) c\_MAX\_RETRIES\_NO\_RESTART Minor ProgramManager.  
 84009 (364) c\_FIFO\_ERROR Critical ProgramManager.  
 84039 (365) c\_RSM\_FAILED\_CONNECT Critical ProgramManager.

**Clock Manager Alarms**

90113 (367) PRIMARY\_CLOCK\_DOWN\_ALARM Minor ClockManager Primary Clock Driver trunk %d on board %d is down.  
 90114 (368) SECONDARY\_CLOCK\_DOWN\_ALARM Minor ClockManager Secondary Clock Driver trunk %d on board %d is down.  
 90115 (369) BOTH\_CLOCK\_DOWN\_ALARM Critical ClockManager System has lost all external clocking.  
 90116 (370) PRIMARY\_BOARD\_CLOCK\_DOWN\_ALARM Minor ClockManager Board %d has lost its primary clock source.  
 90117 (371) SECONDARY\_BOARD\_CLOCK\_DOWN\_ALARM Minor ClockManager Board %d has lost its secondary clock source.  
 90118 (372) BOTH\_BOARD\_CLOCK\_DOWN\_ALARM Critical ClockManager Board %d has lost all external clocking.

**Event Server Alarms**

96257 (373) LOCAL\_SRVSOCK\_CREATION\_FAILED Critical EventServer [es\_alm\_001] %s.  
 96258 (374) REMOTE\_SRVSOCK\_CREATION\_FAILED Major, EventServer [es\_alarm\_002] %s.  
 96259 (375) SYSTEM\_RESOURCE\_ERR Critical, EventServer [es\_alm\_003].  
 96260 (376) CONFIG\_ERR EventServer [es\_alm\_004].  
 96261 (377) HAMODE\_CHECK\_FAILED Critical, EventServer [es\_alm\_005].  
 96262 (378) MATE\_EVTSVR\_CONN\_LOST Minor, EventServer [es\_alarm\_006].

**UAS Logs**

|          |        |                                                                                              |
|----------|--------|----------------------------------------------------------------------------------------------|
| ATM logs | ASL001 | General ATM log indicating an ATM interface card problem.                                    |
|          | ASL002 | The ATM service has initialized successfully.                                                |
|          | ASL003 | An ATM delete gateway request has failed.                                                    |
|          | ASL004 | An ATM delete gateway request has failed.                                                    |
|          | ASL005 | An ATM interface card port has failed to lock. The port has returned to its previous state.  |
|          | ASL006 | An ATM interface card port has failed to lock. The port cannot return to its previous state. |

**UAS Logs/Faults available**

|        |                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------|
| ASL007 | An ATM Virtual Channel has experienced an AIS alarm.                                                             |
| ASL008 | An ATM Virtual Channel has experienced an RDI alarm.                                                             |
| ASL009 | An ATM Virtual Channel cleared the AIS alarm.                                                                    |
| ASL010 | An ATM Virtual Channel cleared the RDI alarm.                                                                    |
| ASL013 | The ATM port is configured with the wrong UNI version.                                                           |
| ASL014 | ILMI failure on the ATM port.                                                                                    |
| ASL015 | UNI failure on the ATM port.                                                                                     |
| ASL016 | ILMI is now ready on the ATM port.                                                                               |
| ASL017 | UNI is now ready on the ATM port.                                                                                |
| ASL018 | Invalid ATM SDP parameter received.                                                                              |
| ASL019 | Invalid VCCI received in the incoming AAL2 SVC setup.                                                            |
| ASL020 | A specific ATM software error occurred as described in the log.                                                  |
| ASL021 | Failed to acquire a channel for the endpoint described in the log.                                               |
| ASL022 | An error was reported by the NMS PA200 API.                                                                      |
| ASL023 | ATM audit has started.                                                                                           |
| ASL024 | ATM audit has ended.                                                                                             |
| ASL025 | Audit has dropped a resource on the ATM board as described in the log.                                           |
| ASL026 | Audit has established a resource on the board as described in the log.                                           |
| ASL027 | Audit has found a missing resource on the board that can't be established. The resource is described in the log. |
| APL001 | The ATM interface port has initialized correctly.                                                                |

| UAS399 | Indicates a cleared alarm in a UAS device                                                                        |

**USP Logs/Faults**

For detailed information on logs, refer to NN10275-909, *Fault Management Log Reference*.

USP faults are available to the OSS via a third-party fault probe or fault collector. The fault probe/collector must reside somewhere on the OAM&P VLAN due to security rules for accessing the network elements.

USP logs are available on the USP PC Client GUI.

USP supports SSV format. For details on this format, refer to the Performance section of the FCAPS documentation on USP, NN10137-711.

# Operational measurements/performance measurements

Operating company personnel use operational measurements (OMs) and performance measurements (PMs) to obtain information on the performance and traffic load on a Succession Network. This data provides the information required for network planning and engineering.

## OMs/PMs collection and delivery

There are two major OM/PM interfaces used in SN08:

- For CS2K Core OMs, SDM functionality uses either OM Data Delivery (OMDD) or EADAS. The OMs are grouped into user-defined report elements, formatted into CSV (comma-separated value) format, and delivered to a customer OSS (operations support system). The OMDD application delivers OMs only for the MG 4000, IW-SPM, DPT-SPM, SPM, and XA-Core. For more complete details on the CS2K Core OMs, refer to NN10264-709, *Carrier Voice over IP Performance Management: Operational Measurements Reference*.
- The following CS2K Network Elements use the Integrated Element Management System (IEMS) single performance interface to OSS in Common Performance Record Format (CSV or XML): GWC, Storm, ERS8600 (formerly Passport 8600), MS, USP (raw format), MSS15000, MG9000, MCS, MAS, RTP Portal.

The Integrated EMS provides a centralized location for collecting, storing and forwarding performance data in a CS 2000 central office. Its performance collection sub-system provides some basic tools for viewing and graphing the collected performance attributes. In addition, it does provide interfaces to configure the generation of threshold alarms for the collected Operation Measurement data. For detailed information on the IEMS performance management features please refer to the Integrated EMS Performance Management document (NN10327-711). You may also refer to chapter one of this document, *IEMS Functionality*.

## Available OMs/ PMs

The OM/PM listings on the following pages are limited to the data accessible through OSS interfaces. These listings do not include those network elements

that employ their own graphical user interfaces for delivery/viewing of OM/PM data.

### CS 2000 Core OMs/PMs

The following table lists operational measurements (OMs) and performance measurements (PMs) **that are new or changed since SN04** and that are available from the Call Server 2000 Core network element. For a complete list of Core OMs/PMs available in Carrier Voice over IP, refer to NN10264-709, *Performance Management Operational Measurements Reference*.

CS 2000 Core supports CSV and EADAS formats through SDM functionality. For details on EADAS, refer to the Performance section of CS 2000 FCAPS documentation, NN10149-711.

|                        | SN07 adds the following: If the DPT Node is a GWC, then the associated DPT protocol (i.e., BICC or SIP-T) is added to the information. If the DPT Node is an SPM (i.e., either MG4K or DTP SPM), then the associated bearer network, DPT protocol and SPM node type is added to the information. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |               |
|                        | DPTGTAT                                                                                                                                                                                                                                                                                          | The number of attempts to get a DPT Terminal for a particular DPT node, pegged every time an attempt to get a DPT terminal is made within a given transfer period. For a typical SIPT call the number of pegs is in the range of 1 peg per DPT agent per call. For a typical BICC call the number of pegs is in the range of 1 to 3 pegs per DPT agent per call.                                                                                                                                        |               |
|                        | DPTGTAT2                                                                                                                                                                                                                                                                                         | Extension of DPTGTAT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |

|                        | G711MUCN  | Provides count for total number of G.711 MuLaw codec connections handled by a particular MG4K-IP/IW-IP node.                              |               |
|                        | G711ACN   | Provides count for total number of G.711 A-Law codec connections handled by a particular MG4K-IP/IW-IP node.                              |               |
|                        | TXG711PK  | Provides count for total number of RTP packets transmitted for G.711 connections handled by a particular MG4K-IP/IW-IP node.              |               |
|                        | TXG711PK2 | Extension of TXG711PK.                                                                                                                    |               |
|                        | RXG711PK  | Provides count for total number of RTP packets received for G.711 connections handled by a particular MG4K-IP/IW-IP node.                 |               |
|                        | RXG711PK  | Extension of RXG711PK.                                                                                                                    |               |
|                        | G729CN    | Provides count for total number of G.729 connections handled by a particular MG4K-IP/IW-IP node.                                          |               |
|                        | TXG729PK  | Provides count for total number of RTP packets transmitted for G.729 connections handled by a particular MG4K-IP/IW-IP node.              |               |
|                        | TXG729PK  | Extension of TXG729PK                                                                                                                     |               |
|                        | RXG729PK  | Provides count for total number of RTP packets received for G.729 connections handled by a particular MG4K-IP/IW-IP node.                 |               |
|                        | RXG729PK  | Extension of RXG729PK                                                                                                                     |               |
|                        | CCDCN     | Provides count for total number of 64K Clear Channel Data (CCD) Connections handled by a particular MG4K-IP/IW-IP node.                   |               |
|                        | TXCCDPK   | Provides count for total number of RTP packets transmitted for Clear Channel Data connections handled by a particular MG4K-IP/IW-IP node. |               |
|                        | RXCCDPK   | Provides count for total number of RTP packets received for Clear Channel Data connections handled by a particular MG4K-IP/IW-IP node.    |               |
|                        | VBDCN     | Provides count for total number of Voice Band Data (VBD) Connections handled by a particular MG4K-IP/IW-IP node.                          |               |
|                        | TXVBDPK   | Provides count for total number of packets transmitted for Voice Band Data connections handled by a particular MG4K-IP/IW-IP node.        |               |

|                        |                      | <p>The new SPMOVL group will have 18 OMs that give metrics on the SPM flow control system and the system overload control component. All OMs that apply to the system overload control component start with an 'S', all others apply to the flow control system. The actual peg counts and usage counts (accurate to one second) are accumulated on the peripheral and then uploaded to the OM group using the Spectrum OM Transfer System (SOTS).</p> |               |

## CS 2000 Core OMs/PMs

| OM Group<br>or PM name | Registers | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Applicability |
|------------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| <b>TDGTHRU</b>         |           | TOPS Datagram Throughput.<br>This OM group counts the number of UDP messages sent and received in each of several "buckets" or message size ranges. Each register in this group counts the number of messages in a specific size range that were sent by or received by a particular TOPS application, using a particular Ethernet interface. The group consists of 14 registers and 14 extension registers, counting message sizes ranging from <= 48 bytes up to > 368 bytes.                                                                                                                                                                                                                                                         | TOPS          |
| <b>TONES</b>           |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | CS2K Core     |
|                        | TONEATT   | Counts calls that the system routes to each tone generator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |
| <b>TRKQOS</b>          |           | records instances in which QOS threshold values have been exceeded for calls handled by a particular GWC-based TDM trunk group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | GWC           |
|                        | PKTLOSS   | Packet Loss. Counts the number of times that the packet loss threshold has been exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |               |
|                        | JITTER    | Jitter. Counts the number of times that the jitter threshold has been exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |               |
|                        | DELAY     | Delay (latency). Counts the number of times that the delay threshold has been exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |               |
| N/A                    | Existing  | As noted in the design document for 89007781 (PT-IP), the following data is reported by all gateways: packets sent; packets received; packet loss; octets sent; octets received; inter-arrival latency; jitter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | GWC           |
| (Checking)             |           | The OMs that feature 89008294 (UA-IP) will use already exist for the ATM solution, now extended to IP solutions. It includes the following OM counters: <ul style="list-style-type: none"> <li>• Intra total number of channel allocation requests</li> <li>• Intra total number of failed channel allocation requests</li> <li>• Intra total number of failed channel allocation requests</li> <li>• Inter maximum simultaneous number of channels in use</li> <li>• Inter total number of channel allocation requests</li> <li>• Inter total number of failed channel allocation requests</li> <li>• Intra total number of channel allocation requests</li> <li>• Intra total number of failed channel allocation requests</li> </ul> | GWC           |

| <b>XPMOVL</b> Collects statistics on XPM overload conditions. This is an existing OM group that functions the same as in TDM switches.  |           |                                                                                                                  |               |
| <b>XPMOCC</b> Collects statistics on CPU occupancy in the GWC. This is an existing OM group that functions the same as in TDM switches. |           |                                                                                                                  |               |

## Performance Management

The following section describes performance measurements collected and reported by the Integrated EMS for the various network elements. Pre-IEMS Performance interfaces for Network Elements, if integrated by the customer in SN07, are still supported in SN08, but are subject to the MD process that will be published for all FCAPS interfaces.

### Audio codes Media Servers (AMS) Performance Measurements

Performance Measurements for the AudioCodes media servers are available through the Integrated EMS, and also through an SNMP interface. The media server will provide performance measurements in the form of two types:

- **Gauges:** Gauges represent the current state of activities on the media server. Gauges unlike counters can decrease in value and like counters, can increase. The value of a gauge is the current value or a snapshot of the current activity on the media server at that moment.
- **Counters:** Counters always increase in value and are cumulative. Counters, unlike gauges, never decrease in value unless the server is reset and then the counters are zeroed.

The media server performance measurements will be provided by two AudioCodes MIBs (acPerfMediaGateway and acPerfMediaServices). The first mib is generic-type of PM mib. The second PM mib is media server specific.

The generic PM mib covers the control protocol, the RTP stream, and the system packets statistics. This AC PM enterprise mibs supports statistics which apply to the media server and other AC products like gateways.

### AudioCodes media servers PMs

The media server performance measurements will be provided by two AudioCodes MIBs (acPerfMediaGateway and acPerfMediaServices). The first mib is generic-type of PM mib. The second PM mib is media server

specific. The first table shows performance measurements related to control protocol, RTP stream, and system packet statistics mibs.

#### AMS Control Protocol, RTP, packet statistics PMs

| <b>Network Element: AMS</b>      |                                           |                                                                                                                                                                                                                                                                                                                                                                          |
| acPerfMediaGateway (new in SN08) | acPerfCpNumDupsForCompletedTransactions   | <b>Number of Duplicated Completed Transactions:</b><br>The number of times a duplicate transaction request was received after the initial transaction had already been completed. In this case, the gateway resends the response for this transaction.                                                                                                                   |
|                                  | acPerfCpNumDupsForOutstandingTransactions | <b>Number of Duplicated Transactions Outstanding:</b><br>The number of times a duplicate transaction request was received while the initial transaction was outstanding, that is, still in progress. In this case, the gateway ignores the duplicate request.                                                                                                            |
|                                  | acPerfCpMessageSendsSuccesses             | <b>Messages Send Successes:</b><br>Number of times there was a success in sending a call control (H.248) message. Call control messages are sent using the system's socket library. This counter tracks successes in using the local socket services. It does not track successes in end-to-end message transfer between the gateway and the call agent.                 |
|                                  | acPerfCpMessageSendsErrors                | <b>Message Send Errors:</b><br>Number of times there was a failure in sending a call control (H.248) message. The message is sent via a datagram using the system's socket library. Normally a failure on a socket send operation would be attributed to an internal system problem.                                                                                     |
|                                  | acPerfCpMessageReceiveSuccesses           | <b>Message Receive Successes:</b><br>Number of times there was a success in receiving a call control (H.248) message. Call control messages are received using the system's socket library. This counter tracks successes in using the local socket services. It does not track successes in end-to-end message transfer between the gateway and the call agent.         |
|                                  | acPerfCpMessageReceiveErrors              | <b>Message Receive Errors:</b><br>Number of times there was a failure in receiving a call control(H.248) message. Call control messages are received using the system's socket library. A failure on the socket receive operation can be attributed to an internal system problem or with the call agent sending a message larger than what is supported by the gateway. |
|                                  | acPerfCpProtocolSyntaxErrors              | <b>Protocol Syntax Errors:</b><br>Number of syntax errors detected in incoming call control (H.248) messages.                                                                                                                                                                                                                                                            |

|                     | acPerfSystemPacketEndpoints    | <b>System Packet Endpoints:</b><br>Number of endpoints reserved for all packet network-related functions (conferencing, plays, etc.). |

The second performance measurement mib is media server specific mib and contains statistics for these major categories:

- IVR – interactive voice response
- BCT – bearer channel tandeming
- CONF – Conferencing
- TT – Test Trunks

**CICM PMs**

CICM Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format. The CICM Performance reference NTP is NN10248-711.

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms. The CICM uses one MIB, nortelPerfRefMIB.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

### **Ethernet Routing Switch 8600 (formerly Passport 8600) PMs**

ERS8600 Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format.

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

For information on performance measurements (PMs) available for the Media Gateway 15000 (previously PVG) network element, refer to Appendix G in this document, *Ethernet Routing Switch 8600 Trap List*.

### **GWC Performance Measurements**

GWC Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format. The GWC uses 4 MIBs: GWC-UNIT-STATUS-MIB, GWC-DPT-SERVICES-PM-MIB, RFC1213-MIB, and HOST-RESOURCES-MIB (RFC2790).

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

For more detailed information, refer to NN10208-711, Gateway Controller Performance Management. The following table lists the GWC performance measurements.

### GWC Performance Measurements

| OIDs                                                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                         |

## IEMS Performance Measurements

The following table lists the performance measurements (PMs) collected by the Integrated Element Management System.

| Collection Attribute Name                 | Description                                                         |

### MCS, RTP Media Portal, and MAS Performance Measurements

For information on performance measurements (PMs) available for these network elements, refer to the following documents:

- NN10384-700, *MCS 5200 Performance Management*
- NN10367-111, *CVoIP RTP Media Portal Basics*
- NN10303-111, *MAS Meetme Basics*

### MG 9000 Performance Measurements

MG9K Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format.

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

For more information on MG9000 PMs, refer to NN10140-711, *MG 9000 Performance Management* and Appendix B of this document, *MG 9000 MIB*

*OMs/PMs*. That appendix, together with the following table, list the MG 9000 performance measurements.

### MG 9000 Performance Measurements

## Media Gateway 15000 OMs/PMs and Passport 15000/Multiservice Switch OMs/PMs

**Note:** For SN08, the terms Packet Voice Gateway (PVG) and Passport 15000 have been rebranded as part of Nortel Networks' brand simplified naming format. The PVG is now referred to as Nortel Networks Media Gateway 15000. The Passport 15000 is now referred to as the Nortel Networks Multiservice Switch 15000.

Performance measurements for MSS 7400, 15000, 20000 are available only from the MDM directly. For details on Media Gateway 15000 and Multiservice Switch 15000 performance measurements, refer to NTP NN10158-711, *MSS 15000, MG 15000 & MDM Performance*.

In SN08, the 5- and 30-minute performance measurements (PMs) now provide Internet protocol (IP) statistics. The IP statistics are available at a physical interface level. You can use IP statistics for operational monitoring and for network planning and engineering. Also, you can obtain performance information from IP statistics, such as link bandwidth utilization, voice call volumes, and error conditions. These are key for monitoring the network using PMs. Within the Multiservice Switch, performance measurements (PMs) are referred to as network traffic management (NTM) statistics.

IP interface statistics apply to all physical interfaces on Nortel Networks Multiservice Switch 15000 nodes that process layer 3 IP. This includes ports on the Ethernet-based Gigabit Ethernet (GE) function processors (FPs), the control processor (CP) operations, administration, and maintenance (OAM) Ethernet port, and the asynchronous transfer mode (ATM)-based OC-3, OC-12 and DS3 ports. PMs for these nodes now include an expanded range of values.

### Statistics collection and data flow

The data collection system (DCS) on the node collects NTM statistics from the control and function processors, and ATM and IP interfaces, at 5-minute intervals. To collect the statistics, the DCS uses a real-time statistics stream (rtstats). Each node forwards these records to Nortel Networks Multiservice Data Manager (MDM) servers.

On Nortel Networks Multiservice Data Manager (MDM) servers, the Performance Measurements Stream Processor (PMSP) server application manages performance. NTM statistics originating from node processors flow to the PMSP server application. The PMSP server application converts the statistics into ASCII comma separated value (CSV) formatted 5-minute records. It also creates 30-minute data records by aggregating six 5-minute data records. These are referred to as 5-minute and 30-minute performance measurements (PMs).

The MDM servers transfer the NTM data directly to the OSS applications, or to the CS2000 Core Manager running on the SDM, depending on the network configuration.

### Accessing files through the SDM or MDM

**Note:** Access via SDM is not generally available for Media Gateway 15000 (previously PVG) performance measurements.

NTM statistics data can be configured to be obtained from the SuperNode Data Manager (SDM). The PM file follows the file naming conventions of the Operational Measurement Delivery (OMD) application. The format of the file name is:

`<name>.<date>.<time>.PP.<type>.CSV`

The collected NTM statistics files are stored in the /omdata/closedNotSent directory. They are now available to the OSS application. The OSS application retrieves the files and moves them to the /omdata/closedSent directory. Upon the transfer of the files, the OMD automatically sets the retention period for the files. The retention period for a file can be configured using the OMUI. It can range from one to fourteen days.

When NTM statistics data is configured to be obtained from Nortel Networks Multiservice Data Manager (MDM) servers, the name of the file is similar to that used by SDM. However, the Host Group Directory Server (HGDS) group name or shelf name indicating the source of the NTM statistics data replaces the “PP” string found after the time stamp in the SDM file name. The format for the file name appears below.

`<name>.<date>.<time>.<HGDS group or shelf name>.<type>.CSV`

### PMs for Media Gateway 15000

Performance measurements for MSS 7400, 15000, 20000 are available only from the MDM directly. For details on Media Gateway 15000 and Multiservice Switch 15000 performance measurements, refer to NTP NN10158-711, *MSS 15000, MG 15000 & MDM Performance*

### MS 2000 Series Node OMs/PMs

MS 2000 Series Node Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format.

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

Refer to NN10300-100, *IP Solutions Basics*.

### **NGSS-Trunks OMs/PMs**

NGSS-Trunks Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format.

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

For details, refer to NN10342-711, *Session Server Performance Management*.

### **SAM21 OMs/PMs**

The SAM21 EM has no operational or performance measurements for IP solutions.

### **Session Server Manager OMs/PMs**

Refer to NN10342-711, *Session Server Manager Performance Management*.

## SSPFS OMs/PMs

SPFS is the base OAM&P Server application. The following servers use SPFS on N240s: CBM, CMT, IEMS, MG9KEM. SSPFS Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format. The SSPFS Performance reference NTP is NN10150-711.

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

The SPFS uses 2 MIBs (RFC1213 and SUN-SNMP). Each MIB will contain the following layout including the MIB name, MIB table, Entry Name, and PM-ID Name, Syntax, and description.

## STORM OMs/PMs

STORM Performance Measurement data files are stored in predetermined paths on the IEMS server. For SN08+, IEMS polls (via SNMP) the PM data and converts the data into XML or CSV format. Refer to NN10054-711, *STORM Performance Management* for more details

MIB input data files are found at: /opt/nortel/iems/current/mibs. The OM CSV output data files are in: /data/oms.

The /data/oms directory will contain 7 sub-directories (named 1-7). Each of these sub-directories contains a day's collection of CSV output files. The current day's output file are always written in subdirectory '1'. File rotation occurs just prior to midnight every 24 hour period. When rotation occurs, sub-directory '7' contents are removed and then sub-directories 1-6 are moved up a directory.

STORM uses two MIBs: RFC1213-MIB, and HOST-RESOURCES-MIB (RFC2790).

## UAS OMs/PMs

The following table lists the operational measurements (OMs) and performance measurements (PMs) available for the UAS network element. UAS supports XML and CSV format. For details, refer to NN10139-001, *UAS Performance*.

| OM group or PM name                     | Description                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Network Element: UAS</b>             |                                                                                                                                                                                                                                                                                                                                                               |
| CRC Count                               | A Minor alarm is raised when the CRC error count threshold is exceeded.                                                                                                                                                                                                                                                                                       |
| Plane Msg Count                         | A Minor alarm is raised when the plane message count threshold is exceeded.                                                                                                                                                                                                                                                                                   |
| norUasProtocolSyntaxErrors              | Number of syntax errors detected in incoming call control (MGCP, H.248) messages.                                                                                                                                                                                                                                                                             |
| norUasProtocolMessageValidationErrors   | Number of times an incoming call control (MGCP, H.248) message had valid syntax, but failed validation                                                                                                                                                                                                                                                        |
| norUasUdpSendErrors                     | Number of times there was a failure in sending a call control (MGCP, H.248) message. The message is sent via a datagram using the system's socket library. Normally a failure on a socket send operation would be attributed to an internal system problem.                                                                                                   |
| norUasUdpReceiveErrors                  | Number of times there was a failure in receiving a call control (MGCP, H.248) message. Call control messages are received using the system's socket library. A failure on the socket receive operation can be attributed to an internal system problem or with the call agent sending a message larger than what is supported by the gateway.                 |
| norUasMgcpMessageRetransmissions        | Number of retransmissions of media gateway control protocol messages. Media gateway control protocol is used in here in a generic sense to include both MGCP and H.248                                                                                                                                                                                        |
| norUasMgcpMessageRetransmissionFailures | Number of times a retransmitted media gateway control protocol message was not acknowledged. Media gateway control protocol is used in here in a generic sense to include both MGCP and H.248.                                                                                                                                                                |
| norUasAudioSegmentPlayed                | Number of successful attempts to play audio. For the current number of play attempts, see norUasCurrentNumberOfPlays.                                                                                                                                                                                                                                         |
| norUasAudioSegmentFailed                | <p>Number of failed attempts to play audio. Failures can occur for the following reasons:</p> <ul style="list-style-type: none"> <li>- call agent sent a bad audio segment id</li> <li>- the audio segment is not provisioned</li> <li>- there was an internal program error</li> </ul> <p>Examine the logs to determine the exact nature of the failure.</p> |

| OM group or PM name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| norUasAckfail                           | Number of negative acknowledgements (nacks) received. Nacks can be sent by the call agent in response to RSIP or NTFY messages.                                                                                                                                                                                                                                                                                  |
| norUasTimeout                           | Number of times the call engine timed out waiting for an acknowledgement.                                                                                                                                                                                                                                                                                                                                        |
| norUasProterror                         | Number of call control protocol errors detected. Typical reasons for these errors are: <ul style="list-style-type: none"> <li>- duplicate parameter</li> <li>- invalid range of parameter</li> <li>- mandatory parameter missing</li> </ul> Examine the logs to determine the exact nature of the failure.                                                                                                       |
| norUasRestart                           | Number of abnormal restarts of one of two critical threads in the call processing process. The two threads are the event state machine thread and the maintenance state machine thread. Examine the logs to determine which thread failed.                                                                                                                                                                       |
| norUasComperror                         | The number of times the call engine failed to build a response to a call agent message. Examine the logs to determine the exact nature of the failure.                                                                                                                                                                                                                                                           |
| norUasConndeleted                       | Number of times that the call engine receives a bad connection id from the call agent. This is normally a result of the call agent sending a message for a connection that has already been deleted.                                                                                                                                                                                                             |
| norUasCallControlMessageSendFailures    | Number of times the call control message maximum retransmission count was exceeded. The UAS attempted several times to send a message to the call agent, but each time, an ack was not received. A failure of this type results in a failed call and is usually an indication that subsequent calls will fail. This problem is typically a result of the call agent being down or a result of a network problem. |
| norUasEndpointsInUse                    | Number of endpoints that the call engine is currently using for all packet network-related functions (conferencing, plays, etc.).                                                                                                                                                                                                                                                                                |
| norUasNumDupsForCompletedTransactions   | The number of times a duplicate transaction request was received after the initial transaction had already been completed. In this case, the gateway resends the response for this transaction.                                                                                                                                                                                                                  |
| norUasNumDupsForOutstandingTransactions | The number of times a duplicate transaction request was received while the initial transaction was outstanding, that is, still in progress. In this case, the gateway ignores the duplicate request.                                                                                                                                                                                                             |
| norUasConfTotal                         | The total number of conferences processed since the last application restart.                                                                                                                                                                                                                                                                                                                                    |

| OM group or PM name                | Description                                                                                                        |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| norUasConfLackOfResourceRejections | The number of times a conference request was rejected due to lack of resources since the last application restart. |
| norUasConfPlays                    | The total number of plays made into conferences since the last application restart.                                |
| norUasRequestsFailed               | The number of resource requests for endpoints on this pool that failed.                                            |
| norUasNumberOfPlayRecords          | The total number of play record operations.                                                                        |
| norUasNumberOfPlayRecordErrors     | The total number of failed play record operations.                                                                 |

## USP OMs/PMs

### See Appendix D

Refer to Appendix D for a complete list of the operational measurements (OMs) and performance measurements (PMs) available for the USP network element. You may also refer to NN10137-711, *USP Performance Management* and NN1038-711, *USP-Compact Performance Management*.

USP supports SSV format. For details on this format, refer to the Performance section of the FCAPS documentation on USP, NN10137-711.

## Appendix A: Passport 8600 Performance Metrics

| <u>Performance Metric Identifier</u> | <u>MIB Name</u> | <u>Description</u>                                                                                                                                                                                                                                                                                                                                                                                                                              | <u>Default Succession<br/>IEMS Collection<br/>Interval</u> |

| <b>RFC1213-MIB</b>                   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                            |
| sysDescr                             | RFC1213-MIB     | A textual description of the entity. This value should include the full name and version identification of the system's hardware type, software operating-system, and networking software. It is mandatory that this only contain printable ASCII characters.                                                                                                                                                                                   | Every 30 mins                                              |
| sysObjectID                          | RFC1213-MIB     | The vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining 'what kind of box' is being managed. For example, if vendor 'Flintstones, Inc.' was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its 'Fred Router'. | Every 30 mins                                              |
| sysUpTime                            | RFC1213-MIB     | The time (in hundredths of a second) since the network management portion of the system was last re-initialized.                                                                                                                                                                                                                                                                                                                                | Every 30 mins                                              |
| sysName                              | RFC1213-MIB     | An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name.                                                                                                                                                                                                                                                                                                                         | Every 30 mins                                              |
| sysLocation                          | RFC1213-MIB     | The physical location of this node (e.g., 'telephone closet, 3rd floor').                                                                                                                                                                                                                                                                                                                                                                       | Every 30 mins                                              |
| ifInOctets                           | RFC1213-MIB     | The total number of octets received on the interface, including framing characters.                                                                                                                                                                                                                                                                                                                                                             | Every 5 and 30 mins                                        |
| ifInDiscards                         | RFC1213-MIB     | The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.                                                                                                                                                                                       | Every 30 mins                                              |
| ifInErrors                           | RFC1213-MIB     | The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.                                                                                                                                                                                                                                                                                                                          | Every 30 mins                                              |
| ifOutOctets                          | RFC1213-MIB     | The total number of octets transmitted out of the interface, including framing characters.                                                                                                                                                                                                                                                                                                                                                      | Every 5 and 30 mins                                        |
| ifOutDiscards                        | RFC1213-MIB     | The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.                                                                                                                                                                                                                 | Every 30 mins                                              |
| ifOutErrors                          | RFC1213-MIB     | The number of outbound packets that could not be transmitted because of errors.                                                                                                                                                                                                                                                                                                                                                                 | Every 30 mins                                              |
| ipInReceives                         | RFC1213-MIB     | The total number of input datagrams received from interfaces, including those received in error.                                                                                                                                                                                                                                                                                                                                                | Every 5 and 30 mins                                        |
| ipInDiscards                         | RFC1213-MIB     | The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.                                                                                                                                                                           | Every 30 mins                                              |
| ipOutRequests                        | RFC1213-MIB     | The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.                                                                                                                                                                                                                                  | Every 5 and 30 mins                                        |
| ipOutDiscards                        | RFC1213-MIB     | The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.                                                                                                                 | Every 30 mins                                              |
| <b>RFC1271-MIB</b>                   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                            |
| etherStatsCRCAlignErrors             | RFC1271-MIB     | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but were not an integral number of octets in length or had a bad Frame Check Sequence (FCS).                                                                                                                                                                                                | Every 30 mins                                              |

| rcSysBufferUtil                      | RAPID-CITY             | Buffer utilization as a percentage of the total amount of buffer space in the system. A high value indicates congestion.                                                | Every 30 mins                             |
| rcSysBufferUtilPeak                  | RAPID-CITY             | The largest buffer utilization since sysUpTime.                                                                                                                         | Every 30 mins                             |
| rcSysBufferUtilPeakTime              | RAPID-CITY             | Timestamp for rcSysPeakBandwidth.                                                                                                                                       | Every 30 mins                             |
| rcSysNVRamUsed                       | RAPID-CITY             | Non-volatile RAM in use in Kbytes.                                                                                                                                      | Every 30 mins                             |
| rcSysCpuUtil                         | RAPID-CITY             | Percentage of CPU utilization.                                                                                                                                          | Every 30 mins                             |
| rcSysSwitchFabricUtil                | RAPID-CITY             | Percentage of Switching Fabric utilization.                                                                                                                             | Every 30 mins                             |
| rcStatFrameTooShorts                 | RAPID-CITY             | The total number of frames that are too short that were encountered on this interface.                                                                                  | Every 30 mins                             |
| rcStatBridgeInDiscards               | RAPID-CITY             | The total number of frames that were discarded by the bridging entity.                                                                                                  | Every 30 mins                             |
| rcStatRouteInDiscards                | RAPID-CITY             | The total number of frames that were discarded by the routing entity.                                                                                                   | Every 30 mins                             |
| rcStatStgForwardTransitions          | RAPID-CITY             | The number of times this port has transitioned from the Learning state to the Forwarding state.                                                                         | Every 30 mins                             |
| rcStatGigLinkFailures                | RAPID-CITY             | The total number of link failures encountered on this interface.                                                                                                        | Every 30 mins                             |
| rcStatGigPacketErrors                | RAPID-CITY             | The total number of packet errors encountered on this interface.                                                                                                        | Every 30 mins                             |
| rcStatGigCarrierErrors               | RAPID-CITY             | The total number of carrier errors encountered on this interface.                                                                                                       | Every 30 mins                             |
| rcStatGigLinkInactiveErrors          | RAPID-CITY             | The total number of link inactive errors encountered on this interface.                                                                                                 | Every 30 mins                             |
| rcStatSmltStDownCnt                  | RAPID-CITY             | Counters that counts how the session between the two peering switches has done down since last boot.                                                                    | Every 30 mins                             |
| rcStatSmltSmltDownTxMsgCnt           | RAPID-CITY             | Counters that counts the tx Smlt Down msg.                                                                                                                              | Every 30 mins                             |
| rcStatSmltSmltDownRxMsgCnt           | RAPID-CITY             | Counters that counts the rx Smlt Down msg.                                                                                                                              | Every 30 mins                             |
| rcStatSmltSmltUpTxMsgCnt             | RAPID-CITY             | Counters that counts the tx Smlt Up msg.                                                                                                                                | Every 30 mins                             |
| rcStatSmltSmltUpRxMsgCnt             | RAPID-CITY             | Counters that counts the rx Smlt Up msg.                                                                                                                                | Every 30 mins                             |
| rc2kAtmPortStatsInDroppedPkts        | RAPID-CITY             | Number of AAL5 CPCS PDUs dropped due to resource exhaustion.                                                                                                            | Every 30 mins                             |
| rc2kAtmPortStatsOutDroppedPkts       | RAPID-CITY             | Number of AAL5 CPCS PDUs dropped because the transmitter closed the channel.                                                                                            | Every 30 mins                             |
| rc2kAtmVPortStatsInOctets            | RAPID-CITY             | AAL5 CPCS PDU octets received from ATM interface                                                                                                                        | Every 5 and 30 mins                       |
| rc2kAtmVPortStatsOutOctets           | RAPID-CITY             | AAL5 CPCS PDU octets transmitted out of ATM interface                                                                                                                   | Every 5 and 30 mins                       |
| rc2kAtmVPortStatsInErrors            | RAPID-CITY             | AAL5 CPCS PDUs received with errors from ATM interface. These errors include CRC-32 errors,SAR time-out errors and oversized SDU errors.                                | Every 30 mins                             |
| rc2kAtmVPortStatsOutErrors           | RAPID-CITY             | Number of AAL5 CPCS PDUs that couldn't be transmitted due to errors.                                                                                                    | Every 30 mins                             |
| rc2kAtmVPortStatsInDiscards          | RAPID-CITY             | Number of received AAL5 CPCS PDUs discarded.                                                                                                                            | Every 30 mins                             |
| rc2kAtmVPortStatsOutDiscards         | RAPID-CITY             | Number of AAL5 CPCS PDUs which are to be transmitted but discarded.                                                                                                     | Every 30 mins                             |
| rcStgPortForwardTransitions          | RAPID-CITY             | The number of times this port has transitioned from the Learning state to the Forwarding state.                                                                         | Every 30 mins                             |

## Appendix B: MG 9000 MIB OMs/PMs

| OM Name                                     | Description                                                                               | MIB Table Name                       | MIB Name                | For OSS |
|---------------------------------------------|-------------------------------------------------------------------------------------------|--------------------------------------|-------------------------|---------|
| <b>NORTEL-UEMG-NODE-MIB</b>                 |                                                                                           |                                      |                         |         |

| snmplnBadCommunityNames        | The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is to authenticate community-based SNMP messages specify the precise conditions that contribute to this value. |                                 | SNMPv2-MIB                | Yes |
| snmplnPkts                     | The total number of messages delivered to the SNMP entity from the transport service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                 | SNMPv2-MIB                | Yes |
| <b>NORTEL-UEMG-CLKSYNC-MIB</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                 |                           |     |
| <b>NnClkSyncRefTable</b>       | This table provides status information for each of the sync reference inputs associated with the ITP card. There are six references per ITP card, two ITP cards on each shelf.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                 |                           |     |
| nnClkSyncRefId                 | Reference Identification... Identifies the six possible clock synchronization references on the ITP card. This field along with entPhysicalIndex defines a unique row in the nnClkSyncRefTable.<br><br>itx0 (1), -- reference coming from the left ITX (ITX 0)<br>itx1 (2), -- reference coming from the right ITX (ITX 1)<br>dcc0 (3), -- reference coming from the left DCC (DCC-0)<br>dcc1 (4), -- reference coming from the right DCC (DCC-1)<br>host0 (5), -- reference cabled into the ITP ATM25 phy0<br>host1 (6) -- reference cabled into the ITP ATM25 phy1 "                                                                       | NnClkSyncRefTable               | NORTEL-UEMG-CLKSYNC-MIB   | Yes |

| apsChanSignalDegrades        | A count of Signal Degrade conditions. This condition occurs when the line Bit Error Rate exceeds the currently configured threshold.                                                                                                                                                                                                   | apsChanStatusTable           | APS-MIB   | Yes |
| apsChanSignalFailures        | A count of Signal Failure conditions that have been detected on the incoming signal. This condition occurs when a loss of signal, loss of frame, AIS-L or a Line bit error rate exceeding $10^{-3}$ is detected on an incoming line.                                                                                                   | apsChanStatusTable           | APS-MIB   | Yes |
| apsChanSwitchovers           | The number of times this channel has switched to the protection line. When queried with index value apsChanNumber set to 0, which is the protection line, this object will return 0.                                                                                                                                                   | apsChanStatusTable           | APS-MIB   | Yes |
| <b>ATM-MIB</b>               |                                                                                                                                                                                                                                                                                                                                        |                              |           |     |
| <b>atmInterfaceTCTable</b>   |                                                                                                                                                                                                                                                                                                                                        |                              |           |     |
| atmInterfaceOCDEvents        | The number of times the Out of Cell Delineation (OCD) events occur. If seven consecutive ATM cells have Header Error Control (HEC) violations, an OCD event occurs. A high number of OCD events may indicate a problem with the TC Sublayer.                                                                                           | atmInterfaceTCTable          | ATM-MIB   | No  |

| atmSigDetectClgPtyEvents  | Number of Calling Party Events detected on this interface.                                                                                                                                                                                                                                                                                               | atmSigStatTable   | ATM2-MIB     | No |
| atmSigEmitClgPtyEvents    | Number of Calling Party Events transmitted from this interface.                                                                                                                                                                                                                                                                                          | atmSigStatTable   | ATM2-MIB     | No |
| atmSigDetectTimerExpires  | Number of Timer Expiries detected on this interface.                                                                                                                                                                                                                                                                                                     | atmSigStatTable   | ATM2-MIB     | No |
| atmSigEmitTimerExpires    | Number of Timer Expiries transmitted from this interface.                                                                                                                                                                                                                                                                                                | atmSigStatTable   | ATM2-MIB     | No |
| atmSigDetectRestarts      | Number of Restart Activity errors detected on this interface.                                                                                                                                                                                                                                                                                            | atmSigStatTable   | ATM2-MIB     | No |
| atmSigEmitRestarts        | Number of Restart Activity errors transmitted from this interface.                                                                                                                                                                                                                                                                                       | atmSigStatTable   | ATM2-MIB     | No |
| atmSigInEstabls           | Number of SVC VCCs established at this signaling entity for incoming connections.                                                                                                                                                                                                                                                                        | atmSigStatTable   | ATM2-MIB     | No |
| atmSigOutEstabls          | Number of SVC VCCs established at this signaling entity for outgoing connections.                                                                                                                                                                                                                                                                        | atmSigStatTable   | ATM2-MIB     | No |
| <b>ATMF-CES-MIB</b>       |                                                                                                                                                                                                                                                                                                                                                          |                   |              |    |
| <b>atmfCESStatsTable</b>  |                                                                                                                                                                                                                                                                                                                                                          |                   |              |    |
| atmfCESHdrErrors          | The count of the number of AAL1 header errors detected, including those corrected. Header errors include correctable and uncorrectable CRC, plus bad parity.                                                                                                                                                                                             | atmfCESStatsTable | ATMF-CES-MIB | No |
| atmfCESPointerReframes    | This records the count of the number of events in which the AAL1 reassembler found that an SDT pointer is not where it is expected, and the pointer must be reacquired. This count is only meaningful for structured CES modes, as unstructured CES modes do not use pointers. For unstructured CES modes, this count, if present, should indicate zero. | atmfCESStatsTable | ATMF-CES-MIB | No |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                        |                       |                     |    |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|---------------------|----|
| atmfCESPointerParityErrors   | This records the count of the number of events in which the AAL1 reassembler detects a parity check failure at the point where a structured data pointer is expected. This count is only meaningful for structured CES modes, as unstructured CES modes do not use pointers. For unstructured CES modes, this count, if present, should indicate zero.                                                                 | atmfCESStatsTable     | ATMF-CES-MIB        | No |
| atmfCESLostCells             | Number of lost cells, as detected by the AAL1 sequence number processing, for example. This records the count of the number of cells detected as lost in the network prior to the destination CES IWF AAL1 layer processing.                                                                                                                                                                                           | atmfCESStatsTable     | ATMF-CES-MIB        | No |
| atmfCESMisinsertedCells      | Number of AAL1 sequence violations which the AAL Convergence sublayer interprets as a misinserted cell, as defined by ITU-T I.363.1.                                                                                                                                                                                                                                                                                   | atmfCESStatsTable     | ATMF-CES-MIB        | No |
| atmfCESBufUnderflows         | Number of buffer underflows. This records the count of the number of times the CES reassembly buffer underflows. In the case of a continuous underflow caused by a loss of ATM cell flow, a single buffer underflow should be counted. If the CES IWF is implemented with multiple buffers (such as a cell level buffer and a bit level buffer), then either buffer underflow will cause this count to be incremented. | atmfCESStatsTable     | ATMF-CES-MIB        | No |
| atmfCESBufOverflows          | Number of buffer overflows. This records the count of the number of times the CES reassembly buffer overflows. If the CES IWF is implemented with multiple buffers (such as a cell level buffer and a bit level buffer), then either buffer overflow will cause this count to be incremented.                                                                                                                          | atmfCESStatsTable     | ATMF-CES-MIB        | No |
| <b>NORTEL-UEMG-ATM-MIB</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                        |                       |                     |    |
| <b>nnAtmStatsIfDataTable</b> |                                                                                                                                                                                                                                                                                                                                                                                                                        |                       |                     |    |
| nnAtmStatsIfInOctets         | Total octets received on this interface                                                                                                                                                                                                                                                                                                                                                                                | nnAtmStatsIfDataTable | NORTEL-UEMG-ATM-MIB | No |

| imaGroupIntervalUnavailSecs    | Count of one second intervals where the IMA Group Traffic State Machine is Down in one of the previous 96, individual 15 minute, intervals                                                                                                                  | imaGroupIntervalTable | IMA-MIB | Yes |
| imaGroupIntervalNeNumFailures  | The number of times a near-end group failure (Config-Aborted, Insufficient-Links) has been reported in one of the previous 96, individual 15 minute, intervals                                                                                              | imaGroupIntervalTable | IMA-MIB | Yes |
| imaGroupIntervalFeNumFailures  | The number of times a far-end group failure (Config-Aborted-FE, Insufficient-Links-FE, Blocked-FE) has been reported in one of the previous 96, individual 15 minute, intervals. This is an optional attribute                                              | imaGroupIntervalTable | IMA-MIB | No  |
| <b>imaGroupTotalTable</b>      |                                                                                                                                                                                                                                                             |                       |         |     |
| imaGroupTotalUnavailSecs       | Count of one second intervals where the IMA Group Traffic State Machine is Down in the previous 24 hour interval. Invalid 15 minute intervals count as 0.                                                                                                   | imaGroupTotalTable    | IMA-MIB | No  |
| imaGroupTotalNeNumFailures     | The number of times a near-end group failure (Config-Aborted, Insufficient-Links) has been reported in the previous 24 hour. interval. Invalid 15 minute intervals count as 0.                                                                              | imaGroupTotalTable    | IMA-MIB | No  |
| imaGroupTotalFeNumFailures     | The number of times a far-end group failure (Config-Aborted-FE, Insufficient-Links-FE, Blocked-FE) has been reported in the previous 24 hour interval. Invalid 15 minute intervals count as 0. This is an optional attribute.                               | imaGroupTotalTable    | IMA-MIB | No  |
| <b>imaLinkCurrentTable</b>     |                                                                                                                                                                                                                                                             |                       |         |     |
| imaLinkCurrentImaViolations    | ICP violations: count of errored, invalid or missing ICP cells, except during SES-IMA or UAS-IMA conditions, in the current 15 minute interval                                                                                                              | imaLinkCurrentTable   | IMA-MIB | No  |
| imaLinkCurrentOifAnomalies     | The number of OIF anomalies, except during SES-IMA or UAS-IMA conditions, at the near-end in the current 15 minute interval. This is an optional attribute                                                                                                  | imaLinkCurrentTable   | IMA-MIB | No  |
| imaLinkCurrentNeSevErroredSecs | Count of one second intervals containing $\geq 30\%$ of the ICP cells counted as IV-IMAs, or one or more link defects (e. g., LOS, OOF/ LOF, AIS, or LCD), LIF defects, or LODS defects, except during UAS-IMA condition, in the current 15 minute interval | imaLinkCurrentTable   | IMA-MIB | No  |
| imaLinkCurrentFeSevErroredSecs | Count of one second intervals containing one or more RDI-IMA defects, except during UAS-IMA-FE condition, in the current 15 minute interval                                                                                                                 | imaLinkCurrentTable   | IMA-MIB | No  |
| imaLinkCurrentNeUnavailSecs    | Count of unavailable seconds at near-end in the current 15 minute interval: unavailability begins at the onset of 10 contiguous SES-IMA and ends at the onset of 10 contiguous seconds with no SES-IMA                                                      | imaLinkCurrentTable   | IMA-MIB | No  |

|                                |                                                                                                                                                                                                                                 |                      |         |     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------|-----|
| imaLinkCurrentFeUnavailSecs    | Count of unavailable seconds at far-end in the current 15 minute interval: unavailability begins at the onset of 10 contiguous SES-IMA-FE and ends at the onset of 10 contiguous seconds with no SES-IMA-FE                     | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentNeTxUnusableSecs | Tx Unusable seconds: count of Unusable seconds at the near-end Tx LSM in the current 15 minute interval                                                                                                                         | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentNeRxUnusableSecs | Rx Unusable seconds: count of Unusable seconds at the near-end Rx LSM in the current 15 minute interval                                                                                                                         | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentFeTxUnusableSecs | Tx Unusable seconds at far-end: count of seconds with Tx Unusable indications from the far-end Tx LSM in the current 15 minute interval                                                                                         | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentFeRxUnusableSecs | Rx Unusable seconds at far-end: count of seconds with Rx Unusable indications from the far-end Rx LSM in the current 15 minute interval                                                                                         | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentNeTxNumFailures  | The number of times a near-end transmit failure alarm condition has been entered on this link (i.e., some form of implementation specific transmit fault) in the current 15 minute interval                                     | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentNeRxNumFailures  | The number of times a near-end receive failure alarm condition has been entered on this link (i.e., LIF, LODS, RFI-IMA, Mis-Connected, or some form of implementation specific receive fault) in the current 15 minute interval | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentFeTxNumFailures  | The number of times a far-end transmit failure alarm condition has been entered on this link (i.e., Tx-Unusable-FE) in the current 15 minute interval. This is an optional attribute                                            | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentFeRxNumFailures  | The number of times a far-end receive failure alarm condition has been entered on this link (i.e., Rx-Unusable-FE) in the current 15 minute interval. This is an optional attribute                                             | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentTxStuffs         | Count of stuff events inserted in the transmit direction in the current 15 minute interval. This is an optional attribute                                                                                                       | imaLinkCurrentTable  | IMA-MIB | No  |
| imaLinkCurrentRxStuffs         | Count of stuff events detected in the receive direction in the current 15 minute interval. This is an optional attribute                                                                                                        | imaLinkCurrentTable  | IMA-MIB | No  |
| <b>imaLinkIntervalTable</b>    |                                                                                                                                                                                                                                 |                      |         |     |
| imaLinkIntervalImaViolations   | ICP violations: count of errored, invalid or missing ICP cells, except during SES-IMA or UAS-IMA conditions, in one of the previous 96, individual 15 minute, intervals                                                         | imaLinkIntervalTable | IMA-MIB | Yes |
| imaLinkIntervalOifAnomalies    | The number of OIF anomalies, except during SES-IMA or UAS-IMA conditions, at the near-end in one of the previous 96, individual 15 minute, intervals. This is an optional attribute                                             | imaLinkIntervalTable | IMA-MIB | Yes |

| imaLinkIntervalFeTxUnusableSecs | Tx Unusable seconds at far-end: count of seconds with Tx Unusable indications from the far-end Tx LSM in one of the previous 96, individual 15 minute, intervals                                                                                                                     | imaLinkIntervalTable | IMA-MIB | No  |
| imaLinkIntervalFeRxUnusableSecs | Rx Unusable seconds at far-end: count of seconds with Rx Unusable indications from the far-end Rx LSM in one of the previous 96, individual 15 minute, intervals.                                                                                                                    | imaLinkIntervalTable | IMA-MIB | No  |
| imaLinkIntervalNeTxNumFailures  | The number of times a near-end transmit failure alarm condition has been entered on this link (i.e., some form of implementation specific transmit fault) in one of the previous 96, individual 15 minute, intervals                                                                 | imaLinkIntervalTable | IMA-MIB | Yes |
| imaLinkIntervalNeRxNumFailures  | The number of times a near-end receive failure alarm condition has been entered on this link (i.e., LIF, LODS, RFI-IMA, Mis-Connected, or some form of implementation specific receive fault) in one of the previous 96, individual 15 minute, intervals                             | imaLinkIntervalTable | IMA-MIB | Yes |
| imaLinkIntervalFeTxNumFailures  | The number of times a far-end transmit failure alarm condition has been entered on this link (i.e., Tx-Unusable-FE) in one of the previous 96, individual 15 minute, intervals. This is an optional attribute                                                                        | imaLinkIntervalTable | IMA-MIB | No  |

|                                |                                                                                                                                                                                                                                                       |                      |         |     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------|-----|
| imaLinkIntervalFeRxNumFailures | The number of times a far-end receive failure alarm condition has been entered on this link (i.e., Rx-Unusable-FE) in one of the previous 96, individual 15 minute, intervals. This is an optional attribute                                          | imaLinkIntervalTable | IMA-MIB | No  |
| imaLinkIntervalTxStuffs        | Count of stuff events inserted in the transmit direction in one of the previous 96, individual 15 minute, intervals. This is an optional attribute                                                                                                    | imaLinkIntervalTable | IMA-MIB | Yes |
| imaLinkIntervalRxStuffs        | Count of stuff events detected in the receive direction in one of the previous 96, individual 15 minute, intervals. This is an optional attribute                                                                                                     | imaLinkIntervalTable | IMA-MIB | Yes |
| <b>imaLinkTotalTable</b>       |                                                                                                                                                                                                                                                       |                      |         |     |
| imaLinkTotalImaViolations      | ICP violations: count of errored, invalid or missing ICP cells, except during SES-IMA or UAS-IMA conditions, in the previous 24 hour interval                                                                                                         | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalOifAnomalies       | The number of OIF anomalies, except during SES-IMA or UAS-IMA conditions, at the near-end in the previous 24 hour interval. This is an optional attribute                                                                                             | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalNeSevErroredSecs   | Count of one second intervals containing >= 30% of the ICP cells counted as IV-IMAs, or one or more link defects (e. g., LOS, OOF/ LOF, AIS, or LCD), LIF defects, or LODS defects, except during UAS-IMA condition, in the previous 24 hour interval | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalFeSevErroredSecs   | Count of one second intervals containing one or more RDI-IMA defects, except during UAS-IMA-FE condition, in the previous 24 hour interval                                                                                                            | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalNeUnavailSecs      | Count of unavailable seconds at near-end in the previous 24 hour interval: unavailability begins at the onset of 10 contiguous SES-IMA and ends at the onset of 10 contiguous seconds with no SES-IMA                                                 | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalFeUnavailSecs      | Count of unavailable seconds at far-end in the previous 24 hour interval: unavailability begins at the onset of 10 contiguous SES-IMA-FE and ends at the onset of 10 contiguous seconds with no SES-IMA-FE                                            | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalNeTxUnusableSecs   | Tx Unusable seconds: count of Unusable seconds at the near-end Tx LSM in the previous 24 hour interval                                                                                                                                                | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalNeRxUnusableSecs   | Rx Unusable seconds: count of Unusable seconds at the near-end Rx LSM in the previous 24 hour interval                                                                                                                                                | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalFeTxUnusableSecs   | Tx Unusable seconds at far-end: count of seconds with Tx Unusable indications from the far-end Tx LSM in the previous 24 hour interval                                                                                                                | imaLinkTotalTable    | IMA-MIB | No  |
| imaLinkTotalFeRxUnusableSecs   | Rx Unusable seconds at far-end: count of seconds with Rx Unusable indications from the far-end Rx LSM in the previous 24 hour interval                                                                                                                | imaLinkTotalTable    | IMA-MIB | No  |

|                              |                                                                                                                                                                                                                                |                       |                  |     |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|------------------|-----|
| imaLinkTotalNeTxNumFailures  | The number of times a near-end transmit failure alarm condition has been entered on this link (i.e., some form of implementation specific transmit fault) in the previous 24 hour interval                                     | imaLinkTotalTable     | IMA-MIB          | No  |
| imaLinkTotalNeRxNumFailures  | The number of times a near-end receive failure alarm condition has been entered on this link (i.e., LIF, LODS, RFI-IMA, Mis-Connected, or some form of implementation specific receive fault) in the previous 24 hour interval | imaLinkTotalTable     | IMA-MIB          | No  |
| imaLinkTotalFeTxNumFailures  | The number of times a far-end transmit failure alarm condition has been entered on this link (i.e., Tx-Unusable-FE) in the previous 24 hour interval. This is an optional attribute                                            | imaLinkTotalTable     | IMA-MIB          | No  |
| imaLinkTotalFeRxNumFailures  | The number of times a far-end receive failure alarm condition has been entered on this link (i.e., Rx-Unusable-FE) in the previous 24 hour interval. This is an optional attribute                                             | imaLinkTotalTable     | IMA-MIB          | No  |
| imaLinkTotalTxStuffs         | Count of stuff events inserted in the transmit direction in the previous 24 hour interval. This is an optional attribute                                                                                                       | imaLinkTotalTable     | IMA-MIB          | No  |
| imaLinkTotalRxStuffs         | Count of stuff events detected in the receive direction in the previous 24 hour interval. This is an optional attribute                                                                                                        | imaLinkTotalTable     | IMA-MIB          | No  |
| <b>UEMG-PERFMON-MIB</b>      |                                                                                                                                                                                                                                |                       |                  |     |
| <b>nnPmUtilOmRecentTable</b> | This table contains measurements of CPU, Ram, Flash and Channel Usage. Measurements in this table are rolling (peak and average values) on the most recent 15 minutes.                                                         |                       |                  |     |
| nnPmUtilRecentCpuPeak        | Peak CPU Occupancy (as a percentage of usage)                                                                                                                                                                                  | nnPmUtilOmRecentTable | UEMG-PERFMON-MIB | No  |
| nnPmUtilRecentCpuAvg         | Average CPU Occupancy (as a percentage of usage)                                                                                                                                                                               | nnPmUtilOmRecentTable | UEMG-PERFMON-MIB | No  |

| <b>dot3StatsTable</b>                |                                                                                                                                                                                                                                                                                                                                                                     |                       |                      |  |
| dot3StatsAlignmentErrors             | A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check.                                                                                                                                                                                                                             | dot3StatsTable        | Ethernet-Like MIB    |  |
| dot3StatsFCSErrors                   | A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame too-long or frame-too-short error.                                                                                                                                       | dot3StatsTable        | Ethernet-Like MIB    |  |
| dot3StatsInternalMac                 | A count of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object. | dot3StatsTable        | Ethernet-Like MIB    |  |
| dot3StatsCarrierSenseErrors          | The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface.                                                                                                                                                                                                                      | dot3StatsTable        | Ethernet-Like MIB    |  |
| dot3StatsFrameTooLongs               | A count of frames received on a particular interface that exceed the maximum permitted frame size.                                                                                                                                                                                                                                                                  | dot3StatsTable        | Ethernet-Like MIB    |  |
| dot3StatsInternalMacReceiveErrors    | A count of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsFrameTooLongs object, the dot3StatsAlignmentErrors object, or the dot3StatsFCSErrors object.                   | dot3StatsTable        | Ethernet-Like MIB    |  |
| dot3StatsSymbolErrors                | For an interface operating at 100 Mb/s, the number of times there was an invalid data symbol when a valid carrier was present.                                                                                                                                                                                                                                      | dot3StatsTable        | Ethernet-Like MIB    |  |
| <b>dot3PauseTable</b>                |                                                                                                                                                                                                                                                                                                                                                                     |                       |                      |  |
| dot3InPauseFrames                    | A count of MAC Control frames received on this interface with an opcode indicating the PAUSE operation                                                                                                                                                                                                                                                              |                       |                      |  |
| dot3OutPauseFrames                   | A count of MAC Control frames transmitted on this interface with an opcode indicating the PAUSE operation                                                                                                                                                                                                                                                           |                       |                      |  |
| <b>Remote Network Monitoring MIB</b> |                                                                                                                                                                                                                                                                                                                                                                     |                       |                      |  |
| <b>etherStatsTable</b>               |                                                                                                                                                                                                                                                                                                                                                                     |                       |                      |  |

|                          |                                                                                                                                                                                                                                                                                                                        |                   |                               |  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|-------------------------------|--|
| etherStatsDropEvents     | The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number packets dropped; it is just the number of times this condition has been detected.                                                                                  | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsBroadcastPkts  | The total number of good packets received that were directed to the broadcast address. Note that this does not include multicast packets.                                                                                                                                                                              | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsMulticastPkts  | The total number of good packets received that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address.                                                                                                                                                 | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsCRCAlignErrors | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsUndersizePkts  | The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.                                                                                                                                                             | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsOversizePkts   | The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.                                                                                                                                                              | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsFragments      | The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)                       | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsJabbers        | The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)                           | etherStatsTable   | Remote Network Monitoring MIB |  |
| etherStatsCollisions     | The best estimate of the total number of collisions on this Ethernet segment.                                                                                                                                                                                                                                          | etherStatsTable   | Remote Network Monitoring MIB |  |
| <b>etherHistoryTable</b> |                                                                                                                                                                                                                                                                                                                        |                   |                               |  |
| etherHistoryDropEvents   | The total number of events in which packets were dropped by the probe due to lack of resources during this sampling interval. Note that this number is not necessarily the number of packets dropped, it is just the number of times this condition has been detected.                                                 | etherHistoryTable | Remote Network Monitoring MIB |  |

|                                    |                                                                                                                                                                                                                                                                                                                                            |                             |                               |  |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-------------------------------|--|
| etherHistoryBroadcastPkts          | The number of good packets received during this sampling interval that were directed to the broadcast address.                                                                                                                                                                                                                             | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryMulticastPkts          | The number of good packets received during this sampling interval that were directed to a multicast address. Note that this number does not include packets addressed to the broadcast address.                                                                                                                                            | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryCRCAlignErrors         | The number of packets received during this sampling interval that had a length (excluding framing bits but including FCS octets) between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryUndersizePkts          | The number of packets received during this sampling interval that were less than 64 octets long (excluding framing bits but including FCS octets) and were otherwise well formed.                                                                                                                                                          | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryOversizePkts           | The number of packets received during this sampling interval that were longer than 1518 octets (excluding framing bits but including FCS octets) but were otherwise well formed.                                                                                                                                                           | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryFragments              | The total number of packets received during this sampling interval that were less than 64 octets in length (excluding framing bits but including FCS octets) had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)                 | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryJabbers                | The number of packets received during this sampling interval that were longer than 1518 octets (excluding framing bits but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)                        | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryCollisions             | The best estimate of the total number of collisions on this Ethernet segment during this sampling interval.                                                                                                                                                                                                                                | etherHistoryTable           | Remote Network Monitoring MIB |  |
| etherHistoryUtilization            | The best estimate of the mean physical layer network utilization on this interface during this sampling interval, in hundredths of a percent.                                                                                                                                                                                              | etherHistoryTable           | Remote Network Monitoring MIB |  |

# Appendix C: VOA/IP MSS15000, MG15000, and MDM Alarm Log Summary

## 1. Introduction

This document provides a list of Multiservice Switch 15000 (MSS15000), Media Gateway 15000 (MG15000) (formerly known as PVG) and Multiservice Data Manager (MDM) alarm logs applicable to up to SN08 for Voice over ATM (VOA) and Voice over IP (VOIP) solutions.

The purpose of this document includes:

- It provides a VOA/VOIP customer (and more specifically an OSS Fault application writer) a summarized subset of the possible alarms that can appear when MSS15000 and MDM are configured for the VOA/VOIP application. The descriptions of the alarms are found in [6] and [3].
- When configured to receive MSS15000/MDM Alarm logs in SCC2 format from the Supernode Data Manager (SDM), it also provides the mapping information needed to interpret the SCC2 format.
- It is also input to solution-level OSS Guide information which is in progress of being delivered to provide this information in the FCAPS-based solution documentation.

## 2. SCC2 Log Format

The SCC2 log report for MSS15000 and MDM alarms comprises a one line header, followed by seven lines of body text, as per the following example:

```
37 PPEM300 8169 TBL
time: 2002 01 11 15 37 06
event: clear
compld: EM P15KF LP 7 SONET 3
severity: cleared
faultCode: 70115201
alarmType: communications
commentData: Loss of frame condition has been cleared.
```

The header is of format:

```
aabbccdddeeeffgghhijjj
```

Each field, as applicable for MSS15000 and MDM alarms, is described in Table 1.

**Table 1 MSS15000 and MDM SCC2 Header Field Description**

| Field | Description                                       | Applicable Log Values                                                                                                                                                        |
|-------|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aa    | Alarm severity<br>MSS15000/MDM alarm log severity | "*C" = critical alarm<br>"***" = major alarm<br>"* " = minor and warning and indeterminate alarm<br>" " = clear alarm<br>Two characters, left justified, padded with blanks. |

| Field                                 | Description                                                                                                                                                                       | Applicable Log Values                                                                                                                                                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bb                                    | Minute indicator<br>Two numeric character indicator representing the minutes after the hour. Generated by SDM at time SDM receives the alarm log from MDM.                        | Ranges from 00 to 59, right justified, padded with zeros.                                                                                                                                                                                                 |
| c                                     | single space                                                                                                                                                                      | " "                                                                                                                                                                                                                                                       |
| dddd                                  | Log Name<br>Assigned by SDM. Based upon the first four digits ("Index Group") of the eight-digit MSS15000 or MDM alarm identifier.                                                | Four characters, left justified, padded with blanks.<br>"CA " for index group 0000.<br>"PPEM" for index groups beginning with 70xx and some fault codes in group 0999.<br>"MDM " for index groups beginning with 30xx and some fault codes in group 0999. |
| eee                                   | Log Number<br>Three numeric characters representing the MSS15000 or MDM Alarm Type. Note that the Alarm Type "debug" is not translated as a fault, but rather as information log. | "300" = communications<br>"301" = quality of service<br>"302" = processing<br>"303" = equipment<br>"304" = environmental<br>"305" = security<br>"306" = operator<br>"307" = unknown                                                                       |
| f                                     | A single space for all MSS15000 and MDM alarm logs.                                                                                                                               | " "                                                                                                                                                                                                                                                       |
| gg                                    | Global Sequence Number<br>Generated by SDM. Two numeric characters, incremented by SDM upon receipt of every alarm log.                                                           | Ranges from 00 to 99, right justified, padded with zeros.                                                                                                                                                                                                 |
| hh                                    | Device Sequence Number<br>Generated by SDM. Two numeric characters, incremented by SDM upon receipt of every device specific alarm log from MDM (originated by MSS15000 or MDM).  | Ranges from 00 to 99, right justified, padded with zeros.                                                                                                                                                                                                 |
| i                                     | single space                                                                                                                                                                      | " "                                                                                                                                                                                                                                                       |
| jjjj                                  | Event Type<br>Assigned by SDM. ### 3. MSS15000 Alarm Logs

Table 2 presents the list of MSS15000 set/clear alarm logs that are applicable for Succession VOA/VOIP.

Table 2 does not explicitly state all MSS15000 clear alarm logs that correspond to each set. The SCC2 header for the clear differs from its corresponding set by only the first two characters. The characters “aa” are replaced by “ ” (two spaces). This format is presented in Table 1.

The MSS15000 alarm identifier consists of an eight-digit number identifying the alarm. The first four digits comprise the **Index Group**, which represents logical groupings of alarms. The last four digits are the **SubIndex**, which is an identifier within each index group.

**Component Name** indicates the managed object against which the alarm Log is generated. This table contains the CLI format of a component name. The “compld” field in SCC2 format contains this information (with the module’s <nodename> pre-pended). Also, “compld” follows the MDM API-style format (with component type and instance separated by a space instead of a slash, and ‘\$’ appearing in place of a null instance value). Variables (usually instance value ranges) are denoted by <> and the reader should reference the Alarms NTP’s [3] and [6] for further information.

**Table 2 MSS15000 Set/Clear Alarms Supported for Succession**

| MSS15000 Index Group | Component Name                                                                                                                          | MSS15000/MG 15000 configuration (N/A) | MSS15000 Subindex | Importance Category (N/A) | SCC2 Header                                                                 |

The following table specifies the alarms where field “event” has the value “message”. There won’t be a “clear” for these, but some action may still be required (e.g., security issue).

**Table 3 MSS15000 Message Alarms Supported for Succession VOA/VOIP**

| MSS15000 Index Group | Component Name                                                                                                                          | Solution Notes | MSS15000 Subindex | Importance Category | SCC2 Header              |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|----------------|-------------------|---------------------|--------------------------|
| 0000                 | OSI administrative state changes, general engineering and memory alarms, etc.                                                           |                |                   |                     |                          |
|                      | These alarms can apply to many MSS15000 components. Often, it is:<br>EM/<nodename>                                                      |                | 9000              |                     | * bb CA eee gghh         |

Reference [6] provides detailed descriptions of MSS15000 alarm logs, of which only a portion are applicable for Succession VOA/VOIP.

## 4. MDM Alarm Logs

Table 4 presents the list of MDM and MDM proxy set/clear alarm logs that are applicable for Succession VOA/VOIP. Table 5 presents the list of MDM and MDM proxy message alarm logs that are applicable for Succession VOA/VOIP.

Applicable MDM set/clear alarms logs include those due to MDM software failure, and alarms related to the monitoring of the platform on which MDM is operating. MDM proxy alarm logs are alarms that MDM initiates on behalf of MSS15000 (for a number of reasons) and injects into the MSS15000 alarm log stream.

The table does not explicitly state all MDM clear alarm logs that correspond to each set. The clear differs from its corresponding set by only the first two characters. The characters “aa” are replaced by “ ” (two spaces). This format is presented in Table 1.

The MDM alarm identifier consists of an eight-digit number identifying the alarm. The first four digits comprise the **Index Group**, which represents logical groupings of alarms. The last four digits are the **SubIndex**, which is an identifier within each index group.

**Component Name** indicates the managed object against which the alarm Log is generated. This table contains the CLI format of a component name. The “compld” field in SCC2 format contains this information (with the module’s <nodename> pre-pended). Also, “compld” follows the MDM API-style format (with component type and instance separated by a space instead of a slash, and ‘\$’ appearing in place of a null instance value). Variables (usually instance value ranges) are denoted by <> and the reader should reference the Alarms NTP’s [3] and [4] for further information.

**Table 4 MDM Set/Clear Alarms Supported for Succession VOA/VOIP**

| MDM Index Group | Component Name                                                                                                                                                                                                                                                                                                        | N/A | MDM SubIndex | Importance category (N/A) | SCC2 Header                                                                     |

| 0999            | MDM proxy-alarm. Issued when a loss of redundancy of alarm feed occurs. The MDM has lost its direct network alarm feed, but is still collecting them from its mate MDM.<br>Note that this message alarm will not be issued for all conditions that could lead to a loss of redundancy, nor is it “cleared” when the problem is resolved. Thus, we do not recommend that this alarm be keyed upon, but include it here because it is likely to be seen.<br><deviceType> is any IP-enabled device, such as “EM” or “PP8600”.<br><nodeName> is the name of the device or shelf. |     |              |                           |                       |
|                 | <deviceType>/<nodeName>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     | 0100         |                           | * bb MDM 303 gghh TBL |
| 3010            | Indicates faults on MDM server processes, which are needed by the MDM tools/applications. The MDM Log Display GUI or corresponding Unix Utility (nmslog) may also be used to find the information for the cause of the problem.<br>NMS instance range (<x>): a string, typically the hostname of the MDM server platform<br>GROUP instance range (<g>): a string, which is the HGDS group name for a set of MSS15000s<br>PP instance range (<nodename>): a string, typically the CLLI identifier for the MSS15000                                                            |     |              |                           |                       |

## Appendix D: USP Operational Measurements

| OM TYPE         | OM TITLE                                          | OM DESCRIPTION                                                                                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | ATM Driver Messaging, Plane 1 CRC Error Count     | This OM measures the number of Plane 1 CRC errors.                                                                                                                                                                                                                                                                                                       |
| Accumulation OM | AS Master, BICC Discard Count                     | This OM measures the number of BICC origination messages that were discarded due to Core Overload Control.                                                                                                                                                                                                                                               |
| Accumulation OM | AS Master, BSSAP Discard Count                    | This OM measures the number of SCCP connection request messages for the BSSAP subsystem that were discarded due to Core Overload Control.                                                                                                                                                                                                                |
| Accumulation OM | AS Master, Core Overload Duration                 | This OM measures the total time, in seconds, that the Core was in Overload.                                                                                                                                                                                                                                                                              |
| Accumulation OM | AS Master, ISUP Discard Count                     | This OM measures the number of ISUP origination messages that were discarded due to Core Overload Control.                                                                                                                                                                                                                                               |
| Accumulation OM | AS Master, RANAP Discard Count                    | This OM measures the number of SCCP connection request messages for the RANAP subsystem that were discarded due to Core Overload Control.                                                                                                                                                                                                                |
| Accumulation OM | AS Master, TUP Discard Count                      | This OM measures the number of TUP origination messages that were discarded due to Core Overload Control.                                                                                                                                                                                                                                                |
| Accumulation OM | ASP Path Management, Path Down Time               | This OM measures the total time that a Path was in the Down state.                                                                                                                                                                                                                                                                                       |
| Accumulation OM | ASP Path Management, Path entered Down state      | This OM measures the total number of times per measurement period that a Path entered the Down state.                                                                                                                                                                                                                                                    |
| Accumulation OM | ASP Path Management, Path entered Restoring state | This OM measures the total number of times per measurement period that a Path entered the Restoring state.                                                                                                                                                                                                                                               |
| Accumulation OM | ASP Path Management, Path entered Up state        | This OM measures the total number of times per measurement period that a Path entered the Up state.                                                                                                                                                                                                                                                      |
| Accumulation OM | ASP Path Management, Path Restore Time            | This OM measures the total time that a Path was in the Restoring state.                                                                                                                                                                                                                                                                                  |
| Accumulation OM | ASP Path Management, Path Up Time                 | This OM measures the total time that a Path was in the Up state.                                                                                                                                                                                                                                                                                         |
| Accumulation OM | ASP Path Traffic, Discarded MSUs Count            | This OM measures the total number of received MSUs on an ASP Path which were discarded because the Network Appearance (or System Identity) associated with the incoming message was not found on the USP                                                                                                                                                 |
| Accumulation OM | ASP Path Traffic, Discarded MTP3b MSUs Count      | This OM measures the total number of received MTP3B MSUs (> 272 octets) on an ASP Path which were discarded because the outgoing link is not MTP3B capable. This doesn't apply to SCCP/LUDT messages since on IPS7 Paths, these messages will be segmented and then sent out. For non-SCCP messages such as BICC messages > 272 octets, this will apply. |
| Accumulation OM | ASP Path Traffic, Originated MSUs Count           | This OM measures the number of originated MSUs (MSUs that contain the PC or capability code for the USP in the OPC field) that are successfully passed to the ASP Path for transmission (for example, network management messages).                                                                                                                      |
| Accumulation OM | ASP Path Traffic, Received MSUs Count             | This OM measures the total number of received MSUs on an ASP Path                                                                                                                                                                                                                                                                                        |

| OM TYPE         | OM TITLE                                          | OM DESCRIPTION                                                                                                                                                                                                                              |
|-----------------|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | ASP Path Traffic, Sent MSUs Count                 | This OM measures the number of through-switched MSUs (MSUs that do not contain the PC or capability code for the USP in either the OPC or DPC) that are acknowledged, translated, and successfully passed to the ASP Path for transmission. |
| Accumulation OM | ASP Path Traffic, Terminated MSUs Count           | This OM measures the number of terminated MSUs (acknowledged, incoming MSUs that contain the PC or capability code of the USP in the DPC field) received.                                                                                   |
| Accumulation OM | ASP Path Utilization, DAUD Received Count         | This OM measures the number of destination audit (DAUD) messages transmitted.                                                                                                                                                               |
| Accumulation OM | ASP Path Utilization, DAVA Transmitted Count      | This OM measures the number of destination available (DAVA) messages transmitted.                                                                                                                                                           |
| Accumulation OM | ASP Path Utilization, DUNA Transmitted Count      | This OM measures the number of destination unavailable messages transmitted.                                                                                                                                                                |
| Accumulation OM | ASP Path Utilization, DUPU Transmitted Count      | This OM measures the number of destination user part unavailable messages transmitted.                                                                                                                                                      |
| Accumulation OM | ASP Path Utilization, SCON Transmitted Count      | This OM measures the number of Signaling Congestion (SCON) messages transmitted.                                                                                                                                                            |
| Accumulation OM | ATM Driver Messaging, Duplicate Messages Count    | This OM measures the number of duplicate messages.                                                                                                                                                                                          |
| Accumulation OM | ATM Driver Messaging, IP Message Count            | This OM measures the number of incoming IP messages.                                                                                                                                                                                        |
| Accumulation OM | ATM Driver Messaging, Plane 1 Messages Count      | This OM measures the number of incoming Plane 1 messages.                                                                                                                                                                                   |
| Accumulation OM | ATM Driver Messaging, Plane 2 CRC Error Count     | This OM measures the number of Plane 2 CRC errors.                                                                                                                                                                                          |
| Accumulation OM | ATM Driver Messaging, Plane 2 Messages Count      | This OM measures the number of incoming Plane 2 messages.                                                                                                                                                                                   |
| Accumulation OM | ATM Driver Messaging, Raw Cell Count              | This OM measures the number of raw cells. Raw cells are typically bad cells or OAM cells.                                                                                                                                                   |
| Accumulation OM | ATM Driver Messaging, Raw Message Count           | This OM measures the number of ATM raw messages. Raw messages are messages not assigned to a protocol.                                                                                                                                      |
| Accumulation OM | ATM Driver Messaging, Sequence Number Reset Count | This OM measures the number of times the sequence numbers are reset due to the receipt of five consecutive duplicate cells.                                                                                                                 |
| Accumulation OM | ATM Driver Messaging, SSCOP Message Count         | This OM measures the number of incoming SSCOP messages.                                                                                                                                                                                     |
| Accumulation OM | ATM Link Traffic, Discarded cells with HEC Viol.  | This OM measures the number of ATM cells discarded due to Header Error Control (HEC) violations.                                                                                                                                            |
| Accumulation OM | ATM Link Traffic, Discarded cells with Prot. Errs | This OM measures the number of cells discarded due to Protocol (ATM-Layer Header) Errors.                                                                                                                                                   |
| Accumulation OM | ATM Link Traffic, In NDC-valid cells on HSL VCL   | This OM measures the number of incoming Network Data Collection (NDC) valid cells on the High Speed Links (HSL) VCL.                                                                                                                        |
| Accumulation OM | ATM Link Traffic, Incoming ATM UI cells           | This OM measures the number of incoming ATM User Information (UI) cells.                                                                                                                                                                    |
| Accumulation OM | ATM Link Traffic, OCD Anomalies                   | This OM measures the number of Out of Cell Delineation (OCD) anomalies.                                                                                                                                                                     |

| OM TYPE         | OM TITLE                                                 | OM DESCRIPTION                                                                                                                                                                                                                                           |
|-----------------|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | ATM Link Traffic, Out NDC-valid cells on HSL VCL         | This OM measures the number of outgoing Network Data Collection (NDC) valid cells on the High Speed Links (HSL) VCL.                                                                                                                                     |
| Accumulation OM | ATM Link Traffic, Outgoing ATM UI cells                  | This OM measures the number of outgoing ATM User Information (UI) cells.                                                                                                                                                                                 |
| Accumulation OM | BICC Received Message Counts, BICC Call P Received Count | This OM measures the number of BICC call processing messages received from the SS7 Network.                                                                                                                                                              |
| Accumulation OM | BICC Received Message Counts, BICC Error No OPC Route    | This OM measures the number of BICC messages discarded as a result of not being able to find the associated OPC route for the received BICC message                                                                                                      |
| Accumulation OM | BICC Received Message Counts, BICC Error No Path         | This OM measures the number of BICC messages discarded as a result of not being able to find an inservice path to a given AS.                                                                                                                            |
| Accumulation OM | BICC Received Message Counts, BICC Error No Route        | This OM measures the number of BICC messages discarded as a result of not being able to find a route to a given AS.                                                                                                                                      |
| Accumulation OM | BICC Received Message Counts, BICC Maint Received Count  | This OM measures the number of BICC maintenance messages received from the SS7 Network.                                                                                                                                                                  |
| Accumulation OM | BICC Received Message Counts, Wrong NE Received Count    | This OM measures the number of BICC messages discarded as a result of not receiving the message for a SG Network Element                                                                                                                                 |
| Accumulation OM | Carrier, Far End Line - Errored Seconds                  | This OM measures the Far End Performance data: Far End Errored Seconds - Line.                                                                                                                                                                           |
| Accumulation OM | Carrier, Far End P - Sev Err Frm/AIS Sec                 | This OM measures the Far End Performance data: Far End Severely Errored Frame/AIS Seconds - Path.                                                                                                                                                        |
| Accumulation OM | Carrier, Far End P - Severely Err Secs                   | This OM measures the Far End Performance data: Far End Severely Errored Seconds - Path.                                                                                                                                                                  |
| Accumulation OM | Carrier, Far End P - Unavailable Seconds                 | This OM measures the Far End Performance data: Far End Unavailable Seconds - Path.                                                                                                                                                                       |
| Accumulation OM | Carrier, Far End Path - Code Violations                  | This OM measures the Far End Performance data: Far End Code Violations - Path.                                                                                                                                                                           |
| Accumulation OM | Carrier, Far End Path - Controlled Slips                 | This OM measures the Far End Performance data: Far End Controlled Slips - Path                                                                                                                                                                           |
| Accumulation OM | Carrier, Far End Path - Errored Seconds                  | This OM measures the Far End Performance data: Far End Errored Seconds - Path.                                                                                                                                                                           |
| Accumulation OM | Carrier, Far End Path - Failure Count                    | This OM measures the Far End Performance data: Far End Failure Count - Path.                                                                                                                                                                             |
| Accumulation OM | Carrier, Line - Code Violations                          | This OM measures the Near End Performance data: Code Violations - Line.                                                                                                                                                                                  |
| Accumulation OM | Carrier, Line - Errored Seconds                          | This OM measures the Near End Performance data: Errored Seconds - Line.                                                                                                                                                                                  |
| Accumulation OM | Carrier, Line - Loss of Signal Seconds                   | This OM measures the Near End Performance data: Loss of Signal Seconds - Line. All performance parameters including this parameter are defined in ANSI T1.231-1997 'Digital Hierarchy - Layer 1 in-Service Digital Transmission Performance Monitoring'. |
| Accumulation OM | Carrier, Line - Severely Errored Seconds                 | This OM measures the Near End Performance data: Severely Errored Seconds - Line.                                                                                                                                                                         |

| OM TYPE         | OM TITLE                                                   | OM DESCRIPTION                                                                                                                                                                                                                                                                                                       |
|-----------------|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | Carrier, P - Severely Err Frame/AIS Secs                   | This OM measures the Near End Performance data: Severely Errored Frame/AIS Seconds - Path.                                                                                                                                                                                                                           |
| Accumulation OM | Carrier, Path - AIS Seconds                                | This OM measures the Near End Performance data: AIS Seconds - Path.                                                                                                                                                                                                                                                  |
| Accumulation OM | Carrier, Path - Code Violations                            | This OM measures the Near End Performance data: Code Violations - Path.                                                                                                                                                                                                                                              |
| Accumulation OM | Carrier, Path - Errored Seconds                            | This OM measures the Near End Performance data: Errored Seconds - Path.                                                                                                                                                                                                                                              |
| Accumulation OM | Carrier, Path - Failure Count                              | This OM measures the Near End Performance data: Failure Count - Path.                                                                                                                                                                                                                                                |
| Accumulation OM | Carrier, Path - Severely Errored Seconds                   | This OM measures the Near End Performance data: Severely Errored Seconds - Path.                                                                                                                                                                                                                                     |
| Accumulation OM | Carrier, Path - Unavailable Seconds                        | This OM measures the Near End Performance data: Unavailable Seconds - Path.                                                                                                                                                                                                                                          |
| Accumulation OM | Gateway Screening Results, Disallowed Cld Party Addr Count | This OM measures the number of MSUs rejected on a particular link, because of disallowed SCCP Called Party Addresses.                                                                                                                                                                                                |
| Accumulation OM | Gateway Screening Results, Disallowed ISUP Count           | This OM measures the number of MSUs rejected on a particular link, because of a disallowed ISDN User Part message type.                                                                                                                                                                                              |
| Accumulation OM | Gateway Screening Results, Disallowed Trans Type Count     | This OM measures the number of MSUs rejected on a particular link, because of a disallowed SCCP GTT type.                                                                                                                                                                                                            |
| Accumulation OM | Gateway Screening Results, Invalid Affct Destination Count | This OM measures the number of MSUs rejected on a particular link, because the destination fields in signaling-routeset-test, TFX/TCx, or TFC messages from the MSUs did not pass GWS checking based on the provisioned criteria.                                                                                    |
| Accumulation OM | Gateway Screening Results, Invalid Affct PC-SSN Count      | This OM measures the number of MSUs rejected on a particular link, because the affected PCs in SCCP subsystem-prohibited (SSP) and subsystem-allowed (SSA) messages and an invalid PC or SSN in SCCP subsystem-status-test (SST) messages from the MSUs did not pass GWS checking based on the provisioned criteria. |
| Accumulation OM | Gateway Screening Results, Invalid Cng Party Addr Count    | This OM measures the number of MSUs rejected on a particular link, because the Calling Party Addresses (PC or SSN) from the MSUs did not pass GWS checking based on the provisioned criteria.                                                                                                                        |
| Accumulation OM | Gateway Screening Results, Invalid DPC Count               | This OM measures the number of MSUs rejected on a particular link, because the DPCs from the MSUs did not pass GWS checking based on the provisioned criteria.                                                                                                                                                       |
| Accumulation OM | Gateway Screening Results, Invalid OPC Count               | This OM measures the number of MSUs rejected on a particular link, because the OPCs from the MSUs did not pass GWS checking based on the provisioned criteria.                                                                                                                                                       |
| Accumulation OM | Gateway Screening Results, Invalid SIO Count               | This OM measures the number of MSUs rejected on a particular link, because the SIOs from the MSUs did not pass GWS checking based on the provisioned criteria.                                                                                                                                                       |
| Accumulation OM | GTT Type, GTTs Not Performed Count                         | This OM measures the total number of GTTs that could not be performed for a particular translation type (all reasons).                                                                                                                                                                                               |
| Accumulation OM | GTT Type, GTTs Performed Count                             | This OM measures the total number of MSUs that successfully completed GTT (that is, a match was found for the global title) for a particular translation type.                                                                                                                                                       |

| OM TYPE         | OM TITLE                                          | OM DESCRIPTION                                                                                                                                                                                |
|-----------------|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | GTT Type, No Translation for Addr Count           | This OM measures the number of times the Address Not Found error was encountered for a particular translation type (that is, there was no match found for the global title in the GTT table). |
| Accumulation OM | ISUP Received Message Counts, ACM Received Count  | This OM measures the number of ISUP Address Complete Messages (ACM) received from the SS7 Network. (Only for SG Identities)                                                                   |
| Accumulation OM | ISUP Received Message Counts, ALT Received Count  | This OM measures the number of ISUP Altering Messages (ALT) received from the SS7 Network. (Only for SG Identities)                                                                           |
| Accumulation OM | ISUP Received Message Counts, ANM Received Count  | This OM measures the number of ISUP Answer Messages (ANM) received from the SS7 Network. (Only for SG Identities)                                                                             |
| Accumulation OM | ISUP Received Message Counts, BLA Received Count  | This OM measures the number of ISUP Blocking Acknowledgement (BLA) received from the SS7 Network. (Only for SG Identities)                                                                    |
| Accumulation OM | ISUP Received Message Counts, BLO Received Count  | This OM measures the number of ISUP Blocking Messages (BLO) received from the SS7 Network. (Only for SG Identities)                                                                           |
| Accumulation OM | ISUP Received Message Counts, CCR Received Count  | This OM measures the number of ISUP Continuity Check Request Messages (CCR) received from the SS7 Network. (Only for SG Identities)                                                           |
| Accumulation OM | ISUP Received Message Counts, CFN Received Count  | This OM measures the number of ISUP Confusion Messages (CFN) received from the SS7 Network. (Only for SG Identities)                                                                          |
| Accumulation OM | ISUP Received Message Counts, CGB Received Count  | This OM measures the number of ISUP Circuit Group Blocking Messages (CGB) received from the SS7 Network. (Only for SG Identities)                                                             |
| Accumulation OM | ISUP Received Message Counts, CGBA Received Count | This OM measures the number of ISUP Circuit Group Blocking Acknowledgement Messages (CGBA) received from the SS7 Network. (Only for SG Identities)                                            |
| Accumulation OM | ISUP Received Message Counts, CGU Received Count  | This OM measures the number of ISUP Circuit Group Unblocking Messages (CGU) received from the SS7 Network. (Only for SG Identities)                                                           |
| Accumulation OM | ISUP Received Message Counts, CGUA Received Count | This OM measures the number of ISUP Circuit Group Unblocking Acknowledgement Messages (CGUA) received from the SS7 Network. (Only for SG Identities)                                          |
| Accumulation OM | ISUP Received Message Counts, CMC Received Count  | This OM measures the number of ISUP Call Modification Completed Messages (CMC) received from the SS7 Network. (Only for SG Identities)                                                        |
| Accumulation OM | ISUP Received Message Counts, CMR Received Count  | This OM measures the number of ISUP Call Modification Request Messages (CMR) received from the SS7 Network. (Only for SG Identities)                                                          |
| Accumulation OM | ISUP Received Message Counts, CMRJ Received Count | This OM measures the number of ISUP Call Modification Rejected Messages (CMRJ) received from the SS7 Network. (Only for SG Identities)                                                        |
| Accumulation OM | ISUP Received Message Counts, CON Received Count  | This OM measures the number of ISUP Connect Messages (CON) received from the SS7 Network. (Only for SG Identities)                                                                            |
| Accumulation OM | ISUP Received Message Counts, COT Received Count  | This OM measures the number of ISUP Continuity Test Messages (COT) received from the SS7 Network. (Only for SG Identities)                                                                    |
| Accumulation OM | ISUP Received Message Counts, CPG Received Count  | This OM measures the number of ISUP Call Progress Messages (CPG) received from the SS7 Network. (Only for SG Identities)                                                                      |

| OM TYPE         | OM TITLE                                          | OM DESCRIPTION                                                                                                                                                  |
|-----------------|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | ISUP Received Message Counts, CQM Received Count  | This OM measures the number of ISUP Circuit Query Messages (CQM) received from the SS7 Network. (Only for SG Identities)                                        |
| Accumulation OM | ISUP Received Message Counts, CQR Received Count  | This OM measures the number of ISUP Circuit Query Response Messages (CQR) received from the SS7 Network. (Only for SG Identities)                               |
| Accumulation OM | ISUP Received Message Counts, CRA Received Count  | This OM measures the number of ISUP Circuit Reservation Acknowledgement Messages (CRA) received from the SS7 Network. (Only for SG Identities)                  |
| Accumulation OM | ISUP Received Message Counts, CRG Received Count  | This OM measures the number of ISUP Charge Information Messages (CRG) received from the SS7 Network. (Only for SG Identities)                                   |
| Accumulation OM | ISUP Received Message Counts, CRM Received Count  | This OM measures the number of ISUP Circuit Reservation Messages (CRM) received from the SS7 Network. (Only for SG Identities)                                  |
| Accumulation OM | ISUP Received Message Counts, CSVr Received Count | This OM measures the number of ISUP Closed User Group Selection and Validation Request Messages (CSVr) received from the SS7 Network. (Only for SG Identities)  |
| Accumulation OM | ISUP Received Message Counts, CSVs Received Count | This OM measures the number of ISUP Closed User Group Selection and Validation Response Messages (CSVs) received from the SS7 Network. (Only for SG Identities) |
| Accumulation OM | ISUP Received Message Counts, CVR Received Count  | This OM measures the number of ISUP Circuit Validation Response Messages (CVR) received from the SS7 Network. (Only for SG Identities)                          |
| Accumulation OM | ISUP Received Message Counts, CVT Received Count  | This OM measures the number of ISUP Circuit Validation Test Messages (CVT) received from the SS7 Network. (Only for SG Identities)                              |
| Accumulation OM | ISUP Received Message Counts, DRS Received Count  | This OM measures the number of ISUP Delayed Release Messages (DRS) received from the SS7 Network. (Only for SG Identities)                                      |
| Accumulation OM | ISUP Received Message Counts, EXM Received Count  | This OM measures the number of ISUP Exit Messages (EXM) received from the SS7 Network. (Only for SG Identities)                                                 |
| Accumulation OM | ISUP Received Message Counts, FAA Received Count  | This OM measures the number of ISUP Facility Accepted Messages (FAA) received from the SS7 Network. (Only for SG Identities)                                    |
| Accumulation OM | ISUP Received Message Counts, FAC Received Count  | This OM measures the number of ISUP Facility Messages (FAC) received from the SS7 Network. (Only for SG Identities)                                             |
| Accumulation OM | ISUP Received Message Counts, FAD Received Count  | This OM measures the number of ISUP Facility Deactivated Messages (FAD) received from the SS7 Network. (Only for SG Identities)                                 |
| Accumulation OM | ISUP Received Message Counts, FAI Received Count  | This OM measures the number of ISUP Facility Information Messages (FAM) received from the SS7 Network. (Only for SG Identities)                                 |
| Accumulation OM | ISUP Received Message Counts, FAR Received Count  | This OM measures the number of ISUP Facility Request Messages (FAR) received from the SS7 Network. (Only for SG Identities)                                     |
| Accumulation OM | ISUP Received Message Counts, FOT Received Count  | This OM measures the number of ISUP Forward Transfer Messages (FOT) received from the SS7 Network. (Only for SG Identities)                                     |

| OM TYPE         | OM TITLE                                                   | OM DESCRIPTION                                                                                                                                        |
|-----------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | ISUP Received Message Counts, FRJ Received Count           | This OM measures the number of ISUP Facility Rejected Messages (FRJ) received from the SS7 Network. (Only for SG Identities)                          |
| Accumulation OM | ISUP Received Message Counts, GRA Received Count           | This OM measures the number of ISUP Circuit Group Reset Acknowledgement Messages (GRA) received from the SS7 Network. (Only for SG Identities)        |
| Accumulation OM | ISUP Received Message Counts, GRS Received Count           | This OM measures the number of ISUP Circuit Group Reset Messages (GRS) received from the SS7 Network. (Only for SG Identities)                        |
| Accumulation OM | ISUP Received Message Counts, IAM Received Count           | This OM measures the number of ISUP Initial Address Message Messages (IAM) received from the SS7 Network. (Only for SG Identities)                    |
| Accumulation OM | ISUP Received Message Counts, IAMN1 Received Count         | This OM measures the number of ISUP Initial Address Message Not Priority One Messages (IAMN1) received from the SS7 Network. (Only for SG Identities) |
| Accumulation OM | ISUP Received Message Counts, IDR Received Count           | This OM measures the number of ISUP Identification Request Messages (IDR) received from the SS7 Network. (Only for SG Identities)                     |
| Accumulation OM | ISUP Received Message Counts, INF Received Count           | This OM measures the number of ISUP Information Messages (INF) received from the SS7 Network. (Only for SG Identities)                                |
| Accumulation OM | ISUP Received Message Counts, INR Received Count           | This OM measures the number of ISUP Information Request Messages (INR) received from the SS7 Network. (Only for SG Identities)                        |
| Accumulation OM | ISUP Received Message Counts, IRS Received Count           | This OM measures the number of ISUP Identification Response Messages (IRS) received from the SS7 Network. (Only for SG Identities)                    |
| Accumulation OM | ISUP Received Message Counts, ISUP Error No AS for OPC/CIC | This OM measures the number of ISUP messages discarded as a result of not being able to find a valid AS for a given OPC/CIC. (Only for SG Identities) |
| Accumulation OM | ISUP Received Message Counts, ISUP Error No OPC/CIC Data   | This OM measures the number of ISUP messages discarded as a result of missing database entry for a given OPC/CIC. (Only for SG Identities)            |
| Accumulation OM | ISUP Received Message Counts, ISUP Error No Path           | This OM measures the number of ISUP messages discarded as a result of not being able to find a path to a given AS. (Only for SG Identities)           |
| Accumulation OM | ISUP Received Message Counts, ISUP Error No Route          | This OM measures the number of ISUP messages discarded as a result of not being able to find a route to a given AS. (Only for SG Identities)          |
| Accumulation OM | ISUP Received Message Counts, ISUP Error Unknown Message   | This OM measures the number of unrecognized ISUP Messages received from the SS7 Network. (Only for SG Identities)                                     |
| Accumulation OM | ISUP Received Message Counts, LOP Received Count           | This OM measures the number of ISUP Loop Prevention Messages (LOP) received from the SS7 Network. (Only for SG Identities)                            |
| Accumulation OM | ISUP Received Message Counts, LPA Received Count           | This OM measures the number of ISUP Loop Back Acknowledgement Messages (LPA) received from the SS7 Network. (Only for SG Identities)                  |
| Accumulation OM | ISUP Received Message Counts, NRM Received Count           | This OM measures the number of ISUP Network Resource Management Messages (NRM) received from the SS7 Network. (Only for SG Identities)                |

| OM TYPE         | OM TITLE                                                     | OM DESCRIPTION                                                                                                                                            |
|-----------------|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | ISUP Received Message Counts, PAM Received Count             | This OM measures the number of ISUP Pass Along Message Messages (PAM) received from the SS7 Network. (Only for SG Identities)                             |
| Accumulation OM | ISUP Received Message Counts, PRG Received Count             | This OM measures the number of ISUP Progress Messages (PRG) received from the SS7 Network. (Only for SG Identities)                                       |
| Accumulation OM | ISUP Received Message Counts, REL Received Count             | This OM measures the number of ISUP Release Messages (REL) received from the SS7 Network. (Only for SG Identities)                                        |
| Accumulation OM | ISUP Received Message Counts, RES Received Count             | This OM measures the number of ISUP Resume Messages (RES) received from the SS7 Network. (Only for SG Identities)                                         |
| Accumulation OM | ISUP Received Message Counts, RLC Received Count             | This OM measures the number of ISUP Release Complete Messages (RLC) received from the SS7 Network. (Only for SG Identities)                               |
| Accumulation OM | ISUP Received Message Counts, RPM Received Count             | This OM measures the number of ISUP Reconfiguration Progress Message Messages (ACM) received from the SS7 Network. (Only for SG Identities)               |
| Accumulation OM | ISUP Received Message Counts, RSC Received Count             | This OM measures the number of ISUP Reset Circuit Messages (RSC) received from the SS7 Network. (Only for SG Identities)                                  |
| Accumulation OM | ISUP Received Message Counts, SAM Received Count             | This OM measures the number of ISUP Subsequent Address Message Messages (SAM) received from the SS7 Network. (Only for SG Identities)                     |
| Accumulation OM | ISUP Received Message Counts, SGM Received Count             | This OM measures the number of ISUP Segmentation Messages (SGM) received from the SS7 Network. (Only for SG Identities)                                   |
| Accumulation OM | ISUP Received Message Counts, SUS Received Count             | This OM measures the number of ISUP Suspend Messages (SUS) received from the SS7 Network. (Only for SG Identities)                                        |
| Accumulation OM | ISUP Received Message Counts, UBA Received Count             | This OM measures the number of ISUP Unblocking Acknowledgement Messages (UBA) received from the SS7 Network. (Only for SG Identities)                     |
| Accumulation OM | ISUP Received Message Counts, UBL Received Count             | This OM measures the number of ISUP Unblocking Messages (UBL) received from the SS7 Network. (Only for SG Identities)                                     |
| Accumulation OM | ISUP Received Message Counts, UCIC Received Count            | This OM measures the number of ISUP Unequipped Circuit Identification Code Messages (UCIC) received from the SS7 Network. (Only for SG Identities)        |
| Accumulation OM | ISUP Received Message Counts, UPA Received Count             | This OM measures the number of ISUP User Part Available Messages (UPA) received from the SS7 Network. (Only for SG Identities)                            |
| Accumulation OM | ISUP Received Message Counts, UPT Received Count             | This OM measures the number of ISUP User Part Test Messages (UPT) received from the SS7 Network. (Only for SG Identities)                                 |
| Accumulation OM | ISUP Received Message Counts, USR Received Count             | This OM measures the number of ISUP User-to-User Information Messages (USR) received from the SS7 Network. (Only for SG Identities)                       |
| Accumulation OM | ISUP Received Message Counts, Wrong NE Received Count        | This OM measures the number of ISUP messages discarded as a result of not receiving the message from a SG Network Element.                                |
| Accumulation OM | Link Faults and Performance, Number of negative ack.received | 1.9 of Q.752 This OM measures number of negative acknowledgements received on the link indicating that the far end did not receive the message correctly. |

| OM TYPE         | OM TITLE                                                       | OM DESCRIPTION                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | Link Faults and Performance, Number of SUs received in error   | 1.8 of Q.752 This OM measures signaling units on a link, received in error.                                                                                                     |
| Accumulation OM | Link Faults and Performance, Octets Retransmitted              | 3.2 of Q.752 This OM counts number of bytes that are retransmitted. This count includes SIO, SIF, opening flags and check bits.                                                 |
| Accumulation OM | Link Faults and Performance, SL alignment or proving failure   | 1.7 of Q.752 This OM measures link synchronization failures during alignment or proving and indicates a signaling data link fault which prevents the SdL moving into service.   |
| Accumulation OM | Link Faults and Performance, SL failure-Abnormal FIBR/BSNR     | 1.3 of Q.752 This OM measures link synchronization failures and indicates complex failures in transmission or an intermittent hardware fault or even designer error.            |
| Accumulation OM | Link Faults and Performance, SL failure-All reasons            | 1.2 of Q.752 This OM measures in-service link failures due to any reason. It does not count link activation failures.                                                           |
| Accumulation OM | Link Faults and Performance, SL failure-Exc. delay of ack      | 1.4 of Q.752 This OM measures link synchronization failures and indicates serious disturbances or an interruption of signaling data link.                                       |
| Accumulation OM | Link Faults and Performance, SL failure-Exc. duration of cong. | 1.6 of Q.752 This OM measures link synchronization failures caused by prolonged congestion on the link.                                                                         |
| Accumulation OM | Link Faults and Performance, SL failure-Excessive error rate   | 1.5 of Q.752 This OM measures link synchronization failures and indicates noisy link.                                                                                           |
| Accumulation OM | Link Faults and Performance, SL failure-Other reasons          | This OM measures link synchronization failures due to reasons other than Abnormal FIBR/BSNR, Excessive delay of ack, Excessive error rate or Excessive duration of congestion . |
| Accumulation OM | Link Management, Changeover Procedure Count                    | This OM measures the number of times the changeover procedure is used to move traffic from a link taken out of service to one or more alternate in-service links.               |
| Accumulation OM | Link Management, Far End Mgmt Inhibit Count                    | This OM measures the number of times a link was successfully inhibited from the far end.                                                                                        |
| Accumulation OM | Link Management, Level 1 Congestion Count                      | This OM measures the number of times a link entered Level 1 congestion from no congestion.                                                                                      |
| Accumulation OM | Link Management, Level 1 Congestion Duration                   | This OM measures the total time, in seconds, a link was in Level 1 congestion.                                                                                                  |
| Accumulation OM | Link Management, Level 2 Congestion Count                      | This OM measures the number of times a link entered Level 2 congestion from Level 1 or no congestion.                                                                           |
| Accumulation OM | Link Management, Level 2 Congestion Duration                   | This OM measures the total time, in seconds, a link was in Level 2 congestion.                                                                                                  |
| Accumulation OM | Link Management, Level 3 Congestion Count                      | This OM measures the number of times a link entered Level 3 congestion from Level 1, Level 2, or no congestion.                                                                 |
| Accumulation OM | Link Management, Level 3 Congestion Duration                   | This OM measures the total time, in seconds, a link was in Level 3 congestion.                                                                                                  |
| Accumulation OM | Link Management, Link Available Duration                       | This OM measures the total time, in seconds, a link was available to MTP Level 3.                                                                                               |
| Accumulation OM | Link Management, Link Deactivated Duration                     | This OM measures the total time, in seconds, a link was manually made unavailable to MTP Level 3 by deactivation.                                                               |
| Accumulation OM | Link Management, Link Local Inhibit Duration                   | This OM measures the total time, in seconds, a link was manually made unavailable to MTP Level 3 by local inhibition.                                                           |

| OM TYPE         | OM TITLE                                           | OM DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | Link Management, Link Remote Inhibit Duration      | This OM measures the total time, in seconds, a link was manually made unavailable to MTP Level 3 by remote inhibition.                                                                                                                                                                                                                                                                                             |
| Accumulation OM | Link Management, Near End Forced Unavailable Count | This OM measures the number of times a link was manually made unavailable to MTP Level 3.                                                                                                                                                                                                                                                                                                                          |
| Accumulation OM | Link Management, RPO Count                         | This OM measures the number of times a link became unavailable to MTP Level 3 after the system received SIPO from the far end. This OM is not applicable for SAAL-based High Speed Links.                                                                                                                                                                                                                          |
| Accumulation OM | Link Management, RPO Cumulative Duration           | This OM measures the total time, in seconds, that a link was unavailable to MTP Level 3 after the system received SIPO from the far end. This OM is not applicable for SAAL-based High Speed Links.                                                                                                                                                                                                                |
| Accumulation OM | Link Management, Unavailable Duration              | This OM measures the total time, in seconds, a link was unavailable (automatically or manually made unavailable) to MTP Level 3.                                                                                                                                                                                                                                                                                   |
| Accumulation OM | Link Traffic, MSUs Received Count                  | This OM measures the number of MSUs received on a link, including those MSUs for which retransmission was requested in the SS7 network. For the SAAL-based High Speed Links, the above description applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                  |
| Accumulation OM | Link Traffic, MSUs Requiring GTT Count             | This OM measures the number of incoming MSUs that require GTT, regardless of the outcome of any GWS operation. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                      |
| Accumulation OM | Link Traffic, MSUs Transmitted Count               | This OM measures the number of MSUs transmitted to the far end, including those MSUs that were retransmitted in the SS7 network. For the SAAL-based High Speed Links, the above description applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                         |
| Accumulation OM | Link Traffic, MTP3b Discard Count                  | This OM measures the number of received MTP3B MSUs (> 272 octets) which were discarded because the outgoing link is not MTP3b capable. This OM only applies to MTP3B links since non-MTP3B links are not capable of receiving message > 272 octets.                                                                                                                                                                |
| Accumulation OM | Link Traffic, Network Indicator Discard Count      | This OM measures the number of received MSUs which were discarded due to a mismatch between the MSU's network indicator (NI) and the NI provisioned in this system. The NI may be provisioned on a network appearance basis. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                        |
| Accumulation OM | Link Traffic, Octets Received Count                | This OM measures the total number of octets actually received for all MSUs counted in the MSUs Received Count OM, before the octets are removed in MTP Level 2 processing for the SS7 network. For the MTP2-based links, this count accounts for MTP User Data + MTP L3 Data + MTP L2 Data octets. For the SAAL-based High Speed Links, this count applies to Message octets (MTP User Data + MTP L3 Data octets). |

| OM TYPE         | OM TITLE                                    | OM DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | Link Traffic, Octets Requiring GTT Count    | This OM measures the total number of MSU octets received for MSUs requiring GTT, including octets removed in MTP Level 2 processing. For the MTP2-based links, this count applies to MSU octets (MTP User Data + MTP L3 Data + MTP L2 Data octets). For the SAAL-based High Speed Links, this count applies to Message octets (MTP User Data + MTP L3 Data octets).                                                                                                                                         |
| Accumulation OM | Link Traffic, Octets Transmitted Count      | This OM measures the total number of octets actually transmitted for all MSUs counted in the MSUs Transmitted Count OM, including octets added in MTP Level 2 processing for the SS7 network. For the MTP2-based links, this count accounts for MTP User Data + MTP L3 Data + MTP L2 Data octets. For the SAAL-based High Speed Links, this count applies to Message octets (MTP User Data + MTP L3 Data octets).                                                                                           |
| Accumulation OM | Link Traffic, OPC Screening Discard Count   | This OM measures the number of received MSUs which were discarded because the OPC in the MSU matches the pointcode of this system ID or the OPC in the MSU matches the mate's pointcode but the MSU is not received from the C-link. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                         |
| Accumulation OM | Link Traffic, Originated MSU Octets Count   | This OM measures the total number of originated MSU octets (MSU that contains the PC or capability code of this system in the OPC field) transmitted, including those octets that were added in MTP Level 2 processing for the SS7 network. For the MTP2-based links, this count accounts for MTP User Data + MTP L3 Data + MTP L2 Data octets. For the SAAL-based High Speed Links, this count applies to Message octets (MTP User Data + MTP L3 Data octets).                                             |
| Accumulation OM | Link Traffic, Originated MSUs Count         | This OM measures the number of originated MSUs (MSUs that contain the PC or capability code of this system in the OPC field) that are successfully passed to Level 2 for transmission (for example, network management messages and MSUs completing GTT) in the SS7 network. For the MTP2-based links, this count applies to MSU octets (MTP User Data + MTP L3 Data + MTP L2 Data octets). For the SAAL-based High Speed Links, this count applies to Message octets (MTP User Data + MTP L3 Data octets). |
| Accumulation OM | Link Traffic, Pri 0 MSU Inbd Discard Count  | This OM measures the number of priority 0 MSUs discarded by the inbound link due to congestion at levels 1, 2, or 3 in the transmit buffers for the outbound link in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                                        |
| Accumulation OM | Link Traffic, Pri 0 MSU Outbd Discard Count | This OM measures the number of priority 0 MSUs discarded due to congestion at levels 1, 2, or 3 in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                                                                                                          |
| Accumulation OM | Link Traffic, Pri 1 MSU Inbd Discard Count  | This OM measures the number of priority 1 MSUs discarded by the inbound link due to congestion at levels 2 or 3 in the transmit buffers in the outbound link in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                                             |

| OM TYPE         | OM TITLE                                     | OM DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | Link Traffic, Pri 1 MSU Outbd Discard Count  | This OM measures the number of priority 1 MSUs discarded due to congestion at levels 2 or 3 in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                                                                                     |
| Accumulation OM | Link Traffic, Pri 2 MSU Inbd Discard Count   | This OM measures the number of priority 2 MSUs discarded by the inbound link due to congestion at level 3 in the transmit buffers for the outbound link in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                         |
| Accumulation OM | Link Traffic, Pri 2 MSU Outbd Discard Count  | This OM measures the number of priority 2 MSUs discarded due to level 3 congestion in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                                                                                              |
| Accumulation OM | Link Traffic, Pri 3 MSU Inbd Discard Count   | This OM measures the number of priority 3 MSUs discarded by the inbound link due to full transmit buffers for the outbound link in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                                                 |
| Accumulation OM | Link Traffic, Pri 3 MSU Outbd Discard Count  | This OM measures the number of priority 3 MSUs discarded due to a full transmit buffer in the SS7 network. For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data) instead of MSUs (MTP User Data + MTP L3 Data + MTP L2 Data).                                                                                                                                                                                                          |
| Accumulation OM | Link Traffic, Terminated MSU Octets Count    | This OM measures the total number of terminated MSU octets (acknowledged, incoming MSU that contains the PC or capability code of this system in the DPC field) received, including octets removed in MTP Level 2 processing for the SS7 network. For the MTP2-based links, this count accounts for MTP User Data + MTP L3 Data + MTP L2 Data octets. For the SAAL-based High Speed Links, this count applies to Message octets (MTP User Data + MTP L3 Data octets).              |
| Accumulation OM | Link Traffic, Terminated MSUs Count          | This OM measures the number of terminated MSUs (acknowledged, incoming MSUs that contain the PC or capability code of this system in the DPC field) received from the SS7 network. For the MTP2-based links, this count applies to MSUs (MTP User Data + MTP L3 Data + MTP L2 Data). For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data).                                                                                            |
| Accumulation OM | Link Traffic, Through-Switched MSUs Count    | This OM measures the number of through-switched MSUs (MSUs that do not contain the PC or capability code of this system in either the OPC or DPC) that are acknowledged, translated, and successfully passed to MTP Level 2 for transmission in the SS7 network. For the MTP2-based links, this count applies to MSUs (MTP User Data + MTP L3 Data + MTP L2 Data). For the SAAL-based High Speed Links, this count applies to Messages (MTP User Data + MTP L3 Data).              |
| Accumulation OM | Link Traffic, Thru-Switched MSU Octets Count | This OM measures the total number of through-switched MSU octets (MSU that does not contain the PC or capability code of this system in either the OPC or DPC) received, including those octets that were added in MTP Level 2 processing for the SS7 network. For the MTP2-based links, this count accounts for MTP User Data + MTP L3 Data + MTP L2 Data octets. For the SAAL-based High Speed Links, this count applies to Message octets (MTP User Data + MTP L3 Data octets). |

| OM TYPE         | OM TITLE                                           | OM DESCRIPTION                                                                                                                                           |
|-----------------|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | Linkset Utilization, Linkset Inactivity Duration   | This OM measures the total time, in seconds, that all links in the linkset were unavailable (automatically or manually made unavailable) to MTP Level 3. |
| Accumulation OM | Linkset Utilization, RST Received Count            | This OM measures the number of restart (RST) messages received.                                                                                          |
| Accumulation OM | Linkset Utilization, RST Transmitted Count         | This OM measures the number of restart (RST) messages transmitted.                                                                                       |
| Accumulation OM | Linkset Utilization, TFA and TCA Received Count    | This OM measures the number of transfer-allowed (TFA) and transfer-cluster-allowed (TCA) messages received.                                              |
| Accumulation OM | Linkset Utilization, TFA and TCA Transmitted Count | This OM measures the number of transfer-allowed (TFA) and transfer-cluster-allowed (TCA) messages transmitted.                                           |
| Accumulation OM | Linkset Utilization, TFC Received Count            | This OM measures the number of transfer-controlled (TFC) messages received by the gateway, listed by the originating network.                            |
| Accumulation OM | Linkset Utilization, TFC Transmitted Count         | This OM measures the number of transfer-controlled (TFC) messages transmitted by the gateway, listed by the destination network.                         |
| Accumulation OM | Linkset Utilization, TFP and TCP Received Count    | This OM measures the number of transfer-prohibited (TFP) and transfer-cluster-prohibited (TCP) messages received.                                        |
| Accumulation OM | Linkset Utilization, TFP and TCP Transmitted Count | This OM measures the number of transfer-prohibited (TFP) and transfer-cluster-prohibited (TCP) messages transmitted.                                     |
| Accumulation OM | Linkset Utilization, TFR and TCR Received Count    | This OM measures the number of transfer-restricted (TFR) and transfer-cluster-restricted (TCR) messages received.                                        |
| Accumulation OM | Linkset Utilization, TFR and TCR Transmitted Count | This OM measures the number of transfer-restricted (TFR) and transfer-cluster-restricted (TCR) messages transmitted.                                     |
| Accumulation OM | Linkset Utilization, UPU Received Count            | This OM measures the number of user part unavailable messages received.                                                                                  |
| Accumulation OM | Log Server, Critical Alarms Ack Count              | This OM measures the number of critical alarms acknowledged by the Log server.                                                                           |
| Accumulation OM | Log Server, Critical Alarms Cleared Count          | This OM measures the number of critical alarms cleared by the Log server.                                                                                |
| Accumulation OM | Log Server, Critical Alarms Received Count         | This OM measures the number of critical alarms received by the Log server.                                                                               |
| Accumulation OM | Log Server, Major Alarms Ack Count                 | This OM measures the number of major alarms acknowledged by the Log server.                                                                              |
| Accumulation OM | Log Server, Major Alarms Cleared Count             | This OM measures the number of major alarms cleared by the Log server.                                                                                   |
| Accumulation OM | Log Server, Major Alarms Received Count            | This OM measures the number of major alarms received by the Log server.                                                                                  |
| Accumulation OM | Log Server, Minor Alarms Ack Count                 | This OM measures the number of minor alarms acknowledged by the Log server.                                                                              |
| Accumulation OM | Log Server, Minor Alarms Cleared Count             | This OM measures the number of minor alarms cleared by the Log server.                                                                                   |
| Accumulation OM | Log Server, Minor Alarms Received Count            | This OM measures the number of minor alarms received by the Log server.                                                                                  |

| OM TYPE         | OM TITLE                                     | OM DESCRIPTION                                                                                                                                                                                                                |
|-----------------|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | NP Database Totals, Add/Change Updates       | This OM measures the total number of add/change updates received from the LSMS.                                                                                                                                               |
| Accumulation OM | NP Database Totals, Delete Updates           | This OM measures the total number of delete updates received from the LSMS.                                                                                                                                                   |
| Accumulation OM | NP Database Totals, Emergency Updates        | This OM measures the total number of application database updates received from the USP debug facility and can only be displayed from the debug facility Note: Debug is only accessible by Nortel Networks Support Personnel. |
| Accumulation OM | NP Database Totals, Operational Time         | This OM measures the total time within the OM interval that the NPDB was operational.                                                                                                                                         |
| Accumulation OM | NP Database Totals, Retransmitted Updates    | This OM measures the total number of updates retransmitted within the system.                                                                                                                                                 |
| Accumulation OM | NP INAP Totals, INAP CdPN Normalize Failures | This OM measures the number of called party number normalization failures.                                                                                                                                                    |
| Accumulation OM | NP INAP Totals, INAP Indeterminate Queries   | This OM measures the number of INAP indeterminate queries.                                                                                                                                                                    |
| Accumulation OM | NP INAP Totals, INAP Invalid Context         | This OM measures the number of INAP queries with invalid application context.                                                                                                                                                 |
| Accumulation OM | NP INAP Totals, INAP Queries Non-Ported      | This OM measures the number of INAP non ported number queries received.                                                                                                                                                       |
| Accumulation OM | NP INAP Totals, INAP Queries Ported          | This OM measures the number of INAP ported number queries received.                                                                                                                                                           |
| Accumulation OM | NP INAP Totals, INAP Queries Ported Across   | This OM measures the number of INAP ported across number queries received.                                                                                                                                                    |
| Accumulation OM | NP INAP Totals, INAP Queries Ported In       | This OM measures the number of INAP ported in number queries received.                                                                                                                                                        |
| Accumulation OM | NP INAP Totals, INAP Queries Ported Out      | This OM measures the number of INAP ported out number queries received.                                                                                                                                                       |
| Accumulation OM | NP INAP Totals, INAP Queries Unknown         | This OM measures the number of INAP queries received for numbers with unknown ported status.                                                                                                                                  |
| Accumulation OM | NP INAP Totals, INAP Query Failures          | This OM measures the number of INAP query failures.                                                                                                                                                                           |
| Accumulation OM | NP INAP Totals, INAP Query Time Outs         | This OM measures the total number of INAP query time outs.                                                                                                                                                                    |
| Accumulation OM | NP INAP Totals, INAP Total Queries           | This OM measures the total number of INAP queries received.                                                                                                                                                                   |
| Accumulation OM | NP LSSI Totals, MR Query Received            | This OM measures the total number of MR queries received by an application database system node.                                                                                                                              |
| Accumulation OM | NP LSSI Totals, NP Query Received            | This OM measures the total number of NP queries received by an application database system node.                                                                                                                              |
| Accumulation OM | NP NETID Totals, MR Failures                 | This OM measures the total number of MR query failures identified. The MR Failures value is based upon the Network ID of a received SCCP message.                                                                             |
| Accumulation OM | NP NETID Totals, MR GTT Overrides            | This OM measures the total number of MR queries receiving GTT override. The MR GTT Overrides value is based upon the Network ID of a received SCCP message.                                                                   |
| Accumulation OM | NP NETID Totals, MR Loop Detection           | This OM measures the total number of potential looping detections. The MR Loop Detection value is based upon the Network ID of a received SCCP message.                                                                       |

| OM TYPE         | OM TITLE                                      | OM DESCRIPTION                                                                                                                                                                                                                              |
|-----------------|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | NP NETID Totals, MR Non-Ported                | This OM measures the total number of MR queries received for non-ported numbers. The MR Non-Ported value is based upon the Network ID of a received SCCP message.                                                                           |
| Accumulation OM | NP NETID Totals, MR Ported                    | This OM measures the total number of MR queries received for ported numbers. The MR Ported value is based upon the Network ID of a received SCCP message.                                                                                   |
| Accumulation OM | NP NETID Totals, MR Total                     | This OM measures the total number of MR queries received. The MR Total value is based upon the Network ID of a received SCCP message.                                                                                                       |
| Accumulation OM | NP NETID Totals, NP Failures                  | This OM measures the total number of NP query failures. The NP Failures value is based upon the Network ID of a received TCAP message.                                                                                                      |
| Accumulation OM | NP NETID Totals, NP Non-Ported                | This OM measures the total number of NP queries received for non-ported numbers. The NP Non-Ported value is based upon the Network ID in the TCAP message.                                                                                  |
| Accumulation OM | NP NETID Totals, NP Ported                    | This OM measures the total number of NP queries received for ported numbers. The NP Ported value is based upon the Network ID contained in the NETID of a received TCAP message.                                                            |
| Accumulation OM | NP NETID Totals, NP Total                     | This OM measures the total number of NP queries received. The NP Total value is based upon the Network ID of a received TCAP message.                                                                                                       |
| Accumulation OM | NP Service Rule Totals, Service Rule Match    | This OM measures the total number of matches for the Service Rule.                                                                                                                                                                          |
| Accumulation OM | NP Service Rule Totals, Service Rule Mismatch | This OM measures the total number of mismatches for all the Service Rules.                                                                                                                                                                  |
| Accumulation OM | NP Service Totals, Database Mismatches        | This OM measures the total number of Database mismatches. This OM is collected by Service ID.                                                                                                                                               |
| Accumulation OM | NP Service Totals, GTA Normalization Failures | This OM measures the total number of GTA number normalization failures. This OM is collected by Service ID.                                                                                                                                 |
| Accumulation OM | NP Service Totals, GTA Replacement            | This OM measures the total number of service queries receiving GTA replacement. This OM is collected by Service ID.                                                                                                                         |
| Accumulation OM | NP Service Totals, GTT Overrides              | This OM measures the total number of service queries receiving GTT override. This OM is collected by Service ID.                                                                                                                            |
| Accumulation OM | NP Service Totals, RN Check Failures          | This OM measures the total number of RN check failures on incoming messages using the NoA/RN table. This OM is collected by Service ID.                                                                                                     |
| Accumulation OM | NP Service Totals, Service Failures           | This OM measures the total number of Service query failures identified. Service query failures occur when the query logic is unable to process the Service query. This OM is collected by Service ID.                                       |
| Accumulation OM | NP Service Totals, Service Non-Ported         | This OM measures the total number of Service queries received for non-ported numbers. This OM is collected by Service ID.                                                                                                                   |
| Accumulation OM | NP Service Totals, Service Ported             | This OM measures the total number of Service queries received for ported numbers. The Service Ported value is the total of OMR_SERVICE_PORTED_IN, OMR_SERVICE_PORTED_OUT, and OMR_SERVICE_PORTED_ACROSS This OM is collected by Service ID. |

| OM TYPE         | OM TITLE                                       | OM DESCRIPTION                                                                                                                                   |
|-----------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | NP Service Totals, Service Total               | This OM measures the total number of Service queries received. This OM is collected by Service ID.                                               |
| Accumulation OM | NP Service Totals, TT Replacement              | This OM measures the total number of service queries receiving TT replacement. This OM is collected by Service ID.                               |
| Accumulation OM | NP SMI Totals, High Congestion                 | This OM measures the total number of times that the high level congestion state was entered.                                                     |
| Accumulation OM | NP SMI Totals, Login Failures                  | This OM measures the total number of failed LSMS login attempts.                                                                                 |
| Accumulation OM | NP SMI Totals, Low Congestion                  | This OM measures the total number of times that the low level congestion state was entered.                                                      |
| Accumulation OM | NP SMI Totals, Medium Congestion               | This OM measures the total number of times that the medium level congestion state was entered.                                                   |
| Accumulation OM | NP SMI Totals, Messages Invalid                | This OM measures the total number of invalid messages received from the LSMS.                                                                    |
| Accumulation OM | NP SMI Totals, Messages Received               | This OM measures the total number of messages received from the LSMS.                                                                            |
| Accumulation OM | NP SMI Totals, Messages Rejected               | This OM measures the total number of received messages from the LSMS that were rejected.                                                         |
| Accumulation OM | NP SRF Totals, SRF Ind. Routing with Ref. Sub. | This OM measures the number of SRF messages relayed to the subscription network via indirect routing with reference to the subscription network. |
| Accumulation OM | NP SRF Totals, SRF No NP DB Record Found       | This OM measures the number of SRF queries received when no record is found in the NP DB.                                                        |
| Accumulation OM | NP SRF Totals, SRF Queries Non-Ported          | This OM measures the number of SRF non ported number queries received.                                                                           |
| Accumulation OM | NP SRF Totals, SRF Queries Ported Across       | This OM measures the number of SRF ported across number queries received.                                                                        |
| Accumulation OM | NP SRF Totals, SRF Queries Ported In           | This OM measures the number of SRF ported in number queries received.                                                                            |
| Accumulation OM | NP SRF Totals, SRF Queries Ported Out          | This OM measures the number of SRF ported out number queries received.                                                                           |
| Accumulation OM | NP SRF Totals, SRF Queries Unknown             | This OM measures the number of SRF queries received for numbers with unknown ported status.                                                      |
| Accumulation OM | NP SRF Totals, SRF Query Failures              | This OM measures the number of SRF query failures.                                                                                               |
| Accumulation OM | NP SRF Totals, SRF Relayed to HLR              | This OM measures the number of SRF messages relayed to the HLR.                                                                                  |
| Accumulation OM | NP SRF Totals, SRF Successful Messages to MSC  | This OM measures the number of SRF successful messages sent back to the MSC.                                                                     |
| Accumulation OM | NP SRF Totals, SRF Total Queries               | This OM measures the total number of SRF queries received.                                                                                       |
| Accumulation OM | NP SRF Totals, SRF Total Queries Ported        | This OM measures the total number of SRF ported number queries received.                                                                         |
| Accumulation OM | NP SRF Totals, SRF Transaction Errors Sent Out | This OM measures the number of SRF transaction error messages sent out.                                                                          |
| Accumulation OM | NP TnT Totals, TNT Acks Sent                   | This OM measures the number of Tariff non Transparency acknowledgement messages transmitted.                                                     |

| OM TYPE         | OM TITLE                                             | OM DESCRIPTION                                                                                                                                                                                              |
|-----------------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | NP TnT Totals, TNT Decode Errors                     | This OM measures the number of Tariff non Transparency MAP decode failures due to incorrect parameters that could not be decoded.                                                                           |
| Accumulation OM | NP TnT Totals, TNT Decode Invalid Params             | This OM measures the number of Tariff non Transparency MAP decode failures due to invalid parameters. (i.e. IMSI instead of MSISDN included)                                                                |
| Accumulation OM | NP TnT Totals, TNT No NP DB Rec Found                | This OM measures the number of Tariff non Transparency queries received for numbers not found in the NP DB.                                                                                                 |
| Accumulation OM | NP TnT Totals, TNT Queries Non-Ported                | This OM measures the number of Tariff non Transparency non ported number queries received.                                                                                                                  |
| Accumulation OM | NP TnT Totals, TNT Queries Ported Across             | This OM measures the number of Tariff non Transparency ported across number queries received.                                                                                                               |
| Accumulation OM | NP TnT Totals, TNT Queries Ported In                 | This OM measures the number of Tariff non Transparency ported in number queries received.                                                                                                                   |
| Accumulation OM | NP TnT Totals, TNT Queries Ported Out                | This OM measures the number of Tariff non Transparency ported out number queries received.                                                                                                                  |
| Accumulation OM | NP TnT Totals, TNT Queries Unknown                   | This OM measures the number of Tariff non Transparency queries received for numbers with unknown ported status.                                                                                             |
| Accumulation OM | NP TnT Totals, TNT Query Failures                    | This OM measures the number of Tariff non Transparency query failures during processing.                                                                                                                    |
| Accumulation OM | NP TnT Totals, TNT Total Messages Received           | This OM measures the total number of Tariff non Transparency queries received.                                                                                                                              |
| Accumulation OM | NP TnT Totals, TNT Total Queries Ported              | This OM measures the total number of Tariff non Transparency ported number queries received.                                                                                                                |
| Accumulation OM | NP TnT Totals, TNT Transmission Failures             | This OM measures the number of Tariff non Transparency failures during transmission of Ack.                                                                                                                 |
| Accumulation OM | Route Set Management, RouteSet Congested Count       | This OM measures the number of times, a routeset went into network congestion.                                                                                                                              |
| Accumulation OM | Route Set Management, Routeset Man-busied Count      | This OM measures the number of times a routeset was manually made unavailable.                                                                                                                              |
| Accumulation OM | Route Set Management, Routeset Unavailability Count  | This OM measures the number of times a routeset was unavailable.                                                                                                                                            |
| Accumulation OM | Route Set Management, Routeset Unavailability Dur.   | This OM measures the total time, in seconds, a routeset was unavailable.                                                                                                                                    |
| Accumulation OM | RTC Sanity, RTC12 Passive Audit Count                | This OM hooks into the node maintenance audit, and is pegged on the control shelf CCs, when it does not receive audit request from RTC12 even once. Thus this is a passive audit of RTC                     |
| Accumulation OM | RTC Sanity, RTC15 Passive Audit Count                | This OM hooks into the node maintenance audit, and is pegged on both the control shelf CCs, when it does not receive audit request from RTC15 even once. Thus this is a passive audit of RTC.               |
| Accumulation OM | SAAL Link Management, Cum. Dur. of FE Processor Out. | This OM measures the cumulative duration in seconds during which the use of the link was precluded due to a remote (far-end) processor outage condition, summed across all far-end processor outage events. |

| OM TYPE         | OM TITLE                                              | OM DESCRIPTION                                                                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | SAAL Link Management, Cum. Dur. of Lack-of-Credit     | This OM measures the cumulative duration of time in seconds during which SSCOP had PDUs to send to its peer but could not do so because it was not given credit by the far end, summed over all the Lack-of-Credit events occurring during the measurement interval. |
| Accumulation OM | SAAL Link Management, Duration of Link in Service     | This OM measures the number of seconds the link is regarded in service.                                                                                                                                                                                              |
| Accumulation OM | SAAL Link Management, Invalid SSCOP PDUs Rx           | This OM measures the number of Invalid SSCOP PDUs Received.                                                                                                                                                                                                          |
| Accumulation OM | SAAL Link Management, Lack of Credit Events           | This OM measures the number of Lack-of-Credit Events.                                                                                                                                                                                                                |
| Accumulation OM | SAAL Link Management, PDUs Tx Requiring RTx           | This OM measures the number of SSCOP PDUs transmitted that required retransmission because they were not acknowledged by the far-end's SSCOP peer.                                                                                                                   |
| Accumulation OM | SAAL Link Management, Signaling Link Alig. Failures   | This OM measures the number of Signaling Link Alignment Failures.                                                                                                                                                                                                    |
| Accumulation OM | SAAL Link Management, SSCOP Connection Disconnects    | This OM measures the number of SSCOP Connection Disconnects which are characterized by the expiry of Timer_NO_RESPONSE.                                                                                                                                              |
| Accumulation OM | SAAL Link Management, SSCOP Connection Init. Fails    | This OM measures the number of SSCOP Initiation Failures, i.e. the inability to establish an SSCOP Connection.                                                                                                                                                       |
| Accumulation OM | SAAL Link Management, SSCOP Connection Re-est/Resync  | This OM measures the number of SSCOP Re-establishments/Resynchronizations.                                                                                                                                                                                           |
| Accumulation OM | SAAL Link Management, SSCOP Connection Sum-of-Errors  | This OM measures the total number of SSCOP Connection Disconnects, Connection Initiation Failures and Connection Re-establishment/Resynchronization.                                                                                                                 |
| Accumulation OM | SAAL Link Management, SSCOP PDUs Sum-of-Errors        | This OM measures the total number of Unexpected SSCOP PDUs, Invalid SSCOP PDUs and SSCOP PDUs with Other/List Element Errors.                                                                                                                                        |
| Accumulation OM | SAAL Link Management, SSCOP PDUs with List Elem. Errs | This OM measures the number of SSCOP PDUs Received with List Element Errors.                                                                                                                                                                                         |
| Accumulation OM | SAAL Link Management, Unexpected SSCOP PDUs Rx        | This OM measures the number of Unexpected SSCOP PDUs Received.                                                                                                                                                                                                       |
| Accumulation OM | SAAL Link Traffic, PDU Octets RTx                     | This OM measures the number of octets associated with retransmitted SSCOP Sequenced Data PDUs.                                                                                                                                                                       |
| Accumulation OM | SAAL Link Traffic, PDU Octets Rx                      | This OM measures the number of octets associated with SSCOP Sequenced Data PDUs received.                                                                                                                                                                            |
| Accumulation OM | SAAL Link Traffic, PDU Octets Tx                      | This OM measures the number of octets associated with SSCOP Sequenced Data PDUs transmitted, including retransmissions.                                                                                                                                              |
| Accumulation OM | SAAL Link Traffic, PDUs RTx                           | This OM measures the number of SSCOP Sequenced Data PDUs retransmitted.                                                                                                                                                                                              |
| Accumulation OM | SAAL Link Traffic, PDUs Rx                            | This OM measures the number of SSCOP Sequenced Data PDUs received.                                                                                                                                                                                                   |
| Accumulation OM | SAAL Link Traffic, PDUs Tx                            | This OM measures the number of SSCOP Sequenced Data PDUs transmitted including retransmissions.                                                                                                                                                                      |
| Accumulation OM | SAAL Link Traffic, Total PDU Octets Rx                | This OM measures the number of octets associated with received SSCOP PDUs of all types.                                                                                                                                                                              |

| OM TYPE         | OM TITLE                                            | OM DESCRIPTION                                                                                                                                                               |
|-----------------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | SAAL Link Traffic, Total PDU Octets Tx              | This OM measures the number of octets associated with transmitted SSCOP PDUs of all types which may include Sequenced Data PDU retransmissions.                              |
| Accumulation OM | SAAL Link Traffic, Total PDUs Rx                    | This OM measures the number of SSCOP PDUs of all types received.                                                                                                             |
| Accumulation OM | SAAL Link Traffic, Total PDUs Tx                    | This OM measures the number of transmitted SSCOP PDUs of all types including Sequenced Data PDU retransmissions.                                                             |
| Accumulation OM | SCCP GTT, Alt Routing on Cong Count                 | This OM measures the number of times a message is routed to the backup system because the routeset to the primary system is congested.                                       |
| Accumulation OM | SCCP GTT, GTT Performed Count                       | This OM measures the total number of MSUs that successfully completed GTT (that is, a match was found for the global title). The count is kept across all translation types. |
| Accumulation OM | SCCP GTT, Hop Counter Violation Count               | This OM measures the number of times that a SCCP hop counter violation has occurred.                                                                                         |
| Accumulation OM | SCCP GTT, No Translation for Addr Count             | This OM measures the number of times a match could not be found for the GTA in the translation table. The count is kept across all translation types.                        |
| Accumulation OM | SCCP GTT, Trans Type Not Found Count                | This OM measures the number of times the translation type specified in the MSU was not supported by the USP.                                                                 |
| Accumulation OM | SCCP Local Subsystem, # Msgs for Local SS discarded | This OM measures the number of messages destined to local subsystems that were discarded.                                                                                    |
| Accumulation OM | SCCP Local Subsystem, # Msgs for Local SS UDTSeD    | This OM measures the number of messages destined to local subsystems that receive an error response (UDTS).                                                                  |
| Accumulation OM | SCCP Local Subsystem, Subsystem Activated           | This OM measures the number of times a subsystem has been manually activated.                                                                                                |
| Accumulation OM | SCCP Local Subsystem, Subsystem Allowed             | This OM measures the number of times a subsystem has gone in service (allowed).                                                                                              |
| Accumulation OM | SCCP Local Subsystem, Subsystem Allowed Duration    | This OM measures the total duration that the subsystem was in service (allowed).                                                                                             |
| Accumulation OM | SCCP Local Subsystem, Subsystem Deactivated         | This OM measures the number of times a subsystem has been manually deactivated.                                                                                              |
| Accumulation OM | SCCP Local Subsystem, Subsystem Prohibited          | This OM measures the number of times a subsystem has gone out of service (prohibited). Unit of measure is a 10 second period.                                                |
| Accumulation OM | SCCP Local Subsystem, Subsystem Prohibited Duration | This OM measures the total duration that a subsystem was out of service (prohibited). Unit of measure is a 10 second period.                                                 |
| Accumulation OM | SCCP LSS Instance, SSI Activated                    | This OM measures the number of times a subsystem instance has been manually activated.                                                                                       |
| Accumulation OM | SCCP LSS Instance, SSI Allowed                      | This OM measures the number of times a subsystem instance has gone in service (allowed).                                                                                     |
| Accumulation OM | SCCP LSS Instance, SSI Allowed Duration             | This OM measures the duration that the subsystem instance was in service (allowed). Unit of measure is a 10 second period.                                                   |
| Accumulation OM | SCCP LSS Instance, SSI Application Failure          | This OM measures the number of times a subsystem instance has gone out of service (application failure).                                                                     |

| OM TYPE         | OM TITLE                                           | OM DESCRIPTION                                                                                                                         |
|-----------------|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | SCCP LSS Instance, SSI Congested                   | This OM measures the number of times a subsystem instance has gone into congestion.                                                    |
| Accumulation OM | SCCP LSS Instance, SSI Deactivated                 | This OM measures the number of times a subsystem instance has gone out of service (manually deactivated).                              |
| Accumulation OM | SCCP LSS Instance, SSI Platform Failure            | This OM measures the number of times a subsystem instance has gone out of service (platform failure).                                  |
| Accumulation OM | SCCP LSS Instance, SSI Prohibited Duration         | This OM measures the duration a local subsystem instance has been out of service (prohibited). Unit of measure is a 10 second period.  |
| Accumulation OM | SCCP System Totals, Conn-Orient IP Dist Viol Count | This OM measures the number of IP originated connection-oriented messages that were discarded because they requested SCCP distribution |
| Accumulation OM | SCCP System Totals, Conn-Orient Msg Handled Count  | This OM measures the number of connection- oriented messages that were successfully routed                                             |
| Accumulation OM | SCCP System Totals, Conn-Orient Msg Rtg Fail Count | This OM measures the number of connection- oriented messages that the USP was unable to route                                          |
| Accumulation OM | SCCP System Totals, LUDT Msg Rcvd Count            | This OM measures the number of LUDT messages that the SCCP level received.                                                             |
| Accumulation OM | SCCP System Totals, LUDT Msg Sent Count            | This OM measures the number of LUDT messages that the SCCP level sent.                                                                 |
| Accumulation OM | SCCP System Totals, LUDTS Msg Rcvd Count           | This OM measures the number of LUDTS messages that the SCCP level received.                                                            |
| Accumulation OM | SCCP System Totals, LUDTS Msg Sent Count           | This OM measures the number of LUDTS messages that the SCCP level sent.                                                                |
| Accumulation OM | SCCP System Totals, Msg Incompatibility            | This OM measures the number of times XUDT to UDT conversion fails.                                                                     |
| Accumulation OM | SCCP System Totals, Msg too large for segmentation | This OM measures the number of times segmentation fails due to an over-long message.                                                   |
| Accumulation OM | SCCP System Totals, MSUs Disc-Unrec SCCP Msg Count | This OM measures the number of MSUs discarded because of an unrecognized SCCP message type.                                            |
| Accumulation OM | SCCP System Totals, Out of sequence SCCP msg count | This OM measures the number of times Segments are received out of sequence                                                             |
| Accumulation OM | SCCP System Totals, Reassembly buffer unavailable  | This OM measures the number of times Reassembly resources unavailable occurred                                                         |
| Accumulation OM | SCCP System Totals, Reassembly failed              | This OM measures the number of times Reassembly fails for any non-specified reason.                                                    |
| Accumulation OM | SCCP System Totals, Reassembly Timer Expired       | This OM measures the number of times Reassembly Timer expired                                                                          |
| Accumulation OM | SCCP System Totals, Routing Failure - Unequip.User | This OM measures the number of times SCCP Routing control fails to find a subsystem to route the message.                              |
| Accumulation OM | SCCP System Totals, SCCP Routing Failure Count     | This OM measures the number of messages that SCCP was unable to route.                                                                 |
| Accumulation OM | SCCP System Totals, Segmentation failed            | This OM measures the number of times segmentation fails for any non-specified reason.                                                  |
| Accumulation OM | SCCP System Totals, Segmentation not supported     | This OM measures the number of messages dumped because segmentation is not supported                                                   |

| OM TYPE         | OM TITLE                                                       | OM DESCRIPTION                                                                                                                                                                                                                                                                                                     |
|-----------------|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | SCCP System Totals, SSA Received Count                         | This OM measures the number of subsystem-allowed (SSA) messages received.                                                                                                                                                                                                                                          |
| Accumulation OM | SCCP System Totals, SSA Transmitted Count                      | This OM measures the number of subsystem-allowed (SSA) messages transmitted.                                                                                                                                                                                                                                       |
| Accumulation OM | SCCP System Totals, SSP Received Count                         | This OM measures the number of subsystem-prohibited (SSP) messages received.                                                                                                                                                                                                                                       |
| Accumulation OM | SCCP System Totals, SSP Transmitted Count                      | This OM measures the number of subsystem-prohibited (SSP) messages transmitted.                                                                                                                                                                                                                                    |
| Accumulation OM | SCCP System Totals, SST Received Count                         | This OM measures the number of subsystem-status-test (SST) messages received.                                                                                                                                                                                                                                      |
| Accumulation OM | SCCP System Totals, SST Transmitted Count                      | This OM measures the number of subsystem-status-test (SST) messages transmitted.                                                                                                                                                                                                                                   |
| Accumulation OM | SCCP System Totals, Total messages handled                     | This OM measures all messages processed by SCCP routing control in both incoming and outgoing directions, whether or not the message is processed or delivered successfully. It includes Class 2 and Class 3 connection oriented messages. It does not include Subsystem Status messages such as SSP, SSA, or SST. |
| Accumulation OM | SCCP System Totals, UDT Msg Rcvd Count                         | This OM measures the number of UDT messages that the SCCP level received.                                                                                                                                                                                                                                          |
| Accumulation OM | SCCP System Totals, UDT Msg Sent Count                         | This OM measures the number of UDT messages sent from the SCCP level.                                                                                                                                                                                                                                              |
| Accumulation OM | SCCP System Totals, UDTS Msg Rcvd Count                        | This OM measures the number of UDTS messages that the SCCP level received.                                                                                                                                                                                                                                         |
| Accumulation OM | SCCP System Totals, UDTS Msg Sent Count                        | This OM measures the number of UDTS messages sent from the SCCP level.                                                                                                                                                                                                                                             |
| Accumulation OM | SCCP System Totals, XUDT Msg Rcvd Count                        | This OM measures the number of XUDT messages that the SCCP level received.                                                                                                                                                                                                                                         |
| Accumulation OM | SCCP System Totals, XUDT Msg Sent Count                        | This OM measures the number of XUDT messages sent from the SCCP level.                                                                                                                                                                                                                                             |
| Accumulation OM | SCCP System Totals, XUDTS Hopcounter violation                 | This OM measures the number of MSUs discarded because of Hopcounter violations.                                                                                                                                                                                                                                    |
| Accumulation OM | SCCP System Totals, XUDTS Msg Rcvd Count                       | This OM measures the number of XUDTS messages that the SCCP level received.                                                                                                                                                                                                                                        |
| Accumulation OM | SCCP System Totals, XUDTS Msg Sent Count                       | This OM measures the number of XUDTS messages sent from the SCCP level.                                                                                                                                                                                                                                            |
| Accumulation OM | SCTP Management/Traffic Counts, Association Aborted Count      | This OM measures the number of associations that are aborted by the application, the peer connection or a failure in the network.                                                                                                                                                                                  |
| Accumulation OM | SCTP Management/Traffic Counts, Association Establish Attempts | This OM measures the number of associations which the user or peer SCTP tried to established.                                                                                                                                                                                                                      |
| Accumulation OM | SCTP Management/Traffic Counts, Association Terminated Count   | This OM measures the number of associations that are terminated by the application or the peer connection.                                                                                                                                                                                                         |
| Accumulation OM | SCTP Management/Traffic Counts, Chunk Retransmitted Count      | This OM measures the number of SCTP chunks retransmitted due to SCTP Packets or SCTP Sacks lost in the network. Note: A SCTP packet may contain more than one chunk.                                                                                                                                               |

| OM TYPE         | OM TITLE                                                      | OM DESCRIPTION                                                                                                                                                                                                                |
|-----------------|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | SCTP Management/Traffic Counts, Chunks Received Count         | This OM measures the number of SCTP chunks received. Note: A SCTP packet may contain more than one chunk.                                                                                                                     |
| Accumulation OM | SCTP Management/Traffic Counts, Chunks Transmitted Count      | This OM measures the number of SCTP chunks transmitted. Note: A SCTP packet may contain more than one chunk.                                                                                                                  |
| Accumulation OM | SCTP Management/Traffic Counts, Established Association Count | This OM measures the number of associations which are in a established state.                                                                                                                                                 |
| Accumulation OM | SCTP Management/Traffic Counts, Out of Blue SCTP Packet       | This OM measures the number of SCTP packets that are received but are not able to identify the association to which they belong.                                                                                              |
| Accumulation OM | SIP Application Service Totals, SIP Call Timeout              | This OM measures the total number of SIP call timeout. This value will be pegged when the SIP transaction stay alive for too long and get cleaned up by the Transaction audit.                                                |
| Accumulation OM | SIP Application Service Totals, SIP message Received          | This OM measures the total number of SIP message received from the Application Server (including all SIP Response msgs)                                                                                                       |
| Accumulation OM | SIP Application Service Totals, SIP message Transmitted       | This OM measures the total number of SIP message transmitted to the Application Server (including all Invite/Notify msgs)                                                                                                     |
| Accumulation OM | SIP Application Service Totals, SIP TCAP Application Timeout  | This OM measures the total number of SIP TCAP application timeout                                                                                                                                                             |
| Accumulation OM | SIP Application Service Totals, TCAP message received         | This OM measures the total number of TCAP orig Or UNI MSUs received for the SIP application on this IP LINK Node.                                                                                                             |
| Accumulation OM | SIP Application Service Totals, TCAP message transmitted      | This OM measures the total number of TCAP Response MSUs received for the SIP application on this IP LINK Node                                                                                                                 |
| Accumulation OM | SLR Database Totals, Add/Change Updates                       | This OM measures the total number of add/change updates received from the HLR provisioning system.                                                                                                                            |
| Accumulation OM | SLR Database Totals, Delete Updates                           | This OM measures the total number of delete updates received from the HLR provisioning system.                                                                                                                                |
| Accumulation OM | SLR Database Totals, Emergency Updates                        | This OM measures the total number of application database updates received from the USP debug facility and can only be displayed from the debug facility Note: Debug is only accessible by Nortel Networks Support Personnel. |
| Accumulation OM | SLR Database Totals, Operational Time                         | This OM measures the total time within the OM interval that the SLRDB was operational.                                                                                                                                        |
| Accumulation OM | SLR Database Totals, Retransmitted Updates                    | This OM measures the total number of updates retransmitted within the BroadBand STP.                                                                                                                                          |
| Accumulation OM | SLR LSSI Totals, Total Failed Queries                         | This OM measures the total number of SLR queries received by an SLR application database system node that failed for any reason across all services and message types.                                                        |
| Accumulation OM | SLR LSSI Totals, Total Queries Received                       | This OM measures the total number of SLR queries received by an SLR application database system node across all services and message types.                                                                                   |
| Accumulation OM | SLR Message Type Totals, IMSI Failed Queries                  | This OM measures the total number of IMSI queries received by an SLR application database system node that failed for any reason.                                                                                             |
| Accumulation OM | SLR Message Type Totals, IMSI Failed SLRDB Lookup             | This OM measures the total number of IMSI queries received by an SLR application database system node that failed in their SLRDB lookup.                                                                                      |

| OM TYPE         | OM TITLE                                                | OM DESCRIPTION                                                                                                                                                                                                    |
|-----------------|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | SLR Message Type Totals, IMSI Query Received            | This OM measures the total number of IMSI queries received by an SLR application database system node.                                                                                                            |
| Accumulation OM | SLR Message Type Totals, IMSI Successful SLRDB Lookup   | This OM measures the total number of IMSI queries received by an SLR application database system node that succeeded in their SLRDB lookup.                                                                       |
| Accumulation OM | SLR Message Type Totals, MSISDN Failed Queries          | This OM measures the total number of MSISDN queries received by an SLR application database system node that failed for any reason.                                                                               |
| Accumulation OM | SLR Message Type Totals, MSISDN Failed SLRDB Lookup     | This OM measures the total number of MSISDN queries received by an SLR application database system node that failed in their SLRDB lookup.                                                                        |
| Accumulation OM | SLR Message Type Totals, MSISDN Query Received          | This OM measures the total number of MSISDN queries received by an SLR application database system node.                                                                                                          |
| Accumulation OM | SLR Message Type Totals, MSISDN Successful SLRDB Lookup | This OM measures the total number of MSISDN queries received by an SLR application database system node that succeeded in their SLRDB lookup.                                                                     |
| Accumulation OM | SLR SMI Totals, High Congestion                         | This OM measures the total number of times that the high level congestion state was entered.                                                                                                                      |
| Accumulation OM | SLR SMI Totals, Login Failures                          | This OM measures the total number of failed HLR provisioning system login attempts.                                                                                                                               |
| Accumulation OM | SLR SMI Totals, Low Congestion                          | This OM measures the total number of times that the low level congestion state was entered.                                                                                                                       |
| Accumulation OM | SLR SMI Totals, Medium Congestion                       | This OM measures the total number of times that the medium level congestion state was entered.                                                                                                                    |
| Accumulation OM | SLR SMI Totals, Messages Failed Authentication          | This OM measures the total number of received messages from the HLR provisioning system that failed authentication of the retrieved RN against an associated GTT entry with an RN matching the retrieved value.   |
| Accumulation OM | SLR SMI Totals, Messages Invalid                        | This OM measures the total number of invalid messages received from the HLR provisioning system.                                                                                                                  |
| Accumulation OM | SLR SMI Totals, Messages Passed Authentication          | This OM measures the total number of received messages from the HLR provisioning system that successfully authenticated the retrieved RN against an associated GTT entry with an RN matching the retrieved value. |
| Accumulation OM | SLR SMI Totals, Messages Received                       | This OM measures the total number of messages received from the HLR provisioning system.                                                                                                                          |
| Accumulation OM | SLR SMI Totals, Messages Rejected                       | This OM measures the total number of received messages from the HLR provisioning system that were rejected.                                                                                                       |
| Accumulation OM | Special Study Totals, MSUs Received Count               | This OM measures the number of incoming MSUs acknowledged on the specified linkset with the specified OPC/DPC/SIO combination.                                                                                    |
| Accumulation OM | Special Study Totals, MSUs Transmitted Count            | This OM measures the number of outgoing MSUs successfully transmitted to the far end on the specified linkset with the specified OPC/DPC/SIO combination.                                                         |
| Accumulation OM | Special Study Totals, Octets Received Count             | This OM measures the total number of MSU octets received on a specified linkset with the specified OPC/DPC/SIO combination, including the octets removed in MTP Level 2 processing.                               |

| OM TYPE         | OM TITLE                                                   | OM DESCRIPTION                                                                                                                                                                                     |
|-----------------|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accumulation OM | Special Study Totals, Octets Transmitted Count             | This OM measures the total number of MSU octets transmitted on the specified linkset with the specified OPC/DPC/SIO combination, including those octets that were added in MTP Level 2 processing. |
| Accumulation OM | System Node State, Disabled, Locked Duration               | This OM measures the number of seconds that a specific RTC, CC, or application system node is disabled and locked.                                                                                 |
| Accumulation OM | System Node State, Disabled, Unlocked Duration             | This OM measures the number of seconds that a specific RTC, CC, or application system node is disabled and unlocked.                                                                               |
| Accumulation OM | System Node State, Enabled, Locked Duration                | This OM measures the number of seconds that a specific RTC, CC, or application system node is enabled and locked.                                                                                  |
| Accumulation OM | System Node State, Enabled, Unlocked Duration              | This OM measures the number of seconds that a specific RTC, CC, or application system node is enabled and unlocked.                                                                                |
| Accumulation OM | System Node State, Locked, Off-line Duration               | This OM measures the number of seconds that a specific RTC, CC, or application system node is locked and off-line.                                                                                 |
| Accumulation OM | System Totals, No Route MSU Discard Count                  | This OM measures the number of MSUs discarded due to routing failure of various causes (for example, an inaccessible DPC).                                                                         |
| Accumulation OM | Task Management, Idle Task Duration                        | This OM measures the number of milliseconds spent in idle time.                                                                                                                                    |
| Accumulation OM | TUP Received Message Counts, B/TUP Error No AS for OPC/CIC | This OM measures the number of TUP messages discarded as a result of not being able to find a valid AS for a given OPC/CIC.                                                                        |
| Accumulation OM | TUP Received Message Counts, B/TUP Error No OPC/CIC Data   | This OM measures the number of TUP and BTUP messages discarded as a result of missing database entry for a given OPC or OPC/CIC.                                                                   |
| Accumulation OM | TUP Received Message Counts, B/TUP Error No Path           | This OM measures the number of TUP and BTUP messages discarded as a result of not being able to find an inservice path to a given AS.                                                              |
| Accumulation OM | TUP Received Message Counts, B/TUP Error No Route          | This OM measures the number of TUP messages discarded as a result of not being able to find a route to a given AS.                                                                                 |
| Accumulation OM | TUP Received Message Counts, BTUP Call P Received Count    | This OM measures the number of BTUP call processing messages received from the SS7 Network.                                                                                                        |
| Accumulation OM | TUP Received Message Counts, BTUP Maint Received Count     | This OM measures the number of BTUP maintenance messages received from the SS7 Network.                                                                                                            |
| Accumulation OM | TUP Received Message Counts, TUP Call P Received Count     | This OM measures the number of TUP call processing messages received from the SS7 Network.                                                                                                         |
| Accumulation OM | TUP Received Message Counts, TUP Maint Received Count      | This OM measures the number of TUP maintenance messages received from the SS7 Network.                                                                                                             |
| Accumulation OM | TUP Received Message Counts, Wrong NE Received Count       | This OM measures the number of TUP messages discarded as a result of not receiving the message for a SG Network Element                                                                            |
| Accumulation OM | UDP, Full Socket Count                                     | This OM measures the number of counts that the udpstat full_socket variable has changed in the om period.                                                                                          |
| Maximum OM      | Link Traffic, Link utilization                             | This OM provides percentage of link utilization. For LSL it is calculated in erlangs while for HSL it is calculated as percentage of processor utilization.                                        |

| OM TYPE    | OM TITLE                                        | OM DESCRIPTION                                                                                                                                                                                                                                             |
|------------|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum OM | NP Database Totals, Max Average Update Rate     | This OM measures the highest update rate (in updates per second) averaged over a 60 second period. ie total updates over the 60 second window divided by 60. If the number of updates received in the 60 second window is less than 60 , the OM will be 0. |
| Maximum OM | NP Transaction Mgmt Totals, TxMgr Percent Used  | This OM measures the maximum percentage of used transactions in the Transaction Management application.                                                                                                                                                    |
| Maximum OM | SLR Database Totals, Max. Update Rate           | This OM measures the highest update rate (in updates per second) during any 60 second period                                                                                                                                                               |
| No Action  | System Node State, Percentage Enabled           | This OM measures the percentage of time that a specific RTC, CC, or application system node is enabled, or busy (for the Processor Utilization OM, GR-82-CORE section 6.4.5, item 10). The value for this OM ranges from 0 to 100 percent.                 |
| No Action  | Task Management, Collection Period Duration     | This OM measures the total number of milliseconds for an OM collection period. This OM can be used to calculate the percentage of use for all the other Task Management OMs.                                                                               |
| No action  | Task Management, Level 0 Priority Task Duration | This OM measures the number of milliseconds spent in Level 0 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 1 Priority Task Duration | This OM measures the number of milliseconds spent in Level 1 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 2 Priority Task Duration | This OM measures the number of milliseconds spent in Level 2 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 3 Priority Task Duration | This OM measures the number of milliseconds spent in Level 3 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 4 Priority Task Duration | This OM measures the number of milliseconds spent in Level 4 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 5 Priority Task Duration | This OM measures the number of milliseconds spent in Level 5 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 6 Priority Task Duration | This OM measures the number of milliseconds spent in Level 6 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 7 Priority Task Duration | This OM measures the number of milliseconds spent in Level 7 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 8 Priority Task Duration | This OM measures the number of milliseconds spent in Level 8 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, Level 9 Priority Task Duration | This OM measures the number of milliseconds spent in Level 9 priority task(s).                                                                                                                                                                             |
| No Action  | Task Management, OS System Tasks Duration       | This OM measures the number of milliseconds spent in VxWorks OS tasks.                                                                                                                                                                                     |

## Appendix F: CICM Logs and Alarms for SN08

The following table is the list of events that can be generated by the SAM21 blade-based CICM product in SN08. Some notes on the table's contents at the time of writing:

- The CICM353 log events are unique to the SAM16-based CICM product and are not contained in the table below.
- The CICM328 log (WindowsRestart alarm) has no identified clear in the table below. The WindowsRestart alarm occurs when CICM restarts. When the CICM application comes up, there is a cold start trap generated which is not documented in the table below. It may be possible to use this event as a "clear" for WindowsRestart.
- Items highlighted in bold are changes one can expect from the previous release.

### CICM Logs and Alarms in SN08

| Log            | CICM Log Output Path         | Alarm                                                               | Log Severity | Category       | Description                  | Specific Problem                                                    |
|----------------|------------------------------|---------------------------------------------------------------------|--------------|----------------|------------------------------|---------------------------------------------------------------------|
| CICM300        | Legacy Error Log.            | Log details: XXX                                                    | None         | environmental  | Legacy Error Log.            | Log details: XXX                                                    |

## Appendix H: : SNMP-based PM Poller

### Performance Monitoring Poller data collection output

The SNMP-based PM poller collects performance attributes from several network elements (i.e., UAS, GWC, SSPFS platform). The data collected by the PM device pollers is output in CSV files to the '/ data/oms' file output directory. The oms directory contains seven sub- directories (named 1- 7). Each of these sub-directories contains a day's collection of CSV output files (i.e., one sub-directory each for the seven-day history the poller maintains). The current day's output files are always written to subdirectory '1'. File rotation occurs just prior to midnight every 24-hour period. When file rotation occurs, the files in sub-directory '7' are removed and contents of all subsequent sub-directories are moved up the directory chain (i.e., files in directory 6 are moved to directory 7, 5 to 6, etc.).

A separate file is created for each device during each profile polling interval. When creating the CSV files the poller adheres to the following naming conventions:

<NodeType>.<NodeName>.OMs.<Report  
Name>.Year.Mon.Date\_HR.MN\_<TZ>.csv

where:

NodeType -> Node type (i.e, GWC, UAS, etc....)

NodeName -> A unique node name.

Report Name -> For the SSPFS poller this will correlate to the associated profile name.

TZ -> timezone (i.e., cst or cdt)

An example file name is provided below:

GWC.GWC-10\_UNIT\_1.OMs.GWC.2002.05.02\_10.52\_EDT.csv

### Viewing CSV files

The CSV files can be viewed locally on the SSPFS platform by using a standard text editor. Alternately the SSPFS platform is configured with a snmp-poller ftp userid. A craftperson can utilize ftp to retrieve the CSV output data files for further analysis. When the snmp-poller ftp userid is used to ftp into the SSPFS server, the home directory for this account is the file oms output directory. For security reasons the snmp-poller ftp user only has access to the output directory and its sub-directories. Sample output files from the MIB-2 profile is provided in the following table:

Note: A device can reside in more than one profile.

Note: Keep in mind, however, that the CSV file format is not intended to be a user-friendly format for viewing the output in a standard text editor. Typically these files would be parsed by an editor that can format CSV files in a legible manner, or they would be parsed by a machine interface.

Note: The 'poller' ftp userid should be used to retrieve the PM poller output files. Contact your network administrator to obtain the associated password.

| Sample CSV output file for profile MIB-2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Appendix J: SN07/SN08 IEMS Fault Transparency with SDM/CBM

Prior to IEMS, Succession supported sending faults and events from network elements via Syslog to the SDM. This feature, SYSLOG Consolidation for Succession, then allows the SDM to convert these logs to SCC2 or NTSTD to forward to the OSS. See the Figure below.

The fault feeds, delivered via IEMS supports SCC2 & NTSTD to the OSS, as did SDM. The implementation with IEMS used a more robust interfaces between the NE/EMS to IEMS and thus on a NE by NE basis there may be changes in the SCC2 log feed versus the SDM implementation. To understand fault diagram with IEMS see the diagram below.

To understand the differences between the IEMS implementation and the SDM implementation see the tables below.

### On NT STD and SCC2 Log Format Delimiters (SDM/CBM or IEMS to Fault OSS)

Table 1- ASCII Character Legend

| ASCII Character Legend |             |         |                   |
|------------------------|-------------|---------|-------------------|
| Character Name         | Hexidecimal | Decimal | Control Character |
| Line Feed:             | 0A          | 10      | ^J                |
| Carriage Return:       | 0D          | 13      | ^M                |
| End of Message:        | 19          | 25      | ^Y                |

|        |    |    |       |
|--------|----|----|-------|
| Null:  | 00 | 00 | ^@    |
| Space: | 20 | 32 | space |

Table 2 - STD and SCC2 Log Delimiter Comparison between SDM/CBM and IEMS

| STD and SCC2 Log Delimiter Comparison between SDM/CBM and IEMS |                                                                               |             |                      |                |

| <b>Log Format:</b>                                             | <b>STD/STD_OLD</b>                                                            | <b>STD</b>  | <b>SCC2/SCC2_OLD</b> | <b>SCC2</b>    |
| <b>Start of Log String (HEX):</b>                              | 0A 0D                                                                         | 0D          | 0A 0D                | 0D             |
| <b>End of Line String (HEX):</b>                               | 0A 0D                                                                         | 0A 0D       | 0A 0D                | 0A 0D          |
| <b>End of Log String (HEX):</b>                                | 20 0A 0D 0A 0D 00                                                             | 0A 0D 00 0A | 0A 19 0A 0D          | 0A 0D 0A 19 0A |

Comments on Table 2:

- The above Log String data in Table 2 data for SN07 is applicable to and unchanged in SN08.
- The spaces between the hexadecimal numbers in Table 2 are there just to enhance readability. ie. 0D immediately follows 0A in the Start of Log String for SDM/CBM.
- In the SDM/CBM, the logroute user interface allows customers to modify, if desired, the:
  - Start of Log String (default value: 0A 0D in hex)
  - End of Line String (default value: 0A 0D in hex) and
  - The provisionable portion of the End of Log strings (default value: 20 0A 0D 0A 0D 00 where the second 0A 0D sequence is the provisionable portion).
- The log delimiters of IEMS are not provisionable in SN07 or SN08.
- IEMS was first generally available (GA) to customers in SN07. There was an SN06.2 beta where the delimiters for IEMS may have been different from those stated above.
- SDM Log delimiters may have been different in SN06 and previous releases. An OSS should consider the potential requirement of needing to support multiple Nortel software releases concurrently.

|                                                                                                                                                                                                                      | <p><b>Notes:</b></p> <p><b>a)</b> Certain logs generated by the CS2K such as OMAU, OMGA, and the protologs (SWER, TRAP, INIT and so on) have no log number, just blank spaces. This is how they look on the CS2K and SDM/CBM. In an SN07 office where the SDM is feeding CS2K logs to IEMS, IEMS adds 000 for a log number. Eg. SWER000. In SN08, a resolution was implemented in IEMS whereby the 000 log number was no longer added to these SDM/CBM logs and the 3 spaces are maintained as it is received. <b>Resolved in SN08 via CR Q00980472.</b></p> <p><b>b)</b> When IEMS receives logs from managed components, it implements an 80 character per line rule for log bodies. If 80 characters is exceeded, an End of Line String is inserted at the 80<sup>th</sup> character and the remainder of the line is put onto the next line. In the case of logs from the SDM/CBM, where rows often exceed 80 characters, this wrap rule could result in visual or transparency differences between what the log looks like on SDM/CBM and IEMS. In some cases, trailing whitespace in a row could potentially be wrapped resulting in a blank line being created. In order to maintain transparency and avoid parsing issues with blank lines and so on, the 80 character wrap rule has been removed from the incoming feed to IEMS from SDM/CBM. <b>Resolved in SN07 via patch IEM0507D</b></p> <p><b>c)</b> Certain CS2K logs such as CARR and PM support an optional field called Equipment Identifier that shows up at the end of the log header after the Event Label. The CS2K has a "newline" rule (which the SDM/CBM implements as well) where the Equipment Identifier is removed from the header line in that it has its own line immediately following the header. The SDM/CBM's Log Delivery Service at SN07 final compile in its implementation of the 65 character newline rule incorrectly took into consideration the 9 characters for the optional ECOPE_FORMAT field. (Even when ECOPE is set to OFF in the SDM/CBM log device in logroute). This results in the Equipment Identifier field being "newlined" when the CS2K normally would not. (A transparency difference between what the log looks like on the CS2K and on the SDM/CBM). The end result of all this is that templates parsing CARR and PM logs (and any other Equipment Identifier-supporting logs) may no longer be able to parse these logs properly prior to implementation of the patch for this CR. <b>Resolved in SN07 via patches SDM_BASE.logs-20.82.7.10.tape, SDM_BASE.gdd-20.82.7.3.tape for SDM and NTLOGS208208-15.patch, NTGDD208208-03.patch for CBM.</b></p> <p><b>d)</b> SDM / CBM transparency issue. In the SN07 CBM product, some applications had started to communicate their failure events via an alarmd process. The resultant log looks different than the original (as seen on SDM). For failure events common to both SDM and CBM platforms, this created 2 versions of the log. 1 for SDM and 1 for CBM. Known logs affected were SDM327/SDM627. This second CBM version was undone in that . <b>Resolved in SN07 CBM patch CR Q01001000-01</b></p> |                   |                   |                                                                                                                                                                                                                      |                                                                                                                                                                                                                      |                                                                                             |

| <b>MG9K ATM/IP &amp; MG9000 EM</b><br>Partial<br>Transparency | <b>Differences:</b><br>a) For all MG9000 logs having a format which includes the Category and State fields (generally alarm logs - approx. 200 in SN07, and 40 more in SN08), you will find that the syntax of the field value between SDM and IEMS can be slightly different. This is due to the MG9K EM outputting syslog to SDM and Corba to IEMS.<br>Example for SDM:<br>State: cleared<br>Category: Equipment Alarm<br>Example for IEMS:<br>State: Cleared<br>Category: equipment<br><br><b>Notes:</b><br>a) In SN07, the MG9000 Element Manager in an IEMS implementation was duplicating alarm logs sent to IEMS by including them in the syslog feed in addition to the Corba feed to IEMS. Application of the MG9000 EM patch will de-activate sending alarm logs to syslog remove the duplication. <b>Resolved in SN07 via patch IEM0807D for IEMS and 9K EM patch ZOD50</b> | a) No Impact |
| <b>SAM21</b><br>Transparent                                   | <b>Differences:</b><br>a) Some SAM21 logs (worst case 19 SCU logs) indent the event label 1 character (space). When IEMS processes this, the leading space in the Event Label is removed. SDM maintains the leading space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | a) No Impact |

| Passport 8600<br>Not transparent                                                                                     | <b>Differences: (SN07)</b><br><b>a)</b> The logs reporting Passport 8600 SNMP trap events are completely different between SDM/CBM and IEMS. In SN07, the SDM uses the PPES300-307 log name/number set and obtains the data for these logs from MDM. IEMS listens to SNMP traps directly from the Passport 8600 and implements the PP398 log for the sets and PP399 for the clears.                                                                                                                                                                                  | <b>SN07:</b><br><b>a)</b> <b>No impact</b> – OSS coding support challenges may be present with extracting data from the Specific Problem and Description fields and being able to correlate the sets with the clears.<br><b>b)</b> <b>Impact Major</b> - A customer is either other going to ignore all IEMS602s or mark all critical – either way, it is going to be problem in SN07.<br><b>c)</b> <b>Impact Major</b> - There is insufficient information (only an IP address) to determine what is causing the fault and what needs to be corrected.<br><br><b>SN08:</b><br><b>a)</b> <b>No impact</b> – The above SN07 issues are resolved in SN08 and as with any new logs in a release, new templates will have to be written to support them. With the current |                                                                                                                                                                                                                      |                        |                                                                                                                                                                                                                     |                                                                                                                                                                                                                      |

|                       | Notes: (SN08)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                          |                                                                                                                                        |            |                |     |           |                       |       |           |                          |       |           |                       |       |           |                          |       |          |                       |       |        |                       |       |                       |                           |       |                     |                            |       |               |                           |       |             |                            |       |              |                            |       |            |                            |       |              |                            |       |                |

a) SN08 feature A00007343 was created to help address the above issues in 8600 fault management via IEMS. With the feature, a new set of logs (PP310 -> PP392) was created to addresses log format/content issues [a) and c)] and PP398/399 is no longer used. Full SNMP trap support as of SN08 was implemented as well [b)] and hence no IEMS602 logs would be seen for unsupported 8600 SNMP traps. This feature does not result in transparency between SDM and IEMS but it does clean up the IEMS log situation. See the SN08 IEMS log samples below for Passport 8600. PP317 is cleared by PP318 when the Component ID matches. At the time of writing, two SN08 IEMS logs for Passport 8600 (PP368 and PP369) have been patched back to SN07.

**IEMS PP317 SN08 SCC2 Sample:**

```

**01 PP 317 0119 TBL PP Fault
  Location: PP8600A;10.102.15.130
  State: Raised
  Category: communications
  Cause: loss of communication
  Time: Feb 10 16:01:46 2005
  Component ID: PP8600=10.102.15.130; ifIndex=72
  Specific Problem: Generic Link Status
  Description: Link Down: ifIndex = 72( AdminStatus = up OperationStatus =
down)
.1.3.6.1.6.3.1.1.4.1.0: .1.3.6.1.6.3.1.1.5.3.0
.1.3.6.1.2.1.1.3.0: 73 days, 5 hours, 35 minutes, 4 seconds.

```

**IEMS PP318 SN08 SCC2 Sample:**

```

01 PP 318 0120 INFO PP Fault
  Location: PP8600A;10.102.15.130
  State: Cleared
  Category: communications
  Cause: communication regained
  Time: Feb 10 16:01:48 2005
  Component ID: PP8600=10.102.15.130; ifIndex=72
  Specific Problem: Generic Link Status
  Description: Link Up: ifIndex = 72( AdminStatus = up OperationStatus = u
p)
.1.3.6.1.6.3.1.1.4.1.0: .1.3.6.1.6.3.1.1.5.4.0
.1.3.6.1.2.1.1.3.0: 73 days, 5 hours, 35 minutes, 6 seconds.

```

**Differences: (SN08)**

a) One noted difference between SN08 IEMS 8600 trap/log fault management and that of SDM/CBM via MDM is that MDM has implemented a per alarm aging mechanism where a trap is not part of a set/clear pair. (There are a lot of 8600 SNMP traps like this.) After a certain period of time, one of these autonomous logs (that has severity) will be cleared automatically. IEMS as of SN08 does not have a per alarm aging mechanism. In order to prevent a situation in IEMS where these autonomous logs are being raised but never cleared, an 8600 device alarm clearing policy has been implemented by default in the SN08 load. If any 8600 alarm has been present in IEMS for 7 days, it will automatically

|  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |
|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|  | be cleared by this policy. The clear notification will be an IEMS608 log which will contain information required in order to clear the previous set log for the alarm. While clearing 8600 alarms related to hardware such as fan or link down after 7 days is undesirable it was felt better than having no clear for the multitude of 8600 autonomous traps. Note: An OSS does not have to take action on aging clears if it does not want to. Or it can take action on only a subset of them. The 8600 aging policy in IEMS can also be disabled or modified to be something other than 7 days. |  |

| <b>b)</b> IEMS has changed the field values of alarmType in some cases so that it aligns with a standard list of X.733 alarm categories. Where there was no equivalent alarm type in X.733, IEMS uses "other". (See table below). When logs come out of SDM/CBM, the original alarmtype as provided by MDM is maintained.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                           |

This corrective content feature will be patched back to SN07.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                          |
| <b>CMT-NPM</b><br>Transparent                                    | <b>Differences:</b><br><b>a)</b> Some NPM logs (11 logs worst case) indent the event label 1 character (space). When IEMS processes this, the leading space in the Event Label is removed. SDM/CBM maintains the leading space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>a)</b> No Impact                                                                                                                      |
| <b>CMT-IEMS</b><br>(general northbound feed comparison with SDM) | <b>Differences:</b><br><b>a)</b> For NT STD and SCC2 log formats, the characters contained within the “Start of Log” and “End of Log” string delimiters are different. See Table 1 at the beginning of this Appendix.<br><b>b)</b> When IEMS re-syncs its alarm list with devices that support re-sync, IEMS creates clear logs for when discrepancies are found. ie Alarms it thought were there but went away. These clear logs used the original log name/number for the alarm in the database and the content of the “re-sync clear” was not necessarily the same. Resolution of this CR has resulted in the creation of a new IEMS log for re-sync raises/clears. (IEMS607). SDM/CBM has no such re-sync capability.<br><b>Resolved in SN07 via IEM1007D patch</b><br><br><b>Notes:</b><br>SN07 CR Q01001051 tracked the fact that the “end of log string” for SDM differs depending on whether ECORE_FORMAT is on or off in the device. This is not an SDM/IEMS transparency but an SDM/SDM one. (ECORE_FORMAT is not supported in Succession.) This issue has been resolved through the SN07 SDM/CBM patches. The End of Log string is now the same whether ECORE format is ON or OFF. (ECORE format is not supported in Succession and should be turned off for the SDM/CBM log device for IEMS fault communication). | <b>a)</b> No Impact.<br><b>b)</b> No Impact. A new template would have to be created for the IEMS607 log as is the case for any new log. |
