The LGRP Generation field is included to dictate whether a new LGRP is created when a GW with the profile in question is associated. This field is applicable to Nortel and Third Party line GWs that allow the system to manage TID allocation. This ability has been added with the introduction of this feature. For example, pre-SN08 small line GWs with a category of small

would only allocate a new LGRP when an existing LGRP was not available with capacity for the new GW that was being added. Category large profiles would always add a new LGRP upon GW creation. This functionality is altered in SN08 so that the decision of whether a new LGRP is created or not is dictated by this newly introduced field, “LGRP Generation”. Indicating “true” for this field means that a GW that is added will cause a new LGRP to be created. “false”, indicates to use existing LGRPs if one exists that still has capacity. Indicating that a new LGRP is created should be taken with caution due to the limited number of LCD nodes available on the XaCore. For a discussion of XaCore LCD nodes, refer to the NTPs.

#### 3.9.1.1.5 Reserved Terminations Mandatory Field

This certificate field is used to dictate the behavior concerning the Associate GW “reserved terminations” value. If this field is left blank in the client, then server behavior is to default this value to the maximum reserved termination value defined in certificate field value “Maximum Endpoints”. For some GWs, it is mandatory that the customer specify this value. In other words, setting the Reserved Terminations Mandatory field to “true” in the certificate forces the user to specify a reserved terminations client value and the system default will not be used. This is enforced by not turning the OK button on at the GUI and by rejecting the command if the OSSGate Associate GW Maximum Termination field is not included. Currently, only GW’s using the H.323 protocol use this restriction and this certificate field is typically be set to “false” for all other GW types.

**Figure 47 GUI fields affected by Rsvd Terms Mandatory Field**

The screenshot shows a dialog box titled "Associate Media Gateway". It contains several input fields and buttons. The "Reserved terminations" field is highlighted with a red rectangle. The "OK" button is also highlighted with a red rectangle. The fields include:

- Gateway name: [text input]
- Gateway IP address: [text input]
- Gateway controller name: [<auto select> dropdown]
- Gateway profile name: [dropdown]
- Reserved terminations: [text input, highlighted]
- Signal Protocol section:
  - Protocol type: [dropdown]
  - Protocol port: [text input]
  - Protocol version: [text input]
- Buttons: OK (highlighted), Cancel

#### 3.9.1.1.6 Change IP Available Field

This certificate field is used to dictate the behavior concerning the “pick” list for the GUI operation change GW. If this certificate element is set to “false”, then the “Change gateway IP address” pick is removed from the list of changeable attributes. As of SN08, only H.323 GWs support the change GW IP functionality.

**Figure 48 Change Gateway IP Pick Affected**

#### 3.9.1.1.7 Display Physical Location

The Display Physical Location field is used to indicate that additional fields should be datafilled in the Associate Media Gateway GUI. These fields are used to populate specific LGRP and LEN information. Currently, these fields are unique to the Third Party Large Line and CICM profiles only. For a detailed discussion concerning this topic, refer to SN08 activity Third Party Gateway Provisioning (A00007072).

**Figure 49 Associate Media Gateway Dialog**

The dialog box is titled "Associate Media Gateway" and contains several input fields and sections. A red rectangle highlights the "LGRP Location" section, which includes fields for Frame number, Floor position, Unit number, Row position, Frame type, Frame position, and Unit position. Below this is the "Internet Transparency" section, which includes a checkbox for "MG outside CS2K VPN, not behind NAT", a radio button selection for "IP-VPN / LBL Selection" (NATs, LBLs, NAT-LBLs), and a dropdown for "Adj ITRANS Zone". The "Signal Protocol" section includes a dropdown for "Protocol type" (set to MEGACO (4)), a text field for "Protocol port" (set to 2944), and a text field for "Protocol version" (set to 1.0). The dialog has "OK" and "Cancel" buttons at the bottom right.

Gateway name:

Gateway IP address:

Gateway controller name:

Gateway profile name:

Reserved terminations:

Gateway site name:

**LGRP Location**

Unit number:  Row position:

Frame type:  Frame position:

Unit position:

**Internet Transparency**

☐ MG outside CS2K VPN, not behind NAT

**IP-VPN / LBL Selection**

☐ NATs ☐ LBLs ☐ NAT-LBLs

Adj ITRANS Zone

**Signal Protocol**

Protocol type:

Protocol port:

Protocol version:

OK Cancel

### 3.9.1.1.8 Inventory Role Field

The Inventory Role field dictates the expected use of the GW. Currently, only the "Media GW" role has been defined, but, other uses may be defined for future deliveries.

### 3.9.1.1.9 Inventory Type Field

The inventory type field is similar to the Endpoint Type field in that it affects how endpoints are provisioned. Unique behavior is associated with the different values available. This behavior affects generation of LGRPs for lines or trunk behaviors for trunks. The following list is available for datafill in SN08.

**Table 7 Datafill Values for Inventory Type Field**

| DEFINED VALUES      |
|---------------------|
| Large Trunk Gateway |
| H.323 Gateway       |
| Audio Server        |
| Large Line Gateway  |
| Small Line Gateway  |
| Audio Server        |
| CICM                |
| UE9000MG            |
| Third Party         |

### 3.9.1.1.10 Maximum Endpoints Field

As the name implies, the Maximum Endpoint field is a field that dictates the maximum number of endpoints that can be added to a GW. In theory, this field should be less than or equal to the maximum number of endpoints that can be assigned to the GWC it is intended to be provisioned for. Because the profile type for the GWC assignment is not know, range error checking for this field is not performed and it is the responsibility of the certificate creator to assign this field with an appropriate value. For example, if this field is assigned the value of 2000, and the GWC that will use it can only support 1000 endpoints, an error condition would be realized if the user datafilled 2000 in the “reserved terminations” field for the Associate GW operation. This is because the GWCs capacity is overrun. In some situations, this may be deemed appropriate if the GWs capacity is truly 2000. The user has the option of associating the GW with a reserved capacity of less than the value assigned to this certificate field. The screen captures below show the affected fields.

**Figure 50 Associate Media GW Reserved Terminations**

The image shows a dialog box titled "Associate Media Gateway". It contains several input fields and a "Signal Protocol" section. The "Reserved terminations" field is highlighted with a red rectangle.

Gateway name:

Gateway IP address:

Gateway controller name:

Gateway profile name:

Reserved terminations:

Signal Protocol

Protocol type:

Protocol port:

Protocol version:

OK Cancel

**Figure 51 H.323 GWC Profile Port Capacity**

The image shows a dialog box titled "H.323 GWC Profile Port Capacity". It displays a table with three columns: Capability, Capacity, and Units. The "H.323" row is highlighted with a red rectangle.

Profile

Current: H.323\_NA

| Capability     | Capacity | Units    |
|----------------|----------|----------|
| Large Gateways | 300      | gateways |
| IP Security    | NA       | NA       |
| H.323          | 1032     | ports    |

### 3.9.1.1.11 Supported Protocol Field

As the name implies, the supported profile field is used to define the protocol associated with this profile. Prior to SN08, multiple protocols were available within a profile. This functionality has been altered so that a profile and protocol has a 1 to 1 correspondence. If a GW supports multiple protocols, then a unique certificate should be created for each protocol supported. Profiles that supported multiple protocols prior to the SN08 release have been modified to conform to this behavior. For example, the PVG\_7K profile has been expanded in the SN08 release and is listed as PVG\_7K\_ASPEN and PVG\_7K\_MEGACO.

Although datafile for this field is defined as enumerated types, these types are mapped to integers and stored with the representation listed below in the database. The following list of mappings is provided for informational purposes only and is subject to change.

**Table 8 Protocol Mappings**

| Element Value | Database Value |
|---------------|----------------|
| NCS_PROTOCOL  | 1              |
| ASPEN         | 2              |
| DSM-CC        | 3              |
| MEGACO        | 4              |
| MGCP          | 5              |
| TGCP          | 6              |
| H.323         | 11             |

#### **3.9.1.1.12 GWC Profile Number Field**

The GWC Profile Number field is a field used in the GWC device that dictates the behavior of the GWC. The number sent to the GWC is associated with a unique series of flags in the GWC. These flags instruct the GWC on specific actions to use in the GWC device. For any 3rd party certificate creation, one of the “spare” profiles created for this activity should be used. For details concerning which number should be used, please contact GWC Persistent Data architects and designers.

The following table shows the range of “spare” profile numbers.

**Table 9 Profile numbers and reference gateways**

| Profile numbers | Reference gateways       |
|-----------------|--------------------------|
| 100 - 124       | Arris MTA                |
| 125 - 149       | Motorola MTA             |
| 150 - 174       | Generic MTA              |
| 175 - 224       | IAD                      |
| 225 - 249       | UE9000                   |
| 250 - 274       | CentrexIP Client Manager |
| 275 - 299       | MG9000                   |
| 300 - 324       | ABI                      |
| 325 - 349       | MG15000 (previously PVG) |

**Table 9 Profile numbers and reference gateways**

| Profile numbers | Reference gateways               |
|-----------------|----------------------------------|
| 350 - 374       | CVX                              |
| 375 - 399       | AudioCodes PRI                   |
| 400 - 424       | Upgrade MG15000 (previously PVG) |
| 425 - 449       | Nuera trunking GW                |
| 450 - 474       | TGCP                             |
| 475 - 499       | Nortel BCM                       |
| 500 - 524       | Nortel Meridian 1                |
| 525 - 549       | CISCO 2600 / 3600 / AS5300       |
| 550 - 574       | Nortel Westell                   |
| 575 - 599       | H.323 proxy gateway              |

**3.9.1.1.13 EPID Generation Field**

The EPID Generation field is used to describe the behaviors of endpoint groups that are expanded. It dictates properties such as using a “.” or “/” as naming delimiters and other attributes as listed in the table below. An example of H.323 expansion is listed below in the screen shot. This example uses the auto1 expansion. With this expansion, a “.” is used for the delimiter, the numbering starts at 1, and it is not “0” padded.

**Table 10 EndpointDesc Mappings**

| Element Value | Delimiter | Channel Start | Pad Supported |
|---------------|-----------|---------------|---------------|
| manual        |           | 1             | N             |
| auto1         | .         | 1             | N             |
| auto2         | .         | 1             | Y             |
| auto3         | /         | 1             | N             |
| auto4         | /         | 1             | Y             |
| auto5         | /         | 0             | N             |
| auto6         | /         | 0             | Y             |
| auto7         | .         | 0             | N             |
| auto8         | .         | 0             | Y             |

**Figure 52 Expansion of a H.323 Carrier Group Using auto01**

#### 3.9.1.1.14 Service Type Field

The Service Type field dictates the capabilities of the GW. Some GWs may have multiple capabilities within this list and can be assigned several values. For instance, some gateways have middle box “ITRANS” or “DQOS” abilities in addition to being a “line” GW.

The following table lists the current set of defined Service Type values that can be assigned. Although datafile for this field is defined as enumerated types, these types are mapped to integers and stored with the representation listed below in the database. The following list of mappings is provided for informational purposes only and is subject to change.

**Table 11 ServiceType Mappings**

| Element Value | Database Value |
|---------------|----------------|
| line          | 0              |
| trunk         | 1              |
| audio         | 2              |
| APG           | 3              |
| DQOS          | 4              |
| ITRANS        | 5              |

| Element Value | Database Value |
|---------------|----------------|
| H323          | 6              |
| ITRANS_ROAM   | 7              |

#### 3.9.1.1.15 Compatible Gateway Profile

The compatible GW profile field describes which profiles are compatible with this profile. This field should be set to the name of the profile being defined at a minimum.

#### 3.9.1.1.16 Bearer Fabric Field

The bearer fabric field is an optional field used to dictate the type of network used by GW. Two ATM versions, AAL1 and AAL2, are available and an IP version too. For more information concerning specifics of this field, refer to the Tri-modal provisioning (A00003487) documentation.

#### 3.9.1.1.17 Gateway Name Format Field

The data within this tag is used to define the syntax for the name of the Gateway associated with this certificate/profile. Gateway association/addition will be rejected if the gateway name does not conform to this definition. See section **NameFormatsType Schema** for a more complete description of the sub-tags which make up this syntax definition.

#### 3.9.1.1.18 Endpoint Name Format Field

The data within this tag is used to define the syntax for the name of the Endpoints added to a gateway associated with this certificate/profile. No endpoints will be allowed to be created which do not conform to this definition. See section **NameFormatsType Schema** for a more complete description of the sub-tags which make up this syntax definition.

### 3.9.1.2 XML Schema Definitions for Certificates

#### 3.9.1.2.1 Base Certificate Schema

The base certificate schema is used to define a profile. Many of the fields are mandatory, but, a few are optional as indicated by the “minOccurs=”0” terminology. These fields allow users to define a profile’s certificate as described in this document.

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            version="1.0"
            xml:lang="en" >

<xsd:include schemaLocation="../../../xsd/certificateif/certificateTypes.xsd" />

<xsd:element name="certificate">
  <xsd:complexType>
    <xsd:sequence>
      <xsd:element name="MaxEndpoints" type="maxEndpointsType" />
```

```

        <xsd:element name="Category" type="categoryType" />
        <xsd:element name="EndpointType" type="endpointTypeType" />
        <xsd:element name="GenerateLGRP" type="stringBoolean" />
        <xsd:element name="ResvTermMandatory" type="stringBoolean" />
        <xsd:element name="ChangeIPAavailable" type="stringBoolean" />
        <xsd:element name="DispPhyLocation" type="stringBoolean" />
        <xsd:element name="InventoryType" type="inventoryTypeType" />
        <xsd:element name="InventoryRole" type="inventoryRoleType" />
        <xsd:element name="SupportedProtocol" type="supportedProtocolType" />
        <xsd:element name="GWCProfileNumber" type="profileNumberType" />
        <xsd:element name="EPIDGenDesc" type="EPIDGenDescType" />
        <xsd:element name="ServiceTypeList" type="serviceTypeListType"
minOccurs="1" maxOccurs="7" />
        <xsd:element name="CompatibleGWProfileList" type="profileNameType"
minOccurs="1" maxOccurs="5" />
        <xsd:element name="BearerFabricList" type="bearerFabricListType"
minOccurs="0" maxOccurs="5" />
        <xsd:element name="GatewayNameFormatList" type="nameFormatsType" />
        <xsd:element name="EndpointNameFormatList" type="nameFormatsType" />
    </xsd:sequence>
</xsd:complexType>
</xsd:element>

</xsd:schema>

```

### 3.9.1.2.2 CertificateTypes Schema

The Certificate Types Schema is used in conjunction with the certificate schema listed above and defines allowable values for the base certificates values. Typically, an enumerated list of values is listed. However, some elements has ranges of values that can be used or allow a free form string value.

```

<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
version="1.0"
xml:lang="en" >

<xsd:include schemaLocation="../../../xsd/namesif/nameFormatsType.xsd" />

<xsd:simpleType name="profileNumberType">
    <xsd:restriction base="xsd:integer">
        <xsd:minInclusive value="1" />
        <xsd:maxInclusive value="250" />
    </xsd:restriction>
</xsd:simpleType>

<xsd:simpleType name="profileNameType">
    <xsd:restriction base="xsd:string">
        <xsd:minLength value="1" />
        <xsd:maxLength value="32" />
    </xsd:restriction>
</xsd:simpleType>

<xsd:simpleType name="stringBoolean">
    <xsd:restriction base="xsd:token">
        <xsd:enumeration value="true"/>
        <xsd:enumeration value="false"/>
    </xsd:restriction>
</xsd:simpleType>

<xsd:simpleType name="maxEndpointsType">
    <xsd:restriction base="xsd:integer">

```

```
<xsd:minInclusive value="0" />
<xsd:maxInclusive value="4094" />
</xsd:restriction>
</xsd:simpleType>

<xsd:simpleType name="serviceTypeListType">
  <xsd:restriction base="xsd:token">
    <xsd:enumeration value="line"/>
    <xsd:enumeration value="trunk"/>
    <xsd:enumeration value="audio"/>
    <xsd:enumeration value="APG"/>
    <xsd:enumeration value="DQOS"/>
    <xsd:enumeration value="ITRANS"/>
    <xsd:enumeration value="H323"/>
    <xsd:enumeration value="ITRANS_ROAM"/>
  </xsd:restriction>
</xsd:simpleType>

<xsd:simpleType name="categoryType">
  <xsd:restriction base="xsd:token">
    <xsd:enumeration value="niltype"/>
    <xsd:enumeration value="LARGE"/>

```

### 3.9.1.3 Directories Used for Certificates and Schemas

Placing a certificate in the Third Party directory listed below is how a profile is imported into the CMT software. Every 5 minutes, a polling cycle starts and scans these directories for changes. If a new file is found, its contents are verified for correctness and if verification passes, the profile is imported into the system. In addition, profiles can be removed from the system by removing certificates from this directory. Error conditions such as malformed certificates are reported as alarms. For more information on error conditions, refer to the “FM” document which accompanies this documentation.

The Nortel Certificates directory is auto datafilled by profiles that are included in customer delivered software. Users should never put a certificate directly in this directory. Nortel/Interop personnel should use the Third Party directory while working with the certificate file until a production version is ready. For updates or additions to Nortel certificates directory, Clear Case modifications are required. Appropriate Nortel personnel should be contacted for detailed information concerning building the final version of a newly defined certificate into customer deliverable software.

#### 3.9.1.3.1 Certificate Directories

The directories listed below hold the certificate files (XML documents) The Third Party directory is polled every 5 minutes for changes:

- /opt/nortel/NTsesm/properties/certificates/NortelCertificates
- /opt/nortel/NTsesm/properties/certificates/ThirdPartyCertificates

The following list shows certificates that are available in the /opt/nortel/NTsesm/properties/certificates/ThirdPartyCertificates as of the SN08 release. When building new certificates, these files can be used as a reference for understanding profile attributes.

**Figure 53 SN08 Nortel Defined Certificates in the NortelCertificates Directories**

#### 3.9.1.4 Schema Directories

The following directory holds the schema files that are used as the template to define certificates. Three files are made available. The base “certificate” file defines the fields that define a certificate. The certificateTypes file holds the data values that should be used for the majority of the fields. And the nameFormats file which holds the Endpoint and Gateway naming conventions which should be used for these fields.

- /opt/nortel/NTsesm/xsd/namesif

### 3.9.2 Changed OSSGate Commands

In SN08, each Profile is defined with a unique Protocol and no longer supports multiple Protocols. With this change, the Change GW command has been updated to remove the Change Protocol command and now supports Change Profile only. Other restrictions may apply.

#### 3.9.2.1 Change MG Schema

The following text lists the schema definition for the Change GW Profile

command. This existing command has been updated to include a new “choice” of “mgProfile”. Because the field is defined within the choice block, the user must choose between changing the Reserved Terminations, IP information, or newly added Profile and is not allowed to change multiple attributes at the same time.

```
<!-- ***** -->
<!-- * Define changeMG Method Parameters -->
<!-- ***** -->
<xsd:complexType name="changeMGMethodType">
<xsd:all>
<xsd:element name="Parameters" type="changeMGParamsType" />
</xsd:all>
<xsd:attributeGroup ref="Usn_VersionAttrbGroup" />
</xsd:complexType>
<xsd:complexType name="changeMGParamsType">
<xsd:sequence>
<xsd:sequence>
<xsd:element name="mgUIName" type="NoSpaceNameType" />
</xsd:sequence>
<xsd:choice >
<xsd:element name="reservedTerminations" type="ReservedTerminationsType" />
<xsd:element name="mgProfile" type="NoSpaceNameType" />
</xsd:sequence>
<xsd:element name="mgIpAddr" type="IPAddressType" minOccurs="0" />
<xsd:element name="mgProtocolPort" type="IpPortType" minOccurs="0" />
</xsd:sequence>
</xsd:choice>
</xsd:sequence>
</xsd:complexType>
</xsd:schema>
```

### 3.9.2.2 Change MG Document

The following XML document definition shows a GW that is being changed to the “ARRIS\_TOUCHTONE\_NN03\_4” profile definition. In order for this command to work, this profile must have been previously defined and imported into the CMT software.

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
<Command>
<Interface>cs2kCfgMgrIf</Interface>
<Methods>
<changeMG usn="1" version="1.0" >
<Parameters>
<mgUIName>MG1</mgUIName>
<mgProfile>ARRIS_TOUCHTONE_NN03_4</mgProfile>
</Parameters>
</changeMG>
</Methods>
</Command>
</CommandList>
```

### 3.9.3 New OSSGate Commands

This activity introduces two new commands that can be issued via the OSSGate interface. These commands allow users to retrieve information that is associated with profiles.

### 3.9.3.1 Get Certificate List

The `getCertificateList` command is a newly introduced XML command for the SN08 release. Unlike the GUI interface, which provides a pull down menu of defined profiles, the user must know the specific name of a profile in order to associate a GW to the system. This command is included as a means to retrieve profiles that have been imported into CMT software. Valid profile names are returned in a list and can be used with the `associate GW` command.

### 3.9.3.2 Get Certificate List Schema

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  version="1.0"
  xml:lang="en" >

  <xsd:include schemaLocation="../certificateossif/certificatecommon.xsd" />

  <!-- ***** _
-->
  <!-- * Define GWCCConfiguration getCertificateList Method Parameters -->
  <!-- ***** _
-->
  <xsd:complexType name="getCertificateDataMethodType">
    <xsd:all>
      <xsd:element name="Parameters" type="getCertificateDataType" />
    </xsd:all>
    <xsd:attributeGroup ref="Usn_VersionAttrbGroup" />
  </xsd:complexType>

  <xsd:complexType name="getCertificateDataType">
    <xsd:sequence>
      <xsd:element name="CertificateName" type="NoSpaceNameType" />
    </xsd:sequence>
  </xsd:complexType>

</xsd:schema>
```

#### 3.9.3.2.1 Get Certificate List Document

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList >
  <Command>
    <Interface>CertificateOSSIf</Interface>
    <Methods>
      <getCertificateList usn="1" version="1.0">
        <Parameters>
          </Parameters>
        </getCertificateList>
      </Methods>
    </Command>
  </CommandList>
```

### 3.9.3.3 Get Certificate List Result Set

The `Get Certificate List` command returns a list of profile names that can be used to provision a GW using the `associate GW OSSGate` command.

```
<?xml version='1.0'?>
<CommandList>
```

```

<Response>
  <Interface>CertificateOSSIf</Interface>
  <Methods>
    <getCertificateList usn="1" version="1.0"><ReturnCode value="13.0"

## 3.10 Security

N/A

## 3.11 Configuration Walkthrough

### 3.11.1 Certificate Creation

A certificate is created with the goal of creating a new profile. The following procedure should be used:

1. Understand schema field values by reading field descriptions in this document. Also, existing certificates listed in the appendix of this document and also available in the Nortel certificate directory, give examples of how the certificate fields are being used for other profiles.
2. Use a plain vanilla editor (i.e., UNIX vi) that will not put hidden formatting characters into the file. Or, using any editor, save the file as “text” making sure that hidden characters such as ^Ms are not put in document.
3. Create a XML document (a Certificate) with the desired behaviors of the new profile making sure to name the file with the “.certificate” extension.

**Note:** Certificate names are case insensitive. The convention is to use uppercase when creating Certificates, however, mixed case name are recognized. Mixed case names are converted to upper case when imported into the system.

**Note:** Duplicate Certificate names are not allowed and do not consider case. In other words, XYZ.certificate and xyz.certificate are regarded by software as the same name and would cause a duplicate alarm. This restriction applies to both the Nortel and Third Party directories and spans both directories. For example, if the XYZ.certificate is present in the

Nortel directory and also in the Third Party directory a duplicate alarm would be raised.

### 3.11.2 Importing a Profile into the System

In order to use a newly created certificate, the certificate must be imported into the CMT system. System importation is an automatic process as listed below.

**Note:** Only 3rd Party Interopt certificates are imported into CMT software. Nortel Defined certificates are included in the software that is delivered in the released product.

1. Put the certificate created from the process listed above in the following directory:  
/opt/nortel/NTsesm/properties/certificate/ThirdPartyCertificates
2. A polling cycle occurs every 5 minutes and automatically reads in any new certificates placed in this directory.
3. If a problem is encountered with the certificate, an alarm is raised. In order to clear the alarm, the contents of the certificate should be altered as listed in the alarm, and the file should be reloaded. When the polling cycle runs again, the file is once again scanned into the system if the alarm condition is remedied.

**Note:** Details concerning the “corrupt and changed” certificate alarms are listed in the CMT minor (MNR) log files. These files can be viewed at the following location “/opt/nortel/NTsesm/admin/logs/ptmdebuglog1.mi2.

**Note:** Restricting the logs to list MNR and above logs only can be accomplished using the MI2Admin tool. This tool is located in the /opt/nortel/NTsesm/bin directory.

4. A certificate that is successfully imported into the system gives the following capabilities:
  - The profile is listed in the Associate GW GUI profile combo box
  - The profile is available as a provisioning parameter for the OSSGate Associate GW profile field

### 3.11.3 Changing the Profile Assigned to a GW

The following procedure should be used when a user wants to change the profile assigned to a GW. Note that, certificates should never be manipulated directly to change a profile. The following attributes can be changed: endpoint and gateway format, reserved terminations, mandatory reserved flag, physical location flag, service type, compatible profile, maximum endpoints, and protocol.

1. Create a new profile with the changed Administrative attributes

2. or, have an existing profile available with differences in Administrative attributes only
3. Select the GW to be changed from the Provisioning/Gateways panel and push the “change” button
4. Select the profile that the GW is to be changed to and select OK
5. or, issue the OSSGate Change GW command with the new profile

#### 3.11.4 Removing a Profile

It may be desirable for a user to remove a profile from the system. One reason for doing this is to reduce the clutter for obsolete profiles or to remove the ability to assign one of these profiles to a GW mistakenly. The following procedure should be used to accomplish this.

1. Remove all GWs that have the profile in question assigned to them
2. or, change the GWs with the profile to a different profile as listed above
3. Remove the certificate from the  
/opt/nortelNTsesm/properties/certificates/ThirdParty Directory
4. Wait up to 5 minutes for the certificate directory to be polled and the certificate is remove automatically

**Note:** If a certificate is removed that has GWs assigned to it, an alarm is raised and will not clear until all GWs with the deleted certificate are removed or the certificate is put back in the certificates directory. For more information on this topic, refer to the FM document that accompanies this documentation.

#### 3.11.5 3rd Party Certificate Distribution

A profiles certificate is a text file that can be transferred like any other file. Once a certificate has been created, distribution of the file to customers can be performed using any file transfer program such as FTP. Theoretically, the file can be recreated at the customer site, but, it is recommended that the original certificate is sent to the customer by a file transfer program to avoid inadvertent syntax errors. Important; caution should be used so that hidden or formatting characters are not introduced into Certificate files. For example, editors such as Microsoft Notepad introduce a ^M character.

### 3.12 Appendix

#### 3.12.1 Converted Profile Nortel Certificates

Following is a sample list of Nortel provided certificates that are available at creation of this document. While every attempt has been made to insure completeness and accuracy of these certificates, the content may be incomplete or obsolete. These definitions are provided here for illustration

purposes only. For the released list of certificates, please refer to /opt/nortel/NTsesm/properties/certificates/NortelCertificates directory.

***Product = CS 2000***

## **A00007120--Packet Media Anchor for DPT**

### ***Functional Description***

### **1.1 Applicable Solution(s)**

PT-IP, PT-AAL2

### **1.2 Description**

This activity introduces the Packet Media Anchor for the Dynamic Packet Trunking SIP/SIPt application. The role of the Media Anchor is to provide tone, digit collection and bearer path anchoring capabilities for SIP/SIPt call types.

**Figure 1 Packet Media Anchor Call topology**

The Audiocodes 2010 has been chosen as the packet gateway to supply media anchoring functionality. The Packet Media Anchor solution uses the bearer

channel tandeming (BCT) capability of the AMS to provide media stream anchoring functionality. The media anchor is directed by the CS2K, which is responsible for managing call topology, resource allocation/deallocation and resource usage. Media anchoring through the AMS does not require conversion from packet to TDM back to packet again, thus impact on bearer path latency will be minimal.

This activity has 4 main customer impacting deliverables:

- Table Provisioning
- MAPCI
- Operational Measurements (OMs)
- Logs

### 1.2.1 Table Provisioning

The bearer channel tandeming (BCT) capability of the AMS is provisioned in table SERVSINV. The Packet Media Anchor will share the BCT resources with the Lawful Intercept (ALTTERMS application in the table), however the Packet Media Anchor resources must be provisioned as a separate Subtending Application on a particular GWC. The Packet Media Anchor also requires audio resources, thus an audio application may also be provisioned on the same GWC with the BCT applications.

**Figure 2 Table SERVSINV - Packet Media Anchor (PKTMA) provisioning**

| SRVSNAME |   | SRVRNAME |    | NUMTERMS |                                     | OPTIONS |
|----------|---|----------|----|----------|-------------------------------------|---------|
| AUD      | 4 | GWC      | 20 | 4095     | (3PORT 30) (6PORT 30) (ANNC 300) \$ |         |
| BCT      | 0 | GWC      | 20 | 1024     | (ALTTERMS 100) \$                   |         |
| BCT      | 1 | GWC      | 20 | 4095     | (PKTMA_MAX_CALLS 150) \$            |         |

### 1.2.2 MAPCI

A new MAPCI interface is being provided to monitor the availability of Announcement, Conference, Lawful Intercept and Packet Media Anchor resources subtending from a particular GWC.

**Figure 3 MAPCI;PM Posting GWC Media Resources**

| 17         |                  |        |      |          |           |          |          |         |      |
| 18         |                  |        |      |          |           |          |          |         |      |

### 1.2.3 Operational Measurements

To enable the monitoring of Packet Media Anchoring facilities by downstream OSS systems, a new operational measurement group is being created. The number of PKTMA insertion attempts (PMAREQST), number of insertion failures to do resource exhaustion/no resources (PMAFLNR), and high-water mark (PMAHWM) will be reported.

**Figure 4 Packet Media Anchor OMs**

|                                                               |       |   |     |    |
|---------------------------------------------------------------|-------|---|-----|----|
| PKTMA                                                         |       |   |     |    |

| 1                                                             | PKTMA | 1 | 200 |    |
|                                                               | 38    | 0 | 0   | 12 |

### 1.2.4 Logs

To better enable troubleshooting of the Announcement, Conference and Packet Media Anchor call setup and configuration issues a new core log (XPKT340) is introduced. This log will inform the craftsperson about the potential announcement, conference or BCT resource set up issues that require addressing. Examples of this log follow:

**Figure 5 Packet Media Anchor Logs**

```
RTP7  XPKT340 OCT25 08:16:40 4500 INFO PKTMA Call Failure

```

### 1.2.5 Background

Many services and call processing capabilities on SIP/SIPt require interaction with a call's bearer path to provide progress indications (i.e. tones) into or to collect digits out of the bearer stream. DPT endpoints are logical entities and do not have physical bearer facilities of their own. As well, SIP/SIPt signalling has limited capability to convey tone and/or digit collection requests to preceding offices. Due to this limitation the SIP specification allows for the introduction of a media server into a call topology to perform media functions. The Packet Media Anchor is Nortel's answer to tone insertion and digit extraction on SIP/SIPt.

## 1.3 Hardware Requirements or Dependencies

### 1.3.1 AudioCodes AMS

The AMS audio server 2010 is required for Packet Media Anchor functionality. Both BCT and Audio resources must be provisioned on each AMS that will be used for the PKTMA. The device will register with a CS2K gateway controller and it is expected that multiple AMS devices will be used to comprise the pool of available resources required.

## 1.4 Software Requirements or Dependencies

### 1.4.1 Provisioning

Provisioning for DPT Media Anchors will be provided through CS2K Table Control. Table SERVSINV is the only table that must be provisioned in order to enable Media Anchor endpoints. For additional information on provisioning the Media Anchor see the Configuration section of this feature.

## 1.5 Limitations and restrictions

- The AudioCodes UAS can not support the Packet Media Anchor functionality.
- The Codec Profile for GWCs that control PKTMA resources must only allow the GW to use the G.711 codec.

## 1.6 Interactions

The packet media anchor will be inserted into SIP/SIPt calls that require bearer facility interaction. Some of these scenarios include:

- Local Treatment on a SIP trunk (tone treatment only).
- Digit collection (e.g. DISA service, Auth/Account Codes, CFRA, etc.).
- Interactions with CS2K line or network services (e.g. IN Send-To-Resource) could request digit collection on the trunk, Blind Call Transfer or ACD queuing could request audible ringback on a SIP Trunk after the SIP session has been established. After successful SIP session setup (i.e. “200 OK”) any inband application of tones must be accomplished via the Packet Media Anchor).

## 1.7 Glossary

| Term  | Description            |
|-------|------------------------|
| PMA   | Packet Media Anchor    |
| PKTMA | Packet Media Anchor    |
| UAS   | Universal Audio Server |

## 2: Configuration for A00007120

### 2.1 Hardware and Software Requirements

#### 2.1.1 Required Hardware

- Audiocodes Media Server (AMS) for IP

## 2.1.2 Required Software

- SNO8

## 2.2 Initial Configuration

- Identify the maximum number of anchored calls to support
- Provision the a Packet Media Anchor tuple in table SRVSINV with the maximum number of simultaneous calls to support
- In the GWC element manager:
  - Verify the gateway profile of each AMS is set to “AMS.”
  - Provision a new Network Codec Profile that supports only G.711 for voice calls
  - Change the Codec Profile the AMS GWC uses to be the profile defined above.
- In the AMS element manager provision
  - Three (3) BCT resources for each anchored call. (3 \* the maximum number of simultaneous anchored calls)
  - One (1) Audio resource for each anchored call
- Cold SWACT the ACC GWC or Re-initialize all the AMS gateways

## 2.3 Upgrade Considerations

### 2.3.1 Dump and Restore (CM)

A new option is added in table SERVSINV. There is no impact on the Dump and Restore process.

### 2.3.2 Element Management Upgrade

No impact.

### 2.3.3 Downgrade impact

No impact.

## 2.4 Data schema (DS) (CM, MIBS, RDB)

### 2.4.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| SERVSINV       | CHANGED                  | UNCHANGED                          |

## 2.4.2 Table Database Schema information

### 2.4.2.1 Name: SERVSINV

GWC Services Inventory

#### 2.4.2.1.1 Functional description

Table SERVSINV lists the services associated with a Gateway Controller. Examples of the supported services are:

- Conferencing
- Announcements
- Lawful intercept
- SIPT and BICC Dynamic Packet Trunking

In SNO8 the new Packet Media Anchor service is added to this list of services provisioned in the table.

#### 2.4.2.1.2 Usage sequence and implications (CM Only)

The table must be datafilled in the following sequence:

- SERVRINV
- SERVSINV

#### 2.4.2.1.3 Size

Table 2 Table size

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory |
|------------------------|----------------|----------------|-----------------------|
| SERVSINV               | 0              | 256            | Protected             |

**2.4.2.1.4 Fields/OIDs** The following table lists the changed fields for table SERVSINV.

Table 3 Table field descriptions

| Field   | New or Changed | Subfield or refinement | Entry                    | Explanation and action                                            |
|---------|----------------|------------------------|--------------------------|-------------------------------------------------------------------|
| OPTIONS | Changed        |                        | See refinement (table 4) | Options. New PKTMA_MAX_CALLS option may be entered in this field. |

OPTION = PKTMA\_MAX\_CALLS

**Table 4 Table field descriptions**

| Field   | New or Changed | Subfield or refinement | Entry           | Explanation and action                                                                                           |
|---------|----------------|------------------------|-----------------|------------------------------------------------------------------------------------------------------------------|
| OPTIONS | new            |                        | PKTMA_MAX_CALLS | Used to control the number of Packet Media Anchor calls. This field contains subfield PKTMA_MAX_CALLS.           |
|         |                | PKTMA_MAX_CALLS        | 1 to 1000       | Anchor calls. Defines the number of supported anchored calls on the audio server. Enter value between 1 to 1000. |

#### 2.4.2.1.5 Datafill example

The following example shows a sample datafill for table SERVSINV. Table 5 shows an example of datafill prior to provisioning the PKTMA\_MAX\_CALLS option. Table 6 shows an example of the provisioning changes when the PKTMA\_MAX\_CALLS option is added.

**Table 5 Table SERVSINV Datafill without the PKTMA\_MAX\_CALLS Option**

```
TABLE: SERVSINV
>LIST ALL
TOP
      SRVSNAME      SRVRNAME  NUMTERMS      OPTIONS
-----
      AUD      4      GWC      20      4095      (3PORT 30) (6PORT 30) (ANNC 300)$
      DPT      6      GWC      15      2048      (      SIPT )$
      BCT      4      GWC      20      1024      (ALTTERMS 90)$
BOTTOM
```

**Table 6 Table SERVSINV Datafill with the PKTMA\_MAX\_CALLS Option**

```
TABLE: SERVSINV
>LIST ALL
TOP
      SRVSNAME      SRVRNAME  NUMTERMS      OPTIONS
-----
      AUD      4      GWC      20      4095      (3PORT 30) (6PORT 30) (ANNC 600)$
      DPT      6      GWC      15      2048      (      SIPT )$
      BCT      4      GWC      20      1024      (ALTTERMS 90)$
      BCT      5      GWC      20      4095      (PKTMA_MAX_CALLS 300)$
BOTTOM
```

#### 2.4.2.1.6 Table release history update

The PKTMA\_MAX\_CALLS option was added in SN08.

#### 2.4.2.1.7 Supplementary information

- A GWC may support a maximum of one BCT node for Lawful Intercept (ALTTERMS) and one BCT node for the Packet Media Anchor (PKTMA\_MAX\_CALLS). Multiple appearances of either option, on a single GWC, is not permitted.
- The PKTMA\_MAX\_CALLS option ranges from 0 to 1000 for future expansion. The functional limit per GWC is 480 PKTMA calls. This limitation is determined with the following calculation:
  - $(30 \text{ PKTMA calls per AMS}) * (16 \text{ AMS gateways per GWC}) = 480 \text{ PKTMA calls per GWC.}$
- The Audio Server must be configured to support three BCT resources and one announcement resource per call. Using the example above, the Audio Server should be configured with:
  - 990 BCT resources:  $(3 * \text{PKTMA\_MAX\_CALLS}) + \text{ALTTERMS}$
  - 600 ANNC resources:  $(\text{Orig. ANNC value}) + (\text{PKTMA\_MAX\_CALLS})$
- Changes to the PKTMA\_MAX\_CALLS parameter require the AMS gateways to be re-initialized for the parameter to take affect.
- The PKTMA option can be provisioned on a GWC that does not have audio resources provisioned in table SERV辛INV; however, the AMS must be provisioned with the following resources to support the PKTMA functionality.
  - Announcement resources
  - BCT resources
  - Voice Prompt file
  - Call Progress Tone file
  - Pre Recorded Tones file
- In the GWC element manager, the profile of the AMS must be set to “AMS,” and not “UAS.” This enables functionality on the AMS necessary to support the PKTMA application.

#### 2.4.2.1.8 Translation verification and other tools

Not Applicable.

## 2.5 Software optionality control (SOC)

Not Applicable.

**Table 7 SOC**

|                          |                        |

| Option defined in DRU: | <DRU>        |
| Affected products:     | <PCL(s)>     |

## 2.6 User interface changes

### 2.6.1 Directory: GWC

#### 2.6.1.1 Directory description

Posts the GWC peripherals and provides commands for viewing the status of GWC peripherals. No maintenance actions, such as BSY and RTS, can be performed from this MAP level.

#### 2.6.1.2 Accessing directory: GWC

##### 2.6.1.2.1 Access to directory or MAP level and return to CI

>MAPCI;MTC;PM;POST GWC ALL

>QUIT ALL

### 2.6.2 Command: QUIT

#### 2.6.2.1 Command type: Listed MENU

#### 2.6.2.2 Command target: All

#### 2.6.2.3 Command availability: RES

#### 2.6.2.4 Command description

Exits the GWC level and returns the user to a previous MAP level or to the CI prompt.

#### 2.6.2.5 Command syntax

**Table 8 QUIT command parameters and variables**

| Command                  | Parameters and variables             |
|--------------------------|--------------------------------------|
| QUIT                     | <nlevels   incrname   ALL>           |
| Parameters and variables | Description                          |
| nlevels                  | Exits the specified number of levels |

**Table 8 QUIT command parameters and variables**

| Command  | Parameters and variables      |
|----------|-------------------------------|
| incrname | Exits the specified increment |
| All      | Returns to the CI prompt      |

**2.6.2.6 Qualifications and warnings**

None.

**2.6.2.7 Example Commands**

>MAPCI;MTC;PM;POST GWC ALL

- Enters the GWC MAP level and places all GWC type peripherals in the posted set.

>QUIT

- Returns to the PM MAP level

>QUIT All

- Returns to the CI level

**2.6.3 Command: POST****2.6.3.1 Command type: Listed MENU****2.6.3.2 Command target: All****2.6.3.3 Command availability: RES****2.6.3.4 Command description**

Used to post a specific GWC, or a set of GWC type peripherals.

**2.6.3.5 Command syntax****Table 9 POST command parameters and variables**

| Command                  | Parameters and variables                                                                                                                                                                         |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POST                     | [<All> {All}]<br>[<PMNo>.... {0 TO 2047}]<br>[<PMTYPE>...{GWC [<All> {All}]<br>[<PMNo>... {0 TO 255}}]<br>[<state>... {SysB, ManB, OffL, CBsy, ISTb, InSv}]<br>[<Alarm>... {Minor, Major, Crit}] |
| Parameters and variables | Description                                                                                                                                                                                      |

**Table 9 POST command parameters and variables**

| Command | Parameters and variables                         |
|---------|--------------------------------------------------|
| ALL     | Posts all GWC type peripherals                   |
| PMNo    | Posts a specific GWC using the PM Number         |
| PMTYPE  | Posts all GWC type peripherals or a specific GWC |
| State   | Posts all GWC peripherals in the specified state |
| Alarm   | Posts all GWC peripherals in the specified state |

**2.6.3.6 Qualifications and warnings**

None.

**2.6.3.7 Example Commands**

>MAPCI;MTC;PM;POST GWC ALL

- Enters the GWC MAP level and places all GWC type peripherals in the posted set.

>POST 2

- Displays GWC 2 and modifies the posted set to contain only GWC 2.

>POST MANB

1. Changes the posted set to contain GWC peripherals in the MANB state.

**2.6.4 Command: LISTSET****2.6.4.1 Command type: Listed MENU****2.6.4.2 Command target: All****2.6.4.3 Command availability: RES****2.6.4.4 Command description**

Lists the peripherals in the current posted set.

**2.6.4.5 Command syntax****Table 10 LISTSET command parameters and variables**

| Command | Parameters and variables    |
|---------|-----------------------------|
| LISTSET | noparm<br><ALL><br><PMTYPE> |

**Table 11 DISP command parameters and variables**

| Command                  | Parameters and variables                                                     |
|--------------------------|------------------------------------------------------------------------------|
| Parameters and variables | Description                                                                  |
| STATE                    | Display the PMs in a specific state                                          |
| DIAGHIST                 | Display the diagnostic history of all PMs                                    |
| PM Type                  | Specify the state, or diagnostic history, for all PMs of a specific PM type. |

### 2.6.5.6 Qualifications and warnings

- The DIAGHIST option of this command is not valid for GWC type peripherals.

### 2.6.5.7 Example Commands

>DISP STATE MANB

- Displays a concise list of the peripherals in the MANB state

>DISP STATE MANB GWC

- Displays a concise list of all GWC type peripherals in the MANB state.

## 2.6.6 Command: NEXT

### 2.6.6.1 Command type: Listed MENU

### 2.6.6.2 Command target: All

### 2.6.6.3 Command availability: RES

### 2.6.6.4 Command description

Step to the next PM in post set or to the first PM of the next PM type in post set

### 2.6.6.5 Command syntax

**Table 12 NEXT command parameters and variables**

| Command                  | Parameters and variables                             |
|--------------------------|------------------------------------------------------|
| NEXT                     | [<PM TYPE> {PMTYPE}]                                 |
| Parameters and variables | Description                                          |
| PMTYPE                   | Optional parameter for stepping to the next PM type. |

### 2.6.6.6 Qualifications and warnings

None.

### 2.6.6.7 Example Commands

>NEXT

- Steps to the next PM in the post set

>NEXT PMTYPE

- Steps to the next PM type in the post set

## 2.6.7 Command: LISTRES

### 2.6.7.1 Command type: Listed MENU

### 2.6.7.2 Command target: All

### 2.6.7.3 Command availability: RES

### 2.6.7.4 Command description

Displays information related resources associated with the Gateway Controller (GWC). The command is only valid for Audio Server GWCs. The resources presented are:

- Announcements
- Conferencing
- Lawful Intercept
- Packet Media Anchor

For each resource type, the following data is displayed:

- Maximum number of provisioned resources in table SERVSINV (MaxPorts)
- Number of in-service resources (InsvPorts)
- Number of resources involved in a call (CPBports)
- Number of busy resources (BsyPorts)

The LISTRES command provides a snapshot of the resource usage, the MAP display is not updated dynamically. The command must be re-entered to update the display.

### 2.6.7.5 Command syntax

**Table 13** LISTRES command parameters and variables

| Command | Parameters and variables |
|---------|--------------------------|
| LISTRES | None.                    |

**Table 13 LISTRES command parameters and variables**

## 2.6.8 Command: QUERYPM

### 2.6.8.1 Command type: Listed MENU

### 2.6.8.2 Command target: All

### 2.6.8.3 Command availability: RES

### 2.6.8.4 Command description

Presents general information about the posted GWC, including:

- The load name for each unit
- The active unit IP address
- In-service trouble reasons

### 2.6.8.5 Command syntax

**Table 14 LISTRES command parameters and variables**

| Command                  | Parameters and variables                                                 |
|--------------------------|--------------------------------------------------------------------------|
| QUERYPM                  | [<option> {FLT,<br>CNTRS,<br>FILES,<br>CONFIG,<br>DIAGHIST,<br>ABICONN}] |
| Parameters and variables | Description                                                              |
| none                     | Displays general information about the posted GWC                        |
| FLT                      | Displays in-service trouble reasons for the GWC                          |
| CNTRS                    | Not supported for GWC type peripherals                                   |
| FILES                    | Not supported for GWC type peripherals                                   |
| CONFIG                   | Not supported for GWC type peripherals                                   |
| DIAGHIST                 | Not supported for GWC type peripherals                                   |
| ABICONN                  | Not supported for GWC type peripherals                                   |

### 2.6.8.6 Qualifications and warnings

- GWC Type peripherals only support the “FLT” option.

### 2.6.8.7 Example Commands

>QUERYPM

- Displays general information regarding the posted GWC

>QUERYPM FLT

- Displays in-service trouble reasons for the posted GWC

## 2.7 Configuration Walkthrough

- Identify the maximum number of anchored calls to support
- Provision the a Dynamic Packet Trunk Media Anchor tuple in table SRVSINV with the maximum number of simultaneous calls to support
- In the GWC element manager:
  - Verify the gateway profile of each AMS on the GWC is set to “AMS.” (See note 2 below).
  - Provision a new Network Codec Profile that supports only G.711 for voice calls
  - Change the Codec Profile the AMS GWC uses to be the profile defined above.
- In the AMS element manager provision
  - Three (3) BCT resources for each anchored call. (3 \* the maximum number of simultaneous anchored calls)
  - One (1) Audio resource for each anchored call
- Cold SWACT the ACC GWC or Re-initialize all the AMS gateways
- Use the LISTRES command to verify resource allocation. All discrepancies between the provisioned resources (MaxPorts) and in-service resources (InsvPorts) should be investigated. Differences may be caused by
  - Provisioning errors in the gateway element manager
  - Provisioning errors in table SERVSINV
  - Gateways not registered with the GWC

### Notes:

1. Ensure each AMS is configured with the following files to support the PKTMA functionality.
  - Voice Prompt file
  - Call Progress Tones file
  - Pre Recorded Tones file
2. When converting an existing AMS to support the PKTMA functionality, the AMS must be disassociated from the GWC in the GWC element manager and re-associated using the new AMS profile. Standard maintenance procedures should be followed to perform this action as it will result in a call processing outage on the gateway.

## 3: Performance for A00007120

### 3.1 Performance management strategy

The Packet Media Anchor (PKTMA) performance management provides the customer a means to monitor the PKTMA resources. To assist the customer with network engineering, the system monitors:

- Anchored call attempts
- Failed anchored call attempts
- Maximum anchored call attempts (High Water Mark)

A new XPKT340 log will be introduced for reporting a variety of Gateway, Gateway Controller, and PKTMA resource problems. The infrastructure for such logs will be constructed.

### 3.2 Performance management tools and utilities

When an Packet Media Anchor is provisioned in table SERVSINV, the PKTMA Operational Measurement group can be used to monitor the anchor resource usage. To view the group data the OMSHOW CI command may be used.

Example: OMSHOW PKTMA ACTIVE

### 3.3 Performance Measurements (PM), Operational Measurements (OM), and stats

PKTMA presents usage counts for Dynamic Packet Trunk Anchor resources.

#### 3.3.1 PM, OM, and stats format

Performance Measurement Name: PKTMA

Performance Measurement Description: Presents usage counts on a GWC basis

Performance Registers: PMAREQST, PMAFLNR, PMAHWM

History: Created in SN08/GWC11

#### 3.3.2 OM Group template (applies only to DMS)

##### 3.3.2.1 OM description

PKTMA

Packet Media Anchor

### 3.3.2.2 Release history update

The OM group is new in SN08.

### 3.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

**Figure 1 OM Group Display**

PMAREQST                      PMAFLNRPMAHWM

### 3.3.2.4 Group structure

OM group provides 1 tuple for each GWC provisioned with PKTMA resources.

Key field: Integer.

The PKTMA anchor number derived from datafill order

Info field: PKTMA\_OM\_INFO

Presents the GWC number and the maximum number of anchored calls supported by the GWC resources.

Example:

1                      GWC 20      125

### 3.3.2.5 Associated OM groups

None.

### 3.3.2.6 Associated functional groups

The following functional groups are associated with OM group: None.

### 3.3.2.7 Associated functionality codes

**Table 15 Functionality codes associated with OM group**

| Functionality | Code |
|---------------|------|
| NA            |      |
| NA            |      |

### 3.3.2.8 OM group registers logic flow chart

### 3.3.3 Register (applies only to DMS)

#### 3.3.3.1 PMAREQST Register description

Register PMAREQST:

PMAREQST is a peg register to indicate the number of anchored call attempts.

#### 3.3.3.2 Register release history update

New in SN08

#### 3.3.3.3 Associated registers

None.

**3.3.3.4 Associated logs**

None.

**3.3.3.5 PMAFLNR Register description**

Register PMAFLNR

PMAFLNR is a peg register to indicate the number of failed anchored call attempts due to the unavailability of resources.

**3.3.3.6 Register release history update**

New in SN08

**3.3.3.7 Associated registers**

None.

**3.3.3.8 Associated logs**

XPKT340 log will be generated for failed anchor attempts.

**3.3.3.9 PMAHWM Register description**

Register PMAHWM

PMAHWM is a high water mark register to indicate the maximum number of simultaneous anchored calls.

**3.3.3.10 Register release history update**

New in SN08

**3.3.3.11 Associated registers**

None.

**3.3.3.12 Associated logs**

None.

**3.4 New XPKT340 log.**

The infra-structure to generate an XPKT340 log will be added for SN08.

**3.5 Log format**

An example of such a log is shown in Table 16 on page 1115.

**Table 16 example XPKT340 log**

|                                                                        |  |
|------------------------------------------------------------------------|--|
| RTP7 <b>XPKT340</b> FEB01 11:44:12 7100 INFO PKTMA <b>Call Failure</b> |  |

| 17    | Gateway Exception       | IP address, GWC exception value, protocol error code, signal ID.<br><br>example specific data:<br>Cause: Number 17 - Gateway Exception<br>IP Address: 47.142.134.147<br>Gateway Exception Value: 11<br>Protocol Error Code: 0<br>Signal ID: 0 |
| 18    | No Conf Resources       | None                                                                                                                                                                                                                                          |
| 19    | No Annc resources       | None                                                                                                                                                                                                                                          |

| Cause | Output String on CM | Debug Info |
|-------|---------------------|------------|
| 20    | No PKTMA Resources  | None       |
| 21    | Max Anchored Calls  | None       |

Note: When a signal ID or phrase ID is output, only one ID is provided, so in the cases where more than one signal or phrase has been requested, the first one in the request is provided. Typically only one signal is required in a request. There are times when more than one phrase is requested in a single request, but the phrases are usually very unique so that providing the first of the phrase segments indicates which announcement phrase list has been requested and subsequently resulted in an audio failure.

### 3.6 Log management

When a error cause is logged which indicates an exception at the audio server, the craftsperson should check the error code (associated protocol specifications are used to determine the error cause meaning) to determine the possible mismatch. For errors indicating an unsupported request, the craftsperson should check the audio server for appropriate signal and audio provisioning.

When a GW cause is logged which indicates a missing phrase from the audio server, the craftsperson should check the announcement datafill at the call server (Table ANNAUDID, Table ANNPHLST) for the announcement phrases which contain the flagged segment ID, and these segments must be compared against those supported on the audio server. Then action must be taken by the craftsperson to either change the call server datafill to use audio segments that are supported on the audio server, or the desired audio segments must be incorporated on the audio server.

When an resource unavailable cause is logged, the craftsperson should compare the call server audio datafill (table SERVSINV) against the provisioned port data on the audio server to determine if this information matches and if the provisioned port size is large enough to provide the announcement and conferencing support needed for the office.

***Product = CS 2000***

**A00007121--New Map Level for SPM maintenance**

## *Functional Description*

### 1.1 Applicable Solution(s)

DMS

### 1.2 Description

This feature has the following component.

- Provide an IW bridge Map maintenance for deload.
  - This feature introduces an IW bridge maintenance MAP level (BrgMtce) which provides a method to deload call processing from IW bridges.

#### 1.2.1 IW Bridge Maintenance

A new MAP level 'BRGmtce' will be provided to manage the state of the IW SPM bridge terminals. **Offl**, **Bsy**, **Rts**, **Frls**, **Post** and **Next** commands will be provided at this command subdirectory.

A new status for all terminals on an IW SPM bridge is going to be introduced: deload, which means that the bridge involving in a call will be put in a pending deload state before the call is terminated. The bridge will no longer be available to CallP when the old call terminates. This state will be set via the **Bsy** command. Prior to having deload status, the IW SPM bridge terminal has the following states: Idle, Call Processing Busy and System Busy. When combining the deload state with these three states, the following new terminal states are introduced: Call Processing Deload and Manual Busy. In addition, Offl state will be introduced to the state of bridge terminals. This will be the initial state and can only be set when the group state of bridges in a DS512 link is G\_ManB.

A new group state of bridge terminals in each DS512 link, {G\_OFFL, G\_MANB, G\_SYSB, G\_INSV}, will be introduced. These states are used to determine the individual bridge terminal state, which can be OFFL, MANB, SYSB, CPB, CPD, and IDLE. The state transition diagram for the bridge group state is depicted as follows:

**Figure 2 bridge group state transition diagram**

Note that rts command will be rejected if the group state of bridges in a DS512 link is G\_SYSB.

The bridge terminal state transition due to manual actions is shown in the following figure:

**Figure 3 Bridge terminal state transition diagram**

The following list describes the required IW SPM bridge terminal state transitions that result from the Bsy command:

- Idle to Manual Busy - this transition results from a 'Busy' command being issued to a bridge terminal that is in the 'idle' state.
- Call Processing Busy to Call Processing Deload - this transition results from a Bsy command being issued to a bridge terminal that is in the 'call processing busy' state.
- System Busy to Manual Busy - this transition results from a Bsy command being issued to a bridge terminal that is in the 'system busy' state.
- Off line to Manual Busy - this transition results from a Bsy command being issued to a bridge terminal that is in the 'Off Line' state.

Two options, "all" and "DS512\_link\_number", will be provided. "Bsy all" will "busy" all the bridge terminals of the posted IW SPM, while "Bsy number" will just busy the bridge terminals of the specified DS512 link. The group state of the DS512 link will be set to MANB.

Command **Offl** will be supported to allow the craftsmen to set the state of IW SPM bridge terminals to off line. This command can be issued on the bridge terminal link that is in a ManB state. The group state of the DS512 link will be set to OFFL.

Two options, "all" and "DS512\_link\_number" will be provided. "Offl all" will "offl" all the bridge terminals of the posted IW SPM, while "Offl number" will just offl the bridge terminals of the specified DS512 link.

Command **Rts** will be supported to allow the craftperson to allow the IW SPM bridge terminals to be used by call processing. The following list illustrates the required IW SPM bridge terminal state transitions that result from the 'Rts' command:

- Manual Busy to Idle - this transition results from an 'Rts' command being issued to a bridge terminal that is in the 'manual busy' state and the associated IW SPM node is in service.
- Call Processing Deload to Call Processing Busy - this transition results from an 'Rts' command being issued to a bridge terminal that is in the 'call processing deload' state.
- Manual Busy to System Busy - this transition results from an 'Rts' command being issued to a bridge terminal that is in the 'manual busy' state and the associated IW SPM node is out of service.

Two options, "all" and "DS512\_link\_number", will be provided. "Rts all" will "Rts" all the bridge terminals of the posted IW SPM, while "Rts number" will just Rts the bridge terminals of the specified DS512 link. The group state of the DS512 link will be set to INSV.

Command **Frls** will be supported to allow the craftsperson to remove the IW SPM bridge terminals from use by call processing immediately. The following list illustrates the required IW SPM bridge terminal state transitions that result from the 'Frls' command:

- Idle to Manual Busy - This transition results from a 'Frls' command being issued to a bridge terminal that is in the 'idle' state.
- Call Processing Busy to Manual Busy - this transition results from a 'Frls' command being issued to a bridge terminal that is in the 'call processing busy' state.
- Call Processing Deload to Manual Busy - this transition results from a 'Frls' command being issued to a bridge terminal that is in the 'call processing deload' state.
- System Busy to Manual Busy - this transition results from a 'Frls' command being issued to a bridge terminal that is in the 'system busy' state.

Two options, "all" and "DS512\_link\_number", will be provided. "Frls all" will "Frls" all the bridge terminals of the posted IW SPM, while "Frls number" will just Frls the bridge terminals of the specified DS512 link. The group state of the DS512 link will be set to MANB.

Command **Post** will be supported to display the terminal states of the IW SPM currently posted. It supports the option "all" and "spm #". The following information will be displayed on the map:

- Number of bridge terminals in an 'Idle' state
- Number of bridge terminals in a 'Call Processing Busy' state
- Number of bridge terminals in a 'Call Processing Deload' state
- Number of bridge terminals in a 'Manual Busy' state
- Number of bridge terminals in a 'System Busy' state
- Number of bridge terminals in a 'Offl Line' state

The above terminal status window will be updated continuously.

Command **Next** will be supported to display the terminal states of the next IW SPM in the post set (post set is created via "post all"). If the current IW SPM is the last one in the post set, Next will clear the display on the map.

**Note 1:** The newly introduced deload state is independent of the IW node state. This means that the IW SPM bridge terminal states can be driven separately from the state of the IW SPM node.

**Note 2:** The requirements described above will be applicable to all types of IW SPMs.

### 1.2.1.1 Accessing 'BrgMtce' from PKT MAPCI level

BrgMtce subdirectory is created up the MAPCI;MTC;APPL;PKT level of MAPCI as shown in Figure 1.

**Figure 4 Accessing BRGMtce level from PKT level**

### 1.2.1.2 New Logs

Four new logs are created: IWBM502, IWBM503, IWBM504, IWBM505.

The following new logs will be created to keep the users informed about the group state transitions.

- IWBM502 - A Bsy command being requested for a set of IW SPM bridge terminals.

```
RTP708AK  ** IWBM502 AUG12 00:37:09 5900 INFO MBSY IW Bridge Terminals
           SPM Number: 3
           DS512 link: 3
           IW bridge group state changed from SYSB to MANB
           IW bridge terminal range: 1 through 504
           Reason: Manual Request
           Issued by: YD2
```

- IWBM503 - A Rts command being requested for a set of IW SPM bridge terminals.

RTP708AK      IWB503 AUG12 00:37:19 6700 INFO RTS IW Bridge Terminals  
SPM Number: 3  
DS512 link: 0  
IW bridge group state changed from MANB to SYSB  
IW bridge terminal range: 1513 through 2016  
Reason: Manual Request  
Issued by: YD2

- IWB504: An Offl command being requested for a set of IW SPM bridge terminals.

RTP708AK    \*\* IWB504 AUG12 00:04:26 3200 INFO OFFL IW Bridge Terminals  
SPM Number: 3  
DS512 link: 3  
IW group terminal state changed from OFFL to MANB  
IW bridge terminal range: 1 through 504  
Reason: Manual Request  
Issued by: YD2

- IWB505 - A Frls command being requested for a set of IW SPM bridge terminals.

RTP708AK    \*\* IWB505 AUG12 00:37:51 8000 INFO FRLS IW Bridge Terminals  
SPM Number: 3

IW bridge terminal range: 1 through 504  
Reason: Manual Request  
Issued by: YD2

## 1.3 Hardware Requirements or Dependencies

N/A

## 1.4 Software Requirements or Dependencies

## 1.5 Limitations and restrictions

Since the newly introduced Offl state will be set as an initial bridge terminal state in SN08, the group state of barges in each DS512 link and bridge terminal state need to be restored on the newly active side over swact. The bridge terminal state transition over swact will be as follows:

From SN08 to SN08, SysB -> SysB, Idle -> Idle, CPB -> CPB

From SN08 to SN08: OFFL -> OFFL, SysB -> SysB, Idle -> Idle, CPB -> CPB, ManB -> ManB, CPD -> CPD

## 1.6 Interactions

Once the deload state is ON (ManB) on a bridge terminal, new calls cannot be established using that bridge.

## A00007135--GWC DPT Audits and Counter Drift Prevention

**Note:** This activity also applies to MG4k and DPT SPM, not just GWC.

## 1.1 Applicable Solution(s)

UA-IP

## 1.2 Description

This feature addresses two areas of weakness in the existing DPT application:

### 1. Counter drift.

DPT software has several counters, e.g., the total number of DPT terminals in use, that have been observed to drift from their proper values over time. Negative consequences of counter drift include network management and OM distortions, SWERRs on certain scenarios (e.g. dead shelf recovery), and artificially reduced DPT capacity.

### 2. Trunk OM anomalies

DPT OMs are both unlike regular trunk OMs and sometimes quite similar also. This “split personality” has led to issues both with documentation and behavior.

### 1.2.1 Counter drift

Any changes made by this activity to handle counter drift will be visible in greater accuracy of the OMs described in the next section of this document.

### 1.2.2 Trunk OM anomalies

The changes made by this activity to the OMs TRK, DPTOFC, and DPTNODE are behavioral and/or documentation clarifications:

- No new OMs are introduced by this activity.
- No new registers are introduced by this activity.
- No existing OMs are removed by this activity.
- No existing registers are removed by this activity.

### 1.2.3 Behavioral Changes

#### 1.2.3.1 OMs DPTOFC and DPTNODE

For registers DPTNODE::DPTGTAT and DPTOFC::DPGTAT/DPGTAT2 the “attempts” counted at the nodal level exclude failed optimization attempts whereas the office level OM includes them. The pegging of these registers will be changed such that both the nodal level and the office level are counted at the same point (except in cases where the code exits prior to knowing a particular node).

The DPTOFC::DPGTFLO/DPGTFLO2 registers & DPTNODE::DPTGTFLO registers will be changed such that failed optimized attempts on nodes “not DPT-enabled” are not pegged against these registers.

The changes described here will also change the corresponding registers in the DPTOFCP OM.

### 1.2.3.2 OM TRK

Register MAXBU is effectively disabled for DPT trunk groups. The value of the MAXBU register for a DPT trunk group will always be equal to zero.

The MAXBU register was designed to be used with non-DPT trunks. The DPTOFC and DPTNODE usage registers and high water registers are directly applicable to DPT trunks and should be used in the place of the MAXBU register.

This change was sourced in the SN07 stream by CR Q00868638.

## 1.2.4 Documentation Clarification

### 1.2.4.1 OM - DPTOFC

Customers have requested that the documented descriptions of the DPTOFC and DPTNODE OMs be clarified. The CR Q00881441, states “*Customer would like better explanation or data to reflect exactly what we are trying to determine with this field*”, i.e., the DPTNODE OM register DPTHWT. As well, Nortel employees have noted that the documentation is confusing for these OMs, especially the high water registers.

The intent of this activity is to increase the accuracy of the DPT OMs and to rewrite the customer facing documentation for OM DPTOFC and OM DPTNODE. To help understand the DPT OMs the following definitions are provided:

#### 1.2.4.1.1 Definitions

- optimized

In the context of the DPT OMs this means “occurring on the same device”. An “optimized” attempt is an attempt to get a TID from the same device (where “device” is an MG4K, DPT SPM, or DPT GWC) that hosts the other agent in the call.

- non-optimized

A “get” attempt not constrained to be on the same device (where “device” is an MG4K, DPT SPM, or DPT GWC).

- port depletion

The exhaustion of the DPT terminal pool, because the DPT SOC limit on usable DPT tids has been exceeded.

- cpb

The number of terminals that are call processing busy.

— cpd

The number of terminals that are call processing deloaded. Where CPD is a terminal that is CPB on a device that is no longer in service, such as, during an upgrade.

The DPTOFC OM provides information for the entire office and is composed of the registers described in “Table 1 OM - DPTOFC” shown below.

**Table 1 OM - DPTOFC**

| Register | Extension Register | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

a. For further information about BICC OMs see the FN of A89007299 in PLS FM-DOC.

### 1.2.5 Considerations

When using a customer defined long duration OM by using a customer defined “accumulating” class (rather than the active or holding class) the meaning of the high water registers (DPHWT/DPHWT2) changes. In this case the value of the high water mark is only valid when divided by the number of transfer periods within the duration of the long duration OM. The result of which is the *average* high water mark for the long term duration. For example, if we define a “weekly” long duration class, with 15 minutes transfer periods, we would need to divide the high water mark by 672 [(7days \* 24 hours \* 60 minutes)/15 minute transfer period].

**Note:** It is recommended that the DPTOFC/DPTOFCP/DPTNODE high water registers **not** be used in conjunction with long duration “accumulating” OMs. For more information on “accumulating” registers see NTP 297-1001-300, Section 1, Understanding the Operational Measurement System, sub section Measurement Classes, pg 1-9, v 03.08, May 2000.

Figure 1 below shows an example of the DPTOFC OM.

**Figure 1 OM DPTOFC**

### 1.2.5.1 OM - DPTNODE

The DPTNODE OM provides information per DPT node. Each is composed of the registers described in “Table 2 OM - DPTNODE”

**Table 2 OM - DPTNODE**

| Register | Extension Register | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DPTGTAT  | DPTGTAT2           | <p>The number of attempts to get a DPT Terminal for a particular DPT node.</p> <p>This is an incremental register. The register is pegged every time an attempt to get a DPT terminal is made within a given transfer period.</p> <p>For a typical SIPT call the number of pegs is in the range of 1 peg per DPT agent per call.</p> <p>For a typical BICC<sup>a</sup> call the number of pegs is in the range of 1 to 3 pegs per DPT agent per call.</p>                                                                                                                                                                                                |
| DPTGTFL  | n/a                | <p>The number of attempts to get a DPT Terminal that failed (non-optimized) for a particular DPT node.</p> <p>This is an incremental register. The register is pegged every time an attempt to get a <i>non-optimized</i> DPT terminal fails within a given transfer period.</p>                                                                                                                                                                                                                                                                                                                                                                         |
| DPTUSAG  | DPTUSAG2           | <p>The number of DPT Terminals in use for a particular DPT node.</p> <p>This is an accumulator register. The register is pegged every one-hundred seconds within a given transfer period.</p> <p>The formula used for calculating the usage is as follows:</p> $\text{current\_usage} = (\text{current\_cpb} + \text{current\_cpd})$ $\text{usage\_om} = \text{usage\_om} + \text{current\_usage}$ <p>Since this register is an accumulator and is added to itself the register can be misleading.</p> <p>To interpret the usage register divide the value by the number of slow samples to determine the average usage for a given transfer period.</p> |

Table 2 OM - DPTNODE

| Register | Extension Register | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## **A00007196--PacketCable™ Event Messaging For Accounting** *Functional Description*

### **1.1 Applicable Solution(s)**

IAC

### **1.2 Description**

#### **1.2.1 Background**

CableLabs is a consortium of cable operators and cable equipment vendors that creates specifications for cable. This work is done under the “PacketCable™” project ([www.packetcable.com](http://www.packetcable.com)). The purpose of the PacketCable™ project is to ensure Cable Network Operators’ desired functionality is available and to promote vendor inter-operability. In order to provide a billing capability, PacketCable™ has created a specification for an event reporting mechanism that is called “PacketCable™ Event Messaging” (PCEM). PCEM uses RADIUS accounting (RFC 2866) to deliver event messages to a record keeping server (RKS). This activity provides an implementation of PCEM for the Succession Cable Solution.

This development activity is one component of Nortel’s development effort to support “Packet Cable 1.5” compliance in the Succession Cable Solution.

This activity provides CMS PacketCable™ 1.5 compliance with PCEM for PacketCable™. Specifically for event messaging PKT-SP-EM-I10.

---

1. There is no performance section within this document since there are no visible changes to the OMs. However, the changes documented in this FN need to be propagated into any customer visible documentation that describes these OMs. The DPT OMs were originally defined in PLS FMDOC A59015752.

## 1.2.2 Component Architecture

The EMDI (Event Messaging Delivery Interface) encapsulates the capability of formatting event messages with RADIUS headers and sending to the RKS (including retries). For this activity, the EMDI is provided by the IAA (Integrated Accounting Application) on the CBM. The IAA may also receive event messages from the GWC for ES (Electronic Surveillance).

The RKS (Record Keeping Server) is third party equipment provided by any RKS vendor. The RKS receives event messages from the EMDI and the CMTS.

The PacketCable™ architecture refers to two network elements that are not labeled in figure 1, the CMS and the MGC. The CMS, or call management server, is PacketCable™'s line solution. Nortel implements the CMS by using functionality in the core and small-lines GWCs. The MGC, or media gateway controller (not to be confused with our GWC), is PacketCable™'s trunk

solution. Nortel implements the MGC using the core and trunk GWCs controlling TGCP trunk gateways.

### 1.2.3 Event Messages

Event messages are generated at different points in the call and they contain information which can be used for billing purposes. For example: a signaling\_start event message contains the calling and called DNs.

Unlike traditional billing systems which generate one billing record when the call is released, packet cable event messaging generates several event messages for each call at various times during the call. Another difference is that event messages are generated for each half call. Generally, each leg of a call consists of two half calls (one for the originator and one for the terminator). Therefore, separate event messages are generated for the originating and terminating call halves.

#### 1.2.3.1 Message Structure

Refer to the Packet Cable specification PKT-SP-EM-I10 for details regarding the individual components in the Packet Cable event messages. Event messages have dynamic lengths. Generally, a message that contains a full 247 byte FEID would have a length of approximately 400 bytes. Typically, FEIDs are shorter than 247 bytes and result in message lengths that average less than 400 bytes.

#### 1.2.3.2 Message Types

**Table 17: PacketCable™ Event Messages**

| Name                 | Description                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Signaling_Start      | Start of signaling for originating or terminating half of the call                                                                   |
| Signaling_Stop       | End of signaling for originating or terminating half of the call                                                                     |
| Database_Query       | An inquiry into an external database; for example 800, LNP. A TCAP with multiple return values from a single query is not supported. |
| QoS_Reserve*         | Reservation of QoS for originating or terminating half of the call                                                                   |
| QoS_Commit*          | Commitment of QoS for originating or terminating half of the call                                                                    |
| QoS_Release*         | Release of QoS for originating or terminating half of the call                                                                       |
| Service_Activation   | Indicates a subscriber has activated a service                                                                                       |
| Service_Instance     | Indicates an occurrence of a service                                                                                                 |
| Service_Deactivation | Indicates a subscriber has deactivated a service                                                                                     |
| Call_Answer          | Indicates that all network resources have been allocated for originating or terminating half of the call                             |

| Name               | Description                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Media_Alive        | Indicates if the call is still active. A media alive event message is generated after an agent (line or trunk) has been active for more than 24 hours. For the report interval and time, PCEM only supports the default value for LONGCALL in table AMAOPTS which is every 24 hours at midnight. |
| Call_Disconnect    | Indicates that all network resources have been released for originating or terminating half of the call                                                                                                                                                                                          |
| Media_Report       | Indicates a change in media session information. ES (Electronic Surveillance) ONLY.                                                                                                                                                                                                              |
| Signal_Instance    | Indicates an NCS signal instance. ES(Electronic Surveillance) ONLY.                                                                                                                                                                                                                              |
| Interconnect_Start | Start of network interconnect signaling (between PacketCable and PSTN) for originating or terminating half of the call                                                                                                                                                                           |
| Interconnect_Stop  | Stop of network interconnect signaling (between PacketCable and PSTN) for originating or terminating part of the call                                                                                                                                                                            |
| Time_Change        | Indicates time change on a network element.                                                                                                                                                                                                                                                      |

\*QOS\_XXXX messages are generated by the CMTS and sent directly to the RKS from the CMTS.

### 1.2.4 Agents Generating Event Messages

PCEM supports the CS2K components that form the packet cable solution. Specifically, PCEM supports event messaging for calls and agents hosted on MTA cable line gateways and trunk agents hosted on TGCP cable gateways.

Agents Types that generate event messages:

- POTS and RES Lines (1FR and 1MR)
- PRI Trunks (PRA)
- ISUP Trunks (IT, ATC, T2, TI, and TO)
- OP MF Trunks
- ES MF Trunks

Agent types that do not generate event messages:

- SIPT
- Announcements

In SN08, the North American, non-IXC, non-Centrex trunk group types (IT, ATC, T2, TI, and TO) are supported.

Typically, tandem trunking is not done in a packet cable solution, however, call forwarding can cause a trunk to trunk call.

## 1.2.5 Features Generating Event Messages

**Table 18: CS2K PCEM Supported Features**

| <i>PKT-SP-EM-I10 Feature Title</i>                                 | <i>Nortel CS2k RES Feature(s)/Notes</i>                                                                      |
|--------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Interconnection with circuit-switched PSTN                         | Various Trunk Agent Call Types                                                                               |
| Support for 911 emergency services                                 | 911 Routed Calls to PSTN or ES Trunk                                                                         |
| n11 (411, 611, etc.) assume outside directory service              | Directory Assistance                                                                                         |
| Toll-free services (800, 888, 877...)                              | Toll Free Service (TFS on AIN) or E800                                                                       |
| Operator services                                                  | PSTN or OP Trunk                                                                                             |
| Call block service                                                 | Selective Call Rejection(SCRJ)<br>Anonymous Call Rejection(ACRJ)<br>Subscriber Activated Call Blocking(SACB) |
| Call waiting service                                               | Call Waiting (CWT) and Cancel Call Waiting (CCW)                                                             |
| Call forwarding/call redirection services                          | Call Forwarding (CFW/CFDA/CFBL)                                                                              |
| Return call service                                                | Automatic Recall (AR)                                                                                        |
| Repeat call service                                                | Automatic Call Back (ACB)                                                                                    |
| Voice mail service                                                 | Nortel Call Pilot or Non-Nortel using SMDI                                                                   |
| Message waiting indicator service (E-mail/voice mail notification) | Message Waiting (MWT)                                                                                        |
| Three-Way Call                                                     | Three Way Call (3WC)                                                                                         |
| Customer Originated Trace                                          | Customer Originated Trace (COT)                                                                              |

Note: The CS2K supports more features than listed. However, these are the only features contained in the event messaging spec and are therefore the only features that have a defined set of event messages. Activation of event messaging does NOT cause the CS2K to have a diminished feature set.

## 1.2.6 Configuration and Provisioning

To configure the CS 2000 CMS for event messaging, carry out the following steps in order. Detailed instructions for each step appear in subsequent sections.

1. Configure the PCEM Accounting Stream.
2. Configure the Element-ID.
3. Add a COMMON tuple entry in table PCEMENTT.
4. Add an EMDI tuple entry in table PCEMENTT.
5. Add a Timezone tuple entry in table PCEMENTT.
6. Add RKS tuple entries in table PCEMENTT.
7. Add RKSPAIR tuple entries in table PCEMENTT.
8. Add a Financial Entity ID (FEID) in table PCEMFEID.
9. Configure Network Time Source and UTC Offset.
10. Configure RKSPAIR(s)/FEID on IAA/CBM
11. Online the RKS pairs.
12. Offline RKS pairs, if needed.
13. Activate PCEM.

In addition to the above, refer to the IAA documentation for instructions on configuring the server for event message reception/distribution.

Moreover, consult the FN for activity A00006635 regarding details on provisioning of table LNENDPT. In order for a line to generate event messages, table LNENDPT must contain gateway and endpoint name information for the line.

Furthermore, instructions to change the EMDI and the RKS data in table PCEMENTT are described in this section as well.

### 1.2.6.1 STEP 1: Configure Accounting Streams

Add PCEM and PCES stream data fill in table CRSFMT.

```
>table crsfmt
>add<key><format><datadump><cdrscrch><alarms><timerdmp><timerval>
```

For example:

```
>add PCEM PCEMFMT      N NIL_FM  N   N   0
>add PCES PCESFMT      N NIL_FM  N   N   0
```

The resulting CRSFMT table will appear similar to the following:

| TABLE: CRSFMT |         |          |         |        |          |          |
|---------------|---------|----------|---------|--------|----------|----------|
| KEY           | FORMAT  | DATADUMP | CDRSRCH | ALARMS | TIMERDMP | TIMERVAL |
| PCEM          | PCEMFMT | N NIL_FM | N       | N      | 0        |          |
| PCES          | PCESFMT | N NIL_FM | N       | N      | 0        |          |

Change the PCEM and PCES stream datafill in table CRSMAP.

```
>table crsmap
>replace <key> <stream>
```

For example:

```
>replace PCEM PCEM
>replace PCES PCES
```

The resulting CRSMAP table will appear similar to the following:

| TABLE: CRSMAP |        |
|---------------|--------|
| KEY           | STREAM |
| PCES          | PCES   |
| PCEM          | PCEM   |

At this point, consult A00007464/A00007465 for additional details regarding the configuration of the PCEM and PCES streams for delivery of event messages to the EMDI/IAA. The streams must be brought INSV after CRSMAP is datafilled. Add the IAA application must be INSV. Refer to the A00007464 FN for the procedures required to bring the streams INSV. In addition, the IAA application must be active in the CBM. For IAA refer to A00007465.

### 1.2.6.2 STEP 2: Configure Element-ID

The element ID is a number between 0 and 99999 that uniquely identifies the network element within the network. Typically an element ID would be assigned for the CMS and MGC. However, since the CS2K combines the MGC and CMS, a single element ID can be used for the CS2K. The default element ID will be 0 and must be changed to a setting compliant with Packet Cable specifications for each MSO's network.

Set the element ID in table OFCENG:

```
>table OFCENG
>pos Element_ID
>rwok on
>change
PARVAL:0
>12345
TUPLE TO BE CHANGED:
ELEMENT_ID 12345
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>Y
>rwok off
```

In this example, the element has been set to 12345.

### 1.2.6.3 STEP 3: Add the COMMON tuple entry

The COMMON tuple entry contains configuration for the Accounting Sending Mode, and Accounting Indicator and Electronic Surveillance Indicator flags.

```
> table pcementt
> add common 0 common <accounting sending mode> <accounting
indicator> <surveillance indicator>.
```

For example:

```
> add common 0 common realtime y y
```

Where **realtime** is the EM delivery mode, **y** means that EM accounting is enabled and **y** means that EM for electronic surveillance is enabled.

- i. <accounting sending mode> can be set to either real-time, batch or ftp (Realtime Mode - Sends event messages to the RKS as they are generated) (Batch Mode- Multiple event messages are batched in a RADIUS message before sending to the RKS) (FTP Mode- Multiple event messages are stored in a file which are sent to the RKS for processing, using FTP as the transport protocol)
- ii. <accounting indicator> is set to **y** if PacketCable<sup>TM</sup> Accounting event messages are desired, **n** otherwise.
- iii. <surveillance indicator> is set to **y** if PacketCable<sup>TM</sup> Electronic Surveillance event messages are desired, **n** otherwise.

Consult activity A00007548 for information regarding Electronic Surveillance configuration.

#### 1.2.6.4 STEP 4: Add an EMDI Tuple Entry

From the CS2K point of view, the EMDI encapsulates the capability of formatting event messages with RADIUS headers and sending to RKS/DF (including retries).

In the SN08 release, the EMDI capability will be provided by the IAA on the CBM.

```
>table pcementt
>add emdi <index> <entity><ip address><port>
```

For example:

```
>add emdi 0 emdi 1 2 3 4 7109
```

Where the EMDI IP address is 1.2.3.4 and the EMDI port is 7109. In SN08, the IAA default configuration uses port 7109.

The IP address used in this tuple is the IP address of the CBM. For further details, refer to Table 10 in Section 11.5.2.2 of the Configuration document of A00007196.

#### 1.2.6.5 STEP 5: Add the Timezone tuple entry

```
> table pcementt
> add timezone 0 timezone <DST> <direction> <UTC Offset>.
```

For example:

```
>add timezone 0 timezone y plus 053000
```

Where Y indicates that the office is in Daylight Savings Time (DST).

##### Note-

The DST indicator values are:

- Y: The local time of the office is currently in Daylight Savings Time.
- N: The local time of the office is currently in Standard Time.

The value used for the UTC offset does not matter since the system will automatically update the UTC offset to the correct value. See Section 1.2.6.9.

#### 1.2.6.6 STEP 6: Add RKS tuple entries

```
>table pcementt
>add rks <index> rks <ip address> <port>
```

For example:

```
>add rks 21 rks 168 24 0 0 1813
```

Where the RKS entry number is 21, the RKS IP Address is 168.24.0.0, and the RKS Port Number is 1813. Repeat for other RKS IP addresses and ports. The index must be a unique value(i.e, no RKS already assigned for that index) between 0 and 31. A maximum of 32 RKS entries may be added.

Typically, an RKS uses a port number of 1813. However, this must be confirmed with the RKS vendor in order to properly data fill RKS tuples in table PCEMENTT.

### 1.2.6.7 STEP 7: Add RKSPAIR tuple entries

Provision RKS pair(s).

If more than one RKS pair is provisioned, event messages will be evenly distributed across the set of online RKS pairs in a round-robin fashion. All event messages for a given BCID (Billing Correlation ID) will be sent to the same RKS pair.

> **table pcementt.**

> **add rkspair # rkspair <primary rks> <secondary rks> <associated emdi>**

For example:

> **add rkspair 0 rkspair 21 31 0**

Where 21 and 31 are RKS entries and 0 is an EMDI entry in table PCEMENTT.

The index must be a unique value(i.e., no RKSPAIR already assigned for that index) between 0 and 15. A maximum of 16 RKSPAIR entries may be added.

The associated EMDI identifies the “EMDI” (Refer to section 1.2.6.4) that this RKSPAIR expects to receive event messages from.

If desired, both the primary RKS and the secondary RKS can reference the same RKS entry. This allows for support of high-availability RKS systems that present only a single IP address and port for both units.

### 1.2.6.8 STEP 8: Configure Financial Entity ID (FEID)

>**table pcemfeid**

>**add <msodef> <msodmn> [<msodmsn> <msodmn><msodmn>]**

For example:

>**add 0 12345678 'test.feid' \$**

Where 12345678 is the MSO defined data, and the MSO domain name is test.feid. The MSO domain name may be up to 239 characters. Refer to Section 11.5.2.1 of the Configuration document of A00007196 for further details.

### 1.2.6.9 STEP 9: Configure Network Time Source and UTC Offset

The network time source is a NTP server which can be configured from the succession SAM21 element manager where the 3PC call agent is installed. Its UTC offset is based on the timezone the Linux OS is set to use.

Here are steps about how to configure a NTP server to use for 3PC.

1. Start the SAM21 element manager from web.
2. Under Configuration pull down menu, select adding or modifying the SAM21 element manager for the lab.
3. Enter the primary and secondary NTP servers' IP addresses in Primary NTP and Secondary NTP fields.
4. Save the changes.
5. Lock and unlock all SAM21 cards for the NTP server address change to take effect.

The steps to configure a timezone to use under Linux OS where 3PC application is running under are:

1. telnet to the 3PC call agent IP address which can be found from the SAM21 element manager where the card is provisioned.
2. login as a root user.
3. cd to directory: /usr/sbin.
4. Run tzconfig and then following the directions to set it.

The system will use the timezone information to set the UTC in table PCEMENTT automatically.

After using tzconfig changed time zone, the last step is to check timezone tuple in PCEMENTT table to make sure the DST flag (Y/N) is set correctly. If not, the appropriate change needs to be made. The UTC OFFSET in the tuple will be adjusted automatically with the DST flag.

When the DST flag is changed from Y/N to N/Y in table PCEMENTT, the UTC OFFSET will be adjusted automatically by one hour in that tuple. But there is no event message reported in this case since the local system time is not changed.

Another thing to notice is that when changing time zone, it may take several steps for the underline OS to adjust the local time to the correct one, in some cases, the local time may be adjusted to GMT time first and then back to the time zone requested. In this case, there will be 2 event messages generated since the local system time is changed twice. Some times, it even takes more then 2 steps to adjust the time zone. So when checking event messages during the process, care needs to be taken because it may have more than one event messages spilled out. The event message system reports all the time adjustment notified by 3PC during this process. And the time will be synchronized automatically with NTP server.

### 1.2.6.10 STEP 10: Configure RKSPAIR(s)/FEID on IAA/CBM

For full details regarding IAA configuration, please refer to the IAA documents directly (Activity A00007464).

The core is capable of distributing event messages in round robin fashion over the online RKS pairs. Each RKS pair consists of a PRIMARY and a SECONDARY RKS. Please note, it is acceptable to configure the PRIMARY and SECONDARY RKS of an RKS pair to be the same RKS.

As each RKS pair is added to table PCEMENTT, the CS2K core will assign a “channel ID” to the RKS pair. These channel IDs are used in communications between the CS2K and the IAA application as a means of uniquely identifying RKS pairs. Please note, the channel ID is not the same as the RKSPAIR index in table PCEMENTT.

When configuring the IAA, the channel IDs (as assigned by the CS2k core) must be assigned to the RKS pairs in the IAA. In order to obtain the channel ID information for use when configuring the IAA, use the PCEMCI tool on the CS2k as follows:

```
>pcemci  
> cidmap
```

The output will appear similar to:

| Collector | Channel ID |
|-----------|------------|
| -----     |            |
| RKSPAIR 0 | -> 1       |

In this example, channel ID 1 has been assigned to RKS pair 0.

At this point, you may telnet to the CBM and invoke the `iaa_config_cli` tool to begin adding output destinations (RKS Pairs). Refer to the A00007464 documentation for full details. The following is a brief example of configuring an output destination on the IAA/CBM.

Telnet to the CBM maintenance interface. At the prompt, enter “iaa\_config\_cli”.

For example:

**maint: iaa\_config\_cli**

This will display the IAA config “Main” menu:

**Status: None**

```

=====
==
[A]dd   [R]eturn   [N]extPage   [P]revPage   [Q]uit
Select:

```

Select each field and enter the appropriate information for the primary and secondary RKS for this RKS pair. Although not required, a suggested value for the description field would be the RKS pair index from table PCEMENTT on the CS2k core. For example “RKSPAIR 0”.

Be sure to enter the Channel ID (use the channel ID provided by the PCEMCI>CIDMAP command on the CS2K core for this RKS pair).

There are several pages of information that must be entered for each RKS destination. Please refer to the A00007464 documents for details.

When all data has been entered, select option “A” to add the new RKS pair data in the IAA.

After adding the RKS pair to the IAA, you can list the RKS destination from the “RKS Server Destinations” menu as follows:

**Status: None**

```
=====
=
      Record Keeping Server Destinations      Page 1 of 1
=====
=

=====

==

[S]ave    [R]eturn    [N]extPage    [P]revPage    [Q]uit

#### Select:

Select each of the fields and enter the data. Be sure to enter the element ID (as configured on the CS2K in STEP 2 of this procedure). When all data has been entered, save the changes (option s)

Once all of the RKS pairs and Global Parameters have been added in the IAA, proceed to the next step "Online the RKS pairs"

### 1.2.6.11 STEP 11: Online the RKS pairs

RKS pairs must be online to be included in the set of RKS(s) that the CMS will use as destinations when sending event messages. The event messages will be distributed over the set of online RKS pairs in round-robin fashion.

To enable an RKSPAIR to receive accounting event messages, set the RKSPAIR status to ONLINE:

```
>pcemci
> rkspair <desired pair #> online
```

For example:

```
> rkspair 0 online
```

where 0 is an RKSPAIR entry in table PCEMENTT.

### 1.2.6.12 STEP 12: Offline RKS pairs, if needed

RKS pairs must be online to be included in the set of RKS(s) that the CMS will use as destinations when sending event messages. The event messages will be distributed over the set of online RKS pairs in round-robin fashion.

If an RKSPAIR must be removed from the round-robin selection for delivery of event messages, set the RKSPAIR to offline as follows:

```
>pcemci
> rkspair <desired pair #> offline
```

For example:

```
>rkspair 0 offline
```

Offlining an RKS pair will prevent the RKS pair from being selected as a destination for EM delivery for new calls. Already existing calls queued against a particular RKS pair will continue using the RKS pair until the current call has concluded.

### 1.2.6.13 STEP 13: Activate PCEM

Activating PCEM with Accounting active in table PCEMENTT will cause event message generation for all lines and trunks in the CS2K.

```
>table ofceng
>pos pcem_is_active
>rwok on
>change
PARMVAL:N
>Y
TUPLE TO BE CHANGED:
  PCEM_IS_ACTIVE Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>Y
>rwok off
```

All of the previous step must be done prior to activation of PCEM or an error message will be generated. See Section 11.3.2.1 in the Configuration document of A00007196 for details.

### 1.2.6.14 Changing EMDI tuple in table PCEMENTT

The following ordered steps **MUST** be followed **before** changing the EMDI IP address in table PCEMENTT:

1. Stop the IAA application in the CBM. (See Note below.)
2. Perform the EMDI IP address/port change in the IAA.
3. Start the IAA application in the CBM. (See Note below.)

**Note:** The SDM Application Manager (SAM) controls the starting and stopping of the IAA. (See FN Sections 2.2.3 and 2.2.4 of A00007465.) While the IAA application is stopped, the Accounting Event Messages from the CORE are saved in the PCEM SBA stream.

After the above ordered steps, change the EMDI IP address in table PCEMENTT.<sup>2</sup>

### 1.2.6.15 Changing RKS data in table PCEMENTT

To change an RKS IP address/port.

1. Perform the RKS IP address/port change in the IAA application in the CBM. Use the RKS Output Destination (RKSOD) GUI as described in Configuration Section 1.4.2.1 of A00007465.

---

2. Event messages from the GWCs will be lost until after the EMDI IP address/port has been changed in the CORE. This is because the GWCs are only notified of the new EMDI data when the EMDI tuple in table PCEMENTT is changed in the CORE.

2. Change the RKS tuple with the new IP address/port in table PCE-MENTT in the CORE. Between steps (1) and (2), QoS\_Commit and QoS\_Release messages for existing calls in the GWCs will be sent to the old RKS IP address.

### 1.2.7 PCEM Operational Measurements (OMs)

In SN08, a new OM group “PCEM” is introduced. It pegs a success or failure for every event message generated by the core for Accounting (CMTS generated event messages are not pegged). Also please note, OM counts are not incremented for event messages generated for Electronic Surveillance.

**Note:** This OM group pegs success and failure based on the core (i.e. it does not peg failures for messages that fail to arrive at the RKS after leaving the core).

The register names and definitions are shown in the table below.

**Table 19: PCEM OM Group Register Definitions**

| <i>PCEM Register Name</i> | <i>Definition</i>                    |
|---------------------------|--------------------------------------|
| EMSENT                    | Event message successfully generated |
| EMFAIL                    | Failed to build event message.       |
| EMSYSFL                   | System unable to send event message. |
| EMSENT2                   | Extension register for EMSENT        |
| EMFAIL2                   | Extension register for EMFAIL        |
| EMSYSFL2                  | Extension register for EMSYSFL       |

The current PCEM OM register counts may be displayed using the OMSHOW CI command as follows:

```
>omshow pcem active
PCEM
CLASS: ACTIVE
START:2004/08/04 14:00:00 WED; STOP: 2004/08/04 14:18:08 WED;
SLOWSAMPLES: 11 ; FASTSAMPLES: 108 ;
```

```
EMSENT EMFAIL EMSYSFL
```

| 17 TIME_CHANGE          | 0 | 0 | 0 |
| 20 MEDIA_ALIVE          | 0 | 0 | 0 |

Refer to OM system configuration NTPs for details regarding register holding and transfer periods (NTP 297-9051-8551).

### 1.3 Hardware Requirements or Dependencies

**Table 20: Packet Cable CS2K PCEM Hardware Dependencies**

| Device       | Baseline Hardware                                           |
|--------------|-------------------------------------------------------------|
| GWC          | SN08 Baseline                                               |
| CS2K Core    | 3PC SN08 Baseline                                           |
| CS2M         | SN08 Baseline                                               |
| CBM/SBA/EMDI | SN08 Baseline                                               |
| CMTS         | *compliant to PKT-SP-DQOS-I10-040721 & PKT-SP-EM-I10-040721 |

\* Contact Nortel Networks for inter operability testing results.

## 1.4 Software Requirements or Dependencies

In order to support the generation of event messages, the various network elements must contain at least the following baseline software.

**Table 21: Network Element Software Baselines For PCEM**

| Device            | Baseline PCEM Software Load                                 |
|-------------------|-------------------------------------------------------------|
| GWC               | SN08 Load Lineup                                            |
| CS2K Core(3PC)    | SN08 Load Lineup                                            |
| CS2M              | SN08 Load Lineup                                            |
| Telesciences EMDI |                                                             |
| CBM/SBA           | SN08 Load Lineup                                            |
| CMTS              | *compliant to PKT-SP-DQOS-I10-040721 & PKT-SP-EM-I10-040721 |

\* Contact Nortel Networks for inter operability testing results.

## 1.5 Limitations and restrictions

### 1.5.1 Core ONP/SWACT/Upgrade Maintenance Behavior

**Table 22: ONP/SWACT Accounting EM Behavior**

| MTC Action       | Stable Calls (i.e., answered)                                                                                                                                                    | Unstable Calls                                                                                                                               |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| No Restart SWACT | Calls Remain Active, but the following EMs are prematurely generated <sup>a</sup> :<br>- Call Disconnect,<br>- Interconnect Signaling Stop (for trunks), and<br>- Signaling Stop | Calls Remain Active, but the following EMs are prematurely generated:<br>- Interconnect Signaling Stop (for trunks), and<br>- Signaling Stop |

**Table 22: ONP/SWACT Accounting EM Behavior**

| MTC Action     | Stable Calls (i.e., answered)                                                                     | Unstable Calls                                                                                                                                                        |
|----------------|---------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Warm Restart   | Calls Remain Active, accounting EMs continue to generate after Restart                            | Calls Released, the following EMs are generated when the calls are released after the restart:<br>- Interconnect Signaling Stop (for trunks), and<br>- Signaling Stop |
| Cold Restart   | Calls Released, No Further Event messages. Unmatched signaling start and signaling stop possible. | Calls Released, No Further Event messages. Unmatched signaling start and signaling stop possible.                                                                     |
| Reload Restart | Calls Released, No Further Event messages. Unmatched signaling start and signaling stop possible. | Calls Released, No Further Event messages. Unmatched signaling start and signaling stop possible.                                                                     |

a. Similar behavior as with premature billing records.

### 1.5.2 GWC SWACT/Upgrade Maintenance Behavior

In general, the CS2K will continue to generate accounting event messages for calls that survive GWC warm swact.

**Table 23: GWC Maintenance Behavior**

| MTC Action | Stable Calls                                                                                                                          | Unstable Calls                                                                                                                        |
|------------|---------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Warm SWACT | Survives SWACT, accounting EMs continue to be generated normally after the SWACT                                                      | Call Released, EMs generated at release.                                                                                              |
| Cold SWACT | Call Released, EMs generated for end of call (GWC generated EMs[i.e. PCES media report] will not be generated at the end of the call) | Call Released, EMs generated for end of call.(GWC generated EMs[i.e. PCES media report] will not be generated at the end of the call) |

**Table 23: GWC Maintenance Behavior**

| MTC Action                                      | Stable Calls                                                                                                                          | Unstable Calls                                                                                                                        |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Reload (Lock/Unlock, assumes both units locked) | Call Released, EMs generated for end of call.(GWC generated EMs[i.e. PCES media report] will not be generated at the end of the call) | Call Released, EMs generated for end of call.(GWC generated EMs[i.e. PCES media report] will not be generated at the end of the call) |
| GWC Shelf Power Cycle                           | Call Released, EMs generated for end of call.(GWC generated EMs[i.e. PCES media report] will not be generated at the end of the call) | Call Released, EMs generated for end of call.(GWC generated EMs[i.e. PCES media report] will not be generated at the end of the call) |

### 1.5.3 CBM Failure

In the event of CBM failure, the SBA subsystem will queue accounting event messages for later delivery to the CBM. Refer to “SBA Packet Cable Event Messaging” activity A00007464 for further details.

### 1.5.4 RKS Failure

In the event of an RKS failure, the IAA will store accounting event messages for up to seven days or until the RKS becomes available at which time the accounting message information will be delivered to the RKS. Refer to IAA and CBM documentation for further details. This will utilize the IAA FTP delivery mechanism to the RKS.

### 1.5.5 BHCA Capacity

Refer to the IAA/CBM documentation (A00007464) for the call capacity limitations.

### 1.5.6 XA Core Platform Not Supported

PCEM for SN08 is only supported on the 3PC CS2K platform. XA Core is not supported.

### 1.5.7 IBN and MBS Lines

PCEM supports RES and POTS line types in SN08. IBN lines and MBS (Meridian Business Set) lines are not supported.

### 1.5.8 CS2K Trunk Variants

In SN08, only the North American, non-IXC, non-Centrex trunk variants will be supported. This includes OP, ES, PRA, IT, ATC, T2, TI, and TO.

### 1.5.9 SIP-T Trunks

SIP-T trunks do not generate event messages for their call half since they may be used for inter-CMS/MGC calls. However, the exchange of the FEID and Related BCID is not supported by SIP-T. The CMSS agent will support FEID and Related BCID when it is supported and used for inter-CMS/MGC calls.

### 1.5.10 Media\_Alive Event Message

Generation of the Media\_Alive event message is supported. If an agent (line or trunk) is active on an answered call for more than 24 hours, a Media\_Alive event message will be generated for each half call. However, for the report time and interval, PCEM only supports the default value for LONGCALL in table AMAOPTS which is every 24 hours at midnight.

### 1.5.11 Trunk Endpoint Names

MGC trunk agents do not support endpoint names. Therefore, the signaling\_start event message will not contain the mta\_endpoint\_name attribute.

### 1.5.12 Off-net to Off-net Call Forwarding

If an off-net call comes in over an ISUP trunk to a line which is call forwarded to an off-net destination via an ISUP trunk, the Interconnect\_Start event message will not be generated until answer.

### 1.5.13 Database\_Query Multiple Return Values

The Database\_Query event message does not support a TCAP response that contains multiple returned numbers from a single query.

### 1.5.14 SACB Service\_Instance Event

When the SACB feature is active and the subscriber dials a blocked number, a Service\_Instance event message is generated with a service name of Call\_Block. The Service\_Instance event message is generated even if SACB prompts for a PIN and the user overrides the blocking by dialing the correct PIN.

## 1.6 Interactions

PCEM is not affected by other billing streams and can co-exist with other billing types. To activate PCEM, AMA need not be present in the office

## 1.7 Glossary

| TERM       | Description                                                                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACB        | Automatic Call Back                                                                                                                                      |
| ACRJ       | Anonymous Call Rejection                                                                                                                                 |
| AIN        | Advanced Intelligent Network                                                                                                                             |
| AMA        | Automated Message Accounting                                                                                                                             |
| AR         | Automatic Recall                                                                                                                                         |
| Batch Mode | Multiple Event Messages are batched in a single RADIUS message before sending to RKS                                                                     |
| BCID       | Billing Correlation ID                                                                                                                                   |
| BHCA       | Busy Hour Call Attempts                                                                                                                                  |
| CFW        | Call Forward                                                                                                                                             |
| CMS        | Call Management Server - refers to GWC/CS2K for lines                                                                                                    |
| CMSS       | Call Management Server Signaling                                                                                                                         |
| CMTS       | Cable Modem Termination System                                                                                                                           |
| COT        | Customer Originated Trace                                                                                                                                |
| CW         | Certification Wave                                                                                                                                       |
| DF         | Delivery Function                                                                                                                                        |
| DST        | Daylight Saving Time                                                                                                                                     |
| EMDI       | Event Messaging Delivery Interface                                                                                                                       |

## *Product = CS 2000*

### **A00007250--ACDMIS over TCP**

#### *Functional Description*

#### **1.1 Applicable Solution(s)**

DMS

#### **1.2 Description**

The ACDMIS feature provides informational ACD messaging concerning ACD events that are occurring on the DMS-100/CS2K to a downstream processor (DSP). Currently, the ACDMIS connectivity between the DMS-100/CS2K and DSP is via an X.25 link that is implemented on the DMS-100/CS2K through an MPC (Multi-Protocol Controller) card in the IOC (Input-Output Controller) module using X.25 protocol.

This SN08 activity will implement the necessary changes to enable the transport of ACDMIS messaging over TCP/IP to a DSP. The new TCP/IP transport will be in addition to the X.25 transport that already exists. The new TCP/IP transport will interface to the ethernet network via the EIU (Ethernet Interface Unit) or via the ethernet port that resides on a Call Agent card for the CS2KCompact.

##### **1.2.1 Functional Overview**

The ACDMIS link is a messaging interface provided by the DMS-100//CS2K to the host MIS computer (or DSP). The information carried across the messaging link allows ACD applications running on the DMS-100/CS2K to communicate with MIS applications running on the host computer. The two-way information flow allows the DMS and host computer to provide enhanced services to an ACD customer.

This feature will provide an ACDMIS link between the switch and the host computer using the TCP/IP protocol via EIU or Call Agent card that uses port 2700. This TCP/IP link may be used as an alternative to the X.25 MPC ACDMIS link. The transport (TCP/IP vs. MPC X.25) used is transparent to any application using the ACDMIS link to communicate with a host computer.

The functional areas of the feature are:

- **TCP/IP transport:** TCP/IP connectivity between the DMS-100/CS2K and the remote DSP through the EIU or Call Agent card on the switch and network access.
- **Table Control:** ACDMIS link datafill to support either X.25 or TCP/IP transport via the ACDMISPL table.

- **Operational Measurements:** There are no functional changes as a result of this feature however, existing ACDMIS OMs will be updated / pegged as necessary.

### 1.2.2 Hardware

The X.25 protocol is currently available on the DMS using the Multi-Protocol Controller (MPC 1X89AA/BA card). The MPC is downloadable input/output device that resides on a DMS I/O Controller (IOC) shelf. The MPC has two programmable data communication links. The MPC accomplishes real time savings in the CM by performing low-level data communications functions.

The TCP/IP transport uses the existing TLI interface to provide connectivity between the DMS-100/CS2K and a DSP. The DMS is provided with Local Area Network (LAN) connectivity by an Ethernet Interface Unit (EIU) or in the case of a CS2KCompact, the Call Agent card. This activity will utilize port 2700 for incoming and outgoing TCP message traffic. Messages originated from the DSP are routed via the network and terminate on the EIU/Call Agent which forwards the messages to the destination port (2700) on the DMS. For some hardware configurations internet routers may be used between the DMS-100/CS2K and DSP.

### 1.2.3 Software

This feature enhances existing ACDMIS software to handle the following areas:

- TCP/IP Transport.
- Table Control mechanism to support TCP/IP transport.
- OM's and Logs specific to the TCP/IP transport.

## 1.2.4 TCP/IP Transport

- TCP and X.25 ACD MIS Message Components**

**TCP/IP Message**

**X.25 Message**

- TCP connection checking**

For this feature the ACDMISPL table will be modified to include a LNKSEL type of either X25 or TCP that will be associated with each datafilled pool. The LNKSEL field for a TCP connection will contain a “TCP” designation as well as the remote ACD System’s IP Address, an Alternative ACD System IP Address, a User ID and a Login Password<sup>3</sup>.

Prior to establishing a TCP connection, the DMS-100/CS2K will crosscheck the incoming remote ACD System’s IP address against those IP addresses that are datafilled in the ACDMISPL. The incoming remote ACD System’s IP address must match either the IP Address or Alternative IP Address that is datafilled under the LNKSEL field for a given Pool in table ACDMISPL. Only one ACDMIS link/session is allowed per datafilled Pool.

If the incoming remote ACD System’s IP address is verified the events to establish a TCP connection will proceed, otherwise the connection will not be allowed.

- Establishing a TCP connection**

Establishing the base TCP connection is a function of the existing base TCP/IP layers which will not be impacted by this feature. The following is provided as informational only and not as an indication of the work being done by this feature.

---

3. Please see Section 1.3.5 for details on the table control changes associated with table ACDMISPL.

To establish a connection, TCP uses a three-way handshake. The DMS-100/CS2K will wait passively for the handshake that is initiated by the remote host (DSP) application.

The IP address and the port number of the DMS-100/CS2K will be needed by the remote host application in order to establish a connection. Initially a SYN segment is sent by the host computer application requesting a connection to the DMS-100/CS2K. DMS-100/CS2K will then send an acknowledgment along with the SYN segment to the ACDMIS subscriber to indicate that it is ready to establish a session. The Host computer of the subscriber will then send an acknowledgment. Once the DMS-100/CS2K receives the acknowledgment, the connection is fully established as shown in Figure 1 below.

**Figure 3 Sequence of messages in Three way handshake.**

- **Establishing an ACDMIS Session**

When establishing the ACD MIS Session the remote ACD MIS System must initiate a nosLogon<sup>4</sup> message that is sent to the DMS-100/CS2K.

The nosLogon message contains the following arguments: Protocol Version, Userid, Password and Profile. As a result of this feature it is required that the Userid and Password that is sent in the nosLogon message match the Userid and Password that has been datafilled in table ACDMISPL<sup>5</sup> for a given Pool.

4. Please reference the NT NIS-Q209-2 ACD-MIS Interface Specification for detailed information on the nosLogon message and related arguments.

5. Please see Section 1.3.5 for details on the table control changes associated with table ACDMISPL.

Other standard existing DSP Control messaging i.e. dspAssociatePool, dspRequestInit, dspStartTransfer etc. will be used to establish and setup the ACDMIS Session once the base TCP connection has been made.

- **Terminating TCP connection**

Terminating the base TCP connection is a function of the existing base TCP/IP layers which will not be impacted by this feature. The following is provided as information only and not as an indication of the work being done by this feature.

To close the TCP connection, the remote host application will send the FIN segment as shown in Figure 2. The DMS-100/CS2K acknowledges the FIN segment and acknowledges that no more data is available. Once the connection is closed by the remote host application, TCP refuses to accept more data from the remote host application. The DMS-100/CS2K will then send a FIN segment. When both directions have been closed, the connection is deleted.

**Figure 4 Sequence of messages in terminating a TCP connection**

- **TCP connection Reliability**

TCP connection reliability is a function of the existing base TCP/IP layers which will not be impacted by this feature. The following is provided as information only and not as an indication of the work being done by this feature.

TCP has a “Keep Alive” option consisting of an out-of-band packet which is sent during idle line conditions. This is mainly used to detect any connection failures. The default delay is 45 seconds before the keep alive packet is sent. The keep alive timer value is configurable between 5 to 60 seconds by the user application via the TLI mechanism. An acknowledgment must be received from the peer, or TCP will retransmit the keep alive packet three times with the delay equal to the maximum of

Round trip time-out or 10 seconds. If the peer does not respond, the connection is closed.

### 1.2.5 Table Control Mechanism

The existing ACDMISPL table will be modified to define the relationship between the ACDMIS pool and the transport type, X.25 or TCP/IP. This feature will introduce a new field named LNKSEL to the ACDMISPL table. The new LNKSEL field will be datafillable with either X25 or TCP with the TCP designation having additional refinements of an IP address that refers to the remote DSP, an Alternative IP address for the remote DSP, a UserID and a Password. The newly created LNKSEL field will serve a dual purpose of defining which remote IP addresses are allowed access to the DMS-100/CS2K as well as defining the relationship between the pool and session link.

- ACDMISPL Field Description**

| Field    | New or Changed | Subfield or refinement | Entry                                      | Explanation and action                                                                              |
|----------|----------------|------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------|
| POOL     |                | n/a                    |                                            | ACD Pool Name                                                                                       |
| PASSWORD |                | n/a                    |                                            | Pool Password                                                                                       |
| PROTOCOL |                | n/a                    |                                            | ACD MIS Protocol Version                                                                            |
| OUTEVENT |                | n/a                    | 10 to 200                                  | Message Buffers                                                                                     |
| BUNDLING |                | n/a                    | Y or N                                     | Message Bundling                                                                                    |
| LNKSEL   | NEW            | n/a                    | X25 or TCP                                 | Indicates whether this pool will use a X25 or TCP transport.                                        |
| X25      | NEW            | n/a                    | n/a                                        | If X25 is chosen no additional refinements are needed as existing X25 tables and datafill are used. |
| TCP      | NEW            | IP_ADDR                | IP Address                                 | If TCP is chosen an additional refinement is required to indicate the remote systems IP Address.    |
|          | NEW            | ALT_IP_ADDR            | IP Address                                 | Optional refinement to allow an alternative or "back-up" IP Address for the remote system.          |
|          | NEW            | USER_ID                | Alphanumeric<br>>=5 and <= 8<br>Characters | Mandatory refinement which will be used to verify the Userid field of the nosLogon message.         |
|          | NEW            | LOGIN_PASSWD           | Alphanumeric<br>>=5 and <=16<br>Characters | Mandatory refinement which will be used to verify the Password field of the nosLogon message.       |

- ACDMISPL - LNKSEL Field Information**

The TCP refinement to the LNKSEL field allows datafilling of an alternative IP Address (ALT\_IP\_ADDR) to be used as a "back-up".

Historically only one link is allowed per ACD Pool, therefore only one IP Address per ACD Pool is allowed to be active at any given time.

The TCP refinement to the LNKSEL field includes the mandatory refinements USER\_ID and LOGIN\_PASSWD that will be used for login validation in conjunction with the nosLogon message that is sent by the DSP.

LNKSEL field datafill changes from X25 to TCP/IP or TCP/IP to X25 will require the ACDMIS link to be brought down and may require datafill changes to other X25 related tables as needed.

- **ACDMISPL Table Enhancement Example**

TABLE: ACDMISPL

| POOL   | PASS   | PROTOCOL | OUTEVENT | BUND | LNKSEL                   |
|--------|--------|----------|----------|------|--------------------------|
| POOL01 | POOL01 | BCS43    | 110      | N    | X25                      |
| POOL02 | POOL02 | BCS43    | 110      | N    | TCP 47 245 5 247 246 6 3 |

- **ACDMISPL Datafill Example for TCP Transport**

TUPLE TO BE ADDED:
  ACDPOOL  PASSWD1  BCS35  110 N  X25
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
```

## 1.2.6 Operational Measurements

This feature makes no functional changes to ACD MIS OM's, however the ACD MIS related OM's as described below will be updated / pegged as necessary using the new TCP transport.

### 1.2.6.1 ACDMISPL - OM Group

The ACDMISPL OM Group will not be impacted by this feature. The following is provided as information only and not as an indication of the work being done by this feature.

- The OM group ACDMISPL monitors the ACD MIS output message buffer and provides buffer usage and peg count registers for messages lost or transmitted. The following is a brief description of the ACDMISPL OM registers:
- **MISLOST**: Pegs the number of valid MIS event messages that fail to enter the outgoing message buffer because the buffer is full. The message is subsequently discarded and no retransmission is attempted and further buffering is offered.
- **MISQUSAG**: Records the number of messages waiting to be transmitted in the outgoing message buffer every 100 seconds. Under normal traffic conditions, MISQUSAG should be zero since all messages are dispatched as soon as they enter the outgoing message buffer.
- **MISTRANS**: Pegs the number of valid outgoing messages that are transferred successfully to the MIS downstream processor via the X.25 data link through the MPC/EMPC card. The register counts each call event, return\_result, or initialization message that is transmitted.

## 1.3 Software Requirements or Dependencies

Not Applicable

## 1.4 Limitations and restrictions

- Maximum number of TCP/IP connections to a single DMS-100/CS2K is 96.
- The number of ACDMIS TCP/IP Links per single DMS-100/CS2K will be limited to 60.

## 1.5 Interactions

## 1.7 Glossary

| Term | Description                   |
|------|-------------------------------|
| 3PC  | Third Party Core              |
| ACD  | Automatic Call Distribution   |
| CS2K | Communication Server 2000     |
| DMS  | Digital Multiplex System      |
| DSP  | Down Stream Processor         |
| EIU  | Ethernet Interface Unit       |
| IOC  | Input-Output Controller       |
| IP   | Internet Protocol             |
| MIS  | Management Information System |
| MPC  | Multi-Protocol Controller     |
| OM   | Operational Measurements      |
| TCP  | Transmission Control Protocol |
| TLI  | Transport Layer Interface     |

## **2: Configuration for A00007250**

### **2.1 Hardware and Software Requirements**

This feature will use the existing TLI interface to provide connectivity between the DMS-100/CS2K and a DSP. The DMS -100/CS2K is provided with Local Area Network (LAN) connectivity by an Ethernet Interface Unit (EIU) or in the case of a CS2KCompact, the 3PC card. The basic ACD software package is needed to use this feature.

### **2.2 Initial Configuration**

The configuration for this feature is detailed in the DS section of this document.

### **2.3 Office/Subnet parameters (OP/SP) (CM & SESM)**

N/A

### **2.4 Upgrade Considerations**

#### **2.4.1 Dump and Restore (CM)**

No manual action is required. A reformat Procedure will be used as the software solution.

ONP reformat procedures will be written to default the LNKSEL field of table ACDMISPL to X25 as required. Transport datafill changes from X25 to TCP/IP or TCP/IP to X25 may require the ACDMIS link to be brought down and may require datafill changes to existing X25 related tables.

#### **2.4.2 Element Management Upgrade**

N/A

#### **2.4.3 Downgrade impact**

N/A

### **2.5 Data schema (DS) (CM, MIBS, RDB)**

#### **2.5.1 New/modified tables, MIBs, or Database Schema**

The existing ACDMISPL table will be modified to define the relationship between the ACDMIS pool and the transport type, X.25 or TCP/IP. This feature will introduce a new field named LNKSEL to the ACDMISPL table. The new LNKSEL field will be datafillable with either X25 or TCP with the TCP designation having additional refinements of an IP address that refers to the remote DSP, an Alternative IP address for the remote DSP, a UserID and a Password. The newly created LNKSEL field will serve a dual purpose of defining which remote IP addresses are allowed access to the DMS-100/CS2K

as well as defining the relationship between the pool and session link.  
Impacted tables are listed below in Table 1

**Table 1 New or modified tables**

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| ACDMISPL       | CHANGED                  | UNCHANGED                          |

### 2.5.1.1 Fields/OIDs

The following table lists fields/OIDs for ACDMISPL

**Table 2 Table field descriptions**

| Field    | New or Changed | Subfield or refinement | Entry                                   | Explanation and action                                                                              |
|----------|----------------|------------------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------|
| POOL     |                | n/a                    |                                         | ACD Pool Name                                                                                       |
| PASSWORD |                | n/a                    |                                         | Pool Password                                                                                       |
| PROTOCOL |                | n/a                    |                                         | ACD MIS Protocol Version                                                                            |
| OUTEVENT |                | n/a                    | 10 to 200                               | Message Buffers                                                                                     |

| X25      | NEW            | n/a                    | n/a                                     | If X25 is chosen no additional refinements are needed as existing X25 tables and datafill are used. |
| TCP      | NEW            | IP_ADDR                | IP Address                              | If TCP is chosen an additional refinement is required to indicate the remote systems IP Address.    |
|          | NEW            | ALT_IP_ADDR            | IP Address                              | Optional refinement to allow an alternative or "back-up" IP Address for the remote system.          |
|          | NEW            | USER_ID                | Alphanumeric<br>>=5 and <= 8 Characters | Mandatory refinement which will be used to verify the Userid field of the nosLogon message.         |
|          | NEW            | LOGIN_PASSWD           | Alphanumeric<br>>=5 and <=16 Characters | Mandatory refinement which will be used to verify the Password field of the nosLogon message.       |

### 2.5.1.2 Datafill example

- ACDMISPL Datafill Example for TCP Transport**

```
POOL:
>ACDPOOL
PASSWORD:
>PASSWD1
PROTOCOL:
>BCS35
```

```

OUTEVENT: 200
>110
BUNDLING:
>N
LNKSEL:
>TCP
IP_ADDR:
>47 245 5 2
ALT_IP_ADDR:
>47 246 6 3
USER_ID:
>USER2
LOGIN_PASSWD:
>PASS2

TUPLE TO BE ADDED:
ACDPOOL PASSWD1 BCS35 110 N TCP 47 245 5 2 47 246 6 3 USER2 PASS2
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

- **ACDMISPL Datafill Example for X25 Transport**

```

POOL:
>ACDPOOL
PASSWORD:
>PASSWD1
PROTOCOL:
>BCS35
OUTEVENT: 200
>110
BUNDLING:
>N
LNKSEL:
>X25

TUPLE TO BE ADDED:
ACDPOOL PASSWD1 BCS35 110 N X25
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

- **Example of ACDMISPL table**

```

TABLE: ACDMISPL

POOL  PASS  PROTOCOL  OUTEVENT  BUND  LNKSEL
-----
POOL01 POOL01 BCS43    110      N    X25
POOL02 POOL02 BCS43    110      N    TCP 47 245 5 2 47 246 6 3 USER2 PASS2

```

### 2.5.1.3 Supplementary information

Any changes to existing tuples in the ACDMISPL table will require the ACD MIS LINK to be brought down if there is an active session on the Pool/tuple being changed. If there is not an active session on the Pool/tuple being changed, then changes are allowed.

In addition to the above restriction, changes in the LNKSEL field from TCP to X25 will require the standard X25 datafill that has always been used when establishing a ACD MIS X.25 Link, which will involve changes/additions to table datafill in table MPCLINK.

**2.5.1.4 Translation verification and other tools**

N/A

**2.6 Service Orders (SO) (CM & SESM)**

There are no SERVORD impacts for this feature.

**2.7 Software optionality control (SOC)**

There is no SOC interaction with this feature.

***Product = CS 2000*****A00007268--NGSS OM Subsystem Enhancement*****Functional Description*****1.1 Applicable Solution(s)**

PT-IP, PT-AAL2

**1.2 Description**

In SN07 Release, NGSS OM subsystem pegs counts for one set of registers per OM group.

OM enhancement activity is to enhance the existing OM subsystem to support the notion of dynamic number of tuples for OM groups, i.e. tuples can be added to or deleted from OM groups dynamically.

The SIP Gateway OM groups defined in SN07 (SIPGW\_CALLP, SIPGW\_SERVICES and SIPGW\_MISC) are enhanced to track measurements based on SIPLINK.

OM CLI (i.e. **OM SHOW**) is enhanced to support querying of OM peg counts based on TUPLES.

The omshow command syntax at the CLI will be as follows:

```
>omshow <groupname>
      <class> {ACTIVE,
              HOLDING,
              FIVEMIN,
              ZERO}
      [<num> {0 to 4294967295}]]
      [<to_num> {0 to 4294967295}]
      [<Key> string]
      [<Key to> string]
```

The first parameter will be the **OM Group Name**, the second parameter will be the **Query Type** (ACTIVE/HOLDING/LAST5MIN).

*Note 1: “ALL”* is no longer supported for the groupname parameter.

*Note 2: Tuple key* will be a mandatory integer key provided by application that wants to peg OMs, with an optional text keyname (if provided must be unique).

*Note 3: Tuple Key Range:-* The max tuple key range is calculated as “4294967295” by applying the formula “ $2^{32}-1$ ”.

## 1.9 Appendix A: NGSS OM CSV File Format

This section details the CSV file formats, its location, and shows examples.

### 1.9.1 CSV File Location

#### SSH Login Access

If the user desires to login to a session server unit via an account such as MTC and look at the CSV files, the main directory path is /opt/apps/ngsspm. Two subdirectories are located here:

stdhist - This directory contains the 24 hour long term values.

trafhist - This directory contains the 30 minute short term values.

#### FTP Access

This future section will contain the access information when FTP is utilized using the NGSSPM account to pull CSV files from a session server unit.

## 1.9.2 CSV File Format

The CSV file format is shown below. Note that the below format uses an example consisting of two OM groups. The first example OM group has 32 registers and 1 tuple of peg counts. The second example OM group has 9 registers and 3 tuples of peg counts.

## ***Product = CS 2000***

### **A00007270--Session Server Call Processing Overload Controls** ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP, PT-AAL2

#### **1.2 Description**

This feature provides for Overload Controls on the Session Server for the SIP Gateway Call Processing Application.

The Session Server is a platform for delivery of multiple applications. It consists of a NEBS Level 3 compliant hardware platform and a software framework and architecture for developing Carrier Grade applications and services. The SIP Gateway Application is the initial application for the Session Server Platform

The new functionality that will be implemented under this Session Server Overload Controls activity consists of the overload controls mechanism created specifically for Call Processing on the SIP Gateway Application.

##### **1.2.1 SIP CallP Gateway Application Overload Controls**

For SIP Gateway Application's overload monitoring purposes, Queue Monitor Thread will be monitoring the size of the Call Processing Origination Queue

to make the determination on call processing capacity and thus overload state. The overload state thresholds will be pre-defined and thus not provisionable. It is not in the scope of this feature to provide an interface to allow for provisioning of threshold values.

The overload thresholds are as follows:

- Overload will be triggered for UDP traffic over 1.170 M BHCCA
- Pending Overload will be triggered for UDP traffic over 1.080 M BHCCA

In the event that Queue Monitor has indicated that a Call Processing Origination Queue overload condition exists, Sip Gateway Application will discard any new origination (INVITE) messages coming in from remote SIP servers. Outgoing origination messages will continue to be processed as received. Logs and Alarms will be raised to indicate a problem. A new OM register (OVRD\_CALLS\_REJECTED) in the SIPGW\_CALLP group will be pegged every time an INVITE is rejected due to an overload condition. Logs and alarms are defined in section 11 of this document. The OM register is discussed in section 14 of this document

Following are the Overload States and the corresponding actions:

- Overload - Logs and major Alarms are raised and action taken to stabilize the system by rejecting new incoming origination messages. OVRD\_CALLS\_REJECTED OM register is pegged
- Overload Pending - Logs and minor Alarms raised, but no action taken to reject CallP messages.
- No Overload - All prior Alarms cleared.

### **1.3 Hardware Requirements or Dependencies**

This feature doesn't introduce any new hardware requirements or dependencies.

### **1.4 Software Requirements or Dependencies**

This feature doesn't introduce any new software requirements or dependencies.

### **1.5 Limitations and restrictions**

This feature will not provide an user interface for provisioning the Overload Threshold values.

In the event of a Call Processing Origination Queue overload condition, ONLY new origination messages coming in from remote SIP servers will be discarded. The processing of the outgoing calls will not be affected. The reason behind this restriction is that on the outgoing calls, the call processing has already been completed on the XA-core and on the SIPT GWC, and the

therefore these calls have passed the point of alternate disposition (such as alternate route or treatment).

## 1.6 Interactions

This feature implements a Session Server Overload Manager process, which is designed to interact with SIP CallP Gateway Application and other “future” applications on the Session Server.

## 1.7 Glossary

| Term           | Description                              |
|----------------|------------------------------------------|
| CallP          | Call Processing                          |
| GWC            | Gateway Controller                       |
| NEBS           | Network Equipment Building System        |
| Session Server | Platform for the SIP Gateway Application |
| SIP            | Session Initiated Protocol               |

## 2.1 Fault Management for A00007270

### 2.2 Overload Controls Logs and Alarms

The following is a description of logs and alarms that are generated by the SIP Gateway Call Processing Application in regards to the Overload Controls Feature. These logs and Alarms can be viewed via the SIP Gateway Maintenance web browser interface on the Session Server Manger - SIP Gateway application web page.

Note that these logs and alarms are only generated and reported on the SIP Gateway Application.

#### 2.2.1 SIP Gateway Call Processing Application Logs

Following are the two customer logs that will be generated by this feature:

- SIPC310 - SIP CallP Overload Threshold Reached
- SIPC310 - SIP CallP Overload Cleared

##### 2.2.1.1 SIPC310 SIP CallP Overload Threshold Reached

Log SIPC310 “SIP CallP Overload Threshold Reached” is associated with the generation of the Major alarm due to reaching a predefined threshold in call processing capacity.

Log Title: SIP CallP

Name: SIPC310

Description: Overload Threshold Reached

Event Type: Trouble

**FORMAT:** For the SIPC310 log, the following are values/explanations of the variable values:

- alarmLevel = MAJ/MIN- Indicates a major alarm
- componentID = SIPC
- category = Communications
- description = Overload Threshold Reached
- probable cause = System overloaded
- specific cause =
- correlationIdList = None
- neVendorSpecificInfo = None
- technologySpecificInfo = None
- reportName = SIPC
- reportNum= 310
- eventType = TBL
- label = SIP CallP

**ACTION:** Monitor the network

#### 2.2.1.2 SIPC310 SIP CallP Overload Cleared

Log SIPC310 “SIP CallP Overload Cleared” is generated when SIP Gateway Application is no longer in Overload.

Log Title: SIP CallP

Name: SIPC310

Description: Overload Cleared

Event Type: Trouble

**FORMAT:** For the SIPC310 log, the following are values/explanations of the variable values:

- alarmLevel = None
- componentID = SIPC
- category = Communications
- description = Overload Threshold Cleared

- probable cause =
- specific cause =
- correlationIdList = None
- neVendorSpecificInfo = None
- technologySpecificInfo = None
- reportName = SIPC
- reportNum= 310
- eventType = TBL
- label = SIP CallP

**ACTION:** None

### **3.1 Performance Management for A00007270**

#### **3.2 Performance management strategy**

New Operational Measurement Register will added under this activity and be pegged to generate the performance history.

#### **3.3 Performance management tools and utilities**

The OMSHOW command will be used to display the OM statistics on the Session Server.

#### **3.4 Performance Measurements (PM), Operational Measurements (OM), and stats**

This activity adds a new register (OVRD\_CALLS\_REJECTED) to the SIPGW\_CALLP om group in order to track the number of incoming calls that are rejected due to SIP Callp being in overload.

##### **3.4.1 OM Group SIPGW\_CALLP**

###### **3.4.1.1 OM Description**

SIPGW\_CALLP OM Group is used to track the performance statistics of the SIP Gateway Callp Application on the Session Server.

###### **3.4.1.2 Release history update**

In this release a new Register (OVRD\_CALLS\_REJECTED) is added to this OM Group.

###### **3.4.1.3 Registers**

SIPGWY\_CALLP OM group registers display on the MAP terminal as follows:

OMGROUP: SIPGW\_CALLP

\*\*\*\*\*

TUPLE KEY: 1 TUPLE KEY NAME: SIP\_TO\_NGSS

| Register Name       | Value |
|---------------------|-------|
| -----               | ----- |
| IC_CALL_ATTEMPTS    | 0     |
| OG_CALL_ATTEMPTS    | 0     |
| CALLS_ABANDONED     | 0     |
| CALLS_ANSWERED      | 0     |
| CALLS_REJECTED      | 0     |
| CALLS_REDIRECTED    | 0     |
| OVRD_CALLS_REJECTED | 0     |

\*\*\*\*\*

**3.4.1.4 Associated OM groups**

None

**3.4.1.5 Associated functional groups**

None

**3.4.1.6 Associated functionality codes**

Not Applicable

**3.4.1.7 OM group registers logic flow chart**

When the SIP Gateway Application Callp is deemed to be in overload, all incoming INVITE requests are rejected and the OVRD\_CALLS\_REJECTED register is pegged.

**3.4.2 Register OVRD\_CALLS\_REJECTED**

This register represents how many incoming INVITE requests have been rejected due to the SIP Gateway Callp being in Overload.

**3.4.2.1 Register release history update**

New in this release

**3.4.2.2 Associated registers**

None

**3.4.2.3 Associated logs**

SIPC310 MAJOR TBL SIP Callp NCGL=RTP7-UNIT1;Unit=1;SIPC  
Overload Threshold Reached

## **A00007275--Session Server - Session/Application Mgmt Framework and Support for Multiple HTTPS connection to the Session Server through SSPFS**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP, PT-AAL2

#### **1.2 Description**

##### **1.2.1 Session Server - Session/Application Mgmt Framework and Support**

This feature is one of three features whose primary requirements are to provide thread trap recovery as well as overload controls for the (SIP) Gateway Application.

The other features are:

- A00007270 - Session Server - Overload Controls
- A00007276 - Session Server - Application Patching Support

This feature implements light-weight thread-safe message queues for communicating between SIP Gateway Application threads, replacing the Unix Sockets and Inter-Process Communication (IPC) Message Queues used in Session Server Release 07. These new Message Queues provides the framework to make thread recovery and overload controls possible.

This feature introduces software into the SIP Gateway Application which monitors the health of the SIP Gateway Application threads and will attempt to recover any threads that fail rather than choosing to Swact the platform as the first course of action. Of course, if the thread cannot be recovered, the platform will Swact.

##### **1.2.2 Support for Multiple HTTPS connection to the Session Server through SSPFS**

Refer to PLS FMDOC A00008383 for more information on this activity. This feature removes the limitation of one proxy HTTPS connection from IEMS/SSPFS to the Session Server and allows multiple Session Server nodes to reside on the CS-LAN. Multiple Session Servers may be required to allow multiple applications to be deployed on separate boxes or to allow multiple Session Servers running the same application or combinations of both. For the SN08 release, the expected number of Session Servers to be provision on the SSPFS is aimed at 4.

At customer sites, the SSPFS acts as an HTTP proxy between the OAMP and CALLP LANS (which are separated by a firewall). Incoming requests to the SSPFS from the Session Server web provisioning interface are mapped to tag names which are in turn mapped to real URLs in the CALLP LAN to get the request to the correct Session Server box. Tomcat requires that the tag names in the SSPFS must be the same string as the last directory in the destination URL. The destination URLs for the Session Server application's web page is hard-coded to be in the '/prov' directory and therefore the SSPFS must use a tag name of 'prov' to map the HTTPS request to the Session Server. Since tag names must be unique, the SSPFS can only direct HTTPS requests to a single Session Server box in SN07.

This feature provides the support of different tag names in the SSPFS to support multiple HTTPS connections so that the Session Server application web page will end in a variable directory name that is configured at startup. Once the hard-coded use of '/prov' is removed and replaced with the configured string, multiple HTTPS connections through the SSPFS will be possible.

The variable tag name for the Session Server applications will be obtained when the applications are installed. All Session Server applications are installed through the InstallApps script which is run after NCGL is installed. The script will prompt for a new tag name for the Session Server box. The same name must be input on both the active and inactive Session Server application during installation as well as on the SSPFS Apache proxy configuration to identify the said Session Server Application. The tagname is an alphanumeric string with period, underscore or hyphen and a maximum string length of 128 characters.

An example of how the 2 Session server applications will be configured on the Apache proxy configuration is as follows:

The tag name for this Session Server is "**ngss-spc**"

*ProxyPass /10.65.99.67/ https://10.65.99.67:443/ ---> NCGL unit 0*

*ProxyPassReverse /10.65.99.67/ https://10.65.99.67:443/*

*ProxyPass /10.65.99.70/ https://10.65.99.70:443/ ---> NCGL Unit 1*

*ProxyPassReverse /10.65.99.70/ https://10.65.99.70:443/*

*ProxyPass /10.65.99.72/ https://10.65.99.72:443/ ---> NCGL active*

*ProxyPassReverse /10.65.99.72/ https://10.65.99.72:443/*

*ProxyPass /ngss-spc/ https://10.67.99.72:8443/ngss-spc/ ---> NGSS Active*

*ProxyPassReverse /ngss-spc/ https://10.67.99.72:8443/ngss-spc/*

The tag name for this NGSS is “**ngss-trkapp**”

*ProxyPass /172.65.99.67/ https://172.65.99.67:443/ ---> NCGL unit 0*

*ProxyPassReverse /172.65.99.67/ https://172.65.99.67:443/*

*ProxyPass /172.65.99.70/ https://172.65.99.70:443/ ---> NCGL Unit 1*

*ProxyPassReverse /172.65.99.70/ https://172.65.99.70:443/*

*ProxyPass /172.65.99.72/ https://172.65.99.72:443/ ---> NCGL active*

*ProxyPassReverse /172.65.99.72/ https://172.65.99.72:443/*

*ProxyPass /ngss-trkapp/ https://172.67.99.72:8443/ngss-trkapp/ --> NGSS Active*

*ProxyPassReverse /ngss-trkapp/ https://172.67.99.72:8443/ngss-trkapp/*

### 1.3 Hardware Requirements or Dependencies

This feature doesn't introduce any new hardware requirements or dependencies.

### 1.4 Software Requirements or Dependencies

This feature doesn't introduce any new software requirements or dependencies.

The IEMS software has to be SN08 or greater release for multiple HTTPS support on the Session Server through the SSPFS.

### 1.5 Limitations and restrictions

The key assumption for the multiple HTTPS support of the Session Server through the NGSS activity is that the Session Server will continue to use a single launch point for accessing OAMP pages for all applications. This was the planned approach for all applications and should be an accurate assumption. If future applications do not choose to use that single launch point for their OAMP, additional feature work will be required to support additional dynamic tag names for those applications that do not conform.

The tag name for an Session Server application must be unique and cannot be change once the application is installed using the InstallApps script. Any change of the tag name will require a re-installation of the application.

## 1.6 Interactions

This activity interacts with the SSPFS. The tag name that is input into the NGSS during installation for both the active and inactive units, have to match what is input into the SSPFS.

***Product = CS 2000***

## **A00007277--LOGs Throttling**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS

#### **1.2 Description**

This feature is required to implement LOGs throttling functionality for XA-Core.

The requirement of this feature is to use a datafill table for throttling logs. Customer can throttle the log report by specifying the time unit and threshold value.

There is also a requirement to throttle the DLOG when it is specified by the customer. By default throttled logs will go to DLOG, unless it is specified by the user.

Only core logs will be throttled.

Desired behavior of this feature is to implement the throttling mechanism for LOG Devices and DLOGs. New throttling functionality will allow customer to specify on Time Units and Thresholds per Report Name (REPNAME) through a Table LOGTHROT.

New threshold behavior:

- Logs to be throttled, will be output in each unit time until the log count reaches threshold value.
- Logs will then be throttled until the time unit expires.
- When the timer resets the logs will not be throttled.

The new Table LOGTHROT will contain the THRSHOLD and TUNITS values as we have them in table LOGCLASS.

**Figure 1 Functional Diagram**

| TABLE LOGTHROT: |          |           |       |
|-----------------|----------|-----------|-------|
| REPNAME         | THRSHOLD | TUNITS    | DLOG  |
| -----           |          |           |       |
| TRK 113         | [0-255]  | [0-32767] | Y / N |

Logs will be generated in each time unit until the log count reaches the threshold value. The logs will then be throttled until the time unit expires. When the timer resets, the logs will not be throttled.

e.g.

Suppose, we want to throttle TRK113 log. If the threshold value is set to 5 and tunits is 1, that means we only want five TRK113 log in one minute. Any TRK113 logs over five within a minute will be throttled. Because the DLOG field is set to 'NO', we won't be throttling TRK113 DLOGs.

**Figure 2 Functional Diagram**

**TABLE LOGTHROT:**

| REPNAME | THRSHOLD | TUNITS | DLOG |
|---------|----------|--------|------|
| -----   |          |        |      |
| TRK 113 | 5        | 1      | N    |

Recommended TUNITS value is 1 (min). Threshold value can be set based on site engineering information. Following are the some examples of threshold values used in CSP20, TUNITS id 1(mins):

| REPNAME  | THRSHOLD |
|----------|----------|
| -----    |          |
| AUDIT105 | 25       |
| AUDIT106 | 25       |
| TRK113   | 75       |
| C7UP103  | 25       |
| TRK138   | 75       |

## **A00007282--Configurable Threshold for Failed Login Attempts**

### ***Functional Description***

## **1.1 Applicable Solution(s)**

PT-IP, PT-AAL2

## 1.2 Description

This SN08 activity provides a way to configure the limit of failed login attempts for succession applications. The same retry limit will apply to the telnet and ssh access.

### 1.2.1 CLI Tool

The Command Line Interface of SSPFS is modified to provide an additional option to change the login retries limit value. Follow the procedure below to make changes to the retries limit value:

- 1 Start cli
- 2 Select option 2 (Configuration)
- 3 Select option 14 (Login Session)
- 4 Select option 4 (login\_retries)
- 5 Enter a value in the range 1 – 15.  
Any value not in this range will be rejected with an error:  
**“ERROR – Login Retries Limit Value Out Of Range”**

If the change is successful, the following message will be shown:  
**=== “login\_retries” completed successfully**

# SN08 Feature Deltas

*Product = CS 2000*

## **A00007383 - DNH (Directory Number Hunting) enhancements: pilot DN charge and display**

### **1.1 Applicable Solution(s)**

DMS

### **1.2 Description**

#### **1.2.1 General**

This feature provides two new facilities for DNH groups. For any call originated from any DNH group member DN (MDN) or pilot DN (PDN), the group's **pilot DN** will be:

- Charged for the call,
- Presented as the Calling Line Number nodally or to the network to be displayed at the far end, if the call provides Calling Line Identification (CLI) by default or upon Automatic Number Identification (ANI) request.

These facilities are provided for all members of all the DNH groups on an office basis. It is possible to turn on or off each functionality separately. Thus, each functionality can be either applied or not applied officewide at once, i.e. all DNH groups follow the same behavior. These facilities are enabled by defining a new tuple in table **ISERVOPT**. Operating company personnel use table ISERVOPT to configure switch information for service-related features. Figure 3 shows a sample datafill for table ISERVOPT.

**Figure 3 New ISERVOPT Tuple**

```
SOPTSKEY SOPTSVAR
-----
DNH_OPTS DNH_OPTS Y Y
```

The tuple introduces: a new entry *DNH\_OPTS* in the field *SOPTSKEY*; a new entry *DNH\_OPTS* in the field *SOPTSVAR*/subfield *OPTI*; and two new boolean subfields *PILOT\_CHARGE*, *PILOT\_DISPLAY*. The subfields' values 'Y/N' serve to turn functionalities on/off in the office.

## 1.2.2 Pilot DN Charge

### 1.2.2.1 Overview

The DNH group PDN can be charged for all calls originated by its members including calls originated by the PDN itself.

This functionality is achieved when the subfield *PILOT\_CHARGE* value is set to 'Y' in the new *ISERVOPT* tuple.

The pilot DN charge functionality uses the existing line option **SPB** (Special Billing). The SPB option allows a number other than the subscriber's DN to be used for billing.

Thus, to supply the desired functionality, every single member DN of a DNH group must have the SPB option assigned on it, with the field *SPBDN* (Special Billing Directory Number) filled with the pilot DN of that group. As the PDN is also charged for its own calls, it is not allowed to have the SPB option.

### 1.2.2.2 Service Order

Therefore, after the functionality is activated, a number of restrictions to SO commands take place:

The field *SPBDN* of the SPB line option being assigned or changed on any DNH group member, accepts only the value of the PDN of that group.

The supported SO commands are: ADO 'SPB', CHF 'SPB', ADD a new DNH member with the SPB option, and EST a new DNH group with the SPB option on a member.

- Addition of the SPB option to a pilot DN with the ADO and EST commands, is forbidden.
- Deletion of the SPB option from a DNH member with the command DEO, is forbidden.
- Definition of a new DNH member without the SPB option, is forbidden. It concerns commands ADO 'DNH', ADD, and EST.

Every restriction is accompanied by displaying an appropriate message.

Deletion of the DNH option from a member DN is allowed. A user gets a reminder message that the SPB option remains on this DN.

### 1.2.3 Pilot DN Display

For any call providing CLI, originated from a DNH group MDN, only the group's PDN is presented as the Calling Line Number nodally or to the network to be displayed at far end, by default or upon ANI request. The functionality must be set in the new tuple of table ISERVOPT as described above.

The **IBN** and **ISDNKSET** originators and local terminators are supported.

The PDN sending as a calling number is supported for calls outgoing via **ISUP** and **MFC** trunks as described below.

**ISUP:** When a call initiated by a DNH group member, goes out through an ISUP trunk, the Calling Party Number parameter in the ISUP Initial Address Message (**IAM**) contains the pilot DN of that group instead of the MDN.

As well, the PDN is also provided instead of the MDN in the INformation message (**INF**) that is sent in response to the received INformation Request message (**INR**).

**MFC:** MFC (FDCP R2, Type-A) support: Similarly, instead of the DNH group MDN call originator, its PDN is presented as the DN of the calling party in the **setup** message and also in the **information** message sent in response to the information request message.

## 1.3 Hardware Requirements or Dependencies

Not applicable.

## 1.4 Software Requirements or Dependencies

Not applicable.

## 1.5 Limitations and restrictions

For both Pilot Charge and Pilot Display only homogeneous IBN/ISDN DNH groups are supported, i.e. those consisting from only IBN or only ISDN lines.

### 1.5.1 Pilot DN Charge.

All limitations and restrictions of the SPB feature take place.

After the functionality is activated in table ISERVOPT, this feature controls only **further** actions performed with **SO** commands. It is the responsibility of TELCO personnel to handle all SPB definitions on all DNH groups defined before the activation of the functionality. Any changes carried out by any other means, e.g. Table Control, are beyond the scope of the feature.

SO support performs **no automatic** actions (such as addition of the SPB option to a newly added MDN). An appropriate **message** is displayed each time any restriction to SO commands set by this feature is violated (see above), and the

SO checking **rejects** the command. A user can then decide which further actions may be taken to achieve the goal, or may not take action at all.

### 1.5.2 Pilot DN Display.

For network calls, only **ISUP** and **MFC** trunk types are supported to send PDN as a calling number:

- **ISUP:** ETSI ISUP V2 Ethiopia (ETC) variant only;  
To support other ISUP variants, additional development is required.
- **MFC:** FDCP R2 and Type A protocols.

Only **IBN** and **BRI** subscribers are supported as call originators, local terminators, and pilots.

## 1.6 Interactions

The key requirement of the Pilot Display is that the pilot DN must be seen on the terminator's telephone display as a calling number in every call originated by its member - if presentation of the CGN of the originator is not suppressed.

Therefore this feature, being in effect, takes precedence over all other features that modify the display of the CGN:

For local calls:

- All these features are ignored when the Pilot Display is active, and the pilot DN is displayed as it is datafilled in table DNINV etc without any modification;
- All the features that use CGN but that do not change its display for a terminator, are not affected.

For line-to-trunk calls:

As an originating switch always sends a PDN instead of its MDN as a CGN, all the features that manipulate with the CGN in their way, are suppressed by the Pilot Display.

Definite interest may be presented in analysis of the interaction with the **Call Forward** feature:

**Pilot Charge.** When a call forward subscriber forwards a call, it pays for the second call leg, i.e. that between him and the terminator. The SPB feature covers this interaction, therefore no additional development is required to charge a pilot when its member forwards a call.

**Pilot Display.** In a call forward scenario, the real originator, and not the call forwarder, is displayed at the terminator's display. Hence, if a member forwards a call, its DN does not appear as the calling party DN and therefore

must not be replaced by the PDN in this interaction, which means that no development is required.

In **Malicious Call Trace** (MCT) feature, when MDN originated a call:

- For a **nodal** terminator, an MCT153 / MCT154 log is generated without any changes, i.e. the real originator (MDN, not PDN) appears at the field CALLING\_PARTY;
- For a **remote** terminator accessed via trunks, the PDN appears at the field CALLING\_PARTY.

## 2: Configuration for A00007383

### 2.1 Hardware and Software Requirements

The feature is developed in ISN08 (MMP21) s/w release and patched back to ISN04 (MMP17).

### 2.2 Initial Configuration

In loads older than ISN08 (MMP21), the patches containing the development code, are to be applied using the Post Release Software Manager (PRSM).

### 2.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable.

### 2.4 Upgrade Impact

#### 2.4.1 Dump and Restore

Data of the only modified table ISERVOPT are transferred from the old s/w release to the new s/w release as usual within the data transfer process during ONP. Table changes do not require a reformat, since area refinement is added only.

It is obvious that if the table ISERVOPT being transferred, has the new tuple in the old release side, the patches must be applied in the new release side (unless the new release is ISN08 or higher).

#### 2.4.2 Element Management Upgrade

Not applicable.

## 2.5 Data schema (DS) (CM, MIBS, RDB)

### 2.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/OLD/UNCHANGED) |
|----------------|--------------------------|-----------------------------------|
| ISERVOPT       | changed                  | unchanged                         |

### 2.5.2 Table/MIB/Remote Database Schema information

#### 2.5.2.1 Name: ISERVOPT

International SERVICE OPTion

##### 2.5.2.1.1

Operating company personnel use table ISERVOPT to configure switch information for service-related features. This table groups multiple related pieces of data in a single entry.

Each service that uses this table provides a subfield related to that service. Each subfield asks for information in a format relevant to the service. This table accepts an entry if operating company personnel enter a service that is in the load.

##### 2.5.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

##### 2.5.2.1.3 Size

Table 2 Table size

| Abbreviated table name | Minimum tuples | Maximum tuples             | Information on memory                                   |
|------------------------|----------------|----------------------------|---------------------------------------------------------|
| ISERVOPT               | Unchanged      | Current maximum tuples + 1 | Memory is automatically allocated for additional tuple. |

##### 2.5.2.1.4 Fields/OIDs

The following table lists fields for ISERVOPT.

**Table 3 Table field descriptions**

| Field    | New or Changed | Subfield or refinement | Entry    | Explanation and action                                                                                                                                                                                                                                     |
|----------|----------------|------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOPTSKEY | Changed        |                        | DNH_OPTS | Directory Number Hunting Options.<br><br>New entry DNH_OPTS in field SOPTSKEY is the key in ISERVOPT.                                                                                                                                                      |
| SOPTSVAR | Changed        | OPTION                 | DNH_OPTS | Directory Number Hunting Options.<br><br>New entry DNH_OPTS in field OPTION is the option name.                                                                                                                                                            |
|          |                | PILOT_CHARGE           | Y or N   | PILOT_CHARGE controls activation of the Pilot Charge functionality. When PILOT_CHARGE is set to N, the Pilot Charge functionality has no impact. When PILOT_CHARGE is set to Y, the Pilot Charge functionality is activated. The default value is N.       |
|          |                | PILOT_DISPLAY          | Y or N   | PILOT_DISPLAY controls activation of the Pilot Display functionality. When PILOT_DISPLAY is set to N, the Pilot Display functionality has no impact. When PILOT_DISPLAY is set to Y, the Pilot Display functionality is activated. The default value is N. |

**2.5.2.1.5 Datafill example**

The following example shows sample datafill for table ISERVOPT.

**Figure 4 Map display example for DNH\_OPTS option in table ISERVOPT**

```
SOPTSKEY SOPTSVAR
-----
DNH_OPTS DNH_OPTS Y Y
```

**Note:** The following list gives datafill examples for the DNH\_OPTS service. They are based on the four possible values for the DNH\_OPTS tuple, namely: KEY (SOPTSKEY), OPTION (SOPTSVAR), PILOT\_CHARGE, and PILOT\_DISPLAY.

No enhancements are turned on:  
DNH\_OPTS DNH\_OPTS N N

With this datafill neither functionality has impact. The tuple can be absent.

- Only the pilot charge enhancement is operational:  
DNH\_OPTS DNH\_OPTS Y N
- Only the pilot display enhancement is operational:  
DNH\_OPTS DNH\_OPTS N Y
- Both pilot charge and pilot display enhancements are operational;  
DNH\_OPTS DNH\_OPTS Y Y

#### **2.5.2.1.6 Table release history update**

The following information was added:

- Entry DNH\_OPTS added to field SOPTSKEY
- Entry DNH\_OPTS added to field SOPTSVAR/OPTION
- New subfields PILOT\_CHARGE and PILOT\_DISPLAY added to entry DNH\_OPTS in field SOPTSVAR/OPTION.

Maximum table size increased in number of one tuple.

#### **2.5.2.1.7 Supplementary information**

This table does not contain initial datafill. The operating company using this table provides datafill that refers to indicated services.

The default values of parameters PILOT\_CHARGE and PILOT\_DISPLAY are N. Even if tuple does not exist in ISERVOPT, the state is considered to be N for both functionalities. If the state of either parameter is Y, the respective functionality of the feature is available officewide. If the state is N, the respective functionality is suppressed.

PILOT\_CHARGE and PILOT\_DISPLAY require no restarts.

Every change of PILOT\_CHARGE and PILOT\_DISPLAY values including tuple addition/deletion is accompanied by displaying an appropriate message. This message informs a user about which functionality is activated/deactivated (one or both), briefly describes it, and informs a user about what actions are required from his side, if any. For more information please refer to “1.5.1 Pilot DN Charge.” on page 1193.

#### **2.5.2.1.8 Translation verification other tools**

ISERVOPT does not use translation verification tools.

## 2.6 Service Orders (SO) (CM & SESM)

### 2.6.1 Service order change details

Only **pilot charge** functionality has impacts on Service Order.

The overall impact consists in **additional** servord **checking** carried out when the pilot charge functionality is in active state (subfield *PILOT\_CHARGE* value is set 'Y' in the *DNH\_OPTS* ISERVOPT tuple).

The brief background of this functionality explaining **why** additional SO checking is needed, is as follows.

The pilot DN charge functionality uses the existing line option **SPB** (SPecial Billing). The SPB option allows a number other than the subscriber's DN to be used for billing. To charge a pilot DN (PDN) for all the calls originated by its members DN (MDN), **every** single **MDN** of a DNH group **must have** the SPB option assigned on it, with the field **SPBDN** filled with the PDN of that group. The **PDN** is also charged for its own calls therefore it is **not allowed** to have the SPB option. Therefore any SO command that may **violate** this state, passes through additional checking to avoid this. Besides, in one special case the additional SO checking is done in order to only attract a user's **attention** to possible need of further actions. More detailed description is in "1.2.2.2 Service Order" on page 1192.

SO support performs **no automatic** actions. That means:

- All the DNH groups that exist **at the moment** of activation of the pilot charge functionality, must be checked by the TELCO personnel for the correspondence with the state described above, and appropriate actions should be taken to bring them into this state. When setting this functionality 'Y', a user gets a message - see "2.5.2.1.7 Supplementary information" on page 1199, and also "1.5.1 Pilot DN Charge." on page 1193.
- If a performed SO command did not pass additional checking, only an appropriate **message** is displayed, and the command is **rejected** (except for the one special case mentioned above when the additional checking **allows** the command). A user can then decide which further actions may be taken to archive the goal, or may not take action at all.

This feature does not introduce any new LCC.

This feature does not introduce any new option.

#### 2.6.1.1 LCC and options

Neither a new LCC nor option is introduced by this feature.

All the limiting conditions of the SPB option remain valid.

This feature supports only **IBN** and **ISDNKSET LCC**.

### 2.6.2 New commands

This feature does not provide any new commands.

## 2.7 Software optionality control (SOC)

Table 4 SOC

|                          |                                   |
|--------------------------|-----------------------------------|
| SOC option name:         | DNH Pilot Enh                     |
| SOC option title:        | DNH Pilot Num for CLI and Billing |
| SOC option control type: | Tracked                           |
| New SOC option?          | Yes                               |
| SOC option order code    | SVBI0035                          |
| Option defined in DRU:   | WT                                |
| Affected products:       | DMS100                            |

All tracked SOC's are automatically created via PCA enforcement and no longer require design implementation.

## **A00007393--Session Policy Controller**

### ***Functional Description***

## **1.1 Applicable Solution(s)**

## CHS

## 1.2 Background

In SN07, the CS2000 delivered admission control functionality by means of virtual call admission control (VCAC) on the Gateway Controller (GWC) component of the CS2000 architecture. The limitations of this as policy control platform along with the need to support CS2000 and potentially other application servers together behind the same access links drove the requirements to move VCAC onto a common platform which could serve multiple applications.

## 1.3 Overview

The SPC product functionality is implemented by the following feature activities:

- A00007389 SPC Policy Control Framework
- A00007390 SPC Protocol Handler
- A00007391 SPC Provisioning Framework
- A00007392 SPC OAM
- A00007393 SPC Base
- A00007398 SPC Topology Manager

This FN document serves as the “umbrella” FN for the all above activities.

## 1.4 Feature Description

The Session Policy Controller monitors, controls, and enforces use of network resources. The SPC main functions are policy control and management. The SPC software application is delivered on the SAM-XTS hardware platform and the product is developed and based on the NGSS (Nortel General-purpose Session Server) software platform. The general model describing the Release 1 Session Policy Controller application functional components and interfaces is shown below.

Figure 1- Session Policy Controller (SPC) functional components

#### 1.4.1 Policy Control Framework

The SPC has a Policy Control Framework (PCF) that is responsible for processing requests for resources and applying the necessary policy enforcement mechanisms to the requests. All relevant network topology information needed is retrieved from a Topology Database.

##### 1.4.1.1 Policy Definition

In SN08 there will only one policy supported – VCAC Bandwidth Policy. This default policy exists to carry out network resource reservation function.

##### 1.4.1.2 Policy Enforcement Action

The SPC applies the default policy to all requests for network resources to enforce call admission control. Resource requests could be in the form of a flow specification or an amount of bandwidth requested. VCAC Bandwidth

usage calculations are used to monitor the bandwidth usage status, and ensure there are enough resources for a new call requests.

When an Application Server agrees to provide service to a client, it sends a request to the SPC that contains:

- Identity and location of the client to whom service is to be provided
- FlowSpec specifying traffic requirement for the session

### **Network Reservation using VCAC**

The Network Reservation requests are processed using Virtual Call Admission Control (VCAC) functionality. The initial release of the Session Policy Controller supports a VCAC capability that is substantially equivalent to that introduced on the CS2000 in SN07. One of the main advantages of moving the VCAC functionality off-board to the SPC is that, in SN07, GWCs cannot share count information among themselves. In SN08, resource modeling is performed on the SPC and since the SPC would have a full view of the topology, VCAC could be performed on application server-wide basis instead of just within one particular GWC's scope of control.

VCAC is a policy based Call Admission Control model used to provide Network Resource Based Admission Control by setting service class bandwidth limits based on the bandwidth available on the subscriber's access link. VCAC

### **VCAC Bandwidth Calculations**

The VCAC function can handle the tracking of bandwidth usage in terms of an Explicit or Implicit calculation of encapsulation overhead and link bandwidth. The mechanism is dependent on the definition of a Network Zone and associated Network link. The SPC topology model allows the customer to either describe a Network Link in terms of established Predefined protocol layers or by a custom link layer type.

#### **Implicit calculation**

The customer can choose to describe a network link in terms of the protocol layers (e.g. PPP/Ethernet/ATM) which comprise the link. These link layer types are predefined for use by the customer and are accessible via the SPC provisioning interface. A protocol layer is specified as having either a variable (e.g. Ethernet) or fixed (e.g. ATM) protocol data unit (PDU). In each case there is an encapsulation overhead, and in the fixed PDU case there is also the unit size & overhead. The SPC implicitly derives the value of the link overhead based on the definition of the predefined link layer type because the encapsulation overhead is associated with the protocol. For example, in the case of a fixed length PDU, the customer would also specify the unit size (e.g. ATM cellsize=53) and unit overhead amount (e.g. ATM header of 5 bytes).

Explicit calculation

If the customer prefers a simpler approach, they can choose not to model the specific protocol layers of the network link, but instead create a custom link layer and provision the bandwidth available on the link with a single value for the overhead. In this calculation no assumption is made about multiple link layers and the associated encapsulation overhead of each. It is expected that the craftsperson explicitly accounts for any overhead required for the link layer. In other words, the customer creates a “fudge factor” to account for overhead when they define the bandwidth available on the link. The overall bandwidth is explicitly calculated based on the bandwidth values and overhead provisioned by the customer.

**Networks Service Class (NSC)**

Nortel Networks has an established set of subscriber service classes that can be used to map traffic categories, DSCP, and other QoS/CoS parameter designations. NNSC names can be used to define individual traffic flow policies based on traffic conditions independently of the underlying bearer link protocol or network element resource. This could provide scalability for large networks that interoperate with various policy standards, including: DiffServ, IEEE 802.1p, COPS-PR, and LDAP.

In SN08, only voice calls are supported from the CS2000. All voice calls will be tagged as Premium.

**Table 1 - Sample NNSC Mappings**

| Traffic Category | Nortel Networks Service Class | Default DSCPs         | ATM     |        | Frame Relay |        | Ether-net 802.1p | MPLS E-LSP EXP | Scheduler | AQM  |
|------------------|-------------------------------|-----------------------|---------|--------|-------------|--------|------------------|----------------|-----------|------|
|                  |                               |                       | CoS     | CLP    | CoS         | DE     |                  |                |           |      |
| Network Control  | Critical                      | CS7                   | rt-VBR  | 0      | 3           | 0      | 7                | 111            | PQ        | None |
|                  | Network                       | CS6                   | rt-VBR  | 0      | 3           | 0      | 7                | 111            | WFQ       | None |
| Interactive      | Premium                       | EF, CS5               | rt-VBR  | 0      | 3           | 0      | 6                | 110            | PQ        | None |

|                  | Silver                        | AF21, AF22, AF23, CS2 | nrt-VBR | 0<br>1 | 1           | 0<br>1 | 3                | 011            | WFQ       | WRED |
| Timely           | Bronze                        | AF11, AF12, AF13, CS1 | nrt-VBR | 0<br>1 | 1           | 0<br>1 | 2                | 010            | WFQ       | WRED |
|                  | Standard                      | DF                    | UBR     | 1      | 0           | 1      | 0                | 000            | WFQ       | WRED |

### 1.4.2 Protocol Handler

The Protocol Handler provides a standard application interface specification to the Policy Control Framework. The Protocol Handler parses request messages that are delivered by the protocol stack and converts those requests into generic request messages which are passed to the Policy Control Framework. The protocol handler also receives generic responses from PCF, encodes the response in the required format for the specified protocol, and then sends this response back to application server.

Various protocols could be used between the application server and the SPC, such as COPS, Diameter, SOAP, etc... In release 1, an extension of the COPS based DQos protocol is the only protocol supported over the signaling interface between the CS2000's GWC and the SPC.

### 1.4.3 Provisioning Framework

The Session Policy Controller functions as its own element manager. This means that provisioning and maintenance activities for a Session Policy Controller takes place on the Session Policy Controller itself. The SPC provision framework provides a web based interface to configure SPC system parameters, provision network topology, perform application maintenance, and display SPC specific OMs, alarms, and logs. The SPC GUI has a similar look and feel some other Nortel Networks products. It shares a common 'look and feel' with other NGSS based applications such as SIP-GW. An OSS interface is also provided.

The SPC uses a database for persistent data storage of topology data and run-time configuration parameters. There are many components in SPC that access database to retrieve, insert, or update data. For example, PCF may need to retrieve topology from the database to construct the topology in the memory and Topology data needs to be input from the OSS into the database. Topology data and system tunable parameters can be changed by system operator or externally while the SPC is running and the internal components of the SPC must be notified of the change. An internal change notification mechanism is used to notify the internal components of the SPC what information has been changed.

The OSS and web browser are the only interfaces to manage provisioned data.

### 1.4.4 OAM Function

The SPC provides functionality for application maintenance such as Logs, Alarms, and OMs. The OMs, Logs, and Alarm information are recorded on the internal hard disk. These subsystems provide an interface to export the data off-board to IEMS. The Web Server can also retrieve active alarms and logs so that they can be displayed on the Web GUI.

Access to Application Maintenance commands is available from Web GUI.

The OM format is presented in the Performance Management section of this document.

The Alarm format is presented in the Fault Management section of this document.

The Log format is presented in the Fault Management section of this document.

#### **1.4.5 Topology Management**

The Session Policy Controller provides a topology database, topology configuration tools and schemas to support the VCAC capability. These topology configuration tools allow the craftsperson to manage topology data such as network zones and network links. There are topology provisioning interfaces for the web GUI and OSS.

### **1.5 Hardware Dependencies**

#### **1.5.1 SAM-XTS**

The hardware platform is the SAM-XTS (Service Application Module – eXtremely Thin Server). It is the Intel Langley Prestonia OEM’ed by Hewlett Packard as the HP-CC3310. The HP-CC3310 provides processing, memory, and disk capacity for Session Policy Controller application.

The HP cc3310 carrier-grade server is a Network Equipment Building Standards (NEBs) Level 3-certified platform in a 2U form factor. The server is designed for telecommunications central offices or data centers and deployed in a rack-mounted, space-saving configuration. Based on IA-32 processors and tuned for the Linux operating system, the HP cc3310 carrier-grade server is modular and based on industry standards.

The SAM-XTS is a platform for the delivery of multiple applications. Other applications that would reside on the SAM-XTS are the SIP Gateway application or STORM application.

#### **1.5.2 SAMF Frame**

The SAM-XTS server is mounted on the SAMF (NTRX51HA) frame.

### **1.6 Software Dependencies**

#### **1.6.1 Nortel Networks Software Dependencies**

##### **1.6.1.1 NGSS**

The Session Policy Controller product is developed on the NGSS (Nortel General-purpose Session Server) software platform. The NGSS software platform has a layered architecture, which consists of an application layer, a shared layer, and a Nortel Carrier-Grade Linux base layer. The Session Policy Controller software resides in the NGSS application layer, and the Session

Policy Controller uses the NGSS Application Maintenance Module to interface with the NGSS shared and base layer functions. In SN08, the NGSS platform does not support multiple applications to co-run together. Only one application can be enabled to operate on the platform.

## **1.6.2 Non Nortel Networks Software Dependencies**

The SPC application relies on several 3<sup>rd</sup> party software libraries and utilities.

### **1.6.2.1 ACE**

The Adaptive Communication Environment (ACE) is a freely available, open-source object-oriented tool framework that implements many core patterns for concurrent communication software. It is free to use and distribute without compromising Nortel IPR. The license can be found at <http://www.cs.wustl.edu/~schmidt/ACE-copying.html>

### **1.6.2.2 Xerces**

Xerces is one of the Apache Foundation projects. Xerces is a library that provides XML parsing and generation. Fully-validating parsers are available for both Java and C++, implementing the W3C XML and DOM (Level 1 and 2) standards, as well as the de facto SAX (version 2) standard. The parsers are highly modular and configurable. Initial support for XML Schema is also provided. It is free to use and distribute without compromising Nortel IPR. The license can be found at <http://apache.org/licenses/>

### **1.6.2.3 Struts**

Struts is one of the Apache Foundation projects. Struts is an open source framework for building Java web applications. The core of the Struts framework is a flexible control layer based on standard technologies like Java Servlets, JavaBeans, ResourceBundles, and XML. It is free to use and distribute without compromising Nortel IPR. The license can be found at <http://apache.org/licenses/>

## **1.7 Network Component Dependencies**

Refer to the SPC product specification for more information concerning supported configurations.

### **1.7.1 Nortel Networks Components**

#### **1.7.1.1 IEMS**

The Nortel Networks Integrated Element Management System (IEMS) is used to provide proxy connections for SPC OAM functions. The SPC provisioning web client can be launched from IEMS. A secure shell (SSH) connection to SPC from IEMS is required for OSS operations. The OSS operator position can log into the SPC via IEMS secure proxy and SSH.

IEMS can be used as:

- Web proxy for SPC OAM operations via Web GUI
- Secure proxy for SPC logon
- Secure proxy for SPC OAM operations via OSS

Refer to IEMS documentation for information on how to configure IEMS interfaces for web server proxy and secure proxy for OSS.

### **1.7.2 Non Nortel Networks Components**

Not Applicable

## **1.8 Restrictions and Limitations**

- Only one CS2000 per SPC.
- Initial commissioning of SPC in SN08 requires a transfer topology data from SESM to SPC. This requires customer involvement via OSS to query the data on SESM and then add it to SPC.
- Centralized authentication of passwords is not supported by base platform.
- SPC will not co-run with any other NGSS based application.
- There is no synchronization of topology data between the SPC and SESM. If a topology mismatch is encountered during SPC call processing, the call attempt would be still be allowed. However, VCAC would not be applied for that leg of the call, and log would be generated to indicate that there is a topology mismatch between the SPC and GWC/SESM.

## *Fault Management for A00007393*

### 2.1 Fault Management Strategy

Alarm and Logging capabilities span the Session Policy Controller application and NGSS software platform. The SPC derives its Alarm and Logging functionality from the NGSS software platform and a majority of these key functions are provided by the capabilities of the underlying NGSS platform itself. Refer to the NGSS Fault Management documentation for more detail concerning NGSS logs and alarms.

Alarm notifications are sent to the IEMS NMS in the form of SNMP traps. The standard Nortel Alarm MIB is used for this purpose. Alarms notifications are also distributed to the web server and can be viewed from the Web GUI. Active alarms will be refreshed automatically every 45 seconds. Alarms cleared automatically when the issue that raised the alarm has been corrected. The audit alarm will reappear after a period of time if the problem is not corrected.

The SPC captures all system events in the customer log which can be viewed from the web GUI. The log files are automatically rotated so that the log file system is never filled through logging activity.

### 2.1.1 Audits

The Session Policy Controller is capable of initiating audit requests. Audits may be required for the following events:

- The SPC can audit the GWC to determine if a flow is invalid. The mechanism allows the SPC to query the status of suspect flows. There is a configurable timer on each flow; the default value is 60 minutes. If the timer for the flow expires, the flow is considered suspect. SPC then audits the suspect flow by exchanging messages over the signaling interface with the application server.
- Switch of Activity (SWACT) – when Session Policy Controller changes activity from one unit to another, it will initiate audits in order to assure that it has not lost critical information in the transfer.
- Change in Link State – if links to the Application Server are lost, the flow status audits described above should be sufficient to assure any transactions lost during the link outage are accounted for.

The results of the audits are logged.

## 2.2 Fault Management Tools and Utilities

The standard Nortel Alarm MIB is used to deliver alarm notification to the IEMS NMS.

All logs are stored locally on disk in custlog format. They can be viewed on the web GUI and transferred over the network to a log host. The logs use the SYSLOG utility in the NGSS base. File rotation will be based on the file size and file rotation timer. The file rotation time, maximum file size and file retention can be configured using the Logrotate utility. The Logs are sent automatically to IEMS.

## 2.3 SPC Alarms

### 2.3.1 SPC Application Server Signaling Communication Alarm

| Alarm                         |                                                                                                             | Description                                                                                 | Corrective Action                                                          |
|-------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|

| Cause:               | Topology Manager lost database connection. This alarm is raised if SPC cannot establish a connection with the database during Topology Manager process initialization or if the application fails to access the DB. The alarm should clear itself after the next topology change/update request is received. At start-up, if Topology Manager process cannot establish a connection with the database it will restart itself and re-attempt the connection. |                                                                         |                                |
| Duration:            | Until Topology Manager database connection is reestablished                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                         |                                |

Raise and Cleared Alarm Report Parameters:

| Report Parameters | Raise Alarm                             | Clear Alarm                                      |

## 2.4 SPC Logs

Log Files are created to store the logs on the local disk in the custlog format. In addition to the SPC specific logs, NGSS Application Maintenance (NAM) logs 500, 300, 301, and 302 are generated during SPC operation. Refer to the NGSS Fault Management documentation for more information about those logs.

### 2.4.1 SPC Startup

#### 2.4.1.1 Explanation

This log is generated when the SPC starts up.

**2.4.1.2 Format**

|             |             |
|-------------|-------------|
| Report Name | SPCP        |
| Report Num  | 501         |
| Alarm Value | NONE        |
| Event Type  | INFO        |
| LABEL       | SPC Startup |

**2.4.1.3 Action**

None

**2.4.1.4 Associated Operational Measurements or Performance Measurements**

None

**2.4.2 SPC Shutdown****2.4.2.1 Explanation**

This log is generated when the SPC shuts down

**2.4.2.2 Format**

|             |              |
|-------------|--------------|
| Report Name | SPCP         |
| Report Num  | 502          |
| Alarm Value | NONE         |
| Event Type  | INFO         |
| LABEL       | SPC Shutdown |

**2.4.2.3 Action**

None

**2.4.2.4 Associated Operational Measurements or Performance Measurements**

None

**2.4.3 Audit Result****2.4.3.1 Explanation**

This log is generated when a Flow Status Audit is completed.

**2.4.3.2 Format**

|             |              |
|-------------|--------------|
| Report Name | SPCP         |
| Report Num  | 601          |
| Alarm Value | NONE         |
| Event Type  | INFO         |
| LABEL       | Audit Result |

**2.4.3.3 Action**

None

#### **2.4.3.4 Associated Operational Measurements or Performance Measurements**

None

### **2.4.4 CAC Request Denied**

#### **2.4.4.1 Explanation**

This log is generated when CAC request from Application server is denied.

#### **2.4.4.2 Format**

|             |                    |
|-------------|--------------------|
| Report Name | SPCP               |
| Report Num  | 602                |
| Alarm Value | NONE               |
| Event Type  | INFO               |
| LABEL       | CAC Request Denied |

#### **2.4.4.3 Action**

None

#### **2.4.4.4 Associated Operational Measurements or Performance Measurements**

The following OMs are pegged

- SPC Reservation Request or SPC Commit Request
- CAC Request on Network Segment

### **2.4.5 SPC Topology Change**

#### **2.4.5.1 Explanation**

This log is generated when spc callp accepts a topology change.

#### **2.4.5.2 Format**

|             |                 |
|-------------|-----------------|
| Report Name | SPCP            |
| Report Num  | 603             |
| Alarm Value | NONE            |
| Event Type  | INFO            |
| LABEL       | Topology Change |

#### **2.4.5.3 Action**

None

#### **2.4.5.4 Associated Operational Measurements or Performance Measurements**

None

## 2.4.6 Topology Mismatch

### 2.4.6.1 Explanation

This log is generated when callP detects that the Ingress Id of the Network Segment sent in a GateSet message from the GWC is not present in the SPC database. This is an indication that there could be a topology mismatch between the SPC and GWC/SESM. A summary of the requested change is included in the free text portion of the report description field.

### 2.4.6.2 Format

|             |                   |
|-------------|-------------------|
| Report Name | SPCP              |
| Report Num  | 604               |
| Alarm Value | NONE              |
| Event Type  | INFO              |
| LABEL       | Topology Mismatch |

### 2.4.6.3 Action

None

### 2.4.6.4 Associated Operational Measurements or Performance Measurements

None

## 2.4.7 TPM Startup

### 2.4.7.1 Explanation

This log is generated when the Topology Manager starts up.

### 2.4.7.2 Format

|             |                         |
|-------------|-------------------------|
| Report Name | TPM                     |
| Report Num  | 501                     |
| Alarm Value | NONE                    |
| Event Type  | INFO                    |
| LABEL       | TopologyManager Startup |

### 2.4.7.3 Action

None

### 2.4.7.4 Associated Operational Measurements or Performance Measurements

None

## 2.4.8 TPM Shutdown

### 2.4.8.1 Explanation

This log is generated when the Topology Manager shuts down

#### 2.4.8.2 Format

|             |                          |
|-------------|--------------------------|
| Report Name | TPM                      |
| Report Num  | 502                      |
| Alarm Value | NONE                     |
| Event Type  | INFO                     |
| LABEL       | TopologyManager Shutdown |

#### 2.4.8.3 Action

None

#### 2.4.8.4 Associated Operational Measurements or Performance Measurements

None

### 2.4.9 Topology Change

#### 2.4.9.1 Explanation

This log is generated when topology manager accepts a topology change. A summary of the requested change is included in the free text portion of the report description field.

#### 2.4.9.2 Format

|             |                 |
|-------------|-----------------|
| Report Name | TPM             |
| Report Num  | 603             |
| Alarm Value | NONE            |
| Event Type  | INFO            |
| LABEL       | Topology Change |

#### 2.4.9.3 Action

None

#### 2.4.9.4 Associated Operational Measurements or Performance Measurements

None

### *Performance Management for A00007393*

The SPC application has its own set of performance measurement although it relies on the NGSS base platform for some of its OM facilities.

## 3.1 Performance Management Strategy

The SPC has two types of OMs: Static and Per-Instance. Static OMs are performance measurements in the traditional sense where the counter/gauge is created when the application starts and exists for the duration of the SPC application. Per-Instance OMs are dynamic performance measurements that are captured for semi-permanent objects such as network nodes or endpoints.

The number of per-instance OMs can vary. There can be up to 5000 network nodes.

### 3.2 Performance Management Tools and Utilities

The SPC uses the common OM Framework provided by the NGSS platform for all OM functions. The OMs can be retrieved via FTP for off-board processing. The OMSHOW utility can be used to view from the NGSS platform.

In NGSS OM subsystem, the OM system stores the OM data to CSV files. It generates 5Min files and 15~30Min files for all OMs. The 5Min files would be kept for 30 minutes and the 15~30Min files kept for 24 hours.

NGSS platform provides ftp access to the stored OM data. These files can be periodically FTP'ed to the IEMS and viewed.

15 or 30 minutes data are stored in  
/opt/apps/ngsspm/stdhist

5 minutes data would be stored in  
/opt/apps/ngsspm/trafhist

OM files would be named like NGSS. OMs. QoS. 2004. 5. 25\_10. 15\_CDT. csv

### 3.3 Performance Measurements (PM), Operational Measurements (OM), and Stats

#### 3.3.1 SPC Reservation Request

This OM group records reservation request events on the SPC signaling interface.

| OM Item                      | Peg Event                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------|
| IC_RESERVATION_REQUESTS      | When SPC receives a incoming reservation request                                        |
| RESERVATION_REQUESTS_SUCCESS | When SPC sends a reservation success response                                           |
| RESERVATION_REQUESTS_FAILURE | When SPC sends a reservation failure response because resource is unavailable           |
| RESERVATION_REQUESTS_ERROR   | When SPC sends a reservation error response because the request has a incorrect context |

#### 3.3.2 SPC Commit Request

This OM group records commit request events on the SPC signaling interface.

| OM Item                 | Peg Event                                                                          |
|-------------------------|------------------------------------------------------------------------------------|
| IC_COMMIT_REQUESTS      | When SPC receives a incoming commit request                                        |
| COMMIT_REQUESTS_SUCCESS | When SPC sends a commit success response                                           |
| COMMIT_REQUESTS_FAILURE | When SPC sends a commit failure response because resource is unavailable           |
| COMMIT_REQUESTS_ERROR   | When SPC sends a commit error response because the request has a incorrect context |

### 3.3.3 SPC Deletion Request

This OM group records deletion request events on the SPC signaling interface.

| OM Item                   | Peg Event                                                                            |
|---------------------------|--------------------------------------------------------------------------------------|
| IC_DELETION_REQUESTS      | When SPC receives a incoming deletion request                                        |
| DELETION_REQUESTS_SUCCESS | When SPC sends a deletion success response                                           |
| DELETION_REQUESTS_ERROR   | When SPC sends a deletion error response because the request has a incorrect context |

### 3.3.4 SPC CallP

This OM group records SPC Callp OMs.

| OM Item               | Peg Event                                 |
|-----------------------|-------------------------------------------|
| NUM_HalfCall_Attempts | When SPC receives a half call attempts    |
| NUM_HalfCall_Success  | When SPC successfully sets up a half call |

### 3.3.5 Topology Update

This OM group records topology update events in the topology manager

| OM Item                     | Peg Event                                                              |
|-----------------------------|------------------------------------------------------------------------|
| IC_PROV_TOPO_UPDATE         | When TPM receives a incoming topology update transaction from Web Prov |
| IC_PROV_TOPO_UPDATE_FAILURE | When a incoming topology update transaction from Web Prov is failed    |
| IC_OSS_TOPO_UPDATE          | When TPM receives a incoming topology update transaction from OSS      |
| IC_OSS_TOPO_UPDATE_FAILURE  | When a incoming topology update transaction from OSS is failed         |

### 3.3.6 CAC Request on Network Segment

This is a Per-Instance OM. This group records CAC requests to each network segment.

| OM Item              | Peg Event                                             |
|----------------------|-------------------------------------------------------|
| CAC_REQUESTS         | When SPC sends CAC request to certain network segment |
| CAC_REQUESTS_SUCCESS | When CAC request to certain network segment succeeds. |
| CAC_REQUESTS_FAILURE | When CAC request to certain network segment fails.    |

## 3.4 Command User Interface

### 3.4.1 Web GUI

A web-based GUI interface is used to display the Session Policy Controller Element Manager. The Web-based graphical user tools are provided to allow the customer to define and configure topology elements and also supports SPC configuration and management. The web interface is used to perform both provisioning and maintenance activities.

### 3.4.2 Supported Browsers

The following operating systems are supported:

- Win2K, Win2003, Windows XP based operating system
- Solaris version 2.8, 2.9, 2.10

Supported web browsers include:

- Internet Explorer 6.0 SP1+
- Netscape 6.2.3+ with exception of Netscape 7.0

### 3.4.3 OSS

The SPC supports an OSS interface for topology provisioning and maintenance. The OSS interfaces are programmed to process XML command requests as service orders are sent. Separate commands are required for multiple operations. For example, in order to add multiple Network Segments, an XML command request would be needed for each Network Segment.

See the following section for security aspects of using OSS via IEMS.

The SPC XML command schema is published separately.

## 3.5 Security

### 3.5.1 Access

The SPC web GUI pages follow the same security model as other NGSS based applications. There are some privileges which can be assigned to specific craftspersons. For example, some craftsperson may only have read-only privilege, and someone with administrator privileges can write and modify the SPC configuration.

The UID/Password is used to determine the user access level, and privileges are based on user access level. The authentication of user is done during the login process. For each topology configuration command, the access privilege is checked and based on the user group. If the user does not have sufficient privilege to execute a command, an error message "Insufficient Security Privileges to perform this action" is returned as part of the response.

The SPC reuses the same set of access groups as other NGSS based applications for configuration, provisioning, and maintenance commands. The access group levels would be as follows:

- mgcadm
- mgcrw
- mgcprov
- mgcmtc
- mgcro

### 3.5.2 CSLAN

The SPC is deployed on the CSLAN. The signaling between the CS2000-GWC and SPC takes place on a subnet of the CSLAN.

The SPC provisioning web client can be launched from IEMS. The OSS operator can log into the SPC via IEMS/SSPFS's

### 3.5.3 Overload Controls

The SPC provides a uniform topology provisioning interface for OSS and SPC Web GUI. This interface is responsible for creating server sockets, listening ports, setting up a new connection when a client (OSS or GUI) is connected, authenticating users, and receiving client (OSS or GUI) requests. Since the management interface can process multiple connections at the same time, the SPC implements a delayed IP address holder function to prevent any one user from abusing these connections.

For example if a user setup many connections, and once those connections are established, ignores them, closes connections, and repeatedly sets up new

connections, this could waste much CPU time and other resources, and even block other applications running in the same machine.

The SPC Delayed IP Holder function detects this type of activity. If a user sets up a connection and does nothing but immediately closes connection, the client's IP address will be recorded and any connections from that IP address are rejected until the delay-time for that IP address has expired. The delay timer is configurable and default value is 10 seconds

### **3.5.4 Platform security**

The Session Policy Controller derives Security functionality from the NGSS software platform.

In SN08, the platform provides:

- User login and password authentication
- Web based security user access via HTTPS
- Secure shell environment (SSH)

## **3.6 SOC and Keycoding**

The SPC revenue model is based on the number of Endpoints in use on the SPC. A usage control function is used to restrict the number of Endpoint that the service provider can use.

The endpoint usage is purchased in blocks of 5000. The Endpoint block size is maximum number of end points allowed to be in use on the SPC. The endpoint block size allotment is configurable from the GUI, and its provisioning protected by set of passwords. Changes to this endpoint block size require the craftsperson to enter a password. The password protection or software license key functions as a SOC. So for example, if the endpoint block size was 5000, there would be 20 passwords for each increment in block size up to 100,000. In effect every increase in block size is protected by a specific password.

OMs are used to track the number of endpoint in use over 14 days. When the endpoint count passed a threshold (a percentage of endpoint block size), alarms are raised, and the event logged. After the endpoint count exceeded the maximum endpoint block size, call attempts to additional endpoints are denied. Subsequent calls to new endpoints continue to be denied until the endpoint block size is increased. A password is required to increase the Endpoint block size. The service provider has to contact Nortel customer support to get the password.

## **A00007394--Network VCAC CallP**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

CHS

#### **1.2 Overview**

This FN mainly covers Network Virtual Call Admission Control (network VCAC), Actid A00007394. In addition, it also contains some information on following features.

- Network VCAC Maintenance & Upgrades (A00007399)
- Session Policy Controller (A00007393)
- Network VCAC Topology Provisioning (A00007242)

#### **1.3 Description**

Network Virtual Call Admissions Control (Network VCAC) is a Quality of Service (QoS) mechanism that allows the Communication Server 2000 (CS 2000) to cancel post-dial, pre-ringing calls that would overload a segment of the packet network. This is an enhancement of Basic VCAC (SN07, ACT.A00002739).

##### **1.3.1 Network VCAC vs. Basic VCAC**

For those familiar with Basic VCAC, its worth mentioning the main differences between Network VCAC and Basic VCAC.

The first notable difference is that bandwidth is tracked on the GWC in SN07. Whereas in SN08, the tracking is done externally to the GWC on a Session Policy Controller (SPC).

In SN08, Network VCAC removes the critical restrictions on deploying VCAC on sites with a mix of gateway types, which is imposed by Basic VCAC in SN07. It also removes the limitation of an LBL and the gateway behind it having to be on the same GWC.

In addition, the presence of a Session Policy Controller (SPC) adds new network management flexibilities through its management interface. It also provides additional logs and Operational Measurements (OM). For further information on the SPC see reference 1.

Network VCAC also supports composite network zones (a zone type that is a NAT and LBL at the same time). This type of zone is not supported by the SN07 Basic VCAC.

### **1.3.2 Detailed description**

Network VCAC depends on a logical model of the packet network. This starts with the Service Provider's core packet network and points of bandwidth concentration. These could, for example, be customer enterprises that are made up of a collection of sites or a regional broadband aggregation point. These sites are connected by a mix of Limited Bandwidth Links (LBLs) and NATs. The Voice over IP (VoIP) Gateways (GWs) and hence the lines are located within the sites in each enterprise.

It should be noted that when we say a 'site' or a 'network zone', we are really talking about the same thing. Similarly, when we say a 'link' it is the same as a 'network link'.

Figure 1, High level view of a sample VCAC topology

The logical model that network VCAC uses is based on the links between the sites. The GWs are described as being behind or below a particular link. So, in Enterprise A in Figure 1, A GW in Site A-3 is behind link 4, which is behind link 2, which in turn is behind link 1.

Each of these links will be either a Limited Bandwidth Link (LBL) or a NAT. The LBLs have a provisioned level of resources available and know how many resources each call type consumes. NAT traversal was handled in Feature ACT.89007980 in SN06.

Once a call is made, the CS 2000 identifies the LBLs and NATs that the GWs are behind and informs the Session Policy Controller (SPC) that a call is being made using these LBLs and NATs as the entry and exit points on the network. The SPC looks up the LBLs along the speech path between the two endpoints, and calculates if there are sufficient resources available on all the LBLs not to exceed the provisioned limits. The SPC provides a response allowing or not allowing the call as follows:

- 1) If all the LBLs can handle the new call, then the call progresses as normal.
- 2) If one or more LBLs cannot handle the call the originator receives a treatment provisioned by the carrier. The terminator has not reached a ringing stage so is unaware of the call attempt.

An example would be a call between a GW in Site A-3 and Site A-2. This call will use resources on links, 2, 3 and 4, but not on link 1 as the call doesn't leave the enterprise. An insufficient resources failure on any of the links will result in the call going to treatment.

The CS2M provisioning is described in activity ACT.A00007242CS2M, Network VCAC topology Provisioning and the SPC provisioning is described in activity ACT.A00007393SPC

It should be noted that if the SPC application is not available or the TCP connection between the GWC and the SPC is down, the call will be allowed to go through without doing any checks on bandwidth availability. Also, should the SPC topology not know about any particular link it is queried on it will reply with an error and the GWC will allow the call to proceed without any Admissions Control. These types of error can degrade the VCAC application as it allows calls access to the network without accounting for them.

#### Detailed description

##### The Logical Network Model

VCAC requires an operator to create a logical model of their network, made up of Limited Bandwidth links (LBL) and NATs. NAT traversal was added in ACT.89007980 in SN06, so the remainder of this description will focus on LBLs. This topology is provisioned on to the CS2M and the SPC using the OSS if it is present or onto each system separately if no OSS is present.

A LBL can represent a physical part of the network that has a bandwidth restriction (e.g. an ADSL line running at 600kbs) or a logical 'QoS point' (e.g. a customer has purchased a maximum of 1Mb/s of simultaneous VoIP calls). Each LBL has a maximum count associated with it. This is the maximum amount of bandwidth for calls available over the LBL.

The logical network model is a tree structure made up of LBLs and NATs according to the following rules (a generic term used to represent a LBL or NAT is network zone or zone; middlebox (MB) was used in SN07):

- A zone can be either an LBL, a NAT or a composite NAT & LBL at the same time.
- A top level zone must be connected to a non-bandwidth constrained 'core network'.
- A zone can have only one parent zone (closer to the core network) or the core network.
- A zone can have any number of children (subject to the maximum number of zones that may be datafilled per GWC).

These rules mean that:

- There can be no circular network paths.
- There can only be one route from a particular zone back to the core network

This logical model of the network must contain the key connectivity routes in the modeled network. E.g. If a set of duplicate routes exist between 2 zones, they must be modeled as one link, not two, as otherwise the network VCAC capacity counting will not be accurate.

Figure 2, Sample VCAC network model

#### Adding GWs to the Model

GWs can be added to any zone in the logical model. A zone can have any number of GWs hanging off it. This is usually described as having GW 'leaves' on the zone 'tree'.

**Note:** PVG and UAS/AMS GWs are assumed to be within the core network. Similarly, Interdomain SIP-T trunks are assumed to start and finish in the core network

This means that any GW will have a single path through the model to the core network, and to any other GW that is within the model.

Figure 3, GWs attached to the zone network model

#### Network VCAC

Network VCAC works by calculating the path between the originating and terminating GWs, looking at the negotiated codec and ptime for the call and checking that each LBL in the path has sufficient resources for the call to be set up. If so, the call proceeds as normal, if not the call is released and a user provisionable treatment (which must be a tone) is applied to the originator. The terminator has not reached a ringing stage.

**Note:** Network VCAC uses the real, negotiated codec for the call. There are exception for certain call types (e.g. fax, modem) that are detailed below.

**Note:** Only the zones on the path are used - resources are not always used all the way to the core network if there is a shorter route through the network.

For example in Figure 4 below:

- An A-to-B call uses resources on LBL 3. LBL 1 is not used even though it is a part of the zone chain as the path between the GWs does not use it.
- An A-to-C call uses resources on LBL 3, LBL 1, LBL 2 and LBL 4. All the zones in the originator and terminator chains are on the GW path.
- A D-to-E call uses resources on LBL 6 and LBL 7. They are both behind the same NAT so no Media proxy is required.

Figure 4, VCAC path finding

If there is a NAT zone on the call path then the call must extend as far as a Media Proxy (MP) (as described in ACT.89007980). These are located in the core network, so both the originator and terminator must use resources up to the core network, even if there is a shorter path between them.

Figure 5 below has examples of path finding when there is a NAT on the path between the GWs.

- An F-to G call uses resources on LBL 3 and LBL 1. LBL 1 has two call flows on it as both the originator and terminator need to use it to reach the Media Proxy (MP) in the Core network
- A H-to-J call uses resources on LBL 7, LBL 5 and LBL 2. This call will require a MP but the path between the GWs already traverses all the zones in the chain so there is no need to change this.

Figure 5, VCAC path finding through NATs

Basic VCAC is controlled by state SOC order code CS2Q0002. This has two states:

- ON, which will display ON and have VCAC enabled.
- OFF, which will display IDLE and will disable VCAC.

This SOC option also controls Network VCAC. It has to be in the ON state for Network VCAC to be usable.

In addition to the SOC option, Network VCAC is also controlled by a Service enabled flag, provisioned from the CS2M as part of feature ACT.A00007242CS2M, Network VCAC topology Provisioning.

#### Treatment

When a call fails due to VCAC failure (i.e. not enough bandwidth on the LBL to carry the call), an NBLN treatment is applied to the originating agent of the node. This can be complex to datafill particularly in a network scenario where the originating agent of the switch is a trunk. There are some caveats relating to SIP-T trunking below, and some limitations relating to services in the restrictions section at the end of the document.

For line originations that are blocked by VCAC a LINE138 log is produced with the treatment set to NBLN. For trunk originations that are blocked by VCAC a TRK138 log is produced with the treatment set to NBLN.

Note that NBLN can be generated by TDM peripherals which experience congestion but are still capable of call processing. This can also be generated by MG9K peripherals that experience congestion on intraswitched calls. The logs identify the originating parties and the dialed digits so it is possible to identify which set of circumstances has produced it.

#### Treatment Datafill

The significant tables are TMTCNTL, TMTMAP and FLXCMAP.

Table TMTCNTL is used to identify treatments to be played to lines. It is made up of several subtables, dependant on datafill. Each of these subtables must have the following tuple

NBLN Y S <tone>

NBLN is the treatment, Y signals that the event must be logged, S means the tone is defined by a CLLI and <tone> is the preferred tone, identified by the telco, to be played to the user. This <tone> can be a standard tone, e.g. T120 or a custom tone defined through table TONES, e.g. CONGESTION.

**Warning:** This MUST be set to a tone. Setting this to an announcement can result in a treatment loop as there is insufficient bandwidth to play the announcement.

Table TMTMAP is used to map signalling protocol and treatment pairs to a trunk release cause. These are used to signal to the previous node that this switch has rejected the call. They must be added for each signaling protocol used on trunks on this node. There is no dedicated VCAC release cause for any protocol, however each protocol does contain a number of release causes that are appropriate for VCAC. It is up to the telco to identify a release cause that will map into their signaling network. Examples of the TMTMAP datafill are:

Q764 NBLN ALLBC ISUP NOLOCAL NORMUNSP LOCLNET Y

Q767 NBLN ALLBC ISUP NOLOCAL NORMUNSP LOCLNET Y

Q931 NBLN ALLBC PRI NOLOCAL NORMUNSP LOCLNET Y

In these examples, Qxxx NBLN is the protocol pair, NOLOCAL indicates the treatment should not be played locally, NORMUNSP is the release cause and the ending Y signals the treatment should be logged.

The examples above will send Normal Unspecified as the release cause to the originating node. The originator of the call will hear a treatment specific to that release cause, not the NBLN treatment used on the terminating node. It is up to the telco to arrange the mappings from the line treatment to tone and release causes to tone if they require consistent tones for both line and trunk NVCAC failures.

**Warning:** The treatment MUST NOT be played locally (NOLOCAL in the example above) if any of the trunks using this node are based on SIP or H323. This can result in a treatment loop as there is insufficient bandwidth to play the announcement.

**Warning:** The release cause MUST NOT allow immediate reattempts. If the terminating line/trunk is blocked a reattempt will create a release loop as a different incoming trunk member will be attempted.

Table FLXCMAP is used to map release causes to treatments. in our example above the release cause is NORMUNSP so an example might be:

NORMUNSP CCITT\_STANDARD RODR N

This will map the NORMUNSP to the RODR treatment. The RODR treatment will be used to index in to the TMTCNTL tables to identify what the user hears. In this example the originator is not guaranteed to hear the same tone (for RODR) as they would for a local NVCAC failure (for NBLN).

**Note:** In these multi-node scenarios it is up to the telco to configure the signaling to ensure the NBLN treatment can reach the originator. If any of the nodes do not support NVCAC (e.g. MCS5200) or do not have the SOC enabled (not configured or running pre-SN07 load) it may not be possible to get the NBLN treatment in all scenarios. The originator will receive a treatment based on the release cause the reaches the originating node instead.

**Note:** If the originating gateway does not support the release cause or the audible signal (e.g. MGCP, H.248) that it is mapped to, the end-user may not hear any tone when the NBLN treatment is provided.

**Note:** The datafill above is an example only. There are regulatory requirements for some aspects of the behavior of signaling links and each customer may have different requirements for the mapping of release codes to treatments and for the management of their signaling network.

#### Inter-domain SIP-T vs. Intra-domain SIP-T

When a SIP-T call is blocked by VCAC, the release could be initiated locally or from the switch on the other end of the trunk, depending on whether the trunk is intra-domain or inter-domain.

In the case where the SIP-T trunk is intra-domain, we assume that the switch on the other end of the trunk understands VCAC. So on a call where the originator is behind an LBL with not enough bandwidth to carry the call, we would let the call continue. This is because, the terminator could be behind the same LBL as the originator, hence eliminating the need to use the failing LBL, and therefore the call can be completed successfully. On the other hand, if the terminator is not behind the same failing LBL as the originator, at that point

the call would then be blocked. A release message would be sent in the backward direction using the release caused datafilled in TMTMAP for the NBLN treatment.

If the switch on the other side of the SIP-T trunk does not understand VCAC, then an inter-domain trunk should be used instead of intra-domain. Failure to do so, could result in a ring-splash/ringing problem when a call is blocked by VCAC. For example, the MCS5200 does not understand the VCAC extensions, so if it is configured with an Intra-domain trunk a person calling to it will hear ringing until answer, when they will be routed to treatment. This is because the MCS5200 uses slow start when it provides SDP. A GW that uses fast start over the same configuration would result in the originator hearing a ringsplash before being routed to treatment.

In the scenario where the SIP-T trunk is inter-domain, we assume that the far end switch does not understand VCAC. Therefore, any inter-domain SIP-T call originating from a gateway behind a low bandwidth link with not enough bandwidth to carry the call will be blocked before leaving the originating switch.

## 1.4 Migration from Basic VCAC to Network VCAC

The resource usage database in Network VCAC is located on the SPC, whereas it is on the GWCs in Basic VCAC. Sites that are already running Basic VCAC, and wish to migrate to Network VCAC, should follow the procedures outlined in this section to ensure the migration of the database is successful.

The migration from Basic VCAC to Network VCAC can be performed once the CS2000 has been upgraded to the SN08 software load. During the upgrade of the CS2000 software Basic VCAC will be operational. When the software upgrade is complete, the migration to Network VCAC can commence. Basic VCAC may be used for as long as desired following the upgrade before activating Network VCAC. Basic VCAC is supported for migration purposes from SN07 to SN08 and SN09. Support for Basic VCAC may be discontinued after these releases.

**Figure 5 Anticipated Upgrade Timeline**

Figure 5 illustrates the anticipated timeline over which the various switch components are upgraded. Initially the CS2M system is upgraded, as this is required prior to upgrading GWC cards. Following this, the GWC cards can then be upgraded. When the GWC cards are upgraded, they will continue to run the Basic VCAC software as before. The Network VCAC software in the new load will be dormant for the time being.

Following upgrade of all GWC cards, the core may be upgraded. After this, the switch has been upgraded to SN08, but the SPC and its associated external VCAC application have not been enabled. For customers not wishing to deploy these, this is as far as they need proceed.

Following verification of the upgrade of the main switch components to SN08, the switch to external VCAC can be considered. From now on, it is necessary to freeze the topology database and not allow any further changes to it until the migration process is complete. This is required in order to maintain consistency of the database during the migration.

When the SPC is commissioned, the topology model must be identically entered onto the SPC. This does not occur automatically, and should be done in accordance with the corresponding SPC documentation. The Basic VCAC software in use will still be using the database from CS2M, but the SPC will now contain a version in preparation for the switch to network VCAC. These two topology databases are separate and there is no automated synchronization process. Even after this procedure is complete, and topology changes are again allowed, care must be taken to ensure that both remain up to date.

Next, the SPC should be provisioned into the CS2M system, but Network VCAC not enabled. This will cause the GWCs to establish connections to the SPC. At this stage, it should be ensured that all is well with the SPC, that it's TCP links to the GWC are up, and that no alarms have been generated.

The switch to Network VCAC is controlled by the Network VCAC flag in CS2M. When Network VCAC is enabled via this option, the GWCs will cease to run Basic VCAC, and switch to using the SPC for VCAC policy decisions. Due to the significant change to call processing, it is recommended that the changeover should be performed at a quiet time, when few calls are in progress. Also, the Network VCAC software will not be aware of LBL resource usage of calls in progress at the time of the cutover. This anomaly will be cleared as these calls terminate.

If, for some reason, it is desired to revert to Basic VCAC, the Network VCAC option may be disabled in CS2M. The GWCs will then use revert to Basic VCAC and, as previously, use the topology model from CS2M. LBLs which are provisioned into SESM while Network VCAC in 'ON', cannot have VCAC correctly applied to them if the system is then reverted to Basic VCAC. Therefore, LBL provisioning should only be carried out once Network VCAC software has soaked for a sufficient length of time.

**Note:** Both the SPC and CS2M topology databases must be manually kept synchronized following the switch to Network VCAC. Failure to do this could result in malfunction of the feature.

## 1.5 Step-by-step Migration Procedure

This section describes the migration procedure in a step-by-step fashion. This is in anticipation of it being used to prepare an official MOP procedure document.

### 1.5.1 Purpose

This procedure describes how to convert a switch already running Basic VCAC with a particular topology, to run Network VCAC with the exact same topology. If any changes are required to the topology, e.g. new gateway associations or LBLs, then this must be done either before or after execution of this procedure.

Use of this procedure is not required for green-field installations of Network VCAC or for offices upgrading to SN08 Basic VCAC.

### 1.5.2 Documentation used by this procedure

The procedure references the following documents. Please ensure that you have them to hand and are familiar with them before starting.

SPC Provisioning Guide

A cook book is available at: <http://livelink-asiapac.us.nortel.com/asiapac/livelink.exe?func=ll&objId=1729558&objAction=browse&sort=nameRegards>. This has been captured in the Policy Controller Configuration Management NTP.

#### SESM Provisioning Guide

FN A00007242 (PLS FMDOC) “SESM support for SPC topology”. The corresponding customer documentation should be used when it is available.

#### Basic VCAC Documentation

FN A00002730 (PLS FMDOC) - Basic VCAC. The corresponding customer documentation should be used when it is available.

### 1.5.3 Pre-requisites

1. All switch components must be upgraded to SN08 load line-up prior to network VCAC activation. Basic VCAC is supported over the upgrade from SN07 to SN08 load line-ups.
2. The VCAC SOC option will be active, as the switch is already running Basic VCAC. Refer to Basic VCAC documentation.
3. SPC should be installed and commissioned with SN08 load. Refer to SPC Provisioning Guide. Check for no DQoS connection alarms or other suspicious logs on SESM or SPC.
4. Basic VCAC topology must be frozen prior to start. No topology changes are allowed during the procedure. Selection of Network VCAC is switch wide. It is not possible to run part of the switch on Basic VCAC and part on Network VCAC. Please ensure that the provisioned topology will be sufficient for your needs for the whole duration of the procedure before proceeding. Refer to Basic VCAC Documentation for further guidance.
5. Topology details for basic VCAC need to be available to migration engineers. This information is likely to be available through customer network data. It is also available in the basic VCAC configuration in CS2M. Refer to Basic VCAC Documentation.
6. It is recommended that this procedure should be executed during a time when call processing is at a minimum.

### 1.5.4 Network VCAC Activation

1. Provision basic VCAC topology (from pre-requisite step 5) in SPC. Please refer to SPC Provisioning Guide.

NB: It is critical to ensure that the VCAC topology provisioning in the SPC matches the CS2M topology before Network VCAC is activated otherwise access control will not function correctly. In SN08 this is not checked automatically and needs to be validated by the upgrade engineer.

2. Activate Network VCAC flag in CS2M. Please refer to the SESM Provisioning Guide for further details on this.

NB: When Network VCAC is activated, all new calls will trigger bandwidth management through the SPC. There is no transfer of current bandwidth status between Basic and Network VCAC. This means that the SPC will have no knowledge of existing calls set-up under basic VCAC. This may lead to temporary degradation of voice quality on some calls. As existing calls are cleared, potential problem will be removed.

3. Verify call processing to confirm network VCAC is functioning correctly. Check for any suspicious logs on SPC, GWC or CM. We suggest allowing the system to soak for some time to allow any potential errors to come to the surface.

4. Once you are fully satisfied that the system is functioning correctly, topology changes may be made. Note that the provisioning restrictions have changed between SN07 and SN08. Specifically, in SN08 it is possible to mix agent types (IAD, CICM, H323) behind a common link. **These changes will not survive a rollback correctly, so the topology freeze must extend long enough for the VCAC behavior to be thoroughly tested and soaked in.**

5. Ensure that all topology changes are entered identically on both CS2M and SPC databases. These must both be manually kept in sync going forwards, otherwise access control will not function correctly. Refer to both SESM and SPC Provisioning Guides.

### 1.5.5 Network VCAC activation without Basic VCAC

The pre-requisite steps 1, 2 and 3 will be complete. I.e. the switch has been upgraded, the VCAC SOC is enabled, the SPC is installed and configured.

1. Provision the required treatment datafill as described in this document. In the migration scenario this would have been present for Basic VCAC.

2. Activate Network VCAC flag in CS2M. Please refer to the SESM Provisioning Guide for further details on this.

3 Start configuring the topology on both SESM and the SPC. These must be manually kept in sync, otherwise access control will not function correctly. Refer to both SESM and SPC Provisioning Guides. Once active gateways are associated with the topology in SESM, confirm network VCAC is functioning correctly. Check for any suspicious logs on SPC, GWC or CM. We suggest allowing the system to soak for some time to allow any potential errors to come to the surface.

### 1.5.6 Network VCAC Rollback

This procedure describes how to abort the switch to Network VCAC, by rolling back to Basic VCAC. It should only be carried out while the topology database

is frozen, i.e. up until step 4 of the activation procedure. If this is not the case, topology mismatches may occur, leading to basic VCAC functioning incorrectly.

1. Deactivate Network VCAC flag in CS2M. Please refer to the SESM Provisioning Guide.

NB: Once network VCAC is deactivated, bandwidth will be managed on the GWC. Bandwidth status will not be transferred from the SPC to the GWC. This may lead to temporary degradation of voice quality on some calls. As existing calls are cleared potential problem will be removed.

### **1.5.7 VCAC Deactivation**

In the event of a serious VCAC malfunction, the VCAC SOC may be disabled. This will disable all VCAC functionality - Network and Basic VCAC. When this option is taken, no access control will be performed by the switch. The VCAC SOC option is described in the Basic VCAC Documentation.

## **1.6 Hardware Requirements or Dependencies**

Network VCAC requires a Session Policy Controller installed and configured as per Act A00007393SPC.

## **1.7 Software Requirements or Dependencies**

Standard SN08 CS2K software components are required.

## **1.8 Limitations and restrictions**

The VCAC architecture has some provisioning limits that are enforced by the the provisioning system. These are:

1. There is a maximum of 5 network links between a GW and the Service Provider's core network.
2. VCAC only uses the negotiated values for a call. This means that fax and modem upspeeding to G711 from G729 will not be modelled. Similarly T.38 fax calls will not change the modelled bandwidth for the call.
3. There is a requirement that voice traffic is prioritized over the data traffic. Furthermore, VCAC does not model voice and non-SPC controlled data traffic on the same LBL. This has to be done by careful modeling of the logical network, as a part of the system engineering.
4. Interactions with codec negotiation. In a network configured to use G729 and the preferred codec and G711 as the default codec the originator offers a list of codecs to the terminator who chooses which one the call will use. Initially the NVCAC application assumes the worst case (G711) at the originator until the negotiated SDP is returned by the terminator. However, this means that it is not always possible to get the expected number of G729 on a link. This is difficult to detect as it is difficult to guarantee that all calls will negotiate to G729.

## 1.9 Logs and Operational Measurements

No new logs or OMs are introduced by this feature.

### 1.10 Interactions

VCAC potentially affects any call. If there is insufficient resources for a call or call leg to complete then the call will be released, and the user directed to a treatment. Some specific service examples are described in the Service Interactions section below.

VCAC can deny call admission whenever the speech path changes, so the main scenarios are:

1. **Call Origination.** After the digits have been dialed and the CS 2000 attempts to establish a speech path prior to ringing/ringback VCAC can deny admission to the call. This is the main VCAC scenario.
2. **Call Hold.** The bearer path is dropped for a call placed on hold, whether as a call hold service or as a step in another service such as 3WC or consultation transfer. If other calls have consumed the available resources then an attempt to retrieve the held call will fail.
3. **Call Transfer.** The bearer path is changed after it has been set up. This can be caused by services such as call transfer, CFNA, 3WC. IN services use this functionality by connecting a call to announcements before routing to other destinations. This fails if there is a LBL in the new path without resources for the new call leg.
4. **Calls that ring before negotiating the speech path.** Examples of these service are non-pilot members for simring and pre-answer call waiting attempts. In these cases the application only calculates the bandwidth on answer, so the call will be denied then if there is no bandwidth.

On call denial VCAC will clear down the call that would overload the LBL. **Service failure handling will be on a best effort basis, i.e. there is no attempt to retry or change to a less demanding codec.** See below for more details.

**Note:** On trunk calls that support suspend/resume bandwidth is maintained for the duration of the suspend/resume timer. This means that some of the service behavior described here will vary if some or all of the parties are trunks.

### 1.11 Service restrictions and limitations

Bearing in mind the best effort approach to services, some limitations and restrictions are summarized here.

#### 1.11.1 Lawful Intercept (LI)

There are a number of restrictions for configuring LI:

1. The parties monitoring for the Law Enforcement Agency (LEA) must not be configured behind any LBLs. This is similar to the restriction for NAT traversal, that the parties monitoring for the LEA must not be configured behind any NAT device. If this is not followed then these LEA monitoring parties can ring but not get speech path.
2. C-tone may be interrupted for dedicated LI where a call leg is denied by VCAC. Similarly, there may be ringspash on the LEA monitoring parties for switched LI when a call leg is blocked by VCAC.
3. There is a transparency issue for cases where the subject parties are behind a common, full, LBL. In this case the two people can call each other if they are not subject to LI, but will be blocked if one of them is being monitored, as the call is extended to the LI replicator device. An extreme example is when both parties are on the same GW, and so would never be blocked, thus making LI monitoring very obvious. This can be solved by the Public Network Interception (PNI) feature which will prevent calls from being monitored unless the Law Enforcement Agency (LEA) chooses to take the risk of the monitoring action being discovered.

### **1.11.2 Emergency and other priority calls**

There is no guarantee that any emergency or priority calls will get through. They are subject to the same VCAC process as any other call type. They are NOT given any extra precedence over any other voice traffic by the NVCAC application.

### **1.11.3 Examples of service behavior**

If there is sufficient bandwidth for a service to proceed the NVCAC application has no impact on it. If there is insufficient bandwidth then one or more call legs will not succeed and the service attempt will fail. This section provides some examples of common service failures and how they behave. This is NOT an exhaustive list of service. It is NOT an exhaustive list of ways in which each service can fail.

1. Three Way Call. This can be blocked at a number of points - when retrieving someone from hold, on contacting the second party and when the three members are being connected to the conference bridge. If the second party cannot be reached the controller hears NBLN treatment and can flash back to the first party. If one party cannot reach the conference bridge due to bandwidth restrictions then the controller receives 3 seconds of NBLN treatment to alert them to the problem before being connected to the other party.
2. Call Waiting. Transferring to a waiting call will only apply NVCAC when the switch to the waiting call occurs. This can fail as there may not be sufficient bandwidth for the two parties to reach each other. In this case the waiting party hears ringing, then NBLN treatment and the called party hears 3 seconds of BUSY before being reconnected to their original call.

3. **Call Hold.** A party put on hold releases its bandwidth until a reconnect attempt is made. This reconnection can fail if other calls have consumed the bandwidth in the meantime. In this case the party on hold drops to dialtone and the retrieving party hears NBLN treatment.
4. **Call forward No Answer.** This can fail when the call is made to the first party or when the call is forwarded on to the second party. If the failure occurs on the connection to the second party then the originator will have heard several seconds of ringing before receiving the NBLN treatment.
5. **Music On Hold.** Music on hold is played when a party is put on hold. If there is insufficient bandwidth for the on hold part to reach the audio server then the held party will drop out of the service and hear dialtone.
6. **SIMRING.** SIMRING only reserves bandwidth to the pilot DN. If there is insufficient bandwidth to reach the pilot DN then ring splash is heard on the non-pilot members. If there is enough bandwidth to reach the pilot, but the call is answered on a non-pilot DN without enough bandwidth then the originator hears NBLN treatment followed by DISC treatment, the answering party drops back to dialtone.
7. **CICM EBS secondary DN services.** The CICM secondary DN service can maintain two bearer channels. This means that some service failures will not occur because the speech path is maintained and the bandwidth is not released. However, holding multiple bearer channels will exhaust the bandwidth on links faster.
8. **Meet-Me Conference.** The Meet-Me service applies a short ring tone to existing conferees when a party attempts to join, even if NVCAC actually blocks that party. The denied party hears NBLN treatment but existing conferees hear no indication that the joining attempt failed. If the NVCAC-denied party was first or second to dial into the Meet-Me bridge, the remaining party is disconnected as if the conference had ended normally. Calls to a Meet-Me bridge denied by NVCAC are recorded as answered but with no elapsed time (i.e. instant disconnect) for billing purposes.

This is a sample list of service behavior when NVCAC denies calls. Other service scenarios will behave in similar ways.

## 1.12 Glossary

| Term   | Description                    |
|--------|--------------------------------|
| AMS    | AudioCodes Media Server        |
| CS2000 | Communication Server 2000      |
| GW     | Gateway                        |
| GWC    | Gateway Controller             |
| LBL    | Limited Bandwidth Link         |
| LEA    | Law Enforcement Agency         |
| MB     | Middlebox                      |
| MGCP   | Media Gateway Control Protocol |
| MP     | Media Proxy                    |
| NAT    | Network Address Translator     |
| QoS    | Quality of Service             |
| SPC    | Session Policy Controller      |
| UAS    | Universal Audio Server         |
| VCAC   | Virtual Call Admission Control |
| VoIP   | Voice over IP                  |

## **A00007404--IEMS Security Serialized Patching**

### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

### **1.2 Description**

This feature ensures that only one IEMS security module component is restarted at a time with respect to patching. Specifically if a request is initiated from the NPM GUI, CLUI, or scheduler to restart all IEMS security module components, separate requests will be queued and executed serially.

To ensure the NPM server serializes IEMS security module restart requests for patching, a new platform type is implemented by this feature. The new platform type value is 'SCTY' and can be queried as part of report generation from the NPM GUI or CLUI.

### **1.3 Hardware Requirements or Dependencies**

None.

### **1.4 Software Requirements or Dependencies**

None.

### **1.5 Limitations and restrictions**

During upgrades into SN08 from older releases, a PSE that is upgraded to SN08 will not be able to send its devices or be available for patching to an NPM that is SN08 or older. This configuration and patching support is not changed from the previous policy in SN08.

If patching is required to any components at a version of SN08 and the NPM has not been upgraded, the script utility called "patchUpToDate" should be used to patch those components on a given machine.

## ***Product = CS 2000***

### **A00007417--Ethernet link overload Control** ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS

#### **1.2 Description**

With the significant increase of the call processing power introduced by the XA-Core architecture, messaging resources including the bandwidth for the link and real-time, can be exhausted by the high call processing rate.

Without protection to the messaging resources, critical messages can be dropped due to the unavailable messaging resources.

The purpose of this activity is to provide a mechanism to prevent sustained over-utilization of Ethernet links and notify existing System Overload Control (SOC) which reacts by interacting with the peripherals to reduce the rate of incoming new originating calls.

#### **1.3 Hardware Requirements or Dependencies**

N/A

#### **1.4 Software Requirements or Dependencies**

Feature XA-Core IOCAP Monitoring toolset: A00006693 provides OMs of interest.

#### **1.5 Limitations and restrictions**

Ethernet link overload control is only applicable to XA-Core.

Peripherals must contain software which reacts to the core overload signal.

#### **1.6 Interactions**

This feature provides monitoring of the Ethernet messaging link. When the level of messaging through the Ethernet link is approaching the maximum capacity, it applies throttling through the System Overload Control (SOC) function.

## 1.7 Log

**Table 1** New or modified logs

| Log name | Log number | NEW/MOD/DELETED | System (SOS/UNIX) |
|----------|------------|-----------------|-------------------|
| CAP      | 101        | MOD             | SOS               |

## 1.8 Glossary

N/A

## 2.1 Fault Management for A00007417

### 2.2 Logs

Log Title/Log ID: CAP Capacity Data/ CAP101

#### 2.2.1 Formats

**Figure 1** Formats of log reports

```
<office name> CAP101 <date> <timestamp> INFO CAPACITY_DATA  
  
UTIL <n> ENGLEVELE <BELOW/ABOVE> CCOVRD <OFF/ON>IOOVRD  
<OFF/CMIC-ON/ETHR-ON/CMIC-ETHR-ON> PE_SC <YES/NO>
```

**Figure 2** Sample log reports

```
VENUS21AO CAP101 SEP07 09:42:35 8700 INFO CAPACITY_DATA  
  
CATMP/HR 251881 SMS/HR 180 VLR_UPD/HR 331200 CAP 127%  
  
ENGBHCA 196972 CCOVRD ON IOOVRD ETHR PESD NO
```

#### 2.2.2 Explanation

Description: This feature impacts the existing CAP101 log. Since this feature introduces the Ethernet overload control, the CMICOVLD field will be changed to IOOVRD. IOOVRD indicates the IO messaging link utilization status, including CMIC and Ethernet Link.

### 2.2.3 Field descriptions

Table 2 Field descriptions

| Field  | Value     | Description                                                 |
|--------|-----------|-------------------------------------------------------------|
| IOOVRD |           | Indicates the CMIC and Ethernet link overloading condition. |
|        | OFF       | When CMIC & ETHR are running under link capacity.           |
|        | CMIC      | When CMIC link is over utilized.                            |
|        | ETHR      | When ETHR link is over utilized.                            |
|        | CMIC-ETHR | When CMIC and ETHR links are over utilized.                 |

#### 2.2.4 Action

If the logs indicate IO link overload frequently, then it may suggest upgrading the IO capacity service hardware.

#### 2.2.5 Associated Operational Measurements or Performance Measurements

IOCAP OM group has registers.

#### 2.2.6 Additional information

Please refer A00006693 FN.

### 2.3 Related documentation

## **A00007424--Alarm Enhancements on SAM21**

***Excerpts from the Design Summary***

### **1.1 Applicable Solution(s)**

PT-IP, UA-IP, IAC, IAW, PT-AAL2

## 1.2 Introduction

This document covers the SAM21 SC software robustness on following areas:

- Alarming of locked IO cards
- Alarming of recovering IO cards
- Alarming of the connectivity loss of boot server
- Alarming of the loss of NFS mount

## 1.3 Alarming of Locked Application Card

### 1.3.1 Design Solution

On the SAM21 Shelf Controller, the Salus application is responsible for all IO OAM actions and alarms should failures be detected during an OAM action. Following the infrastructure of IO card alarming, this feature will add Alarm ID 56 - **underlyingResourceUnavailable** and Alarm Type 4 - **Processing Error** for each application card. The severity of the alarm is **minor**, this will have yellow color high-lighting on the card on the SAM21 Manager GUI.

When a card is locked successfully, this alarm will be raised against the card, a trap (Informs) will be sent to the SAM21 Manager with following data:

- PhysicalIndex - the slot number of the card seats in plus 33,
- AlarmID - 56
- TimeStamp - the time when the alarm is raised
- AlarmType - 4
- Severity - 1
- DetailedInfo - "This application card is unavailable"

Considering during upgrade and roll back scenario, Salus will not alarm locked application cards when the Shelf Controller is in the process of upgrade from pre-SN08 release to SN08 release or plus.

## 1.4 Alarming of Application Card being Recovered

### 1.4.1 Design Solution

Same as above, Salus will be used to alarm application card being auto-recovered.

When a card is being recovered by NSS\_BOOT\_AUDIT, it sends a message to Salus to indicate the start and finish of the recovery, Salus will raise a major alarm against the card and clear the alarm after the recovery is successful done.

The alarm is raised through a trap (Informs) with following data:

- PhysicalIndex - the slot number of the card seats in plus 33,

- AlarmID - 56
- TimeStamp - the time when the alarm is raised
- AlarmType - 4
- Severity - 2
- DetailedInfo - “This application card is unavailable and being recovered”

## 1.5 Alarming of Boot Server Unavailable

### 1.5.1 Design Solution

This is a straight-forward extension of the other forms of alarming the loss of network elements. Hubble will ping the Boot Server address and will keep Mama informed of its status. Mama will raise an alarm based on the severity of the issue. And will clear the alarm if Hubble reports that it can be reached.

## 1.6 Alarming of NFS Mounts down

### 1.6.1 Design Solution

Salus will be modified to check the mounts periodically. It will attempt to remount any mounts found to be down, and raise an alarm for any mounts that remain down after the check. Only the mounts for provisioned applications will be checked.

Salus will schedule a reminder with Chronos, so that Chronos will send a message to Salus to kick off the check every 10 minutes. When the NFS mounts down is detected, the interval will be decreased to 1 minutes.

The recover script is currently responsible for the mounting the directories on start-up. It will be modified so that it can be called to check the mounts. This will allow the knowledge of the mount points to remain in one place.

## **A00007464--SBA PacketCable Event Messaging**

***Functional Description***

### **1.1 Applicable Solution(s)**

IAC, DMS

### **1.2 Description**

SN08 PacketCable Solution requires support for two entirely new billing streams. These streams are Accounting (PCEM) and LI (PCES).

This SN08 Activity A00007464(SBA PacketCable Event Messaging) provides modifications to SBA functionality on the 3PC-core as well as CBM to ensure end-to-end billing data delivery for Accounting (PCEM) and LI (PCES) streams.

It should be noted that valid PacketCable Product configuration is 3PC-core connected to CBM. There are no requirements to support this activity on any other configurations such as Xacore, Brisc, or SDM. Consequently, testing will be concentrated on 3pc/cbm configuration. This activity will provide following functionalities:

- CBM-3PCcore: Provides End-to-end delivery of billing data for PCEM stream
- CBM/3PC-core: Provides End-to-end delivery of billing data for PCES stream
- CBM/3PC-core: Will provide PCEM throughput capacity of 225 KBHCA(10 events / call, 200 byte average event) as per 'SN08 PacketCable EM requirements for Billing'.
- CBM/3PC-core: Will provide PCES throughput capacity of 0.2 KBHCA(10 events/call, 200 bytes average event)
- CBM-3PCcore: Will provide latency for PCEM stream as per 'SN08 PacketCable EM requirements for Billing'. This feature will provide latency of 2.5 seconds from Event generation to SBA CBM disk.
- CBM-3PCcore: Will provide latency for PCES stream as per 'SN08 PacketCable EM requirements for Billing'. This feature will provide latency of 2.5 seconds from Event generation to IAA software.
- CBM: Configuration of PCEM stream from billmtc;confstrm;add level
- CBM: Configuration of PCES stream from billmtc;confstrm;add level
- CBM: query of PCEM stream from billmtc;confstrm;list level
- CBM: query of PCES stream from billmtc;confstrm;list level
- CBM: modification of already provisioned parameters for PCEM stream from billmtc;confstrm;change level. Note that modifications are not allowed if the stream is active.
- CBM: modification of already provisioned parameters for PCES stream from billmtc;confstrm;change level. Note that modifications are not allowed if the stream is active
- CBM: deactivation of PCEM stream from billmtc;confstrm;delete level
- CBM: deactivation of PCES stream from billmtc;confstrm;delete level
- 3PC-core: assignment of backup volumes for PCEM stream from mapci;mtc;appl;sdbil;addvol level
- 3PC-core: rejection of backup volumes configuration for PCES stream from mapci;mtc;appl;sdbil;addvol level
- 3PC-core: Activation of PCEM stream from mapci;mtc;appl;sdbil;post level
- 3PC-core: Activation of PCES stream from mapci;mtc;appl;sdbil;post level
- 3PC-core: query of PCEM stream from mapci;mtc;appl;sdbil;post pcem;query level
- 3PC-core: query of PCES stream from mapci;mtc;appl;sdbil;post pces;query level
- 3PC-core: display banner for BKUP and REC subsystem for PCES stream will be set to offl at mapci;mtc;appl;sdbil;post pces level

- 3PC-core: deactivation of PCEM and PCES streams from mapci;mtc;appl;sdbil;post level

### 1.3 Hardware Requirements or Dependencies

Following hardware is required for PacketCable Event Messaging Solution:

- 2 x NTRX51GZ (Call Agent Blades with 1.5GBytes RAM)
- 2 x NTRX51GT (72GBytes STORM-IA disks)

### 1.4 Software Requirements or Dependencies

This activity is dependent on following activities for end-to-end delivery of PCEM and PCES billing streams from the core:

- **A00007196:** PacketCable Event Messaging. Allows successful datafill of CRSFMT and CRSMAP tables for PCES and PCEM streams
- **A00007465:** Antedated Accounting Application (IAA). Ensures PCEM, PCES event messages are delivered downstream.

### 1.5 Limitations and restrictions

- Filtered streams not supported for PacketCable streams PCEM and PCES.
- Some existing commands (such as query, closec, amadump, sendfile, and listfile) are modified for PacketCable streams. These commands are detailed in the Configuration Section (CN).

### 1.6 Interactions

None

## 1.7 Glossary

| Term | Description                                         |
|------|-----------------------------------------------------|
| 3PC  | Third Party Core                                    |
| CBM  | Core Billing Manager                                |
| IAA  | Integrated Accounting Application                   |
| LI   | Legal Intercept                                     |
| PCEM | PacketCable Event Messaging (ie. Accounting stream) |
| PCES | PacketCable Electronic Surveillance (ie. LI stream) |
| SBA  | SDM Billing Application                             |
| SPS  | Sterling PacketCable Software                       |

## 2: Configuration for A00007464

### 2.1 Hardware and Software Requirements

This feature is dependent on actid A00007196 (SBA PacketCable Event Messaging). Namely, it assumes successful datafill of CRSFMT and CRMAP tables for PCEM and PCES PacketCable streams.

TABLE: CRSFMT

| KEY         | FORMAT         | DATADUMP | CDRSRCH       | ALARMS   | TIMERDMP | TIMERVAL |
|-------------|----------------|----------|---------------|----------|----------|----------|
| NIL         | NTFMT          | N        | NIL_FM        | N        | N        | 0        |
| AMA         | BCFMT          | N        | NIL_FM        | N        | N        | 0        |
| <b>PCEM</b> | <b>PCEMFMT</b> | <b>N</b> | <b>NIL_FM</b> | <b>N</b> | <b>N</b> | <b>0</b> |
| <b>PCES</b> | <b>PCESFMT</b> | <b>N</b> | <b>NIL_FM</b> | <b>N</b> | <b>N</b> | <b>0</b> |

TABLE: CRSMAP

KEY STREAM

|             |             |
|-------------|-------------|
| CAMA        | AMA         |
| LAMA        | AMA         |
| TOPS        | AMA         |
| <b>PCEM</b> | <b>PCEM</b> |
| <b>PCES</b> | <b>PCES</b> |

### 2.2 Initial Configuration

This activity spans across switch core (3pc, xacore, brisc) and the CBM (Core Billing Manager).

Following is recommended:

- On CBM:
  - PacketCable Accounting stream (PCEM) must be configured for 6 hours of IAA (Integrated Accounting Application) downtime. This amounts to a logical volume requirement of 8Gbytes for SBA.
  - PCEM stream must be configured so that it grows to maximum possible size 20Mbytes. i.e. File closure based on max number of bytes.

## 2.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Entire section is not applicable

## 2.4 Upgrade Considerations

### 2.4.1 Dump and Restore (CM)

Although new field (EXPEDITE) is introduced in table SDMBILL, the upgrade scenario is handled through the reformat proc. This proc., on upgrade to CSP21(SN08), will convert old tuple appropriately.

### 2.4.2 Element Management Upgrade

Not applicable

### 2.4.3 Downgrade impact

None.

## 2.5 Data schema (DS) (CM, MIBS, RDB)

### 2.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/OLD/UNCHANGED) |
|----------------|--------------------------|-----------------------------------|
| SDMBILL        | CHANGED                  | UNCHANGED                         |

### 2.5.2 Table/MIB/Remote Database Schema information

#### 2.5.2.1 Name: SDMBILL (SDM Billing Table)

This table is modified to include one additional field named EXPEDITE.

##### 2.5.2.1.1 Functional description

- Extra field named EXPEDITE is introduced in table SDMBILL

- PacketCable streams PCEM and PCES needs to provide PacketCable Event Messages as per 'SN08 PacketCable EM requirements for Billing' specifications. This is accomplished through new EXPEDITE field. This field will be set to Y for PCEM and PCES streams, and set to N for legacy streams such as AMA, OCC, SMDR
- Table SDBMILL is dependent on table CRSFMT. If an entry is added to CRSFMT table, corresponding entry will be created in SDBMILL through table dependency proc.
- for each entry in SDBMILL table, corresponding stream is visible in mapci;mtc;appl;sdbmil;post level. Stream can be configured/activated/deactivated from this level
- If an entry is deleted from CRSFMT table, corresponding entry will be deleted from SDBMILL table through table dependency proc.
- EXPEDITE field in software controlled and is not editable

#### 2.5.2.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill table SDBMILL in any specific order

#### 2.5.2.1.3 Size

**Table 2 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory       |
|------------------------|----------------|----------------|-----------------------------|
| SDBMILL                | 1              | 15             | No additional memory impact |

#### 2.5.2.1.4 Fields/OIDs

NA

#### 2.5.2.1.5 Datafill example

The following example shows sample datafill for table SDBMILL

```

TABLE: SDBMILL
SDBMKEY SDBMACT SDBMSTAT  EXPEDITE  VOLUMES
-----
--
      NIL      OFF      Off      N          $
      AMA      ON       InSv     N      (F02LAMA1) (F17LAMA1) $
      PCEM     OFF      Off      Y      (F02LPCEM1) (F17LPCEM1) $

```

#### 2.5.2.1.6 Table release history update

Added field EXPEDITE to provide delivery of PacketCable Event Messages (billing data) to CBM.

#### 2.5.2.1.7 Supplementary information

None

### 2.5.2.1.8 Translation verification and other tools

SDMBILL does not use translation verification tools.

## 2.6 Service Orders (SO) (CM & SESM)

Entire section is not applicable

## 2.7 Software optionality control (SOC)

Not applicable

## 2.8 Element Management

### 2.8.1 CLUI Interface

No new commands are introduced by this activity. Behavior of addvol command has changed for PacketCable Electronic Surveillance (PCES) steam. See “Configuration Walkthrough” on page 1257.

## 2.9 User interface changes

No new commands are introduced by this activity. Behavior of addvol command has changed for PacketCable Electronic Surveillance (PCES) steam. See “Configuration Walkthrough” on page 1257.

## 2.10 OSSGate Interface Changes

Entire section is not applicable

## 2.11 Security

Entire section is not applicable

## 2.12 Configuration Walkthrough

### 2.12.1 Provisioning of PacketCable Accounting stream (PCEM)

- core: create Accounting stream (PCEM) by datafilling CRSFMT table

TABLE: CRSFMT

| KEY         | FORMAT         | DATADUMP | CDRSRCH       | ALARMS   | TIMERDMP | TIMERVAL |
|-------------|----------------|----------|---------------|----------|----------|----------|
| NIL         | NTFMT          | N        | NIL_FM        | N        | N        | 0        |
| <b>PCEM</b> | <b>PCFMFMT</b> | <b>N</b> | <b>NIL_FM</b> | <b>N</b> | <b>N</b> | <b>0</b> |

- core: Due to CRSFMT / SDMBILL table dependency, creation of PCEM entry in CRSFMT creates following entry in table SDMBILL

TABLE: SDMBILL

| SDMBKEY | SDMBACT | SDMBSTAT | EXPEDITE | VOLUMES                  |
|---------|---------|----------|----------|--------------------------|
| NIL     | OFF     | Off      | N        | \$                       |
| AMA     | ON      | InSv     | N        | ( F02LAMA1) (F17LAMA1)\$ |

**PCEM      OFF      Off      Y      \$**

- core: assign backup volumes to Accounting stream PCEM. This is done by issuing mapci;mtc;appl;sdbmil;addvol pcem f02lpcem1 f17lpcem1

TABLE: SDBBILL

| SDBKEY      | SDBACT     | SDBSTAT    | EXPEDITED | VOLUMES                          |
|-------------|------------|------------|-----------|----------------------------------|
| NIL         | OFF        | Off        | N         | \$                               |
| AMA         | ON         | InSv       | N         | (F02LAMA1) (F17LAMA1)\$          |
| <b>PCEM</b> | <b>OFF</b> | <b>Off</b> | <b>Y</b>  | <b>(F02LPCEM1) (F17LPCEM1)\$</b> |

- core: map calldata type PCEM to accounting stream PCEM by datafilling CRSMAP table

TABLE: CRSMAP

| KEY         | STREAM      |
|-------------|-------------|
| CAMA        | AMA         |
| LAMA        | AMA         |
| TOPS        | AMA         |
| <b>PCEM</b> | <b>PCEM</b> |

- cbm: configure PCEM billing stream using billmtc;confstrm;add command

example:

Stream Name [] {} : pcem  
Is this a Filter Stream [NO] {NO YES } : no  
Stream Record Format [] {SMDR BC CDR300 CDR250 PCEM PCES } : pcem  
File Format Type [] {LW } : lw  
Please specify the logical Volume [/cbmdata/00/billing/pcem] {} : /cbmdata/00/billing/pcem  
Do you want Files closed based on time [NO] {NO YES } : no  
Number of records per day [0] {} : 0  
Maximum Number of records per file [500000] {10000 - 500000} : 500000  
Maximum Number of bytes per file [20000000] {1000000 - 20000000} : 20000000

Stream Name -> PCEM  
Is this a Filter Stream -> NO  
Stream Record Format -> PCEM  
File Format Type -> LW  
Logical Volume Name -> /cbmdata/00/billing/pcem  
Do you want Files closed based on time -> NO  
Number of records per day -> 0  
Average record size -> 80  
Maximum Number of records per file -> 500000  
Maximum Number of bytes per file -> 20000000  
Commit ? [Save] {Save Edit Abort} : save  
Saving stream  
Configuration of Stream PCEM is now complete

- cbm: modify logical volume of already configured pcem stream (from billmtc;confstrm;change map level) while stream is still inactive

example:

Stream Name [] {} : pcem  
Stream Record Format [PCEM] {SMDR BC CDR300 CDR250 PCEM PCES } : pcem  
File Format Type [LW] {LW } : lw  
Please specify the logical Volume [/cbmdata/00/billing/pcem] {} :  
/cbmdata/00/billing/acct  
Do you want Files closed based on time [NO] {NO YES } : no  
Number of records per day [0] {} : 0  
Maximum Number of records per file [500000] {10000 - 500000} : 500000  
Maximum Number of bytes per file [20000000] {1000000 - 20000000} : 20000000

Stream Name -> PCEM  
Is this a Filter Stream -> NO  
Stream Record Format -> PCEM  
File Format Type -> LW  
Logical Volume Name -> /cbmdata/00/billing/acct  
Do you want Files closed based on time -> NO  
Number of records per day -> 0  
Average record size -> 80  
Maximum Number of records per file -> 500000  
Maximum Number of bytes per file -> 20000000  
Commit ? [Save] {Save Edit Abort} : save  
Saving stream  
Configuration of Stream PCEM is now complete

- cbm: query PCEM from billmtc;confstrm;list map level) while stream is inactive

example:

Stream Name [] {} : pcem

Displaying stream(s) PCEM  
Stream Name -> PCEM  
Stream Running status -> NO  
Is this a Filter Stream -> NO  
Stream Record Format -> PCEM

## 2.13 Recommended SBA configuration

This activity spans across switch core (3pc, xacore, brisc) and the CBM (Core Billing Manager).

Following is recommended:

- On CBM:
  - PacketCable Accounting stream (PCEM) must be configured for 6 hours of IAA (Integrated Accounting Application) downtime. This amounts to a logical volume requirement of 8Gbytes for SBA.
  - PCEM stream must be configured so that it grows to maximum possible size 20Mbytes. i.e. File closure based on max number of bytes.

## ***Product = CS 2000***

### **A00007465--Integrated Accounting Application** ***Functional Description***

#### **1.1 Applicable Solution(s)**

IAC, DMS

#### **1.2 Description**

This document covers the IAA Event Messaging and Legal Intercept processing functionality supported in the SN08 time frame. This functionality adds a packet cable transport mechanism to the Core Billing Manager 850 (CBM850) which is packet cable compliant.

Accounting and Legal Intercept Event Messages are received by the IAA from the SBA and Gateway Controllers (GWCs). When received, the messages do not contain the RADIUS header necessary to send the event messages to the down stream RKS pair or DF. When sending to a RKS pair, ftp or secure ftp can be used as a primary transport protocol.

The accounting event messages will be reformatted to include a RADIUS header and a Sequence Number in the Event Message Header and then forwarded to a RKS pair. In the event that the accounting event messages cannot be delivered to the RKS, they are stored locally in the packet cable event message file format, and can be retrieved by the RKS or scheduled to be sent using the ftp or secure ftp protocol. In addition, the untransmittable accounting event messages are stored in the internal storage layer and made available to users via a record viewer web interface.

The legal intercept event messages are reformatted to include a RADIUS header and add a Sequence Number in the Event Message Header and then forwarded to a DF over a secure transport path. In the event the messages cannot be sent for any reason the events are dropped.

##### **1.2.1 System Behavior**

Accounting and Legal Intercept Event Messages will be received by the IAA application from the SBA (Supernode Billing Application) and GWCs (Gateway Controllers) via various interfaces.

There will be two SBA Input agents for processing primary and recovery files from the SBA. There will be a LI Collector module, which the SBA and different GWCs interface with, to transmit LI messages over UDP.

At the output side, there will be two Event Message Distribution Agents configured within the Accounting Server - one to handle LI messages and the other for Billing Accounting messages. These two instances will be identified by configuration as to what type of Event Messages each one handles.

The Billing/Accounting EMDA will send RADIUS messages to Record Keeping Server (RKS) pairs and the LI EMDA will send messages to one or more Delivery Function (DF) Servers.

The routing to various destinations will be done on the basis of the Channel ID field present in the LI and Billing Messages obtained from the SBA and GWCs. Each Channel ID will have corresponding to it (in a lookup table), a DF or RKS Pair to which the data needs to be sent to.

The accounting event messages will be reformatted to include a RADIUS header and add a Sequence Number in the Event Message Header and then forwarded to a RKS pair. In the event that the accounting event messages cannot be delivered to the RKS, they are stored locally and can be retrieved by the RKS or scheduled to be sent using the ftp or secure ftp protocol. In addition, the untransmittable accounting event messages are stored in the

internal storage layer and made available to users via a record viewer web interface.

The legal intercept event messages are reformatted to include a RADIUS header and add a Sequence Number in the Event Message Header and then forwarded to a DF over a secure transport path. In the event the messages cannot be sent for any reason the events are dropped.

A FTP agent will take care of sending the data over FTP downstream to the RKS, if configured to do so.

A Web-based User Interface (and Command line tool) will allow configuration and ability to view untransmitted event messages.

### 1.2.2 Configuration

The configuration information used by the IAA is contained in various XML files. These files are found in the directory **/iaa/<xx>/data/config**. The items that can be configured by the user, using the web interface or command line tool (iaa\_config\_cli) can be found in the configuration section.

The configuration files that control the operation of the IAA modules can be found in **/iaa/<xx>/data/<module name>/<module name>.config**. This information is updated during the application installation and should not be modified by the end user. Below is an example of the xml configuration file for the emda module:

```
<?xml version="1.0" encoding="ISO-8859-1"?>

</table>
</config>

```

### 1.2.3 Starting the IAA

The IAA modules are started and controlled by the SDM Application Manager (SAM). Upon startup the input agents bind to ports as defined in /etc/services to listen for LI event messages as well as messages from the SBA to indicate that data was written to a file.

### 1.2.4 Stopping the IAA

The IAA modules are stopped by the SDM Application Manager (SAM).

### 1.2.5 File Management

Temporary files used by the IAA modules are removed after they are no longer needed. Files created by the EMDA (if configured to send to the RKS via ftp or sftp or if they cannot send events to the downstream RKS in realtime) are moved to the **/iaa/<nn>/secondary** directory by the fdsend program. If the filesystem is full the oldest secondary (already transmitted) file or files will be removed to make room for the new file. It is anticipated that this filesystem will remain at 80 to 100 percent capacity.

The event messages that are not sent downstream are also stored in the IAA storage layer and made available to the end user for viewing via the web. This data is stored in the directory **/iaa/<nn>/kdb**. These files are removed by the utility 'remove\_aged\_file'. When invoked it will take as parameters: the number of days old as a reference and the list of directories to search for old files.

### 1.2.6 Filesystems and Directories

Upon installation of the IAA the following filesystems and directories will be created to hold executables, libraries and data used and created by the application.

FileSystems:

```
/cbmdata/<slices>/iaa/data  
/cbmdata/<slices>/iaa/ftpout  
/cbmdata/<slices>/iaa/kdb  
/cbmdata/<slices>/iaa/config
```

Directories:

```
/opt/nortel/cbm/<xx>/iaa  
/opt/nortel/cbm/<xx>/iaa/bin  
/opt/nortel/cbm/<xx>/iaa/slib  
/opt/nortel/cbm/<xx>/iaa/webapps
```

## 1.3 Hardware Requirements or Dependencies

The IAA has the following requirements:

- SUN Netra 240
- 2GB of RAM dedicated for the IAA modules, for a system configuration of 4GB.

## 1.4 Software Requirements or Dependencies

SSPFS 3rd party Software Suite Version 08 with the following version dependencies:

- Apache Web Server 2.0.47 or above
- JRE 1.4.2\_04 or above
- Apache Tomcat 4.1.24 or higher
- SBA
- jdom 1.0 beta 7 or higher
- dom4j 1.4
- saxon 6.4.3

## 1.5 Limitations and restrictions

Due to disk storage requirements only records not sent to the downstream RKS over the RADIUS protocol, will be viewable via the IAA record viewer

## 1.6 .Interactions

- Syslog daemon Server (Designer logs)
- Customer Logs
- State Changes

## 1.7 Applicable customer facing sections

## 2: Fault Management for A00007465

### 2.1 Fault management strategy

Faults and alarms generated by the IAA modules are sent to Customer logs using the API provided and defined in the Log Reporting Rules and Guidelines document. (IEMPG, AF01). The IAA modules will use Log Number SDM799 and SDM399 when generating messages viewable by the customer. Designer information is written to the designer logs using the syslog mechanism directly.

### 2.2 Fault management tools and utilities

As a result of using the API provided by Nortel, the customer logs, state changes and designer logs can be managed using the existing tools Nortel has in place.

### 2.3 Logs

The following new alarms and log ID are being added as part of the IAA feature

.

**Table 1 IAA logs**

| LOG NAME | LOG NUMBER | NEW/MOD<br>DELETED | SYSTEM<br>(SOS/UNIX) |
|----------|------------|--------------------|----------------------|
| IAA      | 341        | NEW                | UNIX                 |

Module: <Module Name>

Reason: <Reason>

#### 2.3.1.1 Overview

The IAA341 log is generated whenever an IAA module fails to initialize. The reason text field may contain one of the following strings:

- **“Error Loading URF Specification File”**

**Cause:** This log message is generated when the modules URF specification file is corrupted or missing.

**Action:** Verify the URF specification file for the module is in the correct location and is not corrupted. Otherwise contact next level of support.

- **“Error Initializing spathreaddata object”**

**Cause:** This log message is generated when the system resources are not available.

**Action:** Determine the cause of unavailable system resources and restart the application. Otherwise contact the next level of support.

- **“License check failed”**

**Cause:** This log message is generated if the software license, needed to run the IAA application, is missing.

**Action:** Verify the license file is in the correct directory and restart the application. Otherwise contact the next level of support.

- **“Cannot create socket, Port # %u”**

**Cause:** This log message is generated if the system resources are unavailable, or if another process is attached to the port number displayed in the alarm.

**Action:** Determine if another application is connected to the port number in question. Determine the cause of unavailable system resources and restart the application. Otherwise contact the next level of support.

- **“Shared Memory Initialization Failed”**

**Cause:** This log message is generated if the system resources are unavailable.

**Action:** Determine the cause of the unavailable system resources and restart the application. Otherwise contact the next level of support.

- **“Failed to flush shared memory queue to disk”**

**Cause:** This log message is generated, if the file system the module is attempting to write its shared memory queue to is full or the permissions are not correct.

**Action:** Verify that the files system has the correct permissions set and that there is space available on the filesystem. Otherwise contact the next level of support.

- **“Bad Parameters Passed at Startup”**

**Cause:** An invalid parameter was passed to the IAA module.

**Action:** Verify the startup script is passing correct parameters, and restart the application. Otherwise contact the next level of support.

### 2.3.2 Log Report - IAA342

Example:

```
CA108CD *** IAA342 APR08 14:50:47 3800 TBL IAA Module Interprocess Communication Failure
Module: <Module Name>
Reason: <Reason>
```

#### 2.3.2.1 Overview

The IAA342 log is generated whenever an IAA module cannot communicate with other IAA modules. The reason text field may contain one of the following strings:

- **“Error Communicating to EMDA”**

**Cause:** This log message is generated when a module cannot communicate with the EMDA module.

**Action:** Verify that the EMDA modules is operational and listening to the correct port. Otherwise contact the next level of support.

### 2.3.3 Log Report - IAA343

Example:

```
CA108CD *** IAA343 APR08 14:50:47 3800 TBL IAA PCEM Processing Error
Module: <Module Name>
FileName: <Name of Bad file if Available>
Reason: <Reason>
```

#### 2.3.3.1 Overview

The IAA343 log is generated when a PCEM processing error occurs. The reason text field may contain one of the following strings:

- **“Error Reading Input File”**

**Cause:** This log message is generated if there is a problem reading an input data file.

**Action:** Verify that the correct permissions are set on the file displayed in the alarm.

- **“Error Renaming or Accessing file”**

**Cause:** This log message is generated if the IAA module cannot access the specified file or rename it.

**Action:** Verify the correct permissions of the file and filesystem displayed in the log messages. Otherwise contact the next level of support.

- **“Error generating checksum”**

**Cause:** IAA module was unable to create the correct checksum.

**Action:** Verify that the input file is not corrupted. Otherwise contact the next level of support.

- **“Error writing to File”**

- **Cause:** This log message is generated if the IAA module cannot write to its output file.

- **Action:** Verify that the permissions on the file and filesystem are correct. Verify there is space available on the filesystem. Otherwise contact the next level of support.

- **“Failed to receive UDP messages”**

**Cause:** This log message is generated if the IAA application cannot receive UDP messages.

**Action:** Determine the cause of the unavailable system resources and restart the application. Otherwise contact the next level of support.

- **“Failed to flush shared memory queue to disk”**

**Cause:** This log message is generated if the file system, the module is attempting to write its shared memory queue to, is full or the permissions are not correct.

**Action:** Verify that the file system has the correct permissions set and that there is space available on the filesystem. Otherwise contact the next level of support.

## 2.3.4 Log Report - IAA344

Example:

CA108CD \*\*\* IAA344 APR08 14:50:47 3800 TBL IAA PCEM Audit Error

Module: <Module Name>

AuditName: <Name of Audit>

Reason: <Reason>

### 2.3.4.1 Overview

The IAA344 log is generated when an IAA module cannot create an audit entry. The reason text field may contain one of the following strings:

- **“Error Creating Audit”**

**Cause:** This log message is generated if there is a problem creating an audit entry.

**Action:** Verify that the correct permissions are set in the audit directory and that there is space on that filesystem.

### 2.3.5 Log Report - IAA345

Example:

```
CA108CD *** IAA345 APR08 14:50:47 3800 TBL IAA Module Configuration Error
Module: <Module Name>
Parameter: <Name of Parameter>
Reason: <Reason>
```

#### 2.3.5.1 Overview

The IAA345 log is generated when an IAA module detects a configuration problem. The reason text field may contain one of the following strings.

- **“Required Configuration parameter not found”**

**Cause:** This log message is generated if a required configuration value is not defined.

**Action:** Datafill the required configuration parameter.

- **“Received messages for Unknown Channel ID <%d>”**

**Cause:** This log message is generated if the IAA module receives a PCEM or PCES message for an unconfigured Channel ID.

**Action:** Datafill the Channel ID for the appropriate RKS pair or DF.

### 2.3.6 Log Report - IAA346

Example:

```
CA108CD *** IAA346 APR08 14:50:47 3800 TBL IAA Downstream Communication Error
Module: <Module Name>
Destination ID: <Name of Bad file if Available>
Reason: <Reason>
```

#### 2.3.6.1 Overview

The IAA346 log is generated when the IAA cannot communicate to the downstream RKS pair or DF. The reason text field may contain one of the following strings.

- **“Destination is down - Writing to file”**

**Cause:** This log message is generated if the downstream RKS pair is unreachable and the message is save to a file for transmission at a later time.

**Action:** The craftsperson should ascertain what was the cause of the problem and correct the problem. Once the connection to the RKS pair is re-established the IAA application will return to InSrv.

- **“DF: Destination is Down - Message dropped for ChannelID <%d>, Dropped Message Count <%d>”**

**Cause:** This log message is generated if the downstream DF is unreachable.

**Action:** The craftsperson should ascertain what was the cause of the problem and correct the problem. Once the connection to the DF is re-established the IAA application will return to InSrv.

- **“Cannot Connect to Primary RKS”**

**Cause:** The IAA cannot connect to the RKS when trying to ftp a file.

**Action:** The craftsperson should ascertain what was the cause of the problem and correct the problem. Once the connection to the RKS pair is re-established the IAA application will return to InSrv.

- **“Cannot place file on RKS”**

**Cause:** This log message is generated if the IAA cannot place the file on the RKS after the connection is made.

**Action:** The craftsperson should ascertain what was the cause of the problem and correct the problem. Once the connection to the RKS pair is re-established the IAA application will return to InSrv.

### 2.3.7 Log Report - IAA347

Example:

```
CA108CD *** IAA347 APR08 14:50:47 3800 TBL IAA Filesystem Management Error
Module: <Module Name>
Directory: <Directory Name>
Reason: <Reason>
```

#### 2.3.7.1 Overview

The IAA347 log is generated when an IAA module detects a problem when trying to manage its filesystem storage. The reason text field may contain one of the following strings.

- **“Unable to move files to Secondary Directory”**

**Cause:** This log message is generated if the IAA module fdscnd cannot move a file it successfully transferred to a RKS to a secondary directory.

**Action:** Verify permissions and space on filesystem.

### 2.3.8 Log Report - IAA641

Example:

```
CA108CD *** IAA641 APR08 14:50:47 3800 INFO IAA Module Startup
Module: <Module Name>
Reason: <Reason>
```

### 2.3.8.1 Overview

The IAA641 log is generated when an IAA module goes into service.

- **“IAA Module has been restarted”**

**Cause:** This log message is generated when an IAA module is successfully started.

**Action:** No Action is needed as this is purely for informational purposes.

### 2.3.9 Log Report - IAA646

Example:

CA108CD \*\*\* IAA646 APR08 14:50:47 3800 INFO IAA Communication Restored

Module: <Module Name>

Reason: <Reason>

#### 2.3.9.1 Overview

The IAA646 log is generated when Communications between the IAA and the downstream RKS pair or DF has been restored.

- **“Communications has been re-established”**

**Cause:** This log message is generated when Communications between the IAA and the downstream RKS pair or DF has been restored.

**Action:** No Action is needed as this is purely for informational purposes.

### 2.3.10 Field Description

Field Name: Module

Field optionally: mandatory

Type: Alphanumeric

Size: Variable

Value(s): Variable

Descriptions: Identifies the module generating the log.

NTP table reference: Not applicable.

Field Name: Destination ID

Field optionally: mandatory

Type: Alphanumeric

Size: Variable

Value(s): Variable

Descriptions: Identifies the Destination the IAA is attempting to communicate to.

NTP table reference: Not applicable.

Field Name: Parameter

Field optionally: mandatory

Type: Alphanumeric

Size: Variable

Value(s): Variable

Descriptions: Identifies the Parameter that is not configured correctly.  
NTP table reference: Not applicable.

Field Name: AuditName  
Field optionally: mandatory  
Type: Alphanumeric  
Size: Variable  
Value(s): Variable

Descriptions: Identifies the audit that the module is attempting to create.  
NTP table reference: Not applicable.

Field Name: FileName  
Field optionally: mandatory  
Type: Alphanumeric  
Size: Variable  
Value(s): Variable  
Descriptions: Identifies the file the IAA module is attempting to operate on.  
NTP table reference: Not applicable.

Field Name: Reason  
Field optionally: mandatory  
Type: Alphanumeric  
Size: Variable  
Value(s): Variable  
Descriptions: Provides an explanation of why the log was generated.  
NTP table reference: Not applicable.

## 2.4 Alarms

### 2.4.1 Alarm - IAA701

Example:

CA108CD \*\*\* IAA701 APR08 14:50:47 3800 TBL IAA Data Corruption

Module: <Module Name>

Reason: <Reason>

#### 2.4.1.1 Overview

The IAA701 log is generated when the data being process by the IAA is corrupted.

- **“Could not get EM Header in Message. Got %u at byte no %u. Channel ID= %u”**

**Cause:** This log message is generated when the EM messages being processed by the IAA is corrupted.

**Action:** Contact the next level of support.

### 2.4.2 Field Description

Field Name: Module

Field optionally: mandatory

Type: Alphanumeric

Size: Variable

Value(s): Variable

Descriptions: Identifies the module generating the log.

NTP table reference: Not applicable.

## 2.5 Related documentation

# 3: Configuration for A00007465

## 3.1 Hardware and Software Requirements

The IAA has the following hardware requirements:

- SUN Netra 240
- 2GB of RAM dedicated for the IAA modules, for a system configuration of 4GB.

The IAA has the following software requirements:

- SSPFS 3rd party Software Suite Version 08 with the following version dependencies:
- Apache Web Server 2.0.47 or above
- JRE 1.4.2\_04 or above
- Apache Tomcat 4.1.24 or higher
- SBA
- jdom 1.0 beta 7 or higher
- dom4j 1.4
- saxon 6.4.3

## 3.2 Initial Configuration

Following the installation of the IAA modules the following items must be configured:

- RKS pair
- DF
- Distribution Schedule
- Global System parameters

### 3.3 Upgrade Considerations

This is the first installation of this application, there are no upgrade considerations for this release. The software is designed and packaged such that two or more versions can reside on the same platform, this allows the system to be upgraded without interruption of service. Tools will be provided to migrate the configuration of previous release to the latest release, beginning with SN09.

#### 3.3.1 Patching

Fixes required to an existing IAA application will be delivered in the form of a solaris patch. The patch will follow the conventions set forth in the CBM Designer's Guide.

#### 3.3.2 Dump and Restore (CM)

For SN08 the ability to backup the current configuration to a removable storage media is supported. This configuration information can be used to populate the configuration of a second instance on the same system or on a second system.

Beginning with SN09 a migration tool will be supplied to take an existing configuration and use the information to populate the configuration of the new version. Once the new release is loaded on the system the command "migrate\_configuration -p<prev\_rel> -c<current\_rel>" is used to move the previous release's configuration information to the new release's configuration.

#### 3.3.3 Downgrade impact

Providing that the old software has not been removed, the old software only needs to be re-registered with SAM, by issuing the \$BASEDIR/bin/appctrl -i command.

### 3.4 Element Management

Configuration changes for the IAA modules can be done via a Web interface or via a command line program. On-line help is available from each web page, by selecting the help button at the top of each page.

#### 3.4.1 New/modified GUIs

Table 1 New or modified GUIs

| GUI name                 | NEW, CHANGED, or DELETED |
|--------------------------|--------------------------|
| RKS Output Destination   | NEW                      |
| DF Output Destination    | NEW                      |
| Global System Parameters | NEW                      |

### 3.4.2 GUI information

### 3.4.2.1 GUI name: RKSOD

RKS Output Destination

#### 3.4.2.1.1 Functional description

This GUI is used to configure the downstream RKS pairs to which the EMDA sends event messages as well as the protocol to use.

Example:

### 3.4.2.1.2 GUI usage and implications

The Schedule GUI must be datafilled prior to datafill of this GUI.

### 3.4.2.1.3 GUI size

Table 2 New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| RKSOD                | 1                 | 1                 | N/A                   |

### 3.4.2.1.4 GUI fields

On-line help is available on this web page which defines the meanings of each field contained on the page.

Table 3 Output Destination Streams

| Parameter  | Description/<br>List of values | Data Format | Validation | Max Value | Max Field Size | Default Value |
|------------|--------------------------------|-------------|------------|-----------|----------------|---------------|
| Channel Id | 1 byte field                   | integer     | required   | 255       |                |               |

**Table 3 Output Destination Streams**

| <b>Parameter</b>                          | <b>Description/<br/>List of<br/>values</b> | <b>Data Format</b>              | <b>Validation</b>              | <b>Max<br/>Value</b> | <b>Max<br/>Field<br/>Size</b> | <b>Default<br/>Value</b> |
|-------------------------------------------|--------------------------------------------|---------------------------------|--------------------------------|----------------------|-------------------------------|--------------------------|
| Destination Type                          | 0 - DF<br>1 - RKS                          | integer                         | required                       |                      | 1                             |                          |
| Description                               | Free Form<br>Text                          | alphanumeric                    | optional                       |                      | 32                            |                          |
| DF Collector / Primary<br>RKS IP          | IP address                                 | alphanumeric                    | required                       |                      | 15                            |                          |
| DF Collector / Primary<br>RKS Radius Port |                                            | positive<br>integer             | required                       | 65535                |                               |                          |
| Primary RKS FTP Port                      |                                            | positive<br>integer             | required if<br>RKS (note<br>1) | 65535                |                               | 21                       |
| Primary RKS FTP<br>Username               |                                            | alphanumeric                    | required if<br>RKS (note<br>1) |                      | 32                            |                          |
| Primary RKS FTP<br>Password               |                                            | alphanumeric<br>[not displayed] | required if<br>RKS (note<br>1) |                      | 32                            |                          |
| Primary RKS Destination<br>Directory      |                                            | alphanumeric                    | Optional<br>(Note 1)           |                      | 512                           |                          |
| Secondary RKS IP                          | IP address                                 |                                 | required if<br>RKS             |                      | 15                            |                          |
| Secondary RKS Radius<br>Port              |                                            | positive<br>integer             | required if<br>RKS             | 65535                |                               |                          |
| Secondary RKS FTP Port                    |                                            | positive<br>integer             | optional<br>(note 1)           | 65535                |                               | 21                       |
| Secondary RKS FTP<br>Username             |                                            | alphanumeric                    | optional<br>(note 1)           |                      | 32                            |                          |
| Secondary RKS FTP<br>Password             |                                            | alphanumeric<br>[not displayed] | optional<br>(note 1)           |                      | 32                            |                          |
| Secondary RKS<br>Destination Directory    |                                            | alphanumeric                    | Optional<br>(note 1)           |                      | 512                           |                          |

Notes

(1) Only if sending mode is set to FTP

**3.4.2.2 GUI name: DFOD**

DF Output Destination

**3.4.2.2.1 Functional description**

This GUI is used to configure the downstream DF which the EMDA sends LI event messages as well as the protocol to use.

Example:

Host: oak > Configuration Logout Help

Network Elements | Process Groups | Schedules | Global Parameters | **Output Destinations**

### DF Output Destination Configuration

Channel ID: 2 Destination Type: DF

Description: DF Server 2

IP Address: 212.12.34.169 RADIUS Port: 21

Retry Limit: 3 Retry Interval: 3

Shared Secret: 0000000000000000

Reset form Save changes

#### 3.4.2.2.2 GUI usage and implications

No other datafill is required prior to datafill of this GUI.

#### 3.4.2.2.3 GUI size

**Table 4 New or modified GUIs**

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| DFOD                 | 1                 | 1                 | N/A                   |

#### 3.4.2.2.4 GUI fields

On-line help is available on this web page which defines the meanings of each field contained on the page.

**Table 5 Output Destination Streams**

| Parameter                              | Description / List of values | Data Format      | Validation | Max Value | Max Field Size | Default Value |
|----------------------------------------|------------------------------|------------------|------------|-----------|----------------|---------------|
| Channel Id                             | 1 byte field                 | integer          | required   |           | 255            |               |

**3.4.2.3 GUI name: GSP**

Global System Parameters.

**3.4.2.3.1 Functional description**

This GUI is used to configure the NE providing the Accounting messages.

Example:

The screenshot shows a web-based configuration interface titled 'Global Parameters'. It contains several input fields and controls:
 

- Packet Cable Element ID:** A text box containing 'asasa'.
- Format Version:** A dropdown menu set to 'PacketCable Multimedia'.
- Time Zone Daylight Savings Time:** An unchecked checkbox.
- Time Zone UTC Offset (h:mm:ss):** A dropdown menu.
- Accounting Message Sending Mode:** A dropdown menu set to 'FTP'.
- Event Message File Path:** A text box containing '/cbndata/00/meddata/outgoing/ftpdata/sending'.
- Buttons:** 'Reset form' and 'Save changes' buttons are located at the bottom of the form.

**3.4.2.3.2 GUI usage and implications**

No other datafill is required prior to datafill of this GUI.

**3.4.2.3.3 GUI size****Table 6 New or modified GUIs**

## 3.5 User interface changes

### 3.5.1 Command: `iaa_config_cli`

#### 3.5.1.1 Command type: NON-MENU

#### 3.5.1.2 Command target: CBM

#### 3.5.1.3 Command availability: RES

#### 3.5.1.4 Command description

This command is used to provide the user with a means to configure the IAA modules from the command line.

At any point during the execution of this command changes can be saved to the active configuration. If the users decide they do not want to save any changes made they can abort the program and leave the configuration unchanged.

### 3.5.1.5 Command syntax

From the command line a user in the maint group may execute this command to configure the IAA application.

**Table 8 <CommandName> command parameters and variables**

| Command    | Parameters and variables |
|------------|--------------------------|
| iaa_config | None (displays a menu)   |

1. From the main menu the user can select to configure Global system parameters or Output Destinations, which includes DFS or RKS pairs.

```

=====
Main Menu                                     Page 1 of 1
=====

1. Global Parameters
2. Output Destinations

=====
[S]ave      e[X]it      [N]extPage      [P]revPage      [Q]uit
Select: █

```

2. From the Global Parameter Screen the user can change any of the Global Parameters as described in section 3.4.2.3. The Daylight Savings field (DST) is used to populate the DST field in the Packet Cable file header when events are ftped to the RKS.

```

=====
Global Parameters                                     Page 1 of 1
=====
1. Element ID [00001]
2. Packet Cable Format Version [1]
3. Enable Daylight Saving [0]
4. UTC Offset [+000000]
5. Sending Mode [0]
* 6. Base EM File Path [/cbmdata/00/iaa/ftpout/]
7. EM File Path [ ]

Note: * Fields are not Editable
=====
[S]ave      [R]eturn    [N]extPage   [P]revPage   [Q]uit
Select: █

```

3. From the Output Destinations screen, Delivery Function or Record Keeping Server Destination configuration screens can be selected.

```

Status: None
=====
Output Destinations                                     Page 1 of 1
=====
1. Delivery Function Destinations
2. Record Keeping Server Destinations

=====
[S]ave      [R]eturn    [N]extPage   [P]revPage   [Q]uit
Select: █

```

4. From the Record Keeping Server screen the user can list the existing RKS destinations, create a new destination, copy an existing destination to a new destination, edit, view or delete an existing destination.

```

=====
Record Keeping Server Destinations                               Page 1 of 1

### 3.5.1.6 Qualifications and warnings

Incorrect configuration of the system could result in lost event messages.

### 3.5.1.7 Responses

The program prompts the user through a menu for information to configure the IAA modules.

### 3.6.1 Network configuration

**3.6.2** IPSec needs to be configured between the CBM and the downstream RKS pair or DF server. This is handled by the SSPSF, the IAA makes use of this feature.**Key management**

Once configured, key management is handled at the SSPSF level, the IAA makes use of this feature.

### 3.6.3 Protocol

IPSec is utilized by the IAA to send real-time events to the downstream RKS pair or DF server. SFTP can be used to send files to the RKS pair if the IAA is configured to do so.

### 3.6.4 Authentication

Access to the Web interface is controlled by the Java JAAS unix authentication method, which uses the same userid and password used to gain CLI access to the CBM. When a user attempts to log in to the Web interface, they must enter their userid and password which allows them access to the system. The user must also be in the maint group to gain access to the configuration and record viewing screens available via the web interface.

## 3.7 Configuration Walkthrough

Once installed the users is required to configure the IAA Global System Parameters, the desired DF(s) to which LI event messages will be delivered and the desired RKS pair(s) to which Accounting event messages will be delivered.

### 3.7.1 Creating Logical Volumes for use by the IAA

The following logical volumes are required before the installation of the IAA software.

1. `makelv /cbmdata/00/iaa/config 512`
2. `makelv /cbmdata/00/iaa/data 5120`
3. `makelv /cbmdata/00/iaa/ftpout 8192`
4. `makelv /cbmdata/00/iaa/kdb 17408`

### 3.7.2 Configure RKS Output Destination

1. On the Main User Interface, click on Configuration -> Output Destinations.
2. Click on Create a new RKS Destination
3. The RKS Output Destination Configuration user interface will appear, as below:

Host: [redwood](#) > [Configuration](#) [Global Parameters](#) | [Output D](#)

### RKS Output Destination Configuration

Channel ID:  Destination Type: RKS  
 Description:

FTP Direction: ☐ Inbound ☒ Outbound  
 Maximum File Length:  MB  
 Maximum File Open Time:  minutes  
 File Priority:   
 Schedule:   
 FTP Mode: ☒ FTP ☐ Secure FTP  
 Security Protocol: ☒ None ☐ IPsec

**Primary RKS**  
 IP Address:  RADIUS Port:   
 FTP Port:   
 Server username:  Server password:   
 Destination Directory:

**Secondary RKS**  
 IP Address:  RADIUS Port:   
 FTP Port:   
 Server username:  Server password:   
 Destination Directory:

Retry Limit:  Retry Interval:   
 Messages in Batch:  Batch Interval:   
 Shared Secret:

4. Enter the requested information such as Channel ID, Description, FTP Direction, Primary IP Address and Primary RADIUS Port.
5. If values other than the defaults are desired, enter them for the Maximum File Length, Maximum File Open Time, File Priority, Retry Limit, Retry Interval, Messages in Batch, Batch Interval, and Shared Secret
6. If selecting the FTP Direction as Outbound, select a Schedule, FTP Mode and the Security Protocol. Also, enter information for the Primary and Secondary FTP Port, Server username, Server password and Destination Directory if desired.
7. Click on Save Changes.

### 3.7.3 Configure DF Output Destination

1. On the Main User Interface, click on Configuration -> Output Destinations
2. Click on Create a new DF Destination

3. The DF Output Destination Configuration user interface will appear, as below:

The screenshot displays the 'DF Output Destination Configuration' page within the Nortel Networks Integrated Accounting Application. The page header includes the Nortel logo and the application name. The breadcrumb trail shows 'Host: redwood > Configuration'. The page title is 'DF Output Destination Configuration'. The form contains the following fields and values:

| Field          | Value            |
|----------------|------------------|
| Channel ID     |                  |
| Description    |                  |
| IP Address     |                  |
| RADIUS Port    |                  |
| Retry Limit    | 3                |
| Retry Interval | 3                |
| Shared Secret  | 0000000000000000 |

At the bottom of the form, there are two buttons: 'Reset form' and 'Save changes'.

4. Enter the requested information such as Channel ID, Description, IP Address and RADIUS Port
5. If values other than the defaults are desired, enter them for the Retry Limit, Retry Interval and Shared Secret
6. Click on Save Changes

### 3.7.4 Sending or Retrieving Files from the IAA

Accounting messages that are stored in files due to communication failures are automatically ftped to the RKS when communications to the destination are restored. In the event there is a need to retrieve the files before communications are restored, the following procedures can be used.

#### 3.7.4.1 Manually sending files from the IAA

1. Login into the IAA.
2. Go to the file staging directory (`cd /iaadata/ftpout/<channelID>`), where `channelID` is the channel ID of the destination, 1 to 255.
3. Transfer the file to the remote system. (`ftp remote host`).
4. Place the files on the remote host using the `ftp put` command.

#### 3.7.4.2 Manually retrieving a files from the IAA

1. From the remote host ftp into the IAA.

2. Go to the file staging directory (cd /iaadata/ftpout/<channelID>), where channelID is the channel ID of the destination, 1 to 255.
3. Using the ftp get command retrieve the requested file.
4. After the file is retrieved, copy the file to the secondary directory so that it is not sent downstream once the communication link is re-established. (cp <filename>../secondary/<ChannelID>).

### 3.7.5 Steps to Configure IPSec between the IAA and a remote RKS or DF

The following steps define the procedures to configure the IAA to communicate with a RKS, DF or GWC over a IPSec connection. The remote system must be configured in a similar fashion to allow for successful communications. The configuration files which need to be modified are found in the following directories:

| Directory        | File                                                                                                         |
|------------------|--------------------------------------------------------------------------------------------------------------|
| /etc/inet        | ipsecinit.conf (If this file does not exist copy /etc/inet/ipsecinit.sample to /etc/inet/ipsecinit.conf)     |
| /etc/inet/ike    | config (If this file does not exist copy /etc/inet/ike/config.sample to /etc/inet/ike/config)                |
| /etc/inet/secret | ike.preshared                                                                                                |
| /etc/inet/secret | ipseckeys (If this file does not exist copy /etc/inet/secret/ipseckeys.sample to /etc/inet/secret/ipseckeys) |

1. Edit the /etc/inet/ipsecinit.conf file to add an entry similar to the following: (note this is all on one line)

Sending host:

```
{ raddr 172.19.160.58 rport 1704 laddr 172.19.160.170 ulp udp dir both }
ipsec { encr_algs 3des encr_auth_algs sha1 auth_algs sha1 sa shared }
```

Receiving host:

```
{ raddr 172.19.160.170 laddr 172.19.160.58 lport 1704 ulp udp dir both } ipsec
{ encr_algs 3des encr_auth_algs sha1 auth_algs sha1 sa shared }
```

Where:

raddr is the ip address of the remote system

rport is the port number of the remote system

laddr is the ip address of the local system (if a cluster it is the cluster IP)

lport is the port number of the local system

2. Edit the /etc/inet/ike/config file so that the following values are set as described below. This only needs to be done for the first IPSec connection.

```
## Global parameters
#
## Phase 1 transform defaults
p1_lifetime_secs 604800
p1_nonce_len 40
#
## Defaults that individual rules can override.
p1_xform
{ auth_method preshared oakley_group 1 auth_alg sha encr_alg 3des }
p2_pfs 0
```

3. Also edit the `/etc/inet/ike/config` file to add an entry for each remote host as required, similar to the one below:

#### On the Sending Host:

```
{ label "cluster1-sundev3"
  local_addr 172.19.160.170
  remote_addr 172.19.160.58
  p1_xform
  { auth_method preshared oakley_group 1 auth_alg sha1 encr_alg 3des p1_lifetime_secs
    604800 }
  p2_pfs 2
}
```

#### On the Receiving Host:

```
{ label "cluster1-sundev3"
  local_addr 172.19.160.58
  remote_addr 172.19.160.170
  p1_xform
  { auth_method preshared oakley_group 1 auth_alg sha1 encr_alg 3des p1_lifetime_secs
    604800 }
  p2_pfs 2
}
```

#### Where:

label is any unique name

remote\_addr is the ip address of the remote system.

local\_addr is the ip address of the local host.

4. Edit the `/etc/inet/secret/ike.preshared` file to add an entry for each remote host as required, similar to the one below:

#### On the Sending Host:

```
{ localidtype IP
  localid 172.19.160.170
  remoteidtype IP
  remoteid 172.19.160.58
  key f1d8ab6cf3bf5f1232e1cea8cf4657e09a63b5b6b575dc3a
}
```

#### On the Receiving Host:

```
{ localidtype IP
  localid 172.19.160.58
  remoteidtype IP
  remoteid 172.19.160.170
  key f1d8ab6cf3bf5f1232e1cea8cf4657e09a63b5b6b575dc3a
}
```

#### Where:

label is any unique name

remoteid is the ip address of the remote system.

localid is the ip address of the local host.

key is a hex string.

5. After the changes to the files are made execute the following to start IpSec with the desired configuration:

```
pkill in.iked
/usr/lib/inet/in.iked
ipseckey -f /etc/inet/secret/ipseckey
ipsecconf -a /etc/inet/ipsecinit.conf
```

6. To verify the data is encrypted:  
on the receiving host:

```
snoop -v host 172.19.160.170

.
.
.
AH:  ----- Authentication Header -----
AH:
```

```

AH:  Next header = 50 (ESP)
AH:  AH length = 4 (24 bytes)
AH:  <Reserved field = 0x0>
AH:  SPI = 0xad42fdc1
AH:  Replay = 54745
AH:  ICV = 98d75a36720c3398cf18e35b
AH:
ESP:  ----- Encapsulating Security Payload -----
ESP:
ESP:  SPI = 0x70498dd0
ESP:  Replay = 54745
ESP:      ....ENCRYPTED DATA....

```

OR

```
snoop -x 0 host 172.19.160.170
```

Using device /dev/eri (promiscuous mode)

```
cluster1 -> sundev3    ESP SPI=0x70498dd0 Replay=56870
```

```

## 3.7.6 Backing Up and Restoring Configuration Data

### 3.7.6.1 Backup Configuration Data

Configuration data can be backed up to any removable device by using the following commands:

1. Busy the IAA application modules, (IAA Accounting Event Message Processing, IAA Accounting Event Message Viewing, and IAA LI Event Message Processing).
2. Go to the configuration directory, (cd /iaadata/config).
3. Write the data to a removable media device, (tar cvf /dev/[device name] \*).
4. Restart the IAA application modules.

### 3.7.6.2 Restoring Configuration Data

Configuration data can be restored from any removable device by using the following commands:

1. Busy the IAA application modules, (IAA Accounting Event Message Processing, IAA Accounting Event Message Viewing, and IAA LI Event Message Processing).
2. Go to the configuration directory, (cd /iaadata/config).
3. Extract the data from the removable media device, (tar xvf /dev/[device name] \*).
4. Restart the IAA application modules.

## 3.7.7 Changing File Aging Parameters for the IAA

Processed and temporary files used by the IAA are removed from the system by programs run from the user maint's crontab file. This time a file resides on the system can be changed using the following procedures.

### 3.7.7.1 Record Viewing

Events which have not been delivered to the destination because of communication problems are made available for viewing for 1 day. On slower volume installations this can be set for a longer value by changing the following entry in the crontab file for the user maint.

```

30 0 * * * /usr/bin/ksh -c ". ./profile.iaa ; [ -x
/opt/nortel/cbm/21/iaa/bin/remove_aged ] &&
/opt/nortel/cbm/21/iaa/bin/remove_aged -d -a 1 -i

```

```
/cbmdata/00/iaa/data/etc/remove_dirs.include -x  
/cbmdata/00/iaa/data/etc/remove_dirs.exclude"
```

1. As the user root edit the crontab file for the maint user, (crontab -e maint).
2. Change the “-a1” to “-a X”.
3. Save the crontab file.

### 3.7.7.2 Temporary Files

Files that are used to process events are stored on the system for a period of 5 days. This can be set to a different value by changing the following entry in the crontab file for the user maint.

```
0 1 * * * /usr/bin/ksh -c ". ./profile.iaa ; [ -x  
/opt/nortel/cbm/21/iaa/bin/remove_aged ] &&  
/opt/nortel/cbm/21/iaa/bin/remove_aged -a 5 -i  
/cbmdata/00/iaa/data/etc/remove_aged.include -x  
/cbmdata/00/iaa/data/etc/remove_aged.exclude"
```

1. As the user root edit the crontab file for the maint user, (crontab -e maint).
2. Change the “-a5” to “-a X”.
3. Save the crontab file.

### 3.7.7.3 Temporary Files

Audit files are stored on the system for a period of 30 days. This can be set to a different value by changing the following entry in the crontab file for the user maint.

```
0 2 * * * /usr/bin/ksh -c ". ./profile.iaa ; [ -x  
/opt/nortel/cbm/21/iaa/bin/remove_aged ] &&  
/opt/nortel/cbm/21/iaa/bin/remove_aged -a 30 -i  
/cbmdata/00/iaa/data/etc/remove_audits.include -x  
/cbmdata/00/iaa/data/etc/remove_audits.exclude"
```

1. As the user root edit the crontab file for the maint user, (crontab -e maint).
2. Change the “-a30” to “-a X”.
3. Save the crontab file.

## 4: Performance for A00007465

### 4.1 Performance management strategy

Auditing information is available for each module delivered as part of the IAA which processes Accounting and Legal Intercept Event Messages. In the case of Legal Intercept Event Messages auditing can be disabled by changing the the LI Collector's configuration file. The purpose of the auditing is to provide the end user with a summary of the number of records received and the number of records sent downstream. This serves as a way for the end user to verify that

no events were lost during processing. Audits are created in 15 minute intervals by each module, with the exception of the SBA Input agents which create audit entries per file processed.

## 4.2 Performance management tools and utilities

The audits created by the IAA modules are stored in XML files on the system and are viewable via the Web Interface provided. Each module will audit the number of records in and out of the process for each 15 minute interval, with the exception of the SBA Input agents which create audit entries per file processed. In addition to these two counts the EMDA will also provide audits for the number of records which retries were attempted and the number of records written to a file.

## 4.3 Performance Measurements (PM), Operational Measurements (OM), and stats

Each module will provide the following OMs:

- Records In
- Records Out
- Channel Type (EMDA Module Only)

- Channel ID (EMDA Module Only)
- Events Sent (EMDA Module Only)
- Acknowledgements Received (EMDA Module Only)
- Events Retransmitted (EMDA Module only)
- Events Written to File (EMDA Module only)
- Events Rejected (EMDA Module Only)
- Last Event Message Header Sequence Number (EMDA Module Only)

#### 4.3.1 PM, OM, and stats format

The OM stats (audits) are stored in an XML file, an example of which is shown below:

```
<?xml version="1.0" encoding="UTF-8" standalone="no" ?>
<!DOCTYPE applicationinfo SYSTEM
"file:/telesci/application_home/./config/caching.dtd">
<applicationinfo applicationname="oak" hostname="oak" processid="24675"

***Product = CS 2000***

## **A00007483--GR740 Secure using SSH**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS

## 1.2 Description

The purpose of this feature is to provide a new scheme for securing the TCP/IP connections used for carrying GR-740<sup>1</sup> data between a CBM or SDM<sup>2</sup> and an OSS. This new scheme will ultimately replace the current DCE security scheme, but in the short term, both security schemes must co-exist. Hence, both the CBM and the OSS sides must support both schemes.

The connections shall be secured using the industry-standard SSH<sup>3</sup> security scheme, which provides transparent 128-bit encryption (and decryption), data integrity, and user and node authentication. On the CBM-side, the SSH product to be used shall be OpenSSH<sup>4</sup> version 3.8.

The connections between the CBM and the OSS will be established from the OSS-side using an SSH technique known as *local port forwarding*. Port forwarding allows forwarding of TCP/IP connections to a remote machine over an encrypted channel and allows those forwarded ports to be used securely by other TCP/IP-based applications. All data flowing through the forwarded port is automatically encrypted and authenticated. In this configuration, the OSS is the (local) client and the CBM is the (remote) server. Depending on the end office configuration, GR740 requires the setup of up to six connections from the OSS to the CBM, and for the purposes of this feature, each connection would have to be separately port-forwarded. The exact means of establishing the required port-forwarded connections is left to the discretion of each individual OSS vendor.

Local port forwarding can be accomplished using variants of the following basic command:

- `ssh -L oss_port:localhost:cbm_port cbm_ip_addr`

Where *cbm\_port* is one of the six standard GR740 ports, i.e. 9550 - 9555, *oss\_port* is any available port on the OSS node (as per vendor), and *cbm\_ip\_addr* is the IP or DNS address of the CBM node.

Connections to the remote server can be authenticated using user names and passwords or public/private key-pairs<sup>5</sup>, at the OSS vendor's or customer's discretion. Public/private key-pairs particularly simplify login with only minimal extra effort required to initially configure the keys.

---

1. And GR-746 data, as applicable to the office configuration.

2. For the remainder of this document, CBM shall be used to refer to both CBM and SDM products, unless otherwise stated.

3. For more information on SSH, please refer to any applicable published text such as "SSH, The Secure Shell: The Definitive Guide" by Barrett & Silverman (O'Reilly).

4. For more information on OpenSSH, please visit <http://www.openssh.org>.

5. Following SSH upgrades on the OSS software, public/private key pairs will have to be regenerated.

**Figure 1 Local port forwarding in an OSS-CBM configuration**

Since the connections have to be established by the OSS, it must also handle the detection and re-establishment of dropped connections. If a connection is lost, the OSS will be responsible for detecting the drop and re-connecting.

To help facilitate dropped connection detection, the ssh server daemon (i.e. *sshd*) on the CBM side has been configured for KeepAlive functionality, and thus any and all SSH connections to the CBM will implicitly use the KeepAlive feature. With KeepAlive set to 'yes' (default), the CBM will periodically transmit keepalive messages to the OSS; if no response is received within the timeout period, the connection is considered to be in error and the CBM will shut the connection down. The *sshd* KeepAlive interval is the generic TCP KeepAlive interval<sup>6</sup>, which is already set to 2 minutes (120000ms) in the CBM and will not be changed. Please note that the CBM's TCP KeepAlive interval value of 2 minutes is significantly less than the default value of more than an hour for most Unix-based systems.

A similar KeepAlive feature is available for client-side SSH, and as such should be available on the OSS. As with the server (CBM) side KeepAlive, the OSS can send keepalive messages to the CBM; if no response is received within the timeout period, the connection is considered to be in error and the OSS will shut the connection down. However, it is important to note that the SSH client KeepAlive setting and the OSS TCP KeepAlive interval are set as per each vendor's discretion. The vendor may also decide to implement a separate keepalive mechanism at the OSS application level.

On the CBM side, changes are generally limited to GR740 Pass Through configuration procedures. When configuring the GR740 Pass Through feature, the options presented to the user will depend on system configuration. During GR740 Pass Through configuration on CBMs and on non-DCE-provisioned

6. Parameter name: *tcp\_keepalive\_interval*

SDMs, users will be presented with a menu consisting of two choices: *Non-secure*; and *Local (SSH) security*. For GR740PT configuration on SDMs which have the DCE installed and activated, users will first be asked if they want to enable DCE security for GR740PT. If they respond positively, then they will be prompted for the DCE userid and password. If the userid and password are valid, or if they answered ‘No’ to the original DCE security question, they will be presented with a menu listing 3 choices: *Non-secure*; *Local (SSH) security*; and *DCE security*.

By selecting the *Local (SSH) security* scheme, only SSH-secured external connections will be permitted to the GR740PT processes (and unsecured connections will not be permitted). This point implies that in order to access the GR740PT processes from another node (e.g. OSS), a port-forwarded SSH tunnel must first be established between the remote node and the CBM or SDM for each GR740PT port to which access is required. In *Local (SSH) security* mode, connections from within the CBM or SDM to the GR740PT processes (i.e. by local users already logged into the node) do not require an inter-nodal SSH tunnel.

If *DCE security* is chosen as the security scheme, then DCE security is established (as per previous software releases). Note that even if the user answered ‘No’ to the DCE security question asked prior to the displaying of the security options menu, *DCE security* can still be selected; the user will simply be prompted for the DCE userid and password at that point.

If the *Non-secure* option is chosen, unsecured connections originating from any node to GR740PT will be permitted (as per previous software releases), but SSH-secured external connections are also possible.

**Note:** The “authorized GR740 users only” requirement described above for the SSH security mode has been deferred to SN09/CBM22. The deferral is being tracked via CR.Q00990244.

## 1.3 Hardware Requirements or Dependencies

None.

## 1.4 Software Requirements or Dependencies

This feature will depend on the SN08/SDM21 software load for the SDM and CBM products.

As this feature deals with the use of OpenSSH on the CBM and SDM products, there is also a dependency on OpenSSH 3.8. Any SSH-related functionality described as part of this feature must work with OpenSSH 3.8. The SSH product used by the individual OSS vendors must also function properly with OpenSSH 3.8.

The system for indicating authorized GR740 users will be the standard user authorization system for the CBM and SDM platforms. The standard authorization mechanism in SDM/CBM is based on user groups and is being modernized as part of activities A00007492SDM “User Group Administration -- 2324” and A00007489SDM “Integration Of SDM User Authentication With IEMS -- 2189” both delivered in this release (SN08). Conformance to the new authorization framework will allow GR740 user authentication and authorization to be centrally managed.

There are no explicit Core software dependencies; Core loads which support CBM08/SDM21 are the only pre-requisite.

## 1.5 Limitations and restrictions

If, when configuring GR740 on the CBM, the user chooses the non-secure or DCE options, then this feature will have no effect.

This feature is limited to providing a security option for GR740 connections TCP/IP only. No other types of connections or applications are supported/affected by feature A00007843, although SSH is available to all TCP connections and applications which use those connections.

## 1.6 Interactions

This feature will interact with the existing GR740 functionality on the CBM. The effects of the changes will be to provide a new means of securing GR740 TCP/IP connections between the OSS and the CBM. After initial configuration, any impacts of the changes should be transparent to the users.

## 1.7 Glossary

| Term | Description               |
|------|---------------------------|
| CBM  | Core & Billing Manager    |
| DCE  | Dispatcher Control Entry  |
| OSS  | Operations Support System |
| SDM  | SuperNode Data Manager    |
| SSH  | Secure SHell              |

***Product = CS 2000***

# A00007489--Integration of SDM User Authentication with the IEMS

## *Functional Description*

### **1.1 Applicable Solution(s)**

DMS, PT-AAL2

### **1.2 Description**

This feature is designed to support SDM integration with IEMS. It provides the following security functionality:

- Utilize the centralized security management of IEMS to provide Authentication, Authorization, Accounting functions.
- Support PAM on SDM to allow AAA via IEMS.
- Allow local emergency access when communication to IEMS is down.
- Support AAA through local security management when IEMS is not part of the SDM deployment.
- Enable access control based on user authorization.

The following two figures show the two deployment scenarios for user authentication/authorization.

**Figure 1 Functional Components (with Centralized Security Server - IEMS)**

The above figure shows the users are authenticated remotely by a central security server (Centralized Authentication): SDM users are authenticated by a RADIUS server running on an IEMS server.

**Figure 2 Functional Components (Standalone SDM without External Security Server)**

The above figure shows users are authenticated locally on an SDM (Standalone SDM): There is no central security server. Users and their authentication/authorization information is stored locally in this case.

The following is a flow chart for user authentication and authorization through SSH.

**Figure 3 Flow chart for user authentication and authorization through SSH**

Emergency access is needed to address any system issue which impacts user authentication. Based on the different needs for emergency access, it is recommended you use local root user accounts for emergency access for both SDM deployment with IEMS and without IEMS.

The following is an example of emergency access:

- SSH demon is not available. No user will be able to access the system through SSH. The only way for a user to access the system in such a case is through console access with a local root account.

### 1.3 Hardware Requirements or Dependencies

No new hardware dependency is introduced in this feature for Standalone SDM deployment without a centralized security server.

For SDM deployment with the IEMS centralized security server, IEMS and its hardware dependencies are needed by this feature.

### 1.4 Software Requirements or Dependencies

No new software dependency is introduced in this feature for Standalone SDM deployment without a centralized security server.

For SDM deployment with the IEMS centralized security server, IEMS and its software dependencies are needed by this feature.

### 1.5 Limitations and restrictions

- When a SDM user account is created on IEMS, the user account also needs to be added on each SDM via an AIX script/command (e.g. mkuser).
- User password expiry warning is only available on IEMS.
- When a SDM is changed from a standalone configuration to a centralized IEMS security server configuration, all the exiting local user accounts on the standalone SDM need to be created on the IEMS server.
- Console/telnet login is only available for authorized user accounts that exist locally on a SDM. In addition, a user login through console/telnet will not get her/his role groups translated to command groups.
- A user can only su (change user) on a local user account. In addition, a user login through su will not get her/his role groups translated to command groups.
- SSH/SFTP login through a public key will not go through PAM authentication, as a result, an SSH/SFTP user login using a key will not get their command groups set based on the role groups she/he has, and the home directory will not be created automatically upon login. The administrator will have to set the command groups and create the home directory on every SDM for every user using key authentication.

## 1.6 Interactions

### Changes to Network Connectivity Applications

The following table shows the impact of this feature on network connectivity applications.

**Table 1 Network Connectivity Applications**

| Application          | Current Release | SN08    | Configurable - i.e. Turn On/Off (Y/N) | Support IEMS central security server (Y/N) |
|----------------------|-----------------|---------|---------------------------------------|--------------------------------------------|
| SSH (with password)  | Enable          | Enable  | N                                     | Y                                          |
| SFTP (with password) | Enable          | Enable  | N                                     | Y                                          |
| SSH (with key)       | Enable          | Enable  | N                                     | N                                          |
| SFTP (with key)      | Enable          | Enable  | N                                     | N                                          |
| Telnet               | Enable          | Disable | Y                                     | N                                          |
| FTP                  | Enable          | Disable | Y                                     | N                                          |
| Login                | Enable          | Disable | Y                                     | N                                          |
| Console access       | Enable          | Enable  | N                                     | N                                          |
| su                   | Enable          | Enable  | N                                     | N                                          |

**Note:** It is recommended that Telnet and FTP applications should not be used since SSH and SFTP are more secure tools.

By default, Telnet, FTP and Login services will be disabled after an SDM is freshly installed with SN08 software. However, these services will be kept as they were, after an SDM is upgraded to SN08 software from a previous release. It is strongly recommended that the administrators on customer sites change the configuration to turn these services OFF through sdmmtc.

When a network connectivity service is not integrated to work with a central security server, the service can only permit access to users who have accounts locally on an SDM.

## 1.7 Glossary

| Term | Description                               |
|------|-------------------------------------------|
| AAA  | Authentication, Authorization, Accounting |
| CBM  | Core and Billing Manager                  |
| IEMS | Integrated Element Manager System         |
| LDAP | Light-weight Directory Access Protocol    |
| MFT  | Management Framework Technology           |
| NE   | Network Element                           |
| OSS  | Operations Support System                 |
| PAM  | Pluggable Authentication Module           |
| SAML | Security Assertion Markup Language        |
| SDM  | SuperNode Data Manager                    |
| SSL  | Secure Sockets Layer                      |
| SSO  | Single Sign-On                            |
| VSA  | Vendor Specific Attributes                |

## 2: Fault Management for A00007489

### 2.1 Fault management strategy

The feature will log security events related to authentication and authorization. Syslog will be used for this feature to deliver the logs.

### 2.2 Fault management tools and utilities

#### 2.2.1 Faults, Alarms and Logs

Standard Syslog utilities will be used for this feature.

### 2.3 Logs

Authentication succeeded.

Log Title/Log ID: SN08 Authentication and Authorization Security Syslog

#### 2.3.1 Formats

*Note:* Only Syslog will be used for this feature.

**2.3.1.1 NTSTD**

Not applicable to this feature.

**2.3.1.2 SCC2**

Not applicable to this feature.

**2.3.1.3 Syslog**

The following is the format for the Authentication and Authorization Security log. It is based on Nortel OA&M Security IPT's Security Audit Logs Format Specification issue 1.1.

```
<PRI> "date time" "host" "program[pid]:" class_security.ver01
"Message_tag"="Message_value" ...
```

The following is an example for the Authentication and Authorization Security Syslog.

```
<157> Sep 17 15:42:40 wcary015 pam_policy_handler[15822]: class_security.ver01 DOC=SSH
Access STAT=Success SRC.USER=iemsuser EVNT.TYP=USER_ACT_Login
MID=SDM_MID_defn.security.123 SRC.OFFEND=47.1.2.3
```

**2.3.1.4 SNMP**

Not applicable to this feature.

**2.3.1.5 Integrated Element Manager GUI Fields**

Not applicable to this feature.

**2.3.2 Explanation**

Description: The Authentication and Authorization Security Syslog is generated when a security event occurs on a SDM. They are created for information purposes.

**2.3.3 Field descriptions**

**Table 2 Field descriptions**

| Field     | Value                          | Description                                                                         |
|-----------|--------------------------------|-------------------------------------------------------------------------------------|
| PRI       | 157                            | Priority value = Facility x 8<br>+ Severity = local3 (19) x 8<br>+ Notice (5) = 157 |
| Date time | Sep 17 15:42:40                | Month, day and timestamp                                                            |
| host      | wcary015                       | SDM system identifier                                                               |
| Program   | e.g. pam_policy_handler<br>RMI | The name of the SDM<br>process which generated<br>the log                           |

**Table 2 Field descriptions**

| Field                | Value                                                                                                                                                                                                                                                                                                                                                            | Description                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| PID                  | 15822                                                                                                                                                                                                                                                                                                                                                            | The process ID of the SDM process which generated the log                                              |

| DOC                  | SSH Access<br>Naming Service Change<br>PAM Config Change<br>Radius Config Change                                                                                                                                                                                                                                                                                 | Document field of the accessed resource                                                                |
| STAT                 | Success<br>Failure                                                                                                                                                                                                                                                                                                                                               | Status of the designed process                                                                         |
| SRC.USR              | e.g. iemsuser                                                                                                                                                                                                                                                                                                                                                    | Login user name or user id (not effective user name or user id).                                       |
| EVNT.TYP             | USER_ACT_Security_Login<br>USER_ACT_Security_Naming_Service_Change<br>USER_ACT_Security_PAM_Auth_Stack_change<br>USER_ACT_Security_Radius_Server_IP_Change<br>USER_ACT_Security_Radius_Secret_Change<br>USER_ACT_Security_Radius_Server_Timeout<br>USER_ACT_Security_SAML_Server_IP_Change (Post SN08)<br>USER_ACT_Security_SAML_Server_Login_Change (Post SN08) | The type of the event                                                                                  |
| MID                  | SDM_MID_defn.security.123 <sup>a</sup>                                                                                                                                                                                                                                                                                                                           | Message Identifier is a unique string to allow message text to change without affecting analysis tools |

**Table 2 Field descriptions**

| Field      | Value    | Description                       |
|------------|----------|-----------------------------------|
| SRC.OFFEND | 47.1.2.3 | Address of the originating packet |

a. SDM\_MID\_defn.security.123 is an example MID for this feature. The final MID will be provided later.

### **2.3.4 Action**

The Authentication and Authorization Security Syslog for this feature is displayed for information purpose only. No further action is needed for handling these logs.

### **2.3.5 Associated Operational Measurements or Performance Measurements**

Not applicable to this feature.

### **2.3.6 Additional information**

Not applicable to this feature.

## **2.4 Alarms**

Not applicable to this feature.

## **2.5 Related documentation**

# **3: Configuration for A00007489**

## **3.1 Hardware and Software Requirements**

SN08 SDM standard hardware and software are required.

No new hardware is needed for this feature. However, the software for this feature needs to be installed on the SDM before feature configuration can take place.

For SDM deployment with the IEMS centralized security server, IEMS and its hardware and software dependencies need to be available and configured.

## **3.2 Initial Configuration**

- No hardware initial configuration for this feature.
- The initial software configuration for this feature uses the local security server (i.e. native AIX security system) for authentication and authorization. No user input is needed for initialization.

### 3.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable to this feature.

## 3.4 Upgrade Considerations

### 3.4.1 Dump and Restore (CM)

Not applicable to this feature.

### 3.4.2 Element Management Upgrade

No impact on the Element Management Upgrade when a SDM is deployed without an external security server.

When a SDM is deployed with the IEMS centralized security server in SN08, the SDM is changed from using the Pre-SN08 local security system to the external security server. In order to migrate to central authentication and authorization, some of the existing local user accounts need to be created on the external security server - IEMS.

The following are the steps for migrating SDM local user accounts to IEMS:

- Login to a SDM and determine which SDM user accounts need to be exported to IEMS. e.g. Local the SDM root account should not be exported to IEMS.
- Obtain the list of the user accounts which need to be migrated to the central server for every SDM.
- Create the accounts on the IEMS security server manually with the list of import SDM user accounts. One local user account can exist on many SDMs and it only needs to be created once on the IEMS server.

### 3.4.3 Downgrade impact

No impact on downgrade if the SDM feature installation is aborted.

### 3.5 Data schema (DS) (CM, MIBS, RDB)

Not applicable to this feature.

### 3.6 Service Orders (SO) (CM & SESM)

Not applicable to this feature.

### 3.7 Software optionality control (SOC)

Not applicable to this feature.

### 3.8 Element Management

Not applicable to this feature.

## 3.9 User interface changes

### 3.9.1 Directory: sdmmtc;SDMConfig

SDM Config level menu will not be changed by this feature. It will be used to commission the feature software.

### 3.9.2 Command: Step

Step command from the SDM Config level menu will not be changed by this feature. It will be used to commission the feature.

#### 3.9.2.1 Security Servers Configuration

A new configuration screen will be presented for selecting security servers for this feature.

**Table 3 Security Servers Configuration prompts and options**

| Configuration prompts                    | Options                                                                            |
|------------------------------------------|------------------------------------------------------------------------------------|
| Available Auth Naming Server:            | LOCAL<br><br>Note: Options that may available in the future - SAML, LDAP.          |
| Enter Authentication Naming Server?      | User Response<br><br>Enter the Auth Naming Server. e.g. LOCAL                      |
| Available Auth PAM Stack:                | LOCAL, IEMS<br><br>Note: Options that may available in the future - LDAP.          |
| Enter Authentication PAM Stack?          | User Response<br><br>Enter the Auth PAM Stack. e.g. LOCAL                          |
| Enter Radius Server IP? <sup>a</sup>     | User Response<br><br>Enter the IP address of the external Radius server.           |
| Enter Radius Port Number? <sup>b</sup>   | User Response<br><br>Enter the shared port number of the external Radius server.   |
| Enter Radius Shared Secret? <sup>c</sup> | User Response<br><br>Enter the Radius shared secret of the external Radius server. |

a. Available only when IEMS is selected for Auth PAM Stack.

b. Available only when IEMS is selected for Auth PAM Stack.

c. Available only when IEMS is selected for Auth PAM Stack.

### 3.9.2.2 Example

The following shows the example screens for configuring local authentication naming service with the local authentication PAM module. Please note this is the default security servers setting. Therefore, the customers do not need to invoke SDM Config level for the default setup.

```

SDM      CON      512      NET      APPL      SYS      HW      CLLI: SNM2

### 3.10 OSSGate Interface Changes

Not applicable to this feature.

### 3.11 Security

The feature will change user authentication and authorization for SDM.

#### 3.11.1 Network configuration

n/a

**3.11.2 Key management**

n/a

**3.11.3 Protocol**

n/a

**3.11.4 Authentication**

When a SDM is deployed without an external security server, user authentication and authorization will be performed locally on the SDM.

When a SDM is deployed with an external security server like IEMS, user authentication and authorization will be performed through IEMS via Radius protocol.

**3.12 Configuration Walkthrough**

The following figure shows the configuration steps for this feature.

Figure 4 Flow chart for feature configuration

The following figure shows the user account administration steps for this feature when deployed with IEMS as the external security server.

**Figure 5** Flow chart for user account admin with IEMS as security server

The following figure shows the steps for migrating SDM local user accounts on an existing system to the IEMS security server. These steps are needed to support central authentication and authorization.

**Figure 6** Flow chart for local user account migration to IEMS security server

***Product = CS 2000***

**A00007491--SDM File Integrity Audit**  
***Functional Description***

## 1.1 Applicable Solution(s)

DMS, PT-AAL2

## 1.2 Description

This feature monitors the files on the SDM and records file change events to log files. File change events will be logged to one of two log files, auditlog, and securitylog. File changes resulting from regular configuration changes will be recorded in the auditlog file. File changes which are abnormal will be recorded in the securitylog file.

Examples of abnormal file changes would include:

- changes to executable files, not as a result of software delivery
- changes to configuration files, not done by the appropriate SDM configuration tools/commands.
- file changes by the root user.

Changes to files resulting from the application of an authenticated software delivery (patch or fileset) will not result in an audit or security log per file. One audit log will be created indicating the name of authenticated patch or package which was applied.

Each audit or security log will contain the following information:

- time of event
- event name (file change)
- login username of the person who changed the file
- complete file name, included the full path

The SDM file audit system utilizes the native AIX audit system, which is a part of the operating system. File change events are detected in real time, not as a result of a periodic comparison.

The audit and security log files will be rotated daily, and kept for one week. The disk storage space for the audit and security logs is monitored, and is alarmed if it exceeds a 70% full threshold. If desired, the files can be securely transferred to a remote host using SFTP (secure file transfer protocol).

In addition to the auditlog and security log files, the logs can also be forwarded in real time to a remote host which supports the UNIX syslog system.

**Figure 1 Functional Behavior Diagram**

### 1.3 Hardware Requirements or Dependencies

None.

### 1.4 Software Requirements or Dependencies

This feature will be distributed in the SN08 release.

## 1.5 Limitations and restrictions

The set files which are monitored are specified in the SDM software load. While this list will be updated as part of software delivery (patch etc.), there is no tool provided to manually update the list of monitored files. It is not expected that the customer will add files to the SDM outside the application of authenticated Nortel software updates. Although it would be possible for a user with security administration privileges to change the audit system configuration by editing a configuration file with “vi”, the practice should not be encouraged.

The mechanism to send audit and security logs to a remote host in real-time (syslogd) does not encrypt the log stream, therefore it cannot be considered secure.

## 1.6 Interactions

This feature does not impact other SDM features.

## 1.7 Applicable customer facing sections

## ***Product = CS 2000***

### **A00007492--SDM User Group Improvements**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS, PT-AAL2

#### **1.2 Description**

A number of SDM maintenance commands require *root* (superuser) privileges. This is a security concern because it results in the wide distribution of the *root* password. This feature will eliminate the requirement to be the *root* user in order to do SDM maintenance procedures<sup>8</sup>, except for procedures which require console access<sup>9</sup>.

Currently there are only two authorization levels on the SDM: 1) the *root* user and 2) users belonging to the *maint* group. In SN08 two new user groups will be created to eliminate the requirement for the *root* user and enable increased authorization granularity. The new groups are **emsadm** for system administration and **secadm** for security administration. While just these two groups will be added in SN08, it will be possible to extend this feature in future releases and add additional groups.

The following table has a general summary of the SDM maintenance functions and the required authorization level.

**Table: 1 Summary of Authorization Levels**

| Function                     | Root | emsadm | secadmin | maint |
|------------------------------|------|--------|----------|-------|
| Initial system installation  | *    |        |          |       |
| Application software install | *    | *      |          |       |
| Application software upgrade | *    | *      | *        | *     |
| System upgrade               | *    |        |          |       |

---

8. Initial installation of an SDM will still require the use of the root account

9. This restriction is documented in the companion feature A00007489. The new user groups are available via ssh access only and are not supported via the console or telnet.

**Table: 1 Summary of Authorization Levels**

| Function                                                            | Root | emsadm | secadmin | maint |
|---------------------------------------------------------------------|------|--------|----------|-------|
| User Administration<br>(create users, add users to groups,<br>etc.) | *    |        | *        |       |
| Application Configuration<br>(effect out of service)                | *    | *      |          |       |
| Application Configuration<br>(no service effect)                    | *    | *      | *        | *     |
| Application State Change                                            | *    | *      | *        | *     |
| Data Access                                                         | *    | *      | *        | *     |
| view security logs                                                  | *    |        | *        |       |
| Backup                                                              | *    | *      | *        | *     |

This feature will extend the SDM maintenance MAP screens for user administration, including additional screens to:

- display list of groups and the users in a group
- display list of users and the groups they belong too
- create / remove users
- add/delete user to group.

**Table 2: SDM Command Authorization Summary**

| SDM Tool | Level         | Commands | Description                               | Old auth. level | New auth. level |
|----------|---------------|----------|-------------------------------------------|-----------------|-----------------|
| sdmmtc   |               |          |                                           | maint           | maint           |
|          | Mtc           |          | Enter the maintenance level               | maint           | maint           |
|          | Mtc>Con       |          | Enter the SDM connectivity status levels. | maint           | maint           |
|          | Mtc>Con>DS512 |          | Go to the DS512 connectivity level.       | maint           | maint           |
|          | Mtc>Con>DS512 | Logs     | Display the last DS512 event reported.    | maint           | maint           |
|          | Mtc>Con>DS512 | Tst      | Test the service DS512 link(s)            | maint           | maint           |
|          | Mtc>Con>DS512 | Change   | Change DS512 connectivity options         | root            | emsadm          |
|          | Mtc>Con>X25   |          | Go to the X25 connectivity level.         | main            | maint           |

**Table 2: SDM Command Authorization Summary**

| SDM Tool | Level         | Commands | Description                                                                                   | Old auth. level | New auth. level |
|----------|---------------|----------|-----------------------------------------------------------------------------------------------|-----------------|-----------------|
|          | Mtc>Con>X25   | Logs     | Display the last X.25 event reported                                                          | main            | maint           |
|          | Mtc>Con>X25   | Daemon   | Control X.25 daemon.                                                                          | root            | emsadm          |
|          | Mtc>Con>Eth   |          | Go to the Ethernet connectivity level.                                                        | maint           | maint           |
|          | Mtc>Con>Eth   | Logs     | Display the last event reported on each of the Ethernet connection status indicators.         | maint           | maint           |
|          | Mtc>Con>Eth   | Change   | Change an ethernet interface.                                                                 | root            | emsadm          |
|          | Mtc>Con>Eth   | Add      | Add a new ethernet interface or monitored node.                                               | root            | emsadm          |
|          | Mtc>Con>Eth   | Delete   | Delete an ethernet interface or monitored node.                                               | root            | emsadm          |
|          | Mtc>Con>Eth   | Period   | Display or change the default ping period.                                                    | root            | emsadm          |
|          | Mtc>Con>Eth   | Failures | Display or change the max number of ping failures before the ethernet switches active domain. | root            | emsadm          |
|          | Mtc>Con>Eth   | Timeout  | Display or change the max timeout before ping failure.                                        | root            | emsadm          |
|          | Mtc>Net       |          | Enter the Network connectivity status level.                                                  | maint           | maint           |
|          | Mtc>Net>Core  |          | Go to the Core level.                                                                         | maint           | maint           |
|          | Mtc>Net>Core  | Add      | Add a communication path to the Core.                                                         | root            | emsadm          |
|          | Mtc>Net>Core  | Change   | Change the values for the given communication path to the Core.                               | root            | emsadm          |
|          | Mtc>Net>Core  | Delete   | Delete the given communication path to the Core.                                              | root            | emsadm          |
|          | Mtc>Net>Nodes |          | Go to the Nodes level.                                                                        | maint           | maint           |
|          | Mtc>Net>Nodes | Add      | Add a node.                                                                                   | root            | emsadm          |
|          | Mtc>Net>Nodes | Change   | Change a node.                                                                                | root            | emsadm          |
|          | Mtc>Net>Nodes | Delete   | Delete a node.                                                                                | root            | emsadm          |
|          | Mtc>Net>Nodes | Primary  | Configure the primary node.                                                                   | root            | emsadm          |
|          | Mtc>Net>Nodes | Monitor  | Toggle monitoring of a node.                                                                  | root            | emsadm          |

**Table 2: SDM Command Authorization Summary**

| SDM Tool | Level           | Commands | Description                                                                            | Old auth. level | New auth. level |
|----------|-----------------|----------|----------------------------------------------------------------------------------------|-----------------|-----------------|
|          | Mtc>Net>DCE     |          | Go to the DCE level.                                                                   | maint           | maint           |
|          | Mtc>Net>DCE     | Add      | Add DCE component(s)                                                                   | root            | emsadm          |
|          | Mtc>Net>DCE     | Delete   | Delete DCE components(s)                                                               | root            | emsadm          |
|          | Mtc>Net>DCE     | Logs     | Display the last DCE event reported (if any).                                          | root            | emsadm          |
|          | Mtc>Net>NTP     |          | Go to the NTP level.                                                                   | maint           | maint           |
|          | Mtc>Net>NTP     | Query    | Display the details of an NTP server.                                                  | maint           | maint           |
|          | Mtc>Net>NTP     | Logs     | Display the last NTP event reported (if any).                                          | maint           | maint           |
|          | Mtc>Net>NTP     | Add      | Add NTP server(s) and peer(s)                                                          | root            | emsadm          |
|          | Mtc>Net>NTP     | Change   | Change NTP server/peer.                                                                | root            | emsadm          |
|          | Mtc>Net>NTP     | Delete   | Delete NTP server(s) and peer(s)                                                       | root            | emsadm          |
|          | Mtc>Appl        |          | Enter the software applications status level.                                          | maint           | maint           |
|          | Mtc>Appl        | logs     | Display the last event reported (if any) on each of the application status indicators. | maint           | maint           |
|          | Mtc>Appl        | Bsy      | Busy an application.                                                                   | maint           | maint           |
|          | Mtc>Appl        | RTS      | Return an application to service.                                                      | maint           | maint           |
|          | Mtc>Appl        | OffL     | Offline an application.                                                                | maint           | maint           |
|          | Mtc>Sys         |          | Enter the operating system software status level.                                      | maint           | maint           |
|          | Mtc>Sys>Storage |          | Enter the STORAGE system status level.                                                 | maint           | maint           |
|          | Mtc>Sys>Storage | ESDAdd   | Add the /swd/sdm/esd logical volume for upgrades from disk.                            | root            | emsadm          |
|          | Mtc>Sys>Storage | ESDDel   | Remove the /swd/sdm/esd logical volume and all its contents.                           | root            | emsadm          |
|          | Mtc>Sys>Storage | Add      | Add new disks to the datavg volume group, OR add a new logical volume.                 | root            | emsadm          |

**Table 2: SDM Command Authorization Summary**

| SDM Tool | Level                | Commands | Description                                                                                                          | Old auth. level | New auth. level |
|----------|----------------------|----------|----------------------------------------------------------------------------------------------------------------------|-----------------|-----------------|
|          | Mtc>Sys>Storage      | Change   | Change the alarm threshold for a system software status indicator, OR expand the size of an existing logical volume. | maint           | maint           |
|          | Mtc>Sys>Backup Clear |          | Clears the Backup Status and alarm.                                                                                  | maint           | maint           |
|          | Mtc>Sys>Audit Clear  |          | Clears the System Audit Status and alarm.                                                                            | maint           | maint           |
|          | Mtc>Hw               |          | Enter the hardware status level.                                                                                     | maint           | maint           |
|          | Mtc>Hw               | logs     | Display the last event reported (if any) on each of the hardware status indicators.                                  | maint           | maint           |
|          | Mtc>Hw               | Bsy      | Busy a hardware device.                                                                                              | maint           | maint           |
|          | Mtc>Hw               | RTS      | Return a hardware device to service.                                                                                 | maint           | maint           |
|          | Mtc>Hw               | Add      | Add a new hardware module to the system.                                                                             | root            | emsadm          |
|          | Mtc>Hw               | Delete   | Delete a hardware module from the system.                                                                            | root            | emsadm          |
|          | Mtc>Hw               | Upgrade  | Upgrade an MFIO.                                                                                                     | root            | emsadm          |
|          | Mtc                  | Quit     | Quit the current level or exit the SDM maintenance interface.                                                        | maint           | maint           |
|          | Mtc                  | Bsy      | Busy the SDM.                                                                                                        | maint           | maint           |
|          | Mtc                  | RTS      | Return the SDM to service.                                                                                           | maint           | maint           |
|          | Mtc                  | OffL     | Offline the SDM.                                                                                                     | maint           | maint           |
|          | Mtc                  | QuerySDM | Query information about the SDM.                                                                                     | maint           | maint           |
|          | Mtc                  | Locate   | Determine location of SDM modules and devices                                                                        | maint           | maint           |
|          | Mtc                  | Help     | Displays help for a single command or all valid                                                                      | maint           | maint           |
|          | Mtc                  | Refresh  | Refresh the current screen.                                                                                          | maint           | maint           |
|          | Admin                |          | Enter the system administration level.                                                                               | maint           | maint           |

|          | TOOLS        | Amadump  | Displays record information                    | maint           | maint           |
|          | TAPE         |          | Enters TAPE level                              | maint           | maint           |
|          | TAPE         | Write    | Write billing files to DAT tape                | maint           | maint           |
|          | TAPE         | List     | List billings files on a DAT tape              | maint           | maint           |
|          | TAPE         | Send     | FTP billings files from a DAT tape             | maint           | maint           |
|          | billmtc      | Set      | Sets context                                   | maint           | maint           |
|          | billmtc      | Query    | Displays current state of streams              | maint           | maint           |
|          | billmtc      | Clli     | Displays core CLLI                             | maint           | maint           |
|          | billmtc      | Mib      | Sets and gets MIB objects                      | maint           | maint           |
|          | billmtc      | Dispal   | Displays all current SDM alarms                | maint           | maint           |
|          | billmtc      | Displots | Displays logs not yet sent to CM               | maint           | maint           |

### 1.3 Hardware Requirements or Dependencies

There are no hardware requirements for this feature.

### 1.4 Software Requirements or Dependencies

This feature is dependent on feature A00007489 (IEMS Integration).

## 1.5 Limitations and restrictions

No user interface is provided to create additional authorization levels.

## 1.6 Interactions

This feature will change the RMI for user creation.

## 1.7 Glossary

| Term  | Description                       |
|-------|-----------------------------------|
| CBM   | Core and Billing Manage           |
| IEMS  | Integrated Element Manager System |
| MS    | Management System                 |
| NE    | Network Element                   |
| NE/MS | NE or MS                          |
| RMI   | Resource Manager Interface        |
| SDM   | Super Node Data Manager           |

## 2.8 Software optionality control (SOC)

## 2.9 Element Management

### 2.10 User interface changes

#### 2.10.1 Directory: <SDM user level>

##### 2.10.1.1 Directory description

The user level of the SDM user interface has been changed. New commands have been added. “Dispusr” enables the operator to display all the users on the system or information about a specific user. “Dispgrp” allows the operator to display all the role groups, the user in a specific role group and the actions that a specific role group can do. The add and change commands of the user interface have also been changed. These commands now prompt the user for each piece of information needed to create a user. The information asked for include primary groups, groups, shell and password.

##### 2.10.1.2 Accessing directory: <sdmmtc; user>

Access to directory or MAP level and return to CI

The user level of the SDMMTC is accessed the same as before.

```
>sdmmtc
```

```
>user
```

#### 2.10.2 Command: <Dispgrp>

##### 2.10.2.1 Command type: < Listed MENU>

##### 2.10.2.2 Command target: <SDM>

##### 2.10.2.3 Command availability: <ALL>

##### 2.10.2.4 Command description

Enables the operator to display all the role groups on the system or the users in a specific user or the activities that a specific role group can perform.

##### 2.10.2.5 Command syntax

Table 1 <CommandName> command parameters and variables

| Command | Parameters and variables |
|---------|--------------------------|
|         |                          |

**Table 1** <CommandName> command parameters and variables

| Command                  | Parameters and variables                                                                                                     |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------|
| dispusr                  | all                                                                                                                          |
|                          | group                                                                                                                        |
|                          | group act                                                                                                                    |
| Parameters and variables | Description                                                                                                                  |
| All                      | Displays all role groups defined on the system. The role group name is displayed along with what users belong to that group. |
| Group                    | Displays the users that belong to the specified group.                                                                       |
| Group Act                | Displays the actions the specified group is allowed to perform.                                                              |

**2.10.2.6 Qualifications and warnings**

Only role groups can be displayed.

**2.10.2.7 Responses****2.10.2.7.1 <errors>****Table 2** MAP outputs with associated meanings and actions

| Command                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dispgrp junk                                                                                                                                                  |
| Cannot execute command. Only Role groups can be displayed.                                                                                                    |
| <b>Meaning:</b> This happens when the group specified is not a role group.                                                                                    |
| <b>System or user actions:</b> User should type a group that is a role group. This command with no parameters or with “all” will display all the role groups. |
| dispusr maint junk                                                                                                                                            |
| Command failed. The third parameter can only be ACT.                                                                                                          |
| <b>Meaning:</b> The third parameter must be the reserved word “ACT”.                                                                                          |
| <b>System or user actions:</b> User should type “act” as the third parameter.                                                                                 |

**Table 2** MAP outputs with associated meanings and actions

| Command                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dispusr junk junk junk                                                                                                                                        |
| DispUsr junk junk - EITHER incorrect optional parameter(s) OR too many parameters.                                                                            |
| <b>Meaning:</b> This happens when too many parameters are given.                                                                                              |
| <b>System or user actions:</b> User should type a group that is a role group. This command with no parameters or with “all” will display all the role groups. |

| Command  | Parameters and variables                                                                                                                                    |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User     | change a user with the name that was specified.                                                                                                             |
| Pgrp     | change the primary group to the value specified. Allowed values are maint, emsadm or secuadm.                                                               |
| Groups   | change the group list for this user. Allowed values are maint, emsadm and secuadm. One or more groups may be added. List them separated by blanks or commas |
| Shell    | change the shell of the user. Allowed values are rash for a restricted shell, fash for a full shell and nash for no shell.                                  |
| password | Change the password for the user.                                                                                                                           |

**2.10.9.6 Qualifications and warnings**

None.

## 2.13 Configuration Walkthrough

*Product = CS 2000*

**A00007548--SN08 Packet Cable Electronic Surveillance**

## ***Functional Description***

### **1.1 Applicable Solution(s)**

IAC

### **1.2 Description**

#### **1.2.1 Background**

CableLabs is a consortium of cable operators and cable equipment vendors that creates specifications for cable access VoIP. CableLabs' PacketCable project promotes vendor inter-operability. In order to provide a billing capability, PacketCable has defined a specification for an event reporting mechanism that called "PacketCable Event Messaging" (PCEM). PCEM uses RADIUS accounting (RFC 2866) to deliver event messages to a record keeping server (RKS). Activity A00007196 (Packet Cable Event Messaging For Accounting SN08) provides an implementation of PCEM for the Succession Cable Solution.

PacketCable has also defined a specification for a lawful interception mechanism called "PacketCable Electronic Surveillance" (PCES). PCES and PCEM use an overlapping set of event messages, and use Radius accounting to send event messages.

*This* feature delivers a PacketCable-compliant Lawful Interception solution for the Call Server 2000 (CS2K) Cable VoIP Solution. It implements PacketCable surveillances, which consist of Call Data and if required Call Content for monitored calls.

This development activity is one component of Nortel's development effort to support "Packet Cable 1.5" compliance in the Succession Cable Solution.

This activity provides CMS PacketCable 1.5 compliance with PCES for PacketCable. Specifically for the Lawful Interception component of event messaging CableLabs specification PKT-SP-EM-I10. The interface to the LEA is provided by the third-party DF component (as described below). The DF must be compliant to PacketCable specification PKT-SP-ESP-I03-040113.

#### **1.2.2 Electronic Surveillance Implementation**

Figure 1 illustrates PCES with respect to the components of the CS2k PacketCable solution. For PCES events which are detected by the CS2K, event notifications are sent to the Event Message Delivery Interface (EMDI), which sends PCES Event Messages (PCES EMs) to the DF, which in turn multicasts it to the LEA collection functions as required.

The CMTS sends PCES event messages directly to the DF. Call Content is sent directly to the DF by the Trunk GW and CMTS.

The EMDI (Event Messaging Delivery Interface) encapsulates the capability of formatting event messages with RADIUS headers and sending to the RKS (including retries). For this activity, the EMDI is provided by the IAA (Integrated Accounting Application) on the CBM. The IAA may also receive event messages from the GWC for ES (Electronic Surveillance).

The DF (Delivery Function) is third-party equipment provided by any DF vendor. The DF receives event messages from the EMDI, the CMTS, and the trunk gateway.

The PacketCable architecture refers to two network elements that are not labeled in Figure 1: the CMS and the MGC. The CMS, or call management server, is PacketCable's line solution. Nortel implements the CMS by using functionality in the CM and small-lines GWCs. The MGC, or media gateway controller (not to be confused with our GWC), is PacketCable's trunk solution. Nortel implements the MGC using the CM and trunk GWCs controlling TGCP trunk gateways.

USNBD is an existing CS2K Cable Solution lawful interception feature. PCES shares much functionality with USNBD, and in order to avoid duplication, the reader is referred to the USNBD NTPs for a description of certain functionality.

**Table 1 Existing USNBD documentation**

| Number      | Title                                                                 |
|-------------|-----------------------------------------------------------------------|
| NN10264-709 | Lawful Intercept                                                      |
| NN10190-113 | Succession Performance Management: Operational Measurements Reference |
| NN10345-501 | Configuration Management: Lawful Intercept Service                    |
| NN10300-100 | IP Solutions Basics                                                   |
| NN10188-511 | Communication Server 2000 Configuration Management                    |

PCES has some common functionality with USNBD, and the existing USNBD documentation may be useful. ("Table 1 Existing USNBD documentation") PCES can not be used in the CM concurrently with USNBD, so the logs apply to the surveillance feature which is currently active in the CS2K. In order to avoid duplication, the reader is referred to the USNBD NTPs for a description of these logs.

**Figure 1 PCES Architecture – subject monitoring**

## 1.3 PCES call monitoring

### 1.3.1 Event Messages (call data)

Event Messages (PCES EMs) are generated at different points in the call and they contain information which can be used for surveillance purposes and for the purpose of interpreting call content. For example: a signaling\_start event message contains the calling and called DNs.

Event messages are generated for each half call. Therefore, separate event messages are generated for the originating and terminating call halves.

#### 1.3.1.1 Message Structure

Refer to the Packet Cable specification PKT-SP-EM-I10 for details regarding the individual components in the Packet Cable event messages.

### 1.3.1.2 Message Types

**Table 2 PacketCable Event Messages**

| Name                                                                      | Description                                                                                                            |
|---------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Signaling_Start                                                           | Start of signaling for originating or terminating half of the call                                                     |
| Signaling_Stop                                                            | End of signaling for originating or terminating half of the call                                                       |
| Database_Query                                                            | An inquiry into an external database; for example 800, LNP                                                             |
| QoS_Reserve*                                                              | Reservation of QoS bandwidth for originating or terminating half of the call                                           |
| QoS_Commit*                                                               | Commitment of QoS bandwidth for originating or terminating half of the call                                            |
| QoS_Release*                                                              | Release of QoS bandwidth for originating or terminating half of the call                                               |
| Service_Activation                                                        | Indicates a subscriber has activated a service                                                                         |
| Service_Instance                                                          | Indicates an occurrence of a service                                                                                   |
| Service_Deactivation                                                      | Indicates a subscriber has deactivated a service                                                                       |
| Call_Answer                                                               | Indicates that all network resources have been allocated for originating or terminating half of the call               |
| Media_Alive                                                               | Indicates if the call is still active (Not supported in SN08)                                                          |
| Call_Disconnect                                                           | Indicates that all network resources have been released for originating or terminating half of the call                |
| Media_Report                                                              | Indicates a change in media session information. (PCES only)                                                           |
| Signal_Instance                                                           | Indicates an NCS signal sent from the subject or from the network. (PCES only)                                         |
| Interconnect_Start                                                        | Start of network interconnect signaling (between PacketCable and PSTN) for originating or terminating half of the call |
| Interconnect_Stop                                                         | Stop of network interconnect signaling (between PacketCable and PSTN) for originating or terminating part of the call  |
| Time_Change                                                               | Indicates time change on a network element.                                                                            |
| *QOS_XXXX messages are generated by the CMTS and sent directly to the DF. |                                                                                                                        |

### 1.3.2 Call Content

When a surveillance requires call content, the transmit of both agents in the connection is provided to Law Enforcement.

The call content (for both parties) is sent directly from the CMTS or MG to the DF. That is, if the subject B\*, hosted on a CMTS, is talking to associate A, the

transmit paths of both the subject  $B^*$  and associate A are sent directly from the CMTS hosting  $B^*$  to the DF (as shown in Figure 1).

If the subject redirects a call on-net, the call content IAP will be the CMTS of the redirected-to party.

On the other hand, if the call is redirected by the subject to the PSTN and the replacement party (or *observed party*) is  $C^+$ , hosted on a trunk MG, the content (or transmit paths) for  $C^+$  and the associate (A) are sent directly from the MG to the DF. This only occurs when a call is redirected by the subject to the PSTN, so neither  $C^+$  nor A is an actual subject.  $C^+$  is a *monitored replacement party*, or MRP.<sup>10</sup> Figure 2 illustrates the case where A calls subject  $B^*$  who forwards the call off-net to  $C^+$ , and the call content IAP is at the trunk MG.

**Figure 2 PCES Architecture – MRP monitoring (subject redirects off-net)**

Since content multicasting to multiple LEAs is done by the DF, PCES will provide a single call content stream if there is at least one PCES surveillance on an agent in a connection which requires call content.

10. A Monitored Replacement Party (MRP) is a party which replaces the subject through a redirection feature controlled by the subject. This could be caused by F calling subject  $A^*$ , and  $A^*$  either forwarding or transferring the call to C, which routes through the MG to the PSTN.

### 1.3.3 Multiple surveillances on a connection

PCES provides call content for a single agent in a connection. If a subject redirects a call to another subject, the resulting call will be monitored for only a single subject. The DF provides multicasting of the content and data to the appropriate LEA Collection Functions.

Consider the following example: Associate A calls subject B\* which has call forwarding to subject C\*. The resulting call is A – C<sup>+</sup>, where C<sup>+</sup> is the terminating party.

If either B or C is subject to a call content surveillance, the resulting call will be monitored for content, regardless whether the other surveillance was data-only. Since at least one surveillance requires call content, the resulting call will be monitored for call content.

It is possible to configure a CS2K to support multiple DFs, and it is also possible to provision different surveillances to use different DFs. If B\* and C\* have surveillances provisioned to use different DFs, the resulting A – C<sup>+</sup> call will be monitored to use C's DF.

In the future PacketCable architecture may require DFs to communicate with each other so that the surveillance data can be multicast by the DF not only to LEA Collection Functions, but also to other DFs (for example, B's). In the current release of the PacketCable architecture, the mechanisms to permit inter-DF communication are not yet specified. Therefore, it is recommended that only a single DF be provisioned for all surveillances on a CS2K.

If multiple DFs are configured on a CS2K, for purposes of redundancy, it is recommended that only one DF be used at any given time, and all surveillances be provisioned to use it.

## 1.4 Configuration

PCES requires PCEM to be configured and active, as described in the documentation for activity A00007196 (PacketCable Event Messaging for SN08). However, where PCEM requires an RKS to receive accounting event messages and forward them to billing systems, PCES requires a DF to Electronic Surveillance event messages and call content, and to forward them to LEA Collection Functions (CFs).

In addition to the PCEM configuration, PCES also requires

### 1.4.0.1 Add DF tuple entries

PCES requires one or more DFs to be provisioned on the CM.

```
> table pcementt
> add DF <df_index> DF <CDC_IP> <CDC_PORT> <CCC_IP> <CCC_PORT>
  <ASSOC_EMDI>
```

For example, to provision a DF using CDC address and port 47.135.41.107:4000, and CCC address and port 47.135.41.107:5000

```
> add DF 3    DF 47 135 41 107 4000 47 135 41 107 5000 0
```

In this example 0 is the index in Table PCEMENTT of the record for the EMDI which will be used to send the event messages to the DF.

## 1.5 Hardware requirements

The PCES solution requires a PacketCable 1.1 certified network (CMTS, Trunk GW, DF, MTAs).

## 1.6 Limitations and restrictions

There is no support for PCES and USNBD interworking. USNBD is a CS2K Lawful Interception application.

Either USNBD is the active LI application or PCES is the active LI application. Both cannot be active at the same time.

A maximum of 5 surveillances may be provisioned against a subject. However only a single surveillance can be activate on a subject at any time.

When there is a change to the Line Class Code (LCC) of a DN (*e.g.*, from POTS to RES or *vice versa*), if that DN is the subject of an active surveillance, the surveillance will be deleted. An inactive surveillance will not be deleted.

PCES surveillance will fail if the DF is either not in service or not properly configured on the CS2K.

DOCSIS requires that connections between two endpoints having the same IP address (and hence hosted on the same MTA) must not be routed to the CMTS. Therefore PCES does not provide call content for a connection between two lines on the same MTA. This due to the fact that the voice stream for intra-MTA calls is locally routed and does not pass through the CMTS (the call content IAP).

## 1.7 Dependencies

The SOC state of USNBD must be set to ON for PCES SOC to be assigned state ON.

PacketCable Event Messaging (PEM) must be active on the switch.

## 1.8 Logs (LG)

All the UNB 300 logs are generated by PCES as they are by USNBD, with the exception of UNB301 (CDC), UNB303 (CCR), and UNB306, which are not generated by PCES. Access to UNB logs is only provided to PCES users through LOGUTIL's OPENSECRET command (no password is required).

LOGUTIL  
OPENSECRET UNB

USNBD log reports

- UNB300 - Reports problems with USNBD shared resources used by PCES
- UNB302 - Reports problems with USNBD processes used by PCES
- UNB304 - reports success and failure of surveillance activation and deactivation, and problems with surveillance activation.

The following is a sample surveillance activation log generated when a surveillance is activated.

```
COMIT_I07CU    UNB304 AUG20 14:15:53 3300 INFO
SURV ACT COMMAND SUCCESSFULLY PROCESSED
SURVEILLANCE HAS BEEN ACTIVATED
SIN: NYPD654
COMMAND ENTERED BY: USERJOE
```

When the line class code of a line changes, an active surveillance on the line will be removed. A UNB304 log will be generated as follows:

```
COMIT_I08AV    UNB304 NOV02 15:20:52 5100 INFO
SUBJECT HAS BEEN DELETED
SURVEILLANCE HAS BEEN DELETED
SIN: 9194303602
AGENCY:
SURV. DEFN.: DN 9194303602 9194303602 N Y N
```

- UNB305- reports problems that affect PCES administration data and reports all user creations and deletions
- UNB306 - Not used by PCES

## 1.9 Operational Measurements (OM)

Lawful Intercept OMs for group UNBCDC are not used by PCES.

Lawful Intercept OMs for group UNBMISC are used by PCES.

RELCPCY - Register RELCPCTY counts the number of monitored calls for which monitoring was stopped because monitoring capacity is exceeded.

RELNMON - Register RELNMON counts the number of calls for which monitoring was stopped because of non-monitorable features. **All features supported by the CS2K PacketCable solution are monitorable.**

UNBMCALL - Register UNBMCALL counts the number of calls monitored by USNBD. Register UNBMCALL determines the real-time impact monitored calls make on the CM.

## **1.10 Some differences between PCES and USNBD**

### **1.10.1 Performance management**

PCES differs from USNBD functionality described in NN10264-709 (I)SN07 Preliminary 01.01 September, 2004 Succession Performance Management Operational Measurements Reference.

The USNBD feature uses the registers in OM group CF3P to monitor usage of 3-way conference bridges used for combined call content resources (Combined CCRs). As PCES does not provide combined call content, this OM group is never incremented by PCES.

### **1.10.2 Private Network Interception**

USNBD can be configured to provide Private Network Interception, as described in NN10190-113 (Lawful Intercept). PCES cannot be configured to provide call content for connections which reside behind a private NAT.

### **1.10.3 User classes**

USNBD distinguishes between Regular users and Administrative users, who in addition to all Regular operations have the privilege to add and delete USNBD users. PCES does not have separate user classes, and any PCES user can add or delete PCES users.

### **1.10.4 Agency separation**

PCES does not support agency separation. All PCES surveillances are visible to all PCES users.

### **1.10.5 Bearer Channel Tandeming**

PCES does not perform call content interception using Bearer Channel Tandeming (BCT), hence all references to BCT and configuring a UAS for BCT do not apply.

### **1.10.6 Call Content delivery via CCRs**

PCES does not deliver call content to the LEA. Instead, Call Content is delivered by the CMTS or MG to the DF, which forwards call content to the LEAs as required. Consequently there is no provisioning of CCCs, or CCRs for PCES, nor is there any associating CCRs with or disassociating CCRs from a surveillance.

USNBD supports a test call capability in order to test CCRs. Since PCES does not provide the call content delivery directly to the LEA, it does not have CCRs and does not have the capability to test CCR call setup.

### **1.10.7 Call Data delivery via CDCs**

PCES does not deliver call data to the LEA. Instead, Call Data is delivered by the CMTS, and EMDI to the DF, which forwards call data to the LEAs as required. Consequently there is no provisioning of CDCs for PCES, nor is there any associating CDCs with or disassociating CDCs from a surveillance.

### **1.10.8 In-Band Digit Collection**

A USNBD surveillance can be provisioned to provide in-band digit collection. PCES does not provide this capability. In the PacketCable architecture in-band digit collection can be provided by the DF. In order to allow the DF to perform in-band digit collection it is necessary to provide the DF with the call content by provisioning the PCES surveillance as data\_content. A properly configured DF can then provide call content or call data to law enforcement as required.

### **1.10.9 In-band CCC\_ID tagging**

A USNBD surveillance can be provisioned to provide the CCC\_ID tag in-band on the call content channel. PCES does not provide call content directly to the LEA. This functionality could be provided by the DF, but is not discussed in the PacketCable specifications.

### **1.10.10 Provisioning surveillance**

NN10188-511 notes that lawful interception is provisioned on a line using the USNBD feature. This should also reflect that PacketCable-compliant Lawful Interception should be provisioned using PCES instead of USNBD.

## **1.11 Data schema (DS)**

No existing tables are modified and no new tables are introduced by this feature. The DF IP address and port, and the CBM application IP address and port, should be entered in Table PCEMENTT prior to defining surveillances.

## **1.12 Office parameters (OP)**

No new office parameters are introduced as part of this functionality.

## **1.13 Service orders (SO)**

No changes to Service Orders are required by this feature.

## **1.14 Alarms (AL)**

No new Alarms are introduced as part of this functionality.

## **1.15 Command interface (CI)**

### **1.15.1 New/modified commands**

This feature introduces a new CI which is used to provision PacketCable surveillances. Table 3 lists the set of PCES user commands.

**Table 3 PCES Commands**

| CI Command                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| >PCES                                                                                                                    | Enter the PacketCable Electronic Surveillance CI                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| >SURV ADD DN <10-digit DN><br><Case ID><br><br><SIN><br><br><Monitor Type><br><br><MRP><br><br><Delivery Function Index> | <p>Add a PCES surveillance by DN.</p> <p>The case ID is an arbitrary character string (up to 10 characters) which may be used for administrative purposes.</p> <p>The SIN is an alphanumeric string Surveillance Identification Name (up to 10 digits) which is used to uniquely identify a surveillance, and must be unique across all surveillances.</p> <p>The Monitor Type specifies whether it is a data-only surveillance (data) or a data-plus-content surveillance (data_content).</p> <p>The MRP field specifies whether Monitored Replacement Party functionality should be assigned to the surveillance. A Replacement Party is a party which the subject redirects his or her calls to, for example by Call Forwarding. The MRP field must be set to 'Y' since PacketCable 1.1 requires Replacement Parties to be monitored.</p> <p>The Delivery Function Index (or DF Index) is the index of the DF associated with the surveillance. This is the index which was assigned to the DF when it was entered in Table PCEMENTT.</p> |

| >HELP <option>; option = {help   surv   quit<br>  user}                                                                  | PCES CI help                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 1.15.2 Process of configuring PCES

1. Activate PCEM event messaging
2. SOC on PCES
3. Configure the EMDI in Table PCEMENTT
4. Bring the EMDI into service
5. Configure the DF in Table PCEMENTT

### 1.15.3 Process of setting up a PCES surveillance

1. Define the surveillance using the SURV ADD command

Example of adding a surveillance:

```
>surv add dn 9194303602 fbi sin123 data_content Y 4
```

Note that in PacketCable terminology the term Surveillance means call data only (data) and Intercept means call data plus call content (data\_content).

2. Activate the surveillance using the SURV ACT command

Example of activating a surveillance:

```
>surv act sin123
```

No monitoring is provided for any calls the subject is involved in when the surveillance is activated. Monitoring of calls will begin after the subject line becomes idle.

### 1.15.4 Process of removing a PCES surveillance

1. Deactivate the surveillance using the SURV DEACT command

Example of deactivating a surveillance:

```
>surv deact sin123
```

Note that when a surveillance is deactivated, any monitored calls in progress will continue to be monitored until completion. The DF may provide the capability to terminate monitoring at any time.

2. Delete the surveillance using the SURV DEL command

Example of deleting a surveillance:

```
>surv del sin123
```

## 1.16 Operational measurements (OM)

No new OMs are introduced as part of this functionality.

OM group PCEM pegs success or failure for every PCEM event message generated by the CM. PCES event messages are PCEM messages cause these registers to be incremented.

The register names and definitions are shown in Table 4 below.

**Table 4 PCEM OM Group Register Definitions**

| <b>PCEM Register Name</b> | <b>Definition</b>                    |
|---------------------------|--------------------------------------|
| EMSENT                    | Event message successfully generated |
| EMFAIL                    | Failed to build event message.       |
| EMSYSFL                   | System unable to send event message. |
| EMSENT2                   | Overflow register for EMSENT         |
| EMFAIL 2                  | Overflow register for EMFAIL         |
| EMSYSFL2                  | Overflow register for EMSYSFL        |

### 1.17 AMA/Billing information (AM)

PCES functionality requires the CS2K to be configured with PacketCable Event Messaging active. It does not require PacketCable event messaging Accounting to be active.

### 1.18 Software optionality control (SOC)

A new SOC code (NBD00005) has been implemented to support PCES and it has been added into the NBD SOC group.

NBD00005 requires NBD00003 (USNBD) to have SOC state ON. USNBD and PCES interworking is not supported and the two features cannot be used simultaneously on the same CS2K. Figure 5 lists the combinations of SOC codes that determine which application is active.

**Table 5 PCES/USNBD SOC states combinations**

| <b>NBD00003 USNBD SOC state</b> | <b>NBD00005 PCES SOC state</b> | <b>Active Application</b> |
|---------------------------------|--------------------------------|---------------------------|
| OFF                             | OFF                            | -none-                    |
| ON                              | OFF                            | USNBD                     |
| ON                              | ON                             | PCES                      |

## 1.19 Glossary

**Table 6 Terminology**

| Term | Definition                          |
|------|-------------------------------------|
| BCT  | Bearer Channel Tandeming            |
| CBM  | Core Billing Manager                |
| CCR  | Call Content Resource               |
| CDC  | Call Data Channel                   |
| CF   | Collection Function                 |
| CM   | Computing Module                    |
| CMS  | Call Management Server              |
| CMTS | Cable Modem Termination System      |
| CS2K | Call Server 2000                    |
| DF   | Delivery Function                   |
| EM   | Event Message                       |
| EMDI | Event Message Delivery Interface    |
| EMS  | Event Message Sender                |
| GW   | Gateway                             |
| GWC  | Gateway Controller                  |
| IAP  | Intercept Access Point              |
| IAA  | Integrated Accounting Application   |
| LEA  | Law Enforcement Agency              |
| LNP  | Local Number Portability            |
| MGC  | Media Gateway Controller            |
| MRP  | Monitored Replacement Party         |
| MTA  | Multimedia Terminal Adapter         |
| PC   | PacketCable                         |
| PCEM | PacketCable Event Messaging         |
| PCES | PacketCable Electronic Surveillance |
| RKS  | Record Keeping Server               |
| SDM  | Supernode Data Manager              |
| SIN  | Surveillance Identification Number  |

**Table 6 Terminology**

| Term  | Definition                        |
|-------|-----------------------------------|
| SOC   | Software Optionality Control      |
| TGCP  | Trunking Gateway Control Protocol |
| USNBD | US Network Broadcast Delivery     |
| VoIP  | Voice over IP                     |

## **A00007602--SDM Software Authenticity**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS, PT-AAL2

#### **1.2 Description**

The intent of this feature is to add more security to the SDM software delivery (patches and ESD loads), and guarantee that the SDM deliverable sent to the field is authenticated by Nortel.

Without this authentication a third party could deliver rogue software to a customer and there would be no way of detecting it. This feature will implement a method of digitally signing any software created by the SDM development team. The SDM deliverable would then be signature checked prior to being applied on the customer system.

This FN document describes the new procedures for the following software delivery applications, using software authentication:

- Patch Apply: New alarms and security logs are created to reflect patch signature check failures. An alarm clearing mechanism is also available to manually clear alarms after detecting bad software. Please refer to section 1.6.1 “Patch Apply” on page 1394 for the full details.
- ESD Load Upgrade: A signature check for the ESD load is done manually prior to the load upgrade. Descriptive messages are displayed to reflect software signature check failures. Please refer to section 1.6.2 “ESD load Upgrade” on page 1401 for the full details.

In SN08, this feature is primarily concerned with Electronic Software Delivery (ESD) and does not provide a solution to authenticate physical media (i.e. tapes).

Figure 1 “Software Management Architecture” on page 1393, provides a high level overview of the SDM software management architecture in SN08.

**Figure 1 Software Management Architecture**

### 1.3 Hardware Requirements or Dependencies

SDM system equipped with the SN08 hardware base line configuration.

### 1.4 Software Requirements or Dependencies

SDM system installed with the SN08 software.

### 1.5 Limitations and restrictions

- This feature supports software authentication only on the SDM platform in SN08, and does not support the CBM platform.

- The software authentication feature is not enabled on the SDM by default. In order to enable this functionality, the user needs to manually install the “SDM software Authentication services” package which will be part of the SDM SN08 load. Please refer to the SN08 SDM SW upgrade customer documentation (Upgrading the SDM - NN10059-461) for full details on how to install a SDM package.
- The software authentication functionality is only supported on patches and ESD loads, and does not support physical media (i.e. tapes). Applying software from physical media will succeed, but will not be authenticated.
- Customer documentation and release notes are not authenticated in SN08.
- Software loads that are serviced by the SDM’s bootp server, packaged through RPM (Redhat Package Manager), will not be authenticated in SN08. These packages are:
  - MG9K0070 (MG9K)
  - GWCC0070 (NA-GWC)
  - GWCW0070 (INTL-GWC)
  - SAM20070 (SAM21)
  - 3PC00070 (3PC)

## 1.6 Interactions

### 1.6.1 Patch Apply

The patch apply procedure (customer documentation) in SN08 is exactly the same as in SN07. In SN08, all patches are digitally signed during packaging, and a signature check is applied on each patch prior to patch apply. This signature check procedure is completely transparent to the user.

Signature check failures are reported as follows:

- A new “SDM Patch Check Status” indicator is introduced under the “sdmmtc sys” level. This state will reflect “Failed”, once a single patch fails signature checking. Please refer to 1.6.1.1 “Minor alarm to reflect patch signature check failure” on page 1395 for more details.
- A new minor alarm is generated under the “sdmmtc sys” level. Please refer to 1.6.1.1 “Minor alarm to reflect patch signature check failure” on page 1395 for more details.
- New security logs are generated to report patch signature check failures and manual alarm clearing. Please refer to 1.6.1.3 “Security logs to reflect Patch signature check failure” on page 1401 for more details.

All patches that fail signature checking will be moved to the following directory on the SDM:

/swd/sdm/fixes/rejected

A manual alarm clearing mechanism is provided to clear the alarm after detecting bad patches. Please refer to 1.6.1.2 “Manual alarm clearing” on page 1397 for more details.

#### 1.6.1.1 Minor alarm to reflect patch signature check failure

A new “SDM Patch Check Status” indicator is introduced under the “sdmmtc sys” level, to reflect the state of patch signature checking. By default this status indicator is set to “.” (in-service), to indicate that no patch failed through signature checking prior to patch apply. Figure 2 “SDM Patch Check Status indicator” on page 1396 reflects the new patch check status indicator.

The user will receive no indication of successful patch checking/apply. Once a single patch fails signature checking, the “SDM Patch Check Status” indicator will reflect a “Failed” indication, and a minor alarm will be generated under the “sdmmtc sys” level. Figure 3 “Patch signature check failure indication” on page 1397 reflects a failure with the patch signature checking.

A security log is generated to reflect the signature check failure (associated with the minor alarm). Please refer to 1.6.1.3 “Security logs to reflect Patch signature check failure” on page 1401.

**Note:** Patches that fail signature checking will not be listed under “sdmmtc swim apply” level once the source command is invoked. The failed patches will be moved to the /swd/sdm/fixes/rejected directory. It is expected that the user detects the minor alarm, reads the security log, and checks the rejected directory for the failed patches.

**Figure 2 SDM Patch Check Status indicator**

**1.6.1.2 Manual alarm clearing**

A manual alarm clearing mechanism is provided to clear the minor alarm generated by the patch signature check failure. Once the failure is detected, the user can clear the minor alarm manually by executing the “patch clear” command from the “sdmmtc sys” level. Please refer to Figure 4 “Manual alarm clearing” on page 1399 for the actual command invocation and system responses.

Once the alarm is manually cleared, the “SDM Patch Check Status” indicator is set to “.” as shown in Figure 2 “SDM Patch Check Status indicator” on page 1396.

A security log is generated to reflect alarm clearing. Please refer to 1.6.1.3 “Security logs to reflect Patch signature check failure” on page 1401 for the actual log generated.

### 1.6.1.3 Security logs to reflect Patch signature check failure

Security logs are generated to reflect patch signature check failure and alarm clearing. Examples of the security logs are shown in Figure 5 “Security logs” on page 1401.

**Figure 5 Security logs**

#### **Signature check failure:**

Aug 24 14:58:02 wcary2p4 syslog: SDM337 MINOR TBL SDM Base Maintenance  
Patch NT\_SIM.tools-21.35.6.2.patch failed signature checking.

#### **Alarm clearing:**

Aug 24 15:05:32 wcary2p4 syslog: SDM637 NONE INFO SDM Base Maintenance  
Patch check status is cleared by user.

## 1.6.2 ESD load Upgrade

An extra step is required to the ESD load upgrade procedure in SN08. A signature check is applied on all of the filesets included in the ESD load. A successful signature check is required on all of the filesets, for the ESD load to pass signature checking. If at least one fileset fails signature checking, the whole load must be rejected.

In summary, the following steps are required for an ESD load upgrade:

- Create a filesystem on the SDM (ex: /load), to hold the ESD load.
- Download the ESD load into the SDM (under the created filesystem).
- Extract the load (unzip/untar the load).
- Invoke signature checking (new step introduced in SN08). Please refer to 1.6.2.1 “ESD Load signature checking” on page 1401 for full details.
- Upgrade the SDM to the new load, provided that a successful signature check is achieved.

Please refer to the SN08 SDM SW upgrade customer documentation (Upgrading the SDM - NN10059-461) for full details of the ESD load upgrade. This section will only address the new introduced ESD load signature checking step.

### 1.6.2.1 ESD Load signature checking

A new command “verifyload” is introduced in SN08 to perform a signature check on the ESD load. This command is packaged within the ESD load. Once the load is extracted on the SDM, the user is expected to invoke the

“verifyload” command manually from the command line before starting the upgrade.

No alarms and security logs are generated in case the ESD load fails signature checking. Instead, a message is displayed on the screen indicating the result of the signature check. It is the responsibility of the user to reject the load and contact “Nortel next level of support” in case of a signature check failure.

Figure 6 “ESD load signature check” on page 1402 show the actual command to perform the signature check on ESD load, and the different expected return messages (success and failure). The “verifyload” command is located under the same directory as the ESD load (the filesystem that holds the load).

**Figure 6 ESD load signature check**

```
# ./verifyload
```

Checking the integrity of the load, please wait....

**Successful return message:**

Integrity and signature check completed successfully.  
Please continue with the upgrade.

**Failure return messages (could be either one of the following messages):**

This load include missing packages.  
Please contact your next level of support.

This load include zero size packages.  
Please contact your next level of support.

This load failed signature checking.  
Please contact your next level of support.

Signature check cannot not be completed.  
Please contact your next level of support.

Integrity check failed, unknown failure.  
Please contact your next level of support.

## *Product = CS 2000*

## **A00007635--CBM Upgrades**

### *Functional Description*

#### **1.1 Applicable Solution(s)**

PT-IP, DMS, PT-AAL2

#### **1.2 Description**

The purpose of this feature is to provide a mechanism to upgrade the CBM 850 product from release CBM07 to release CBM08. The CBM 800 product is not being released for CBM08 and will not be discussed within this document.

The CBM upgrade procedure will involve the upgrade of the SSPFS platform and the upgrade of the CBM applications. The upgrade of the SSPFS platform will not be discussed within this document as it will be discussed within the “SSPFS Upgrades For SN08, A0000817” feature FN. It is important to note that the CBM upgrade procedure will be automatically initiated by the SSPFS platform upgrade.

Another important note is that the CBM07 applications will still reside on the CBM after a successfully completed upgrade. These applications will be dormant however. A separate procedure outside of the upgrade will allow the customer to remove “older” versions of software that are dormant on the system and will not be discussed within this document.

The CBM 850 product is a High Availability cluster made up of an active node and an inactive node. To ensure that the CBM will remain within an HA configuration, a separate boot environment (BE) on the inactive node is

created in which the application upgrade will actually take place. This means that inactive node is still running the CBM07 release in standby mode. This process is actually performed using the Sun Solaris LiveUpgrade suite. The creation of this separate BE will be performed within the SSPFS platform upgrade procedure.

For CBMs in wireless market, the CBM Upgrade will automatically initiate the Wireless upgrade procedure after the required packages, value added packages and patches are applied to the system.

A successful CBM upgrade procedure is as follows:

**Note:** The creation of the separate boot environment and the upgrade of the operating system and other platform software within this separate environment would have been completed by the SSPFS platform upgrade. The CBM procedure starts when the platform upgrade initiates the CBM upgrade.

**Note:** Once the “clone” has been initiated at the end of a successful upgrade, NO fallback to CBM07 will be possible. In order to return the CBM to the CBM07 release, a restore or a fresh install would be required.

- Load the CBM08 software media (CDROM or ESD image file)
- Perform pre-upgrade checks
- Upgrade all CBM08 850 required packages
- Upgrade all value added CBM08 packages
- Apply patches, if any, for the CBM08 load
- Initiate Wireless Upgrade (if necessary)
- Perform post-upgrade checks
- Activate CBM08 load and reboot the CBM08 Inactive node (automatically done by SSPFS upgrade script)
- Perform SWACT from CBM07 node to the CBM08 node (manually initiated by the user)
- Clone the CBM08 node onto the CBM07 node (manually initiated by the user)

### 1.2.1 Logs

Upgrade logs for the CBM will be located within the /var/adm/ directory of the CBM07 environment in a file called cbm\_upgrade\_<from>\_to\_<to>.log where “from” and “to” are the release numbers involved. This log will be transferred to the CBM08 environment before the SWACT.

A customer log will be generated for any CBM upgrade failure. The log will identify the upgrade stage at which failure occurred, the upgrade log.

## 1.2.2 Failures

If a failure occurs during the upgrade, a message will be displayed to the user describing the failure and informing the user to contact next level support. The user will be provided a prompt to 1) Enter a maintenance shell where command could be executed in an attempt to correct the error. Exiting the maintenance shell will re-execute the step that failed. 2) Perform a fallback. This will send a signal back to the SSPFS upgrade for SSPFS to initiate a fallback. Both the Maintenance Shell and the Fallback have a yes/no user confirmation, answering no will re-execute the failed step.

### 1.2.2.1 Fallbacks

Fallbacks during the CBM upgrade would depend on which CBM load, 07 or 08, has been Activated on the inactive node at the time. A fallback will mean that the CBM inactive node will be put back into its original configuration of CBM07 inactive.

If a failure occurs before the “Activate CBM08 load and reboot the Inactive” step then,

- The user would have requested a fallback at a fallback prompt
- The CBM08 separate environment will be deleted

If a failure occurs after the “Activate CBM08 load and reboot the Inactive” upgrade step, but before the SWACT, then,

- The user would execute the SSPFS fallback command
- The CBM07 load will be “Activated” on the inactive node
- The Inactive node will be rebooted
- The CBM08 separate environment will be deleted

If a failure occurs after the SWACT from the CBM07 active node to the CBM08 inactive node then,

- The user would execute the SSPFS fallback command
- A SWACT is performed back to the CBM07 node
- The CBM07 load will be “Activated” on the inactive node
- The Inactive node will be rebooted
- The CBM08 separate environment will be deleted

### 1.3 Hardware Requirements or Dependencies

- CBM850 HA dual node Cluster hardware baseline
- HA Cluster must be fully in-service
- HA cluster must have no alarms

### 1.4 Software Requirements or Dependencies

- CBM must have a patch current CBM07 release.
- All CBM applications must not be in the Fail or Sysb state

### 1.5 Limitations and restrictions

- The CBM08 upgrades will not include the CBM800 product. Only the CBM850 HA configuration will be supported.
- The CBM08 media (CD or ESD) must have been delivered to the customer site prior to the commencement of the upgrade
- The ESD image must be located within the /swd/sdm directory.
- There is no upgrade support for single server CBM 850. A single server 850 must be converted into a dual node HA cluster configuration running CBM07 before being upgraded to CBM08.

### 1.6 Interactions

The CBM upgrade process involves the initial execution of the SSPFS platform upgrade procedure from which the CBM upgrade procedure will be automatically initiated.

#### 1.6.1 Load the CBM08 software media (CDROM or ESD image file)

The CBM load is available on CDROM and via an ESD image (Electronic Software Delivery).

The user will be asked which media type they will be using (CDROM or ESD)

For CDROM, the user will be asked to place the CBM CD disk into the CDROM drive on the Inactive Node. The user will be prompted to “Start” the upgrade once the CDROM has been placed into the drive.

For ESD, the ESD image will be prepared for use and the CBM upgrade will be started automatically. The user will be notified if the ESD image has not been found in the proper location or if there is a problem extracting and preparing the ESD image for use.

In the event of any failure, the user will be prompted to

- 1) Enter a maintenance shell to suspend the upgrade and correct the failure,
- 2) perform a fallback to cancel the upgrade.

### **1.6.2 Perform Pre-upgrade checks**

The prechecks for the CBM upgrade will be performed before any software is upgraded.

#### **1.6.2.1 Examine CBM alarm and Node states**

The CBM should have no major alarms before attempting to perform the CBM upgrade. If an alarm does exist, the user will be notified to contact next level support and is provided a prompt to 1) Suspend the upgrade and enter a maintenance shell to investigate the alarms, 2) perform a fallback to cancel the upgrade and 3) Continue with the upgrade, ignore the alarms.

#### **1.6.2.2 Verify separate upgrade environment**

If the separate boot environment does not exist the user will be notified that the separate boot environment does not exist and that the CBM upgrade cannot be executed.

The only way for a user to obtain this message would be if the `cbm_setup` upgrade script was being executed manually for an upgrade and the `sspf` platform had not been performed.

#### **1.6.2.3 Verify the CBM base directory**

All CBM packages have what is called a BASE Directory or BASEDIR. The directory must exist before attempting to apply the CBM packages.

The platform upgrade will create this directory because there is a CBM package that gets applied during their upgrade procedure. In the event that the directory does not exist, it will be created automatically.

If the directory does not exist, the user will be notified that the CBM Base directory does not exist and that it will be created.

#### **1.6.2.4 Examine installed software**

In order to apply the common packages, a list of the applications that are currently installed within the separate boot environment is generated. This list is required for future steps of the upgrade.

In the event that the software list cannot be created, the user will be notified that there appears to be a problem with the separate boot environment and that the CBM upgrade cannot continue.

### **1.6.3 Upgrade all CBM08 850 required packages**

Required packages are the core applications on the CBM that provide base and service level support.

In the event of a failure to apply any one of the packages the user will be notified of the failure, where the log can be obtained and that they should contact next level support and is provided a prompt to 1) Suspend the upgrade and enter a maintenance shell to correct the failure, 2) perform a fallback to cancel the upgrade.

#### **1.6.4 Upgrade all value added CBM08 packages**

Value added packages are applications that do not make up the required list of applications. The separate boot environment is examined for CBM07 applications. All CBM07 applications that exist within the separate environment and have not yet been upgraded to the CBM08 load are automatically “selected” and applied. A list of the “selected” packages is displayed and then the status of applying each package is displayed.

In the event the CBM does not have any “value added” packages, this step will not be executed.

The actual apply of the value added packages is performed using the command line version of the well known SDM/CBM SWIM application. The output of the swim command line is the same as the output of the SWIM applications within the sdmmtc/cbmmtc interface.

Value added packages may have a “configuration” script that needs to be executed after installation. The scripts will prompt the user for information that will be used later on when the application is turned on or RTS'd.

In the event that there are configuration scripts to apply, the user will be notified that the scripts will be executed in which the user will be requested to press ‘return’ to start the execution of the scripts.

In the event of a failure to apply any one of the packages the user will be notified of the failure, where the log can be obtained and that they should contact next level support and is provided a prompt to  
1) Suspend the upgrade and enter a maintenance shell to correct the failure,  
2) perform a fallback to cancel the upgrade.

#### **1.6.5 Apply patches, if any, for the CBM08 load**

Once all the CBM08 packages have been applied into the separate boot environment, any patches that have been delivered with the CBM media are automatically applied, making the CBM08 load patch current.

The output of the patch apply is the same output as the current CBM patchctrl command.

In the event of a failure to apply any one of the patches the user will be notified of the failure, where the log can be obtained and that they should contact next level support and is provided a prompt to

- 1) Suspend the upgrade and enter a maintenance shell to correct the failure,
- 2) perform a fallback to cancel the upgrade.

### 1.6.6 Initiate Wireless Upgrade

For CBMs within the wireless market, there are additional packages that need to be upgraded. These packages reside on a different media than the CBM product.

If the CBM is a wireless CBM, the wireless upgrade start script will automatically be executed.

### 1.6.7 Perform post-upgrade checks

To ensure that the CBM is still in a healthy state before we perform the reboot and swact upgrade stages, the following checks will be performed.

The CBM should have no major alarms before attempting to perform reboot and swact portion of the upgrade. If an alarm does exist, the user will be notified to contact next level support to investigate the alarm and is provided a prompt to 1) Enter a maintenance shell to investigate the alarms, 2) perform a fallback to cancel the upgrade and 3) Continue with the upgrade, ignore the alarms.

### 1.6.8 Activate CBM08 load and reboot the inactive node

The separate boot environment is automatically “activated” which prepares the system to have the CBM08 load upon a reboot. The activation and reboot of the inactive node is done by the SSPFS upgrade script once the CBM portion of the upgrade is successfully completed.

*Note:* Only the inactive node will be rebooted. The Active node running the CBM07 release will still be providing service.

### 1.6.9 Perform SWACT from CBM07 node to the CBM08 node

Since the CBM upgrade script is no longer running, this step will be a documented procedure. Within documentation, the user will be requested to log into the CBM07 active node as the root user once the CBM08 inactive node has successfully rebooted. For the command line on the CBM07 active node, the user will be documented to execute the “init 0” command to force a swact and prepare the CBM07 active node for the clone operation if the upgrade is successful.

Executing the “init 0” will make the CBM08 inactive node the CBM08 active node, meaning that the new CBM08 software is now running. The CBM07 node is now the inactive node.

This process would be described in more detail within the “SSPFS Upgrades For SN08, A0000817” feature FN.

### 1.6.10 Clone the CBM08 node onto the CBM07 node

If the CBM08 active node applications are all INSV and operational, the documentation will inform the user to initiate the “clone” sequence to change the CBM07 inactive node into a CBM08 inactive node.

This process would be described in more detail within the “SSPFS Upgrades For SN08, A0000817” feature FN.

Fallbacks are no longer possible once this stage of the upgrade is initiated. A restore from backup or a fresh install would be required to go back to the CBM HA cluster running the CBM07 load.

## **A00007709--MCS CD Phase 2 Support**

### ***Functional Description***

### **1.1 Applicable Solution(s)**

DMS

### **1.2 Description**

MCS Converged Desktop Phase 2 is a MCS feature that has a dependency on switch-based functionality in order to provide the presence-indication and call logging services for non-MCS (i.e., switch-based) subscribers.

This switch-based functionality is controlled by a new Software Order Code (SOC) MCD00002 in SN08. This new order code implemented by this activity replaces ACT patches SBB44 for SN04/SN06/SN07 releases and TWH36 for SN06/SN07 releases.

This feature, when enabled via the SOC MCD00002 along with AIN 0.1 (AIN Essentials) software, will enable the MCS Converged Desktop Phase 2 feature to operate correctly. It does so by adding incremental AIN support for CONTINUE response to the AIN 0.1 Off Hook Delay (OHD) trigger query message.

The SOC option MCD00002 is dependent on AIN Essentials software; order code AIN00006. It may only be enabled and used in conjunction with MCS Converged Desktop and is not supported for any other application.

When a MCS CD office with patch TWH36/SBB44 activated on SN06/SN07 upgrades to SN08 or higher release, the SOC option MCD00002 will be automatically turned ON during ONP.

Please refer to figure 1 “Functional Behavior Diagram” on page 1412 for an overview of how SOC MCD00002 and AIN00210 control the AIN Continue message functionality for OHD trigger.

**Figure 1 Functional Behavior Diagram**

### 1.3 Hardware Requirements or Dependencies

None.

### 1.4 Software Requirements or Dependencies

AIN Essentials.

### 1.5 Limitations and restrictions

None.

### 1.6 Interactions

No new AIN feature interactions are introduced by this feature.

## **A00007752--Universal Billing Correlation ID**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS

#### **1.2 Description**

This activity will start the ground work for creating, storing and formatting a universal billing correlation id (UBCID). Currently the MCS generates its own BCID. The CS2K and GWC generate their own BCID for AMA/QOS correlation. With the various agents creating their own correlation id's, it is impossible to correlate the various records which can be produced during a call. Future activity work will provide correlation of these records from end to end.

PacketCable event messaging defines a billing correlation id which is currently used for the cable solution, since this correlation id is an accepted standard we will use the format defined by PCEM for our UBCID. The UBCID will be formatted for the following billing types: Bellcore AMA format (BAF), UCS Flex CDR and AT&T CDR2BAF format. There are currently other activities which are creating billing correlation id's for MCS and NGSS, future activity work will attempt to merge all of these billing correlation id into one format.

#### **1.3 Required Datafill Changes to activate this feature:**

The following sections describe the datafill changes required to activate this feature for both the BC AMA format and CDR billing formats.

### 1.3.1 BC AMA: Table AMAOPTS

To allow the recording of the UBCID for BC format AMA a new option “**CORRID**” is introduced into table AMAOPTS. This is an ON/OFF option. When “**CORRID**” is set to “**ON**”, a module code 613 will be appended to the base billing record which requires the collection of the UBCID.

| Table   | Desc                                                                                           |
|---------|------------------------------------------------------------------------------------------------|
| AMAOPTS | New option <b>CORRID</b> is added to the AMAOPTS table to capture the UBCID for BC AMA format. |

Sample datafill for table **AMAOPTS** (new field in bold).

| OPTION | SCHEDULE |
|--------|----------|
|--------|----------|

-----

|               |     |
|---------------|-----|
| CMCORIG       | ON  |
| CMCTERM       | ON  |
| COIN          | ON  |
| <b>CORRID</b> | ON  |
| CRSEQNUM      | OFF |
| CRT_BILLING   | OFF |

### 1.3.2 CDR: Table CDRTMPLT

To allow the capture and recording of the UBCID for CDR, new parameter “**CORRID**” is added to the list of parameters which can be datafilled in table CDRTMPLT.

| Table    | Desc                                                                                                         |
|----------|--------------------------------------------------------------------------------------------------------------|
| CDRTMPLT | A new parameter for the FIELDS and REORIGCP subfields of table CDRTMPLT is added to record the UBCID for CDR |

Sample datafill for table **CDRTMPLT** (new fields in bold):

NAME ACTIVE PRIMARY FIELDS REORIGCP

## 1.4 Billing record layout and logs

### 1.4.1 BC format AMA - Module code 613

The option CORRID in table AMAOPTS triggers the additional module code 613 with context id 800xx for calls requiring the capture of the UBCID. The format of the module code 613 with the context id of 800xx is as follows:

- The context id 800xx is a 45 digit register.
- The first 8digits are the NTP timestamp.
- The next 5 digits is the Element\_id.
- The next 8 digits is the Time Zone.
- The next 10 digits is the Event counter
- These 35 digits combine to make up the UBCID
- The remaining 12 digits are padded with zeroes and a 'C' delimiter.

Below is a sample of the module code 613 which will be appended to the base billing record.

**Figure 2 Example of module code 613 With Context ID 800xx**

|                             |                  |                                |
|-----------------------------|------------------|--------------------------------|
| MODULE CODE:                | 613C             | GENERIC MOD: THREE DGT STR FMT |
| GENERIC CONTEXT ID:         |                  |                                |
| PARSE RULES                 | 800xx            | Universal Billing Corr ID      |
| SIGNIFICANT DIGITS          | 31C              |                                |
| GENERIC DIGIT STRING ONE:   | 132431017712391C |                                |
| GENERIC DIGIT STRING TWO:   | 345678123456781C |                                |
| GENERIC DIGIT STRING THREE: | 100000000000000C |                                |

**1.4.2 CDR: New Field Description**

The new data captured by this activity will be formatted into the CDR record using the following layout:

| Field Name | Chars | CDR Field Description                          |
|------------|-------|------------------------------------------------|
| CORRID     | 27    | Contains the Universal billing correlation id. |
|            |       |                                                |

## **A00007790--P-phone expansion for CICM lines**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP, DMS

#### **1.2 Description**

This feature will increase the number of Meridian Business Sets (such as M5216) which can be provisioned in Succession offices from the current limit of 31,743 to a new limit of 150,000. The same increase will apply to the number of add-on modules (such as M518 and M536) which can be assigned to these sets.

This activity will only impact the number of tuples which can be provisioned in table KSETINV. Other than that there are no customer visible changes to any of the Key-set provisioning tables nor is there any impact on Servord. There are also no customer visible changes to any of the functionality currently provided by Meridian Business Sets.

#### **1.3 Hardware Requirements or Dependencies**

Not applicable.

## 1.4 Software Requirements or Dependencies

None.

## 1.5 Limitations and restrictions

Although this feature is being done mainly to support Centrex IP clients which are provisioned as M5216 sets, the new limit will apply across all types of business sets which can be provisioned in table KSETINV.

It should also be noted that this feature does not increase the number of equivalent DN appearances (or virtual lines<sup>11</sup>) which can be supported on these Business Sets. Please see Section 1.6, “Interactions”, on page 1419 for further details.

## 1.6 Interactions

Every P-phone provisioned in table KSETINV takes up one line card slot on the line peripheral (or node). In the case of IP Clients, the line peripheral is represented by a Logical Group that is provisioned in table LGRPINV.

Each peripheral or Logical Group maps to a single node which can support up to 1024 lines. In addition, virtual nodes are required to support the DN appearances provisioned on Business Sets in table KSETLINE as well as certain features provisioned in table KSETFEAT. These virtual nodes can support up to 2050 equivalent DN appearances (or virtual lines). The number of virtual nodes required therefore depends on the configuration of the business sets.

As an example, 150 thousand IP Clients provisioned in table KSETINV would require at least 150 Logical Group nodes. Assuming an average of 4 equivalent DN appearances per Business Set, then an additional 300 virtual nodes would be required ( $150K \times 4 = 300 \times 2K$ ).

Strictly from a node perspective these numbers can be supported without any additional development in the Core. Up to 1024 line peripherals (or Logical Groups) can be defined in an office of which up to 944 can be virtual. The 150 thousand IP Clients would therefore require 150 Logical Groups, leaving 874 nodes available for virtual lines.

---

11. One virtual lines is required for each DN appearance as well as services such as Call Waiting, Ring Again and certain programming features.

## 1.7 Glossary

| Term    | Description               |
|---------|---------------------------|

### **A00007934--E800 Routing Enhancements**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS, PT-AAL2

#### **1.2 Introduction**

Enhanced 800 (E800) is a U.S. service currently available in the DMS software. E800 service provides the ability to route toll-free 8XX (e.g. 800) calls in a telecommunications network. The 8XX numbers must be mapped to a specific directory number and can be carried by either the Local Exchange Carrier (LEC) or a specific Inter-Exchange Carrier (IEC). When an 8XX call is originated, a database query is performed using the Transaction Capabilities Application Part (TCAP) layer of the Signaling System 7 (SS7) protocol. The database contains a mapping of 8XX numbers to routing directory numbers. Additionally, the database identifies the IEC to handle the call (when applicable). This information is returned in an E800 Response to the switch that initiated the query. The returned information is used by the switch for translations and routing.

Currently, the DMS100/CS2000 End Office (EO) switch provides two methods for translating an E800 Response:

1. Translate using the Standard Pretranslator (STDPRT) name of the originating subscriber.
2. Translate using the STDPRT name provisioned for option PRETRAN in table NSCDEFS. With this option, all E800 Response translations use a single STDPRT subtable.

With the first method, the STDPRT name of the originating subscriber is used when performing the E800 Response translation. However, this method may cause interaction issues with other datafill in the originating subscriber's STDPRT subtable. For example, if the STDPRT subtable contains datafill to route toll calls to treatment (i.e. toll denied), the E800 Response translation may route to treatment in error.

The second method was introduced as a provisioning alternative to avoid interactions with datafill in the originating subscriber's STDPRT subtable. With the second method, a single STDPRT name is provisioned via option PRETRAN in table NSCDEFS. This STDPRT name provides an *override* to the originator's STDPRT name and is used for translating all E800 Responses.

However, with routing provided via a single STDPRT subtable, all E800 Response translations are limited to a single set of routes<sup>12</sup>.

This activity provides additional flexibility for E800 Response translations by supporting *multiple* STDPRT names as an *override* to the originator's STDPRT name. With the support of multiple STDPRT names, a DMS100/CS2000 EO switch can be configured with multiple routes<sup>13</sup>. This flexibility is provided with the introduction of new option PRETRANMAP in table NSCDEFS and the introduction of new table NSCPMAP. Table NSCPMAP provides a method to *override* or *map* the originating subscriber's STDPRT name with a new STDPRT name.

A new Software Optionality Control (SOC): NTS00030, "E800 Pretran Mapping" is created for this activity. This SOC has an RTU of A/P (Always Present), and it is always at ON state. New option PRETRANMAP, in table NSCDEFS, always takes precedence over existing option PRETRAN since SOC NTS00030 is always set to ON.

## 1.3 Description

The combination of new table NSCPMAP and new option PRETRANMAP (in table NSCDEFS) provides the flexibility to support multiple STDPRT names for E800 Response translations.

Table NSCPMAP is introduced to provide a mapping from the originator's STDPRT name to a new STDPRT name for use by the E800 Response translation. By providing a mapping on a per originating subscriber's STDPRT name basis, E800 terminating routes can be (indirectly) configured on a per-originating subscriber basis.

New option PRETRANMAP is added to table NSCDEFS as a provisioning trigger for activating a lookup in new table NSCPMAP. In addition, new option PRETRANMAP provides equivalent functionality to the existing NSCDEF's option PRETRAN. This is accomplished by adding fields CALLS and IGNORE<sup>14</sup> to option PRETRANMAP.

The following sections provide a detailed description for this new capability.

### 1.3.1 New Table NSCPMAP

New table NSCPMAP provides the ability to override the originating subscriber's STDPRT name with a new STDPRT name for the E800 Response

---

12. This restriction applies when the routing is performed from the STDPRT subtable. E800 calls that complete to the IEC are routed from the STDPRT subtable.

13. Applies when routing is performed from subtable STDPRT. E800 calls that complete to the IEC are routed from the STDPRT subtable.

14. Existing option PRETRAN in table NSCDEFS consists of fields CALLS and IGNORE.

translation. Table NSCPMAP is accessed when new option PRETRANMAP is provisioned in table NSCDEFS.

Refer to Table 1 on page 1424 for a description of table NSCPMAP. The key field, **ORIGPTNM**, is the originating subscriber's STDPRT name. This STDPRT name is *mapped* to the new STDPRT name that is provisioned for field **MAPPTNM**. The *mapped* STDPRT name is used for the E800 Response translation. Note that neither key ORIGPTNM or field MAPPTNM can be provisioned with the nil pretranslator name - "NPRT". Table control will enforce this restriction.

**Table 1: New Table NSCPMAP**

| Key & Field    | Values             | Comments                                                                               |
|----------------|--------------------|----------------------------------------------------------------------------------------|
| Key: ORIGPTNM  | PRETRANSLATOR_NAME | The table key specifies the originating subscriber's STDPRT name.                      |
| Field: MAPPTNM | PRETRANSLATOR_NAME | This field specifies the new STDPRT name to be used for the E800 Response translation. |

The functionality provided by table NSCPMAP is not activated until option PRETRANMAP is provisioned in table NSCDEFS.

Following is a provisioning example for new table NSCPMAP:

|                       |         |
|-----------------------|---------|
| <u>TABLE: NSCPMAP</u> |         |
| ORIGPTNM              | MAPPTNM |
| -----                 |         |
| P819                  | P800    |

### 1.3.2 New Option PRETRANMAP, Table NSCDEFS

To enable the functionality provided by this activity, new option PRETRANMAP must be provisioned in table NSCDEFS. Option PRETRANMAP consists of three fields as shown in Table 2 on page 1425.

**Table 2: Table NSCDEFS, New Option PRETRANMAP**

| New Option | Subfields         | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRETRANMAP | DEFPREXLA         | Specifies the default STDPRT name that is to be used if no entry is found in table NSCPMAP.<br>When provisioned to NPRT and no entry is found in table NSCPMAP, the originating subscriber's STDPRT name is used.<br><br>If option PRETRAN already exists in table NSCDEFS, consideration should be given to provisioning option PRETRANMAP with the same <i>values</i> as existing option PRETRAN. By provisioning the same <i>values</i> , the switch behavior is unchanged from option PRETRAN for those STDPRT names that are not provisioned in table NSCPMAP. |
|            | CALLS {ALL, COIN} | Specifies whether ALL calls or only COIN calls should use this functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | IGNORE {Y/N}      | Specifies whether this option should be ignored for the AIN or LNP Response translation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Option PRETRANMAP provides equivalent functionality to existing option PRETRAN by supporting subfields CALLS and IGNORE. Additionally, a DEFPREXLA field is provided which specifies the default STDPRT name to be used in the event an entry is not found in table NSCPMAP. By provisioning a default STDPRT name, only exception cases need to be provisioned in table NSCPMAP.

An added capability provided by option PRETRANMAP is the ability to use the originator's STDPRT name, rather than a default STDPRT name, in the event an entry is not found in table NSCPMAP. This is accomplished by provisioning NPRT for subfield DEFPREXLA.

An added capability provided by option PRETRANMAP is the ability to use the originator's STDPRT name, rather than a default STDPRT name, in the event an entry is not found in table NSCPMAP. This is accomplished by provisioning NPRT for subfield DEFPREXLA.

Following is a provisioning example for new option PRETRANMAP in table NSCDEFS:

| <u>TABLE: NSCDEFS</u> |         |                            |
|-----------------------|---------|----------------------------|
| NSCCODE               | TIMEOUT | OPTIONS                    |
| -----                 |         |                            |
| E800                  | 3       | (PRETRANMAP PDEF ALL N) \$ |

Existing Option PRETRAN Considerations:

New option PRETRANMAP can be configured to function identical to existing option PRETRAN in table NSCDEFS. This is accomplished by provisioning option PRETRANMAP with the same values that are provisioned for existing option PRETRAN and by not adding STDPRT names in table NSCPMAP.

If existing option PRETRAN functionality is required with the exception of those STDPRT names provisioned in table NSCPMAP, new option PRETRANMAP should be provisioned with the same values as existing option PRETRAN. In this case, new option PRETRANMAP will provide equivalent functionality to existing option PRETRAN with the exception of those STDPRT names provisioned in table NSCPMAP.

### 1.3.3 New SOC NTS00030

SOC NTS00030, “E800 Pretran Mapping” is added by this activity. This SOC is always at ON state and does not control the feature functionality. This SOC has an RTU of A/P (Always Present) and the state cannot be changed to IDLE.

Note SOC NTS00030 requires SOC NTS00005, “E800-US”.

New option PRETRANMAP in table NSCDEFS controls both the call processing and Traver enhancements provided by this activity (refer to sections “Call Processing” on page 1427 and “Traver” on page 1430).

### 1.3.4 Recommended Provisioning Procedure for PRETRANMAP

The following provisioning procedure is recommended:

1. Add the required STDPRT name tuples to table NSCPMAP.
2. For the E800 service, add new option PRETRANMAP in table NSCDEFS. Do not immediately remove option PRETRAN if it is currently provisioned. Once option PRETRANMAP is added, the new functionality is active and option PRETRAN is no longer referenced by the switch software.

If option PRETRAN is currently provisioned in table NSCDEFS, consideration should be given to provisioning option PRETRANMAP

with the same *values* as existing option PRETRAN. By provisioning the same *values*, the switch behavior is unchanged from option PRETRAN for those STDPRT names that are not provisioned in table NSCPMAP.

To revert back to the functionality provided by existing option PRETRAN, option PRETRANMAP should be removed from table NSCDEFS. Option PRETRAN (if previously provisioned) must still be present in table NSCDEFS to revert back.

Once the switch is properly configured to use option PRETRANMAP and table NSCPMAP, existing option PRETRAN can optionally be removed from table NSCDEFS. Removal of option PRETRAN is not mandatory.

### 1.3.5 Call Processing

The DMS100/CS2000 EO call processing software is enhanced to use the new functionality provided by option PRETRANMAP and table NSCPMAP. Figures 1, 2 and 3 provide flow charts of the enhanced call processing behavior. The call processing software enhancements are active only when option PRETRANMAP is provisioned in table NSCDEFS.

Note that figure 2 depicts the switch behavior when an E800 Query is performed on a call and a non-IEC routing number is returned from the E800 database. The E800 Response translation subsequently hits an AIN or LNP trigger resulting in a query to the AIN/LNP database. The IGNORE subfield for option PRETRANMAP specifies whether the AIN/LNP Response translation should ignore the PRETRANMAP option and use the originating subscriber's pretranslator.

Figure 1 E800 Response Translation

**Figure 2 AIN/LNP Response Translation following an E800 Query**

**Figure 3 Response Translation - Part 2**

### 1.3.6 Traver

The DMS100/CS2000 EO Traver software is enhanced to support the display of new option PRETRANMAP in table NSCDEFS and to display the contents of new table NSCPMAP. The existing “NSC” Traver command line option must be input in order to see the new Traver enhancements. The Traver enhancements are active only when option PRETRANMAP is provisioned in table NSCDEFS.

The following set of figures provide examples of the modified Traver output.

**Figure 4 PRETRANMAP:CALLS set to ALL, entry in NSCPMAP**

## 1.4 Hardware Requirements or Dependencies

Not applicable.

## 1.5 Software Requirements or Dependencies

New SOC NTS00030, “E800 Pretran Mapping”, is added by this activity. NTS00030 requires existing SOC NTS00005 - “E800-US”.

## 1.6 Limitations and restrictions

The following limitations and restrictions apply:

- E800 is the only service supported by this activity.  
The 800P and E008 services are not supported with option PRETRANMAP in table NSCDEFS<sup>15</sup>. Table control restrictions are added to table NSCDEFS to prevent the PRETRANMAP option from being provisioned for a service other than E800.
- AIN Toll Free Service is not enhanced by this activity.
- Only the DMS100/CS2000 EO E800 software is enhanced by this activity. The DMS200 E800 software is not enhanced.
- NPRT (nil pretranslator name) can not be provisioned in table NSCPMAP. Table control enforces this restriction.
- This feature does not support Attendant Consoles.
- The NSC option of TRAVER is not supported for PRI, PX, and MF/SS7 IBN trunks originating agents.
- The NSC option of TRAVER is not supported by AIN and LNP response translations.

## 1.7 Interactions

The following interactions apply:

- When option PRETRANMAP is provisioned in table NSCDEFS, existing option PRETRAN is no longer referenced by the switch software.

Existing option PRETRAN and new option PRETRANMAP can co-exist in table NSCDEFS. This is permitted to support a transition from existing option PRETRAN to new option PRETRANMAP.

- If a redirection service (e.g. CFW) is encountered which results in an E800 Query and Response transaction, the STDPRT name of the redirecting agent is used to perform the lookup in table NSCPMAP.

---

15. Note the 800P and E008 services are currently not supported with existing option PRETRAN in table NSCDEFS.

- Using AIN it is possible to alter the translation through table XLAMAP and table PXLAMAP. Either the pretranslator name or the LINEATTR index can be altered. In the event AIN returns an 800 routing number resulting in a subsequent E800 TCAP Query, the interaction with new option PRETRANMAP is dependent on whether the previous AIN translation specified a new pretranslator name or a new LINEATTR index:

If the previous AIN translation specified a new pretranslator name, the E800 response translation uses the originating subscriber's pretranslator<sup>16</sup>. The new PRETRANMAP option is consistent with this behavior. If option PRETRANMAP is provisioned, the originating subscriber's pretranslator is used to perform a lookup in table NSCPMAP.

If the previous AIN translation specified a new LINEATTR index, the E800 response translation uses the pretranslator name associated with the new LINEATTR<sup>17</sup>. The new PRETRANMAP option is consistent with this behavior. If option PRETRANMAP is provisioned, the pretranslator associated with the new LINEATTR index is used to perform a lookup in table NSCPMAP.

AIN should not be configured to use a shared LINEATTR index for two (or more) groups of subscribers if the subsequent E800 translation requires a unique pretranslator for each group of subscribers. The mapping provided by table NSCPMAP uses the pretranslator name associated with the shared LINEATTR index. The shared LINEATTR index can only be mapped to a single pretranslator using table NSCPMAP.

## 1.8 Glossary

## ***Product = CS 2000***

### **A00008350--Trunk group OM registers for establish bearer path failures**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP, PT-AAL2

#### **1.2 Description**

This activity provides an enhancement to the per call failure handling in the CS2K Core by providing new OM registers. These registers will be pegged on a per-trunk group basis when the AUDT106 logs are generated. If throttling of logs is in effect resulting in suppression of AUDT106 logs, these OM registers will continue to be pegged to maintain an accurate count of the failures.

This activity addresses the following:

1. Creating new OM registers in the existing TRK/TRNK2, TRK2NET1/TRK2NET2 OM Groups
2. Pegging the new OM registers

OSS needs to be updated for these additional registers.

### 1.2.1 Creating new OM registers in TRK/TRNK2 OM Groups

The AUDT106 log is generated when a call is forced down by the release of a trunk. Prior to this activity, customers relied on counting the number of AUDT106 logs in order to determine the impact to connecting offices (via trunks) of call failures.

This activity introduces a new register MIDFAIL at the end of the existing registers of the TRK OM group. This register will provide established bearer path failure counts on a per-trunk group basis.

| OM Group Name | NEW, CHANGED or DELETED | Reason                          |
|---------------|-------------------------|---------------------------------|
| TRK           | Changed                 | A new register MIDFAIL is added |

Another register MIDFAIL2 will be introduced in the TRNK2 OM group. This is the extension register of MIDFAIL.

| OM Group Name | NEW, CHANGED or DELETED | Reason                           |
|---------------|-------------------------|----------------------------------|
| TRNK2         | Changed                 | A new register MIDFAIL2 is added |

The snapshot after the addition looks as below.

**Figure 1 TRK OM Group**

### 1.2.2 Creating new OM registers in TRK2NET1/TRK2NET2 OM Groups

The OM groups TRK2NET1/TRK2NET2 were introduced as part of the Trimodal Logs and OM activity.

This activity introduces a new register MIDFAIL3 at the end of the existing registers of the TRK2NET1 OM group. This register will provide established bearer path failure counts on a per bearer network per-trunk group basis.

Another register MIDFAIL4 will be introduced in the TRK2NET2 OM group. This is the extension register of MIDFAIL3.

| OM Group Name | NEW, CHANGED or DELETED | Reason                           |
|---------------|-------------------------|----------------------------------|
| TRK2NET2      | Changed                 | A new register MIDFAIL4 is added |

**Note:** The OMSHOW command would display the OM groups and its fields. However the tuples of the TRK2NET1 OM group or any Trimodal OM groups are not displayed unless the MULTINET\_DISPLAY\_ACTIVE parameter in the table OFCVAR is set to 'Y'.

The snapshot after the addition looks as below.

**Figure 3 TRK2NET1 OM Group**

```

**Note:** Office parameter OFFICETYPE in table OFCSTD controls the generation of the registers for these OM Groups. These new registers will be included in all supported office types as defined for each of the OM groups.

### 1.2.3 Pegging the new OM register

The OM registers MIDFAIL and MIDFAIL3 will be pegged from the same location where the AUDT106 logs are generated irrespective of whether the throttle occurs or not.

## **A89007819--QoS Reporting: QoS Collector Application (QCA)** ***Functional Description***

### 1.1 Applicable Solution(s)

PT-IP, IAW, IAC

## 1.2 Description

This document covers the QoS Collector Application functionality supported in SN08 time frame.

In Voice over IP networks, Quality of Service (QoS) can be adversely affected by the components in the network. Unlike TDM networks where the voice quality is consistent for all calls, VoIP networks can experience different voice quality on all calls.

The common parameters that make up voice quality are;

- Packets sent
- Packets received
- Packet loss
- Octets sent
- Octets received
- Inter-arrival latency
- Jitter

All gateways beginning SN06 VoIP solutions will report these statistics via end-of-call reporting mechanisms specific to the protocol used for MGC - VMG communication.

It is the purpose of this activity is to design a method for reporting these QoS parameters on a per call basis for the purposes of;

- Network engineering
- Trend analysis
- Trouble-shooting network problems
- SLA validation

This is accomplished by implementing a reporting mechanism that will allow QoS reports (as IPDR records) to be delivered to a customer provided OSS for processing. In order to achieve SLA validation, QoS reports are correlated to appropriate billing records so that the QoS of billed calls can be determined.

QoS Reporting is applicable for more than just VoIP networks. It can be used in ATM and hybrid networks as well. In the SN06 time frame, however, QoS Reporting will be limited to pure IP networks which consist only of GWC driven GWs. Support for SPM peripherals and hybrid networks will be accomplished in a later release.

The proposed architecture for QoS Reporting in SN06 consists of the following components;

1. QoS Correlation ID and billing
2. QoS Reporting Application (on GWC)
3. Provisioning
4. QoS Report collection
5. QoS Report processing

This activity implements component 4. QoS Report collection, the QoS Collector Application (QCA).

### 1.2.1 System behavior

All QoS (IPDR) records are stored on a QoS Collector Application (QCA) host. The QCA will receive binary QoS records from the GWCs, converts these to QCA IPDR records and stores them in a file. The QCA IPDR records can be obtained by the OSS for processing.

The configuration of this proposal is shown in Figure 1, "QoS Reporting in a VoIP Network".

**Figure 1 QoS Reporting in a VoIP Network**

### 1.2.2 Configuration

The configuration details for the QoS Collector Application are provided by a properties file. The properties file is located at `/opt/nortel/qca/properties/qca.properties` and can be configured by the user.

The QCA properties are given in Table 1, "QCA properties," on page 1446 and an example QCA properties file is given in Figure 2, "Example of the QCA properties file".

**Table 1 QCA properties**

| Name                               | Description                                                           | Units   | Range          | default |
|------------------------------------|-----------------------------------------------------------------------|---------|----------------|---------|
| portNumber <sup>3</sup>            | the port number the QCA accepts connections on                        | N/A     | 20000 to 20004 | 20000   |
| MaxFileSize                        | maximum size of an output file                                        | MBytes  | 1 to 100       | 1       |
| MaxFileTime                        | interval output file is open                                          | minutes | 1 to 240       | 15      |
| RetainFileTime                     | how long the output files should be retained                          | days    | 1 to 30        | 5       |
| recycleToD                         | the hour in the day the directories will be recycled                  | hour    | 0 to 23        | 0       |
| fileExt                            | the output file extension                                             | N/A     | String         | xml     |
| nodeName                           | the node name to be used in the output files                          | N/A     | String         | QCA     |
| closedFileCompression <sup>1</sup> | whether the file should be compressed when closed and moved to today  | boolean | true or false  | true    |
| oldFileCompression <sup>1,2</sup>  | whether the files should be compressed at the first directory recycle | boolean | true or false  | true    |

Notes:

1. File compression may be required as there is limited disk space for QCA IPDR record storage.
2. If *closedFileCompression* is true the value of the *oldFileCompression* property is negated as the files will have already been compressed.
3. A range of port numbers is provided for flexibility. The main use is for upgrade purposes, where two QCA instance may be running on a single host. Multiple QCAs, and therefore port numbers, should not be used to segregate QCA traffic.

The qca.properties file is read when the QCA is started, therefore the QCA must be stopped and restarted for changes in the qca.properties to be picked up.

When the qca.properties file is read the contents is validated. If any of the properties are not present or invalid, the default value is automatically used. A

warning customer log is generated to indicate that the default value is being used.

An example customer log warning:

```
Oct 11 12:00:02 wmdhs0j8 main:0001 QCA001 WARNING init label:  
RetainFileTime property in properties/qca.properties is out of  
range. QCA is starting with default retain file time of 5 days
```

**Figure 2 Example of the QCA properties file**

```
# QCA Properties file
# The QCA will have to be restarted for changes in the properties
# file to be reflected in the application's operation

# The maximum size of a file, in MBytes, before it is closed
# Range is 1 to 100. Default is 1.
MaxFileSize=1

# The maximum time, in minutes, a file can be open before
# it is closed
# Range is 1 to 240. Default is 15.
MaxFileTime=15

# Hour of the day that the directory structure is recycled
# Range 0 (12:00 AM) to 23 (11:00 PM). Default is 0 (12:00 AM).
# Do NOT specify minutes.
recycleToD=0

# port number to start application on.
# Range is 20000 to 20004. Default is 20000.
portNumber=20000

# How long, in days, the files are kept before deleting
# VERY IMPORTANT: Depending on the call volume and the number of
# days for file retention it could be possible to exhaust all
# available disk space, therefore the value of this property
# should be considered in great depth. If QCA is started with
# the value of this property less than the number of today
# directories for a given port the older directories will be
# deleted.
# Range 1 to 30. Default is 5.
RetainFileTime=5

# File Extension used in the QCA output file name.
# Default is xml.
fileExt=xml

# Node name to be used in the QCA output file name.
# Default is QCA.
nodeName=QCA

# true or false value indicating whether the output file
# should be compressed when closed. Default is true.
closedFileCompression=true

# true or false value indicating whether the file should be
# compressed at the first directory recycle
# Note: If closedFileCompression is true the value of the
# oldFileCompression property is negated as the files will have
```

### 1.2.3 Starting QCA

The `qca_server` script is used to start the QCA. The user should log in as root to execute this script.

When the `qca_server` script is run the following warning is displayed:

Attempting to register QCA as Qca with PMFADM.

If a QCA instance has not already been started with `qca_server` the following message is displayed:

```
Registration as Qca was ok. QCA started.
```

If a QCA instance has already been started with `qca_server` the following message is displayed:

```
pmfadm: Request "Qca" already queued
Could not register QCA as Qca with PMFADM, this suggests a QCA
instance is already running.
```

When the QCA is started the following steps are performed:

- the QCA is registered with PMFADM (processes monitor facility administration).
- This is a Solaris utility that monitors register processes and restarts the process if no longer running.
- configuration details (`qca.properties` file) are read
- If any of the properties information is not present or is invalid the default value is used and a customer log is generated to indicate this. It is at this point the user can stop the QCA if using default values is not acceptable.
- the QCA attempts to open a server socket on the specified port.
- If the specified port is in use the QCA can not be started.
- a file management process is started
- If the QCA output directory is not available when the QCA is started the directories are created.
- If a file exists in the active output directory, this indicates that QCA did not stop gracefully, the QCA will attempt to complete the file and move it to the today directory.
- the QCA waits for connections from clients (GWCs and SPMs) on the port number specified in the `qca.properties`.

### 1.2.4 Stopping QCA

The `stop_qca` script is used to stop the QCA. The user should log in as root to execute this script.

When the `stop_qca` script is run the following warning is displayed:

```
Are you sure you want to stop the QCA? Have you checked the port
number in qca.properties? [no or yes]
```

If the port number in `qca.properties` has been checked and is correctly specified for the QCA to be stopped, this should be validated against the QCA datafill in PTM, then **yes** should be entered, otherwise **no** should be entered and the port number checked.

If a QCA instance was started by `qca_server` the following message will be displayed:

```
Attempting to unregister QCA as Qca from PMFADM.  
Attempting to stop local QCA on port: 20001  
QCA stopped successfully.
```

If a QCA was not started by `qca_server` the following message will be displayed:

```
Attempting to unregister QCA as Qca from PMFADM.  
pmfadm: "Qca" No such <nametag> registered  
  
QCA not registered with PMFADM as Qca, so stop_qca aborted.
```

If the above message is seen the `query_qca` script should be used to determine if a QCA instance is running on the host.

When the QCA is stopped the following steps are performed, in order:

- the QCA is unregistered with PMFADM
- the QCA stops accepting connections from clients
- the connection to the client(s) is closed
- the IPDR / XML structure in the output file is closed
- the output file is closed and moved to the today directory

**Note:** to avoid alarms being generated by all the GWCs sending QoS records to the QCA when the QCA is stopped, the QCA details must be removed from PTM first. Please refer to activity 89007781 - QoS Reporting: Provisioning for QoS Reporting provisioning details.

### 1.2.5 Client (GWC) connection to QCA

When the QoS reporting mechanism is started on a client (GWC) it will connect to the QCA as specified in PTM, e.g. IP Address and port.

When a connection is established the QCA waits to receive data from the client (GWC).

### 1.2.6 Client (GWC) Connection heart beat

The TCP/IP connection between the client and QCA will be automatically closed if it is not used for more than 2 hours. To ensure the connection is not closed in this circumstance, the client will send a 'heart beat' message after 2 hours of inactivity.

The QCA simply receives the client ‘heart beat’, and does not generate a QCA IPDR record.

## 1.2.7 QCA File Management

The active output file is in the active directory. When a file is closed it is moved to the today directory.

### 1.2.7.1 Initialization

When the QCA is started the following file management steps are performed:

- the output directories are created if they do not already exist.
- any files in the active output directory are validated, ensuring that the last IPDR is complete and that the file structure is closed. Once the file is complete it is moved to the today output directory.
- all ‘today’ directories older than the file retention period are deleted. This can occur if the qca.properties is change such that file retention period is reduced.
- a new file is created using the naming convention given below. If the file name already exists the new file will have the number 0 added before the file extension, if this exists, the number 1 will be used, then 2 and so on.

### 1.2.7.2 Output directory

The directory used for the current QCA output is:

/data/qca/”port number”/output/active

*Note:* In SN08, QCA registers with the ‘servman’<sup>18</sup> on the SSPFS machine. Depending on your selection of `RetainFileTime` property in qca.properties file and your calculation of Disk consumption depending on Call traffic at your CO, proper disk partition size of /data/qca should be requested during SSPFS installation. For calculation on how much disk space should be allocated, refer to section 2.2.7.5.

Where “port number” is the port number that is specified in qca.properties and that the QCA accepts connections on. This allows the output of two QCAs running on the same host to be distinguished.

### 1.2.7.3 File names

The QCA will use the following file naming convention:

<Node Type>.<Node  
Name>.<ReportName>.Year.Mon.Date\_HR.MN\_<TZ>.<File Ext>

---

18. servman is the application service manager on the SSPFS platform starting SN06.2. servman manages registration and de registration of all client applications running on the SSPFS machine whether it is simplex or clustered.

For example:

QCA.Telco\_Switch\_35.QoS.2002.04.11\_02.45\_EDT.xml

Where each of the elements is described as:

**<NodeType>** - A Nortel defined string identifying the product origination. Always "QCA".

**<Node Name>** - This name should MATCH the name of the node that is used in faults, in configuration (FQDN), in accounting and in GUIs. This value is configurable as property nodeName in qca.properties.

**<Report Name>** - The name of the script/filter/report that is used to create this file. There may be 1 or more report names in operation for a given NE simultaneously. Each report type must be identified in the filename. Always "QoS"

**<Year.Mon.Date\_HR.MN\_>** - This field when present in the active directory refers to the time when the file was opened or created in the active directory. The same field when present in today directories refers to the time the file was closed i.e the time when the files are closed and recycled to the today directories.

**<TZ>** - This is the Time Zone of the NE the Performance data is being collected from. This can be an off set from UMT or GMT.

**<File Ext>** - The file extension specified in qca.properties or the default xml.

#### 1.2.7.4 Output file rotation (closure)

QCA file management provides file rotation (closure) based on file size and time the file has been open, on a 'which ever comes first' basis. These values are MaxFileSize and MaxFileTime, respectively, in qca.properties.

#### 1.2.7.5 Output file compression

Due to the size of each QCA IPDR record (maximum about 840 bytes) the required disk space to store several days of QCA output files could be very large.

The required disk space storage requirement calculation is as follows:

Assuming:

- BHCA = 550K
- Calls per day = 10 x BHCA = 5.5 M
- QoS records per day = 2 x Calls per day = 11 M
- Record size = 840-bytes

- Compression ratio = 88% (achieved in testing)

Per day disk space required = 11 M x 840 = 8.6 GBytes

When using compression = 8.6 GBytes \* 0.12 = 1 GByte

It can be seen that file compression offers a major saving in disk space requirements. And without compression the disk space in the /data/qca partition would be quickly exhausted.

The file compression is controlled by two properties, `closedFileCompression` and `oldFileCompression`.

`closedFileCompression` controls whether the active file should be compressed when it is closed and moved to the today directory.

`oldFileCompression` controls whether the retained files should be compressed when the output directories are recycled. When `oldFileCompression` is enabled, the files in the today-n directories will be checked, and compressed if required, every time directory recycling occurs.

#### 1.2.7.6 Output file retention

The file management of the QCA follows that implemented for the SN05 feature SNMP Performance Measurement Poller (59039902). The output directory structures will contain a *number* of directories, for the current active file, today's closed files and the last *number-1* days closed files.

The clean-up mechanism is described by two parameters:

'retain file duration' (`RetainFileTime`) - how long (in days) should the files be retained on the local disk.

'recycle time of day' (`recycleToD`) - the hour of the day that the today directories are recycled.

Both are parameters specified in the `qca.properties` file read when the QCA is started.

At a predefined time (`recycleToD` in `qca.properties`, default is 12:00 AM), the output directories will be recycled.

The today-n directories are not created when the QCA is started but when the output files are recycled.

When the today directory reaches the maximum file retention period the information is discarded.

E.g. Output file structure if *number* were 30:

```
/data/qca/"port number"/output/active  
/data/qca/"port number"/output/today  
/data/qca/"port number"/output/today-1  
/data/qca/"port number"/output/today-2  
.  
/data/qca/"port number"/output/today-28  
/data/qca/"port number"/output/today-29
```

**Note:** if the QCA is stopped and restarted with a new 'retain file duration', that is less than the previous 'retain file duration' the QCA operated with, any existing today directories older than the new 'retain file duration' will be deleted.

The value for the 'retain file duration' should be considered carefully as the operation of the QCA and other applications may be impacted if there is no free disk space because it is used to store QCA output files.

In arriving at a value for the 'retain file duration' the following should be considered:

- the BHCA and total number of calls per day.
- total disk space available for file retention
- whether file compression is used.

A similar calculation to that in section 2.2.7.5 'Output file compression' should be used to determine the required 'per day' disk space requirements and therefore the 'retain file duration', e.g.:

$$\text{'retain file duration'} = \frac{\text{available disk space in MBytes}}{\text{required MBytes/day}}$$

Suppose the /data/QCA partition size is 8GBytes. Using the assumptions in section 2.2.7.5 'Output file compression' and the above calculation the maximum 'retain file duration' value is:

$$\frac{8000 \text{ MBytes}}{1000 \text{ MBytes}} = 8 \text{ days}$$

However, you may request a higher partition size of /data/qca during SSPFS installation as per the calculation shown in section 2.2.7.5.

### 1.2.7.7 Reporting disk space issues

As the QCA operates, disk space in /data/qca is used for the active file and to retain closed files. If the disk space in /data/qca becomes exhausted this would

effect the operation of the QCA. The QCA uses customer logs to report disk space issues before all the space is used to reduce the possibility of completely filling the partition.

Every time the QCA creates a new file it will attempt check the available disk space, in the unlikely event that available space is not determinable the QCA will write a debug log to a file.

The QCA determines the number of free bytes available in the /data/qca partition and compares this with 3 boundary values; 1 GByte, 500 MBytes and 100 MBytes.

### **1 GByte boundary**

If the available disk space is greater than 1 GByte then no further action is taken. However, if the available disk space is less than 1Gb and more than 500Mb, a minor customer log/alarm is generated.

If some disk space is made available in the /data/qca partition, after a customer alarm was raised, to make the available disk space great than 1GByte, the QCA raises a clear customer log for the minor alarm when the next new file is created.

However, if no action is taken and the available space still lies with between 1 GByte and 500 MBytes when the next file is created, the QCA will generate another minor customer log/alarm.

### **500 MByte boundary**

If the available disk space is less than 500 MBytes and more than 100 MBytes, a major customer log/alarm is generated

If the available disk space goes above 500 MBytes, but below 1 GByte, the QCA raises a clear customer log for the major customer log/alarm when the next new file is created.

If the available disk space goes above 1 GByte the QCA raises clear customer logs for both the major and minor customer logs/alarms when the next new file is created.

However, if no action is taken and the available space still lies with between 500 MBytes and 100 MBytes when the next file is created, the QCA will generate another major customer log/alarm.

### **100 MByte boundary**

If the available disk space is less than 100 MBytes a critical customer log/alarm is generated

If the available disk space goes above 100 MBytes, but below 500 MBytes, the QCA raises a clear customer log for the critical customer log/alarm when the next new file is created.

If the available disk space goes above 500 MBytes, but below 1 GByte, the QCA raises clear customer logs for both the critical and major customer logs/alarms when the next new file is created.

If the available disk space goes above 1 GByte, the QCA raises clear customer logs for the critical, major and minor customer logs/alarms when the next new file is created.

However, if no action is taken and the disk space is completely exhausted the QCA will generate a critical customer log/alarm and the QCA will be stopped.

In the scenario where write access is prevented the application will raise a critical customer log/alarm and the QCA will be stopped.

### 1.2.8 Growing the Size of /data/qca

See Appendix B for the Procedure to grow the size of Partition /data/qca.

### 1.2.9 QoS record processing

At the end of every call the client reports the QoS statistics to the QCA in a binary QoS record. The QCA validates the record, ensuring the record sequence number, version and length are correct. The QCA then converts the record to an IPDR form. The QCA IPDR record is then written to a file.

#### 1.2.9.1 Binary QoS record format

The QoS record sent from the client (GWC) is a binary message. A description of the binary QoS record fields is shown in Table 2, "Binary QoS record fields," on page 1456.

**Table 2 Binary QoS record fields**

| Name             | Description                                              | Range                            |
|------------------|----------------------------------------------------------|----------------------------------|
| MT (MGC Type)    | The type of client (MGC) the QoS record was generated by | 0 - GWC<br>1 - SPM               |
| Msg Type         | Message type                                             | 0 - QoS record<br>1 - heart beat |
| Sequence number  | Record sequence number                                   | 0 to 16777215                    |
| RT (Report Type) | Report Type                                              | 0 - local<br>1 - remote          |
| ver (version)    | The QoS record version                                   | 0 to 15                          |

**Table 2 Binary QoS record fields**

| Name                | Description                                                                      | Range                    |
|---------------------|----------------------------------------------------------------------------------|--------------------------|
| MGC number          | The number of the client (MGC) the QoS record was generated by                   | 0 to 255                 |
| Msg length          | The length of the message (including header)                                     | 0 to 255 (should be 130) |
| Gateway port number | The port number on the Gateway used in the call                                  | 0 to 65535               |
| Gateway IP Address  | The IP Address of the Gateway used in the call                                   | 4-bytes                  |
| Gateway FQDN        | Consists of two separate fields; the Gateway name and the endpoint               | 64-bytes                 |
| Switch CLLI         | The CLLI of the CS2K the client is subtended to                                  | 16-bytes                 |
| Correlation ID      | The correlation id that can be used to correlate the QoS record to an AMA record | 10-bytes                 |
| Packets Sent        | The total number of packets transmitted                                          | 0 to 2147483647          |
| Packets Received    | The total number of packets received                                             | 0 to 2147483647          |
| Octets Sent         | The total number of payload octets transmitted                                   | 0 to 2147483647          |
| Octets Received     | The total number of payload octets received                                      | 0 to 2147483647          |
| Packets Lost        | The total number of packets lost                                                 | 0 to 2147483647          |
| Jitter              | Estimate of packet interarrival time (milliseconds)                              | 0 to 32676               |
| Latency             | Estimate of network latency (milliseconds)                                       | 0 to 32676               |

**1.2.9.2 QCA IPDR record format**

The output of the QCA is a single stream (file) of IPDR Version 3.1-A.0.2 compliant records.

**1.2.9.2.1 QCA IPDR elements**

The IPDR elements used in the QoS output format are shown in Table 3, “QCA IPDR tags,” on page 1457.

**Table 3 QCA IPDR tags**

| QoS Field Tag      | Type     | Range                                                          |
|--------------------|----------|----------------------------------------------------------------|
| StartTime          | dateTime | ISO 8601 format.                                               |
| EndTime            | dateTime | ISO 8601 format.                                               |
| timeZoneOffset     | integer  | Time offset, in minutes, of local time zone referenced to GMT. |
| callCompletionCode | String   | Final call completion code for billing use.                    |

**Table 3 QCA IPDR tags**

| QoS Field Tag          | Type    | Range                             |
|------------------------|---------|-----------------------------------|
| originalDestinationId  | String  | Called-party (designation) number |
| hostName               | String  | 0 to 22 characters                |
| subscriberId           | String  | 0 to 65 characters                |
| uniqueCallId           | String  | 20 hexadecimal digits             |
| ipAddress              | String  | 7 to 15 numerical characters      |
| portNumber             | String  | 0 to 65535                        |
| seqNum                 | integer | 0 to 16777215                     |
| averagePacketLatency   | integer | 0 to 32676                        |
| inboundByteCount       | integer | 0 to 2147483647                   |
| outboundByteCount      | integer | 0 to 2147483647                   |
| inboundPacketCount     | integer | 0 to 2147483647                   |
| outboundPacketCount    | integer | 0 to 2147483647                   |
| inboundLostPacketCount | integer | 0 to 2147483647                   |
| packetDelayVariation   | integer | 0 to 32676                        |

An example QCA IPDR record:

```

<IPDR>
<StartTime>1970-01-01T00:00:00.000Z</StartTime>
<EndTime>1970-01-01T00:00:00.000Z</EndTime>
<timeZoneOffset>0</timeZoneOffset>
<callCompletionCode>CC</callCompletionCode>
<originalDestinationId></originalDestinationId>
<hostName>GWC3@COMITIP</hostName>
<subscriberId>aaln/1@http018.mgsite-2.b4sky.ott</subscriberId>
<uniqueCallId>43c01738000f13e30d05</uniqueCallId>
<ipAddress>10.0.15.1</ipAddress>
<portNumber>2427</portNumber>
<seqNum>18</seqNum>
<averagePacketLatency>0</averagePacketLatency>
<inboundByteCount>41538</inboundByteCount>
<outboundByteCount>0</outboundByteCount>
<inboundPacketCount>301</inboundPacketCount>
<outboundPacketCount>0</outboundPacketCount>
<inboundLostPacketCount>0</inboundLostPacketCount>
<packetDelayVariation>0</packetDelayVariation>
</IPDR>

```

The maximum size of a QCA IPDR record is around 840 characters, this equates to 840-bytes (using UTF-8 encoding).

Not all of the QoS statistics are provided by all media gateways, e.g. in SN06 the UAS does not support the Jitter and Latency statistics, therefore if the received binary QoS record does not contain a valid value for any of the QoS statistics the element will not be included in the output QCA IPDR record.

### 1.2.9.3 QCA IPDR element values

See Table 4, “Mapping of input binary QoS Record fields to output QCA IPDR record elements,” on page 1459.

**Table 4 Mapping of input binary QoS Record fields to output QCA IPDR record elements**

| Output QCA IPDR elements | Input Binary QoS field                                         | Comment                                                                                                                                   |
|--------------------------|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| StartTime                | N/A                                                            | Not applicable. Hardcoded value used: 1970-01-01T00:00:00.000Z                                                                            |
| EndTime                  | N/A                                                            | Not applicable. Hardcoded value used: 1970-01-01T00:00:00.000Z                                                                            |
| timeZoneOffset           | N/A                                                            | Not applicable. Hardcoded value used: 0                                                                                                   |
| callCompletionCode       | N/A                                                            | Not applicable. Hardcoded value used: CC (call completed normally)                                                                        |
| originalDestinationId    | N/A                                                            | Not applicable. Empty String                                                                                                              |
| subscriberId             | Concatenation of Endpoint and Gateway Name (from Gateway FQDN) | <EndPoint>@<GW Name>                                                                                                                      |
| hostName                 | Concatenation of MT (MGC Type), MGC Number and Switch CLLI     | <MGC Type><MGC Number>@<Switch CLLI>                                                                                                      |
| uniqueCallId             | Correlation Id                                                 |                                                                                                                                           |
| ipAddr                   | Gateway IP Address                                             | standard 4-part format                                                                                                                    |
| portNumber               | Gateway Port Number                                            |                                                                                                                                           |
| seqNum                   | Sequence number                                                |                                                                                                                                           |
| averagePacketLatency     | Latency                                                        | Element not present in IPDR if the received binary QoS record value is less than 0, indicating that the GW did not support the statistic. |
| inboundByteCount         | Octets Received                                                |                                                                                                                                           |
| outboundByteCount        | Octets Sent                                                    |                                                                                                                                           |

The following elements are 'required' IPDR elements so have been included in the QCA output for IPDR compliancy.

- StartTime
- EndTime
- timeZoneOffset
- CallCompletionCode
- originalDestinationId

#### 1.2.9.4 QCA IPDR file format

The output of the QCA is a file with format conforming to the IPDR structure. The first line in the file is the header, providing details about the XML version and encoding. The next line is the 'open' IPDR tag which gives information about the version of QCA and indicates the start of records. The last line in the file is the 'close' IPDR tag which indicates the end of the file.

Please see Figure 3, "QCA IPDR file format" for an example QoS XML file format.

**Figure 3 QCA IPDR file format**

| Line no. | Line                                                                                                                                                                                                                                                  | Description                    |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|

|          | .                                                                                                                                                                                                                                                     |                                |
|          | .                                                                                                                                                                                                                                                     |                                |
| n-1      | </IPDR>                                                                                                                                                                                                                                               | End of record                  |
| n        | </IPDRDoc>                                                                                                                                                                                                                                            | /IPDRDoc is the file close tag |

The IPDRDoc tag gives information about the IPDR format used and the device that generated the IPDR file, e.g.

IPDRRecorderInfo = "qca.nortelnetworks.com"

### 1.2.10 Detecting Events and Errors

In the situation that the QCA detects an event (e.g. client closes the connection) or an error (e.g. out of sequence record), a customer log is generated and an error IPDR record is written to the output file.

The error IPDR record is generated so that the OSS does not require two interfaces to the QCA host, one to retrieve IPDR records and one to monitor events and errors. All the relevant information to the QCA output processing is provided in the single output stream.

The error IPDR record is compliant to the IPDR specification, i.e. contains all of the required IPDR elements, some of which will contain default or empty values.

#### Multiple errors

This is only applicable to unsupported QoS record version and unsupported QoS record length errors.

The QCA allows up to 9 consecutive unsupported QoS record version and up to 9 consecutive unsupported QoS record length errors. When the 10th consecutive error is detected a customer log is generated to indicate this and the connection is being closed.

If a client sends a QoS record with valid length or version before sending 10 unsupported QoS record version or 10 unsupported QoS record length records, a customer log is generated to indicate that the alarm condition has been cleared.

**Table 5 QCA Error and Event actions**

| Error/Event                                                       | QCA Action                                                                           |
|-------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| out of sequence record                                            | customer log generated<br>error IPDR record generated<br>binary QoS record processed |
| unsupported QoS record version (less than 10 consecutive records) | customer log generated<br>error IPDR record generated<br>binary QoS record discarded |

**Table 5 QCA Error and Event actions**

| Error/Event                                                      | QCA Action                                                                                                |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| unsupported QoS record version (10th consecutive records)        | customer log generated<br>error IPDR record generated<br>binary QoS record discarded<br>connection closed |
| unsupported QoS record length (less than 10 consecutive records) | customer log generated<br>error IPDR record generated<br>binary QoS record discarded                      |
| unsupported QoS record length (10th consecutive records)         | customer log generated<br>error IPDR record generated<br>binary QoS record discarded<br>connection closed |
| unknown message type                                             | customer log generated<br>error IPDR record generated<br>binary QoS record discarded<br>connection closed |
| unable to read binary QoS record header                          | customer log generated<br>error IPDR record generated<br>binary QoS record discarded<br>connection closed |
| unable to process binary QoS record body                         | customer log generated<br>error IPDR record generated<br>binary QoS record discarded                      |
| connection closed (not by QCA) <sup>a</sup>                      | customer log generated<br>error IPDR record generated<br>connection closed (from QCA end)                 |
| QCA stopped                                                      | customer log generated<br>error IPDR record generated                                                     |
| QCA started                                                      | error IPDR record generated                                                                               |
| New GWC Connection                                               | customer log generated<br>error IPDR record generated                                                     |

a. Note: This includes the 'GWC Swact' scenario.

**Note:** please refer to Appendix A for more details of the customer logs generated by the QCA.

#### 1.2.10.1 QCA Error IPDR record

Depending on the type of error, different information can be used in the error IPDR record.

For example, if a message with an ‘unknown message type’ is received the whole message is unreliable so only the connection information can be used. Whereas, if an ‘out of sequence’ record is received the message format is valid so information from the connection and record header can be used.

Default values are used in the QCA error IPDR record for the following required IPDR elements:

- StartTime - 1970-01-01T00:00:00.000Z
- EndTime - 1970-01-01T00:00:00.000Z
- callCompletionCode - CC
- originalDestinationId - empty string
- subscriberId - empty string
- uniqueCallId - empty string

Depending on the type of error or event the following QCA error IPDR record elements may contain information:

- hostName - MGC Id, if the MGC Id is not available it is an empty string and the Node name (the value of the nodeName property in the qca.properties file). Below are some examples.
  - GWC3@CS2K\_LAB (if MGC Id is available)
  - CS2K\_LAB (if MGC Id is an empty string)
- seqNum - the sequence number of the QoS record with the error, the sequence number is not available it is 0

The following QCA error IPDR record elements are always used to convey information:

- ipAddress
- portNumber
- proprietaryErrorCode

The values for each element in the error IPDR record, other than the default elements, is given in Table 6, “Error IPDR record elements,” on page 1464.

**Table 6 Error IPDR record elements**

| <b>Error/Event</b>                                          | <b>Element</b>       | <b>Value</b>                                                                                                       |
|-------------------------------------------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------|
| Unexpected Record Sequence Number                           | hostname             | MGC Id, Node name                                                                                                  |
|                                                             | seqNum               | record sequence number                                                                                             |
|                                                             | ipAddress            | IP Address of connection                                                                                           |
|                                                             | portNumber           | Port number of connection                                                                                          |
|                                                             | proprietaryErrorCode | 0 (plus previous valid record sequence number, e.g. previous sequence number = 1638, proprietaryErrorCode = 01638) |
| Record Lost: Unsupported Version                            | hostname             | MGC Id, Node name                                                                                                  |
|                                                             | seqNum               | record sequence number                                                                                             |
|                                                             | ipAddress            | IP Address of connection                                                                                           |
|                                                             | portNumber           | Port number of connection                                                                                          |

|                                                     | ipAddress            | IP Address of connection  |
|                                                     | portNumber           | Port number of connection |
|                                                     | proprietaryErrorCode | 7                         |
| QCA Started                                         | hostname             | Node name                 |
|                                                     | seqNum               | 0                         |
|                                                     | ipAddress            | IP Address of connection  |
|                                                     | portNumber           | Port number of connection |
|                                                     | proprietaryErrorCode | 8                         |
| New GWC Connection <sup>a</sup>                     | hostname             | MGC Id, Node name         |
|                                                     | seqNum               | record sequence number    |
|                                                     | ipAddress            | IP Address of connection  |
|                                                     | portNumber           | Port number of connection |
|                                                     | proprietaryErrorCode | 9                         |

a. These records will be produced for every new connection from the GWCs.

#### **1.2.10.1.1 Error IPDR record format**

Examples for each of the QCA IPDR error records:

Unexpected Record Sequence Number

```
<IPDR>
  <StartTime>1970-01-01T00:00:00.000Z</StartTime>
  <EndTime>1970-01-01T00:00:00.000Z</EndTime>
  <timeZoneOffset>0</timeZoneOffset>
  <callCompletionCode>CC</callCompletionCode>
  <originalDestinationId></originalDestinationId>
  <hostName>GWC99@CS2K_LAB</hostName>
  <subscriberId></subscriberId>
  <uniqueCallId></uniqueCallId>
  <ipAddress>47.96.0.243</ipAddress>
  <portNumber>37559</portNumber>
  <seqNum>4</seqNum>
  <proprietaryErrorCode>02</proprietaryErrorCode>
</IPDR>
```

### Record Lost: Unsupported Version

```
<IPDR>
  <StartTime>1970-01-01T00:00:00.000Z</StartTime>
  <EndTime>1970-01-01T00:00:00.000Z</EndTime>
  <timeZoneOffset>0</timeZoneOffset>
  <callCompletionCode>CC</callCompletionCode>
  <originalDestinationId></originalDestinationId>
  <hostName>GWC99@CS2K_LAB</hostName>
  <subscriberId></subscriberId>
  <uniqueCallId></uniqueCallId>
  <ipAddress>47.96.0.243</ipAddress>
  <portNumber>37665</portNumber>
  <seqNum>2</seqNum>
  <proprietaryErrorCode>1</proprietaryErrorCode>
</IPDR>
```

### Record Lost: Unsupported Record Length

```
<IPDR>
  <StartTime>1970-01-01T00:00:00.000Z</StartTime>
  <EndTime>1970-01-01T00:00:00.000Z</EndTime>
  <timeZoneOffset>0</timeZoneOffset>
  <callCompletionCode>CC</callCompletionCode>
  <originalDestinationId></originalDestinationId>
  <hostName>GWC99@CS2K_LAB</hostName>
  <subscriberId></subscriberId>
  <uniqueCallId></uniqueCallId>
  <ipAddress>47.96.0.243</ipAddress>
  <portNumber>37676</portNumber>
  <seqNum>2</seqNum>
  <proprietaryErrorCode>2</proprietaryErrorCode>
</IPDR>
```

### Connection closed: Unrecognised Message Type

```
<IPDR>
  <StartTime>1970-01-01T00:00:00.000Z</StartTime>
  <EndTime>1970-01-01T00:00:00.000Z</EndTime>
  <timeZoneOffset>0</timeZoneOffset>
  <callCompletionCode>CC</callCompletionCode>
  <originalDestinationId></originalDestinationId>
  <hostName>CS2K_LAB</hostName>
  <subscriberId></subscriberId>
  <uniqueCallId></uniqueCallId>
```

```
<ipAddress>47.96.0.243</ipAddress>
<portNumber>37642</portNumber>
<seqNum>0</seqNum>
<proprietaryErrorCode>3</proprietaryErrorCode>
</IPDR>
```

### Connection closed: Error while processing QoS record header

```
<IPDR>
  <StartTime>1970-01-01T00:00:00.000Z</StartTime>
  <EndTime>1970-01-01T00:00:00.000Z</EndTime>

<subscriberId></subscriberId>
<uniqueCallId></uniqueCallId>
<ipAddress>47.96.0.243</ipAddress>
<portNumber>37559</portNumber>
<seqNum>567</seqNum>
<proprietaryErrorCode>9</proprietaryErrorCode>
</IPDR>
```

## 1.2.11 Streaming to OSS

Real-Time streaming of the QCA IPDR record stream to the OSS is provided via the streamQoS utility. It should be used as follows:

1. Connect to the machine on which QCA is running, e.g. via telnet
2. Change directory to the QCA home directory, e.g. /opt/nortel/qca/
3. Start the logging to file of the window.

4. Type streamQoS to start the stream
5. The streaming utility is stopped by closing the connection

### 1.2.12 Display tool

A tool to display QCA IPDR records in an output QCA file is provided. There are three outputs from the tool:

- display all the QCA IPDR Records in the file
- display all the QCA IPDR Records for a particular Subscriber Id in the file
- display all the QCA IPDR Records for a particular MGC in the file

The command must have at least one argument, the file name. The command is able to handle the compressed and also uncompressed QCA output files.

To display only the records for a particular Subscriber Id, the Subscriber Id must be provided to the utility.

To display only the records for a particular MGC, the following information is necessary:

- MGC type (GWC or SPM), *mgcType* or *mt* field in QCA IPDR record
- MGC number (0 to 255), *mgcNumber* or *num* in QCA IPDR record

Displaying all QCA IPDR records in a file:

```
displayQoS <file name>
```

Displaying all QCA IPDR record from a particular client in a file:

```
displayQoS <file name> <Subscriber Id>
```

Displaying all QCA IPDR record from a particular client in a file:

```
displayQoS <file name> <MGC type> <MGC number>
```

If the file can not be found an error is displayed.

The first argument is always the file name. If only two arguments are provided the second argument is taken as the Subscriber Id. If more than two arguments are provided they are taken as the MGC type and MGC number.

Example displayQoS output:

```
Displaying QoS Records for GWC 80 from file:  
GWC.Telco_Switch_35.QoS.2002.04.11_02.45_EDT.xml
```

```

```

End of XML QoS File.

**Note:** when displaying error IPDR records, the displayQoS utility adds a textual description to the error code value.

**Note:** when displaying Unexpected Record Sequence Number error IPDR records, the displayQoS utility extracts the previous sequence number value from the proprietaryErrorCode and displays it as a separate field, Previous seq num.

### 1.2.13 Installation

The QCA application (NTQCA.pkg) is available in the CS2M<sup>19</sup> software package. Below are the steps to install the QCA

- Insert the CD with the CS2M load and log onto the SESM server as root. Then change the directory to the bin directory on the CD.

```
cd /cdrom/cdrom0/bin
```

- To start the install process, enter the following command.

```
./appl_mgr.ksh
```

---

<sup>19</sup> CS2M (CS 2000 Management Components) refers to a NCL software package used on the CS 2000 management tools server. This package includes SESM, NPM, SAM21EM, QCA.

**Note:** Select option 1 to install all the application along with QCA.

Below are the steps when QCA needs to be installed on a SSPFS machine which does not run the CS2M load.

- FTP the NTQCA.pkg onto the SSPFS machine. Log in as root.
- Install the new QCA software using: `pkgadd -d NTQCA.pkg`

Below are the steps to follow to uninstall the QCA package.

- Connect to the host where the QCA is running.
- Log in as root.
- Stop the QCA server: `stop_qca`.
- Uninstall the original QCA package: `pkgrm NTQCA`.

### 1.2.14 Upgrades

As of SN06.2, the QCA is a patchable component. The patchability mechanism conflicts with the in-service upgrade mechanism. So the support for in-service upgrade of QCA on a single SSPFS machine is removed. Please see section 2.2.15 for more details.

The QCA software upgrades are performed using the install scripts provided with QCA as part of the new software release. Software upgrades of QCA must be coordinated with the OSS to avoid loss of data. The OSS would be redirected to an alternative QCA instance while the primary QCA is being updated. Once the primary instance is updated, the OSS can be redirected back to the primary instance and the other instances can be updated.

In-service upgrade, with no loss of records, is only supported if two, or more, QCAs are operating in the network. This can be in two configurations; QCAs on different hosts, or multiple QCAs on a single host.

The new QCA should be started and run in parallel with the original QCA for a soak period. After the new QCA has successfully passed the soak period the original QCA can be stopped.

Installing the new QCA software overwrites the original QCA software. So it is suggested to take a backup of the original QCA software in the event that the new QCA software needs to be backed out.

### 1.2.15 QCA customer logs

In addition to QCA Error IPDR Records the QCA raises alarms and events via the customer logging stream.

The QCA uses the logging API introduced by activity 89008996 “Log Reporting and Storage Mechanism for Managed Elements”.

**Figure 4 Sample customer log message generated by QCA**

```
Oct 11 12:00:02 wmdhs0j8 main:0001 QCA201 WARNING init wmdhs0j8
RetainFileTime property in properties/qca.properties is out of
range. QCA is starting with default retain file time of 5 days
```

The QCA customer logs contain the following fields

- Report name
- Report Number
- Priority
- Event Type
- Device ID
- Message

All the QCA customer logs contain the following information:

- Report name = “QCA”
- Device ID = QCA host name

See Appendix A - QCA Customer Logs for a summary of QCA customer logs and the contents of the other fields in the logs.

The QCA also generates debug logs to report software errors.

### 1.2.16 Patchability

Activity A00003229 provides the functionality of making the QCA a patchable OAM device. The Network Patch Manager is responsible for administering individual fixes to QCA. Patches for the QCA will be in the same format and have the same naming convention of OAM patches such as NPM, SAM21EM, etc

When a QCA patch (containing modified Java-based classes) is delivered to a customer site, the patch is applied and then the QCA application is required to be stopped and then restarted by the NPM for the patch to be ‘enabled’. The restart enables a new Java Virtual Machine to be started that picks up the patched/modified Java classes. This procedure also applies to removal of QCA patches. For a QCA patch to be truly removed, the patch is removed and then a restart must be performed via the NPM on the application.

The QCA application must be inservice to perform any maintenance operations such as application, removal, or restart. In addition, the QCA application must be inservice for an audit to succeed. Because QCA is monitored or polled by an external system (OSS) for performance data or SLA

agreements, it is important that any changes to QCA be coordinated to avoid loss of data or duplication of data. The OSS should be moved from monitoring the primary instance of QCA to an alternative QCA instance while the primary QCA is being updated via the restart request initiated by NPM. Once the primary instance is updated, the OSS should be redirected back to the primary instance and the other instances can be updated.

Since QCA is an OAM software application, it will be registered in the NPM database upon system start-up and initialization, and it will appear as a device with the device name `QCA_<node_name>`, where `node_name` is the name of the SSPFS machine where the QCA is running. Reports and queries at the NPM Graphical User Interface (GUI) and NPM Command Line User Interface (CLUI) will show the QCA as a device.

In SN06.2, the support for in-service QCA upgrade (on a single SSPFS machine) is removed to enable QCA patchability. Hence, the scripts to start and stop the second instance of QCA (`qca_server2` and `stop_qca2`) will be obsoleted in this release.

The following sections briefly give information about applying/removing patches to/from QCA.

#### 1.2.16.1 Applying patch to QCA

The following steps are a recommended procedure in applying QCA patches to a QCA application.

- QCA patch files are delivered to a customer site to the SSPFS machine containing the NPM server via RPS/PFRS or by manual action.
- QCA patches are introduced to the NPM database via the NPM CLUI with the 'getpatch' command.
- QCA patches are applied to the QCA application via the NPM apply command at the NPM GUI or NPM CLUI.

After all the QCA patches are applied, a restart command from the NPM GUI or NPM CLUI is invoked on the QCA application to enable or activate the patches.

**Note:** A restart consists of stopping the QCA application and then starting the application. It is important that any maintenance activities associated with the QCA should be completed or stopped before the restart from the NPM GUI or CLUI is invoked. Also, the OSS should be directed from the primary instance of QCA to an alternative instance prior to the restart. The NPM restart will result in current active file being moved into the *today* directory and a new active file will be opened. The whole of this operation will take around **60 seconds**, during this period any QoS records sent from GWC to QCA will be lost.

Also, a NPM restart will result in following logs.

- 1 NPM 620: Initiated restart on device,<qca\_devicename>.
- 2 GWC 312: QCA connection failure, indicating that GWC is having communication problems with QCA.
- 3 NPM 620: A restart initiated by the NPM on device <qca\_devicename> has completed.
- 4 QCA 322: New GWC Connection, indicating that QCA has come up after the restart, and is accepting connections.
- 5 GWC 399: Clear event for GWC312, indicating that previous 'Raise' event is cleared.

**Note:** It is important to note the NPM database could show patches to be applied to an OAM device, but the patch is not actually enabled or performing its task to address the original problem. It is only after a restart is performed from the NPM GUI or CLUI on the OAM device that the patch is enabled.

- After the restart is performed on the QCA an NPM audit needs to be executed to update OAM patch enabled statuses in the NPM database. The audit can be performed manually from the NPM GUI or CLUI or it will be done automatically on the device approximately 20-25 minutes after the restart has been completed.

### 1.2.16.2 Removing Patch from QCA

The following steps are a recommended procedure in removing QCA patches from QCA.

- QCA patches are removed via the NPM remove command at the NPM GUI or NPM CLUI.
- After all QCA patches are removed, a restart command from the NPM GUI or NPM CLUI is invoked on the QCA to disable the patches.

**Note:** A restart consists of stopping the QCA application and then starting the QCA application. It is important that any maintenance activities associated with QCA should be completed or stopped before the restart from the NPM GUI or CLUI is invoked. Also, the OSS should be directed from the primary instance of QCA to an alternative instance prior to the restart. The NPM restart will result in current active file being moved into the *today* directory and a new active file will be opened. The whole of this operation will take around **60 seconds**, during this period any QoS records sent from GWC to QCA will be lost.

Also, a NPM restart will result in following logs.

- 1 NPM 620: Initiated restart on device,<qca\_devicename>
- 2 GWC 312: QCA connection failure, indicating that GWC is having communication problems with QCA.
- 3 NPM 620: A restart initiated by the NPM on device <qca\_devicename> has completed.
- 4 QCA 322: New GWC Connection, indicating that QCA has come up after the restart, and is accepting connections.
- 5 GWC 399: Clear event for GWC312, indicating that previous 'Raise' event is cleared.

**Note:** It is important to note the NPM database could show patches to be removed from an OAM device, but the patch is still enabled or performing its task to address the original problem. It is only after a restart is performed from the NPM GUI or CLUI on the OAM device that the patch is disabled.

- After the restart is performed on the QCA, an NPM audit needs to be executed to update QCA patch enabled statuses in the NPM database. The audit can be performed manually from the NPM GUI or CLUI or it will be done automatically on the device approximately 20-25 minutes after the restart has been completed.

#### 1.2.16.3 AutoApply

QCA patches can be automatically applied if the end user has the automated process scheduled to run. Refer to the NPM online help for more information on this automated process.

#### 1.2.16.4 Restart and Auto Restart Restrictions

Due to the implications to the OSS, restrictions are placed on the NPM restart command for QCA devices. The following restrictions are enforced by the NPM:

- QCA devices are not included in the set of OAM devices that can be auto-restarted, nor can a QCA restart be included in any plans scheduled at a designated time. Only a manual restart of a QCA device is supported.
- Only one QCA at a time can be restarted. The multitasking ability of NPM is not utilized for QCA.

A warning will be displayed to the user by the NPM CLUI or GUI explaining the implications of restarting QCA. The user will be forced to choose whether to continue with the restart command or to cancel.

### 1.2.17 QCA Software Management

The QCA application is designed to allow multiple copies to run in the network to provide increased levels of reliability. Additional copies of the QCA application should be installed on different servers and assigned in the GWC EM. Two instances of QCA can not be installed on the two halves of the same high availability cluster; they must be on separate servers. Because QCA is monitored or polled by an external system (OSS) for performance data or SLA agreements, it is important that any changes to QCA be coordinated with the OSS to avoid loss of data or duplication of data. These changes include starting or stopping the application, applying corrective content, or applying upgrades. The OSS must be able to move from monitoring one instance of QCA to another during patching or upgrades or any activity that interrupts the QCA application. The OSS can either be manually redirected to another instance of QCA or programmed to automatically redirect on command.

## 1.3 Hardware Requirements or Dependencies

The QCA application has the following requirements:

- SUN Netra T1400

440Mhz UltraSPARCC IIi with QFE card, 4MB Cache, 512MB RAM, 2x18.2GB Disk Running SUN Solaris 8 Oracle DB 8.1.6 Enterprise and Java Virtual Machine.

*Note:* The QCA can run on the same SUN Netra T1400 that SESM and other network management tools are running on.

## 1.4 Software Requirements or Dependencies

- SSPFS 3d party software suite Version 06.

## 1.5 Limitations and restrictions

### 1.5.1 Upgrades

To ensure that the QCA support the version of QoS record used in the network, the QCA must be upgraded before the QoS reporting clients are upgraded.

*Note:* For a major release upgrade, where the SSPFS software is upgraded before the QCA, a QCA running on a separate host is required to ensure no loss of QoS records.

*Note:* For a QCA maintenance release upgrade or when applying patches, a QCA running on a separate host is required to ensure no loss of QoS records.

*Note:* Corrective content is applied and managed by the Network Patch Manager (NPM). Because of the need to coordinate QCA changes like

patching with the external OSS, QCA patches are manually applied and activated. This allows the OSS to be redirected to an alternative QCA instance while the primary QCA is being updated. Once the primary instance is updated, the OSS can be redirected back to the primary instance and the other instances can be updated.

To comply with X.733, the structure of the logs will also contain following attributes. The logs are differentiated from each other by Specific Problem and Description attributes.

- Location : QCA Host Name
- Category : Appropriate category from X.733 list of available categories.
- Cause : Appropriate category from X.733 list of available cause-values.

- Time : Time at which log was generated.
- ComponentID : File /Directory path, GWC name (components causing generation of log)
- SpecificProblem : Text giving details of the specific-problem
- Description : Text describing the problem and/or giving more information.

**Note:** (There is no changes in Alarms as a result of feature A00008338)

There are 3 different Types of Alarms uniquely identified by the Notification ID:

- Notification ID: 9  
Event: Client is sending Records with unsupported Length.  
Raise Severity (Major or Minor)  
Raise Customer Log Report Number: QCA 301  
Clear Severity: (None)  
Clear Customer Log Report Number: QCA 399.
- Notification ID: 57  
Event: Client is sending Records with unsupported Version.  
Raise Severity (Major or Minor)  
Raise Customer Log Report Number: QCA 301  
Clear Severity: (None)  
Clear Customer Log Report Number: QCA 399.
- Notification ID: 49  
Event: Critical/Major/Minor Disk Space issue.  
Raise Severity (Critical, Major or Minor)  
Raise Customer Log Report Number: QCA 310.  
Clear Severity: (None)  
Clear Customer Log Report Number: QCA 399.

#### Example of Raise/Clear Alarms:

## Appendix B- Increasing the size of a file system on a Sun server

### *Application*

Use one of the following procedures to increase the size of a file system on a Succession Server Platform Foundation Software (SSPFS)-based server:

- Simplex configuration (one server)
- High-availability configuration (two servers)

It is recommended you perform this procedure during off-peak hours.

The Succession Server Platform Foundation Software (SSPFS) creates file systems to best fit the needs of applications. However, it may be necessary to increase the size of a file system.

Not all file systems can be increased. The table below lists the file systems that cannot be increased, and lists examples of those that can be increased.

### **SSPFS file systems**

Cannot be increased

Can be increased (examples)

/ (root)

/data

/var

/opt/nortel

/opt

/data/oradata

/tmp                                      /audio\_files

/PROV\_data

/user\_audio\_files

/data/qca

/data/mg9kem/logs

During the time file systems are being increased, writes to the file system are blocked, and the system activity increases. The more size that is added to the file system, the greater the impact on performance.

### ***Prerequisites***

Before you perform this procedure, verify that the file system is full or nearly full and that its content is valid application data. Remove any unneeded files or files generated in error that could be taking up disk space.

### **Action**

Perform the following steps to complete this procedure.

#### **Simplex configuration (one server)**

*At your workstation*

1> Telnet to the Sun server by typing

    > telnet <server>

    and pressing the Enter key.

    where

        server

        is the IP address or host name of the Sun server that has the file system you want to increase

2> When prompted, enter your user ID and password.

3> Change to the root user by typing

```
$ su - root
```

and pressing the Enter key.

4> When prompted, enter the root password.

5> Access the command line interface by typing

```
# cli
```

and pressing the Enter key.

Example response

Command Line Interface 1 - View

2 - Configuration

3 - Other

X - exitselect -

6> Determine which file system to increase by checking the current disk capacity utilization as follows:

a> Enter the number that corresponds to the “View” option in the menu.

Example response

View 1 - sspfs\_soft (Display Software Installation Level Of SSPFS) 2 - chk\_sspfs (Check SSPFS Processes) 3 - sw\_conf (The software configuration of the znc0s0jx) 4 - cpu\_util (Overall CPU utilization) 5 - cpu\_util\_proc (CPU utilization by process) 6 - port\_util (I/O port utilization) 7 - disk\_util (Filesystem utilization) X - exitselect -

b> Enter the number that corresponds to the “disk\_util” option in the menu.

Example response

7> Determine the appropriate size for the file systems based on your specific needs.

8> Exit each menu level of the command line interface to eventually exit the command line interface, by typing

```
select - x
```

and pressing the Enter key.

9>

#### ATTENTION

Once you increase the size of a file system, you cannot decrease it.

Increase the size of the file system by typing

```
# filesystems grow -m <mount_point> -s <size>{m,g}
```

Where

mount\_point

is the name associated with the file system

- /data
- /opt/nortel
- /data/oradata
- /PROV\_data
- /audio\_files
- /user\_audio\_files
- /data/qca
- /data/mg9kem/logs

size

is the size in megabytes (m) or gigabytes (g) you obtained in step 7

Example# filesystems grow -m /data/qca -s 512m

Note: The example above increases the "/data" file system by 512 megabytes (MB).

10> You have completed this procedure.

### ***High-availability configuration (two servers)***

#### **ATTENTION**

During this procedure, the cluster will be running without a standby node. The duration is estimated at approximately one hour.

#### ***At your workstation***

1> Telnet to the inactive node of the server cluster by typing

```
> telnet <server>
```

and pressing the Enter key.

where

server

is the physical IP address of the inactive node in the server cluster

2> When prompted, enter your user ID and password.

3> Change to the root user by typing

\$ su - root

and pressing the Enter key.

4> When prompted, enter the root password.

5> Ensure the cluster is in a good state as follows:

a> Run the udstat command by typing

# udstat

and pressing the Enter key.

If the system response contains “nodaemon”, “offline”, “down”, “not mounted”, contact your next level of support. Otherwise, proceed to the next step.

b> Run the ubmstat command by typing

# ubmstat

and pressing the Enter key.

If the system response is other than “ClusterIndicatorSTBY”. contact your next level of support. Otherwise, proceed to the next step.

c> Run the CheckConfiguration command by typing

# CheckConfiguration

and pressing the Enter key.

If the system response is other than “Checking local cluster configuration against <other node>”, contact your next level of support. Otherwise, proceed to the next step.

*At the Inactive node*

6>

#### ATTENTION

Once you increase the size of a file system, you cannot decrease it.

Increase the size of the desired file system by typing

```
# GrowClusteredFileSystem.ksh <mount_point> <size>{m,g}
```

Where

mount\_point

is the name associated with the file system, for example

- /data
- /opt/nortel
- /data/oradata
- /PROV\_data
- /audio\_files
- /user\_audio\_files
- /data/qca**
- /data/mg9kem/logs

size

is the size in megabytes (m) or gigabytes (g)

Example# GrowClusteredFileSystem.ksh **/data/qca** 10m

Note: The example above increases the “/data/qca” file system by 10 megabytes (MB).

7> Reboot the Inactive node by typing

```
# init 6
```

and pressing the Enter key.

8> Wait for the Inactive node to reboot, then log in again using its physical IP address.

9> Telnet to the active node of the Sun server cluster by typing

```
> telnet <server>
```

and pressing the Enter key.

where

server

is the physical IP address of the active node in the Sun server

cluster

10> When prompted, enter your user ID and password.

11> Change to the root user by typing

```
$ su - root
```

and pressing the Enter key.

12> When prompted, enter the root password.

At the Active node

13> Stop the cluster by typing

```
# StopCluster
```

and press the Enter key.

This action causes a cluster failover and makes the active node inactive, and the inactive node active.

At the newly Active node

14> Clone the other node using procedure Cloning the image of one node in a cluster to the other node on page 9 in this document.

15> You have completed this procedure.

## ***Product = CS 2000***

### **Q00720293--Change in SWREL value**

#### **13.1 Applicable Solution(s)**

All

#### **13.2 Description of change**

Office parameter SITELABELINFO in table OFCVAR controls the SWREL (Software Release) value. The default value is derived from the actual product load of the switch, i.e. SNxx. Effective with SN07, the software release value is no longer NCSxx/UCSxx, but is now SNxx. The SWREL value is used in the Block Header record when writing CDR records to DIRP files. It is also passed to the SDM and CBM when using SBA billing.

The SWREL value is not transferred with an ONP as are the SITEID and SITELOC portions of SITELABELINFO. To check the value for a software load, use the IMAGENAME command. Once the ONP has completed, the customer may change the default SWREL value if desired.

# SN08 Feature Deltas

***Product = CS 2000 Compact***

## **A00008431--System Masterhip Support for CS2Kc Geo Survivability Configuration**

***Functional Description***

### **1.1 Applicable Solution(s)**

PT-IP, UA-IP, IAC, IAW, CHS, PT-AAL2

### **1.2 Description**

This activity supports the Geographic Survivability configuration of the CS 2000 - Compact by modifying the mastership selection algorithm to obtain better performance during disaster scenarios.

The Geographic Survivability configuration splits the control components between 2 physically separate sites, using a highly available Optical transport system to connect the 2 sites.

In steady state, each of the components maintains communication with its mate in the other site, and they decide and negotiate activity between the two components using their existing mastership algorithm. This is the default behaviour when communications are up between the two sites, and maintains the current non-Geographic Survivability behavior when inter-building communications is present.

The enhanced mastership algorithm is used primarily in disaster scenarios, that is, when the communications between the buildings is lost, or either an entire site, or portions of it are down. The mastership algorithm detects what portions of the system are still active and reconfigures the system in an optimal mode to maintain services with the remaining inservice components.

The Geographic Survivability mastership algorithm spans the following components:

- CCA - Compact Call Agent - the master node in the algorithm
- GC - Gateway Controller
- USPc - Universal Signalling Point-Compact

Other components, while redundant, are not configured with components on both sites. These are:

- CMT & IEMS: both HA units configured on site A. Standby unit prepared on site B.
- CBM: both HA units configured on site B. Standby unit prepared on site A.
- Session Server and Policy Server: both units configured on single site

The SAM21 Manager GUI has a Geographic Survivability tab to allow configuration of the backup WAN path between the CS 2000 - Compact cards. Configuration of Call Agent interactions with the local ERS 8600 in each site is configured on each Call Agent blade using the setgeoconfig script tool.

The recommended CS-LAN router is the ERS 8600, dual processor version in each site. The CA is able to interact with the ERS 8600 in ring down scenarios, disabling OSPF on the inactive site, and thereby improving the call completion rate.

Other routers may be used, but the CA can only interact with the ERS 8600 to disable OSPF at this time.

### **1.2.1 Reference Configuration**

The Geographic Survivability reference configuration consists of the principal core components split into 2 separate physical sites, which are connected via optical equipment. Although line gateways, trunk gateways and RTP Media Portals may be present at either of both of the CS 2000 - Compact Call Agent sites, they are not survivable in the event of a site disaster.

An example configuration is shown here for help in reviewing this document.

Figure 1 Geographic Survivability Reference Configuration

### 1.2.1.1 Key components of the Geographic Survivability configuration

- Main callp and oam control components split between two geographically separate sites (i.e. CA, GWCs, USPc, CICM).
- Highly survivable Optical connections (Ring or Mesh) between the two main control sites.
- Ethernet connectivity extended over the optical ring between the Ethernet Routing Switch 8600s in each site. CALLP and OAM subnets exist transparently between the two sites.
- Fiber Channel (FC) connectivity extended over Optical for the inter-Call Agent FC connection.
- IP WAN Gateway connections from each site. Configured separately from the optical ring.
- SS7 connectivity from each site to the SS7 network. Normally operates in load sharing mode.

- Backup path configured via WAN, separately from optical network for maximum redundancy.
- CMT/IEMS and CBM are configured in HA mode, with both units on the same site. For maximum OAM redundancy, the CMT/IEMSs and CBMs are configured on opposite sites. In case of a disaster scenario where one of the sites is unavailable for an extended period of time (days or more), additional hardware is pre-installed in each site which is recovered to a temporary CBM or CMT/IEMS via a manual recovery procedure.

It is important to note that not all components in the network are Geographically Survivable. The main core components are Geographically Survivable, but typically the access GWs are single units, and exist externally to both sites, close to the access point.

The core components in the Geographic Survivability configuration, categorized by type appear in the following table:

**Table 1 Categorized core components**

| Type                   | Component      | Geo Survivable                | Comment                                                                                                          |
|------------------------|----------------|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| HA Pair<br>(Act/Inact) | CCA            | Yes                           | Master node in Geographic Survivability algorithm. Data sync across FC/Optical ring.                             |
|                        | GWC            | Yes                           | Data sync across ring                                                                                            |
|                        | CICM           | Yes                           |                                                                                                                  |
|                        | CBM            | Recoverable on standby server | HA configured in site B. (Standby server configured in Site A)                                                   |
|                        | CMT/IEMS       | Recoverable on standby server | HA configured in site A. (Standby server configured in Site B)                                                   |
|                        | SC             | N/A                           | 2 units control a specific shelf. Call Control shelves are geo-survivable as there is at least 1 shelf per site. |
|                        | Session Server | No                            | Not Geo Survivable in SN08. Configure both units in single site.                                                 |
|                        | Policy Server  | No                            | Not Geo Survivable in SN08. Configure both units in single site.                                                 |
| Load Shared            | USPc           | Yes                           | Load shared. 1 unit in each site. Geo Survivable with single unit.                                               |
|                        | MC             | No                            | Load shared units in single site only. CS 2100 Hybrid solution only.                                             |
|                        | MS2010         | Yes                           | N units at each site, where N meets engineered requirements.                                                     |
|                        | Storm-IA       | No                            | 2 separate units, 1 per site.                                                                                    |

### 1.2.2 Behaviour Overview during Failure scenarios

The goal of the Geographic Survivability algorithm is to detect and react to failure scenarios, to keep the maximum amount of equipment in service, during single or multiple fault scenarios.

To concentrate the majority of the decision making in a single place during failure scenarios, a master was chosen among the components (the CA). The master monitors multiple network connections, and has an additional backup link to its mate that are not available to the other components during optical ring failure.

Overall, the Geographic Survivability mastership algorithm works as follows:

- Algorithm spans both master (CA) and other components.
- Normal operations for master and other components: mates in contact with each other and negotiate activity and services between them.
  - This means that activity for the different components will generally be spread across both sites in normal operation.
- The master monitors several connections with its mate, and several connections with other components in order to determine the state of the overall system.
  - Mate to mate connections monitored are:
    - normal ethernet via ERS 8600 and optical,
    - backup FC link via optical (but not ERS 8600), and
    - backup WAN link via ERS 8600 and WAN, but not optical.
  - Master to network connections monitored are:
    - Master to local ethernet (ping local SC)
    - Master to local WAN edge
- Master uses WAN backup path separate from Optical link to negotiate activity if optical goes down. Only the master has access to this backup link.
- If no master mate connectivity present, master uses connection to WAN edge to determine whether to go/stay active or inactive. Assumes one or other of the locations is isolated.

This includes an assumption that the GWs (apart from those co-located in the bldg) are accessible via the WAN connection.
- When non-master mates lose connectivity with each other, they verify if they have connectivity to active master (CA). They follow the master activity during isolation.
  - During isolation, one building will become active, the other inactive based on the master activity.

- The master to non-master communications rely on the non-master detecting loss of connectivity with the master node.

Summary of system behaviour during various failure scenarios.

**Note:** These scenarios do not include the OAMP configuration. The OAM&P configuration is described in more detail in section “1.2.6 OAM&P configuration” on page 1509.

**Table 2 System Behaviour Summary**

| Scenario                           | Expected Behaviour                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERS 8600 failure in Bldg A.        | <p>All components lose mate connectivity via ethernet. CA also loses WAN backup connectivity. FC backup should remain up.</p> <p>Bldg B CA will remain active if already active. No outage.</p> <p>If Bldg B CA was not active, it will take activity within about 2 sec. SOS goes through WARM or COLD restart (about 30 secs).</p> <p>Bldg A CA will detect IST loss, but will not be able to disable OSPF since ERS 8600 down.</p> <p>Other components are expected to go active in Bldg B, following CA activity after losing mate connectivity.</p> <p>USPc in Bldg A detects isolation and takes down side A SS7 links.</p> |
| Optical Frame failure in Bldg A    | <p>All components lose mate connectivity via ethernet. CA also loses FC backup connectivity. WAN backup should remain up.</p> <p>Active CA will remain active, but without sync. No outage. (Assume active is in Bldg A for remaining discussion). Bldg B CA will detect IST loss, and disable OSPF in bldg B.</p> <p>Other components are expected to go active in Bldg A, and inactive in Bldg B, follow CA activity after losing mate connectivity.</p> <p>USPc in Bldg B detects isolation from Active CA, and takes down Bldg B SS7 links.</p>                                                                               |
| Bldg A lost                        | <p>All components in Bldg B lose mate connectivity. CA loses all mate connectivity including backups. CA loses sync.</p> <p>Bldg B CA will remain active if already active. No outage.</p> <p>If Bldg B CA was not active, it will take activity within about 2 sec. SOS goes through WARM or COLD restart (about 30 secs).</p> <p>Bldg A gone. Nothing happens there. SS7 network takes down links to site A.</p> <p>Other components are expected to go active in Bldg B, following CA activity after losing mate connectivity.</p>                                                                                             |
| CA card fails Bldg A (when active) | <p>All components in both sites can still see their mates. No change required.</p> <p>CA in Bldg B (inact) detects loss of connectivity with mate. Detects local and WAN connectivity. Takes activity, performing SOS restart.</p> <p>Other components will experience disconnection with SOS for about 30 secs. (Normal restart behavior)</p>                                                                                                                                                                                                                                                                                    |

**Table 2 System Behaviour Summary**

| Scenario                                               | Expected Behaviour                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CA card fails Bldg A (when inactive)                   | All components in both sites can still see their mates. No change required.<br><br>CA in Bldg B (act) detects loss of connectivity with mate. Detects local and WAN connectivity. Stays active. No switch of activity required. No restart required.                                                               |
| Recovery from Isolation Split Brain (Act/Act) scenario | During Recovery: Once CAs can talk to mate, they recognize that both are active. The one which was inactive previously backs down, leaving the other active. The fallout is to force unit 0 active, unit 1 inactive.<br><br>Other components talk to their mates, negotiate activity and resume normal operations. |

### 1.2.2.1 System impact of failure scenarios

Reacting to certain failure scenarios may cause a system impact. These are described below:

- When negotiating activity, the CA preference is always to remain on the same side, if this side supports activity.
- If failover of the CA is necessary, the CA switches activity in less than 2 secs, however there is a call processing interruption of approximately 30 seconds while the Callp Application performs a restart.
- If failover of other Callp nodes is necessary, they follow the CA within 2 secs.

### 1.2.2.2 Hybrid Configuration

In the CA Hybrid configuration, supported only in the Enterprise CS 2100 product, where the solution contains MC cards connected to Message Switches, supporting TDM peripherals, the MC cards and Message Switches are co-located in one of the principal Geographic Survivability sites. The behavior described above is modified in the following ways:

- During building isolation, when determining the appropriate master site, preference is given to the site containing the MC cards (assuming it is able to take activity). If necessary, activity is switched to this side during the activity negotiation.

## 1.2.3 Recovery Behaviour

A very important part of the algorithm is the recovery aspects. In general, the recovery portion of the algorithm works as follows:

- All components, regardless of their activity state, continually monitor connections with their mate, and with other network components that they normally communicate with. When connectivity is not present, they continue to monitor the connections, waiting for connectivity to return.
- All components negotiate activity and services when connectivity recovers, and resume normal operations.

### **1.2.3.1 System impact of recovery scenarios**

In general, recovery scenarios have less system impact than failure scenarios. However, reacting to certain recovery scenarios may cause a system impact. These are described below:

- When negotiating activity, the CA preference is always to leave activity on the same side. When recovering to a full system configuration, activity remains on the same unit, without impact.
- If recovering from a split system where confusion was introduced into the system due to incorrect message routing, while the activity of the nodes will be resolved within a few seconds, it may take up to 15 mins before all call processing has completely recovered.

### **1.2.4 Geographic Survivability Mode Configuration**

In SN08, it is necessary to configure Geographic Survivability mode as part of installation and commissioning of the new Geographic Survivability office.

- Configure the Backup path vlans and filtering on the CS-LAN.
- Configure the CCA access account, permissions etc on the ERS 8600.
- When configuring the CA cards in the EM GUI, fill in the Geographic Survivability portion of the panel, and include the IP addresses for the GEO WAN backup link.
- Use the setgeoconfig script tool to configure the interactions with the local ERS 8600, on each CA interface.

### **1.2.5 WAN backup path**

An important component of the reliability of the Geographic Survivability algorithm is the WAN backup path configured to go via the WAN. This link has several important attributes:

- It is only used by the CA for mate to mate communication; not by any other network component.
- It is configured separately from the optical network, thus it provides an additional path which can stay up if the optical network completely fails.
- It routes packets via the external IP network, rather than over the Optical network.
- It is monitored continually, and alarmed if it goes down.

#### **1.2.5.1 Backup Link Security**

It is noted that:

- Information is exchanged over the IP network between the 2 CA units.
- The Call Agent IP addresses are visible on the external network.
- The messages are unencrypted and unauthenticated.

- Status/control information is exchanged over this link in certain conditions, which is used to determine CA activity.

The security risks are mitigated by the following:

- In normal operation, when the Optical ring is insv, only ping messages are exchanged over the IP network (no control information). This is used simply to monitor the state of the link.
- Status/Control messages are discarded if they arrive on the backup link, while the other links are still up. Only if the other links are down, are status/control messages from the mate used to decide on activity.
- ERS 8600 filters enabled to only allow packets to be received from the mate IP address, and on the single port used for mate communication.
- Msg Rate filtering is configured on the ERS 8600 to minimize the impact of a denial of service (DOS) attack on the CA IP addresses.

### 1.2.6 OAM&P configuration

The OAM components CMT, IEMS, CBM are in HA mode on one site with a standby server at the other site.

#### 1.2.6.1 CBM accesibility

The CBM will be inaccessible during certain failure scenarios:

- Ethernet IST down (ring down) between sites, with site B core inactive (due to OSPF disable) when using ERS 8600 routers.
- Loss of site B

For various failure scenarios, the following table lindicates the impacts to CBM applications for the duration of the condition (if the optical ring is down) or until restoration of the CBM applications on the standby server (if site B is lost).

**Table 3 CBM functionality during fault conditions**

| CBM Application/Function | Description                                                                                                                                                  | CMT/IEMS Site A lost | CBM Site B lost | Ring down, Core on Site A | Ring down, Core on Site B                     |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-----------------|---------------------------|-----------------------------------------------|
| Fresh Install            | Ultimate recovery mechanism, or to prep standby unit on site A. Needs to have both Core and CMT INSV/ Accessible to complete installation and commissioning. | NA                   | OK              | OK                        | Cannot talk to Core to complete commissioning |

**Table 3   CBM functionality during fault conditions**

| <b>CBM Application/<br/>Function</b> | <b>Description</b>                                                                                                          | <b>CMT/IEMS<br/>Site A lost</b> | <b>CBM Site B<br/>lost</b>                    | <b>Ring down,<br/>Core on Site<br/>A</b>                                     | <b>Ring down,<br/>Core on Site<br/>B</b>                                     |

| Lawful Intercept (International Market Only) | Provides detailed call information for law enforcement officials                                                                                                    | OK                              | Unavailable                                                                                         | Unavailable                                                   | OK                                       |

### 1.2.6.2 Backup Access when CBM unavailable

When access via the CBM is unavailable due to failure conditions, the recommended method to connect to the Core or other nodes on either site is via telnet through the CS-LAN router.

- Telnet to the ERS 8600 can be used as a starting point. Once access is gained to the ERS 8600, access from there can be gained to the OAM and CallP devices. Since the ERS 8600 supports multiple telnet sessions, access to multiple devices can be gained using this strategy.
  - Telnet to the IP of the ERS 8600.
  - Login as a user with r/w privileges
  - Telnet to the core or other node using the IP address of the node.
- This assumes that network connectivity is available between the NOC and site.
- To minimize the impacts of having OSPF disabled on the inactive site during certain failure scenarios, it is recommended to connect to the Circuitless IP for the CS-LAN router, which is outside the IPs used for OAMP access (and is not affected by OSPF disable).

### 1.2.6.3 CMT/IEMS accessibility

The CMT/IEMS will be inaccessible during certain failure scenarios:

- Ethernet IST down (ring down) between sites, with site A core inactive (due to OSPF disable) when using ERS 8600 routers.
- Loss of site A

When the CMT/IEMS is inaccessible the following services are retained:

- Call processing
- CBM functions for transfer of billing records, core logs and core OMs downstream and as the bootp load repository

The following CMT/IEMS resident services are unavailable:

- OA&M functions of the CS 2000 Management Tools and IEMS - GUI access, element management, alarms, non-core logs
- Access to the CS 2000 Compact Core Manager on the CBM (craft would be able to telnet to the CBM and from there access the Call Agent)

During an extended CMT/IEMS outage, the following recovery actions are recommended:

- Bring the standby Sun server(s) at Site B into service as the CMT and IEMS

**Note:** Requires manual intervention – roughly 2 to 3 hours once personnel are on site

The following is a detailed list of services which are not available during a period of CMT/IEMS inaccessibility:

- alarm reporting northbound
- alarm collection from NEs
- log collection from NEs
- log reporting northbound
- provisioning functions
- visibility to NEs (SC, GWC)
- GUI access (very similar to line above)
- maintenance actions on NEs (bsy/rts, lock/unlock etc)
- table access via the CBM
- QCA data collection
- OM collection
- OM push functions
- NTP services to NEs
- line maintenance function
- trunk maintenance functions
- proxy connections to Storm, USPc, Session Server ( devices can not be accessed)

### 1.3 Hardware Requirements or Dependencies

Single ERS 8600 (dual processor) in each site, is the only router which supports interactions with the CA for OSPF disable. When the ERS 8600 is used, then an IST link must be configured across optical equipment between sites.

Enhanced GFSRM optical cards used for FC link between sites.

### 1.4 Software Requirements or Dependencies

SN08 loads for all components.

CMT/IEMS and CBM are HA versions.

### 1.5 Limitations and restrictions

This activity only addresses the mastership enhancements required for Geographic Survivability. It does not address other requirements of Geographic Survivability, including the optical requirements for syncing and communications over the distance required in the POR, or inservice upgrades from non-Geographic Survivability to Geographic Survivability configurations.

- In Hybrid configurations (with TDM equipment homed at 1 site), the TDM equipment is not Geo Survivable. Preference is given to the TDM side, only when either side can support callp. If necessary, a swact will be performed to the TDM side in order to allow callp on TDM side.

Geographic Survivability Hybrid is supported only in Enterprise (CS2100) solutions.

- Due to the necessity for the CA to interact with the ERS 8600, this activity requires that there be only a single ERS 8600 per site, with IST links configured between sites. Dual ERS 8600s per site are not supported nor are SMLT links between sites. Enterprise upgrades from previous releases in Geographic Survivability configuration (which have dual ERS 8600s per site) require that the dual ERS 8600s be migrated to a single ERS 8600 per site.
- Other routers can be used for the CS-LAN, but the geographic survivability interactions with the call agent are only supported on the ERS 8600. If another router is used, the following limitations are in effect:
  - OSPF will not be disabled automatically on the inactive site when Ethernet connectivity is down between sites -- this will lead to additional call failures due to misdirected messages.
  - It may also lead to extended recovery times after the failure condition is removed.
- In cases of total communication loss between the two sites (i.e. all 3 master links), activity decision cannot be negotiated between the 2 call agents, and will be made based on connectivity check from each site to the WAN network.
  - While very unlikely, it could be possible to have an active/active (i.e. split brain) scenario, or an inactive/inactive scenario (no processing).
  - The WAN backup path was chosen as a method of mitigating the risk of the optical ring failure. The WAN connection check helps resolve activity when even the backup path is down.
- CS 2000 - Compact supports only a single time zone setting; if the two physical sites are in different time zones, then it is recommended to set the timezone to either GMT or the timezone of one of the sites.
- Session Server and Policy Server plans no mastership changes in SN08. Both Session Server and Policy Server units will be homed on 1 site.
- Geographic Survivability requires a WAN backup path configured separately from the Optical network for maximum redundancy.
  - dedicated vlan configured on each ERS 8600 for use by backup path only
  - vlans route via the WAN network, not over the optical ring
  - vlans are not disabled with OSPF disable
  - lack of connectivity is alarmed
- In general, the gateways and services node components of CS 2000 - Compact are single units, and not geographically survivable. Depending

on where these nodes are located and how they are connected to the network impacts whether they survive any particular failure. Although the same nodes are supported in Geographic Survivability and non-Geographic Survivability config, there is no anticipated change in configuration or connection in the Geographic Survivability configuration.

## 1.8 Glossary

| Term      | Description          |
|-----------|----------------------|
| CA or CCA | Compact / Call Agent |
| MC        | Message Controller   |

## 2: Fault Management for A00008431

### 2.1 Fault management strategy

The CS2000 - Compact in Geographic Survivability mode has extensions to the alarm strategy to support alarming additional connections monitored in Geographic Survivability mode. Specifically, the Call Agent (CA) monitors connectivity to its mate CA via the WAN backup path. Additionally, the CA monitors connectivity to the local wan edge router used to connect to the

WAN. These additional connections are also described in existing connectivity logs, when in Geographic Survivability mode.

New logs in Geographic Survivability mode are used to show interactions with the local Ethernet Routing Switch 8600 (where used). OSPF is disabled on the CALLP and OAM vlans on the inactive call agent site in the case of optical and ethernet isolation between sites. Specifically, information logs are output as OSPF is enabled or disabled by the CA.

## 2.2 Fault management tools and utilities

No special fault management tools.

Alarms are available from the alarm command at the coremtc map level of the ccamtc map.

Logs are available from the logquery command at the coremtc map level of the ccamtc map.

## 2.3 New Logs CCA685 & CCA686

### 2.3.1 Explanation

Log Title: CCA685

Name: CCA Geo OSPF Disable

Description: The CCA disabled OSPF in the local ERS 8600.

Event type: Info

### 2.3.2 Explanation

Log Title: CCA686

Name: CCA Geo OSPF Enable

Description: The CCA enabled OSPF in the local ERS 8600.

Event type: Info

### 2.3.3 Format

CCA685 JAN11 12:38:05 INFO OSPF Disabled

Unit Number: 1, INACTIVE

Description: Open Shortest Path First routing protocol disabled on the local default gateway.

CCA686 JAN11 14:26:05 INFO OSPF Enabled

Unit Number: 0, ACTIVE

Description: Open Shortest Path First routing protocol enabled on the local default gateway.

### 2.3.4 Field descriptions

**Table 1** Field descriptions

| Field       | Value              | Description                     |
|-------------|--------------------|---------------------------------|
| Unit Number | 0 or 1             | The CCA unit number             |
| Activity    | ACTIVE or INACTIVE | The activity state of this unit |

### 2.3.5 Action

No action required; this is an INFO only log.

For CCA685 - OSPF Disable log, this indicates that OSPF routing has been disabled on the local ERS 8600. This will only happen on the Inactive unit when the Ethernet connectivity or Optical Ring goes out of service between sites. This system action improves the ability of outside nodes to route to the remaining active call agent site.

### 2.3.6 Associated Operational Measurements or Performance Measurements

None

### 2.3.7 Additional information

None

## 2.4 Changed Logs CCA331 CCA335 CCA336 CCA631 CCA635 CCA636

These logs have an enhanced *Description* when in Geographic Survivability mode, giving details of the connection states being monitored. The description format is the same for each of these logs, although the fields differ depending on the condition being logged.

When not in Geographic Survivability mode, the logs appear as documented previously.

The following sections describe the logs as seen in Geographic Survivability mode.

### 2.4.1 Explanation

Log Title: CCA331

Name: Mate Connectivity

Description: Indicates a connectivity problem with the mate CCA unit.

Event type: FLT

#### **2.4.2 Explanation**

Log Title: CCA631

Name: Mate Connectivity Restored

Description: Indicates connectivity problem with the mate CCA unit has been resolved.

Event type: INFO

#### **2.4.3 Explanation**

Log Title: CCA335

Name: Link Connectivity

Description: Indicates a link connectivity problem.

Event type: FLT

#### **2.4.4 Explanation**

Log Title: CCA635

Name: Link Connectivity Restored

Description: Indicates a link connectivity problem has been resolved.

Event type: INFO

#### **2.4.5 Explanation**

Log Title: CCA636

Name: Network Connectivity

Description: Indicates a connectivity problem with monitored network connections.

Event type: FLT

#### **2.4.6 Explanation**

Log Title: CCA336

Name: Network Connectivity Restored

Description: Indicates a network connectivity problem has been resolved.

Event type: INFO

| wanEdge  | OK or BAD    | Network connectivity to local wan edge router.                          |
| BLink:   | INSV or SYSB | Backup Link state via Fiber Channel                                     |
| mateCon: | OK or BAD    | Mate connectivity via BLnk.                                             |
| FC       | INSV or SYSB | Fiber Channel (FC) state                                                |

**2.4.9 Action**

For CCA335, CCA331, CCA336 FLT logs:

- Use the description info in the logs, or in the corresponding CON alarm to determine the type of connectivity problem. Determine whether this is caused by a maintenance action underway, or by an actual network connectivity fault.
- If due to a network fault, attempt to isolate the connectivity problem.
- If due to a maintenance action, monitor the condition until the maintenance action is completed.

For CCA635, CCA631, CCA636 INFO logs:

- No action is required. These logs indicate a resolution of previously logged and alarmed connectivity problems.

**2.4.10 Associated Operational Measurements or Performance Measurements**

None

**2.4.11 Additional information**

These logs are associated with the CON alarm.

In normal (non-Geo) mode, these logs have a description like the following:

Description: Link0: INSV, mateCon: AVAIL, netCon: AVAIL;  
 Link1: INSV, mateCon: AVAIL, netCon: AVAIL;  
 BLink: INSV, mateCon: AVAIL; FC: INSV;

## 2.5 Alarms

### 2.5.1 CCA CON alarms

The description field of the LnkCon, MatCon and NetCon alarms describes the connectivity map for the monitored connections. In Geographic Survivability mode, the description is extended to show the enhanced connection monitoring. The description fields are identical to the corresponding logs described above.

The alarm severity varies with the number and types of connectivity problems.

Figure 1 shows an example of a MatCon and LnkCon alarms displayed on the CCA map, using the *alarm con* command.

**Figure 1 Example Map showing MatCon and LnkCon alarms**

| CallAgent   | SYS                               | CON      | APPL                                                                                  | Unit: 1 |
|-------------|-----------------------------------|----------|---------------------------------------------------------------------------------------|---------|

### 3.8.1 New/modified GUIs

| GUI name                        | NEW, CHANGED, or DELETED |
|---------------------------------|--------------------------|
| SAM21 EM 3PC provisioning Panel | Changed                  |

### 3.8.2 GUI information

#### 3.8.2.1 GUI name: SAM21 EM 3PC Provisioning Panel SAM21 EM 3PC Provisioning Panel

##### 3.8.2.1.1 Functional description

This panel is for provisioning 3PC card through SAM21 EM GUI. In this feature, a new sub panel for provisioning GR backup WAN IP addresses is added to the existing 3PC provisioning panel (refer to the following figure).

**Figure 1 SAM21Manager Call Agent Provisioning Panel**

##### 3.8.2.1.2 GUI usage and implications

Current datafill order unchanged.

##### 3.8.2.1.3 GUI size

**Table 1 New or modified GUIs**

| Abbreviated GUI name           | Minimum instances | Maximum instances | Information on memory             |
|--------------------------------|-------------------|-------------------|-----------------------------------|
| SAM21EM 3PC provisioning Panel | 0                 | 1 per card view   | Memory is automatically allocated |

### 3.8.2.1.4 GUI fields

The following table lists fields for the GR backup WAN IP addresses configuration panel which is newly added to existing SAM21 EM 3PC provisioning panel.

**Table 2 GUI field descriptions**

| Field         | New or Changed | Subfield | Entry | Explanation and action                                                                                                                                                                                | Associated MIB entry |
|---------------|----------------|----------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| Enable        | New            | 0        | 0     | Check this box to enable Geographical Survivable WAN IP addresses configuration                                                                                                                       |                      |
| GEO UNIT 0 IP | New            | 0        | 0     | The IP address for the GEO UNIT 0 Backup path IP for CA 0.<br>The address specified here is the network ip +4.<br>The last octet of this IP address must be 4 less than a base multiple of 8 address. |                      |
| GEO UNIT 1 IP | New            | 0        | 0     | The IP address for the GEO UNIT 1 Backup path IP for CA 1.<br>The address specified here is the network ip +4.<br>The last octet of this IP address must be 4 less than a base multiple of 8 address. |                      |

### 3.8.2.1.5 Usage example

The following example shows sample datafill for GR backup WAN IP addresses configuration panel:

*Enable: true*

*GEO UNIT 0 IP: 47.142.114.84*

*GEO UNIT 1 IP: 47.142.114.44*

### 3.11 Configuration Walkthrough

During the CS 2000 - Compact Geographic Survivability Configuration mode, it is necessary to perform specific configuration for Geo Survivability at various phases of the commissioning and setup of the office.

#### 3.11.1 During Planning:

Ensure that the following additional configuration information is identified. Additional details are found in the System Engineering Bulletins.

- CA Backup Link VLANs and IP addresses. 2 separate 8 IP address ranges are required to setup packet routing via the IP network. These values are be configured in the GUI when configuring the CA cards. Both VLANs are configured with a subnet max of 255.255.255.248.

**Table 3 Example Backup Path IP addresses**

| IP                            | Comment                                             |
|-------------------------------|-----------------------------------------------------|
| 192.168.0.0 (base + offset 0) | Network ID - base address for vlan                  |
| 192.168.0.1 (base + offset 1) | Used by CA to access the local ERS 8600             |
| 192.168.0.2 (base + offset 2) | port 0 (localwan0 or matewan0)                      |
| 192.168.0.3 (base + offset 3) | port 1 (localwan1 or matewan1)                      |
| 192.168.0.4 (base + offset 4) | backup path provisioned value (localwan or matewan) |
| 192.168.0.5 (base + offset 5) | reserved                                            |
| 192.168.0.6 (base + offset 6) | reserved                                            |
| 192.168.0.7 (base + offset 7) | broadcast                                           |

- To enable the setgeoconfig script to automatically identify the CallP and OAM vlans, the following naming convention for CallP and OAMP VLANs is required. Additional details are found in the System Engineering Bulletins.

- The OAMP VLAN name must start with the string “OAMP”.
- All CallP VLAN names must start with the string “CallP”, except for the Private-CallP VLAN.

### 3.11.2 During CS-LAN configuration:

- Create 1 backup path vlan on each of the CS LAN routers. Additional details are found in the System Engineering Bulletins.
  - Create Backup\_path\_subnet VLAN by IPSubnet
  - Remove all ports from the backup\_path\_subnet except the two physical ports from the CA
  - Create a IP Traffic filter-set to allow traffic to/from the backup\_path\_subnet's only
  - Setup routing to ensure the backup path always routes through the core network, and not over the IST.
- If the CS LAN router is an ERS 8600, create a user acct and access policy for the CA access:
  - Enabling rlogin server
    - config bootconfig flags rlogind true
  - configuring and enabling an access policy.
    - # Create 3PC access policy on the ERS8600
    - config sys access-policy enable true
    - config sys access-policy policy 2 create
    - config sys access-policy policy 2 accesslevel rwa
    - config sys access-policy policy 2 host <CA IP address>
    - config sys access-policy policy 2 name "3PC-script"
    - config sys access-policy policy 2 username "root"
    - config sys access-policy policy 2 service rlogin enable

### 3.11.3 During CA GUI configuration:

In the CA GUI for each blade:

- Check the Enable check box in the Geographic Survivable section of the CA GUI.
- Enter the Unit0 and Unit1 Backup Link IPs as determined during planning.

**Figure 2 Backup Path provisioning**

**3.11.4 During CA setup:**

Once the CA blades have been booted and brought inservice, use the setgeoconfig.sh script tool to configure the local router actions with the CA:

**3.11.4.1 Configuration with ERS 8600 router**

- As root user, invoke the setgeoconfig.sh script tool to begin the configuration:

**Figure 3 setgeoconfig.sh script invocation**

```
[root@10.73.17.19 root]# cd /usr/admin_bin/
[root@10.73.17.19 admin_bin]# ./setgeoconfig.sh
```

- Enter the ERS 8600 configuration mode, and enter the 8600 userid created for CA access.

**Figure 4 ERS 8600 configuration mode and userid**

```
*****
3PC-P8600 Passport Interaction configuration
*****
```

Note: Current value are put in [] at prompts  
Type new value or press enter for default

```
-----

Configuration of the CS2Kc use p8600
```

Type yes or no  
P8600\_used => [] : yes

```
-----
Type in Passport P8600 User ID
P8600_USER => [] : rwa
-----
```

- The script then validates connectivity to the ERS 8600, then connects to the ERS 8600 and retrieve a list of CallP and OAMP vlans. Confirm each vlan which will be configured to be part of the set to have OSPF disabled during certain failure scenarios. The script prompts for each vlan in turn.

**Figure 5 ERS 8600 configuration of CallP and OAMP vlans**

Configuring CallP & OAMP VLANs to monitor

```
-----
The following CallP & OAMP are configured on passport
```

```
[root@10.73.17.19 admin_bin]#
```

### 3.11.4.2 Configuration with non-ERS 8600 router

If the CS-LAN is not using ERS 8600 routers, this is also configured using the setgeoconfig.sh script tool.

- Invoke the setgeoconfig.sh script tool to begin the configuration:

**Figure 7 setgeoconfig.sh script invocation**

```
[root@10.73.17.19 root]# cd /usr/admin_bin/
[root@10.73.17.19 admin_bin]# ./setgeoconfig.sh
```

- Configure non-ERS 8600 mode.

**Figure 8 non-ERS 8600 configuration mode**

```
*****
3PC-P8600 Passport Interaction configuration
*****
```

Note : Current value are put in [] at prompts  
Type new value or press enter for default

```
-----
Does this Geographic Redundant (RC)
Configuration of the CS2Kc use p8600
```

```
Type yes or no
P8600_used => [yes] : no
-----
```

- Configure WAN edge IP to monitor. First configure the number of wan edge IPs to monitor (default 1), then the IPs to monitor. The script tests that the IPs are reachable by ping.

**Figure 9 non-ERS 8600 Wan edge configuration**

```
Configure WAN Edge IP

## **A00002512--GWC-EM Internet Transparency VCAC Provisioning**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

IAW, IAC

**Note:** This is an SN07 feature, included here by special request.

## 1.2 Description

The Internet Transparency (“ITrans”) solution, implemented in the SN06.x stream, provides a means for CS2K to enable IP-telephony across and between VPNs (Virtual Private Networks). This is achieved by taking into account the presence of NAT (Network Address Translator) middleboxes between MGs (Media Gateways) and the ‘outside world’, and inserting publicly-addressable MP (Media Proxy) devices into the media path where required.

The SN06 provisioning component of this work dealt with:

- datafilling of Media Proxy and (virtual) NAT devices
- association of MGs to an ‘adjacent’ NAT.
- association of MPs to GWCs (Gateway Controllers)
- downloading of MP/NAT information to GWCs as necessary.

See feature ACTIDs 89007809, 89007814 and 89007657 for further information on the SN06 provisioning functionality.

The present feature (SN07) builds on this provisioning functionality to add support for:

- datafilling of LBL (Limited Bandwidth Link) middleboxes in addition to NATs
- datafilling of RU (Resource Usage) data for use in the VCAC (Virtual Connections & Admissions Control) function of LBLs
- manual or automatic assignment of a GWC to carry out the RU capacity counting function on behalf of an LBL
- ‘chaining’ of middleboxes (NATs/LBLs) in a hierarchical network topology.
- downloading of MP/NAT/LBL/RU information to GWCs as necessary.

### VCAC Background

LBLs are a virtual representation of ‘policed’ capacity-restricted links in the network. An LBL carries a number (“max count”) representing maximum capacity through the link. Call set-up through the link causes a running total of used capacity to be incremented, and call take-down causes the running total to be decremented. If call set-up will cause the running total to exceed the LBL’s maximum capacity figure, the call attempt is rejected and routed to treatment (congestion tone).

The specific amount used to increment/decrement the running total is supplied by the Resource Usage entry used by the LBL. Each Resource Usage entry has

a set of ‘capacity-used-per-call’ values, depending on the codec and packetization rate in use on the call.

The running total is maintained by a counting device - in the SN07 release this device is a GWC. The counting device for a particular LBL is identified by entering the counter’s address into the LBL’s IP address field. There is one method for allocating the LBL’s counting device:

- “auto-generated” - the LBL’s address field is filled automatically when the LBL is first downloaded to a GWC.

### 1.3 Hardware Requirements or Dependencies

**Figure 1 System Configuration**

Note: The components outlined in blue will be affected by this provisioning activity.

#### **Requirements for the whole Pre-midcom solution:**

- CS2K.
- SESM Platform (Succession Element and Sub-Element Manager).
- IMS manager to handle provisioning of the Media Proxy.
- Uncontrolled NATs.
- Media Proxies.

- MGs.

## 1.4 Software Requirements or Dependencies

Dependencies:

- GWC should be running a software load of an equivalent stream to that of the SESM/GWC-EM, and should be running under a profile that enables ITrans functionality.

## 1.5 Limitations and restrictions

- There is only one NAT exit point from a local network.
- A Media Gateway has one or no adjacent middlebox. A NAT/LBL has one or no parent middlebox.
- The maximum length of sequentially 'chained' middleboxes (e.g. A --> B --> C, etc) is five.
- If two gateways are behind the same NAT then they can set up a call without requiring a Media Proxy.
- If two gateways are behind the same LBL, a call between them is not considered to use capacity on that LBL.
- The DQoS IAC solution (ACTID 59039082/59006771) uses "PepServer" middleboxes. The ITrans IAW solution uses NAT/LBL middleboxes. These two solutions are mutually exclusive as defined in the gateway profile service type (i.e. DQOS and ITRANS cannot be defined together in a profile).
- Where an LBL is 'shared' between two or more Succession Call Server networks (see ACTID.A00002644 "Common Topology Identifier Provisioning"), the LBL must be provisioned with exactly the same details on each network.

## 1.6 Interactions

The provisioning of LBL/RU data brings changes to the following GUIs:

- GWC-EM Network Panel (figures 2, 3, 4)
- Associate Media Gateway window (section 2.7.1.4).

The following features will also make changes in the Network Panel GUI:

- ACTID.A00002644 "Common Topology Identifier Provisioning"
- other [AT LEAST ONE OTHER... get details from Keith Raker]

This feature provisions data for use by the SN07 GWC CallP feature ACTID A00002739 "Virtual Connections Admissions Control".

## 1.7 Applicable customer facing sections

### Fault Management

Performance (includes operational measurements) \_N/A\_

### 1.7.1 User Interface - GUI

The upper section of the GWC-EM Network Panel GUI is reorganized to put the existing three subsections into tabbed panes. VCAC Resource Usage data is provisioned via the new RU table in a fourth tab in the upper section.

NATs are provisioned as before, except that:

- the tab is renamed “IP-VPNs (Virtual NATs)”
- a new field is added to provision a “Parent” (northbound neighbor) middlebox in the topology.

LBLs are provisioned via a table in a new tab added to the central section of the Network Panel.

Figures 2 and 3 and 4 show the Network Panel:

- before reorganization (SN06 version)
- after reorganization, NAT table visible
- after reorganization, new LBL table visible

The new RU data table can be seen in the upper part of the reorganized view.

**Figure 2 Unmodified (SN06) view of GWC-EM Network Panel**

**1.7.1.1 Provisioning Resource Usage data: Add, Change, Delete**

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the VCAC Resource Usage table (figure 3).

**Add Resource Usage data:** click the “Add” button in the Resource Usage tab to obtain the following box.

The dialog box titled "Add Resource Usage Data" contains five input fields and two buttons. The fields are labeled "RU Description:", "RU Value (G.711/10 ms):", "RU Value (G.711/20 ms):", "RU Value (G.729/10 ms):", and "RU Value (G.729/20 ms):". Each of the four "RU Value" fields contains the number "0". The "OK" and "Cancel" buttons are at the bottom right.

Enter a valid text description, and non-negative integer entries for each “RU Value” (zero is provided as a default). Click “OK” to confirm.

**Change Resource Usage data:** select an RU table entry and click the “Change” button to obtain the following box:

The dialog box titled "Change Resource Usage Data" contains five input fields and two buttons. The fields are labeled "RU Description:", "RU Value (G.711/10 ms):", "RU Value (G.711/20 ms):", "RU Value (G.729/10 ms):", and "RU Value (G.729/20 ms):". The "RU Description" field contains the text "voip-ethernet". The "RU Value" fields contain the numbers "130", "97", "74", and "41" respectively. The "OK" and "Cancel" buttons are at the bottom right.

Modify the required data fields and click “OK” to confirm.

**Delete Resource Usage data:** select an RU table entry and click the “Delete” button to obtain the following confirmation box:

Click "Yes" to confirm. Note that the operation will be rejected if the RU Factor is currently 'in use', i.e. is currently referred to by an LBL.

#### 1.7.1.2 Provisioning NAT middleboxes: Add, Change, Delete

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the IP/VPN table (figure 3).

**Add NAT middlebox:** click the "Add" button on the "IP-VPNs (Virtual NATs)" tab to obtain the following box:

Enter a unique (DNS compliant, see ref 1) name. If appropriate use the filtered selection box to select a Parent Middlebox. Filtering is performed by one or both of:

- radio button selection to limit the choice to only NATs or only LBLs
- typing the starting letters of the Parent middlebox name to limit selection to those with matching starting letters.

An example of filtered selection is shown below:

Selection of Parent middlebox is restricted to already provisioned middleboxes. Both NAT and LBL middleboxes can have either a NAT or an LBL as parent. Click “OK” to confirm.

**Change NAT middlebox:** select a NAT table entry and click the “Change” button to obtain the following box:

Modify the selected Parent middlebox as required (i.e. select another middlebox or <none>), and click “OK” to confirm.

**Delete NAT middlebox:** select a NAT table entry and click the “Delete” button to obtain the following confirmation box:

Click "Yes" to confirm. Note that the operation will be rejected if the NAT is currently 'in use', i.e. is currently referred to:

- as a parent by another middlebox
- as an adjacent middlebox by a Media Gateway.

### 1.7.1.3 Provisioning LBL middleboxes: Add, Change, Delete

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the Low B/W Links table (figure 4).

**Add LBL middlebox:** click the "Add" button on the "Low B/W Links (VCAC)" tab to obtain the following box:

A Windows-style dialog box titled "Add Limited B/W Link (VCAC MiddleBox)". It contains several input fields: "Name:" (text box), "RU Profile Name:" (dropdown menu), "Max Count Value:" (text box), and "Parent MiddleBox Selection (create hierarchy)" which includes three radio buttons labeled "ALL", "IP-VPNs", and "LBLs" (with "ALL" selected), and a "Parent MiddleBox" dropdown menu showing "<none>". At the bottom are "OK" and "Cancel" buttons.

Enter the following information:

- valid text name (DNS compliant, see ref. 1)
- select RU Factor from the list provided
- enter a non-negative integer value for "Max Count Value"
- select Parent middlebox from the (filtered) list. Remember that an LBL can have either another LBL or a NAT as Parent middlebox.

Click “OK” to confirm.

**Change LBL middlebox:** select an LBL table entry and click the “Change” button to obtain the following box:

The dialog box titled "Change Limited B/W Link (VCAC MiddleBox)" contains the following fields and controls:

- Name:** A text field containing "lbl2".
- RU Profile Name:** A dropdown menu showing "mfProf.1".
- Max Count Value:** A text field containing "3".
- Parent MiddleBox Selection (create hierarchy):** A section containing three radio buttons: ☒ ALL, ☐ IP-VPNs, and ☐ LBLs.
- Parent MiddleBox:** A dropdown menu showing "<none> (Top Level LBL)".
- Buttons:** "OK" and "Cancel" buttons at the bottom right.

The name field is not modifiable, other fields may be edited as required. Parent middlebox may be changed to either another middlebox or <none>. Click “OK” to confirm. NB: the RU Factor and the Parent may not be changed in the same operation - they must be modified in separate change operations.

**Delete LBL middlebox:** select an LBL table entry and click the “Change” button to obtain the following confirmation box:

The dialog box titled "Confirm LBL Delete" contains the following elements:

- Question:** "Do you want to delete the LBL MiddleBox 'upton1.eastEndFoods.co.uk'?"
- Buttons:** "Yes" and "No" buttons.

Click “Yes” to confirm. Note that the operation will be rejected if the LBL is currently ‘in use’, i.e. is currently referred to:

- as a parent by another middlebox
- as an adjacent middlebox by a Media Gateway.

#### 1.7.1.4 Associate/Change Middlebox to a Media Gateway

This is unchanged from SN06 functionality except that filtered selection is used to choose an Adjacent Middlebox, as shown below for the Associate operation:

**Associate Media Gateway**

Gateway name: aslwg4.1.upton1

Gateway IP address:

Gateway controller name: GWC-102

Gateway profile name: ASKEY\_LINE\_GW\_4

Reserved terminations: 4

Gateway site name: LG

Protocol type:

Protocol port:

Protocol version:

OK Cancel

Note: attempting to remove an adjacent middlebox from a Media Gateway will be rejected if the middlebox or any member of it's 'northbound' topology chain is a NAT.

#### 1.7.2 XML Interfaces

Modified Interfaces in Sn07

- Add/Query NATs - added parent middlebox attribute

New Interfaces introduced in Sn07 are as follows:

- Change NATs

- Add/Delete and Change Media Proxies.
- Add/Delete/Query and Change Resource Usage profiles
- Add/Delete/Query and Change LBL entries.

#### 1.7.2.1 Add NAT XML command

Add NAT is modified SN07 the <parentMB> tag has been added. The value of this tag must have been previously provisioned into the system to successfully complete this command.

The XML for this command is shown in Figure 5, Figure 6. Error messages returned are described in Appendix B.

**Figure 5 XML command to Add NAT device.**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <Parameters>
          <NATname>NAT-A</NATname>
          <ParentMB>VPN-Eastenders</ParentMB>
        </Parameters>
      </addNAT>
    </Methods>
  </Command>
</CommandList>
```

**Figure 6 XML response to Add NAT**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addNAT>
    </Methods>
  </Response>
</CommandList>
```

### 1.7.2.2 Query NAT XML command

The Query NAT response is modified SN07 the <parentMB> tag has been added

The XML for this command is shown in Figure 7, Figure 8. Error messages returned are described in Appendix B.

**Figure 7 XML command to Query a NAT**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <Parameters>
          <NATname>NAT-A</NATname>
        </Parameters>
      </queryNAT>
    </Methods>
  </Command>
</CommandList>
```

**Figure 8 XML response to Query NAT**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <ReturnData>
          <NATname>NAT-A</NATname>
          <ParentMB>VPN-Eastenders</ParentMB>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNAT>
    </Methods>
  </Response>
</CommandList>
```

### 1.7.2.3 Change NAT XML command

Change NAT is new to SN07 because there was no data in the SN06 releases to change, in Sn07 the only attribute that can change is the <ParentMB>

tag. The value of this tag must have been previously provisioned into the system to successfully complete this command.

The XML for this command is shown in Figure 9, Figure 10. Error messages returned are described in Appendix B.

**Figure 9 XML command to Change specified NAT parent middlebox**

        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeNAT>
    </Methods>
  </Response>
</CommandList>
```

#### 1.7.2.4 Add Media Proxy XML command

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure 11, Figure 12. Error messages returned are described in Appendix B.

**Figure 11 XML command to Create a new Media Proxy**

```
<?xml version="1.0" encoding="UTF-8" ?>

          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addMP>
    </Methods>
  </Response>
</CommandList>
```

### 1.7.2.5 Change Media Proxy XML command

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure 13, Figure 14. Error messages returned are described in Appendix B.

**Figure 13 XML command to Change IP data of a Media Proxy**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <changeMP usn="1" version="1.0">
        <Parameters>
          <MPname>MP-A</MPname>
          <IPAddress>47.165.32.22</IPAddress>
          <Protocol>MGCP+</Protocol>
          <ProtocolVersion>2.0</ProtocolVersion>
        </Parameters>
      </changeMP>
    </Methods>
  </Command>
</CommandList>
```

**Figure 14 XML response to Change Media Proxy IP data.**

    <Methods>
      <changeMP usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeMP>
    </Methods>
  </Response>
</CommandList>
```

### 1.7.2.6 Delete Media Proxy XML command

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure 15, Figure 16. Error messages returned are described in Appendix B.

**Figure 15 XML command to Delete a Media Proxy**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <deleteMP usn="1" version="1.0">
        <Parameters>
          <MPname>MP-A</MPname>
        </Parameters>
      </deleteMP>
    </Methods>
  </Command>
</CommandList>
```

**Figure 16 XML response to Deleting Media Proxy.**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <deleteMP usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </deleteMP>
    </Methods>
  </Response>
</CommandList>
```

#### 1.7.2.7 Creating RU profile command

Resource Usage provisioning is new to SN07. To successfully create an RU profile the XML client must provide every Codec/packetRate combination that has been entered into the CS2K config manager.

The XML for this command is shown in Figure 17, Figure 18. Error messages returned are described in Appendix B.

**Figure 17 XML command to Create an RU profile**

```

<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <addRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>103</Value>
          </RUValue>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>133</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>132</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>103</Value>
          </RUValue>
        </Parameters>
      </addRU>
    </Methods>
  </Command>
</CommandList>

```

        </ReturnData>
      </addRU>
    </Methods>
  </Response>
</CommandList>

```

### 1.7.2.8 Changing RU profile command

Resource Usage provisioning is new to SN07. To successfully change an RU profile the XML client must either provide and <RUNewDescription> OR every Codec/packetRate combination that has been entered into the CS2K config manager.

The XML for this command is shown in Figure 19, Figure 20, Figure 21. Error messages returned are described in Appendix B.

**Figure 19 XML to Change an RU profile Description.**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <changeRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUNewDescription>AAL1/IP71 </RUNewDescription>
        </Parameters>
      </changeRU>
    </Methods>
  </Response>
</CommandList>
```

          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeRU>
    </Methods>
  </Response>
</CommandList>
```

#### 1.7.2.9 Query RU profile XML command

Resource Usage provisioning is new to SN07. The XML client has the option to either Query all the RU profiles, or the RU data for a particular profile.

The XML for this command is shown in Figure 22, Figure 23, Figure 24, Figure 25. Error messages returned are described in Appendix B.

**Figure 22 XML command to Query all RU Profiles**

```
<?xml version="1.0" encoding="UTF-8" ?>

<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryRU usn="1" version="1.0">
        <ReturnData>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>123</Value>
          </RUValue>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>133</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>152</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>163</Value>
          </RUValue>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryRU>
    </Methods>
  </Response>
</CommandList>
```

#### 1.7.2.10 Delete RU profile XML command

Resource Usage provisioning is new to SN07.

The XML for this command is shown in Figure 26, Figure 27. Error messages returned are described in Appendix B.

**Figure 26 XML command to Delete an RU Profile**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <deleteRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
        </Parameters>
      </deleteRU>
    </Methods>
  </Command>
</CommandList>
```

**Figure 27 XML response to Deleting an RU profile.**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <deleteRU usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </deleteRU>
    </Methods>
  </Response>
</CommandList>
```

#### 1.7.2.11 Add LBL XML command

Limited Bandwidth Links provisioning is new to SN07. The <CounterGWC> tag is optional, if omitted the counterGWC is automatically assigned. The <RUDescription> and <ParentMB> values must have been previously provisioned into the system to successfully complete this operation.

The XML for this command is shown in Figure 28, Figure 29. Error messages returned are described in Appendix B.

**Figure 28 XML command to Create a LBL device**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <addLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL1</LBLname>
          <CounterGWC>47.132.132.12</CounterGWC>
          <RUDescription>AAL1/ip40</RUDescription>
          <MaxCount>1000</MaxCount>
          <ParentMB>VPN-A</ParentMB>
        </Parameters>
      </addLBL>
    </Methods>
  </Command>
</CommandList>
```

**Figure 29 XML response to Creating a LBL device.**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <addLBL usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addLBL>
    </Methods>
  </Response>
</CommandList>
```

#### 1.7.2.12 Change LBL XML command

Limited Bandwidth Links provisioning is new to SN07. The <LBLname> tag is required the other changing data tags are optional. The <RUDescription> and <ParentMB> values must have been previously provisioned into the system to successfully complete this operation.

The XML for this command is shown in Figure 30, Figure 31. Error messages returned are described in Appendix B.

**Figure 30 XML command to Change a LBL device RU profile.**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <changeLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL1</LBLname>
          <RUDescription>AAL2/ip40</RUDescription>
        </Parameters>
      </changeLBL>
    </Methods>
  </Command>
</CommandList>
```

**Figure 31 XML response to Changing a LBL device.**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <changeLBL usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeLBL>
    </Methods>
  </Response>
</CommandList>
```

### 1.7.2.13 Query LBL XML command

The Query LBL is new to SN07

The XML for this command is shown in Figure 32, Figure 33. Error messages returned are described in Appendix B.

**Figure 32 XML command to Query a LBL**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL-A</LBLname>
        </Parameters>
      </queryLBL>
    </Methods>
  </Command>
</CommandList>
```

**Figure 33 XML response to Query LBL**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryLBL usn="1" version="1.0">
        <ReturnData>
          <LBLname>LBL1</LBLname>
          <CounterGWC>47.132.132.12</CounterGWC>
          <RUDescription>AAL1/ip40</RUDescription>
          <MaxCount>1000</MaxCount>
          <ParentMB>VPN-A</ParentMB>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryLBL>
    </Methods>
  </Response>
</CommandList>
```

#### 1.7.2.14 Delete LBL XML command

Limited Bandwidth Links provisioning is new to SN07.

The XML for this command is shown in Figure 34, Figure 35. Error messages returned are described in Appendix B.

**Figure 34 XML command to Delete a LBL device**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <deleteLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL1</LBLname>
        </Parameters>
      </deleteLBL>
    </Methods>
  </Command>
</CommandList>
```

**Figure 35 XML response to Deleting a LBL device.**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <deleteLBL usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </deleteLBL>
    </Methods>
  </Response>
</CommandList>
```

## 1.8 Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or 'Authorization' levels for commands. Each command is associated with one or more user groups. In order to execute a command, a user must belong to at least one of the associated user groups. The user groups associated with the new /modified commands associated with this feature are specified in the table below.

**Table 4 Internet Transparency Commands Authorization**

| Command   | User Group |       |        |          |       |
|-----------|------------|-------|--------|----------|-------|
|           | mgcadm     | mgcrw | mgcmic | mgcsprov | mgcro |
| addNat    | X          | X     |        |          |       |
| changeNAT | X          | X     |        |          |       |
| queryNAT  | X          | X     | X      | X        | X     |
| addMP     | X          | X     |        |          |       |
| changeMP  | X          | X     |        |          |       |
| deleteMP  | X          | X     |        |          |       |
| addRU     | X          | X     |        |          |       |
| changeRU  | X          | X     |        |          |       |
| queryRU   | X          | X     | X      | X        | X     |
| deleteRU  | X          | X     |        |          |       |
| addLBL    | X          | X     |        |          |       |
| changeLBL | X          | X     |        |          |       |
| queryLBL  | X          | X     | X      | X        | X     |
| deleteLBL | X          | X     |        |          |       |
|           |            |       |        |          |       |
|           |            |       |        |          |       |

## 1.9 References

1. DNS naming conventions: see for example IETF RFC 1034, or <http://www.dns.net>

## 1.10 Glossary

| Term   | Description                                |

| SESM   | Succession Element and Sub-Element Manager |
| SNMP   | Simple Network Management Protocol         |
| VCAC   | Virtual Connection Admission Control       |
| VPN    | Virtual Private Network                    |

## 1.11 Appendix A: ITrans/VCAC Provisioning Steps

This section provides a high-level overview of the provisioning steps required to set up the ITrans VCAC functionality NEW installation SN07.

- 1 Network Analysis/Modelling: identify the key locations in the network for NAT and LBL **functions** (not physical devices). Model and provision the Resource Usage values required for the VCAC functionality.
- 2 On the CS2K Config Manager provision model as defined by step 1. Starting with individual NAT/LBL middleboxes: these are provisioned in top-down hierarchical order, i.e. starting with those closest to the network

core. Remember that a 'parent' middlebox must be already provisioned before a 'child' that refers to it can be provisioned.

- 3 On the CS2K Config Manager provision MGs: select the appropriate ITrans middlebox (NAT or LBL) from the topological model as the 'adjacent middlebox' for the MG.

Existing ITrans network models (SN06.x stream, NATs and MGs) may be adapted to the SN07 form by:

- 1 following steps 1 and 2 above for new middleboxes.
- 2 changing the parent middlebox fields of existing (NAT) middleboxes as required to insert them at the correct location in the topology.
- 3 changing the adjacent middlebox field of existing MGs as required to associate them to the appropriate middlebox (NAT or LBL) in the topology.

## 1.12 Appendix B: XML validation schemas

```

## 1.14 Appendix D: XML Commands: description of method parameters

### 1.14.1 Parameter definitions (new in SN07)

- **ParentMB** - The name of the parent Middlebox for this device. This allows ITrans devices to be connected into a hierarchy. A value of <none> indicates that this device has no parent. TYPE *NoSpaceNameType*. (32 character token without spaces, see xsd definitions in Appendix A).
- **MPname** - The unique name of the Media Proxy. This must be in a valid DNS format. TYPE *NoSpaceNameType*.
- **IPAddress** - The Media Proxy IP address. TYPE *IPAddressType*.
- **Protocol** - The Media Proxy communication protocol (GWC to MP). This must be either MGCP+ or MPCP. TYPE *NoSpaceNameType*.
- **ProtocolVersion** - The Media Proxy communication protocol version. This must be 1.0 or 2.0. TYPE *NoSpaceNameType*.
- **RUDescription** - The Resource Usage profile name. TYPE *NoSpaceNameType*.
- **RUValue** - a composite of the following parameters. Codec, PacketRate, Value  
TYPE *CodecPacketValue*
- **Codec** - A valid codec that has been entered in the CS2K config manager. E.G. G.711 or G.729. TYPE *CodecType*
- **PacketRate** - A valid Packet is at ion rate. E.G. 10 ms, 20 ms. TYPE *PacketType*
- **Value** - A resource usage value that one call will use. This is the basic call count value that VCAC uses to measure calls through a Limited Bandwidth Link.  
TYPE *NoSpaceNumberType*
- **RUNewDescription** - The new name of an RU profile.  
TYPE *NoSpaceNameType*
- **LBLName** - The unique name of the Limited Bandwidth Link device. This must be in a valid DNS format. TYPE *NoSpaceNameType*.
- **CounterGWC** - The VCAC counter GWC IP address. TYPE *IPAddressType*
- **MaxCount** - The VCAC count maximum limit.

### 1.14.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **addNAT** - Method to create a new NAT (virtual NAT function). This method has the following parameters:
  - Input data:
    - usn
    - version
    - NATname. The unique name of the NAT device
    - ParentMB (Optional). The name of the parent Middlebox for this device. This allows ITrans devices to be connected into a hierarchy. A value of <none> indicates that this device has no parent. (default = <none>)
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - CallAgentId - The value of the Call Agent Id for this Call Agent (CS2k).
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
2. **queryNAT** - Method to list the NATs. Optional parameters allow the client to choose the data returned. This method has the following parameters:
  - Input data:
    - usn
    - version
    - NATname (Optional, cannot be included as well as GWCname)- A Unique Name of a NAT device, to get full info on a device
    - GWCname (Optional, cannot be included as well as NATname) - To obtain a list of all NATs on a GWC (Use GWC-XX format)
    - ListNATid (Optional) - Set to true if the NAT ids are required.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - GWCname (only when the GWCname option requested)
    - NATname
    - ParentMB (only when the full details are requested)
    - NATType (returned only when the full details are requested)
    - NATid (returned only when ListNATid is set to 'true' in the input data)

- ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
3. **changeNAT** - Method that changes a provisioned NAT information into the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn
    - version
    - NATname - unique name for the NAT to be changed
    - ParentMB - The new parent middlebox name. Enter <none> to remove the topology for this NAT device. Note: the parent Middlebox name entered must have been already provisioned into the CS2k Mgr.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
4. **addMP** - Method that creates a Media Proxy device into the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn
    - version
    - MPname - unique name for the MP to be provisioned
    - IPAddress - The IP address of the MP device
    - Protocol - Enter “MGCP+” for the control protocol of the device
    - ProtocolVersion - Enter “1.1” for the control protocol version.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
5. **changeMP** - Method that changes a provisioned MP information into the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn

- version
- MPname - unique name for the MP to be changed
- IPAddress - The new IPAddress of the MP device.
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode
- 6. **deleteMP** - Method that deletes provisioned MP information from the CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - MPname - unique name for the MP to be deleted
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
- 7. **addRU** - Method that creates resource usage information into the CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - RUDescription - A unique String to label this RU profile
    - RUValue - an RU Value must be entered for every Codec/Packetrate combination that has been created in the CS2k Mgr. An RUValue consists of the following three parameters.
      - Codec - The Codec that this value refers to
      - PacketRate - The packet is at ion rate this value refers to
      - Value - The VCAC value for a call using this codec/packetrate.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode

8. **changeRU**- Method that changes provisioned RU information into the CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - RUDescription - The RU profile to change
    - RUNewDescription (Optional - not allowed with RUValue)- The New name of the RU profile
    - RUValue (Optional - not allowed with RUNewDescription) - The full list of RU values for this RU profile, this will overwrite the existing values.
    - Codec (Optional - not allowed with RUNewDescription) - The Codec that this value refers to
    - PacketRate (Optional - not allowed with RUNewDescription) - The packet is at ion rate this value refers to
    - Value (Optional - not allowed with RUNewDescription) - The VCAC value for a call using this codec/packetrage.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
9. **queryRU** - Method that queries provisioned RU information from the CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - RUDescription (Optional if omitted all RU profiles are returned)- The RU profile to query
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - RUDescription - If RUDescription committed from query then a list of multiple description fields are returned.
    - RUValue returned if a RUDescription query was requested. A value for every Codec/Packetrage combination is returned, this comprises of the following three parameters.
    - Codec returned if a RUDescription query was requested.

- PacketRate returned if a RUDescription query was requested.
  - Value returned if a RUDescription query was requested.
  - ReturnCode
- 10. deleteRU** - Method that deletes provisioned RU information from the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn
    - version
    - RUDescription - The RU profile to be deleted
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
    -
- 11. addLBL** - Method that creates Limited Bandwidth Link information into the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn
    - version
    - LBLname - A unique name for the LBL device
    - CounterGWC (optional) a Counter GWC IP address, if omitted the Counter IPaddress is automatically allocated.
    - RUDescription - The RU profile that this LBL device is using, the RU profile must exist already in the CS2k Mgr.
    - MaxCount - The maximum value that this LBL can handle with respect to the number of calls using the Codec/Packetrate as defined in the RU profile.
    - ParentMB - The parent middlebox name, a link into a middlebox hierarchy. The parent middlebox device must already be in the CS2k Mgr.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
- 12. changeLBL** - Method that changes provisioned LBL information in the CS2k Mgr. This method has the following parameters:

- Input data:
    - usn
    - version
    - LBLname - The name for the LBL device to change.
    - CounterGWC (optional) a new Counter GWC IP address.
    - RUDescription (optional) - The new RU profile, the RU profile must exist already in the CS2k Mgr.
    - MaxCount (Optional)- The new maximum value.
    - ParentMB (Optional)- The new parent middlebox name. The parent middlebox device must already be in the CS2k Mgr.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
- 13. queryLBL** - Method that queries provisioned LBL information from the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn
    - version
    - LBLname (Optional, cannot be included as well as GWCname)- A Unique Name of a LBL device, to get full info on a device
    - GWCname (Optional, cannot be included as well as LBLname) - To obtain a list of all LBLs on a GWC (Use GWC-XX format)
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - LBLname - if GWCname option used above, then a list of LBLnames returned without the full info on each device
    - CounterGWC returned if LBLname option used.
    - RUDescription returned if LBLname option used.
    - MaxCount returned if LBLname option used.
    - ParentMB returned if LBLname option used.
    - ReturnCode

**14. deleteLBL** - Method that deletes provisioned LBL information from the CS2k Mgr. This method has the following parameters:

- Input data:
  - usn
  - version
  - LBLname - The LBL device to be deleted
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode

***Product = CS 2000 - GWC***

## **A00007101--GWC Telnet Authentication**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP, UA-IP, IAW, CHS, PT-AAL2

#### **1.2 Description**

This activity replaces the existing login mechanism for accessing the PMDebug on the GWC (telnet to GWC IP address, “gonow”, or use serial port) with a user-id/password login system which has a standard look and feel. Currently, no user-id is prompted, and the password is only required for telnet from a non-EM IP address.

Every user connecting to a GWC will see a standard login banner (not changeable) and a generic login prompt. Both a user-id and password are required, and when entering the password, it will not be echoed. Telnet connections from any device or serial port connections behave identically. User-ids are used as defined on the IEMS security server, and any account there which has “mgcadm” group privileges will be able to log in to a GWC. Five failing login attempts will result in a disconnected telnet session. Successful login will connect directly into PMDebug.

Functionality similar to the existing “force out” will be available. Any user-id which can log in, may force out another user on any interface. A login session left idle (no input) for 10 minutes will be automatically disconnected.

There will be a default “local” access user-id/password always available on the GWC. The existing GWC login mechanism from the Core is not impacted. The local account login is only checked if the login attempt with the security server has failed. The local password has the following characteristics:

- It is changeable, done by using the ‘Passwdchg’ and ‘Passwdreset’ commands. These new commands are grouped together in a new top-level directory called ‘Access.’
- It is stored in a NVRAM which means in the event the GWC card is restarted, reloaded or locked/unlocked or pulled out and then inserted back into the slot the local password still survives.
- The default local password is the MAC address of the GWC card. The MAC address as a password should be entered as its full ASCII representation of 12 hexadecimal characters, such as ‘0001AF02A3FC’ in all capital letters with no separators.

An idle timer is established, with a default of 30 minutes. The default can be changed by using the ‘Idletimer’ command available on the new PMDebug level named ‘Access.’

This activity will add a number of new security logs (syslog local3/info) which will be stored in /var/log/securitylog on the CS2M server and forwarded upstream. Based on interpretation of the reference docs and requirements, there will be at least events for the following:

- telnet connection from remote host,
- serial connection,
- login attempted,
- login result,
- authentication server unreachable,
- logout (by request, force out, or idle timeout),
- local account login,
- local password change/reset,
- GWC restart,
- GWC reload

## 1.3 Hardware Requirements or Dependencies

None

## 1.4 Software Requirements or Dependencies

Authorization of defined or new users is controlled by group memberships managed by the IEMS security system, which includes a set of standard group privileges. Only and All user-ids which are members of the “mgcadm” group will be able to log in to GWCs. All SN08 GWCs will utilize the new login system, and there is no “backwards compatibility” allowing the use of the old “gonow” login after the completion of the feature.

If a SSPFS box hosting IEMS is not accessible from the CS2M, it may respond with authentication reflecting it’s local password/group setup, and that should be an acceptable fallback mechanism.

## 1.5 Limitations and restrictions

Only as noted above in descriptions.

## 1.6 Interactions

Other authentication/logins for the GWC are not affected (e.g. SNMP community, FTP login). The interruption from the core login to retrieve trap data (“CC Trapinfo logged on”) will still occur.

# *Product = CS 2000 - GWC*

## **A00007102--Dual C-Side IP for GWC**

### *Functional Description*

#### **1.1 Applicable Solution(s)**

DMS, PT-AAL2

#### **1.2 Description**

This feature will eliminate the requirement to provision a default gateway IP address when provisioning a GWC. The gateway IP will be automatically provisioned for all GWCs. This eliminates provisioning errors. When the call server is an XA-Core, the two available core IP addresses will be automatically distributed across the GWCs. The Call Server IP is not displayed on the GWC Provisioning panel for the individual GWC. Instead, it is shown on the ‘General Network Settings’ panel.

#### **1.3 Hardware Requirements or Dependencies**

None

## 1.4 Software Requirements or Dependencies

This is a new gateway controller element manager feature contained within the CS2M software load.

## 1.5 Limitations and restrictions

None

## 1.6 Interactions

None

## 1.7 Glossary

| Term | Description        |
|------|--------------------|
| GWC  | Gateway Controller |

# 2: Fault Management

## 2.1 Fault management strategy

## 2.2 Fault management tools and utilities

There are two CMT alarm GUIs. One shows active alarms on the managed devices and the other shows the alarm history. This activity will update alarms associated with the GWCEM.

## 2.3 Logs

An automatically generated customer log on raising an alarm will be provided. No other log will be implemented in this feature.

In this feature, the new alarm “No Available Call Server IP” will be added, a corresponding customer log when the alarm is raised/cleared will be automatically generated. The log file is “/var/log/customerlog”.

### 2.3.1 Formats

The **log header** will be organized as in the following format:

|                |          |
|----------------|----------|
| Report name:   | CMT      |
| Report number: | 303      |
| Priority:      | Critical |
| Event:         | TBL      |

Device ID: CMT

Label: Fault

Application name: CS2K Config Manager

The **log body** will be organized as in the following format:

<Location> <NotificationID> <State> <Category> <Cause> <Time>  
<Component Id> <Specific Problem> <Description>

Please refer to the following table for log body field details.

#### 2.3.1.1 NTSTD

#### 2.3.1.2 SCC2

#### 2.3.1.3 Syslog

#### 2.3.1.4 SNMP

**Table 1 Log Body Fields**

| Field Name       | Used (Y/N) | Value(s)                          | Fixed/Variable | Description                            |
|------------------|------------|-----------------------------------|----------------|----------------------------------------|
| Location:        | Y          | 47.166.56.10                      | variable       | IP address                             |
| Notification Id: | Y          | 14                                | variable       | 1-3 digits                             |
| State:           | Y          | Raised                            | fixed          | constant - values: "Raised", "Cleared" |
| Category:        | Y          | environmentalAlarm                | fixed          | constant                               |
| Cause:           | Y          | configurationOrCustomizationError | fixed          | constant                               |
| Time:            | Y          | <MMM dd:hh:mm:ss YYYY>            | fixed          | Time stamp                             |
| Component Id:    | Y          | CS2K Config Manager               | variable       | constant                               |

#### 2.3.1.5 Integrated Element Manager GUI Fields

### 2.3.2 Explanation

### 2.3.3 Field descriptions

### 2.3.4 Action

### 2.3.5 Associated Operational Measurements or Performance Measurements

### 2.3.6 Additional information

## 2.4 Alarms

One new alarm “No Available Call Server IP” will be raised if the SESM cannot get any available C-Side IP address from the Core. The alarm can be viewed via the Alarm Manager on the CS 2000 Management Tools GUI. If the Call Server IP can be obtained later, then the alarm is cleared.

### 2.4.1 Alarm format

The format of this alarm should be:

|                         |                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Network Element:</b> | CS2K Config Manager                                                                                                          |
| <b>Alarm Level:</b>     | Critical                                                                                                                     |
| <b>Category:</b>        | Environment                                                                                                                  |
| <b>Alarm Time:</b>      | <Data and time when the alarm was raised>                                                                                    |
| <b>Probable Cause:</b>  | No Call Server IP was filled in Core table <Table Name>.                                                                     |
| <b>Description:</b>     | SESM cannot get available the Call Server IP address information from the Core. This information is necessary for every GWC. |

### 2.4.2 Cause or condition

This scenario will happen if no C-Side IP address was filled in table CMIPADDR on the XA-Core or table IPNETWRK on the Compact Core.

### 2.4.3 Integrated Element Manager GUI Fields

### 2.4.4 SNMP Northbound Alarm Event (Non-legacy logs only)

### 2.4.5 Explanation

Description: SESM cannot get available Call Server IP information from the Core, this information is necessary for every GWC, the reason is that no Call Server IP information was filled in the Core table.

Severity: The severity level of this new alarm is Critical.

### 2.4.6 Action

Action is required to properly fill the Core table manually (Table CMIPADDR on the XA-Core or table IPNETWRK on the Compact Core). SESM will check the table periodically every 5 minutes. Once SESM can get at least one available Call Server IP address from the Core table, this alarm will be cleared.

### 2.4.7 Corresponding Clear Log

## 2.5 Related documentation

## 3: Configuration

### 3.1 Hardware and Software Requirements

This feature makes changes to the Gateway Controller Element Manager GUI.

### 3.2 Initial Configuration

Launch the Gateway Controller Element Manager.

### 3.3 Office/Subnet parameters (OP/SP) (CM & SESM)

No parm changes.

### 3.4 Upgrade Considerations

None

### 3.5 Data schema (DS) (CM, MIBS, RDB)

#### 3.5.1 New/modified tables, MIBs, or Database Schema

Table 2 New or modified tables

| Table/MIB name         | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|------------------------|--------------------------|------------------------------------|
| INVENTORY.ROLES        | Changed                  | Old                                |
| INVENTORY.ELEMENTTY PE | Changed                  | Old                                |

**Table 2 New or modified tables**

| Table/MIB name    | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|-------------------|--------------------------|------------------------------------|
| INVENTORY.ELEMENT | Changed                  | Old                                |

### 3.5.1.1 SESM Table INVENTORY.ROLES

#### 3.5.1.1.1 Functional description

At the SESM server, this table defines all element roles. In order to support new element “C-Side IP address” storage in the Inventory database, a new role will be added into this table.

#### 3.5.1.1.2 Fields

No structure changes on this table.

#### 3.5.1.1.3 Datafill example

The new role will be defined as in the following datafill.

**Table 3 INVENTORY.ROLES: New pre-defined role**

| NAME | TYPE       | DESCRIPTION            |
|------|------------|------------------------|
| CSIP | IP address | Core c-side IP address |

### 3.5.1.2 SESM Table INVENTORY.ROLES

#### 3.5.1.2.1 Functional description

At the SESM server, this table defines all element types. In order to support new element “C-Side IP address” storage in the Inventory database, a new type will be added into this table.

#### 3.5.1.2.2 Fields

No structure changes on this table.

#### 3.5.1.2.3 Datafill example

The new role will be defined as in the following datafill.

**Table 4 INVENTORY.ELEMENTTYPE: New pre-defined element type**

| NAME       | TYPE       | CATEGORY |
|------------|------------|----------|
| IP address | IP address | Logical  |

### 3.5.1.3 SESM Table INVENTORY.ELEMENT

#### 3.5.1.3.1 Functional description

This table will be used to store the new element “C-Side IP address” retrieved from the Core. Up to two CSIPs will be stored in this table, the element name should be “CSIP-0” and “CSIP-1”.

#### 3.5.1.3.2 Fields

No structure changes on this table.

#### 3.5.1.3.3 Datafill example

The new element will be filled as in the following sample.

**Table 5 INVENTORY.ELEMENTTYPE: Usage sample for CSIP storage**

| ELEMENTID | PARENTID | ROLE | TYPE       | IP ADDRESS    | EMID | LAUNCHURL | OWNERID |
|-----------|----------|------|------------|---------------|------|-----------|---------|
| CSIP-0    | COMPACT5 | CSIP | IP address | 47.142.128.24 | -    | -         | XaCore  |
| CSIP-1    | COMPACT5 | CSIP | IP address | 47.142.128.25 | -    | -         | XaCore  |

Note:

- Element ID will be filled with the format “CSIP-<nn>”, where the <nn> is a valid number starting from 0. Every CSIP record will use a unique number.
- PARENTID will be filled as the current configured CM CLLI.
- EMID and LAUNCHURL will be filled as blank as they are not required for the CSIP record.
- OWNER ID will always be filled as “XaCore”.

## 3.6 Service Orders (SO) (CM & SESM)

None

## 3.7 Software optionality control (SOC)

None

## 3.8 Element Management

### 3.8.1 New/modified GUIs

**Table 6 New or modified GUIs**

| GUI name            | NEW, CHANGED, or DELETED |
|---------------------|--------------------------|
| GWC Network Display | Changed                  |

**Table 6 New or modified GUIs**

| <b>GUI name</b>        | <b>NEW, CHANGED, or DELETED</b> |
|------------------------|---------------------------------|
| GWC Display            | Changed                         |
| Add Gwc Node Interface | Changed                         |

### **3.8.2 GUI information**

The first screen GWC Network Display has been modified to accommodate the C-Side IP addresses, which have been shifted here in respect of the requirement to have C-Side IP common to the entire network rather than to individual GWC's. The first snapshot is of the GWC Network Display Panel:

**Figure 1 GWC Network Display Panel**

C-Side IP Address1: 172.16.16.12

Once the first requirement is met, we need to eliminate the redundancy of having the Message Router IP address at every GWC Display Panel. To achieve this we remove the Message Router IP address at the GWC Display Level. This is how the GWC Display Panel looks after it has been modified:

**Figure 2 Removal of Message Router IP address from GWC Display Panel**

Also since the Provisioning has been changed to auto-provisioning, the need for manual provisioning does not arise. Hence we need to modify the 'Add GWC Interface' where we insert the Message Router IP address. We remove the Message Router IP address from this panel. The screen after this modification looks as shown below:

**Figure 3 Removal of Message Router IP address from Add GWC Node**

### 3.8.2.1 GUI name: GND Panel

GWC Network Display Panel

### 3.8.2.1.1 Functional description

This panel is used for representing the attributes that occur across the network of GWCs rather than for each GWC. The GUI can be invoked through the CMT application. Once we invoke the application we get the CS2000 Management Tools Screen. On this screen we will find a Folder GUI with 'Device Types' written alongside it. Under this we will find 'Gateway Controller'. On clicking the 'Gateway Controller', we get a page which has a section called 'General Network Settings'. Under this we find our required information 'C-Side IP addresses'.

### 3.8.2.1.2 GUI usage and implications

N/A.

### 3.8.2.1.3 GUI size

Table 7 New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|

N/A

### 3.8.2.1.8 Supplementary information

N/A.

## 3.8.2.2 GUI name: G D Panel

GWC Display Panel

### 3.8.2.2.1 Functional description

This panel is used for representing the attributes corresponding to each GWC, i.e. each panel represents a GWC in the Network. We remove the Core IP address as we have settled for the Core IP address on a Network level rather than on a GWC level. The GUI can be invoked through the CMT application. Once we invoke the application we get the CS2000 Management Tools screen. On this screen we will find a folder GUI with 'Device Types' written alongside it. Under this we will find 'Gateway Controller'. On clicking the 'Gateway Controller', we get a 'Gateway Controllers' display. Under this will be displayed the list of all GWCs in the network. On clicking on any one of the list, we get the GWC display for that listed GWC. We get 2 tabbed panes to select, the first is 'Maintenance' and the second is 'Provisioning'. Take 'Provisioning' and in that take the next pane 'Controller', here we remove the display for the Message Router IP address and end up having only IP address' and 'Element Manager'.

### 3.8.2.2.2 GUI usage and implications

N/A.

### 3.8.2.2.3 GUI size

Table 9 New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |

| G D Panel            | N/A               | N/A               | N/A.                  |

### 3.8.2.2.4 GUI fields

No new fields added or changed.

### 3.8.2.2.5 Usage example

N/A.

### 3.8.2.2.6 GUI release history update

The GWC Display panel has been changed by the Removal of the 'Message Router IP address' from the panel.

### 3.8.2.2.7 Context sensitive launching information

N/A.

### 3.8.2.2.8 Supplementary information

N/A.

### 3.8.2.3 GUI name: Add GWC Node Interface Panel

#### 3.8.2.3.1 Functional description

We have moved from the Manual Provisioning of the GWC Message Router IP address to the Auto Provisioning of the C-Side IP address. The GUI can be invoked through the CMT application. Once we invoke the application we get the CS2000 Management Tools screen. Here on the toolbar we get a Configuration button and when we click the button a drop down menu is obtained. On the drop down menu we have an option of 'Add GWC Node'. When we click on this option we get a Add GWC Node interface. Here we have modified the interface, so as to avoid manually setting the Message Router IP address.

#### 3.8.2.3.2 GUI usage and implications

N/A.

#### 3.8.2.3.3 GUI size

Table 10 New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| Add GWC Node I/f's   | N/A               | N/A               | N/A.                  |

#### 3.8.2.3.4 GUI fields

No new fields added or changed.

#### 3.8.2.3.5 Usage example

The following the interface is used when we need to add a new GWC to the network. In the CMT application we go to the Configuration--> Add GWC Node interface. Here in this interface we can add a new GWC.

#### 3.8.2.3.6 GUI release history update

The modification we have made here is that we have removed the Message Router IP address from this interface, so that we avoid manually provisioning the C-Side IP address.

#### 3.8.2.3.7 Context sensitive launching information

N/A.

#### 3.8.2.3.8 Supplementary information

N/A.

### 3.8.3 CLUI Interface

The CLUI interface is modified such that the C-Side IP addresses are displayed on a Per-GWC basis.

Note : Currently CLUI does not support the Network level interface. All existing interfaces focus on the per GWC level. This will make it inconsistent between CLUI and GUI (GUI now only supports the C-Side IP address on a Network level.). Since we do not extend CLUI support to the customer , these inconsistencies are acceptable at this moment.

### 3.9 User interface changes

None

### 3.10 OSSGate Interface Changes

#### 3.10.1 XML Command Changes

- a Add GWC: the new XML command change is that during adding a GWC. Here we need to forgo the need to pass the Message Router IP address and Message Router port.
- b Query GWC: the other is when we get a response for a Query for the GWC. Here the response is changed so that Message Router IP address and Message Router port are not displayed.

##### 3.10.1.1 Command XML

- a Add GWC: here we need to remove the XML reference to the Message Router IP address and the Message Router port. The red indicates the lines that will be removed.

**Example:**

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<CommandList >
<Command>
<Interface>cs2kCfgMgrIf</Interface>
<Methods>
<addGWctoCS usn="1" version="1.0">
<Parameters>
<csUIName>COMPACT5</csUIName>
<gwcUIName>GWC-0</gwcUIName>
<profileName>TRUNKNA</profileName>
<gwcActvIp>47.142.128.36</gwcActvIp>
<gwcSnmpPort>161</gwcSnmpPort>
<msgRouterIp>47.142.128.24</msgRouterIp>
<msgRouterIpPort>4684</msgRouterIpPort>
</Parameters>
</addGWctoCS>
</Methods>
</Command>
</CommandList>
```

- b** Query GWC: no changes in the Query GWC Command.

**Table 11 XML Command Tag Descriptions**

| tag name | description of valid values |
|----------|-----------------------------|
| N/A      |                             |
| N/A      |                             |

**3.10.1.2 Response XML**

- a** Add GWC: no changes on the response side for Add GWC.
- b** Query GWC: The display here will not have the Message Router IP address and Message Router port. The red indicates that those lines will not be displayed.

**Example:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Response>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <queryGWC usn="1" version="1.0">
        <ReturnData>
          <Row>
            <gwcUList>GWC-3</gwcUList>
            <gwclpList>47.142.128.52</gwclpList>
            <callServerId>COMPACT5</callServerId>
            <nodeName>GWC 3</nodeName>
            <typeList>2</typeList>
            <typeList>8</typeList>
            <typeList>15</typeList>
            <xacNodeNumber>24</xacNodeNumber>
            <actvIpAddress>47.142.128.52</actvIpAddress>

## ***Product = CS 2000 - GWC***

### **A00007113--GWC External Interface Robustness**

#### ***Functional Description***

#### **3.1 Applicable Solution(s)**

PT-IP, PT-AAL2

#### **3.2 Description**

This feature is aimed at enhancing error reporting of external communication paths from the Gateway Controllers (GWCs) and External hosts such as gateways, peer GWCs and USP. New alarms are added to report communication path lost and new Operational Measurements (OMs) are collected by IEMS every 5 minutes.

The customer will use the existing SESM alarm manager for the new alarms. IEMS will be configured to receive the new OMs every 5 minutes. Only the Active GWC will report the OMs, while the inactive will report no OMs found in table.

All the OMs are only pegged on the active GWC units, and they won't retain over a reload/SWACT SWACT/COLD SWACT of a GWC unit. This means that whenever a reload/SWACT SWACT/COLD SWACT occurs on the GWC unit, the values of those OMs on that unit will all be reset, and the alarms previously raised are also cleared. No alarm will be raised for the inactive GWC unit.

The behavior diagram below shows all the GWC communication paths and which ones have been included for OM collections as part of this feature.

Five new alarms are introduced in this feature and their detail description is in the optfm.did section of the document.

**Figure 1 Behavior Diagram**

### 3.3 Hardware Requirements or Dependencies

Not Applicable.

### 3.4 Software Requirements or Dependencies

This functionality is available for SN08 and above.

### 3.5 Limitations and restrictions

The new OMs for USP require a configuration of direct messaging between GWC and USP

Due to time constraints, the following interfaces will be handled in future releases:

SDM - This interface is used for the bootptab file. In future releases the bootptab file will be moved to the SSPFS host where the SAM21-EM resides.

NTP - Network Time Protocol Server. When this interface is not there, the battery operated clock on the GWC is used to get the time.

NGSS - counters and alarms will be added in later releases.

Event Messaging - counters and alarms will be added in later release.

### 3.6 Interactions

Not Applicable.

### 3.7 Glossary

| Term | Description              |
|------|--------------------------|
| GWC  | Gateway Controller       |
| OM   | Operational Measurements |

## 4: Fault Management for A00007113

### 4.1 Fault management strategy

The **GWC External Interface Robustness** feature provides improved fault management for existing Gateway Controller (GWC) components. The strategy for this feature is covered by two aspects: Collecting Operational Measurements (OMs) with error counters, and raising alarms based on the error counters.

### 4.2 Fault management tools and utilities

The scope of this feature in perspective to fault management is to provide a method of reporting information to the end-user; all tools and utilities for the analysis and handling procedures are controlled and maintained by the SESM Alarm manager or IEMS.

The SESM Alarm manager on the SSPFS is used to display the GWC alarms and log alarms history. Alarms can be filtered for display purposes, based on the alarm severity field.

The Operational Measurements will be collected by IEMS polling covered in feature ACTID A00007388.

## 4.3 Alarms

### 4.3.1 External Host Interface Signal Loss

**Category:** Communication

**Description:** External Communication Interface

**Severity:** Based on number of Elements involved and the number of elements with a signal loss collected with a 5 minute poll.

- Critical - Over 50% signal loss
- Major - Over 20% signal loss
- Minor - Any signal loss

**Cause:** Signal Loss.

**Interface or Specific Problem:** This field provides the external host type.

- “Small GWs in Disabled State”

This alarm is based on the number of gateways that are out of service as compared to the number of gateways provisioned checked on a 5 minute polling period. Therefore, with very few gateways provisioned, few gateways out of service will have a more significant effect on call processing. Gateways are considered out of service when the heartbeat messages between the GWC and the gateway are lost.

Customer logs are sent as each small lines gateway goes out of service and when it comes back in service. The customer should use the alarm as an indication that there is a problem with the small lines gateways. It can use the new OM collected to see how many small lines gateways are out of service and then use the customer logs to identify the gateways that need attention.

- “USP SS7 paths disabled”

This alarm is based on the number of USP connections that are out of service as compared to the number of maximum paths of 2 checked on a 5 minute polling period. The link paths are considered out of service when the heartbeat messages between the GWC and the USP are lost.

The customer should view the alarm as an indication that there is a problem with the USP connections. A Major alarm is raised when both links are down while a minor alarm is raised if only one link is down. Since not all calls require SS7 signaling, this messaging path does not raise any critical alarms.

• “Peer connections failed during interval”

This alarm is based on the number of call setups failed as compared to the number of calls attempted in a 5 minute polling period. In this case as the number of calls is increased, the number of failed calls is not as significant for the alarm.

The customer should view this alarm as an indication of a problem with calls and look at the new Peer Communications OMs to see the number of calls failed over a longer period.

**Action:** Verify the Ethernet link to between the GWC and the remote host or Peer GWCs.

#### 4.3.2 External Host Interface Configuration Error

**Category:** Quality of Service

**Description:** External Communication Interface

**Severity:** Non service effecting errors are warning alarms.

**Cause:** Configuration Or Customization Error.

**Interface or Specific Problem:** This field provides the external host type.

• “DNS failed GW discovery”

This alarm is based on the number of gateways that failed DNS lookup. This alarm is based on a 5 minute polling period. The new DNS OMs can be used to see the number of gateways that are not discovered and also the number of gateways that were discovered using RSIP. Note that RSIP discovery does not survive a Cold Swact on the GWC, which may result in long outages for the customer.

**Action:** Verify the DNS server entries for every gateway.

#### 4.3.3 External Host Interface Protocol Error

**Category:** Communication

**Description:** External Communication Interface

**Severity:** Based on service effecting.

- Major - effects some callp service.
- Minor - redundancy error.

**Cause:** Communications Protocol Error.

**Interface or Specific Problem:** This field provides the external host type.

- "USP SS7 path not Active"

This alarm is based on the number of USP connections that are not active but do have heartbeat messages checked on a 5 minute polling period. Therefore this is a protocol error with USP.

The customer should you the alarm as an indication that there is a problem with the USP connections. A Major alarm is raised when both links are not active while a minor alarm is raised if only one link is not active.

**Action:** Verify the USP configuration to the GWC.

#### 4.4 Operational Measurements or Performance Measurements

Every new alarm in this feature will have associated measurements that will be reported using the performance MIB. The Specific problem field in the alarm is also the name of the metric that will be reported. The relationship between alarms and performance metrics are as follows:

The Alarm **Category** will be used as the Group in the performance metric.

- Measurement
- Communication
- Quality of Service

The alarm **Interface or Specific Problem** will be used as the name for the metric.

**Table 3: Performance Measurements Metrics**

| name                          | Group         | Source | Type       |
|-------------------------------|---------------|--------|------------|
| "Small GWs in Disabled State" | communication | multi  | COUNTER_32 |
| "Large GWs in Disabled State" | communication | multi  | COUNTER_32 |
| "Trunk GWs in Disabled State" | communication | multi  | COUNTER_32 |
| "Audio GWs in Disabled State" | communication | multi  | COUNTER_32 |

**Table 3: Performance Measurements Metrics**

| name                                         | Group               | Source | Type       |
|----------------------------------------------|---------------------|--------|------------|
| "Total Gateways Provisioned"                 | measurement         | multi  | COUNTER_32 |
| "DNS failed GW discovery"                    | quality of service  | multi  | COUNTER_32 |
| "DNS good GW discovery"                      | measurement         | multi  | COUNTER_32 |
| "RSIP used in GW discovery"                  | quality off service | multi  | COUNTER_32 |
| "Total DNS GWs to discover"                  | measurement         | multi  | COUNTER_32 |
| "USP SS7 paths disabled"                     | communication       | multi  | COUNTER_32 |
| "USP SS7 path not Active"                    | communication       | multi  | COUNTER_32 |
| "Peer connections failed during interval"    | communication       | multi  | COUNTER_32 |
| "Peer connections completed during interval" | communication       | multi  | COUNTER_32 |
| "Peer connections attempted during interval" | measurement         | multi  | COUNTER_32 |

***Product = CS 2000 - GWC***

## **A00007327--Media Proxy 5 and 30 minute Operational Measurements**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

CHS

#### **1.2 Description**

This feature implements a number of Media Proxy specific Operational Measurements (OMs) on the Gateway Controller (GWC) to be collected by IEMS at 5 minute intervals. These metrics can be used by the crafts person to diagnose problems with Media Proxy usage and identify requirements to better engineer the network to handle internet transparency calls.

The OMs covered are number of passed and failed calls per Media Proxy and per GWC for every 5 & 30 minute interval. A Media Proxy communications path lost alarm is also added by this feature. The detailed description of the

OMs and alarm can be found in the Performance Management and Fault Managements sections of this feature, respectively.

The customer will use the existing SESM alarm manager for the new alarm. IEMS will be configured to receive the new OMs every 5 minutes. The 30 minute OMs are only updated and reported every 30 minutes, 30 minute periods are aligned with the 5 minute OM poll period on the GWC. Only the active GWC will report the OMs, while the inactive will report no OMs found in table.

This feature is intended to complement the OMs that are already available for the RTP Portal via IEMS and gives the GWC view of calls as oppose to the Media Proxy view.

**Figure 1 Behavior Diagram**

### 1.3 Hardware Requirements or Dependencies

Not applicable.

### 1.4 Software Requirements or Dependencies

This functionality is available for SN08 and above.

### 1.5 Limitations and restrictions

Not applicable.

## 1.6 Interactions

Not applicable.

## 1.7 Glossary

| Term | Description                                |
|------|--------------------------------------------|
| GWC  | Gateway Controller                         |
| IEMS | Integrated Element Management System       |
| OM   | Operational Measurement                    |
| SESM | Succession Element and Sub-Element Manager |

### *Fault Management for A00007327*

#### 2.1 Fault management strategy

The **Media Proxy 5 and 30 minute** OMs feature provides operational measurements for calls involving media proxies and alarms for lost communication with media proxies.

#### 2.2 Fault management tools and utilities

The scope of this feature in perspective to fault management is to provide a method of reporting information to the end-user; all tools and utilities for the analysis and handling procedures and controlled and maintained by the SESM alarm manager or IEMS.

The SESM Alarm manager on the SSPFS is used to display the GWC alarms and log alarms history. Alarms can be filtered for display purposes, based on the alarm severity field.

#### 2.3 Alarms

##### 2.3.1 Media Proxy Communications Failure

**Category:** Communication

**Description:** Media Proxy Communications Failure

**Severity:** Based on number of elements involved and the number of elements in a disabled state collected with a 5 minute poll.

- Critical - Over 50% of media proxies disabled
- Major - Over 20% of media proxies disabled
- Minor - Any media proxies disabled

**Cause:** Signal loss

This alarm is based on the number of media proxies that are out of service as compared to the number of media proxies provisioned checked on a 5 minute polling period. Media proxies are considered out of service when they fail to respond to messages sent from the GWC, and returned to service when the regular RSIP message is received by the GWC.

Alarms are raised as a media proxy goes out of service and cleared when it comes back in service. The customer should view the alarm as an indication that there is a problem with the media proxy. The new OM collected can be used to see how many media proxies are out of service and then use the customer logs to identify the media proxies that need attention.

An OM “Number of media proxies currently provisioned” is also implemented to complement this alarm - see the Performance Management section of this feature.

***Performance Management for A00007327*****3.1 Performance management strategy**

The **Media Proxy 5 and 30 minute** OMs feature provides operational measurements for calls involving media proxies and alarms for lost communication with media proxies.

**3.2 Performance management tools and utilities**

The scope of this feature in perspective to performance management is to provide a method of reporting information to the end-user; all tools and utilities for the analysis and handling procedures and controlled and maintained by the IEMS.

The Operational Measurements will be collected by IEMS polling covered in feature ACTID A00007388.

**3.3 Performance Measurements (PM), Operational Measurements (OM), and stats****3.3.1 Number of provisioned Media Proxies**

**Description:** The number of currently provisioned media proxies on the GWC.

**Behavior:** Simply counts the number of currently provisioned media proxies on the GWC each 5 minute period. This OM is intended to complement the Media Proxy Communications Failure alarm described in the Fault Management section of this feature.

### 3.3.2 Media Proxy 5 minute successful calls

**Description:** The number of calls that were successfully setup using this Media Proxy on this GWC in the last 5 minute OM period.

**Behavior:** Each time a successful call is setup involving a given Media Proxy, the specific count for that Media Proxy is incremented. At every 5 minute polling period, the count is reported and then reset to 0 to begin counting for the next period.

### 3.3.3 Media Proxy 30 minute successful calls

**Description:** The number of calls that were successfully setup using this Media Proxy on this GWC in the last 30 minute period.

**Behavior:** Same as 14.3.2 except reported/reset only every sixth 5 minute period (i.e. 30 minute period).

### 3.3.4 Media Proxy 5 minute failed calls

**Description:** The number of failed attempts to setup a call using this Media Proxy on this GWC in the last 5 minute OM period.

**Behavior:** Each time an attempt to setup a call on a given Media Proxy fails, the specific count for that Media Proxy is incremented. At every 5 minute polling period, the count is reported and then reset to 0 to begin counting for the next period.

### 3.3.5 Media Proxy 30 minute failed calls

**Description:** The number of failed attempts to setup a call using this Media Proxy on this GWC in the last 30 minute period.

**Behavior:** Same as 14.3.4 except reported/reset only every sixth 5 minute period (i.e. 30 minute period).

### 3.3.6 GWC 5 minute successful calls

**Description:** The number of calls that were successfully setup using any available Media Proxy on this GWC in the last 5 minute OM period.

**Behavior:** Each time a successful call is setup involving any Media Proxy, the count for the whole GWC incremented. At every 5 minute polling period, the count is reported and then reset to 0 to begin counting for the next period.

### 3.3.7 GWC 30 minute successful calls

**Description:** The number of calls that were successfully setup using any available Media Proxy on this GWC in the last 30 minute period.

**Behavior:** Same as 14.3.7 except reported/reset only every sixth 5 minute period (i.e. 30 minute period).

### 3.3.8 GWC 5 minute failed calls

**Description:** The number of failed attempts to setup a call on any available Media Proxy on this GWC in the last 5 minute OM period.

**Behavior:** Each time an attempt to setup a call involving any Media Proxy fails, the count for the whole GWC is incremented. A failure in this case is deemed to be a call where a media proxy is required and media proxy resources have been requested but subsequently ends for any reason before media proxy resources are successfully allocated.

At every 5 minute polling period, the count is reported and then reset to 0 to begin counting for the next period.

### 3.3.9 GWC 30 minute failed calls

**Description:** The number of failed attempts to setup a call on any available Media Proxy on this GWC in the last 30 minute period.

**Behavior:** Same as 14.3.8 except reported/reset only every sixth 5 minute period (i.e. 30 minute period).

### 3.3.10 Important Notes

If a call fails to setup on a media proxy attempted by the GWC, it may still succeed on another media proxy. In this case, a failure will still be logged against the failing media proxy, but the call itself will be counted as successful for the GWC.

If there are no media proxies in service when one is required, a fail will be counted against the whole GWC, but not against any individual media proxy.

For the above two reasons, the total number of failed calls for the GWC will not always be equal to the sum of failed calls on all its media proxies.

### 3.3.11 Limitations

If a media proxy is de-provisioned, its operational measurements for the current 5 minute and 30 minute periods are lost.

# SN08 Feature Deltas

## *Product = CS 2000 Management Tools*

### **A00006269--OSSGate Password No Echo**

#### *Functional Description*

#### **1.1 Feature name**

OSSGate Password No Echo - Actid A00006269

#### **1.2 Description**

This document details the OSSGate login changes. It describes the changes being made to OSSGate application which is part of CS2K Management Tools (CMT).

This feature is introduced to make OSSGate consistent with other user interfaces in the CS2K Configuration Management System.

This feature provides the following new or amended functionality:

- No echo of password to the screen when logging in to OSSGate using telnet client
- Ability to turn on or off this functionality using SESM configuration option
- Change to BPT tool to support either login modes

An important change to point out as a consequence of this feature is that OSS vendor software will be impacted by this change. In order to get existing OSS software to work when this new functionality is turned on by SESM configuration, there are couple of changes which need to be implemented in the OSS software. The following are the changes, only if OSSGate Password Control option is turned on (default: off).

- recognize the new login prompt. Prior to SN07 Verizon release, the user name and password was prompted in the same line separated by space. Now, the username and password are prompted one after the other
- OSSGate sends telnet protocol bytes to client to tell it to turn off echo and turn on echo. This is needed for telnet client software. OSS vendor software just needs to ignore these bytes.

## ***Configuration for A00006269***

### **2.1 Upgrade Impact**

This activity is responsible for handling modifications to OSSGate login. By default the OSSGate login functionality will be same as in SN07 and to turn on the new functionality, the user has to manually turn on an option via SESM configuration.

Prior to the SN07 release, login to the OSSGate involved entering username and password in one line separated by space, and the password entered was visible on the telnet window. In SN08, the user has to manually configure to turn on the OSSGate Password Control option in the SESM's OSSGate configuration section. Once this option is turned on, when attempting to login to OSSGate, it will prompt for the username first and then the password and the password being entered will not be displayed to the screen.

The default value of this OSSGate Password Control option is off, meaning the OSSGate login will be similar to SN07. This is done to minimize the impact to OSS operations, since the new login prompts of OSSGate will require changes in OSS vendor software. With this approach, it gives the customer the flexibility to turn on OSSGate password control option, when they are ready with changes to OSS vendor software. There is no impact after upgrades other than this OSSGate Password Control option is now available in SESM's OSSGate configuration section and the user can turn it on (default is off)

## 2.5.2 OSSGate configuration

In this section, the screen output below shows the new OSSGate Password Control option which needs to be turned on to enable OSSGate to not echo password to the screen. The new configuration option is available in SESM's OSSGate configuration section and is shown in red. The user input is shown in blue.

After logging into the SESM box as root,

```
#cd /opt/nortel/NTsesm/admin/bin
```

```
#./configure
```

SESM configuration

- 1 - SESM common configuration (IP addresses, Market, CM CLI)
- 2 - SESM database tools
- 3 - SESM related applications configuration (MG9K, LMM, CICM)
- 4 - SESM provisioning configuration
- 5 - SESM logging configuration (syslog, sesm debug log)
- 6 - view sesm configuration settings
- 7 - SESM refresh properties

X - exit

select - 4

SESM Provisioning Configuration

- 1 - XML Trunk Provisioning configuration
- 2 - OSSGate Provisioning configuration
- 3 - Office Provisioning Type configuration

X - exit

select - 2

### SESM OSSGate Provisioning Configuration

Enter the Primary Port OSSGate will use for telnet connections (default: 10023):  
Enter the Secondary Port OSSGate will use for telnet connections (default: 11023):

Enter the OSSGate Timeout period, in seconds (default: 600):  
Do you wish to have OSSGate Port Forwarding on for SSH [y/n]: n

Do you wish to turn on/off OSSGate Password Control option  
( when this option is turned on, OSSGate will not echo  
password on screen when logging onto it) [default:off] : on

Updating the property files with changed values, please wait...

Reloading the changed property values into memory, please wait...

### 2.5.3 Login prompt change implications

Prior to the SN08, the user name and password was prompted in the same line. In this release however, there are two main changes which impact clients of OSSGate. They are

1. Instead of looking for login prompt “Enter username and password”, clients should look for “Enter User Name” prompt from OSSGate first. Once it gets this, the user name should be sent to OSSGate. Ossgate will then send “Enter Password” prompt. After receiving this prompt, the password should be sent to OSSGate.
2. OSSGate sends telnet echo off byte sequence to clients (to tell telnet clients to not display password entered onto screen) after sending the “Enter Password” prompt. This echo off byte sequence is necessary to make telnet client software not echo password typed on screen.

#### 2.5.3.1 Impact to BPT tool

There are no external interface changes to BPT. Internally, BPT tool will handle the different prompts and will also strip telnet bytes and ignore them. But for users of BPT tool, there are no changes in the interface.

#### 2.5.3.2 Impact to OSS vendor software

OSS software should be able to handle the new login prompts and also detect telnet bytes and strip these bytes and ignore them.

Shown in the Figure 1 below are the changes need to be done to OSS vendor software to interact with OSSGate when the OSSGate password control option is enabled.

**Figure 2** OSS Vendor software and its interaction with OSSGate

In the above figure, the new prompts are shown in dark red. The telnet bytes sent are explained below.

The Telnet Echo Off byte sequence are 3 bytes shown below

#### IAC WILL ECHO

IAC byte value is 255  
 WILL byte value is 251  
 ECHO byte value is 1

OSS software should look for these bytes and when received, just ignore them

The Telnet Echo On byte sequence are 3 bytes shown below

#### IAC WONT ECHO

IAC byte value is 255  
 WONT byte value is 252  
 ECHO byte value is 1

## ***Product = CS 2000 Management Tools***

### **A00006570--CS2M Robustness enhancement - Moving SDM IP & CLLI input to SSPFS**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

#### **1.2 Description**

##### **1.2.1 Existing Functionality**

Prior to SN08, SDM IP/CLLI/CM IP are configured both in SSPFS, CS2M and NPM.

**Table 1 SDM IP / CLLI / CM IP Configuration areas in CS2M/NPM (SN07)**

| <b>Property</b> | <b>Component</b> | <b>Required</b>            | <b>Command</b> | <b>Save in</b>  |
|-----------------|------------------|----------------------------|----------------|-----------------|
| SDM_IP          | SESM             | Required                   | configure      | sesm.properties |
| SDM_IP          | SAM21 EM         | Required                   | cli (SSPFS)    | /etc/profile    |
| SDM_IP          | NPM              | N/A                        | N/A            | N/A             |
| CM_CLLI         | SESM             | Required                   | configure      | sesm.properties |
| CM_CLLI         | SAM21 EM         | Optional (For GUI display) | cli (SSPFS)    | /etc/profile    |
| CM_CLLI         | NPM              | Required for PFRS          | cli (SSPFS)    | NPM Database    |
| CM_IP           | SESM             | N/A                        | N/A            | N/A             |
| CM_IP           | SAM21 EM         | N/A                        | N/A            | N/A             |
| CM_IP           | NPM              | N/A                        | N/A            | N/A             |

In SN07, For SESM application, the SDM IP and CLLI configuration are required for the communication between SESM and SDM/CBM/Core. User should run the command “**configure**” to set the SDM IP and CM CLLI to file **sesm.properties**.

In SN07, for SAM21 EM application, the SDM IP configuration by cli tool is required for the SAM21 EM server. The CM CLLI configuration is the optional one for displaying on the GUI of SAM21 EM. The SDM IP and CM CLLI configuration could be finished by **cli** tool.

In SN07, For NPM application, the step of configure CLLI is required for PFRS enable. The CLLI value is stored in the NPM database. User should run the command “**pfrsCli**” to enable the PFRS service as well as configure the CM CLLI to NPM database.

## 1.2.2 Feature Functionality

In the SN08 release, the robustness enhancement is implemented to improve the SDM IP/CM CLLI configuration and reusing for CS2M/IEMS server. This feature seeks to stop user to input CM CLLI manually and retrieve it by SDM IP automatically.

The SDM IP / CM CLLI will be set to /etc/profile as system environment variables during SSPFS installation process or by cli tool after SSPFS installation for each application reading and using. Each application will stop to reserve the entry for these two parameters.

### 1.2.2.1 SSPFS installation

In SN08, SSPFS will be changed to prompt the user to enter the SDM IP during SSPFS installation. CM CLLI is retrieved automatically from Core by SDM IP.

Whenever CLLI is retrieved successfully, SDM IP and CLLI will be set in the system environment file /etc/profile, which is easy access and read.

### 1.2.2.2 SSPFS cli tool

In cli tool, the command “sdm\_conf” adds the function of SDM IP validation and CM CLLI retrieving automatically by SDM IP.

### 1.2.2.3 SESM configuration & starting up

#### 1. Configuration

In SN08, SDM IP and CLLI duplicate configuration in SSPFS and SESM will be eliminated.

The SESM script *configure* is changed to stop to require for user to input SDM IP and CLLI manually. It will reuse the SDM IP and CM CLLI which are set as system environment variables in SSPFS level.

#### 2. Starting up

SESM startup script will add a process to check whether SDM IP and CLLI are configured or not. If not, the SESM start up script will prompt user to configure the SDM IP & CM CLLI by *cli tool*. The start up process will fail.

### 1.2.2.4 SESM applications

SDM IP/CLLI related parameters are not provided in file sesm.properties any more. All related applications which retrieve these parameters transfer to retrieve them from system wide environment variables (in /etc/profile).

Parameters removed from sesm.properties/PTM.properties:

- ptm.base.cmcli=CMCLLI
- lmm.cmcli=CLLI
- ptm.cmcli.<CMCLLI>=<SDMIP>

Parameters removed from NetworkView.properties

- nv.callserver.name

#### 1.2.2.5 SAM21 EM starting up

When SAM21 EM is starting up, in the case of SDM IP is configured but the CLI is NOT configured, it will retrieve CLI automatically by SDM IP and set it to /etc/profile. The starting up process will continue.

#### 1.2.2.6 NPM configuration & starting up

In SN08, NPM will reuse the common configuration of CLI in file /etc/profile. It will stop user to input it manually when enabling PFRS.

#### 1.2.2.7 CS2M Installation and Configuration

In SN08, User should not have to know to go run X configure steps to complete CS2M installation. The system should walk them through it, perhaps with the option of bypassing it to be done manually later.

#### 1.2.2.8 Upgrading

The SSPFS upgrade & CS2M upgrade should transfer the CM\_CLI and SDM IP settings from sesm.properties to /etc/profile smoothly.

### 1.3 Hardware Requirements or Dependencies

No new hardware or hardware dependencies are introduced.

### 1.4 Software Requirements or Dependencies

No new customer software or firmware dependencies are introduced in this feature.

### 1.5 Limitations and restrictions

No limitations or restrictions that is visible to any user are planned as part of this feature.

### 1.6 Interactions

No interactions between this feature and existing features.

### 1.7 Glossary

| Term     | Explanation                            |
|----------|----------------------------------------|
| CS2M     | CS2000 Management Components           |
| SESM     | Succession Element Sub-element Manager |
| SAM21 EM | CS2000 SAM21 Manager                   |
| NPM      | Network Patch Manager                  |

|       |                                                                                                                |
|-------|----------------------------------------------------------------------------------------------------------------|
| SSPFS | Succession Server Platform Foundation Software                                                                 |
| CLLI  | The coding system used to identify Central Offices uniquely, entered as a string not longer than 16 characters |
| SDM   | SuperNode Data Manager                                                                                         |

## *Configuration for A00006570*

### **1.8 Hardware and Software Requirements**

None.

### **1.9 Initial Configuration**

None.

### **1.10 Office/Subnet parameters (OP/SP) (CM & SESM)**

None.

### **1.11 Upgrade Considerations**

None.

### **1.12 Data schema (DS) (CM, MIBS, RDB)**

#### **1.12.1 New/modified tables, MIBs, or Database Schema**

Table 1 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| pfrsScheduler  | CHANGED                  | UnChanged                          |

#### **1.12.2 Table/MIB/Remote Database Schema information**

##### **1.12.2.1 NPM table: pfrsScheduler**

##### **1.12.2.1.1 Fields/OIDs**

The following table lists fields/OIDs for pfrsScheduler.

**Table 2 Table field descriptions**

| Field | New or Changed | Subfield or refinement | Entry       | Explanation and action                                                                   |
|-------|----------------|------------------------|-------------|------------------------------------------------------------------------------------------|
| cli   | Removed        |                        | VARCHAR(20) | Field <b>cli</b> is removed from this table. NPM transfers to use CM CLI in /etc/profile |

#### 1.12.2.1.2 Table release history update

— Field “cli” removed from table pfrsScheduler

#### 1.12.2.1.3 Supplementary information

None

#### 1.12.2.1.4 Translation verification and other tools

pfrsScheduler does not use translation verification tools.

### 1.13 Service Orders (SO) (CM & SESM)

None.

#### 1.13.1 Element ManagementNew/modified GUIs

**Table 3 New or modified GUIs**

| GUI name | NEW, CHANGED, or DELETED |
|----------|--------------------------|
| LMM      | Changed                  |

#### 1.13.2 GUI information

##### 1.13.2.1 GUI name: LMM

Line Maintenance Manager Graphical User Interface

##### 1.13.2.1.1 Functional description

The LMM will be changed to let user input SDM IP instead of CM CLI to transfer to another core server.

##### 1.13.2.1.2 GUI usage and implications

Current datafill order unchanged.

### 1.13.2.1.3 GUI size

Table 4 New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| LMM                  | Unchanged         | Unchanged         | Unchanged             |
| CS2M                 | Unchanged         | Unchanged         | Unchanged             |

### 1.13.2.1.4 Usage example: Set New CS CLI

The following example shows sample datafill or menu selection for GUI LMM:

Select “Set CS CLI...” from LMM menu:

A dialog pops up to let user input SDM IP:

Input the SDM IP:

SDM IP is verified and the CM CLI is retrieved and set on client GUI.

#### 1.13.2.1.5 GUI release history update

The following information was changed:

For the menu of “Set CS CLLI“, it pops up a dialog to prompt user inputting SDM IP instead of CM CLLI.

#### 1.13.2.1.6 Context sensitive launching information

None.

#### 1.13.2.1.7 Supplementary information

None.

### 1.13.2.2 GUI name: TMM

Trunk Maintenance Manager Graphical User Interface

#### 1.13.2.2.1 Functional description

The TMM will be changed to let user input SDM IP instead of CM CLI to transfer to another core server.

#### 1.13.2.2.2 GUI usage and implications

Current datafill order unchanged.

#### 1.13.2.2.3 GUI size

Table 5 New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| TMM                  | Unchanged         | Unchanged         | Unchanged             |
| CS2M                 | Unchanged         | Unchanged         | Unchanged             |

#### 1.13.2.2.4 Usage example: Set New CM CLI

The following example shows sample datafill or menu selection for GUI TMM:

Click the “CM CLI” from left menu:

A dialog pops up to show the current settings. A input box which let user input SDM IP:

Input the SDM IP:

SDM IP is verified and the CM CLI is retrieved and set on client GUI.

#### 1.13.2.2.5 GUI release history update

The following information was changed:

For the menu of “CM CLI”, it pops up a dialog to prompt user inputting SDM IP instead of CM CLI.

#### 1.13.2.2.6 Context sensitive launching information

None.

#### 1.13.2.2.7 Supplementary information

None.

## 1.14 User interface changes

### 1.14.1 SSPFS Installation Changes:

A step of SDM IP configuration is added to SSPFS installation for cs2kmt, cs2kaps, iemscs2k packages.

In this section, the screen output below shows the new step added in SSPFS installation process. The new step is shown in **blue**. The user input is shown in **red**.

Adding NTci (cs2kmt Profile Software Package 18 of 18)

Unzipping NTci From the Cdrom

.

Installing NTci Package

..

Done Installing NTci Package...

Executing server profile specific commands

Will the SDM IP be specific now? (y/n) **y**

Enter the ip address of the SDM [] **47.142.128.131**

Retrieving CM CLLI. Please wait a minute.....

SDM IP: 47.142.128.16

CM CLLI: COMPACT6

Enter "ok" to accept current settings **ok**

Please perform a logout and login so your  
shell will pick up the SDM environment settings

SDM IP and CM CLLI is Successfully Configured

Unzipping DCE From The Cdrom

.....

### 1.14.2 SSPFS cli Tool Changes

SSPFS cli tool has some changes as below:

1. For cs2kmt, cs2kaps, iemscs2k packages, retrieve the CM CLLI while user configures the SDM IP in menu sdm\_conf
2. Split the SDM IP configure and SDM User configure into two separate menus.
3. Binding the ddmsproxy to cli tool

In this section, the screen output below shows the cli tool changes in SSPFS. The new step is shown in blue. The modified menu is shown in magenta. The user input is shown in red.

## 1.17 Configuration Walkthrough

Provisioning/configuring component software and services.

# *Product = CS 2000 Management Tools*

## **A00006635--SESM Support for Cable Gateway Event Messaging** *Functional Description*

### 1.1 Applicable Solution(s)

IAC

### 1.2 Description

In SN08, a new table NENDPT will be introduced to the Core which is used to map the gateway/endpoint with LEN in CM, which can be used to create the event messaging records that are sent to north bound OSS. In order to meet this, all the small gateways need to be pre-provisioned when they are associated to system.N/A.

#### 1.2.1 Existing Functionality

Prior to SN08, only MG9K and CICM gateways have been pre-provisioned when the gateway is associated to the system. For small gateways ("C" LGRP type gateways), the endpoint in GWCEM and lens in the Core are populated/deleted by Line Provisioning when customers configure service for the gateway using NEW/OUT command.

On the other hand, Core has no knowledge about the mapping relationship of Lens and endpoint and gateways.

#### 1.2.2 Feature Functionality

In SN08 release, the provisioning data will be added to CS2K from CS2M-SESM component. It is used to do the datafill of CM table LNENDPT. LNEDNPT is an new table for SN08, which is used to map gateway/endpoints and Lens in CM.

Cable gateways (small line gateways) will be pre-provisioned when the MG is associated to system, which means endpoints and Lens will be pre-populated in GWCEM and the Core during the MG addition period.

The general strategy is, for those Dqos gateways, generate endpoints in SESM and populate both LNINV and LNENDPT table in the Core; for other small line gateways, only populate endpoints and LNINV table.

Due to the pre-provisioning in SN08, the gateways which are associated to the system prior this feature need to be converted to populate endpoints and Lens, which means a upgrade process must be provided.

And since all the Lens pre-provisioned for small gateways have HASU status in LNINV table, it is necessary to provide a new interface for OSSGate to retrieve these HASU lens.

### **1.2.3 Node Provisioning**

#### **1.2.3.1 Associate MG**

MG association requires an additional process to populate LNINV & LNENDPT in the Core and generate endpoints in GWCEM.

This functionality has no effect on CS2K GUI.

1. Cs2kCfgMgr receive the MG association request and verify whether it is a small line gateway.
2. If the MG request is a small line gateway, Cs2kCfg will retrieve the CCM layer version from the Core through XaCore. If the Core is upgraded to SN08, endpoints will be pre-provisioned in GWCEM and GWC Device, then LNINV table will be populated (LNENDPT is also populated as well if the MG is a Dqos gateway).
3. If the Core is still SN07 or before, the MG is added to system just like what was done in SN07.

Table 6 Table LNENDPT example datafill

| TABLE: LNENDPT |          |                     |
|----------------|----------|---------------------|
| LEN            | ENDPOINT | GATEWAY             |
| LG 00 0 00 00  | aaln/1   | test_gw1.nortel.com |
| LG 00 0 00 01  | aaln/2   | test_gw1.nortel.com |
| LG 00 0 00 02  | aaln/3   | test_gw1.nortel.com |
| LG 00 0 00 03  | aaln/4   | test_gw1.nortel.com |
| LG 00 0 00 04  | aaln/1   | test_gw2.nortel.com |
| LG 00 0 00 05  | aaln/2   | test_gw2.nortel.com |

Figure 3 GWCEM flow through for small line MG Association in SN08

### 1.2.3.2 Disassociate MG

Cs2kCfgMgr will take different actions based on the Core CCM layer version when a delete MG request is arriving.

This functionality has no effect on CS2K GUI.

1. Before the request is performed, Cs2kCfgMgr will first retrieve the CCM layer version of the Core.
2. If Core is SN07 or before, the MG will be delete as it was in SN07, which means backward compatibility must be supported.
3. If the Core is upgraded to SN08, Lens will be first delete from the Core, then the endpoints in GWCEM will be deleted as well.

An automatic rollback will be done when the disassociateMG operation fails to rollback the lens and endpoints deleted before failure occurs. And an appropriate message like following will be returned to client.

Figure 4 GWCEM flow through for MG disassociation in SN08

### 1.2.3.3 Change MG

Only changing reserved endpoints capacity for a specific MG is affected by this functionality.

Again, CS2K GUI has not been affected for this functionality.

1. When a changing reserved endpoint request is arriving, Cs2kCfgMgr will first retrieve the Core CCM layer version and take corresponding action based on the CCM version.
2. If the Core is prior to SN07, the gateway will be changed just as what has been done in SN07.
3. If the Core is upgraded to SN08, the additional endpoint/lens will be populated if the input changed reserved capacity is larger than the prior one. Otherwise, some endpoints/lens will be delete.

The total amount of adding/deleting is equal to the difference between input capacity and the prior one.

And also, an automatic rollback process will be done once the changeMG operation fails. All the Lens and endpoints populated before failure occurs will be deleted and an appropriate message like following will be returned to client.

Figure 5 GWCEM flow through for changing MG in SN08

#### 1.2.3.4 OSSGate enhancement

Since all the small line gateways will be pre-provisioned in SN08, the lens pre-populated in the Core should be in HASU status. So it is necessary to provide a interface for OSSGate to show the HASU lens so that customer can select one to configure service.

The detail request/response/error message will be defined later.

#### 1.2.3.5 Node Provisioning Recovery

This functionality provides an activity to allow node provisioning to be recovered when a provisioning operation (Associate/Disassociate/Change MG) is abort or disrupted by a server switch over or crash.

The recovery can be running without user's participation and has no effect on GUI.

This functionality is running at the server side and has no affect on the CS2K GUI. And this activity will be finished automatically without customer's participating.

### 1.2.4 Upgrade

Due to the pre-provisioning for small line gateway, for those gateways which was added prior to SESM/Core upgrading to SN08, an automated upgrade process will be responsible for pre-provisioning LNINV and possibly LNENDPT tables in the XACore following the XACore upgrade.

This functionality has no affect on CS2K GUI. But probably a alarm will be raised if upgrade is failed or disturbed.

The alarm detail will be:

|                                                                             |
|-----------------------------------------------------------------------------|
| Alias Name: EventMessagingUpgrae                                            |
| Category: Processing Error                                                  |
| Alarm Time: hh:mm:ss DD-MM-YYYY <TimeZone Info>                             |
| Severity: Major                                                             |
| Probable Cause: "Upgrade Failure"                                           |
| SpecificProblem: The Event Messaging Upgrade failed or has been interrupted |

#### 1.2.4.1 Notes:

In the case of following gateway upgrade or for gateways provisioned following the CS2K upgrade, the LEN may be used in OSSGate commands interchangeably with gateway/termination. Use of LEN will NOT cause data corruption as is currently documented in the OSSGate User's Guide.

#### 1.2.4.2 Limitations:

Upgrade process probably last several hours to convert all the gateways in a large lab. During the upgrade period,

1. Conversion begins when CM completes upgrade to SN08 load. SESM detects upgrade and SN07 behavior for Lines Provisioning of Small MG's (C type LGRPs) is disabled and SN08 behavior commences. SN08 behavior requires LEN to be pre-populated in LNINV
2. New service requests or move service requests that include a LEN not yet populated in LNINV will fail. OSSGate will return SERVORD error message from the CM. Any Line Prov command that references an empty LNINV tuple fails. Line is not HASU in LNINV thus SERVORD fail.

The following error message indicating Lens is not existing might be returned to client if user attempt to execute NEW commands at upgrade time on a gateway which is not yet pre-provisioned.

3. A minor alarm will be provide to identify the conversion progress on a GWC basis. Alarm clears when conversion is completed.
4. Line Prov audit will be disabled to prevent delaying completion of the conversion and possibly erroneous results.
5. Node provisioning (change MG / Disassociate MG) will be block during the MG's converting. Following error message will be returned to client if user want to change/Disassociate a specific MG during this gateway upgrade.

#### ChangeMG error message from OSSGate during upgrade

```
<?xml version="1.0" encoding="UTF-8" ?> <CommandList>
  <Response><Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <changeMG usn="1" version="1.0">
        <RC>20</RC><mgUIName>mg1.nortel.net</mgUIName>
        <MsgTxt> mg1.nortel.net Change MG Failed - The MG is under upgrade.Please try
again later.
        </MsgTxt>
      </changeMG>
    </Methods>
  </Response>
</CommandList>
```

#### DisassociateMG error message from OSSGate during upgrade

```
<?xml version="1.0" encoding="UTF-8" ?> <CommandList>
  <Response><Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <disAssocMG usn="1" version="1.0">
        <RC>20</RC><mgUIName>mg1.nortel.net</mgUIName>
        <MsgTxt> mg1.nortel.net DisAssocMG Failed - The MG is under upgrade.Please try
again later.
        </MsgTxt>
      </disAssocMG>
    </Methods>
  </Response>
</CommandList>
```

The error message shown on GUI will be filled later.

### 1.2.5 Audit Enhancement

Prior to SN07, any HASU lens which LGRP type is “C” will be considered as an error. But in SN08, since all the “C” type LGRP gateways will be pre-provisioned, the case above is no longer an error. So Audit system must be enhanced to handle the case.

On the other hand, a new table LNENDPT has been introduced into SN08, which also needs audit to ensure that GWCEM keeps consistent with the Core.

The following error situation will be detected and corrected.

1. Endpoint exists in GWCEM but the corresponding Len is NOT existed in Core.
2. Lens exists in Core but the corresponding endpoint is NOT existed in GWCEM.

*Note:* The two scenarios above has already cover by current LineDataIntegrity Audit.

3. Endpoint exists in GWCEM but the corresponding tuple is NOT existed in LNENDPT table of Core.
4. The tuple exists in LNENDPT table but the corresponding endpoint is NOT existed in GWCEM.

During the process, audit will not raise the alarm, instead, the correct matched data will be logged into a report file, and the detected problem will be logged

into another report file. The file will be loaded into a report shown on GUI when audit completes.

Limitations:

Line Audit will be disabled when upgrade is in progress. If a Line Audit is scheduled to start when the upgrade is running, a message like “Gateways upgrade is in progress. Please run Audit again later.” will be returned to client.

If the upgrade process finds that the Line Audit is running when it starts, it will sleep for a while and retry to restart until the Line Audit finishes.

### **1.3 Hardware Requirements or Dependencies**

N/A.

### **1.4 Software Requirements or Dependencies**

This feature requires SN08 XA-Core Load or later.

### **1.5 Limitations and restrictions**

N/A.

### **1.6 Interactions**

### **1.7 Glossary**

# SN08 Feature Deltas

***Product = CS 2000 Management Tools***

## **A00007007--Session Border Controller - Application Layer Gateway**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

IAC

#### **1.2 Description**

This activity provides a way for a network operator to separate the Cable hosted network IP address space from the service provider operator IP address space. It will allow the connection of two different IP address space domains without having to understand the exact IP address within the other domain.

This is accomplished through the use of an Application Layer Gateway (ALG). ALGs are NATs that understand the application (in this case, NCS protocol) and enable the application to continue to work even though it is “behind” the NAT. The ALG provides a single IP address interface to the CS2K via a GWC while interfacing to multiple small gateways each with its own unique IP address. For the purposes of this document, these small gateways are said to “subtend” the ALG. The IP address of the gateways which subtend the ALG are not known to the CS2K and thus will be set to 0.0.0.0 during provisioning.

The ALG is positioned in the path of packets flowing from media gateways and media gateway controllers. In this level the ALG provides a level of packet translation without directly participating in the media flow, that is to say the ALG does not directly establish a media path like a gateway, instead it serves as a proxy for the media through a request from the Call Server.

Generally the ALG is transparent to the call server; however to support the insertion of an ALG, the call server must be able to let multiple gateways share a single IP address.

### **1.2.1 Adding an ALG through SESM**

To add an ALG and associate it to a gateway, the following steps must be taken:

1 - From the Network Device view click on the new ALG tab (see section 1.3.1)

2 - Click Add

3 - The new 'Add ALG' panel is presented, enter the appropriate data. Note: the Port field will be pre-set to the NCS well known port value. It can however be changed by the user (see section 1.3.2)

4 - To associate an ALG while provisioning a new gateway, select the 'Associate Gateway' pull down option from the Configuration pull down menu. When the new panel is presented, provide the gateway name, the gateway profile and the gwc number. When the gateway profile selected is the NCS supported profile, two radio buttons will appear, one for Pep Server and one for ALG. Once the ALG radio button is selected the ALG name must be provided in the field next to the radio button. At this point, the ip address of the gateway will be presented as 0.0.0.0 (see section 1.3.3)

5 - To change ALG assigned to a particular gateway, or to associate an ALG to an existing gateway, select the GWC associated with the gateway, select the Provisioning tab, Gateways tab and retrieve all the gateways. Highlight the gateway to be changed, select 'Change' at the bottom. The 'Change Gateway' panel is presented. Select 'Change ALG'. Enter the new ALG name to be associated (see section 2.8.4)

**Figure 1 A view of how the ALG will be inserted into our network.**

## 1.3 GWC-EM ALG Provisioning

### 1.3.1 New ALG Nat Tab

The main GUI panel will be modified to add a new tab to allow provisioning of the ALG Nat. The GUI will be presented as follows:

### 1.3.2 New ALG provisioning Panel

A new pop panel will be provided to add an ALG to the network. The panel will be presented as follows:

The "Add ALG" dialog box contains the following fields and buttons:

- Name:** Text input field
- IP Address:** Text input field
- Port:** Text input field
- Protocol:** Text input field with "NCS" entered
- OK** button
- Cancel** button

### 1.3.3 Associate Gateway GUI

The associate gateway dialogue has been modified to allow the user to associate a new gateway to a GWC, at which time you can associate an ALG Nat to the new gateway. Two options will be provided to allow for either a Pep Server or ALG to be assigned. When the Pep Server radio button is selected the panel will appear as follows:

The image shows a Windows-style dialog box titled "Associate Media Gateway". It contains several input fields and two main sections. The fields are: "Gateway name:" with the value "billr.gw1", "Gateway IP address:" (empty), "Gateway controller name:" with a dropdown menu showing "<auto select>", "Gateway profile name:" with a dropdown menu showing "MOTOROLAMTA\_2", "Reserved terminations:" with the value "2", "Gateway site name:" with a dropdown menu showing "LG", and "Gateway PEP server:" (empty). Below these is a section titled "PEP Server / ALG Selection" containing two radio buttons: "PEP Server" (which is selected) and "ALG". Below that is a section titled "Signal Protocol" containing three input fields: "Protocol type:" with a dropdown menu showing "NCS (1)", "Protocol port:" with the value "2427", and "Protocol version:" with the value "1.0". At the bottom right are "OK" and "Cancel" buttons.

| Field                      | Value                                                                 |
|----------------------------|-----------------------------------------------------------------------|
| Gateway name:              | billr.gw1                                                             |
| Gateway IP address:        |                                                                       |
| Gateway controller name:   | <auto select>                                                         |
| Gateway profile name:      | MOTOROLAMTA_2                                                         |
| Reserved terminations:     | 2                                                                     |
| Gateway site name:         | LG                                                                    |
| Gateway PEP server:        |                                                                       |
| PEP Server / ALG Selection | <input checked="" type="radio"/> PEP Server <input type="radio"/> ALG |
| Signal Protocol            |                                                                       |
| Protocol type:             | NCS (1)                                                               |
| Protocol port:             | 2427                                                                  |
| Protocol version:          | 1.0                                                                   |

When the ALG radio button is selected, a field will be provided to enter the ALG name. The panel will be presented as follows:

The image shows a Windows-style dialog box titled "Associate Media Gateway". It contains several input fields and a section for selecting between PEP Server and ALG. The fields are: Gateway name (billr.gw1), Gateway IP address (0.0.0.0), Gateway controller name (<auto select>), Gateway profile name (MOTOROLAMTA\_1), Reserved terminations (empty), Gateway site name (LG), and Gateway ALG (empty). Below these is a "PEP Server / ALG Selection" section with two radio buttons: "PEP Server" (unselected) and "ALG" (selected). Below that is a "Signal Protocol" section with three fields: Protocol type (NCS (1)), Protocol port (2427), and Protocol version (1.0). At the bottom right are "OK" and "Cancel" buttons.

|                                  |                                      |
|----------------------------------|--------------------------------------|
| Gateway name:                    | billr.gw1                            |

OK Cancel

### 1.3.4 Change Gateway Association

An additional option will be added to the existing change gateway panel to include ALG option. Once the ALG option is selected another panel is provided which allows input of the ALG name to be associated to the gateway. The two panels will be presented as follows:

## 1.4 XML Interface

This feature implements an XML based command and response protocol. XML command documents are transported via Telnet within the context of a session to the OSSGate component in the SESM. The session is established via a secure logon sequence.

The application supporting this feature receives the XML document instance validates it and then processes the command.

A reply or response XML document instance is returned to the originating Telnet session.

The XML command and response documents for each of the new and modified operations are described in the following sections.

The AssocMG and QueryMG interface has been modified to allow/display ALGs configured in the system.

The following new XML commands have been provided:

- AssocMG
- QueryMG
- ChangeMGGWCEMData
- GetALGData
- getAlgNamesbyGWCId

## 1.4.1 AssocMG command

**Figure 2 XML command AssocMG**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <assocMG usn="1" version="1.0">
        <Parameters>
          <mgUIName>MGXML.5</mgUIName>
          <mgProfileName>MOTOROLAMTA_2</mgProfileName>
          <mgIpAddr>0.0.0.0</mgIpAddr>
          <mgProtocolType>4</mgProtocolType>
          <mgProtocolVersion>1.0</mgProtocolVersion>
          <mgProtocolPort>2427</mgProtocolPort>
          <gwcUIName>GWC-113</gwcUIName>
          <reservedTerminations>4</reservedTerminations>
          <algName>ALG1-0</algName>
        </Parameters>
      </assocMG>
    </Methods>
  </Command>
</CommandList>
```

## 1.4.2 QueryMG command

**Figure 3 XML command for queryMG (No change)**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <queryMG usn="1" version="1.0">
        <Parameters>
          <mgUIName>MGXML.5</mgUIName>
        </Parameters>
      </queryMG>
    </Methods>
  </Command>
</CommandList>
```

**Figure 4 XML response for queryMG**

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>
<Response>
<Interface>cs2kCfgMgrIf</Interface>
<Methods><queryMG usn="1" version="1.0">
<ReturnData>
<Row>
      <mgUIList>MGXML.5</mgUIList>
      <mgIpList>0.0.0.0</mgIpList>
      <callServerId>CABLAB</callServerId>
      <gwcUIName>GWC-0</gwcUIName>
      <svcTypeList>0</svcTypeList>
      <svcTypeList>4</svcTypeList>
      <nodeName>LG 00 0</nodeName>
      <pepServerName>NOT_SET</pepServerName>
      <algName>ALG1-0</algName>
      <engrEndPoints>2</engrEndPoints>
      <protType>ncsprotocol</protType>
      <protVersion>1.0</protVersion>
      <protPort>2427</protPort>
      <profileName>MOTOROLAMTA_2</profileName>
      <maxEngrEndPoints>2</maxEngrEndPoints>
      <frameNumber>not_set</frameNumber>
      <unitNumber>not_set</unitNumber>
      <frameType>not_set</frameType>
      <floorPos>not_set</floorPos>
      <rowPos>not_set</rowPos>
      <framePos>not_set</framePos>
      <unitPos>not_set</unitPos>
    </Row>
    <RC>0</RC>
    <MsgTxt>Query of a Single MG was
      successful</MsgTxt>
  </ReturnData>
</queryMG>
</Methods>
</Response>
</CommandList>
```

### 1.4.3 ChangeMGGWCEMData Command and Response

An example instance of a ChangeMGGWCEMData command follows:

**Figure 5** ChangeMGGWCEMData command instance example

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ALGOSSIf</Interface>
    <Methods>
      <changeMGGWCEMData usn="135" version="1.0" >
        <Parameters>
          <MGUIName>MG1</MGUIName>
          <algName>billr.alg1</algName>
        </Parameters>
      </changeMGGWCEMData>
    </Methods>
  </Command>
</CommandList>
```

An example instance of the response to ChangeMGGWCEMData command follows:

**Figure 6** ChangeMGGWCEMData Response XML instance example

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Response>
    <Interface>ALGOSSIf</Interface>
    <Methods>
      <changeMGGWCEMData usn="135" version="1.0">
        <ReturnCode value="0" text="Successful result" />
        <MsgTxt>MG ALG association changed successfully</MsgTxt>
      </changeMGGWCEMData>
    </Methods>
  </Response>
</CommandList>
```

#### 1.4.4 GetALGData Command and Response

An example instance of a GetALGData command follows:

**Figure 7 GetALGData command instance**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ALGOSSIf</Interface>
    <Methods>
      <getALGData usn="1" version="1.0" >
        <Parameters>
          <algName>billr.alg1</algName>
        </Parameters>
      </getALGData >
    </Methods>
  </Command>
</CommandList>
```

A response example to the GetALGData command follows:

**Figure 8 GetALGData Response XML document**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Response>
    <Interface>ALGOSSIf</Interface>
      <Methods>
        <getALGData usn=123 version=1.0>
          <ReturnCode value="0" text="Successful result" />
          <MsgTxt>Data Available</MsgTxt>
          <algName>billr.alg1</algName>
          <ServerType>DQoS</ServerType>
          <IPAddress>47.192.234.88</IPAddress>
          <Port>2427</Port>
        </getALGData>
        <getALGData usn=124 version=1.0>
          <ReturnCode value="0" text="Successful result" />
          <MsgTxt>Data Available</MsgTxt>
          <algName>billr.alg1</algName>
          <ServerType>DQoS</ServerType>
          <IPAddress>47.192.234.100</IPAddress>
          <Port>2427</Port>
        </getALGData>
      </Methods>
    </Response>
  </CommandList>
```

### 1.4.5 getAlgNamesbyGWCIId Command and Response

An example instance of a getAlgNamesbyGWCIId command follows:

**Figure 9 getAlgNamesbyGWCIId example XML document instance**

```
<?xml version="1.0"?>
<CommandList>
  <Command>
    <Interface>ALGOSSIf</Interface>
    <Methods>
      <getAlgNamesbyGWCIId usn="1", version="1.0">
        <Parameters>
          <GWC>GWC_1</GWC>
        </Parameters>
      </getAlgNamesbyGWCIId>
    </Methods>
  </Command>
</CommandList>
```

An example getAlgNamesbyGWCIId response is shown below:

**Figure 10 getAlgNamesbyGWCIId example XML instance response**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Response>
    <Interface>ALGOSSIf</Interface>
    <Methods>
      <getAlgNamesbyGWCIId usn="1" version="1.0">
        <ReturnCode value="0" text="Successful result" />
        <MsgTxt>Data Available</MsgTxt>
        <GWC>GWC_1</GWC>
        <algName>billr.alg1</algName>
        <algName>billr.alg2</algName>
        <algName>billr.alg3</algName>
        <algName>billr.alg4</algName>
        <algName>billr.alg5</algName>
      </getAlgNamesbyGWCIId>
      <getAlgNamesbyGWCIId usn="2" version="1.0">
        <ReturnCode value="0" text="Successful result" />
        <MsgTxt>Data Available</MsgTxt>
        <GWC>GWC_5</GWC>
        <algName>billr.alg6</algName>
        <algName>billr.alg7</algName>
        <algName>billr.alg8</algName>
      </getAlgNamesbyGWCIId>
    </Methods>
  </Response>
</CommandList>
```

## 1.5 Hardware Requirements or Dependencies

No new hardware is required. The application components provided by this feature execute as part of the SESM and GWC.

Integration will be performed with the ACME Net-Net Session Director.

## 1.6 Software Requirements or Dependencies

No new software or firmware dependencies are introduced by this feature.

## 1.7 Limitations and restrictions

### 1.7.1 ALG Limitations

- The CS2K has a limit of 2000 “middleboxes” which is the number of ALGs, PEP servers, NATs and media Proxies combined.
- The CS2K has a limit of 200 ALG middlebox.
- A single GWC on the CS2K has a limit of 20 ALG middleboxes.
- ALGs can only be provision against MTA gateways.
- ALG only supports the NCS protocol.
- Although the ALG solution does not require it, 64 character FQDN support requires that each domain (cable hosted customer) use separate GWC pairs.
- If the ALG does not transmit Audit Endpoint (AUEP) messages to the MTA before the MTA sends its first message (typically an RSIP) then the lines in the CS2K will appear SYSB because the Audit Endpoint is rejected or not responded to. This could happen in the event that the ALG loses all state information and requires the first MTA originated message to re-establish its bindings. To correct this problem, the MTA needs to send any message, e.g. an RSIP or an offhook and this will re-establish the binding and clear the SYSB state on the line. This problem will not occur if the ALG vendor supports discovery through the use of DNS of the MTA IP Address before the MTA sends its first message.

### 1.7.2 Packet Cable Protocol Limitations

- DQoS is not supported on an MTA behind an ALG. Nortel is not aware of any ALG on the market that supports DQOS.
- IPSEC is not supported since a NAT device will cause end to end (GWC to MTA) security to fail because of the IP address and message content manipulation done by the ALG.
- Packetcable Electronic Surveillance can not be fully supported with an ALG. This is because the specification requires the transport of the MTA IP address which is not available to the CS2K. However, regular DMS packet electronic surveillance is supported.
- Event Messaging is partially supported. We support event messaging, but since DQoS is not supported, CMTS records will not appear.

### 1.7.3 DNS Limitations

- If a Redirecting Media Gateway Controller (RMGC) is configured, the DNS servers must be configured correctly. For example the ALG upon receiving the response from the RMGC on the CS2K, must be able allow

the gateway to resolve the Fully Qualified Domain Name (FQDN) in the message thru DNS queries.

- DNS is not supported by the CS2K to discover the ALG IP address. We only support static configuration of the IP address of the ALG since it is not expected that there will be many ALGs.
- DNS is not required by the CS2K to discover the IP address of the MTA (although it may be used in the cable IP space) because the CS2K no longer needs the cable MTA IP address. Therefore DNS discovery is automatically disabled for gateways behind ALGs.

#### 1.7.4 Other CS2K Limitations

- The GWC specified must have the small lines gateway profile in order to support provisioning of ALG.
- When an ALG is associated to a gateway a DQOS PEP Servers, Low Band Width (LBL), IP-VPN Nats will not be allowed on the same gateway.
- The IP address of the gateway being associated with an ALG will not be modified. If the IP address field is left blank, the default value of 0.0.0.0 will be provision against the gateway.
- CS2K QoS collector will collect statistics as reported by the ALG. There is no separation of statistics between the ALG boundaries.
- A Nortel Media Proxy is not supported for the cable MTAs that are behind an ALG since they are both performing a similar function. However, the Media Proxy is supported for other gateways in the solution that need it.
- The real IP address of the MTA is not known by the call server and therefore the ALG IP address will be used in those cases.

## 1.8 Interactions

The following existing GUIs have been modified:

- New ALG dialog for creating the ALG
- Associate Media Gateway Dialog
- Change Gateway Dialog

The following XML commands have been modified:

- AssocMG
- QueryMG
- ChangeMGGWCEMData
- GetALGData
- getAlgNamesbyGWCId

The on-line help facility will be updated with information on the use, syntax and valid values for all the above modifications/additions.

```

## 1.12 Appendix B: XML Commands: description of method parameters

### 1.12.1 Parameter definitions

- **encoding??**
- **version** - The version refers to the version of the method or operation - e.g., the changeALGMiddleboxNames operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parms X, Y, and Z. TYPE *decimal*.
- **usn** - Unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.
- **ReturnCode value**- A numeric value indicating the result of the attempted operation (see Table 3, for range and definitions of each possible value). TYPE *string*.
- **Return code text**- Appropriate text that describes the result of the operation. TYPE *string*.
- **ALGMiddleboxName1** - The Middlebox name(s) of the ALG node middlebox(es). TYPE *NoSpaceNameType*. (32 character token without spaces, see xsd definitions in Appendix A.

### 1.12.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **AssocMG** - Method to associate a gateway to the CS2K. This method has the following NEW parameters: (only NEW ones described, see standard documentation for the other definitions).
  - Input data:
    - usn
    - version
    - ALGMiddleboxName (Optional, Cannot be included as well as pepServerName) - defines the ALG (optional) for this gateway.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

2. **QueryMG** - Method that gets the gateway information from a CS2K. This method has the following NEW Output parameters: (only NEW ones described, see standard documentation for the other definitions):
  - Output data:
    - ALGMiddleboxName - defines the ALG Middlebox for this gateway.
    -
3. **changeALG**- Method that changes the ALG for a given gateway. This method has the following parameters:
  - Input data:
    - usn
    - version
    - MGname indicates the gateway that this change command is for.
    - ALGName - defines the new ALG name
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

## ***Product = CS 2000 Management Tools***

### **A00007072--Third-party GW Interop pre-provisioning** ***Functional Description***

#### **1.1 Applicable Solution(s)**

IAW

#### **1.2 Description**

Feature A0007072 will deliver end-point pre-provisioning capability in the Succession Element and Sub-element Manager (SESM) required for the third party GW inter-op with the Succession OAMP system.

This feature provides the following major functionalities:

- Ability to associate a third party large line GW with its GWC and assign a node in the CS2K Core based on a user specified frame and the unit numbers.
- Ability to pre-provision the GW end-points from the OSSGATE interface using XML.
- Ability to delete GW end-points from the OSSGATE interface using XML.
- Ability to query GW end-points from the OSSGATE interface using XML.
- Ability to export a query end-point XML output response as an add end-point input XML request.
- Ability to perform bulk provisioning using the Batch Provisioning Tool (bpt).
- Ability to view the output from all the above XML operations in a nicely formatted html.

### 1.3 Hardware Requirements or Dependencies

Not applicable.

### 1.4 Software Requirements or Dependencies

Not applicable.

### 1.5 Limitations and restrictions

- Only the XML based machine interface is provided for end-point provisioning of third party large line GWs.
- The change end-point command is not supported.

### 1.6 Interactions

This feature facilitates end-point provisioning of third party GWs. The end-point format is defined by the GW profile specified during the provisioning of the GW. The profile definitions are facilitated by the GW Profile feature, Activity A00007071.

The gateway end-points must be pre-provisioned before attempting to assign a service to these end-points.

## 1.8 Glossary

| Term | Description              |
|------|--------------------------|
| GW   | GateWay                  |
| GWC  | GateWay Controller       |
| XML  | eXtended Markup Language |

## 2: Configuration for A00007072

### 2.1 Hardware and Software Requirements

SN08 base loads will be required across all the components of this solution to effectively use this feature.

### 2.2 Initial Configuration

Not applicable.

**Note:** A third party GW must have been successfully associated with its GWC using appropriate GW profile, before attempting the end-point provisioning. This feature makes use of this pre-condition to facilitate end-point provisioning of such a GW.

### 2.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable.

**Note:** This feature leverages a previously defined gateway profile for third party large line gateways.

### 2.4 Upgrade Impact

#### 2.4.1 Dump and Restore

Not applicable.

## 2.4.2 Element Management Upgrade

Conversion of existing third party large line GW data to SN08 format is not supported. To leverage any of the capabilities delivered by this feature, the existing GW and the associated end-points and the Service must be removed and re-added in SN08. Both new and old format data will be allowed to co-exist in SN08, however the existing GW and the end-points will be managed in the same format as defined in the previous release.

Due to a dependency of this feature on the GW Profile Feature, A00007071, the capabilities provided by this feature cannot be fully utilized until all the components of the OAMP are at the base 08 load line up. There is a dependency on the new LGRPTYPE in the 08 CS2K Core that will be used by the third party GW nodes in the Core. The GWC devices are required to be on the 08 release as well to support spare profiles. Please refer to the A00007071 feature documentation for additional details regarding this dependency.

## 2.5 Data schema (DS) (CM, MIBS, RDB)

### 2.5.1 New/modified tables, MIBs, or Database Schema

Not Applicable.

## 2.6 Gateway and End-point Name Mapping to Logical Group and Line Equipment Number (LEN)

The logical group name is derived from the GW SITE, the frame number and the unit number. The end-point name is user defined and its associated LEN has absolutely no bearing on the end-point name. The LEN is derived from the logical group name and the user specified circuit number. The following sections clarify this relationship with an example.

### 2.6.1 GW

<GWNAME>, e.g. "MyGW"

#### 2.6.1.1 Logical Group

<SITE> <FFF> <U>, e.g. "CARY 142 0"  
where:

<SITE> = SITE name chosen at gateway provisioning time. Matching gateway name to SITE name is not an enforced rule, however it is suggested that a third party GW SITE name be defined in the CS2K Core and that all third party gateway provisioning utilize the "third party GW" SITE name.

<FFF> = Frame number that is specified during the third party GW provisioning. This number can range between 0 - 511.

<U> = Unit number that is specified during the third party GW provisioning. This number can range from 0 - 9.

### 2.6.1.2 End-point

The end-point name is flexible. The format of the name is defined during the GW profile creation time and enforced during the GW provisioning time. The name is completely user-defined. The name can include any physical location data of the hardware. The end-point name can be up to 32 characters long with no spaces in between.

### 2.6.1.3 LEN Format

<SITE> <FFF> <U> <TT> <tt>, e.g. "CARY 142 0 10 13"  
where:

<SITE>, <FFF>, <U>, <TT>, and <tt> are as defined in the above sections.

The following summarizes the correlation between a GW, its end-points and the associated LENs:

- One third party "GW" mapped to one logical group in the CS2K Core.
- 1023 terminations are supported per logical group.
- 1 terminal number is reserved in the CS2K Core for maintenance/messaging.

**Table 1 GW, LGRP, End-point, TN and LEN Relationship**

| GW Name<br>(User Input) | Profile | LGRP Name     | End-point<br>(User Input) | Circuit<br>Number (<br>User Input) | LEN              |
|-------------------------|---------|---------------|---------------------------|------------------------------------|------------------|
| MyGW.ext.net            | PRF_1   | CARY 100<br>5 | ext/100/5/1/1             | 0                                  | EXT 100 5 00 00  |
| MyGW.ext.net            | PRF_1   | CARY 100<br>5 | ext/100/5/1/2             | 2                                  | EXT 100 5 00 01  |
| :                       |         | :             | :                         | :                                  | :                |
| :                       |         | :             | :                         | :                                  | :                |
| MyGW2.ext.net           | PRF_2   | EXT2 200 8    | ext2-ep-last              | 1022                               | EXT2 200 8 10 22 |

Terminal number 0 is reserved in the CS2K Core for the maintenance/messaging terminal on the node.

LEN is generated using the following formula:

(LGRPName) (CN/100) (CN%100) where CN => Circuit Number

The last two parts of LEN are 0 padded to keep the value to 2 digits similar to the other LENs.

## 2.7 Service Orders (SO) (CM & SESM)

Not applicable.

## 2.8 Software optionality control (SOC)

Not applicable.

## 2.9 Element Management

### 2.9.1 New/modified GUIs

The CS2000 Management Tools GUI is modified by this feature. Specifically the ‘Associate Media Gateway’ dialog box will be altered to support provisioning of the frame and unit numbers and the LGRPLOC information as part of LGRPOPTS (LGRP OPTions).

A third party GW will be associated with its GWC using an appropriate gateway profile. The profile must have been defined before associating the GW. When the third party GW profile is selected on the “Associate Media Gateway” GUI, the new fields for taking the input for the frame and unit numbers along with the other LGRPLOC fields will be displayed.

**Table 2 New or modified GUIs**

| GUI name | NEW, CHANGED, or DELETED |
|----------|--------------------------|
| AssocMG  | CHANGED                  |

### 2.9.2 GUI information

#### 2.9.2.1 GUI name: AssocMG

“Associate Media Gateway”

##### 2.9.2.1.1 Functional description

The existing “Associate Media Gateway” GUI prompts the user for profile specific information based on the profile selection. For the third party gateways, there are additional parameters required to be gathered along with the SITE name. The new fields are for gathering the frame number, the unit number and the LGRP OPTION data. These new fields will be populated in the GUI based on the query of a specific field in the GW profile definition.

##### 2.9.2.1.2 GUI usage and implications

Current datafill order unchanged.

##### 2.9.2.1.3 GUI size

Not applicable.

#### 2.9.2.1.4 GUI fields

Two new fields are introduced as part of provisioning a third party gateway to successfully create a node in the CS2K core for the GW being added.

**Table 3 GUI field descriptions**

| Field      | New or Changed | Subfield       | Entry      | Explanation and action | Associated MIB entry |
|------------|----------------|----------------|------------|------------------------|----------------------|
| Frame Type | New            | Not applicable | User Input | Frame Type             | Not applicable       |
| Frame #    | New            | Not applicable | User Input | Frame Number           | Not applicable       |
| Unit #     | New            | Not applicable | User Input | Unit Number            | Not applicable       |
| Floor Pos  | New            | Not applicable | User Input | Floor Position         | Not applicable       |
| Row Pos    | New            | Not applicable | User Input | Row Position           | Not applicable       |
| Frame Pos  | New            | Not applicable | User Input | Frame Position         | Not applicable       |

#### 2.9.2.1.5 Usage example

Usage of the “Associate Media Gateway” GUI has not changed.

#### 2.9.2.1.6 GUI release history update

Not applicable.

#### 2.9.2.1.7 Supplementary information

None.

### 2.9.3 CLUI Interface

There are 3 sub-sections in this component. One of them is the XML interface for providing the end-point provisioning and the other component includes the Batch Provisioning Tool (BPT) enhancements to support bulk provisioning of end-points. These are discussed in detail in the following sections:

#### 2.9.3.1 XML interface for GW provisioning:

The XML interface, for the Associate MG XML command in Nodes Provisioning facilitates, provisioning the LGRPLOC information including the frame and the unit number data in the input XMLs for this command.

Please see later sections for the corresponding schema definitions (XSDs) and the XML document templates.

### 2.9.3.2 XML interface for end-point provisioning:

The end-point pre-provisioning is achieved by using XML from the OSSGATE interface similar to Nodes Provisioning.

The following are the supported XML commands:

1. addLineEndpoint
2. delLineEndpoint
3. queryLineEndpoint
4. queryAllLineEndpoints

The above mentioned XML commands are the OSS interfaces supported by this feature. A brief description of each one of these interfaces, including input parameters and possible output parameters are listed below.

A brief description of the common parameters used across these different commands:

- **mgUIName** - fully qualified gateway name. This can be 1 - 32 characters long. TYPE *string*.
- **endpointName** - name of the end-point that is being provisioned. This can be 1 - 32 characters long. TYPE *string*.
- **circuitNumber** - number to associate the terminal with. The range of this value is 0 - 1022. TYPE *unsignedShort*
- **cardCode** - string that defines the card code associated with the card. TYPE *string*. Optional parameter. The default is RDLSG.
- **padGroup** - string that defines the pad group. TYPE *string*. Optional parameter. The default is PKLNL.
- **ground** - string that defines the ground property. TYPE *string*. Values can be “N” or “Y”. Optional parameter. The default is “N”.
- **version** - the version refers to the version of the method or operation - e.g., the AddSubscriber operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parameters X, Y, and Z. TYPE *decimal*.
- **usn** - unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.
- **RC** - return Code. A numeric value indicating the result of the attempted operation (see Table 3, above for range and definitions of each possible value). TYPE *short*.
- **MsgTxt** - appropriate text that describes the result of the operation. TYPE *string*.

Individual XML document structure for each of the end-point provisioning commands is described in the following sections:

**addLineEndpoint** - interface/method that adds a specified end-point to the SESM database and allocates a LEN to the corresponding terminal in the CS2K core.

- Input data:
  - usn
  - version
  - mgUIName
  - endpointName
  - cardCode - Default: RDTEBS
  - padGroup - Default: STDLN
  - ground - Default: N
- Output data:
  - usn (the value should be the same as the input)
  - version (the value should be the same as the input)
  - RC - Return Code
  - MsgTxt - text data detailing specific results of the operation in terms of the success or failure of the operation and the possible indication of the failure reason in case of a failure.

**delLineEndpoint** - interface/method that deletes a specified end-point from the SESM database and de-allocates LEN from the corresponding terminal in the CS2K core.

**Pre-condition:** service on the end-point must be un-assigned before attempting this operation.

- Input data:
    - usn
    - version
    - mgUIName
    - endpointName
- OR
- to delete a bunch of end-points with a specified range of circuit numbers:
- circuitNumberBegin

- circuitNumberEnd

OR

to delete ALL the end-points on this GW:

- ALL

- Output data:

- usn (the value should be the same as the input)
- version (the value should be the same as the input)
- RC - Return Code
- MsgTxt - text data detailing specific results of the operation in terms of the success or failure of the operation and the possible indication of the failure reason in case of a failure.

**queryLineEndpoint** - interface/method that queries a specific end-point data on this gateway.

The end-point data will be enclosed within the <Row> tags similar to the output of the other nodes XML operations.

- Input data:

- usn
- version
- mgUIName
- endpointName

- Output data:

- usn (the value should be the same as the input)
- version (the value should be the same as the input)
- usn (the value should be the same as the input)
- version (the value should be the same as the input)
- mgUIName
- endpointName
- CircuitNumber
- cardCode
- padGroup
- status
- ground
- status

- tid
- LEN
- RC - Return Code
- MsgTxt - text data detailing specific results of the operation in terms of the success or failure of the operation and the possible indication of the failure reason in case of a failure.

**queryAllLineEndpoints** - interface/method that queries all the end-points on this gateway.

The end-point data for each of the end-points will be enclosed within the <Row> tags similar to the output of the other nodes XML operations.

- Input data:
  - usn
  - version
  - mgUIName
- Output data:
  - usn (the value should be the same as the input)
  - version (the value should be the same as the input)
  - mgUIName
  - endpointName
  - CircuitNumber
  - cardCode
  - padGroup
  - status
  - ground
  - status
  - tid
  - LEN
  - RC - Return Code
  - MsgTxt - text data detailing specific results of the operation in terms of the success or failure of the operation and the possible indication of the failure reason in case of a failure.

### 2.9.3.2.1 XML - Example Commands and Responses

#### Introduction:

The end-point pre-provisioning capability is provided using the OSSGate interface with XML documents. This application takes XML based command files as input and returns XML formatted response messages. (See [www.w3.org](http://www.w3.org) for more information on XML.)

OSSGate accepts client connections and forwards incoming XML input to the pre-provisioning application. The XML commands are parsed, processed, and the appropriate response is returned to the client.

The following format is the general file format for a valid XML input file:

**Table 4 XML File Format**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <someMethod usn="1" version="1.0">
        <Parameters>
          <fieldName>somevalue</fieldName>
          <fieldName>somevalue</fieldName>
        </Parameters>
      </someMethod>
      <someMethod usn="2" version="1.0">
        <Parameters>
          <fieldName>somevalue</fieldName>
          <fieldName>somevalue</fieldName>
        </Parameters>
      </someMethod></Methods>
    </Command>
  </CommandList>
```

Response to XML commands are returned in the XML formatted response documents. The following format is the general file format for a valid XML response file:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Response>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <someMethod usn="1" version="1.0">
        <ReturnData>
          <fieldName>somevalue</fieldName>
          <RC>somevalue</RC>
          <MsgTxt>somevalue</MsgTxt>
        </ReturnData>
      </someMethod>
    </Methods>
  </Response>
</CommandList>
```

A few important guidelines for valid XML documents are:

- For every open tag there must be a close tag.
- Every attribute value must be quoted, either with single or double quotes, but they must be consistent.
- No attribute name may appear more than once in a single element.
- Elements must be nested (closed) properly.
- Only one root element is allowed.
- XML is case-sensitive.
- The document must conform to the rules defined in the XML schema file (XSD file). Please see later sections towards the end of this document for details on the individual XSD documents.

### 2.9.3.2.2 Examples of the pre-provisioning XMLs

The following are few examples of the end-point pre-provisioning commands for each operation supported by this activity. The XML messages in these examples are formatted for the ease of understanding.

#### **addLineEndpoint Command:**

Example of an **addLineEndpoint** XML request:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <addLineEndpoint usn="1" version="1.0">
        <Parameters>
          <mgUIName>MYMG000-0-1</mgUIName>
          <endpointName>aaln/1/2</endpointName>
          <circuitNumber>1</circuitNumber>
          <cardCode>RDTLSG</cardCode>
          <padGroup>PKLNL</padGroup>
        </Parameters>
      </addLineEndpoint>
    </Methods>
  </Command>
</CommandList>
```

#### **delLineEndpoint XML Command:**

Example of a **delLineEndpoint** XML request:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <delLineEndpoint usn="1" version="1.0">
        <Parameters>
          <mgUIName>MYMG000-0-1</mgUIName>
          <endpointName>aaln/1/2</endpointName>
        </Parameters>
      </delLineEndpoint>
    </Methods>
  </Command>
</CommandList>
```

An example of a **delLineEndpoint** request for deleting **a range** of end-points (with circuit numbers ranging from 2 - 10 with limits inclusive) of this gateway:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <delLineEndpoint usn="1" version="1.0">
        <Parameters>
          <mgUIName>MYMG000-0-1</mgUIName>
          <circuitNumberBegin>2</circuitNumberBegin>
          <circuitNumberEnd>10</circuitNumberEnd>
        </Parameters>
      </delLineEndpoint>
    </Methods>
  </Command>
</CommandList>
```

An example of a **delLineEndpoint** request for deleting **ALL** the end-point of this gateway:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <delLineEndpoint usn="1" version="1.0">
        <Parameters>
          <mgUIName>MYMG000-0-1</mgUIName>
        </Parameters>
      </delLineEndpoint>
    </Methods>
  </Command>
</CommandList>
```

**queryLineEndpoint XML Command:**

An example of a **queryLineEndpoint** XML request:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <queryLineEndpoint usn="1" version="1.0">
        <Parameters>
          <mgUIName>MYMG000-0-1</mgUIName>
          <endpointName>aaln/1/2</endpointName>
        </Parameters>
      </queryLineEndpoint>
    </Methods>
  </Command>
</CommandList>
```

An example of a **qryAllLineEndpoints** request for querying **ALL** the endpoint of this gateway:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <queryAllLineEndpoints usn="1" version="1.0">
        <Parameters>
          <mgUIName>MYMG000-0-1</mgUIName>
        </Parameters>
      </queryAllLineEndpoints>
    </Methods>
  </Command>
</CommandList>
```

**2.9.3.2.3 Examples of Response XMLs:**

**addLineEndpoint Response with 4 commands:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
<Response>
<Interface>cs2kCfgMgrIf</Interface>
<Methods>
  <addLineEndpoint usn="1" version="1.0">
    <ReturnData>
      <RC>18</RC>
      <MsgTxt>The MG service type is not supported by the GWC.</MsgTxt>
    </ReturnData>
  </addLineEndpoint>
  <addLineEndpoint usn="2" version="1.0">
    <ReturnData>
      <RC>18</RC>
      <MsgTxt>The MG service type is not supported by the GWC.</MsgTxt>
    </ReturnData>
  </addLineEndpoint>
  <addLineEndpoint usn="3" version="1.0">
    <ReturnData>
      <RC>18</RC>
      <MsgTxt>The MG service type is not supported by the GWC.</MsgTxt>
    </ReturnData>
  </addLineEndpoint>
  <addLineEndpoint usn="4" version="1.0">
    <ReturnData>
      <RC>18</RC>
      <MsgTxt>The MG service type is not supported by the GWC.</MsgTxt>
    </ReturnData>
  </addLineEndpoint>
</Methods>
</Response>
</CommandList>
```

### **delLineEndpoint XML Response:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
<Response>
<Interface>cs2kCfgMgrIf</Interface>
<Methods>
  <delLineEndpoint usn="1" version="1.0">
    <ReturnData>
      <RC>18</RC>
      <MsgTxt>Delete Failed </MsgTxt>
    </ReturnData>
  </delLineEndpoint>
</Methods>
</Response>
</CommandList>
```

### **queryLineEndpoint XML Response:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
<Response>
<Interface>cs2kCfgMgrIf</Interface>
<Methods>
  <queryLineEndpoint usn="1" version="1.0">
    <ReturnData>
      <mgUIName>myMG.usa.net</mgUIName>
      <Row>
        <endpointName>first/ep</endpointName>
        <circuitNumber>1010</circuitNumber>
        <cardCode>RDTLSG</cardCode>
        <padGroup>PKLNL</padGroup>
        <ground>N</ground>
        <status>HASU</status>
        <tid>1011</tid>
        <LEN>CARY 111 2 10 10</LEN>
      </Row>
      <RC>0</RC>
      <MsgTxt>Query Single Endpoint Successful</MsgTxt>
    </ReturnData>
  </queryLineEndpoint>
</Methods>
</Response>
</CommandList>
```

**queryAllLineEndpoints XML Response:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
<Response>
<Interface>cs2kCfgMgrIf</Interface>
<Methods>
<queryAllLineEndpoints usn="1" version="1.0">
<ReturnData>
  <mgUIName>thirdParty.us.com</mgUIName>
  <Row>
    <endpointName>first/ep</endpointName>
    <circuitNumber>1010</circuitNumber>
    <cardCode>RDTLSG</cardCode>
    <padGroup>PKLNL</padGroup>
    <ground>N</ground>
    <status>HASU</status>
    <tid>1011</tid>
    <LEN>CARY 111 2 10 10</LEN>
  </Row>
  <Row>
    <endpointName>second/ep</endpointName>
    <circuitNumber>1011</circuitNumber>
    <cardCode>RDTLSG</cardCode>
    <padGroup>PKLNL</padGroup>
    <ground>Y</ground>
    <status>WORKING</status>
    <tid>1012</tid>
    <LEN>CARY 111 2 10 10</LEN>
  </Row>
  <RC>0</RC>
  <MsgTxt>Query endpoints operation successful</MsgTxt>
</ReturnData>
</queryAllLineEndpoints>
</Methods>
</Response>
</CommandList>
```

**assocmg XML Command:**

Example of a **assocmg** XML request:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <assocMG usn="1" version="1.0">
        <Parameters>
          <mgUIName>MyGW.ext.net</mgUIName>
          <mgProfileName>THIRD_PARTY</mgProfileName>
          <mgIpAddr>47.171.3.44</mgIpAddr>
          <mgProtocolPort>2427</mgProtocolPort>
          <gwcUIName>GWC-2</gwcUIName>
          <lgrpLocation>
            <frameType>ABCD</frameType>
            <frameNumber>5</frameNumber>
            <unitNumber>8</unitNumber>
            <floorPosition>10</floorPosition>
            <rowPosition>SS</rowPosition>
            <framePosition>44</framePosition>
          </lgrpLocation>
        </Parameters>
      </assocMG>
    </Methods>
  </Command>
</CommandList>
```

#### 2.9.3.2.4 XML Schema Language (XSD)

XML schemas validate each incoming XML request and ensure that the instance document follows the required content model and the parameters are valid before sending the provisioning request down to the server.

#### addLineEndpoint.xsd:

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  version="1.0"
  xml:lang="en" >

  <!-- ***** -->
  <!-- * Define Method Parameters -->
  <!-- ***** -->
  <xsd:complexType name="addLineEndpointMethodType">
    <xsd:all>
      <xsd:element name="Parameters" type="addLineEndpointParamsType" />
    </xsd:all>
    <xsd:attributeGroup ref="Usn_VersionAttrbGroup" />
  </xsd:complexType>
  <xsd:complexType name="addLineEndpointParamsType">

### 2.9.3.3 Batch Provisioning Tool (bpt):

The SESM application, 'bpt', is a command line tool that provides an ability to perform bulk provisioning. Enhancements to this tool include new menu options to facilitate end-point bulk provisioning and a new option to facilitate converting query end-point operation output into add end-point operation input.

In addition, the 'bpt' help text will be updated to include the new enhancements. The 'bpt' menus are enhanced as follows:

```
=====
```

*Batch Provisioning Tool (BPT V1.0)*

```
=====
```

*Username: ptm*

*Password:*

*Login in progress ...*

*You are currently logged in as: ptm*

```
=====
```

*Main Menu:*

=====

- (1) Execute Batch File
- (2) Display Output
- (3) Display Logs
- (4) Delete Output or Log Files
- (h) Help
- (x) Exit

*Selection: [1/2/3/4/h/x:1] 1*

=====

*Provisioning Input Entry Menu:*

=====

*Coming from this menu:*

- (1) Lines
- (2) ADSL
- (3) Line Endpoints**
- (4) Go to shell prompt
- (r) Return to the main menu.
- (x) Exit BPT.

*Selection: [1/2/3/4/r/x:1] 3*

=====

*Line Endpoints Sub-Menu:*

=====

- (1) Line Endpoints
- (2) Export queryLineEndpoints Output
- (b) Back to the previous menu
- (r) Return to the main menu

(x) *Exit BPT.*

*Selection: [1/2/b/r/x:1] 1*

*Which mode would you like to have the log file on?*

*Critical/Verbose/Major/Minor [c/v/ma/mi:c]:c*

*Please enter the input file name:*

For the “export” command (option 4 on the ‘Provisioning Input Entry Menu’), the generated output XML file name will be auto-generated and (in a format for addLineEndpoint XML command) will be available on the SESM Server at the following location:

*/opt/nortel/NTsesm/tools/bpt/output/export*

The line endpoints menu will be integrated into the other menus of bpt for managing the output files and the log files. For example, the following are the output snapshots:

***For output file management:***

=====

Main Menu:

=====

- (1) Execute Batch File
- (2) Display Output
- (3) Display Logs
- (4) Delete Output or Log Files
- (h) Help
- (x) Exit

*Selection: [1/2/3/4/h/x:1] 2*

=====

Display Output Menu:

=====

Coming from this menu: output

(1) Lines

(2) ADSL

(3) Line Endpoints

(4) Go to shell prompt

(r) Return to the main menu.

(x) Exit BPT.

Selection: [1/2/3/4/r/x:1] 3

=====

Line Endpoints Sub-Menu:

=====

(1) Line Endpoints

(2) Export queryLineEndpoints Output

(b) Back to the previous menu

(r) Return to the main menu

(x) Exit BPT.

Selection: [1/2/b/r/x:1] 1

The following files are listed in the output directory:

test.xml

Please enter the file name (or press 'Enter' to go to the previous menu):

***For Log file management:***

=====

Main Menu:

=====

(1) Execute Batch File

- (2) Display Output
- (3) Display Logs
- (4) Delete Output or Log Files
- (h) Help
- (x) Exit

Selection: [1/2/3/4/h/x:1] 3

=====

Display Log File Menu:

=====

- (1) Lines
  - (2) ADSL
  - (3) Line Endpoints
  - (4) Go to shell prompt
  - (r) Return to the main menu.
  - (x) Exit BPT.

Selection: [1/2/3/4/r/x:1] 3

***For deleting output or log files:***

=====

Main Menu:

=====

- (1) Execute Batch File
  - (2) Display Output
  - (3) Display Logs
  - (4) Delete Output or Log Files
  - (h) Help

(x) Exit

Selection: [1/2/3/4/h/x:1] 4

=====

Delete Files Menu:

=====

Coming from this menu: del

(1) Lines

(2) ADSL

(3) Line Endpoints

(4) Go to shell prompt

(r) Return to the main menu.

(x) Exit BPT.

Selection: [1/2/3/4/r/x:1] 3

Going to show Line EP Sub-menu

The input parm is dollar 1: del

=====

Line Endpoints Sub-Menu:

=====

(1) Line Endpoints

(2) Export queryLineEndpoints Output

(b) Back to the previous menu

(r) Return to the main menu

(x) Exit BPT.

Selection: [1/2/b/r/x:1]

## 2.10 Command interface changes

Not applicable.

## 2.11 Security

Authorization is supported based on the user privileges similar to other Nodes-related operations. All the end-point pre-provisioning XML commands are allowed to be performed *only if the logged-in user is successfully authorized for that particular operation*. Each operation requires a level of authorization and the user has to belong to a specific group that has the required access rights or to a higher group in the hierarchy of the defined groups.

Here is the mapping of each of the XML command to the required permissions:

addLineEndpoint=nortel.mgc.iprov

delLineEndpoint=nortel.mgc.iprov

qryLineEndpoint=nortel.mgc.ro

All the successful authorization attempts will be logged to the audit log located in the /var/log directory on the SESM server.

All the authorization failures will be logged to the security log located in the /var/log directory on the SESM server.

### 2.11.1 Network configuration

Not applicable.

### 2.11.2 Key management

Not applicable.

### 2.11.3 Protocol

Not applicable.

### 2.11.4 Authentication

Not impacted. Same authentication to login to the SESM GUI is applicable.

## 2.12 Configuration Walkthrough

The general order of provisioning is as follows:

- Provision table SITE in the CS2K core. SITE values for third party gateways should be restricted for use for this type of gateway.
- Provision table PADDATA in CS2K core (PKLNL and PKNIL entries).
- Provision the third party gateway in SESM (auto-creates the LGRPINV entry).

- Configure the gateway at its EM, if needed.
- Pre-provision the GW end-points from OSSGATE (auto-creates the LNINV entry)
- Execute the SERVORD+ commands via the OSSGate (the service is assigned to the LENS in LNINV).

## ***Product = CS 2000 Management Tools***

### **A00007242--SESM support for SPC topology**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

IAW, IAC, CHS

#### **1.2 Description**

In SN08, a new succession component, the SPC (Session Policy Controller) is being introduced. Its purpose is to provide the capability to apply policies during call-processing, e.g. policy-based codec selection, connection admission control etc. In general the policy may be implemented on the SPC itself, or (in the future) the SPC may communicate with other devices, such as intelligent middleboxes, in order to apply the policy.

In SN08, the SPC will support exactly one policy, that of Network Resource Reservation, using Virtual Connection Admission Control (VCAC) as the enforcement mechanism. Hence counting of available resource across Limited Bandwidth Links (LBLs) and connection admission decisions will be carried out on the SPC, instead of being done on the GWCs as in SN07 (SN07 feature A00002512). The SN08 GWCs communicate with the SPC to determine whether a call can be set-up. This will allow LBLs to be shared across different GWCs.

The SPC will reside on the NGSS platform. In SN08, the SPC encompasses a Topology Server application. In order to carry out VCAC, middlebox/zone topology information must be provisioned both into the SESM and into the SPC's Topology Server. The network configuration is shown in figure 1.

The SPC (Topology Server) will not communicate directly with the SESM. In addition there is no Succession flow-through provisioning interface to both systems. Hence the user (i.e. OSS/GUI user) is responsible for provisioning identical NAT and LBL topology information into both the SESM and the

SPC. If identical information is not input into the two systems, VCAC may not work correctly.

For the GUI interface, the user should provision the information first into SESM and then into the SPC. It is important that the information is provisioned in the same order into each system. In particular, adding/deleting NATs & LBLs should be carried out identically in both systems. For example this could be achieved by adding an LBL to SESM and then to SPC, followed by adding the next LBL to SESM and then the SPC etc.

Hence in SN08, feature ACTID A00007242 covers the modifications required in SESM to integrate with the SPC and to provide provisioning for GWCs which support external counting. The resulting functional changes/additions are described in this document.

- Related activities are:
- ACTID A00007398\_SPC\_Topology\_Manager
- GWC modifications for provisioning for external counting

**Figure 1 SN08 Network Configuration with SPC**

The user operations provided by this feature which affect the GUI client are:

- Provide new GUI to set/change SPC parameters:

- SPC name
- SPC IP address

If there is only one supported protocol type and version in SN08 then these will be selected by default and the selections disabled.

- Provide new GUI to set Network VCAC on/off. If Network VCAC is set to 'on' (this requires an SPC to be provisioned), a warning message is provided indicating that:
  - VCAC counting will now be done on the SPC
  - all GWCs and XA-core should be at version SN08 (or above)
  - Reversion to internal counting ('Basic VCAC') is provided on a best effort basis
- Modifications to the existing GWCEM GUI as follows:
  - NAT and LBL panels will be situated on a new 'Network Zones' tab
  - It will be possible to provision (add/change/delete) a Network Zone which contains a NAT and an LBL. These Zones will be displayed on a new composite 'NAT & LBL' panel on the new 'Network Zones' tab
  - VCAC counting will now be done on the SPC
  - all GWCs and XA-core should be at version SN08 (or above)
  - Reversion to internal counting ('Basic VCAC') is provided on a best effort basis

**Figure 2 GUI Client and OSSGate interfaces**

### 1.3 Hardware Requirements or Dependencies

No new hardware is required or introduced by this feature. The application components provided by this feature execute as part of the SESM.

### 1.4 Software Requirements or Dependencies

Dependencies:

- CR.xxx: Extend Gateway Controller to support SPC provisioning and Network VCAC

### 1.5 Limitations and restrictions

- No MCS in SN08, but will be required in future releases
- Only one SPC per CS2k in SN08, but may be more in future releases
- VCAC will be supported with SPC and without SPC.
- There will be no provisioning connection between SPC and SESM in SN08. All topology information must be provisioned first into SESM and then into the SPC.
- Topology data transfer from SESM to SPC when SPC is commissioned will be done manually using existing SESM GUI/OSS interfaces and minor interface enhancements to support bulk query of topology data. Automatic bulk data transfer from SESM to SPC will NOT be provided.
- SESM will not provide an 'undo' capability to the GUI/OSS user.
- In order to facilitate the flow-through provisioning function carried out by the OSS, each SPC command must map to the same SESM command.
- Centralized authentication of passwords is not provided by base platform.
- SPC will not co-reside with any other NGSS based application.
- Bandwidth on-demand requests are incompatible with VCAC solution.
- Upgrade to SN08 should be carried out as described in and limitations on operation of VCAC during upgrade as described there will apply.
- Once Network VCAC is switched on, the SESM will remove any topology provisioning constraint checks which apply to Basic VCAC (internal counting). If Network VCAC is subsequently switched off, the internal counting checks will NOT be restored. It is not recommend to switch Network VCAC off once it has been switched on. Also, if it is switched off, Basic VCAC will only work correctly if the topology still meets the Basic VCAC/'internal counting' topology constraints. In normal use it is expected that Network VCAC will be switched on as soon as the upgrade and soak process is complete and SPC commissioned and will not be switched off.

## 1.6 Interactions

The following existing GUIs have been modified:

- Network Devices Panel
- Network Devices Panel, NATs tab.
- Network Devices Panel, LBLs tab.
- Add/change/delete NAT Dialogs
- Add/change/delete LBL dialogs
- change adjacent MB dialogs
- change root mb dialogs

The following GUIs have been added:

- SPC provisioning network panel.
- Add/change/delete SPC dialogs
- Network Zone tabbed Panel
- Composite NAT/LBL zone tabbed Panel
- Add/change/delete composite NAT/LBL zone dialogs

The following XML commands have been added:

- Add/change/delete/query Network Zone

The on-line help facility will be updated with information on the use, syntax and valid values for all the above modifications/additions.

## 1.8 SPC Provisioning (including Network VCAC)

The General Network Settings display and change dialog will be modified to include a new panel which will allow setting/change of the SPC provisioning information and Network VCAC flag. Note that for SN08, at most one SPC can be provisioned.

Provisioning constraints will be applied as per the GWCEM GUI guidelines, i.e. with disallowed input data resulting in a red outline to the input field and disabling of appropriate 'ok' buttons etc.

Note that in order to ensure optimum system operation is maintained during an upgrade, the upgrade of GWCs to SN08 should follow details specified in section xxxx.

### 1.8.1 Provision SPC information

The SPC information is displayed in the Gateway Controller Main Panel, as a tab in the 'Network Devices' area. This is shown in Figure 3

**Figure 3 SPC Tab**

### Add SPC

An SPC can be added via the 'Add' button and Add SPC dialog, Figure 4

**Figure 4 Add SPC Dialog**A screenshot of the 'Add SPC' dialog box. It has a title bar with a blue icon and the text 'Add SPC'. The dialog contains five input fields: 'Name' with the value 'SPC-1', 'IP Address' with the value '47.165.111.1', 'Port' with the value '2126', 'Protocol' with a dropdown menu showing 'DQOS+', and 'Protocol Version' with a dropdown menu showing '1.0'. At the bottom are 'OK' and 'Cancel' buttons.

Following information must be added:

- Name (FQDN characters only)
- IP address (a.b.c.d) where a, b, c, d are integers between 0 and 255.
- Port (1 to 65535), defaults to DQOS port 2126.
- Protocol version (selected from list, or fixed at value if only one available)
- Protocol type (selected from list, or fixed at value if only one available)

If invalid data is entered, the corresponding input field is outlined in red and the ok button is disabled, Figure 5

**Figure 5 Add SPC Dialog - invalid data**A screenshot of the 'Add SPC' dialog box, similar to Figure 4, but with the 'IP Address' field containing the invalid value '47.165.111.a'. The 'IP Address' field is outlined in red, and the 'OK' button is disabled (grayed out).

Tool tips describe the valid input data for each text field, e.g. as shown in Figure 6

**Figure 6 Add SPC dialog - example tool tip**

The image shows a Windows-style dialog box titled "Add SPC". It contains four input fields: "Name:", "Port:", "Protocol:", and "Protocol Version:". The "Name:" field is currently empty, and a yellow tooltip box is displayed over it with the text "Valid values: DNS styled character string". The "Port:" field contains the value "2126". The "Protocol:" field is a dropdown menu showing "DQOS+". The "Protocol Version:" field is a dropdown menu showing "1.0". At the bottom of the dialog are "OK" and "Cancel" buttons.

### Delete SPC

If an SPC is selected in the table then the 'delete' button is enabled. If delete is clicked then a confirmation message is displayed and if the user confirms the action, the SPC is deleted.

An error dialog is displayed and the delete is not performed if a policy is enabled for the SPC.

### Change SPC

If an SPC is selected in the table then the 'change' button is enabled. If change is clicked then a change dialog is displayed, Figure 7

**Figure 7 Change SPC Dialog**

The image shows a Windows-style dialog box titled "Change SPC". It contains five input fields: "Name:", "IP address:", "Port:", "Protocol:", and "Protocol Version:". The "Name:" field contains the value "dave.com". The "IP address:" field contains the value "9.1.1.1". The "Port:" field contains the value "2126". The "Protocol:" field is a dropdown menu showing "DQOS+". The "Protocol Version:" field is a dropdown menu showing "1.0". At the bottom of the dialog are "OK" and "Cancel" buttons.

The following fields can be changed:

- Name
- IP address
- Port
- Protocol type (only one protocol in SN08)
- Protocol version (only one protocol version in SN08)

If invalid data is entered, the corresponding input field is outlined in red and the ok button is disabled. Tool tips describe the valid input data

### **Set Network VCAC on/off**

The SN08 Gateway Controllers can operate in two VCAC modes: they can either attempt to count resource usage on the GWC itself (internal counting, Network VCAC 'off') or they can rely on the SPC to count resource usage and signal to the SPC for admission control during call set-up (Network VCAC 'on').

The current state of Network VCAC is shown on the SPC Panel. The user can set the Network VCAC on/off by using the Network VCAC change button on the SPC panel, see Figure 8, "Network VCAC field". A confirmation message is displayed stating

- VCAC counting will now be done on the SPC
- all GWCs and XA-core should be at version SN08
- If this is the first time Nw VCAC is set on, warning indicating that internal counting provisioning checks will no longer be supported.

**Figure 8 Network VCAC field**

The screenshot shows a configuration window titled "Network Devices". It has several tabs: "PEP Servers", "Media Proxies", "Network Zones", "QoS Collectors", "Location Recipient", and "Session Policy Controller". The "Network Zones" tab is selected. Below the tabs is a table with the following data:

| Name     | IP Address | Port | Protocol | Protocol Version |
|----------|------------|------|----------|------------------|
| dave.com | 9.1.1.1    | 2126 | DQOS+    | 1.0              |

Below the table, there is a large empty rectangular area. At the bottom of the window, there is a section labeled "Network VCAC: OFF". To the right of this label is a button labeled "Change...", which is circled in red. Further to the right are three buttons: "Add...", "Delete", and "Change...".

Note that after Network VCAC is set on for the first time, SESM will no longer carry out 'internal counting' related provisioning checks, regardless of whether Network VCAC is later switched off or not.

## 1.9 Network Zone provisioning

### 1.9.1 XML Interface

New XML interfaces are added are implemented by this feature for use in network installations where the SESM platform is required to operate in conjunction with an SPC. These interfaces align with the provisioning model used by the SPC for NAT and VCAC functionality and is described in terms of Network Zones and Zone characteristics.

The XML interfaces are identical to those supported by the SPC. In order to provision any entity, the information must first be provisioned into SESM and then, if successful, the same information must be provisioned into the SPC. The provisioning should be done first on SESM because SESM has more constraints to check (e.g. whether the Zone is currently associated with a Gateway) and hence is more likely to fail the provisioning request. The XML and XSD for these interfaces are specified in the SPC FN [Ref: <http://livelink-asiapac.us.nortel.com/asiapac/livelink.exe?func=ll&objId=1534787&objAction=browse&sort=name>] and will not be repeated here.

The SESM model only supports a subset of the information used by the SPC. The following general rules will be used:

- Add/change/delete commands: where a parameter is specific to the SPC and of no meaning to SESM, it will be ignored. Where a parameter is interpretable by SESM, its value will be validated

- queries: all relevant parameters for the specific query that are supported by SESM will be returned with valid data. No other parameters will be returned

The SN07 ITRANS VCAC interfaces for NAT and LBL provisioning are still available. However, when a SPC is deployed in the network configuration, the SPC consistent provisioning model is provided via use of the Zone provisioning interfaces and the SN07 ITRANS VCAC interfaces for NAT and LBL provisioning are not required. A mapping is available in table 3.

Note that, when adding a Network Zone, Resource Usage Factor and Max Count values are not required as long as Network VCAC is on (Details of Logical Network Link sent in XML messages 'addNetworkZone' and 'changeNetworkZone' are ignored by SESM. However if Network VCAC is 'off', resource usage factor and max count details ARE required and hence the XML command 'addLBL' should be used to add LBL Network Zones. However it is not recommend to switch Network VCAC off once it has been switched on. Also, if it is switched off, Basic VCAC will only work correctly if the topology still meets the Basic VCAC/'internal counting' topology constraints.

#### 1.9.1.1 Supported Interfaces For SPC Interworking

Add, Change and Delete Network Zone interfaces are implemented by SESM. In general, the Zone and the Zone parent can be referenced by either name or Zone ID, but not by both. For 'Add Network Zone', the Zone ID is optional and will be generated by SESM if not specified.

**Table 1 XML Interfaces Specific To SPC Topology Server Interworking For ITRANS**

| Interface         | SN07 VCAC ITRANS Equivalent | Description                                             |
|-------------------|-----------------------------|---------------------------------------------------------|
| addNetworkZone    | addNAT or addLBL            | Add either a NAT, LBL or Composite type network zone    |
| changeNetworkZone | changeNAT or changeLBL      | change either a NAT, LBL or Composite type network zone |
| deleteNetworkZone | deleteNAT or deleteLBL      | delete either a NAT, LBL or Composite type network zone |
| queryNetworkZone  | queryNAT plus queryLBL      | query on NAT, LBL and Composite data fill               |

##### 1.9.1.1.1 addNetworkZone Interface

This interface will add a new NAT, LBL or Composite type Network Zone. A composite Network Zone is one comprising the attributes of both a NAT and LBL type Network Zone.

The following parameters will be interpreted when adding a new Network Zone, with all other SPC specific parameters being ignored:

- <Name>NZ-Name</Name> - Unique name for the new Network Zone (NAT, LBL or Composite Name).
- <ID>1234</ID> - Unique ID for the Network Zone (NAT, LBL or Composite) to be created. If this is not specified, it is generated by SESM.
- <Parent> - Optional tag. Specified if Network Zone has a parent and contains tags ParentID or ParentName.
  - <ParentID>5678</ParentID> - ID of parent Network zone. Mutually exclusive with ParentName.
  - <ParentName>Parent-Name</ParentName> - Name of parent Network zone. Mutually exclusive with ParentID.
- </Parent>
- <Service>NAT</Service> - Optional. Identifies Network Zone as being a NAT or Composite type Network Zone. For a Composite Network Zone the LogicalNetworkLink tag should also be present.
- <LogicalNetworkLink> - Optional. Identifies the Network Zone as being an LBL or Composite Network zone. For a Composite Network Zone the Service tag should also be present.
  - ... Contents of LogicalNetworkLink are ignored but should be correctly populated.
- </LogicalNetworkLink>

At least one of the tags Service and LogicalNetworkLink must be present.

If both Service and LogicalNetworkLink tags are present, the Zone is a composite NAT & LBL zone.

All other input data is ignored by SESM.

#### **1.9.1.1.2 changeNetworkZone Interface**

This interface will modify either a NAT, LBL or Composite type Network Zone.

For the change command, the user will specify tags for the parameters that are to be changed. Unchanged parameters do not have to be specified. The Network Zone name and ID cannot be changed. All other parameters can be changed. SESM will ignore changes to parameters that it does not hold (e.g. bandwidth, link types etc.).

Interpreted parameter tags are as follows:

- <Name>NZ-Name</Name> - Network Zone Name

\*\* or \*\*

- <ID>1234</ID> - Network Zone ID
- <Parent> - Optional tag identifying a new Parent Network Zone. Contains either ParentName or ParentID tags but not both.
  - <ParentID>5678</ParentID> - new parent ID. Set to 0 if no parent required. Mutually exclusive with ParentName.
  - <ParentName>New-Parent-Name</ParentName> - new parent Network Zone name. Mutually exclusive with ParentID.
- </Parent>
- <LogicalNetworkLink> - optional. If present the Network Zone type is checked to ensure it is not a NAT as the presence of this tag implies a change of Network Zone type which is not supported.
  - ... contents of LogicalNetworkLink are ignored
- </LogicalNetworkLink>

#### 1.9.1.1.3 deleteNetworkZone Interface

This interface will delete either a NAT, LBL or Composite type Network Zone.

Interpreted parameter tags are as follows:

- <Name>NZ-Name</Name> - Name of Network Zone to be deleted.

\*\* OR \*\*

- <ID>1234</ID> - ID of the Network Zone to be deleted.

#### 1.9.1.1.4 queryNetworkZone Interface

This interface will perform a selective query on the provisioned NAT, LBL and Composite type network zones. Based on the population of the request it is possible to retrieve a single network zone name or all network zones names. The network zone IDs may also be optionally retrieved. This command differs from the SN07 queryNAT and queryLBL interfaces in that the returned data is a combination of the provisioned NATs and LBLs. It is not possible to selectively retrieve those network zones of a particular service type.

In general, since SESM holds a subset of the topology information held by SPC (i.e. it has no link information), the user should carry out queries on SPC. SESM will support both individual and bulk queries, however it is expected that only the bulk queries will be used. Bulk queries will be needed e.g. to audit the SESM-SPC data consistency. The result of the bulk query will be sorted by ID.

Interpreted input parameter tags are as follows:

Name or ID - Optional parameter indicating we wish to query a specific Network Zone. If not specified it is assumed that all Network Zones should be queried.

- `<Name>Bob</Name>` - requests retrieval of “Bob” Network Zone OR
- `<ID>1234</ID>` - requests retrieval of Network Zone with ID 1234.

Filtering parameters to limit the number of zones returned. These are optionally present but only for bulk zone queries (i.e. when no name or id is specified)

- `<IDMax>12000</IDMax>` - maximum Network Zone ID
- `<IDMin>11001</IDMin>` - minimum Network Zone ID
- `<MaxZones>1234</MaxZones>` - maximum number of Zones to be returned. If more Zones exist than the maximum specified, this will be indicated via an error code.

Returned parameter tags are as follows:

- `<ID>1234</ID>` - Unique ID for a Network Zone.
- `<Name>NZ-Name</Name>` - Unique Network Zone name.
- `<ParentID>5678</ParentID>` - ID of parent Network Zone. Where there is no parent this will be set to 0.

Additionally for query of individual Network Zone, the following information is also returned:

- `<Service>NAT</Service>` - Service type indicating if this Network Zone is a NAT. If the zone is has no services, no service tag is returned.
- `<LogicalNetworkLink>` - returned only if the Network Zone type is LBL or Composite. This will contain LayerInfo, Layer and LinkLayerInfo tags, with the LinkLayerInfo tag assigned a dummy value of “UNKNOWN” as SESM has no knowledge of Network Zone parameter values.

### 1.9.1.2 Unsupported Interfaces

The SESM platform only supports a subset of the SPC Topology server VCAC ITRANS interfaces. In SN08, add/change/delete/query LinkLayer type are not supported by SESM. However, to aid simple XML command replication by the OSS, these will be a dummy commands in SESM & will always return an error code 306 and text 'SPC Interface Unsupported By Platform'. (The alternative is for SESM not to support this, however this means a single XSD cannot be published and requires OSS to understand which commands go only to the SPC.)

Unsupported interfaces are described in the following table:

**Table 2 SPC Topology Server ITRANS Interfaces Unsupported By SESM**

| Interface           | Description                   |
|---------------------|-------------------------------|
| addLinkLayerType    | add a new link layer          |
| changeLinkLayerType | change an existing link layer |
| deleteLinkLayerType | delete a link layer           |
| queryLinkLayerType  | query provisioned link layers |

### 1.9.1.3 NAT/LBL provisioning interfaces

The SN07 ITRANS VCAC interfaces for NAT and LBL provisioning are still available. When a SPC is deployed in the network configuration, a consistent provisioning model is provided via use of the Zone provisioning interfaces.

However the SN07 interfaces remain valid ITRANS VCAC interfaces for NAT and LBL provisioning (table 3) and should be used when the SPC is not present in the network configuration.

**Table 3 SN07 SESM ITRANS VCAC Interfaces.**

| Interface             | Description                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| addNAT                | Add NAT - use addNetworkZone.                                                                                                                                                                                     |
| changeNAT             | Change NAT - use changeNetworkZone                                                                                                                                                                                |
| deleteNAT             | Delete NAT - use deleteNetworkZone                                                                                                                                                                                |
| queryNAT              | Query NAT - use queryNetworkZone. See Note following table.                                                                                                                                                       |
| addLBL                | Add LBL - replaced by addNetworkZone. Resource usage and counter functionality is set to default values.                                                                                                          |
| changeLBL             | ChangeLBL - replaced by changeNetworkZone. Resource usage and counter functionality is set to default values.                                                                                                     |
| deleteLBL             | Delete LBL - replaced by queryNetworkZone.                                                                                                                                                                        |
| queryLBL              | Query LBL - use QueryNetworkZone Interface (safe but deprecated)                                                                                                                                                  |
| changeRootMiddleBoxes | Change Root Middle Boxes - use changeNetworkZone interface                                                                                                                                                        |
| changeAssocMB         | Change associated middlebox - use changeNetworkZone interface                                                                                                                                                     |
| addRU                 | Add Resource Usage. SESM has no concept of resource usage where SPC Topology server is present. Internally default settings will be used for modelling purposes, and attempting manipulation would make no sense. |
| changeRU              | Change Resource Usage.                                                                                                                                                                                            |
| deleteRU              | Delete Resource Usage                                                                                                                                                                                             |

**Table 3 SN07 SESM ITRANS VCAC Interfaces.**

| Interface | Description          |
|-----------|----------------------|
| queryRU   | Query Resource Usage |

*Note:* Interface remains used by CICM Element Manager.

## 1.9.2 Error codes

Each error code will have a descriptive text string associated with it. It is not possible to guarantee that the same error will result in the same error code being returned by SPC and SESM. However the sequential provisioning required (first into SESM and then into SPC) means that typically the OSS will get an error code back from one machine only - since if the SESM command fails, it will not continue to do the provisioning into SPC.

### 1.9.2.1 Examples Of XML Interface Usage

#### 1.9.2.1.1 Add NAT using addNetworkZone (Request)

```

<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <addNetworkZone usn="1" version="1.0"/>
      <Parameters>
        <ID>1001</ID>
        <Name>My_NAT</Name>
        <Service>NAT</Service>
        <Parent>
          <ParentID>1000</ParentID>
        </Parent>
        ...
      </Parameters>
    </addNetworkZone>
  </Methods>
</Command>

```

Parent if we have a parent  
Named parent by ID

SPC Parameters, not shown, no logical network link is present

### 1.9.2.1.2 Add LBL using addNetworkZone (Request)

```

<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <addNetworkZone usn="1" version="1.0">
        </Parameters>
        <Name>My_LBL</Name>
        <Parent>
          <ParentName>MyParent</Parent>
        </Parent>
        <LogicalNetworkLink>
          <BandwidthInfo>
            <Symmetry>true</Symmetry>
            <UpBWInfo>
              <BWCIR>1000</BWCIR>
              ... SPC specific parameters
            </UpBWInfo>
            <DownBWInfo>
              <BWCIR>1000</BWCIR>
              ... SPC specific parameters
            </DownBWInfo>
          </BandwidthInfo>
          ...SPC specific parameters
        </LogicalNetworkLink>
        ... SPC specific parameters
      </Parameters>
    </addNetworkZone>

#### 1.9.2.1.4 Change Network Zone (LBL or NAT) (Request)

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <changeNetworkZone usn="1" version="1.0">
        <Parameters>
          <Name>My_Zone</Name>
          <Parent>
            <ParentName>New-Parent</ParentName>
          </Parent>
          ...
        </Parameters>
      </changeNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

Change parent using name

SPC specific parameters not shown

#### 1.9.2.1.5 Delete Network Zone (LBL or NAT) (Request)

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <deleteNetworkZone usn="1" version="1.0">
        <Parameters>
          <Name>My_Zone</Name>
        </Parameters>
      </deleteNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

Target Network Zone using Name

### 1.9.2.1.6 Query Network Zone (All) (Request)

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNetworkZone usn="1" version="1.0">
        <Parameters>
        </Parameters>
      </queryNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

### 1.9.2.1.7 Query Network Zone (Range Min ID Max ID) (Request)

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNetworkZone usn="1" version="1.0">
        <Parameters>
          <IDMin>500</IDMin>
          <IDMax>900</IDMax>
        </Parameters>
      </queryNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

### 1.9.2.1.8 Query Network Zone (Range Min ID MaxZones) (Request)

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNetworkZone usn="1" version="1.0">
        <Parameters>
          <IDMin>500</IDMin>
          <MaxZones>200</MaxZones>
        </Parameters>
      </queryNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

### 1.9.2.1.9 Query Network Zone (Individual ID Based) (Request)

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNetworkZone usn="1" version="1.0">
        <Parameters>
          <ID>101</ID>
        </Parameters>
      </queryNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

### 1.9.2.1.10 Query Network Zone (Individual Name Based) (Request)

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNetworkZone usn="1" version="1.0">
        <Parameters>
          <Name>Peter67</Name>
        </Parameters>
      </queryNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

### 1.9.2.1.11 Query Network Zone (All / Range) (Response)

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>

          </NetworkZone>
          <NetworkZone>
            <ID>65540</ID>
            <Name>lbl1</Name>
            <ParentID>0</ParentID>
          </NetworkZone>
          <NetworkZone>
            <ID>65541</ID>
            <Name>comp1</Name>
            <ParentID>0</ParentID>
          </NetworkZone>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNetworkZone>
    </Methods>
  </Response>
</CommandList>
```

### 1.9.2.1.12 Query Network Zone (Individual) (Response)

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNetworkZone usn="1" version="1.0">
        <ReturnData>
          <ID>65541</ID>
          <Name>comp1</Name>
          <Service>NAT</Service>
          <Parent>
            <ParentID>0</ParentID>
          </Parent>
          <LogicalNetworkLink>
            <LayerInfo>
              <Layer>
                <LinkLayerType>UNKNOWN</LinkLayerType>
              </Layer>
            </LayerInfo>
          </LogicalNetworkLink>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNetworkZone>
    </Methods>
  </Response>
</CommandList>
```

## 1.9.3 GUI Client

The GUI client for internet transparency NAT and VCAC entity provisioning will be available for network deployments where the SPC is present and for deployments where the SPC is not present. Hence the GUI must effectively support both the SN07 and SN08 models. Hence the GUI will not be changed significantly from the SN08. The changes are as follows:

### 1.9.3.1 Network Zone Display

There will be a new panel on the Network Devices tabbed panel, this will be a tabbed panel with tab 'Network Zones'.

The NAT and LBL provisioning panels will be moved from the Network devices tabbed panel the Network Zones tabbed panel. In addition, there will be a new provisioning panel for provisioning composite NAT/LBL Network Zones (this functionality to be confirmed), see Figure 9

**Figure 9 Network Zones tabbed panel**

Network Devices \_\_\_\_\_

PEP Servers | Media Proxies | **Network Zones** | QoS Collectors | Location Recipient | Session Policy

NAT Zone | LBL Zone | NAT&LBL Zone

| Name    | NAT Type       |            |
|---------|----------------|------------|
| Fred.1  | Non-Controlled | <none> (To |
| MFNAT.1 | Non-Controlled | <none> (To |
| MFNAT.2 | Non-Controlled | <none> (To |
| MFNAT.3 | Non-Controlled | <none> (To |
| MFNAT.4 | Non-Controlled | <none> (To |
| MFNAT.5 | Non-Controlled | <none> (To |
| MFNAT.6 | Non-Controlled | MFLBL.4    |

Add... Delete

### 1.9.3.2 Add/Change/Delete Zone

In the add/change/delete NAT & LBL dialogs and for add/change NAT/LBL associated to gateway, the word 'Middlebox' will generally be replaced with either 'Zone' or 'Network Zone', for example as in Figure 10.

**Figure 10 Add NAT Zone**

**Add IP-VPN (NAT Zone)**

Name: \_\_\_\_\_

☐ Shared Zone

NAT Type: Non-Controlled

Parent Zone Selection (create hierarchy)

☒ ALL ☐ IP-VPNs ☐ LBLs

Parent Zone: <none>

OK Cancel

### 1.9.3.3 LBL provisioning

When the SPC is present, the user does not need to provision the RU Profile Name and Max Count Value when provisioning an LBL. Hence, when the Network VCAC flag is switched 'on', fields to provision and change RU

Profile and Max count information will be hidden. Internally, the RU Profile will be set to a system provisioned RU Profile created on system initialisation, SPC\_DEFAULT and the Max count set to 0 (tbc). Fields which display this information in the LBL zone table will also be hidden. If the Network VCAC flag is switched off, the RU Profile and max count information is displayed again.

Similarly, the RU provisioning panel will be hidden/displayed when the Network VCAC flag is switched on/off.

#### 1.9.3.4 Composite NAT & LBL provisioning (this work item tbc)

Similar dialogs will be supported for add/change/delete composite NAT/LBL zone as for NAT zones. This option is only available when the SPC is used and RU Profile and max count information is not required. Hence similar dialogs/display will be supported for add/change/delete/display composite NAT/LBL zone as for NAT zones. Note that in this case, NO profile or max count information is sent to the GWC and, for internal counting, the zone is treated as a NAT zone.

### 1.10 XML Interfaces Supported By SPC

The SPC platform only supports a subset of the ITRANS XML interfaces. No attempt should be made to direct unsupported XML interface operations against the SPC.

The set of supported XML interfaces at the SPC are as follows. All other interfaces should be considered as supported only by SESM.

**Table 4 ITRANS XML Interfaces Supported By The SPC Platform**

| Interface Name      |
|---------------------|
| addNetworkZone      |
| changeNetworkZone   |
| deleteNetworkZone   |
| queryNetworkZone    |
| addLinkLayerType    |
| changeLinkLayerType |
| deleteLinkLayerType |
| queryLinkLayerType  |

## 1.11 Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or 'Authorization' levels for commands. Each command is associated with one or more user groups. In order to execute a command, a user must belong to at least one of the associated user groups. The user groups associated with the new /modified commands associated with this feature are specified in the table below.

**Table 5 Internet Transparency Commands Authorization**

| Command                 | User Group |       |        |          |       |
|-------------------------|------------|-------|--------|----------|-------|
|                         | mgcadm     | mgcrw | mgcmic | mgcsprov | mgcro |
| add SPC                 | X          |       |        |          |       |
| delete SPC              | X          |       |        |          |       |
| change SPC              | X          |       |        |          |       |
| display SPCs            | X          | X     | X      | X        | X     |
| set Network VCAC        | X          |       |        |          |       |
| add Network Zone        | X          | X     |        |          |       |
| delete Network Zone     | X          | X     |        |          |       |
| change Network Zone     | X          | X     |        |          |       |
| query Network Zone      | X          | X     | X      | X        | X     |
| query all Network Zones | X          | X     | X      | X        | X     |

## 1.12 Upgrade

In order to ensure optimum system operation is maintained during an upgrade, the upgrade of GWCs to SN08 should follow details specified in the FN for feature A00007394

## 1.13 Glossary

| Term  | Description                        |
|-------|------------------------------------|
| CS2K  | Communication Server 2000          |
| GUI   | Graphical User Interface           |
| GWC   | Gateway Controller                 |
| GWCEM | Gateway Controller Element Manager |

| Term | Description                                |
|------|--------------------------------------------|
| ID   | Identifier                                 |
| IEMS | Integrated Element Manager System          |
| LBL  | Limited Bandwidth Link                     |
| ME   | Media Endpoint                             |
| NAT  | Network Address Translation                |

| OSS  | Operations Support System                  |
| SESM | Succession Element and Sub-element Manager |
| SPC  | Session Policy Controller                  |
| VCAC | Virtual Connection Admission Control       |
| VPN  | Virtual Private Network                    |
| XML  | Extensible Markup Language                 |

## 1.14 Appendix A: Error codes and messages

**Table 6 Return codes when command is unsuccessful**

| Error meaning                                                                                                  | Return code | Example return messages                                |
|----------------------------------------------------------------------------------------------------------------|-------------|--------------------------------------------------------|
| Platform applications internal error: OSS Interface applications cannot connect to required server application | 302         | Interfacing error                                      |
| Unable to provision requested data because a database error occurred                                           | 303         | Database error occurred during setting of Network Zone |
| Unable to provision requested data because of problem with the GWCEM component of the CS2k Mgr.                | 304         | Element Manager Initialisation in progress             |
| No data for this query meets selection criteria or the filtering criteria specified do not exist               | 305         | No Network Zones found                                 |

| Error meaning                                                                           | Return code | Example return messages                            |
|-----------------------------------------------------------------------------------------|-------------|----------------------------------------------------|
| Interface is valid based on ITrans XSD schema but is unsupported by SESM (SPC specific) | 306         | SPC Interface<br>Unsupported By Platform           |
| User is not a member of any of the user groups allowed to perform this action           | 501         | Insufficient permissions to perform this operation |

### 1.14.1 Example Error Message

```

<?xml version='1.0'?>
  <CommandList>
    <Response>
      <Interface>ITransIf</Interface>
      <Methods>
        <queryNAT usn="1.0" version="1.0">
          <ReturnData>
            <NATname>nat1111</NATname>
            <ReturnCode value= "305" text="NAT not found"/>
          </ReturnData>
        </queryNAT usn="1.0">
      </Methods>
    </Response>
  </CommandList>

```

## 1.15 Appendix B: XML Commands: description of method parameters

### 1.15.1 Parameter definitions

Only those parameters that are read / returned by the VCAC ITrans interface are described.

- **encoding** - UTF-8.
- **version** - The version refers to the version of the method or operation - e.g., the addNAT operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parms X, Y, and Z. TYPE *decimal*.
- **usn** - Unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.
- **Name** - Unique Network Zone name.
- **ID** - Unique Network Zone ID.

- **ParentName** - Name of parent Network Zone.
- **ParentID** - ID of parent Network Zone.
- **Service** - Network Zone service type. Only supported value is “NAT”.
- **Symmetry** - LogicalNetworkLink - BandwidthInfo symmetry field. Boolean value but setting ignored by SESM but has meaning to SPC.
- **BWCIR** - LogicalNetworkLink - BandwidthInfo - UpBWInfo / DownBWInfo BWCIR setting. Value is ignored by SESM but has meaning to SPC.
- **LinkLayerInfo** - LogicalNetworkLink - LayerInfo - Layer - LinkLayerType field. Value is ignored by SESM being SPC specific.
- **IDMin** - Minimum Network Zone ID for a query.
- **IDMax** - Maximum Network Zone ID for a query.
- **MaxZones** - Maximum number of Network Zones for a query.
- **ReturnCode value**- A numeric value indicating the result of the attempted operation (see Table 3, for range and definitions of each possible value). TYPE *string*.
- **Return code text**- Appropriate text that describes the result of the operation. TYPE *string*.

### 1.15.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **addNetworkZone** - Method that adds a new Network Zone. This method has the following parameters:
  - Input data:
    - usn
    - version
    - Name
    - ID (optional internally generated if not specified)
    - ParentName (optional and mutually exclusive with ParentID)
    - ParentID (optional and mutually exclusive with ParentName)
    - Service (optional only if NAT / Composite Network Zone required)
    - Symmetry (optional only if LBL / Composite Network Zone required)
    - BWCIR (optional only if LBL / Composite Network Zone required).
  - Output data:
    - usn (value should be the same as the input)

- version (value should be the same as the input)
  - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
2. **changeNetworkZone** - Method that modifies a parent Network Zone. This method has the following parameters:
- Input data:
    - usn
    - version
    - Name (Mutually exclusive with ID parameter)
    - ID (Mutually exclusive with Name parameter)
    - ParentName (optional and mutually exclusive with ParentID)
    - ParentID (optional and mutually exclusive with ParentName)
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
3. **deleteNetworkZone** - Method that deletes a Network Zone. This method has the following parameters:
- Input data:
    - usn
    - version
    - Name (Mutually exclusive with ID parameter)
    - ID (Mutually exclusive with Name parameter)
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
4. **queryNetworkZone** - Method that queries the Network Zones provisioned on the SESM platform. This method has the following parameters:
- Input data:

- usn
- version
- Name (optional and mutually exclusive with ID. Presence restricts query to a single Network Zone)
- ID (optional and mutually exclusive with Name. Presence restricts query to a single Network Zone)
- IDMin (Optional. Not valid if query targets a specific Network Zone).
- IDMax (Optional. Not valid if query targets a specific Network Zone).
- MaxZones (Optional. Not valid if query targets a specific Network Zone).
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ID
  - Name
  - ParentID
  - Service - where individual Network Zone is targeted and type is NAT or Composite. Value is set to “NAT”
  - LinkLayerType - where individual Network Zone is targeted and type is LBL or Composite. Value is set to “UNKNOWN”
  - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

## ***Product = CS 2000 Management Tools***

### **A00007300--Enable by default IPSec on All GWC Profiles**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP, PT-IP, CHS, PT-AAL2

#### **1.2 Description**

This SN08 activity enables IPSec on all GWC profiles that do not currently have the IPSec capability. As a result of enabling IPSec on all remaining GWC

profiles, the IPSec provisioning tab will now be available in the CS2000 Management Tools GUI for all GWC profiles.

### 1.3 Hardware Requirements or Dependencies

## *Product = CS 2000 Management Tools*

## **A00007564--SAM21 EM support for new hardware MCPN905** *Functional Description*

### 1.1 Applicable Solution(s)

UA-IP, PT-AAL2

### 1.2 Description

#### 1.2.1 Feature Overview

This feature introduces two new components:

- Enable Supporting MCPN 905 card in SAM21 EM
- Enable provisioning of GWC and USPc service types on MCPN 905 card

#### 1.2.2 Feature Functionality

MCPN 905 card currently support three functions, GWC and USPc, which are already supported by SAM21 EM. Their provisioning requirements for MCPN905 card are same as those for other cards. So the existing codes for all

services are reused here, including provisioning panel, bootp entries, database storage, etc. However, to support a new card type, you must modify the hardware and memory requirements definition for the applications.

### 1.2.2.1 MCPN 905 card insertion support

When a MCPN 905 card insert into SAM21 shelf, the SAM21 EM will get the insertion trap, and show the card on the EM GUI. When opening the card view panel about this card, the card name will be displayed on the “Equip” panel.

### 1.2.2.2 MCPN 905 card service support

MCPN 905 card supports two type services, GWC and USPc. SAM21 EM should determine the services that can be assigned to the card according to the memory size. Below table shows the relation between the memory size and the service type.

**Table 7 Memory requirements to enable GWC or USP service on MCPN 905 card**

| Memory on MCPN 905 Card | Is GWC Service Allowed (Yes/No) | Is USPc Service Allowed (Yes/No) |
|-------------------------|---------------------------------|----------------------------------|
| 512M                    | Yes                             | Yes                              |
| 1.5G                    | Yes                             | No                               |

### 1.3 Hardware Requirements or Dependencies

This feature will support a new card model, MCPN 905, which supports USPC and GWC services.

### 1.4 Software Requirements or Dependencies

No new customer software or firmware dependencies are introduced in this feature.

### 1.5 Limitations and restrictions

No limitations or restrictions that is visible to any user are planned as part of this feature.

### 1.6 Interactions

- MCPN905 support in Shelf Controller DID A00007423
- MCPN905 support in Shelf Controller DSUM A00007423
- support MCPN905 card in SAM21EM DID A00007564

## *Product = CS 2000 Management Tools*

## **A00007927--SAM21 Enhancements from Bell Canada**

### *Functional Description*

#### 1.1 Applicable Solution(s)

UA-IP

#### 1.2 Description

In SN07 and earlier, there is “Administrative State” in both SAM21 EM and GWC EM GUI. In SAM21 EM the “Administrative State” indicates the H/W state of a card, while in GWC EM it indicates the state of the application running on the card. However, if a user doesn’t understand what it means, he/she may feel confused.

In SN07 and earlier, when a NSS card (no matter it’s Unlocked/Enabled or Locked/Disabled) is pulled out and then inserted, it will come back in a Locked/Disabled state. The user needs to manually unlock it to bring it into service.

This document outlines the design scope and requirements of this feature that:

- Changes the label of “Administrative” to “Card Status” in every card view on SAM21 EM GUI (refer to figure 1 and figure 2).
- Changes the behavior of EM on pulling/inserting NSS card. If a Locked/Disabled NSS card is pulled, when it is re-inserted, the card will come back in Locked/Disabled status. However, if an Unlocked/Enabled NSS card is pulled, when it is re-inserted, SAM21 EM will automatically unlock this card.

**Figure 11 Non-System Card View**

**Figure 12 Shelf Controller Card View**

### 1.3 Checking the State Tab of card views on the SAM21 EM GUI

Use the following procedure to see changes in the state tab of every card view on the SAM21 EM GUI.

At your workstation

1. Launch your web browser.
2. Launch the SAM21 EM GUI via the common launch page: <http://{SSPFS serve IP or hostname}>.
3. Click on the Shelf icon to open the Shelf View.

4. Right click on a card (e.g. a STORM) to bring up the Card View.
5. Click the States tab on the Card View.

In SN07 or earlier, you will see a display as below:

In SN08, you will see a display as below:

You have completed this procedure.

**A00008338--QCA Log/Alarm Consolidation**

## ***Functional Description***

### **1.1 Applicable Solution(s)**

IAC

### **1.2 Description**

This document covers the LOG/ALARM Consolidation for QoS Collector Application functionality supported in SN08 time frame.

It is the purpose of this activity is to remove the discrepancies in the existing Log report instances

It is intended that the logs generated by the QCA application running on the SESM fulfill certain requirements.

- Software: Each log name/number must have 1 consistent format
- Software: Set and Clear logs must be unique to enable event correlation (For example if the Set and Clear use Location and Notification-ID tags the same Location and Notification-ID pair cannot be duplicated until after the log is cleared)
- Software: all set logs with a severity need to have a clear logs with no severity. If the same log name/number is used for the clear must have the exact same format. (As per #1.). The clear log can have a different format it must be a different log name/number.
- Software: The sequence number in log headers which is a tracking mechanism of lost logs must increment by 1. Downstream applications such as SDM Log Delivery Service and IEMS track this number and flag any lost log events (which is a bug/deficiency) to northbound OSSs.
- Documentation: All QCA logs need to be documented in customers' NTPs. Specifically, OSS Guide and Succession Log Reference Manual.

This is accomplished by ensuring

- all instances of each log report number have the same consistent format.
- Assigning new Log report number to achieve 1>
- All Logs which have a severity of Critical/Major/Minor are required to have a corresponding Clear Log. All instances which had a severity but didn't have a detectable mechanism (from within QCA's scope) to generate a corresponding Clear Log have been changed to have a severity of None.

**Figure 1 QoS Reporting in a VoIP Network****1.2.1 QCA customer logs**

In addition to QCA Error IPDR Records the QCA raises alarms and events via the customer logging stream.

The QCA uses the logging API introduced by activity 89008996 “Log Reporting and Storage Mechanism for Managed Elements”.

Prior to this feature the QCA had 9 different Log report numbers (total instances = 62). After this feature it will have 11 different Log report numbers (total instances = 62)

All the QCA customer log instances have been listed in the table below.

The newly introduced logs and the modified log instances are in bold.

## 1.3 QCA Customer logs

## ***Product = CS 2000 TOPS***

### **A00007271--TOPS EOL for SN08**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP

#### **1.2 Description**

This feature addresses all activities needed to support the TOPS End Of Life (EOL) program through SN08, including the following:

- Disables the TOPS Position via the Enhanced TOPS Message Switch (ETMS) functionality.
- Disables the TOPS Operator Centralization (OC) via the ETMS functionality.
- Identifies usage of the OSSAIN Management Information System (MIS) in the TOPS EOL logs.
- Removes the tables, parms, and OM groups which are obsolete.

Upgrades to SN08 or higher will result in loss of functionality if proper conversions to replacement features are not performed prior to the upgrade.

#### **1.3 Hardware Requirements or Dependencies**

None.

#### **1.4 Software Requirements or Dependencies**

None.

#### **1.5 Limitations and restrictions**

A position using an ETMS for data connectivity to a host will not be able to RTS or login once the host is upgraded to SN08 or higher.

A remote using an ETMS for data connectivity to a host will not be able to send calls to that host once the host is upgraded to SN08 or higher.

A host using an ETMS for data connectivity to a remote will stop receiving calls from that remote once the remote is upgraded to SN08 or higher.

## 1.6 Interactions

Positions connected via ETMS must be replaced by IP positions prior to an upgrade to SN08 or higher.

TDM-OC links must be replaced by OC-IP links prior to an upgrade to SN08 or higher. **Any OCHOST or OCHOSTQ tuple which references a TDM-OC link will cause a TABXFR to halt if not replaced prior to such an upgrade.**

## 1.7 Glossary

| Term | Description                      |
|------|----------------------------------|
| EOL  | End Of Life                      |
| ETMS | Enhanced TOPS Message Switch     |
| IP   | Internet Protocol                |
| OC   | Operator Centralization          |
| MIS  | Management Information System    |
| TOPS | Traffic Operator Position System |

## 2: Fault Management for A00007271

### 2.1 Fault management strategy

Not applicable.

### 2.2 Fault management tools and utilities

Not applicable.

### 2.3 Logs

Log Title/Log ID: TEOL100

The TEOL100 log was added in CSP12 and patched back to CSP09. This feature merely adds a potential new line to the existing log.

#### 2.3.1 Format

If OSSAIN MIS is used during a week, a TEOL100 log will be generated at midnight the following Sunday with the “OSSAIN MIS” functionality listed (other functionalities may also be listed). For example:

```
TEOL100 mmmdd hh:mm:ss ssdd INFO TOPS End Of Life Notification
Use of functionality scheduled for removal:
  Functionality Used      Scheduled Removal
  -----
  OSSAIN MIS              SN10
```

### 2.3.2 Explanation

Description: A TEOL100 log identifies functionality no longer supported in an upcoming load. A log is generated only when a functionality is used while scheduled for removal within 3 releases. All such functionalities used in the previous week are listed in that week's TEOL100 log.

### 2.3.3 Field descriptions

**Table 1** Field descriptions

| Field              | Value      | Description                                                                              |
|--------------------|------------|------------------------------------------------------------------------------------------|
| Functionality Used | OSSAIN MIS | This field identifies the functionality that is scheduled for removal yet is being used. |
| Scheduled Removal  | SN10       | This field identifies the release in which the functionality is scheduled to be removed. |

### 2.3.4 Action

If there is a plan in place to transition off of the identified functionality prior to upgrading to the identified release (or beyond), then the notification logs can be ignored. If there is no such plan in place, then the next level of support should be contacted to initiate an appropriate transition plan.

### 2.3.5 Associated Operational Measurements or Performance Measurements

Unchanged.

### 2.3.6 Additional information

The log indicates only that the functionality was used one or more times in the previous week. It does not indicate when the functionality was used (i.e. the time of the log itself is not at all related to the time of usage), nor does it indicate the number of times it was used.

## 2.4 Alarms

Not Applicable.

## 2.5 Related documentation

A59036888 - TOPS EOL Succession Baseline

## 3: Configuration for A00007271

### 3.1 Hardware and Software Requirements

None.

### 3.2 Initial Configuration

Not applicable.

### 3.3 Office Parameters

The following office parameters have been deleted as of SN08:

- TOPS\_CROSS\_TEAM\_ROUTING (table OFCVAR)
- TOPS\_PASSWORD\_ENABLE (table OFCENG)

### 3.4 Upgrade Considerations

#### 3.4.1 Dump and Restore

This section documents the behavior of certain tables over an ONP from a pre-SN08 load to an SN08 load (or higher).

##### 3.4.1.0.1 Table TMSOCDL

All tuples datafilled in table TMSOCDL will be dropped.

##### 3.4.1.0.2 Table OCGRP

All tuples datafilled in table OCGRP as LAPD (indicating ETMS) will be dropped.

##### 3.4.1.0.3 Table VLMEM

All tuples datafilled in table VLMEM which reference a LAPD tuple in OCGRP will be dropped.

##### 3.4.1.0.4 Table OCHOST

*A tuple datafilled in table OCHOST which references a LAPD tuple in OCGRP will halt the table transfer.*

##### 3.4.1.0.5 Table OCHOSTQ

*All tuples datafilled in table OCHOSTQ which reference a LAPD tuple in OCGRP will halt the table transfer.*

##### 3.4.1.0.6 Table TQMSFCQA

*All tuples datafilled in table TQMSFCQA as SA (in the ASSTAREA field) will halt the table transfer.*

##### 3.4.1.0.7 Table TOPSPOS

All tuples datafilled in table TOPSPOS as TMS (indicating ETMS) will be dropped.

#### 3.4.1.0.8 Table PARSMBR

All tuples datafilled in table PARSMBR which reference a TMS tuple in TOPSPOS will be dropped.

### 3.4.2 Element Management Upgrade

Not applicable.

### 3.4.3 Downgrade impact

None.

## 3.5 Data Schema

### 3.5.1 New/modified tables

Table 1 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/OLD/UNCHANGED) |
|----------------|--------------------------|-----------------------------------|
| ARUIBMRT       | DELETED                  | N/A                               |
| DUAQOPT        | DELETED                  | N/A                               |
| DQMODEM        | DELETED                  | N/A                               |
| HOICDEV        | DELETED                  | N/A                               |
| OPRDAT         | DELETED                  | N/A                               |
| SAQSIZE        | DELETED                  | N/A                               |

| TMSOCDL        | CHANGED                  | UNCHANGED                         |
| TQOGTKEY       | CHANGED                  | UNCHANGED                         |

### 3.5.2 Table information

The following tables have been deleted as of SN08:

- ARUIBMRT

- DUAQOPT
- DQMODEM
- HOBICDEV

The following tables have been deleted as of SN08:

- OPRDAT
- SAQSIZE

#### **3.5.2.1 Name: TOPSPARM**

The following parms have been removed as of SN08, and cannot be re-added:

- LANG\_ERROR\_SCREEN\_DISPLAY
- ADAS\_ENABLE

The following parms have been removed as of SN08, and cannot be re-added:

- SA\_QUEUEING\_BY\_REQUEST\_AGE

#### **3.5.2.2 Name: VSNOPT**

The following parms have been removed as of SN08, and cannot be re-added:

- OPR\_0PLUS\_3RD\_DISPLAY
- OPR\_0PLUS\_COL\_DISPLAY
- OPR\_0PLUS\_3RDCON\_DISPLAY
- OPR\_0PLUS\_CLDCON\_DISPLAY

#### **3.5.2.3 Name: VROPT**

The following parms have been removed as of SN08, and cannot be re-added:

- DA\_BP\_HOTEL\_ROOM\_REQUIRED

The following parms have been removed as of SN08, and cannot be re-added:

- TOPSACD\_DASERV\_INSTANCE
- TOPSACD\_INTCserv\_INSTANCE

#### **3.5.2.4 Name: OCGRP**

All tuples with a DLSEL (within the DLOVRLAY field) of LAPD will be removed as of SN08, and cannot be re-added.

#### **3.5.2.5 Name: TOPSPOS**

All tuples with a DATATYPE (within the DATAPATH field) of TMS will be removed as of SN08, and cannot be re-added.

#### **3.5.2.6 Name: OCHOSTQ**

As of SN08, all tuples which have a REROUTESEL of Y will have VLTHROTL removed from their REASONS set (if it is present). If a REASONS set contains only VLTHROTL, then the REROUTESEL will be set

to N and the ALTHOST will be removed. VLTHROTL cannot be re-added to a REASONS set.

#### **3.5.2.7 Name: TQMSFCQA**

All tuples with an ASSTTYPE (within the ASSTAREA field) of SA cannot be added as of SN08.

#### **3.5.2.8 Name: TMSOCDL**

All tuples will be removed as of SN08, and cannot be re-added.

#### **3.5.2.9 Name: TQOGTKEY**

A tuple with a KEYTYPE (within the KEYINFO field) of ASST will be removed as of SN08, and cannot be re-added.

## 4.3 Performance Measurements (PM), Operational Measurements (OM), and stats

### 4.3.1 OM groups removed

The following TOPS OM groups have been removed as of SN08:

- DUAQ
- DUAQMOD

The following TOPS OM groups have been removed as of SN08:

- TOPSPSZ

### 4.3.2 OM group TOPSALT changed

The ALTVL register has been removed from the TOPSALT OM group as of SN08. The ALTDEF, ALTOFL, ALTDL, and ALTTOT registers are unchanged, although the ALTTOT register will now appear on the same line as the others.

Previously, a tuple was displayed within OM group TOPSALT if and only if the corresponding call queue was datafilled in table OCHOSTQ. As of SN08, a tuple is displayed within TOPSALT if and only if the corresponding call queue is datafilled in OCHOSTQ **with a REROUTESEL (within the RRDATA field) of Y**. Tuples with a REROUTESEL of N do not specify an alternate host, and hence cannot generate a peg in TOPSALT for that call queue.

### 4.3.3 OM group TOPSOC changed

The OCMCCS register has been removed from the TOPSOC OM group as of SN08. The OCINI and OCQABN registers are unchanged.

***Product = CS 2000 TOPS***

## **A00007713--TOPS-IP Robustness**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP, DMS

#### **1.2 Description**

The feature enhances the TOPS-IP product with the following:

- A TOPS615 information log indicating operator teams and number of positions in each team using voice auto-compression is created.
- The post command in the mapci;mtc;appl;topsip;topspos level is enhanced to create a post set of all in service IP positions with auto-compression on. The listset command displays the positions in the posted set. The info command in the mapci;mtc;appl;topsip;topspos level is enhanced to display the auto-compression status for the posted position.

## 1.2.1 Background

IP positions typically select the G.711 voice packet protocol as long as voice quality (latency, jitter, packet loss) is acceptable. When facilities are lost or data network equipment fails, and the available bandwidth is less than that required for IP positions, network performance degrades (that is, packet loss and jitter increase). IP positions detect the network quality degradation and will go into the voice auto-compression mode selecting G.723 protocol on the next call. Once auto-compression is entered, the position remains in that mode for approximately four hours.

## 1.2.2 New Functionality

### 1.2.2.1 TOPS615 Log

The IP position sends an auto-compression message to TOPS to indicate the position has voice auto-compression turned on. When the position exits the auto-compression mode, an auto-compression message indicating off is sent.

The TOPS615 information log is generated indicating the operator teams and the number of positions in each team with auto-compression turned on. The log is generated if an auto-compression message has arrived during an approximate 5 minute audit period. It is also generated if an IP position with auto-compression turned on goes through a service affecting state change (i.e. bsy). Once auto-compression has been turned off for all positions, the log indicates no operator teams or positions have auto-compression on.

### 1.2.2.2 TOPSPOS MAP Post / Info Commands

The mapci;mtc;appl;topsip;topspos post command has parameter 'AC' added. When used, this parameter creates a post set of all in service IP positions with voice auto-compression turned on. The listset command is then used to display the position list.

The mapci;mtc;appl;topsip;topspos info command is enhanced to display the auto-compression status for the posted position.

## 1.3 Hardware Requirements or Dependencies

None

## 1.4 Software Requirements or Dependencies

- TOPS base functionality, SOC option OSB00101

## 1.5 Limitations and restrictions

- The auto-compression status of IP positions is not maintained during the One Night Process norestartswact. The auto-compression status is turned off for all IP positions after the norestartswact.
- If the auto-compression message indicating auto-compression has been turned off is lost, manual intervention (i.e. bsy) may be required to update the auto-compression status.
- If the auto-compression message indicating auto-compression has been turned on is lost, the auto-compression status in the switch is not updated to indicate an on status. In this event, the RAMP position may be utilized verify the auto-compression status.
- The IP position software must be capable of sending the auto-compression message.

## 1.6 Interactions

TOPS-IP positions send TOPS an auto-compression message indicating if auto-compression is on or off.

## 1.7 Glossary

# SN08 Feature Deltas

***Product = Centrex IP Client Manager (CICM)***

## **A00003953--Active Call Fiber**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

CHS

#### **1.2 Description**

On a GigE MG9The Dual-Node Redundancy feature implemented in SN06.2 took the first steps in shifting the CICM's architecture away from a load-sharing model to one with a master-slave relationship. However, DNR restricted itself to implementing takeover redundancy on the northbound interface (i.e. H.248) only. The south-side of the CICM continued to maintain its load-sharing capacity allowing terminals to connect to either node. The obvious implication of this is that on failure of a node, while communication to the GWC is maintained, all terminals hosted off the defunct node experience an outage they reboot and reconnected to the mate.

The Active Call Failover feature aims to address this shortcoming by completing the shift away from a load-sharing model on the terminals interface to one of full takeover redundancy. With ACF, all terminals connect to of the CICM., the mate assumes the role of the master and begins the recovery of terminals while maintaining active calls.

The ACF feature is developed and tracked as 4 separate sub-activities. Each activity tracks a somewhat independent component. Together, the 4 activities each contribute to the overall ACF feature.

The 4 sub-activities and software components are:

- A00003953 – Base
- A00007637 – Authority

- A00007619 – Call Processing
- A00007639 – OAMP

Although this document is maintained under the A00003953 activity, it applies equally to all 4 activities listed above.

### 1.3 System Description

Figure 1 shows the relationships between software components of the CICM as they interact in SN06.2 following the implementation of Dual Node Redundancy.

**Figure 1 The pre-ACF CICM**

The figure shows that communication to the GWC (with H.248) is provided by a single active interface managed by the master node. However, communication to the terminals takes place equally on both nodes regardless of which node is the master. Each node presents its own interface (or IP address) to the terminals.

Figure 2 illustrates the overall architecture of the CICM with ACF. The significant differences from Figure 1 are highlighted in italicised red.

**Figure 2 The ACF CICM**

As shown, the north-side of the CICM continues to communicate with the GWC using the H.248 protocol via a single interface. This remains consistent with the SN06.2 behaviour.

However, Active Call Failover changes the CICM's architecture such that the south side now also presents a single, but unique interface. Terminals no longer have an option to connect to one node vs. the other as in SN07. Instead, they are now only aware of a single IP address towards which all Unistim messaging must be directed. This address is bound to the master node.

Thus both the H.248 and Unistim interfaces each make use of own "floating" IP address that is bound dynamically to the master node's interface. Each component shown in Figure 2 is responsible for managing its floating address and to ensure it is swapped to the mate on a switch of activity.

The inactive VMG component keeps in constant near-full synchronisation with the active side. The double-headed arrow connecting these components on both nodes of the CICM illustrates this. This is necessary to ensure that both nodes have an accurate view of the state of call processing at anytime thus allowing the inactive side to take over control of these functions on a switch of activity.

As for the Terminals component, the also maintains a state of synchronisation with the . However, the level of this synchronisation is kept to a minimum for various reasons that are outside the scope of this document. The impacts and limitations of this minimal synchronisation will be addressed in more detail in the sections that follow.

### 1.3.1 Switch of activity

A switch of activity (or SWACT) occurs when the role of the master is transitioned from one node to the other. From Figure 2, this implies that following a SWACT, communication with the GWC and the terminals is maintained by the newly promoted master (in this case node B). This is illustrated in Figure 3.

As perhaps suggested by the figures, a platform switch of activity is carried out internally one component at a time. The process begins with the VMG and ends with the Terminals component. It is therefore possible that as the switch of activity is in progress, one node may find itself hosting the active VMG component while simultaneously hosting the inactive Terminals component.

However, such a state is transient and there is no facility for the operator to selectively choose to SWACT an individual component over another or stop the maintenance action mid-stream once initiated. By definition, a switch of activity is carried out atomically over the entire platform such that once completed, both nodes will have entirely exchanged roles.

As part of the SWACT, it is the responsibility of the CICM to ensure that the floating H.248 and Unistim IP addresses are moved to the newly promoted master. This is necessary in order to ensure continued communication with both the GWC and terminals as illustrated.

**Figure 3 The CICM following a switch of activity**

A SWACT is said to be "controlled" when initiated manually by the operator. Following a controlled SWACT, the master and slave nodes assume the other's previous role. A manual SWACT is generally executed in order to perform maintenance activities.

An uncontrolled SWACT is autonomously initiated by the system on failure of the master node. No immediate operator intervention is required for the slave node to assume the role of the master in such a circumstance.

### 1.3.2 Technical details of a switch of activity

A switch of activity requires a number of actions to be performed before it can be considered completed. In the context of ACF, some of these actions can be lengthy. This section aims to provide a summary of what occurs on a SWACT in order to help highlight and explain the reasons behind some of the durations stated later.

The first thing to understand is that each component of the CICM switches its activity rather independently of the other components in the system. Only once a component reports that it has completed its SWACT does the system proceed on to the next. Once all components have switched activity, a final step is performed allowing all new master components to complete any needed clean-up activities.

On the CICM, this translates to the following steps:

- 1 The system detects the need for a switch of activity
- 2 The VMG component undergoes a switch of activity
- 3 The Terminals component undergoes a switch of activity
- 4 Each component gets a chance to perform clean-up actions
- 5 The system marks the switch of activity complete

Note that, implicitly, the steps just listed mean that for some time between steps 2 and 3, each node finds itself running one but not all components.

### 1.3.3 Virtual Media Gateway

The VMG component is the first to switch its activity. The process to SWACT this component has ACF and remains unchanged since it was first implemented for DNR (). In short, the component unbinds and simply hands off ownership of the floating H.248 address to the component. The (), binds the address and resumes communication with the GWC thus taking over the call processing role.

Although the switch of activity of the VMG component is short, during the switch only "stable" calls are guaranteed to survive. Unstable calls may or may not survive.

A stable call is defined as a call in which the parties have achieved the talking state and for which no user interaction is in progress. Anything else is considered to be an unstable call. The following list provides a few examples

of possible problem cases that could occur during a SWACT of the VMG component:

- 1 A call in the middle of being setup may not terminate and could be lost.
- 2 A user interacting with a feature such as setting up a 3 way call could find herself losing both parties should a SWACT occur before speech path is established between all parties.
- 3 General terminal stimulus could be lost during a SWACT that could in turn lead to a misdialled call.

### 1.3.3.1 Terminals

Once the VMG has completed its switch of activity, the system begins the Terminals component SWACT. Similarly, the component unbinds and simply hands off ownership of the floating Unistim address to the component. The binds the address thus assuming the role of the . This is where similarities to the VMG SWACT end.

In order to understand what the new Terminals component does next, it helps to understand some of the details about the nature of the communication between the CICM and its terminals.

When a terminal first boots up, it sends an initial Unistim message to the CICM to advise it that it wishes to establish a session. As part of the initial exchange, the CICM and terminal agree on some sequence numbers to use.

Sequence numbers are part of RUDP's inbuilt retransmission mechanism and serve to ensure that neither party loses any messages. By sequentially numbering each message the CICM sends to the terminal, the terminal can easily determine the sequence number (and therefore message) it is meant to process next. This mechanism naturally allows it to detect the loss of any messages. CICM to terminal messages use one set of sequence numbers while terminal to CICM messages use a different set of numbers.

Due to the large number of terminals that the CICM supports, it is not possible for the Terminals component to actively sync across to its mate each terminal's sequence number for each Unistim message it exchanges with the terminal. This approach would be impractical and would be much too real-time intensive.

As a result, the Terminals component syncs only the minimal set of information needed for its counterpart to actively recover the terminal on a switch of activity.

Therefore, after the new Terminals component has bound the Unistim floating IP address, it begins actively recovering each terminal in order to re-learn the sequence numbers that the terminal expects to use (RUDP provides a

mechanism for this). As the CICM supports a large number of terminals, such an operation can take a while to complete. Refer to section 7 for details on timing.

Between the time that the Unistim floating address is moved and a terminal has been recovered, the CICM has effectively lost its virtual connection to the terminal. However, so long as the terminal does not attempt to communicate with the CICM during this time, it remains unaware of the lost connection. Should it be a in a call, it takes no notice of this situation and continues happily transmitting and receiving audio (RTP and RTCP). Neither party in the call experiences an outage or interruption in the audio stream. Likewise, the core is also unaware of this temporary situation so billing is unaffected.

Naturally, the CICM's goal is to recover all terminals. However, due to the terminal watchdog mechanism, it must do this quickly before any terminal times out and reboots.

A quick recap of this mechanism seems in order. The keep-alive is driven by the Terminals component and periodically sends a message to each terminal effectively telling it to "Reboot in N seconds". Although N currently defaults to 120 seconds, it is configurable. Therefore, if the CICM fails to send a subsequent "Reboot in N seconds" message before the timer expires, the terminal reboots and attempts to reconnect.

Thus, in order to maximise its chances of recovering all terminals before any reboot, the Terminals component begins recovery with the terminal that was least recently sent the "Reboot in N seconds" message and progresses the recovery in this order. Assuming the current default, the Terminals component must recover all terminals within 2 minutes.

As suggested earlier, while the recovery process is executing, it is important to consider that external events may occur. Two types of events could occur between the time the Unistim floating address is transferred and an individual terminal is recovered:

- 1 A Unistim message is received from the terminal itself
- 2 A call processing event destined for the terminal is received from the GWC

The first event type can originate from simple user interaction with the terminal. This could be anything from going on hook, switching between calls (streams) or simply changing some user settings (in the case of a i200x ). In order to avoid the terminal rebooting and to give the user as responsive feedback as possible, the session is placed at the head of the queue for immediate recovery.

Because of this support for early recovery, no user generated events are lost during the SWACT of the Terminals component. However, as the recovery introduces a delay before the user's input may be acted upon, a delay in the response to the first few key events should be expected.

The second event type would most typically occur due to interaction of the user at the far end. In such cases, the resulting events from the GWC see an update to the VMG component's state for the terminal, but any resulting events are not propagated down to the Terminals component or the terminal. Such state updates do not occur until the terminal is later recovered as per the normal recovery mechanism.

This may result in some unexpected behaviour at times. Consider the case in which the far end user goes on-hook. If this state change is not propagated to the terminal, it continues sending RTP (audio) until the recovery occurs. Of course, in this scenario, the most likely outcome is that the local user would also go on-hook thus bringing us back to the first event type (an immediate recovery thus causing the stream to be closed).

Consider a much less likely, but more problematic scenario of the far end attempting a CODEC renegotiation, an update of the destination IP address and/or port, etc. In this case, the VMG component successfully updates its state for the terminal and acknowledges the successful completion of the request to the GWC. The far end then starts using the new parameters. Until the terminal is recovered and its parameters updated, this situation would likely result in one way speech or none at all.

The last point worth mentioning about a system SWACT is that once initiated, it cannot be stopped or aborted. This restriction follows naturally once the effort required to recover individual terminals is considered.

Once the master Terminals component releases the floating Unistim address, all terminals **MUST** be actively recovered. Allowing a SWACT to be aborted could see the floating IP address easily returned to the original node without problem, but then the terminals recovery would once again need to be restarted. Given the minimal window available to recover all terminals without having any of them timeout and reboot, the additional delay introduced by an abort would surely result in a loss of some (and possibly many) terminals.

As a result, should a failure of the master node occur while terminal recovery is in progress, it follows that an autonomous SWACT must occur to attempt and recover the situation as best as possible. In this rare case, it cannot be guaranteed that some terminals will be recovered. These terminals would likely reboot and any calls hosted lost.

## 1.4 System start and stop

This section describes the behaviour that can be expected from the CICM in normal circumstances during start and stop scenarios.

### 1.4.1 First node start-up (master)

As the first node of the CICM initialises and begins operation, it broadcasts periodic heart beat messages on its private admin LAN directed to its mate node. As it does not observe corresponding heartbeats from its mate, it assumes the role of the master.

The north-side binds the floating H.248 address begins sending H.248 messages to the GWC advising it when it is available for service. A number of initialisation messages are exchanged between the CICM and the GWC. Meanwhile the south-side likewise binds the floating Unistim address and begins accepting incoming connections from terminals.

Once in service, users at connected terminals may login, make and receive calls and also use other available CICM services.

### 1.4.2 Second node start-up (slave)

As the second node initialises, it also begins broadcasting periodic heartbeats directed to its mate. As the master is already broadcasting, notice and assumes the role of the slave.

Both the VMG and Terminals components are advised by the system to initialise as slaves. The VMG therefore does not begin communicating with the GWC and the Terminals component does not expect incoming connection requests from terminals.

Instead, the VMG requests a bulk synchronisation of all call processing data from its mate and the Terminals component makes a similar request from its counterpart. Once these operations are completed, each component on the master node continues dynamically sending synchronisation information to keep the corresponding components constantly up to date on the mate node.

Only when all software components have started and the bulk synchronisations have completed is it possible to initiate a switch of activity.

### 1.4.3 Manually stopping a node

A node may be stopped or restarted using the element manager's maintenance page. For the purpose of our redundancy discussion, both actions are effectively equivalent and are therefore treated as such in software. For simplicity we will therefore always refer to a system stop and simply ignore node restarts.

Three scenarios exist:

- Both nodes are running; Operator stops slave

- Both nodes are running; Operator stops master
- Only master is running; Operator stop master

Ultimately, these 3 scenarios are treated exactly as failures of the respective nodes. No special processing is done to automatically initiate a SWACT even though such an action may be desirable. It is the responsibility of the operator to ensure that the node is in the desired state before initiating a node stop.

However, initiating the stop from the CICM element manager verifies such things and presents the operator an appropriate warning message with recommended courses of action in order to minimise any impact on service.

## 1.5 Node failures

Only two interesting scenarios exist. We are interested in the case where both the master and slave nodes are running and one or the other of the following occurs:

- The master node fails
- The slave node fails

The only other case in which a failure is possible is that of a node running in standalone mode and subsequently fails. In this case, as the node is running on its own, it would of course have already assumed the role of the master. However, this case is uninteresting simply because if the node fails, no action can be taken. There is no redundant node to fall back on.

A "node failure" may have any number of possible causes. The term applies equally to both hardware failures of the physical CPU card running the CICM load or to some critical software error for which no recovery action is possible. The following is a non-exhaustive list of just some of possible node failures:

- Should any of the software components that make up the CICM load experience a software exception (i.e. trap), monitoring software automatically initiates an immediate restart of the node.
- A general failure of the CPU card

From the remaining node's perspective, the above cases are identical in that its mate suddenly stops providing heartbeats. The surviving node thus takes appropriate action as described in the following sections.

All but LAN adapter failures are treated equally by the redundancy functionality. When physically possible, any critical failure will result in the node automatically restarting a preset number of times (default is 3) that can be configured by the operator. Following the last restart, the boot controller will not start the CICM software load.

### 1.5.1 Master fails

When the master node experiences an unexpected failure, the slave node detects it and performs autonomous switch of activity to assume the role of the master.

The SWACT occurs transparently to the GWC as the new VMG component binds the floating H.248 IP address. Some inbound messages from the GWC may be lost during the takeover, but the retransmission algorithm built in to H.248 ensures that they are eventually delivered. However, during this component's SWACT, only "stable" calls are guaranteed to survive. Unstable calls may or may not survive.

Likewise, the switch of activity occurs semi-transparently to the terminals as the new Terminals component binds the floating Unistim IP address. We say "semi-transparently" because the Terminals application must now proceed to recover the individual terminals as previously described. Despite this recovery procedure, the end user experiences no loss of any currently active stable calls.

### 1.5.2 Slave fails

When the slave node experiences an unexpected failure, the master detects it, but does nothing except make note of the failure. No SWACT occurs and so no H.248 messages from the GWC are lost and no terminal recovery actions are required. All stable and unstable calls survive the failure on this node.

## 1.6 Network adapter failures

As hinted in the previous section, LAN adapter failures on the CPU cards are treated differently to other types of failures. These cases call for special consideration.

Before continuing, it is worth defining the difference between a node's critical and non-critical adapter. A node's critical physical adapter hosts both the H.248 and Unistim interfaces when it is the master. Therefore, on a given node, the floating IP addresses can only ever be bound to the critical adapter.

The critical adapter also hosts one of the Admin LAN interfaces able to support cross node communication. The non-critical physical adapter simply hosts a second Admin LAN interface thus providing redundant cross-node communication paths.

### 1.6.1 Master loses critical adapter

When the master node detects that it has lost layer-2 connectivity on its critical adapter, the master initiates an autonomous SWACT. This is done in order to conserve connectivity to the GWC and terminals thus maintaining call processing.

In such an event, all terminals are transferred to the newly promoted master node (previously slave). As always, unstable calls may experience problems on SWACT of the VMG component.

### 1.6.2 Master loses both adapters

In the event that the master detects layer-2 loss of connectivity on both its physical adapters, it decides that it is at fault and demotes itself to a slave-like state. The actual slave of course considers the master to have failed and promotes itself to master.

When either of the isolated node's adapters becomes available, it looks for its mate. If found, the node restarts itself in order to come up afresh as the slave and ensure that all its MIB data is synchronised with the master node.

If upon regaining either physical adapter the node does not find a mate, it re-promotes itself to master and proceeds accordingly. Appropriate monitoring software ensures that only one node is ever master at any given time.

In case, terminals hosted of this node lose their connection when the adapters are first lost. Communication to the terminals and GWC (if the node resumes its role as master) can of course only be re-established if the critical adapter is regained.

### 1.6.3 Slave loses critical adapter

Should the slave node lose layer-2 connectivity on its critical adapter, it simply updates its own local state and advises the master node of the state change. This is necessary in order to ensure that a SWACT is not inadvertently initiated either manually or autonomously. No switch of activity occurs.

### 1.6.4 Slave loses both adapters

In the event that the slave detects layer-2 loss of connectivity on both its physical adapters, it acts almost exactly as described previously. The only difference being that the node does not need to demote itself. It is already the slave.

## 1.7 Hardware and Software Requirements

### 1.7.1 Hardware requirements

Active Call Failover introduces no new hardware dependencies or requirements. However due to the redundancy nature of ACF, it is of course necessary for the 8.10 CICM software load to be installed on a *pair* of matching CPU cards.

The 8.10 load is supported on:

- Motorola 5370 CPU cards in a SAM16 chassis, or
- Motorola 5385 CPU cards in a SAM21 chassis

## 1.7.2 Software requirements

Active Call Failover is introduced in the 8.10 CICM release (SN08). This load level must therefore be installed on a pair of CPU cards (as listed above) in order to take advantage of the functionality.

The 8.10 CICM release introduces no special requirements on either the m6350 or the i200x terminals (or their firmware). The latest available and supported versions of the client software ships as part of the CICM release

## 1.8 Maintenance Aspects

### 1.8.1 Initial Installation and Configuration

The initial installation process of the 8.10 CICM remains largely unchanged from 7.20.

Active Call Failover introduces changes to 2 preboot steps run at install time.

#### 1.8.1.1 Unistim VLAN

As mentioned earlier, the main goal of ACF is to provide only a single IP address to which all terminals connect for service. This requires a change to the “Unistim VLAN” configuration step. When this step is reached, it prompts:

```
Enter the Floating Unistim IP address for this CICM:
```

As the question suggests, instead of expecting a different static IP address for each node, preboot now asks for the single floating Unistim address that is to be shared. The user is expected to enter the same information on both nodes of the CICM. Failing to do so will lead to erroneous behaviour.

Next, preboot asks:

```
Enter the network mask for the Unistim IP network:
```

Simply enter the network mask of the Unistim VLAN. Finally, it prompts:

```
Enter the default route for the Unistim IP network
```

```
(Enter 0.0.0.0 for no route):
```

As prompted, enter the default route or “0.0.0.0” for none.

### 1.8.2 H.248 VLAN

In SN07, the H.248 VLAN preboot step required the operator to provide a pair of static address in addition to the H.248 floating address (totalling 3 H.248 VLAN addresses).

For consistency with the Unistim VLAN, provide the pair of static addresses. As a result, the H.248 VLAN preboot step prompts with a near identical set of questions as for the Unistim VLAN step.

Finally, it is worth pointing out that should it become necessary to carry out a network reconfiguration, the H.248 and Unistim VLAN preboot steps can be manually re-executed by issuing the following command through a CICM terminal window:

```
preboot h248 /interactive
```

or

```
preboot unistim /interactive
```

All information is prompted for once again upon issuing these commands, thus allowing the operator to change any aspect of the configuration. However, executing these commands can only be done safely when neither node is in service thus making an outage unavoidable.

### 1.8.3 System Upgrade from 7.20 to 8.10

The only supported upgrade path to 8.10 is from 7.20. this system upgrade effectively reduces the number of needed Unistim IP address from 2 down to the operator has 2 choices in selecting the floating Unistim IP address. S/he may:

- Continue using node A's existing Unistim address, or
- Continue using node B's existing Unistim address

**Warning: As always, it is strongly recommended that upgrades be performed when call processing activity on the CICM is low.**

The following steps assume that the operator wishes to maintain node A's existing Unistim address as the floating address following the upgrade. Obviously, the steps can be adjusted to maintain B's Unistim address.

The upgrade consists of the following steps:

- 1 From the Element Manager's maintenance page, use the terminal transfer tool to transfer all terminals to node B and SWACT if necessary to make that node the master.
- 2 Take node A out of service and carry out the normal re-installation procedure appropriate to the platform in question using the 8.10 installation image.
- 3 When running preboot and prompted to enter the floating IP address, the operator specifies node A's old static Unistim address.

**Warning:** When performing step3 , the operator must **NOT** specify anything other than A's old Unistim static address including B's current Unistim address. As it is still in use at this stage of the upgrade, an address conflict would occur. Such a conflict could have undesirable effects on the terminals currently making use of this address. The software cannot enforce using A's old static Unistim address!!

**Warning:** In fact, it is important to note that care must be taken to enter the same information at each of the preboot stages as was originally done on installation of the node. Any discrepancies in any of the IP information could lead to problems with the upgrade. The software does not safeguard against this.

- 4 When node A returns to service, it will come up as the slave under the new architecture. The VMG component performs a bulk synchronisation of its data. The Terminals component will not synchronise with its mate in this special hybrid situation.
- 5 Once the maintenance page indicates that the system is ready, initiate a SWACT and make node A the master. As per the new Active Call Failover behaviour, the Terminals component on node A binds the floating Unistim IP address (i.e. its old static address). However, unlike the expected ACF behaviour, node B does not release its static Unistim address nor does node A perform any recovery actions. Instead, the 8.10 node mimics the 7.20 behaviour and the Terminals component allows terminals to connect to either node.
- 6 From the Element Manager's maintenance page, initiate a terminal transfer<sup>1</sup> from node B to node A. As the 8.10 node mimics the 7.20 behaviour, the transfer causes sessions on node B to be destroyed and a replacement session created on node A once the terminal connects. Other than redirecting the terminal to a different IP address, no explicit transfer of session data occurs.

**Warning:** After performing step 6, should the operator need to revert back to B as the master node, it is import to remember that the terminals must be transferred back to B manually. Initiating a SWACT at this point cause A to release its floating Unistim address as per the 8.10 behaviour. Naturally, all terminals connected to this node would be lost. For this reason, it is critical that a manual terminal transfer be performed **BEFORE** the SWACT is initiated. The software does not safeguard against this case!!

---

1. At this stage, it must be noted that terminal transfer functionality is made available in this special hybrid situation (one node at 7.20 while the other is at 8.10). However, once the upgrade is complete and both nodes are running 8.10, the tool is hidden from the operator. For 8.10 and later loads, the functionality is not made available as it becomes the context of Active Call Failover.

- 7 Once the terminal transfer to A is complete, take node B out of service and carry out the re-installation procedure.
- 8 When node B returns to service under the 8.10 software load, it initiates a bulk synchronisation of all components and operates fully as slave in the new redundancy architecture.

### **1.9.4 Maintenance and Monitoring Interface**

The operator aspects of system redundancy can be accessed from the status and maintenance pages of the Element Manager. Active Call Failover introduces a number of new fields and changes others. As a result, an overall review and consolidation exercise has been carried out on these pages in order to present a more consistent look and feel. The changed fields or those that are of particular relevance to redundancy are discussed next.

#### **1.9.4.1 System Status**

This page changes only slightly in 8.10. As shown in Figure 4, although previously present, the “virtual media gateway” summary table changes only in how the existing information is presented. The “terminals” table entry changes in function and now reflects the new failover ability of this component.

Figure 4 Element Manager Status Page

Both of the component tables present two identical field in common. The “Active on” field indicates on which node the active component is running (as in Figure 2). The field may display one of three values:

- node A
- node B
- unavailable

The significance of the first 2 values is obvious. A value of “unavailable” typically indicates that neither node is running. In fact, the “unavailable” state applies to all table fields discussed next when neither node is running. However, when this is so, this fact also appears in the more prominent overall summary at the top of the status page.

The “Peer state” field shows if the inactive component on the mate is in synchronisation with the active component. It may have one of 3 values:

- in sync
- out of sync
- unavailable

A state of “in sync” obviously indicates that it is running and in a state of synchronisation with the active unit. A state of “out of sync” may indicate that the mate component has not yet (normal on start-up) or not correctly reached a state of synchronisation with the active unit. If the component is not running (e.g. the node may be down; which would appear in the summary section at the top of the page), the “out of sync” state is also displayed.

The “virtual media gateway” table also maintains a third field labelled “State”. This field serves to show the state of the VMG as controlled at the CS2K. It may assume one of the following values:

- in service
- out of service
- unavailable

A state of “in service” indicates that communication with the GWC is established and that the CICM has been instructed as such.

A state of “out of service” (despite having a node running as master) can be due to the VMG having been manually taken out of service at the CS2K. Otherwise, the VMG typically fails to go into service when communication with the GWC simply cannot be established. This in turn may be due to a general network problem or could also be due to a failed critical adapter (if a node is running stand-alone) or a failure of both critical adapters (if both nodes

are running). However, adapter failures show up in the “network” table on the same page. The connections and terminals performance monitoring pages that are available from the status page are modified to provide a consistent data set. However, these pages are not shown.

### 1.9.5 Maintenance Status

The 8.10 maintenance status page is updated in line with the system status page and is shown in Figure 5.

The screenshot displays the Centrex IP Client Manager web interface in Microsoft Internet Explorer. The browser address bar shows `http://element_manager/centrexip/`. The page title is "Centrex IP Client Manager". The left sidebar contains a navigation menu with categories: CICM (status, configuration, terminals, users, maintenance), CICM-EM 8.0 (status, synchronization, maintenance), profiles (audio, enterprise, language, network, user, feature), and diagnostics. The main content area is titled "maintenance status (cicm-180)". It displays two tables of data for Node A (47.165.168.180) and Node B (47.165.168.180). To the right of the tables are several action buttons and controls, including "apply maintenance release", "restart terminal service on node A", "node A service control", "node B service control", "switch activity", "reset counter", "start auto refresh", "refresh now", and "system status".

| Node A (47.165.168.180)  |                                         |
|--------------------------|-----------------------------------------|
| Status                   | master                                  |
| Application              | running                                 |
| Maintenance status       | system idle (current reboot count: 0)   |
| Version                  | CICM 8.10 Base Release (Build 8.10.xxx) |
| VMG status               | active (in service)                     |
| Active half calls        | 5 (total calls=342)                     |
| Terminals status         | active                                  |
| Logged in users          | 43 (total logins=262)                   |
| Active terminals         | 54                                      |
| Terminal recovery status | n/a                                     |

| Node B (47.165.168.180)  |                                         |
|--------------------------|-----------------------------------------|
| Status                   | slave                                   |
| Application              | running                                 |
| Maintenance status       | system idle (current reboot count: 0)   |
| Version                  | CICM 8.10 Base Release (Build 8.10.xxx) |
| VMG status               | inactive (in sync)                      |
| Active half calls        | n/a                                     |
| Terminals status         | inactive (in sync)                      |
| Logged in users          | n/a                                     |
| Active terminals         | n/a                                     |
| Terminal recovery status | n/a                                     |

At the bottom left of the page, it says "CICM-EM 7.0 administrator". At the bottom right, there is a "maintenance home" link.

**Figure 5 Element Manager Maintenance Page**

In the central area of the page, each node provides a table showing maintenance information about the node. The "Status" field (previously named "Node status") indicates the platform level state of the node in question and assumes one of the following values:

- idle
- master
- slave
- swacting master?slave
- swacting slave?master
- master (no slave)

The new "VMG status" field shows the current state of the virtual media gateway component on the node in question. It effectively combines into a single field the information contained in the "State", "Active on" and "Peer state" fields of the "virtual media gateway" table from the system status page. It may assume one of the following values:

- active (in service)
- active (out of service)
- inactive (in sync)
- inactive (out of sync)
- swacting master->slave
- swacting slave->master

Related to the VMG and just beneath it is the "Active half calls" field. When the node's VMG is active and in service, this field provides the number of currently active half calls (with the total historical number in brackets). When the VMG is inactive, this field is greyed out and displays a value of "n/a" indicating "not applicable".

Similarly, the "Terminals status" field shows the overall state of this component and combines the information of the "Active on" and "Peer state" fields of the "terminals" table from the system status page. It assumes one of the following values:

- active
- inactive (in sync)
- inactive (out of sync)

- swacting master->slave
- swacting slave->master

Related to the Terminals component and just beneath this field appear 2 additional fields:

- Active terminals
- Logged in users

Similarly, when the Terminals component on the node is active, these 2 fields are enabled and display the information as suggested by their names. When the component is inactive on the node, the fields appear greyed out and display a value of “n/a”.

A third field applicable to the Terminals component serves a purpose only during a switch of activity of the component. Accordingly, it is named “Terminals recovered”. Under normal operation (i.e. no terminals are in the process of being recovered), it shows “n/a” for “not applicable”. During a switch of activity, the newly promoted active unit shows the progression of the recovered terminals as a percentage of the total active terminals.

In the actions section of the maintenance page, the "switch activity" link is only displayed when the functionality is actually available. However, once clicked, a number of automated tests are performed before the system proceeds. The operator may be provided with a number of warnings regarding the consequence(s) of proceeding (if any).

*Warning: Once a SWACT is initiated, it CANNOT be manually aborted. The operator must allow for the switch of activity to complete before any further maintenance can be attempted (e.g. performing a second SWACT, applying MRs, etc.).*

Following a switch of activity, the roles of both nodes should be exchanged. Initiating this switch of activity manually would generally be desirable for maintenance purposes just prior to taking a node out of service (to swap a faulty CPU blade for instance).

The "node N service control" (where N is either “A” or “B”) box appears for each available node and offers 3 context sensitive options:

- Restart: Stop all services on this node and reinitialise the CPU card. Services restart automatically following the nodal restart and processing should also be resumed.
- Stop: Stops the CICM service from running thus halting processing on the node in question. However, the CPU card remains active.

- **Start:** Starts a stopped CICM service and resumes processing on the node in question.

In 7.20, the terminal transfer functionality offered a simple mechanism to automate the migration of terminals from one node to the other. This was useful when performing maintenance activities as both nodes actively hosted terminals.

The screenshot shows the Centrex IP Client Manager web interface in a Microsoft Internet Explorer browser window. The address bar shows `http://element_manager/centrexip/`. The page title is "Centrex IP Client Manager". On the left is a navigation menu with categories like CICM, status, configuration, terminals, users, maintenance, and diagnostics. The main content area is titled "maintenance status (cicm-180)". It displays two tables of data for Node A and Node B.

| Node A (47.165.168.180)  |                                         |
|--------------------------|-----------------------------------------|
| Status                   | master                                  |
| Application              | running                                 |
| Maintenance status       | system idle (current reboot count: 0)   |
| Version                  | CICM 7.10 Base Release (Build 7.10.xxx) |
| VMG status               | active (in service)                     |
| Active half calls        | 5 (total calls=342)                     |
| Terminals status         | active                                  |
| Logged in users          | 43 (total logins=262)                   |
| Active terminals         | 54                                      |
| Terminal recovery status | n/a                                     |

| Node B (47.165.168.180)  |                                         |
|--------------------------|-----------------------------------------|
| Status                   | slave                                   |
| Application              | running                                 |
| Maintenance status       | system idle (current reboot count: 0)   |
| Version                  | CICM 8.10 Base Release (Build 8.10.xxx) |
| VMG status               | inactive (in sync)                      |
| Active half calls        | n/a                                     |
| Terminals status         | inactive (in sync)                      |
| Logged in users          | n/a                                     |
| Active terminals         | n/a                                     |
| Terminal recovery status | n/a                                     |

On the right side of the page, there are several action buttons and controls:

- apply maintenance release:** Includes a dropdown for "Node" (set to "Node A (47.165.168.180)") and a "Maintenance Release" dropdown (set to "No files found"). A note states: "Note: Maintenance releases should be securely transferred to 'D:\Centrex\IPsupport\firmware\gateway\_MRs' on the master Element Manager Node".
- transfer terminals:** Includes a dropdown for "Node" (set to "From node A to node B") and a "Terminal Shutdown Timeout" dropdown (set to "10 mins").
- node A service control:** Includes an "Action" dropdown (set to "Stop").
- node B service control:** Includes an "Action" dropdown (set to "Stop").
- switch activity:** A button.
- reset counter:** Includes a dropdown for "Node" (set to "Node A") and a "Reset Counter" dropdown (set to "Current Reboot Count").
- start auto refresh:** A button.
- refresh now:** A button.
- system status:** A button.

At the bottom left, it says "CICM-EM 7.0 administrator". At the bottom right, there is a "maintenance home" link. The browser status bar at the bottom shows "Done" and "Internet".

Figure 6 Maintenance page during an upgrade

In 8.10, the terminal transfer functionality becomes redundant as there is no longer any such concept. All terminals are always hosted by the master node. As a result, the functionality is no longer offered on the maintenance page when the Element Manager is inspecting an 8.10 (or later) CICM. The functionality continues to be offered when inspecting a pre-8.10 CICM.

However, there is one exception to the above statement. As previously mentioned, the functionality remains available in the special case when the Element Manager detects that only one of the nodes is running 8.10. The terminal transfer functionality is thus available (and needed) during the actual upgrade process as shown in Figure 6.

The "system status" link box on this page offers the operator a quick and easy method of navigating to the corresponding node's status page. This may often be useful after some maintenance activity has been carried out on the CICM.

### 1.9.6 Procedure: Taking a node out of service

The following provides the proper procedure to follow to take one of the CICM nodes out of service. This procedure aims to provide the operator with the best method of removing a node from the CICM chassis with the least possible impact on service.

***Warning:** Although this procedure aims to minimise the impact on service, it does not eliminate it. It is strongly recommended that such maintenance procedures only be executed during low activity periods.*

#### 1.9.6.1 Step 1: Perform a SWACT

If the node that is to be taken out of service is currently the master, a switch of activity should be executed. This can be initiated from the Element Manager's maintenance page using the "" link. Upon clicking the link, the operator is presented with a warning message and asked to confirm the action.

Once the SWACT is initiated, the operator must wait for the switch of activity to complete. As the Terminals component must recover all terminals, the SWACT takes a while to complete. Transient states are displayed during the switch and the operator should not proceed to the next step until the switch of activity has fully completed.

A SWACT is complete only once the "Status" field of each node on the maintenance page shows "master" on the node to be kept in service and "slave" on the node that is intended to be taken out of service for the maintenance.

#### 1.9.6.2 Step 2: Stopping the slave node

Once the switch of activity (if needed) is completed, a stop of the slave node can be initiated. No further special actions are needed as the node should no

longer be supporting traffic at this point. The "node N service control" function on the maintenance page can be used to stop the slave node.

### **1.9.6.3 Step 3: Perform desired maintenance**

Once the node has stopped, it is safe to proceed with removing the CPU blade, etc.

## **1.10 Event Monitoring**

### **1.10.1 Logs**

As introduced in SN07, the IEMS logging system continues to be used as high level log unification platform. The CICM reports its most significant logs to it.

Although the Active Call Failover activity introduces no new logs destined for the IEMS, a number of logs pertaining to platform (or node) level redundancy were introduced as part of the activity addressed by [3]. Please refer to that document for further details.

The CICM's own local logging system continues to operate in parallel and is used to capture additional and more detailed information about local events.

These local system logs continue to be generated following existing practices. The three existing severity levels of logs are:

- 1** Error: serious and often unrecoverable events
- 2** Warning: unexpected, but recoverable events
- 3** Information: expected but significant events

As has been suggested throughout this document, it makes sense to differentiate between a node's status and the state of the individual components running on that node.

The concept of a node's status (master vs. slave) was introduced in SN06.2 with the Dual Node Redundancy functionality. At the time, a number of logs were introduced to mark significant platform level events from a redundancy perspective.

The Active Call Failover activity does not introduce any new platform level redundancy logs. As such, please refer reference [1] to review these logs.

This activity does however introduce a number of local logs to clearly identify significant events that occur to the individual components of the system.

Information logs are generated by both the VMG and Terminals components for the following normal start-up events:

- On master: Component initialises as
- On slave: Component initialises as
- On master: Slave component requests a bulk sync
- On slave: Bulk sync of data completes; Ready for SWACT

A number of information logs are generated by each component as it performs an operator-initiated switch of activity:

- On master: Component receives notification to SWACT
- On slave: Component receives request from its counterpart to assume the role of the master
- On slave: Component completes transition to active
- On master: Component receives acknowledgement from mate that it is now active; completes transition to active.

### 1.10.2 SNMP

This feature introduces no new SNMP nodes or traps. Therefore, the original behaviour of the Dual Node Redundancy feature (see reference [1]) combined with the changes made in SN07 (see reference [3]) remain valid.

However, for a CICM installation that does not make use of the IEMS to monitor SNMP, a subtle clarification is of value. Some slight changes have been introduced to the Element Manager's status page with this feature. The "virtual media gateways" section of the page no longer displays its states as:

- In Service
- Out of Service
- Hot Standby
- Stopped

Instead, it now splits the active vs. inactive state of the component from the overall VMG state to make things clearer and more explicit. On the maintenance page, the "VMG status" combines this information into a summary and now reports either:

- active (in service)
- active (out of service)
- inactive (in sync)

- inactive (out of sync)
- swacting master?slave
- swacting slave?master
- stopped

As originally implemented in SN06.2 and described in [1], the *cicmVLCMUnit0State* and *cicmVLCMUnit1State* nodes are located in the MIB hierarchy under:

**...|cicm|cicmVLCM|cicmVLCMTable|cicmVLCMTableEntry**

and are used to reflect the status of the VMG. These SNMP nodes may have one of the following states:

- inService(0): VMG is in service as the active component
- stopped(1): VMG is not running
- outOfService(2): VMG is not in service
- hotStandby(3): VMG is in service as the inactive component

For backwards compatibility reasons and given that the non-IEMS SNMP system is likely to be phased out over time, instead of changing the SNMP nodes as such, a simple mapping to the new status names is offered in the following table.

**Table1 : VMG Status to SNMP Mapping**

|               | <b>VMG status as displayed<br/>on EM status page</b> | <b>SNMP status reported</b> |
|---------------|------------------------------------------------------|-----------------------------|
| <b>master</b> | <del>active</del> -(in service)                      | inService(0)                |
|               | <del>active</del> -(out of service)                  | outOfService(2)             |
|               | stopped                                              | stopped(1)                  |
| <b>Slave</b>  | (in sync)                                            | hotStandby(3)               |
|               | (out of sync)                                        | outOfService(2)             |
|               | Stopped                                              | stopped(1)                  |

### 1.10.3 Alarms

This feature introduces no changes to the alarm system. As a result, the original behaviour introduced with the Dual Node Redundancy feature discussed in [1] and subsequent changes made in SN07 as described in [3] remain valid.

## 1.11 System Engineering

Table 2 summarises the durations of the maintenance activities of particular interest. Additional information follows.

**Table 2: Timing of significant maintenance activities**

|                                                         | Call Processing Load |               |
|---------------------------------------------------------|----------------------|---------------|
|                                                         | Average - High       | Low           |
| Master node<br>Start-up delay                           | N/A                  | < 100 seconds |
| Slave node<br>Start-up delay                            | > 12 minutes         | 4-6 minutes   |
| VMG switch of activity                                  | < 3 seconds          | < 1 second    |
| VMG “at risk” period                                    | < 10 seconds         | < 2 second    |
| Terminals switch of<br>activity                         | 140 seconds          | 70 seconds    |
| Period required to<br>recover an individual<br>terminal | < 2 seconds          | < 1 second    |
| Overall platform switch<br>of activity                  | 150 seconds          | 75 seconds    |

The *master node start-up delay* is measured from the time the node is first physically powered up (or hard reset) to when it sends its first H.248 message to the gateway controller advertising it is ready for service. From this point, it is up to the gateway controller to acknowledge the message and bring individual lines into service. In order to have a complete view of the total start-up time from power up to dial tone, the reader may wish to consult the gateway controller’s engineering guide.

A number of factors influence the total duration required by the slave node to initialise and prepare itself to accept a SWACT request. However, all but a single factor are relative constants to the overall total. The bulk synchronisation mechanisms of the various components discussed earlier are the only variable factors. As call processing must be given a higher priority over this bulk synchronisation, the start-up period increases with increased activity.

Given this prioritisation in an average to high call processing load scenario, the bulk synchronisation could take longer such that even the stated value cannot be guaranteed.

A switch of activity of the VMG component from start to finish lasts no more than 3 seconds, but typically lasts less than a second. The “at risk” period is the time during which unstable calls are in danger of being lost. This period begins when the SWACT is initiated and should last no more 10 seconds even with a high call processing load.

A switch of activity of the Terminals component lasts much longer due to the need to actively recover each individual terminal connected to the CICM at the time. This period is measured as the time that component starts the SWACT process until the time the last terminal has been recovered.

It is also of value to measure the period necessary to recover a single individual terminal. These values are of interest as they directly impact the end-user perception of the responsiveness of the terminal over a recovery. As such, the values provided are only applicable when the user interacts with the terminal sometime after a SWACT has been initiated but before it has been recovered.

The period is measured from the time the first Unistim event is received at the CICM to when it can actually be processed normally. The values stated are therefore in addition to any normal delay (e.g. network congestion, GWC load and therefore delay in processing the event, etc.).

The overall platform switch of activity reflects the sum of individual component SWACTs plus a small correction factor.

## 1.12 Limitations and Restrictions

This section aims to summarise the limitations and restrictions of the Active Call Failover functionality. Many points will have already been discussed in previous sections.

- 1 During the switch of activity of the VMG component, only stable calls are guaranteed to survive. Unstable calls may or may not survive. For the definition of stable versus unstable calls, please refer back to the end of section .
- 2 Performing a stop or restart of a node from the element manager will not automatically initiate a SWACT even if one may be desirable. It is the operator's responsibility to ensure the node is in the desired state before performing the stop. The element manager will however provide warnings of proceeding with any potentially service affecting actions.
- 3 Once initiated, a SWACT cannot be cancelled despite its possibly long duration. To return the system to its original pre-SWACT state, a second SWACT must be carried out once the first one completes.
- 4 The only supported upgrade path to 8.10 is from 7.20 for both the CICM and EM. The 8.10 Element Manager may be used to manage 2.5, SN06.2, SN07 and SN08 CICMs.

- 5 With 8.10, the CICM ceases to support a load-sharing mode. This feature's goal is to shift the role of the secondary node from providing a load-sharing capability to providing full failover redundancy.
- 6 Because of the amount of processing work involved in the terminal recovery process, some real-time impact on call processing may arise during a SWACT.
- 7 The terminal recovery process on a SWACT may be long.
- 8 The terminal recovery process does not prioritise terminals in active calls over idle terminals. The recovery process aims to recover all terminals sequentially and without prejudice. However, the recovery process does give immediate priority to a terminal that experiences user interaction.
- 9 During a SWACT, incoming events (state change requests) from the GWC will NOT be immediately presented to a non recovered terminal. Only at the point that the terminal is recovered is it presented the updates.
- 10 In the rare case that the new master node should experience an outage while a switch of activity is in progress, it cannot be guaranteed that some terminals won't reboot and that calls won't be lost as a result.

### 1.13 Feature impacts and Interactions

Active Call Failover impacts some existing functionality of the CICM and results in a few changes to the overall system:

- 1 The terminal transfer functionality is no longer relevant on an 8.10 CICM as the system now manages terminal recovery (or hand-over) automatically on a switch of activity. The option is therefore not available when managing an 8.10 CICM (or later) with the Element Manager.
- 2 Prior to ACF, each terminal typically would have its S1 IP address pointed to one node of the CICM with S2 directed to the other node as a back-up. Given that the south-side of the CICM now only provides a single IP address to which clients can connect, the S2 IP entry has been made redundant from the CICM's perspective. The entry is now free to be used for other purposes such as directing it to a local SRG for a local back-up system. As always, S1 and S2 can be configured manually or via DHCP. The configuration details of the terminals falls outside the scope of this document.

## ***Product = Centrex IP Client Manager (CICM)***

### **A00004981--VCAC Provisioning Support for CICM Gateways** ***Functional Description***

#### **1.1 Applicable Solution(s)**

IAW, IAC

*Note:* This is an SN07 feature, included here by special request.

#### **1.2 Description**

Activity A00002512 introduces VCAC in the SN07 timeframe. VCAC introduces Limited Bandwidth Links (LBLs) to the SESM (network panel) AND a topological hierarchy that links LBLs and NATs to form a tree of 'internet transparency middleboxes'. These devices are sent to the small lines GWCs via the

GWC-MIDDLE-BOX-MIB and  
GWC-MIDDLEBOX-RSRCUSAGE-MIB (the resource usage of the LBL)

The model for this download of data has been designed for the "fixed-lines" IAD deployment, and occurs when the gateway is associated to an adjacent-middlebox.

This solution is to allow VCAC to function correctly for CICM gateways because unlike the small-lines IAD solution the CICM gateways resides in the TSP (succession) domain. The CICM **gateway** does not "fit" the concept of an "adjacent middlebox". The Adjacent middlebox will always be = 0 ( <none> ).

CICM users login to the CICM terminals, this sends a message to the GWC. In SN07 this message will contain the "discovered" adjacent middlebox of the terminal/endpoint. The CallP ITA function will then "look-up" this middlebox in the GWC static tables. For a more comprehensive problem definition please refer to the DID for this activity.

This solution allows the user to provision a set of root (top-level) middleboxes, allowing the GWCEM to send all the underlying middleboxes to the GWC. Ensuring that when a CICM user logs in, the middlebox will be available on the GWC, see figure 1.

**Figure 1 CICM gateway : Multiple root middlebox provisioning**

This feature provides the following functionality (from the OSS and GWCEM - GUI):

- Provision a set of root middleboxes (a maximum of 5) per CICM gateway.
- Change the current provisioning of root middleboxes against provisioned CICM gateways.
- Display/Query the root middleboxes that are provisioned against a CICM gateway.

### 1.3 Hardware Requirements or Dependencies

No new hardware is required or introduced by this feature. The application components provided by this feature execute as part of the SESM.

### 1.4 Software Requirements or Dependencies

Dependencies:

- A00002512 VCAC provisioning for the GWCEM
- A00003568 E911 support will allow the CICM endpoints adjacent middlebox to be sent to the GWC when the user logs into the gateway.
- A00002739 GWC Call-P for the VCAC functionality.

## 1.5 Limitations and restrictions

- The GWC has a limit of 2000 middleboxes.
- Internal counting limits the provisioning of gateways onto the same GWC as the associated chain of LBLs (they must be provisioned onto one GWC). This needs to be made clear in the engineering guidelines, and will be blocked by code to stop the user from completing such provisioning steps.
- A limit of 5 Root Middleboxes can be provisioned against a gateway.
- The CentrexIP users cannot roam outside of their provisioned “enterprise” area, and expect VCAC to function.

## 1.6 Interactions

The following existing GUIs have been modified:

- Associate Media Gateway Dialog (see Figure 3).
- Change Gateway Dialog (see Figure 4).
- Gateway Provisioning Panel (see Figure 2)

The following existing XML commands have been modified:

- AssocMG (see Figure 6)
- ChangeRootMiddleBoxes (see Figure 9).
- QueryMG (see Figure 7 and Figure 8).

The on-line help facility will be updated with information on the use, syntax and valid values for all the above modifications/additions.

## 1.7 Applicable customer facing sections

## 1.9 Gateway Provisioning changes

The association of a CICM gateway(or other future Roaming user style gateways) to a GWC has been modified to allow the user to provision a set of

root middleboxes (0..5 only). Already provisioned gateways can also be changed to have a different set of (or none) root middleboxes.

## 1.9.1 GUI Client

### 1.9.1.1 Associate gateway GUI

The Associate gateway dialogue has been modified to display a new internet transparency panel, this occurs when a CICM gateway has been selected. The user may optionally select upto 5 root middleboxes to associate with the CICM gateway, these are selected to define the roaming area where VCAC will function for the CICM users/endpoints. The root middlebox selection process is controlled from within the Root middlebox selection area, this is the same for either the Associate gateway or the Change gateway commands.

**Figure 3 Associate gateway dialogue**

**Associate Media Gateway**

### 1.9.1.2 Change Gateway GUI

The change gateway Root Middleboxes dialogue has been created to allow the user to modify (or remove) the Root Middleboxes associated with an already provisioned CICM gateway.

**Figure 4** Change gateway RootMiddleboxes dialogue

### 1.9.1.3 Root Middleboxes Details

**Figure 5** Root Middlebox details can be displayed by selecting the details button.

### 1.9.2 XML Interface

The AssocMG and QueryMG interface has been modified to allow/display (0..5) root middleboxes. A new interface ChangeRootMiddleboxes has been added to the ItransIf code. If any request is unsuccessful, an error message is returned as described in Appendix B.

### 1.9.2.1 AssocMG command

**Figure 6 XML command AssocMG**

```

          <rootMiddleboxName1>NAT1</rootMiddleboxName1>
          <rootMiddleboxName2>NAT2</rootMiddleboxName2>
        </Parameters>
      </changeRootMiddleboxes>
    </Methods>
  </Command>
</CommandList>
```

## 1.10 Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or 'Authorization' levels for commands. Each command is associated with one or more user groups. In order to execute a command, a user must belong to at least one of the associated user groups. The user groups associated with the new commands associated with this feature are specified in the table below.

**Table 1 NEW Internet Transparency Commands Authorization**

| Command                                | User Group |       |        |          |       |
|----------------------------------------|------------|-------|--------|----------|-------|
|                                        | mgcadm     | mgcrw | mgcmte | mgcsprov | mgcro |
| ChangeRootMiddleboxes                  | X          | X     |        |          |       |
| Display Gateway Root Middlebox details | X          | X     | X      | X        | X     |

## 1.11 Upgrade

When upgrading the GWCEM to SN07 when CICM gateways are present in the Network:

It is necessary to (i) set the Call Agent ID and then (ii) update the IDs for all enterprises (NATs) on a CICM to new IDs **prior** to upgrading the CICM Gateway.

Hence the recommended order for upgrade is as described below:

### Upgrade Procedure

1. Upgrade GWCEM to SN07.
2. Set Call Agent ID in GWCEM. This causes all existing middlebox ids to be upgraded to the SN07 format.
3. Upgrade the GWC to SN07 (this may also be done after step 5).
4. Upgrade CICM EM to SN07
5. On the CICM EM, using the provided interface, retrieve the middlebox IDs for all NATs from GWCEM. This will update the NAT information stored in the CICM EM with the new SN07 format middlebox ids.
6. Upgrade CICMs to SN07. CICM upgrade from SN06.2 to SN07 will be done by adding SN07 CICM to GWC and migrating users across to new CICM. The SN07 CICM will have the new format middlebox IDs. All terminals will re-login as part of this upgrade, hence all get new format IDs associated with them in the CICM.

## 1.12 Glossary

| Term  | Description                           |
|-------|---------------------------------------|
| GUI   | Graphical User Interface              |
| GWC   | Gateway Controller                    |
| GWCEM | Gateway Controller Element Manager    |
| NAT   | Network Address Translation           |
| LBL   | Limited Bandwidth Link                |
| VCAC  | Virtual Connections Admission Control |

</assocMG>
</Methods>
</Response></CommandList>
```

## 1.15 Appendix C: XML Commands: description of method parameters

### 1.15.1 Parameter definitions

- **encoding??**
- **version** - The version refers to the version of the method or operation - e.g., the changeRootMiddleboxNames operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parms X, Y, and Z. TYPE *decimal*.
- **usn** - Unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.
- **ReturnCode value**- A numeric value indicating the result of the attempted operation (see Table 3, for range and definitions of each possible value). TYPE *string*.
- **Return code text**- Appropriate text that describes the result of the operation. TYPE *string*.
- **rootMiddleboxName1(1..5)** - The Middlebox name(s) of the root node middlebox(es) that encompasses the enterprise network that the CICM gateway operates with.. TYPE *NoSpaceNameType*. (32 character token without spaces, see xsd definitions in Appendix A, section 1.13)

### 1.15.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **AssocMG** - Method to associate a gateway to the CS2K. This method has the following NEW parameters: (only NEW ones described, see standard documentation for the other definitions).
  - Input data:
    - usn
    - version
    - rootMiddleboxName1 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 1st RootMiddlebox for this gateway.
    - rootMiddleboxName2 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 2nd RootMiddlebox for this gateway.
    - rootMiddleboxName3 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 3rd RootMiddlebox for this gateway.
    - rootMiddleboxName4 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 4th RootMiddlebox for this gateway.
    - rootMiddleboxName5 (Optional, Cannot be included as well as itransMiddleboxName or pepServerName) - defines the 5th RootMiddlebox for this gateway.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
2. **QueryMG** - Method that gets the gateway information from a CS2K. This method has the following NEW Output parameters: (only NEW ones described, see standard documentation for the other definitions):
  - Output data:
    - rootMiddleboxName1 - defines the 1st RootMiddlebox for this gateway.
    - rootMiddleboxName2 - defines the 2nd RootMiddlebox for this gateway.
    - rootMiddleboxName3 - defines the 3rd RootMiddlebox for this gateway.
    - rootMiddleboxName4 - defines the 4th RootMiddlebox for this gateway.

- rootMiddleboxName5 - defines the 5th RootMiddlebox for this gateway.
- 
- 3. **changeRootMiddleboxes** - Method that changes the rootMiddleboxes for a given gateway. This method has the following parameters:
  - Input data:
    - usn
    - version
    - MGname indicates the gateway that this change command is for.
    - rootMiddleboxName1 - defines the 1st RootMiddlebox.
    - rootMiddleboxName2 - (Optional) defines the 2nd Root Middlebox.
    - rootMiddleboxName3 - (Optional) defines the 3rd Root Middlebox.
    - rootMiddleboxName4 - (Optional) defines the 4th Root Middlebox.
    - rootMiddleboxName5 - (Optional) defines the 5th Root Middlebox.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

## ***Product = Centrex IP Client Manager (CICM)***

### **A00007244--GIC and GIAC Support on CICM and MG9K**

#### ***Excerpts from the Test Plan***

#### **1.1 Applicable Solution(s)**

UA-IP, IAW

#### **1.2 Feature Overview**

##### **1.2.1 GIC Feature Overview**

The MBS Group Intercom (GIC) allows an end user to terminate on a member of a selected group using abbreviated dialing. An intercom group can have a maximum size of ten members, 1000 members, or 10 000 members. End users

in a ten member group dial a single digit, 0 to 9, to reach others members in their group. End users in a 100 member group dial a two digit number, 00 to 99. In a 1000 member group, end users dial a three digit code, 100 to 999. In a 10 000 member group, end users dial a four digit code, 0000 to 9999. A Meridian business set (MBS) can have members of several different GIC groups. A separate feature key must represent each group.

To activate MBS Group Intercom, the end user presses the GIC key. The end user dials the correct number of digits. If the call terminates on another MBS, the system rings the GIC key associated with the originating GIC group. The called party must press the GIC key to answer. If the call terminates on a Unity or 500/2500 set, the called party goes off-hook to answer the call. Digits dialed after the end user presses a GIC key appear as dialed. Calls incoming on a GIC key display the GIC member number of the originator.

#### 1.2.1.1 GIC Individual Paging

Individual GIC paging provides for one member of a group intercom (GIC) groups, using the GIC key of MBS set, to activate built-in alerting speaker of another GIC group member's MBS for paging purposes. Both GIC group members must be in same GIC group.

To use GIC individual paging feature, the caller presses the GIC key and dials appropriate GIC member number. Following the first ring, the caller again presses the GIC key. A one-way connection is established, and the caller can then talk over speaker. The called group member can establish a two-way conversation by either pressing the ON key of the handsfree-unit or by lifting the handset.

GIC Individual Paging feature requires GICPAGE option in table CUSTSTN for related customer group

#### 1.2.1.2 GIC and SERVORD command

The assignment of option GIC to an MBS using the ADO command appears in the following SERVORD example. Assignment of option GIC occurs to key 5. The designated name of the line is SMITH. The GIC member number (GICMEMNO) is 24. The SMDR records are a requirement.

SERVORD example for MBS Group Intercom in no-prompt mode

```
>ADO $ 2 0 1 25 2 GIC SMITH 24 Y N $
```

QGRP show the output of GIC group:

```
>qgrp gic HOST 02 0 01 26 4
```

```
SORT_BY_LEN_OR_MEM: LEN
```

```
>len
```

GIC GROUP

-----  
HOST 02 0 01 26      KEY 4      MEMBER 23  
DN 1027835002

HOST 02 0 01 25      KEY 2      MEMBER 24  
DN 1027835001

The number of members in the GIC GROUP "SMITH" is 2

### 1.2.2 GIAC Feature Overview

Group Intercom All Call (GIAC) allows an MBS end user to page up to 100 members (with MDC00077 SOC option) for one-way speech path and up to 30 members for two-way speech path in his or her designated Group Intercom (GIC) group simultaneously, and establish a conference with the paged members. This functionality is extremely useful in situations where common announcements need to be broadcast to several individuals in the same GIC group. These individuals must be equipped with Meridian business sets (MBS). An individual group member hears the page over his or her own set's built-in speaker, and can (when required) respond to the originator.

To activate **manual** GIAC paging, a member lifts the handset, presses the GIC key, and presses the octothorpe (#) key on the dial pad. The member who activates GIAC is known as the originator of the call. Then originator presses GIC key again to start paging. When GIAC is activated, a conference bridge is established, and each member of the GIAC group is placed on a port of the conference circuit. The paged group members can establish a two-way conversation by either pressing the ON key of the handsfree-unit or by lifting the handset.

To use **automatic** GIAC paging (PAGING field is datafilled as "Y"), a member lifts the handset, presses the GIC key. The member who activates GIAC is known as the originator of the call. Then when GIAC is activated, a conference bridge is established, and each member of the GIAC group is placed on a port of the conference circuit. The paged group members cannot establish a two-way conversation by either pressing the ON key of the handsfree-unit or by lifting the handset. Automatic GIAC paging only supports one-way speech path (from originator to paged members).

To use automatic paging function of GIAC feature, MDC00077 SOC implemented by activity A0004007 status should be set to ON.

In order to use GIAC, an individual with an MBS must be a member of an intercom group that has GIAC datafilled in Table KSETFEAT (Business Set

and Data Unit Feature). When a member activates GIAC, the other members that belong to the same GIAC group are paged. A GIAC group can have a maximum of 100 (with MDC00077 SOC option) members (including the originator).

### 1.2.2.1 GIAC and SERVORD command

The following SERVORD example shows how Group Intercom All Call is added to a line using the ADO command.

SERVORD example for MBS Group Intercom in no-prompt mode

```
>ADO $ 02 0 01 25 2 GIAC 7 Y N $
```

QGRP show the output of GIAC group:

```
>qgrp
```

```
GRP_TYPE:
```

```
>giac
```

```
LEN_OR_LTID:
```

```
>HOST 02 0 01 26
```

```
KEY:
```

```
>4
```

GIAC GROUP

-----

```
HOST 02 0 01 25      KEY 2      MEMBER 24
```

```
HOST 02 0 01 26      KEY 4      MEMBER 23
```

THE NUMBER OF MEMBERS IN THE GIAC GROUP "7" IS 2

## ***Product = Centrex IP Client Manager (CICM)***

### **A00007253--MADN Ring Forward Support for CICM and MG9K** ***Excerpts from the Test Plan***

#### **1.1 Applicable Solution(s)**

UA-IP, IAW

## 1.2 Feature Overview

### 1.2.1 MADN description

A directory number (DN) that is assigned to more than one business set or single line set is called a MADN. The telephone sets that are assigned this DN form a MADN group. MADN groups can be comprised of 2 to 32 members and configured in either a single call arrangement (SCA) or multiple call arrangement (MCA). The option MDN must be assigned to the telephone line appearance.

### 1.2.2 Single call arrangement (SCA)

Single call arrangement allows only one call to be active on the SCA group. The active call may be an origination by a SCA member or an incoming call presented to all the SCA members. The originator or answering member will have privacy on the call that excludes all other members. The lamps associated with the SCA appearances on all business set members will be on. The call will remain private, with the active member controlling the option, privacy release (PRL). When the controlling member depresses the PRL key or dials the privacy release activation code (PRLA), the other members will be notified by a blinking lamp associated with the SCA appearance. Upon activation of privacy release, one SCA member may conference into the call.

The MADN ring forward (MRF) option provides four ringing options for calls offered to SCA groups. The ringing options are:

- **abbreviated** - the line appearance rings from call termination until the timer expires.
- **delayed** - the line appearance rings after the timer expires.
- **always** - the line appearance rings from the time the call terminates until it is answered or the caller abandons the call.
- **never** - the line appearance does not ring when a call terminates on the SCA group.

The timer that controls the delayed or abbreviated ring is set on a SCA basis. (0 or 12-60 seconds).

The MADN ring forward manual (MRFM) option provides for the forwarding of ringing of SCA group appearances. The MRFM option allows a station with MRF and the abbreviated ringing option to manually stop its ringing before the timer expires. This is done by pressing a MRFM key. Once the MRFM key is pressed any set with the delayed ringing option begins to ring. MRFM is a subset feature. Therefore, each DN that requires this manual capability must be key listed when this feature is assigned to the business set. One business set can have several MRFM keys. The MADN ring forward (MRF) option must

be assigned to the SCA group before an appearance of that SCA may be assigned to the keylist of the MRFM key.

### 1.2.3 MADN Ring Forwarding and SERVORD command

The following SERVORD example shows how MADN Ring Forward is added to an existing SCA MADN line using the SERVORD ADO command. The group is assigned MRF. The system prompts the end user for the MRF\_RING to assign special ringing to the MADN group member.

**SERVORD example for Assigning MADN Ring Forward to an existing SCA MADN line in prompt mode.**

```
> ADO
SONUMBER :      NOW      92    1    2    AM
>

```

# SN08 Feature Deltas

***Product = IEMS***

## **A00006756--NSSwitch Implementation in IEMS**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Introduction**

This document explains how NSSwitch (Name Service Switch) can be implemented in IEMS. This document covers the following:

- A brief description about the proposed design for NSS implementation in IEMS with a workflow chart
- NSS implementation details
- Major work items involved
- New C APIs that are to be added
- Changes on the client side

Basically, NSSwitch is a standard used in all Unix flavor operating systems, founded by Sun Micro Systems. The OS uses a number of databases of information about hosts, users (passwd/shadow), groups etc., Data for these hostnames and addresses may be found in /etc/hosts, NIS, NIS+ or DNS. Supporting NSSwitch enables IEMS as NSSwitch compliant.

### 1.3 Overview of the NSSwitch Design

The following list depicts the workflow of the implementation of the method “isAuthorized”.

- 1 Request comes in to the Authorization Engine.
- 2 Gets all the groups for the user through NSSwitch. Here, just a call of the URL will return the required data.
- 3 For each group, gets the authorized operations from the Database through Relational classes.
- 4 Applies Security Policy and returns the result.
- 5 For Admin user who wants to create a new user, first authorization check is done (as to whether he is authorized to create a new user).
- 6 If the admin user has got the permission, he directly invokes the AdminAPI and creates a new user. Here NSSwitch API will not be invoked.

### 1.4 Overview of the NSSwitch Implementation

The following list depicts NSSwitch implementation details in IEMS.

- 1 The call getGroup comes from AuthEngine API.
- 2 AuthEngine invokes the Https URL and gets the result regarding Group Information.
- 3 The Servlet calls the **PamPlus.java** which contains the native call for getpwnam(),getgrnam(). (This part is already done.)
- 4 NSSwitch SPI will be invoked since this entry is given in the *nsswitch.conf*. This SPI will contact the Security Server through socket.
- 5 The Security Server gets data from the Security DB through RelationalAPI and returns back to the AuthEngine.

### 1.5 Major Work Involved

Two new Tables PLATFORMUSERDETAILS, PLATFORMGROUPDETAILS have to be created with detailed information about users and groups. These two tables will contain all the information of */etc/passwd*, */etc/shadow*, */etc/group* files.

Schema for the new tables will look like following:

#### **PLATFORMUSERDETAILS:**

| S.No | COLUMN_NAME | DATA_TYPE | PRIMARY_KEY | REMARKS                                                                                 |
|------|-------------|-----------|-------------|-----------------------------------------------------------------------------------------|
| 1    | USERNAME    | VARCHAR2  | YES         |                                                                                         |
| 2    | USER_UID    | NUMBER    |             |                                                                                         |
| 3    | GROUP_GID   | NUMBER    |             | Primary Group ID, It should be any one of the value from PLATFORMGROUPDETAILS.GROUP_GID |
| 4    | GECOS       | VARCHER2  |             |                                                                                         |
| 5    | HOME_DIR    | VARCHER2  |             |                                                                                         |
| 6    | LOGIN_SHELL | VARCHER2  |             |                                                                                         |
| 7    | LAST_CHANGE | NUMBER    |             |                                                                                         |
| 8    | MIN         | NUMBER    |             |                                                                                         |
| 9    | WARN        | NUMBER    |             |                                                                                         |
| 10   | INACTIVE    | NUMBER    |             |                                                                                         |

**PLATFORMGROUPDETAILS:**

| S.No | COLUMN_NAME   | DATA_TYPE | PRIMARY_KEY | REMARKS   |
|------|---------------|-----------|-------------|-----------|
| 1    | GROUPNAME     | VARCHAR2  | YES         |           |
| 2    | GROUP_GID     | NUMBER    |             |           |
| 3    | GROUPPASSWORD | VARCHAR2  |             | NOT USED. |

**1.6 C API implementation:**

The following apis needs to be implemented as part of this operation.

**/etc/passwd:**

- 1 struct passwd \*getpwnam(const char \*name);
- 2 struct passwd \*getpwnam\_r(const char \*name, struct passwd \*pwd, char \*buffer, int buflen);
- 3 struct passwd \*getpwent(void);
- 4 struct passwd \*getpwent\_r(struct passwd \*pwd, char \*buffer, int buflen);
- 5 struct passwd \*getpwuid(uid\_t uid);

```
6 struct passwd *getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
  int buflen);
```

```
7 void setpwent(void);
```

```
8 void endpwent(void);
```

#### **/etc/shadow:**

```
1 struct spwd *getspnam(const char *name);
```

```
2 struct spwd *getspnam_r(const char *name, struct spwd *result, char
  *buffer, int buflen);
```

```
3 struct spwd *getspent(void);
```

```
4 struct spwd *getspent_r(struct spwd *result, char *buffer, int buflen);
```

```
5 void setspent(void);
```

```
6 void endspent(void);
```

#### **/etc/group:**

```
1 struct group *getgrnam(const char *name);
```

```
2 struct group *getgrnam_r(const char *name, struct group *grp, char
  *buffer, int bufsize);
```

```
3 struct group *getgrent(void);
```

```
4 struct group *getgrent_r(struct group *grp, char *buffer, int bufsize);
```

```
5 struct group *getgrgid(gid_t gid);
```

```
6 struct group *getgrgid_r(gid_t gid, struct group *grp, char *buffer, int
  bufsize);
```

```
7 void setgrent(void);
```

```
8 void endgrent(void);
```

```
9 getgroupsbymember();
```

### **1.6.1 Sample result of some of the new APIs:**

The getpwnam(char\* username) will return a structure. This structure will contain following data from the new table.

| S.No | Structure Variable | Definition | Data |
|------|--------------------|------------|------|
|------|--------------------|------------|------|

|   |                    |                                  |                                                                   |
|---|--------------------|----------------------------------|-------------------------------------------------------------------|
| 1 | char<br>*pw_name   | user's login<br>name             | The incoming argument <OR><br><i>PLATFORMUSERDETAILS.USERNAME</i> |
| 2 | char<br>*pw_passwd | no longer<br>used                | Empty String                                                      |
| 3 | uid_t pw_uid       | user's uid                       | <i>PLATFORMUSERDETAILS.USER_UID</i>                               |
| 4 | gid_t pw_gid       | user's gid                       | <i>PLATFORMUSERDETAILS.GROUP_GID</i>                              |
| 5 | char<br>*pw_gecos  | typically<br>user's full<br>name | <i>PLATFORMUSERDETAILS.GECOS</i>                                  |
| 6 | char *pw_dir       | user's home<br>dir               | <i>PLATFORMUSERDETAILS.HOME_DIR</i>                               |
| 7 | char<br>*pw_shell  | user's login<br>shell            | <i>PLATFORMUSERDETAILS.LOGIN_SHELL</i>                            |

Result for getsppnam(char\* username) is tabulated below

| S.No | Structure<br>Variable | Definition                      | Data                                                              |
|------|-----------------------|---------------------------------|-------------------------------------------------------------------|
| 1    | char<br>*sp_namp      | login name                      | The incoming argument <OR><br><i>PLATFORMUSERDETAILS.USERNAME</i> |
| 2    | char<br>*sp_pwdp      | encrypted<br>passwd             | UserPasswordTable.PASSWORD                                        |
| 3    | long<br>sp_lstchg     | date of last<br>change          | <i>PLATFORMUSERDETAILS.LAST_CHANGE</i>                            |
| 4    | long sp_min           | min days to<br>passwd<br>change | <i>PLATFORMUSERDETAILS.MIN</i>                                    |
| 5    | long sp_max           | max days to<br>passwd<br>change | <i>UserConfTable.PASSWORDAGE</i>                                  |
| 6    | long<br>sp_warn       | warning<br>period               | <i>PLATFORMUSERDETAILS.WARN</i>                                   |
| 7    | long<br>sp_inact      | max days<br>inactive            | <i>PLATFORMUSERDETAILS.INACTIVE</i>                               |

|   |                          |                        |                              |
|---|--------------------------|------------------------|------------------------------|
| 8 | long<br>sp_expire        | account<br>expiry date | <i>UserConfTable.USERAGE</i> |
| 9 | unsigned<br>long sp_flag | not used               | (Integer ZERO) 0             |

Result for getgrnam(char\* name) is tabulated below:

| S.No | Structure<br>Variable | Definition                                  | Data                                                                |
|------|-----------------------|---------------------------------------------|---------------------------------------------------------------------|
| 1    | char<br>*gr_name      | the name of<br>the group                    | The incoming argument <OR><br><i>PLATFORMGROUPDETAILS.GROUPNAME</i> |
| 2    | char<br>*gr_passwd    | the<br>encrypted<br>group<br>password       | <i>PLATFORMGROUPDETAILS.GROUPPASSWORD</i>                           |
| 3    | gid_t gr_gid          | the<br>numerical<br>group ID                | <i>PLATFORMGROUPDETAILS.GROUP_GID</i>                               |
| 4    | char<br>**gr_mem      | vector of<br>pointers to<br>member<br>names | Achieved through our implementation.                                |

### 1.6.2 Client Side Changes

In the Security UI, we changed the createUser wizard such that the wizard will prompt for additional User Attributes. A few additional attributes specific to each user are obtained from the IEMS Client GUI. The list of additional attributes is as follows.

- a** gecost - Deceptive text field which contains information about the user.
- b** min - The minimum number of days required between password changes(default=1).
- c** warn - The number of days before the password expires that the user is warned(default=7).
- d** inactive - The number of days of inactivity allowed for each user after which the account will be disabled(default=0).
- e** Login Shell - The login shell that will be invoked after a successful login. User has two options (a) no-access (b) restricted. Currently

'/usr/bin/nash' is populated if no-access option is chosen and '/bin/sh' is populated if restricted option is chosen. The default value is 'no-access'.

**Note:** Changes will be made to show UID,GID & LOGINSHELL

The following is a screen shot provided to enter the additional User attributes in the Add User Wizard. This screen can be invoked from the 3<sup>rd</sup> screen of the Add User Wizard, by clicking on the “Advanced” Button. If the user does not click on this button, or no operation is performed on this GUI, default values for these fields will be populated in the database.

ScreenTitle

Java Application Window

Additional Details

Gcos

Min (days) 1

Inactive (days) 7

Warn (days) 7

Login Shell

☒ no-access

☐ restricted

Expiry: Sun, 8 Aug 2004

Please enter the user's real Name in this field (Mr. Foo Boo)

OK Cancel

The default values given for each of the above fields is configurable. The default values which can be provided currently are present in the following location: `IEMSHOME/conf/defaultUserAttribute.prop`. The format of this file is as below.

Currently the file contents are as follows.

# Security Default Values. The values for the following 5 should be integers

MIN=1

```
WARN=7
INACTIVE=0
PASSWORDAGE=30
ACCOUNTAGE=0
# LOGIN_SHELL can have noaccess/restricted for
other values the behavior is undefined
LOGIN_SHELL=noaccess
```

Changes done in this file will be reflected in the IEMS Client GUI after the client is restarted successfully.

### 1.6.3 Modifying the attributes of a User

The additional attributes of each user can be modified from the IEMS Client GUI. To modify the user attributes, please perform the following steps.

- 1 Invoke the Security Administration GUI by clicking on Tools->SecurityAdministration (or) Alt+S keys.
- 2 All the users will be listed under the “Users” Node in the Tree.
- 3 Click on the user for whom the user attributes has to be modified.
- 4 Click on the “User Profile” tab on the right hand side of the user list tree.
- 5 Click on the “Setting Profile” button on this panel, a panel which has user attributes will be popped up.
- 6 Click on the “Advanced” Button in this panel to view the additional properties of the user. After modifying the attributes, click on the OK button to modify the additional user attributes.

### 1.6.4 Password Complexity

Password complexity is a set of rules based on which passwords for users are set. The main objective behind this feature is to make a password complex while assigning a password for a user. The rules are as follows.

- Each password shall have a minimum number of characters(default=6)
- Each password shall have a maximum number of characters(default=256)
- Each password shall have at least 3 types of characters
  - lowercase characters(default=1)

- uppercase characters(default=1)
- numbers(default=1)
- special characters(default=0)
- Password shall not be the same as login id of the user.
- While changing a user's password he shall re-use his old password.
- Special characters should be configurable by the administrator.

### 1.6.5 Configuring the default values for Password complexity values

The default values provided above are present in the following file. IEMSHOME/conf/defaultUserAttribute.prop. The format of this file is as explained above.

```
PASSWD_MIN_LENGTH=6
PASSWD_MAX_LENGTH=256
LOWERCASE_COUNT=1
UPPERCASE_COUNT=1
SPECIAL_CHAR_COUNT=0
NUMBER_COUNT=1
SPECIAL_CHARS=`~!@#$%^&*()-_+=[]{}\\|;:','<.>/?`
```

If the administrator needs to change the above default values it can be changed from the above file.

## 1.7 Upgrade Process.

The process of using a revised version of software after using an old version is called the Upgrade process. First the software will be upgraded and then old data will be migrated to the new version. Migration should be manually initiated by the user.

Procedure to invoke the migration script. To migrate the data from SN07 to SN08 please follow the steps given below.

- 1 cd /opt/nortel/iems/current/bin
- 2 sh migrationTool.sh UPGRADE
- 3 The above command will migrate the data from SN07 to SN08
- 4 Now start the IEMS server

### Order of migration

- 1 Add Succession 25 groups
- 2 Migrate list of groups created in IEMS in SN07 with GID & empty password
- 3 Migrate list of users created in IEMS including iemsadm,guest

During IEMS Server start up, all the succession 25 groups will be added to the IEMS database. Then all the operations relevant to these groups will be added to IEMS DB from the SuccessionGroupInfo.xml file. After this operation IEMS will migrate the list of groups created in IEMS along with enumerated GID. Now the users created in IEMS will be migrated with primary group ID as succssn.

## 1.8 Succession 25 group-Operations Mapping

The following table contains the initial mapping of groups & their corresponding mapping permission these operations are provided below.

Brief description of **Succession 25 groups Domains**.

| <i>Domains</i> | <i>Application Mapping</i>                                                                           |
|----------------|------------------------------------------------------------------------------------------------------|
| Trk            | Trunks, trunk based services, small trunking gateways (port level), carrier, carrier based services. |
| Ln             | Line services, line cards, small line gateways.                                                      |
| Mgc            | Media Gateway Controllers: CS2K, GWC, SAM21, 3PC, Storm...                                           |
| Mg             | Media gateways: UAS, Line Gateways, Trunk Gateways.                                                  |
| Ems            | SSPFS based EMSs, GWCEM, SAM21EM, UASEM, etc.                                                        |

### Brief Description of **Succession 25 group Roles**

| <i>Roles</i> | <i>Application Mapping</i>                                                                                                                                                                                                 |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adm          | Reconfiguration, access to all functions, setup of fundamental configuration, can commission (add/deletet/rehome) base frames/systems (SAM21 frames, Call servers, large gateways), can run service impacting diagnostics. |

|       |                                                                                                                                                                   |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rw    | Can see and change configuration and status, can commission and reconfigure elements (GWCs, cards, shelves). Also called improv, for infrastructure provisioning. |
| Sprov | Subscriber provisioning; can see status and configuration and change provisioning data, but cannot change mtc state or do base component configuration.           |
| Mtc   | Maintenance role can see configuration and status, can make changes to status, can run service impacting diagnostics                                              |
| Ro    | The "read only" role can see configuration and status, but cannot make changes to them                                                                            |

It is available as below.

| Operation/<br>Groups     | e<br>m<br>s<br>a<br>d<br>m | e<br>m<br>s<br>r<br>w | e<br>m<br>s<br>s<br>p<br>r<br>o<br>v | e<br>m<br>s<br>m<br>t<br>c | e<br>m<br>s<br>r<br>o | m<br>g<br>a<br>d<br>m | m<br>g<br>r<br>w      | m<br>g<br>s<br>p<br>r<br>o<br>v | m<br>g<br>m<br>t<br>c | m<br>g<br>r<br>o      | m<br>g<br>c<br>a<br>d<br>m | m<br>g<br>c<br>r<br>w | m<br>g<br>c<br>s<br>p<br>r<br>o<br>v | m<br>g<br>c<br>m<br>t<br>c | m<br>g<br>c<br>r<br>o | l<br>n<br>a<br>d<br>m | l<br>n<br>r<br>w      | l<br>n<br>s<br>p<br>r<br>o<br>v | l<br>n<br>m<br>t<br>c | l<br>n<br>r<br>o      | t<br>r<br>k<br>a<br>d<br>m | t<br>r<br>k<br>r<br>w | t<br>r<br>k<br>s<br>p<br>r<br>o<br>v | t<br>r<br>k<br>m<br>t<br>c | t<br>r<br>k<br>r<br>o |  |

TRUE -> Indicates that the operation is allowed to the group

FALSE ->Indicates that the operation is not allowed to the group

BLANK FIELD denotes that it is not allowed by the child operation may allow or disallow

Operations and permission settings are done as part of the IEMS migration process. The user **will not be able to set any operation/permission from the IEMS Client GUI. The succession groups is non modifiable & non deletable groups.**

## 1.9 Procedure to add a group to existing succession 25 groups.

- 1 Invoke the IEMS Client GUI.
- 2 Add a group using the Add group Wizard [Provision to enter/modify GID will be provided].
- 3 Then add the groupname along with its group id in the successiongroups.prop present in IEMSHOME/conf/ directory.
- 4 The group name and id should be added to the file in the following format.
- 5 groupname=GID

## 1.10 Adding a group name and group id to a reserved list.

This provision helps the user to stop adding a group which is already available in group datasource other than IEMS.

- 1 Edit the file in IEMSHOME/conf/reservedgroups.prop
- 2 Add the reserved groupname in this file in the following format:  
reservedgroupname=GID

Configurable group ID Range can be given in NmsProcessesBE.conf present in IEMSHOME/conf directory, as an argument to Security Process as groupIDRange 12001-14000

## 1.11 Group ID support

While adding a group the customer has the option to provide a group ID. If this field is left blank then a group ID will be selected from the configurable range provided by the user. The configurable values can be given in the file /opt/nortel/iems/current/conf/NmsProcessesBE.conf.

The contents of this file will be as below.

```
#java com.adventnet.security.authentication.SecurityProcess
PROCESS com.adventnet.security.authentication.SecurityProcess
ARGS SecurityServerPort 7777 maximum_allowed_login_failed_count 0
userIdRange 10001-12000 groupIdRange 12001-14000
```

The text given in bold shows the configurable range of group ID's that can be provided by the user. In this configurable range the lower limit is 12001 & the upper limit is 14000. The user can change these values according to their requirements. During group ID enumeration the values will be chosen from this range. The following is a screen shot added to show the group id in IEMS Security Client.

If the number of groups is equal to the range specified in IEMSHOME/NmsProcessesBE.conf then error message stating that the GID range has exhausted will be logged to nmserr.txt file.

#### **To view the group id**

The group ID for each user can be viewed in IEMS Security Client. To view a group id in IEMS Security Client, click on a group name in IEMS Security Client Tree. In the right hand side, click on the Members tab. The screen shot below shows the group id of a selected group "Users".

## 1.12 Conclusion

With the above specifications and design, we can implement NSSwitch support in IEMS.

## 1.13 Device Vs. Domain

| S.No | Device Type                | Auth. Domain |
|------|----------------------------|--------------|
| 1    | APS Mgr                    | EMS          |
| 2    | CS2K Core Mgr              | EMS          |
| 3    | CEM Mgr                    | EMS          |
| 4    | MCS Mgr                    | EMS          |

## 1.14 Operation Description

Following table describes the operations name with their explanation.

|                        |                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configure Log Levels   | This operation can be used to set the logging and the corresponding levels for various modules in the Integrated EMS Server.                                                                     |
| Runtime Administration | This operation is a powerful tool to configure the Integrated EMS Server settings from the Integrated EMS without a need for the user to restart the server for the new settings to take effect. |

|                             |                                                                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| SystemAdministration        | This Operation is the entry point all the Administrative operations.                                                                |
| Security Administration     | Security Management is about authenticating a user from logging into Integrated EMS to providing permissions to perform operations. |
| Northbound Configuration    | This operation will enable to set/get Northbound configuration devices using NTSTD,SCC2,SNMP                                        |
| User Configuration          | This operation is used to obtain the link for User Administration.                                                                  |
| Add Users                   | This operation is used to create a new user.                                                                                        |
| Assign User To Group        | This operation is used to assign the user to a new or existing group.                                                               |
| Remove Users                | This operation is used to remove the whole account for a particular user.                                                           |
| Remove User From Group      | This operation is used to remove the particular user from a particular group only.                                                  |
| Change Password             | This operation is used to change the existing password for a particular user.                                                       |
| Get List of Users           | This operation is used to view the list of users present in the database.                                                           |
| Set Users Permission        | This operation is used to sets operations or permissions for the existing users.                                                    |
| Set User Profile            | This operation is used to set profiles for the existing users.                                                                      |
| Clear Audit Trails          | This operation is used for clearing audit trails for the user.                                                                      |
| Add Threshold Object        | This operation is used to create a new Threshold Object to create Threshold Events for a new device or the existing device.         |
| Modify Threshold Object     | This operation is used to modify the existing Threshold Object for making performance analysis better.                              |
| Delete Threshold Object     | This operation is used to remove the existing Threshold Object.                                                                     |
| Get Threshold Object        | This operation is used to view the particular Threshold Object.                                                                     |
| Manage and Unmanage Objects | This operation is used to set the management status of the particular object at run time.                                           |
| Add Node                    | This operation is for adding a new node in the topology.                                                                            |

|                        |                                                                                                                                                                                            |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete Object          | This operation is for removing a particular object from the topology.                                                                                                                      |
| Dump Inventory Details | This operation is used to collect the list of discovered devices from the topo database and print them in a text file.                                                                     |
| Map Editing Operations | This operation is mainly used to configure the maps, such as creation of new maps, customization of map hierarchy, map symbol layout, and map symbol renderers through the Integrated EMS. |
| Get Event Filters      | This operation is for viewing the Event Filters present in the server.                                                                                                                     |
| Set Event Filters      | This operation is for modifying existing Event Filters or creating a new Event Filter.                                                                                                     |
| Save Events To File    | This operation is for saving the selected events or the events displayed in the Events Panel.                                                                                              |
| Print Event View       | This operation is for printing either the selected events or events displayed in the Events Panel.                                                                                         |
| Event Cleanup          | This Operation will cleanup all the events in the datastore                                                                                                                                |
| Get Alert Filters      | This operation is for viewing the Alert Filters present in the Server.                                                                                                                     |
| Set Alert Filters      | This operation is for modifying existing Alert Filters or for creating new Alert Filter                                                                                                    |
| Set Alert Annotation   | This operation is for adding notes (annotation) to an alarm.                                                                                                                               |
| Get Alert Details      | This operation is for viewing the details of a particular alarm.                                                                                                                           |
| Save Alerts To File    | This operation is for saving either the selected alarms or the alarms displayed in the current Alarm Panel into a file.                                                                    |
| Print Alert View       | This operation is for printing either the selected alarms or the alarms displayed in the current Alarm Panel.                                                                              |
| Clear Alerts           | This operation is for changing the Alarm Severity to Clear.                                                                                                                                |
| Get Alert Annotation   | This operation is for viewing a particular existing alarm annotation.                                                                                                                      |
| Get Alert History      | This operation is for viewing the alarm history, that is, the change in status of an alarm from the first alarm to the latest alarm.                                                       |

|               |                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------|
| Alert Pickup  | This operation is used to pick up the alarm. (specify person or allocate resources to handle it)   |
| Delete Alarms | This operation is used to remove a particular alarm, which is of no interest or has been resolved. |
| Add Job       | This operation is for creating a new job.                                                          |
| Delete Job    | This operation is for removing an existing job from the system.                                    |

## ***Product = IEMS***

### **A00006757--IEMS Secure Launch to PP8600**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

This feature defines security measures to be applied to communications between Succession management applications and the Passport 8600 Routing Switch.

The management applications include IEMS and the PP8600 graphical configuration and management tool known as the Java Device Manager (JDM).

All communications between OAM applications and the PP8600 must be authenticated and encrypted. The means for doing this are provided by SNMPv3 and SSHv2.

Configuration is required for all three objects in the diagram above. The bulk of the configuration is in the PP8600. It must be completed before the configuration of IEMS or JDM is performed. There is no interaction between IEMS and JDM, hence, the configuration of one is independent of the other.

### 1.3 Configure the PP8600

The following configuration steps must be performed on the PP8600. This is accomplished by using telnet to log in to the PP8600 configuration console. If the PP8600 is contained in a VLAN, telnet must be performed from a workstation that has access. The IEMS Server would be a logical choice.

The default userid/password is “rwa/rwa”

```
> telnet 47.142.126.223
```

```
*****
* Copyright (c) 2004 Nortel Networks, Inc.          *
* All Rights Reserved                               *
* Passport 8010                                      *
* Software Release 3.7.0.0                           *
*****
```

Login: **rwa**

Password: **\*\*\***

The Software Release level must be 3.7 or greater. After successful login the prompt will appear.

```
PP8600:5#
```

The string shown as a prefix (in this case, PP8600) is the mib-2 object, SNMPv2-MIB::sysName.0. It can be changed with the command,

```
config cli prompt <new-prompt>
```

Entering a question mark (?) will display a list of commands that are available at the current context. It will also display a list of sub-contexts that can be entered via the sub-context name. This is akin to traversing a hierarchy of commands.

The command info will display the state of current context and list the available sub-contexts. The state of a context is a list of attributes and corresponding values.

Configuration is done via the config context. Enter the context name.

```
PP8600:5# config
```

The prompt will change to

```
PP8600:5/config#
```

### 1.3.1 Notes on shell cursor movement and editing

- Left and Right arrow keys will move the cursor backward and forward on command line.
- Up and Down arrow keys move backward and forward in the command stack
- Ctrl-a moves the cursor to beginning of command line
- Ctrl-e moves the cursor to end of command line
- Ctrl-h is a destructive backspace. The Backspace key does nothing.
- You are always in insert mode.
- Ctrl-d is passed to telnet/ssh and will the close session

### 1.3.2 Load Encryption Modules

From the config context, enter the commands,

```
load-encryption-module DES
```

```
load-encryption-module 3DES
```

Encryption modules must be loaded onto the PP8600 flash using ftp or tftp or by use of PCMCIA slot. Refer to the applicable installation guide for Passport 8600 Routing Switch.

If the DES encryption module is not available then SNMPv3 –USM can not be configured. This means that authenticated and encrypted communications between Succession OAM applications and the PP8600 will not be available. SNMP communications will only be via

If the Triple DES (3DES) encryption module is not available then SSH can not be configured. Telnet will be the only available communications protocol for accessing the PP8600 command line.

### 1.3.3 SNMPv3 Tables

The following tables are used to configure SNMPv3 authentication and privacy.

- **USM** table defines users, authentication/privacy protocols, and passwords.
- **Group-Member** table defines which groups each USM user belongs to

- **Group-Access** table defines the access rights each user has to the objects in the MIB tree.
- **Notify** table defines the types of notifications (TRAP or INFORM) that are sent.
- **Target-Param** table defines which USM user will receive a notification.
- **Target-Address** table defines the network managers that receive notifications. Each row denotes a unique manager. It will have 1 or more references into the Notify table to determine which notification type. It will also have a 1 reference into Target-Param table to determine the user credentials used to send the notification.
- **Community Table** contains the Read and Write community strings for SNMPv1/v2c. Note that the Target-Param table references the Community Table for the purposes of sending v1/v2c traps.

### 1.3.4 Configure SNMP-v3

Change into the `snmp-v3` context by entering context name. The new prompt will display as,

```
PP8600:5/config/snmp-v3#
```

- 1 Add users `iems` and `jdm`. We create a different user for each application so that a password change made using the JDM will not break the IEMS application. SNMPv3-USM uses an authentication protocol and password and also a privacy protocol and password. Entering the command the command syntax is,

```
usm create <user> <auth_prot> auth <pw1> priv <pw2>
```

where `<auth_prot>` is one of: `sha` | `md5`

Enter the commands,

```
usm create iems sha auth iemspass1 priv iemspass2
```

```
usm create jdm sha auth jdmpass1 priv jdmpass2
```

will create the 2 users: `iems` and `jdm` with:

- authentication protocol of SHA-1 and authentication password of `iemspass1` and `jdmpass1`
- privacy password of `iemspass2` and `jdmpass2`. The privacy encryption protocol is DES. This is the only one supported by the PP8600.

The information above should be noted as it will be used to configure both the IEMS and JDM.

| Attribute               | Value                               |
|-------------------------|-------------------------------------|
| User Name               | <code>iems</code>                   |
| Authentication Protocol | <code>sha</code>                    |
| Authentication Password | <code>&lt;user specified&gt;</code> |
| Privacy Protocol        | DES (only allowed value on PP8600)  |
| Privacy Password        | <code>&lt;user specified&gt;</code> |

Enter the command, `usm info`, to display the current context. It should look like,

| User/Sec Name        | Engine Id              | Protocol              |
|----------------------|------------------------|-----------------------|
| <code>iems</code>    | 800008E00300E07BA7B400 | HMAC_SHA, DES PRIVACY |
| <code>initial</code> | 800008E00300E07BA7B400 | NO AUTH, NO PRIVACY   |
| <code>jdm</code>     | 800008E00300E07BA7B400 | HMAC_SHA, DES PRIVACY |

The user name `initial` is a pre-configured value for SNMPv1.

- 2 Add user `iems` to `vacm`. This will create a group `iemsgrp` and add the users `iems` and `jdm` to it.

The command syntax is,

```
group-member create <user_name> <model> <group_name>
```

where `<model>` is one of: `snmpv1` | `snmpv2c` | `usm`

Enter the commands,

```
group-member create iems usm iemsgrp
```

```
group-member create jdm usm iemsgrp
```

- 3 Now create an access control list for the `iemsgrp`.

The empty double quoted string is the context name. This is equivalent to a null context. It is not used and not supported by the PP8600.

The command syntax is,

```
group-access create <group_name> <prefix> <model>  
<level>
```

where:

`<model>` is one of: `snmpv1` | `snmpv2c` | `usm`

`<level>` is one of: `noAuthNoPriv` | `authNoPriv` | `authPriv`

Enter the command,

```
group-access create iemsgrp "" usm authPriv
```

Note that the `<prefix>` is saved as the context name but is not use in the current level of firmware.

- 4 Finally indicate the branches of the mib tree that `iemsgrp` is allowed to access.

The command syntax is,

```
group-access view <group_name> <prefix> <level> read  
<view_name> write <view_name> notify <view_name>
```

Enter the command,

```
group-access view iemsggrp " " usm authPriv read org
write org notify org
```

Values for <view\_name> can be see with the command,

```
mib-view info
```

These define which part of the mib tree can be accessed. The value `org` specifies every object under the prefix `.iso.org`.

- 5 Add/verify the available notification types. There should be two pre-configured types. These can not be altered or deleted and is sufficient for our needs. Enter the command, `notify info` and the Notify Table should display as,

| Notify Name | Tag       | Type   |
|-------------|-----------|--------|
| Inform      | informTag | inform |
| Trap        | trapTag   | trap   |

If this is not correct add the information via,

The command syntax is,

```
notify create <notify_name> tag <value> type <type>
```

where:

<type> is one of: trap | inform

Enter the commands,

```
notify create tag Inform informTag type inform
```

```
notify create tag Trap trapTag type trap
```

- 6 Add target address for traps. First we must add an entry into target-param,

The command syntax is,

```
target-param create <tparm_name> mp-model <value>
sec-level <value> sec-name <value>
```

where the value for:

mp-model is one of: snmpv1 | snmpv2c | usm

sec\_level is one of: noAuthNoPriv | authNoPriv |  
authPriv

sec-name is the usm user entered in step 1. --  
either iems or jdm

Enter the commands,

```
target-param create TparamV3iems mp-model usm sec-  
level authPriv sec-name iems
```

```
target-param create TparamV3jdm mp-model usm sec-  
level authPriv sec-name jdm
```

This will create a new row in the table with name TparmsV3iems referencing our iems user in the USM table. Enter the command, target-param info and the table should display as,

| Target Name  | MP Model | Security Name | Sec Level    |
|--------------|----------|---------------|--------------|
| TparamV1     | snmpv1   | readview      | noAuthNoPriv |
| TparamV2     | snmpv2c  | readview      | noAuthNoPriv |
| TparamV3iems | usm      | iems          | authPriv     |
| TparamV3jdm  | usm      | jdm           | authPriv     |

TparamV1 and TparamV2 are pre-configured default entries for SNMP v1 and v2c. They should not be deleted.

## 7 Add the ip-address of the IEMS that will receive our traps. Repeat for each IEMS.

The command syntax is,

```
target-add create <target_name> <ip_addr>  
<target_parm> taglist <value>
```

Enter the command,

```
target-addr create bumrot 47.142.94.68:162  
TparamV3iems taglist trapTag
```

...or...

```
target-addr create bumrot 47.142.94.68:162  
TparamV3jdm taglist trapTag
```

This will create an entry for,

- a host called `bumrot`. This is an arbitrary string and does not match the real host name. PP8600 will not use a DNS to resolve the ip-address.
- The ip-address to receive the trap.
- A reference to the user who receive the trap at the specified ip-address. This is designated via the target-param name of `TparamV3iems TparamV3jdm`.
- A reference to the kind of notification to be sent. This is designated via the notify name of `trapTag` and points back to the Notify Table we verified earlier.

Note that the `<ip_addr>` is the primary key in this table. A trap can be sent to only one user (one `target_param`) on the specified address, i.e., one can not issue both of the commands listed above. The second will elicit an error indicating a duplicate ip address.

If SNMP v1/v2c traps are being configured enter the command above but specify either `TparamV1` or `TparamV2` as the `<target_param>`. For example,

```
target-addr create bumrot 47.142.94.68:162 TparamV1
taglist      trapTag
```

### 1.3.5 Enable SSH

Enter the `config` sub-context. From the `config/snmp-v3` sub-context you can enter the context name, `config`, to jump to the correct context or enter a single period (.) to move up one context level. The new prompt will display as,

```
PP8600:5/config#
```

Enter the following command,

```
bootconfig flags sshd true
sys set ssh action dsa-keygen 1024
sys set ssh action rsa-keygen 1024
sys set ssh enable
```

### 1.3.6 Disable Non-secure Services

From the `config` sub-context, enter the following commands,

```
bootconfig flags ftpd      false
bootconfig flags tftpd     false
bootconfig flags rlogind   false
web-server disable
```

We also want to disable telnet but not just yet.

### 1.3.7 Verify SSH is working and Disable telnet

Log in using SSH and from the config sub-context enter,

```
bootconfig flags telnetd false
save bootconfig
```

### 1.3.8 1.2.1.8 Disable SNMPv1/v2c

Access via SNMPv1 and v2c is controlled using community strings. From the config/snmp-v3 context enter the command, community info, to display the current table. The pre-configured values for public and private community names are contained in the Security Names readview and initialview respectively. The column designated as, name, is the community name string and is shown as a list of asterisks. The pre-configured values are “public” and “private”.

| Index  | Name  | Security Name | Transport Tag |
|--------|-------|---------------|---------------|
| -----  |       |               |               |
| first  | ***** | readview      |               |
| second | ***** | initialview   |               |

The PP8600 does not allow pre-configured values to be deleted in most tables. It does not allow either row shown above to be deleted. It does, however, allow the Name field to be changed. We can change the public community string to some real long value, but the PP8600 would be subject to brute force attacks as the community name string is part of the SNMP PDU.

Alternatively, if we alter the Security Name field we can effectively disable SNMPv1/v2c. The Security Name field is used to access the GroupMember table to determine authority to access various elements of the MIB tree. To change the sec-name enter the commands,

```
snmp-v3 community secname first new-secname was
readview
snmp-v3 community secname second new-secname
was_initialview
```

Now all v1/v2c get and set requests will fail VACM access checks due an inability to find the Security Name in the GroupMember table. The PP8600 is not subject to brute force attacks as the Security Name is not included in the SNMP PDU.

### 1.3.9 Change default SNMPv1 community strings

The read and write community name strings of `public` and `private` are trivial and well known and must be changed. From the `config/snmp-v3` context enter the command, `community info`, to display the current table. The pre-configured values for `public` and `private` community names are contained in the Security Names `readview` and `initialview` respectively. The column designated as, `name`, is the community name string and is shown as a list of asterisks.

| Index  | Name  | Security Name | Transport Tag |
|--------|-------|---------------|---------------|
| -----  | ----- | -----         | -----         |
| first  | ***** | readview      |               |
| second | ***** | initialview   |               |

To change community strings enter the commands,

```
community commname first new-commname <publicvalue>
community commname second new-commname <privatevalue>
```

### 1.3.10 Change the login passwords

Passwords are changed via the configuration context,

```
cli password
```

It is recommended that the passwords for the `rwa` and `rw`, at a minimum, be changed. Enter the commands and follow the prompts.

```
cli password rw rw
cli password rwa rwa
```

### 1.3.11 Save the configuration

Enter the following commands,

```
save bootconfig
save config
```

## 1.4 Configure JDM

Start the JDM. The following dialog will appear. Enter a host name or IP-Address in the “Device Name” field and select the “v3 Enabled” checkbox. The Read and Write Community names are not used with SNMPv3. Fill in all SNMPv3 fields using the same information used to create the SNMPv3-USM user in step 1 of Configure SNMP-v3.

This includes:

UserName: jdm  
Authentication Protocol: SHA-96  
Authentication Password: jdmpass1  
Privacy Protocol: DES  
Privacy Password: jdmpass2

Depress the “Open” key and the device should be displayed.

## 1.5 Configure IEMS Manage Object

Start the IEMS client. Create a Network Element manage object. This is a 3 page dialog. Fill in the first page with IP Address, a Type of NE, the PP8600 Device Type and Device Version.

Host Name / IP Address: 47.142.126.223

Time Zone: America/New\_York

Display Name: PP8600

Type: NE

Device Type: PP8600

Device Version: 7.0

Buttons: Back, Next, Help, Cancel

Green bar: Add

Status bar: Java Application Window

Press the “Next” button to move to page 2 and fill in the information for receiving faults. Specify the SNMP version as “v3” from the combo box and enter the V3 Security Details using the same information used to create the SNMPv3-USM user in step 1 of Configure SNMP-v3. The Security Level should be specified as “AuthPriv”. The Context name field is not used by the PP8600 and can be left blank.

The screenshot shows a Java Application Window titled "Add EMS,NE". The window contains two main sections: "SNMP Details" and "V3 Security Details".

**SNMP Details:**

- Port: 161
- Community: (empty field)
- Version: v3 (dropdown menu)

**V3 Security Details:**

- Security Level: AuthPriv (dropdown menu)
- User name: iems
- Context name: (empty field)
- Auth Protocol: SHA (dropdown menu)
- Auth Password: (masked with asterisks)
- Privacy Protocol: CBC-DES
- Privacy Password: (masked with asterisks)

At the bottom of the window, there are four buttons: "Back", "Next", "Help", and "Cancel". Below these buttons is a green bar with the "Add" button. The status bar at the bottom indicates "Java Application Window".

Press the “Next” button to move to page 3 and fill in the information for receiving performance data. Specify the SNMP version as “v3” from the combo box and enter the V3 Security Details using the same information used to create the SNMPv3-USM user in step 1 of Configure SNMP-v3. The Security Level should be specified as “AuthPriv”. The Context name field is not used by the PP8600 and can be left blank.

Performance Interface

SNMP Details

Port: 161

Community:

Version: v3

V3 Security Details

Security Level: AuthPriv

User name: iems Context name: x

Auth Protocol: SHA Auth Password: \*\*\*\*\*

Privacy Protocol: CBC-DES Privacy Password: \*\*\*\*\*

Back Finish Help Cancel

Add

Java Application Window

Press the “Finish” button to complete the creation. IEMS will discover the device and update the map.

## 1.6 Configure IEMS Command Line Launch to PP8600

The PP8600 configuration console we used, via telnet, in Configure SNMP-v3, can be accessed via the IEMS Map.

In SN07 the IEMS Client creates an SSH session with the IEMS Server. The IEMS Server acts as proxy and forwards the connection, using telnet, to the PP8600.

In SN08 the PP8600 will enable the SSH protocol and disable the telnet protocol. The second connection from IEMS Server to PP8600 will change from telnet to SSH.

The first time a client using an SSH application (such as MindTerm) connects to another host, that host will send a public key to the client. The client will be asked if they would like to accept the key. The message may alternatively ask if this host should be added to the set of known hosts on the client machine. Failure to respond affirmatively will cancel the connection.

Because there are two SSH connections it is possible that two prompts will be displayed -- one for each SSH session. This will occur anytime the server changes the public/private keypair; which is seldom. Note that the public key from the IEMS Server will be saved onto the client's machine. The public key from the PP8600 will be saved onto the IEMS Server in the file

## 1.7 Hardware Requirements or Dependencies

None

## 1.8 Software Requirements or Dependencies

- 1 The Passport 8600 must be running v3.7 of the microcode and both the DES and 3DES encryption modules (p80c3700.des, p80c3700.img) should be present in flash.
- 2 The JDM should be version 5.8 or later.

## 1.9 Limitations

None

## 1.10 Interactions

None

## 1.12 Glossary

| Term   | Description                        |
|--------|------------------------------------|
| 3DES   | Triple DES                         |
| DES    | Data Encryption Standard           |
| JDM    | Java Device Manager                |
| MAC    | Message Authentication Code        |
| MD5    | Message Digest (version 5)         |
| PP8600 | Passport 8600 Routing Switch       |
| SHA-1  | Secure Hash Algorithm (version 1)  |
| SNMP   | Simple Network Management Protocol |
| SSH    | Secure Shell                       |
| USM    | User-based Security Model          |
| VACM   | View-based Access Control Model    |

## *Product = IEMS*

### **A00006759--Secure Launch of MDM X11 Client Application** *Functional Description*

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Introduction**

MDM Client applications which are available in MDM Server can be launched in local machine via X11 protocol. This mean of communication needs to be secured via SSHTunneling/Port Forwarding. This document explains the functional details of X11 Port Forwarding for MDM in IEMS.

#### **1.3 X11 Port Forwarding**

Application from remote server will communicate to X11 server running on local client machine via SSH Tunnel which has already been established between the client and the server. The ssh server, running on the remote server machine forwards display of X clients to the ssh client, running on local client

machine. The ssh client will inturn forwards the display content to the X server on local client machine.

## 1.4 X11 Port Forwarding For MDM

The X11 Port forwarding for MDM Client application is achieved using MindTerm tool. The MindTerm tool provides a secure session with x11 port forwarding parameter as true. This will enable a secure X11 communication for MDM Client Application/MDM Gui Launches.

The X11 Port forwarding requires Xserver needs to be run in the local client machine. In the case of solaris/linux, Xserver runs by default and in the case of Windows, Hummingbird's Exceed is used as Xserver.

The steps to launch a MDM Client Application involves,

- 1 Click on MDM ManagedObject's MenuItem - "MDM Mgr GUI", which will launch a "NortelMDMGUILauncher" dialog.
- 2 Now in the dialog, XServer's(Exceed) path has to be provided in the case of Windows OS Only.
- 3 The MDM Centralized Account - username/password will be automatically filled and these fields will not be editable.  
(Use "ChangeMDMCentralizedAccount" - Managed Object menu item to change the same.)
- 4 MDM Client application( say *nmstool* ) which needs to be launched, has to be provided in Command field.
- 5 Now clicking on "Execute" button will execute Exceed ( in the case of Windows) followed by launching the MDM Client Application.

Please refer [usecase](#) to see with snapshots.

The actual mechanism involves is that, Mindterm creates a ssh client by establishing a ssh tunnel with the ssh server running in MDM Manager Device. It provides a secure *ssh session* with DISPLAY variable set, where in the MDM Client Application is launched.

After successful execution, the mentioned MDM Client Application (say *nmstool*) is only visible. Exiting MDM Application will terminate both the application and the ssh session with MDM Manager Device.

For unsuccessful execution of invalid client application ( given in Command field), the ssh session will be simply terminated.

## 1.5 Testing Considerations

- 1 Launching MDM Client Application in Linux, Windows and Solaris systems.
- 2 Test the launch functionality after changing the MDM Manager settings like Client-Server IP Provisioning, MDM Centralized Account etc.
- 3 Usability Testings- NortelMDMGUILauncher dialog

## 1.6 UseCase

The procedure to provision the client server ipaddress and launch the MDM Manager are as follows:

### 1.6.1 Provisioning client-server IP address for MDM Manager

To provision a client-server IP address for MDM object in Integrated EMS, follow these steps:

*At Integrated EMS workstation*

- Launch the Integrated EMS Java Web Start Client
- Select the **Element Managers** topology node in the Integrated EMS tree.
- Select the required **MDM** map symbol in the Integrated EMS display panel.
- Right-click the map symbol and select the **Client-Server IP provisioning** menu item. The system displays a window similar to the following figure.

- Enter the MDM Client-Server primary IP address in the **Primary IP Address** field. The primary ipaddress is that which is configured during adding the MDM device in the “simplex” mode in the Integrated EMS.
- Enter the MDM Client-Server secondary IP address in the **Secondary IP Address** field. The secondary ipaddress is configured when adding a MDM device in the “duplex” mode in the Integrated EMS.
- Click the **OK** button.

*Note:* The above steps must be carried out only once.

### 1.6.2 Launching MDM Manager for MDM

To launch MDM Manager GUI for MDM, follow these steps:

*At Integrated EMS workstation*

- Launch the Integrated EMS Java Web Start Client
- Navigate to the **Element Managers** topology in the Integrated EMS tree.
- Select a **MDM** map symbol.
- Right-click the map symbol and select the **MDM Mgr GUI** menu item. The Client Server List window is launched as shown below.

- Select the IP address of the device from where the MDM manager is to be launched, from the list box.

Click the **OK** button. The system displays a window similar to the following figure.

- Click the **Browse** button to select Exceed executable file path.
- For the MDM Centralized Account the username and password are automatically filled and these fields are not editable.
- Type the command “/opt/MagellanNMS/bin/nmstool” in the **Command** editable list box.
- Click the **Execute** button to execute the specified command. This launches the nmstool application as the one shown below.

# SN08 Feature Deltas

***Product = IEMS***

## **A00007302--SN08 IEMS - CEM Integration**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

#### **1.2 Description**

This feature integrates the functionality of CEM (Core Element Manager) to the IEMS (Integrated Element Management System).

CEM includes the Resource Discovery (RD), Fault Management (FM) and Performance Management (PM) support for wireline succession core (call server). Adding, deleting and managing CEM will be possible from IEMS.

IEMS is comprehensive OAM&P solution with aggregated OSS interfaces, central browser and launching point and with unified security management.

The Core Element Manager system is the Nortel implementation of a Element Management System which provides

- An interconnection between the specific management applications that are on workstations and operated by systems personnel, over a Local Area Network/Wide Area Network (LAN/WAN) using Transmission Control Protocol/Internet Protocol (TCP/IP).
- An exchange of management information (data) between the management applications and the various elements of the Core Network elements. In the Circuit Core Network, the management application is the Core Element Manager, installed on a PC or Sun platform.
- Mediation functionality (data accumulation, filtering, manipulation, and transfer) between the network elements and the Core Element Manager workstation.

An overview for the integration of IEMS to CEM is shown in Figure 1 below:

**Figure 1 Functional Behavior Diagram**

### 1.2.1 Launching CEM From IEMS.

Launch the CEM Browser by selecting the NE from the “Element Manager” subtree in the left panel. Upon the right click on the NE icon, a menu list is invoked where “Launch CEM” can be selected to invoke the CEM Browser.

### 1.2.2 CEM components

The CEM software includes the Core Element Manager GUI, CEM Server, and OMC-S in CBM.

- Core Element Manager Browser: The GUI works on a PC or SUN Platform as a facilitator interaction between operations, administration, maintenance, and provisioning (OAM&P) personnel and the network elements.

- Core Element Manager (CEM) Server runs in a solaris box. The CEM server does back end work for performance management, fault management, configuration management and security management. Only one instance of CEM server software can run with a single IEMS.
- CBM is the mediation device which connects to the network element and get raw data such as OMs, logs and also the table data and pass this information to the cem server software.

These three components together performs the performance management, configuration management, fault management and security management functionality of an element management system.

### **Fault Management**

The Fault Management (FM) function displays logs of alarm or fault events that occur within the network usually within a switch node. These alarms or events may have an impact on the overall service of the network element. To aid you in correcting any problems with a network element, the Fault Management function gives you information about the element so you can perform further maintenance operations. To help manage the alarms or events that occur within the network, Fault Management provides the following capabilities:

- displays alarms for a specific switch node. When a repeated alarm occurs for the same problem and the same resource, the most current alarm is shown. The previous alarms are kept as cleared alarms.
- displays a time-based histogram of alarm activity for time periods of 1 to 30 day. By default, the retention period is 30 days for uncleared alarms and 7 days for cleared alarms.
- displays alarms by alarm type (active, cleared, manual, and/or cleared manual alarms)
- displays alarms by selected severities (Critical, Major, Minor, Warning, unknown, or any combination)
- displays the element color to reflect the current alarm status
- displays alarms for specific filters, and causes specific actions to happen
- provides alarm notifications as they occur within the underlying resources
- exports alarm data to file
- prints alarm data

- provides filter criteria for alarms
- provides online help for alarms
- provides actions triggered by alarms

### **Configuration Management**

The Configuration Management function allows you to manage network elements (call server) within a circuit core network. The Configuration Management identifies the configuration and status of the network when it is initialized. The network elements are identified by icons and are arranged according to the network hierarchy. The Element Manager displays complete information for each target network element and its subordinate elements. The configuration display is updated automatically by the Configuration Manager maintaining consistency between the Element Manager display and its managed objects. This display is called containment tree.

The Configuration Manager includes the following features:

- Physical, Logical, icon, or List views from the Element Manager
- Pin and Unpin nodes
- nodes sorted by name or severity
- find carriers and linksets
- saving and retrieving of notes for nodes
- table access (add/read/delete/modify tuple operations)
- customs wizards to create/modify/delete trunks and other table access operations
- integration with performance management
- launch the Threshold Management window for a PM resource
- threshold management information in the info window for PM resources (last Value: Critical, Major, Minor)
- threshold crossed information in the info bubble
- Performance Management information in the info window for PM resources (pmCurrentData)
- Print support for CM window.

**Figure 2 Configuration Management Window in Icon view**

**Figure 3 Configuration Management window in logical mode**

**Figure 4 Configuration Management Window in List view**

**Figure 5 Configuration Management: Info Window****Figure 6 Table Access Editor**

## Performance Management

The Operational Measurements (OM) system provides the operating company with the following measurements for the Circuit Core Networks (CCN) Call Server:

- switch performance measurements
- traffic measurements
- service data

You can view OM records to ensure that the CS switch operates at its fullest potential with optimum efficiency. New OM data is transferred from the switch every transfer period, such as every 15 or 30 minutes.

The Performance Management (PM) functionality does the following:

- Provides access to OMs in predefined measurement groups
- Displays OMs in operator-configurable studies, including a graph of specific OMs over a given timeframe
- Configures real-time updates of OMs with the CS transfer period as the minimum update frequency
- Allows exports and mass exports of OMs to files in two formats, the original switch text format, or a tab-delimited format for use by third-party applications such as spreadsheets or graphing utilities
- Displays data from multiple network elements on the same graph
- Displays errors, such as incomplete OM data for the requested study
- Sends the output display to printer
- Allows OM threshold settings
- Displays summary reports on a network elements

**Figure 7 Performance Management: Instant Graphing Window**

**Figure 8 Performance Management:Threshold Manager Window**

### Security Management

It is necessary to restrict access to the CEM browser to only users with valid login credentials. The security framework on the CEM system is provisioned with the functionality like login to access the CEM browser, encrypted login credentials, account lockout due to consecutive failed login attempts, change password capability, configuration of the Telnet or FTP session, timeout interval periods, generate Security Alarms and Event Logs (Journal File).

### 1.2.3 Launching CEM from IEMS

The integration of CEM into IEMS will enhance the capabilities of IEMS to manage the cs2k node through the CEM. Alarms from cs2k are stored in the IEMS alarm database and displayed in the existing alarm panel in the IEMS GUI.

### 1.2.4 Discovery of new resources

The resource discovery is implemented by extracting call server switch configuration data via the dmsDataServer. The status of resources are discovered through remote procedure calls (RPC's) on the core from rpcServer process on CBM. This feature ensures that all the tables representing the call server switch resources are discovered. The Table Access function in the CEM Browser supports all the tables residing in the call server switch.

The new RPC's will discover following resources:

- GWC (packetized lines and trunks)
- MG4K (packetized AAL1 trunks)
- IWSPM (hybrid interworking)
- LTC, LGC, SMA (legacy lines peripheral)
- LCD type nodes (legacy lines) – LCM, RDT, RCC
- ABI (packetized legacy lines)
- DPT (virtual trunks, BICC and SIP-T)

### 1.2.5 Support for New OM's

For the PM functionality, accumulation for all the call server OM's are supported. Pre-canned studies for the current DMS-MSC OM's that are common to the call server are also supported. OM groups can be selected and exported in tab delimited format or switch format which is exactly the way they appear in the core. Also OM group studies (graphical and text) are possible from the CEM GUI for the past OM reports. The extension OM groups and OM registers will be combined with base groups and registers. Please refer to the Appendix B for the OM's supported in this feature. These will be available through the interfaces provided by CEM. The existing performance subsystem in IEMS does not change.

### 1.2.6 Mapping of new logs

Alarms from the core will be mapped to their respective components in the containment tree. Please refer to the Appendix A of this feature for the logs supported in this feature.

## 1.2.7 Single authentication for IEMS and CEM

User will be required to enter the user's name and password as the IEMS login window. The userid will then be passed down to CEM.

### 1.2.7.1 Password Management and User Access Control

All password management and user access control will be done through Succession's central security admin system. CEM will be using the SSPFS user defined groups for user access control.

## 1.2.8 Configuration Tools

By default CEM Server supports logs for which there is a mapping defined but An configuration script/tool can be used to configure other logs (for which there is no mapping) coming from succession core.

Using this tool any logs that are coming from succession core can be unblocked and passed through to CEM Server. Such logs that are by default blocked, but later unblocked, get mapped into default containers in the CEM containment tree.

### 1.2.8.1 Addrep/Delrep Tool

A tool called llClient (log list client) on the CEM Server could be used to addrep or delrep the logs coming from the core. The tool provides the below listed functionalities -

- addrep - to pass through a log coming from core so that CEM will be able to receive the log
- delrep - to block a log coming from core so that the log will not be received by CEM
- addrep all - to pass through all logs coming from core so that CEM can receive all of them

#### Usage:

1. On the CEM Server, login as user nortel or root and change directory to /opt/nortel/exe/coreEMS/GEM18/llClient/dat/.
2. Edit the SDM\_HOST parameter value and give the hostname of the SDM/CBM, slicename or the IP Address of the SDM/CBM the server is connected to.
3. Change directory to /opt/nortel/exe/coreEMS/GEM18/llClient/bin/.
4. Issue command: ./logListClient.start <operation> <logType> <logNumber>, where, operation is addrep or delrep, logType is the log name to addrep or delrep and logNumber is the number of the log to addrep or delrep.

[Note: Use “NIL” as logNumber to addrep or delrep all logs of a type.]

5. To make the addrep of the log function, the logNormalizer process must be busy/rts'ed using command line tool applman (Application Manager) on the CEM Sun Server. This tool is used to stop and start the CEM related processes running on the CEM Sun Server. Follow steps below for doing the same -

- a) On the CEM Server, change the directory to  
/opt/nortel/data/coreEMS/nodes/server/bin
- b) Issue the command ./applman -c
- c) Issue command down OMC-S
- d) Issue command down <slicename>
- e) Issue command busy logNormalizer
- f) Issue command rts logNormalizer
- g) Issue command exit to exit from applman
- h) Issue command help to know all the available options in applman

5. Use “all” to addrep all logs. Usage - ./logListClient.start addrep all.  
To restore to the previous configuration, follow steps below -

- a) Login to the SDM/CBM as root.
- b) Change directory to /sdm/configdata/lsv in case of SDM or  
/cbmdata/configdata/00/lsv in case of CBM.
- c) Issue command: cp cmlogs.config.old cmlogs.config
- d) Busy and Rts the logDelivery process using sdmmtc on the SDM or  
using cbmmtc on the CBM.

## 1.2.9 CEM Processes for handling OM's and Logs

### 1.2.9.1 Data Server process

The dmsDataServer process runs on the Core Billing Manager (CBM) platform, connects to call server node and receives both the Performance and Configuration data through Base APIs (Table Access Service and OM Access Service). Depending on whether its operational measurements (OM) or configuration data, it forwards it to performance manager or configuration manager respectively.

The following warning/error/information messages are generated in cutlog to reflect various problems. These messages can be seen in /var/adm/custlog file to find exact cause and fix.

1. Desc Msg: Could not read switch name

Fix Msg: Check state of switch

2. Desc Msg: Could not create tuple

Fix Msg: Check state of switch

3. Desc Msg: Could not read VRINV table

Fix Msg: Check state of switch

4. Desc Msg: Could not initialize OM Access

Fix Msg: Contact system administrator

5. Desc Msg: Could not initialize OM Access

Fix Msg: Contact system administrator

6. Desc Msg: Could not get keyinfo object, excluding group , <group>

Fix Msg: Check OM group for bad key/info type

7. Desc Msg: Could not get key, excluding group , <group>

Fix Msg: Check OM group for bad key type

8. Desc Msg: Could not get info, excluding group , <group>

Fix Msg: Check OM group for bad info type

9. Desc Msg: Could not register initialization timer

Fix Msg: Contact administrator

10. Desc Msg: Rejecting register request for excluded group: <group>

Fix Msg: Check group key/info for validity

11. Desc Msg: "Could not open listening connection

Fix Msg: Check /etc/services

12. Desc Msg: Could not open listening connection: <service name>

Fix Msg: Check services file

### 1.2.9.2 NLClient and NLServer

The operational measurements (OM) are available on the CEM server for graphing, dashboard, thresholding, mass export and correlation. The CEM server gets all the performance data from CBM through NLServer and nlSafServer processes running on CBM platform. The nlClient process running on the IEMS server receives OM data from nlSafServer and NLServer, process it and forward it to the upstream processes. All these processes makes the handling of OM data easier and faster. It offloads the load on CEM server in processing OM data.

The nlClient process will generate the following warning/error/information messages in cutlog to reflect various problems. These messages can be seen in /op/nortel/logs/coreEMS/custlog file to find exact cause and fix.

1. Desc Msg: Failed to Read NLClient listenconfiguration

Fix Msg: update the NLClient.cfg file

2. Desc Msg: Failed to Read NLServer Service configuration

Fix Msg: update the NLClient.cfg file

3. Desc Msg: Failed to Read ConfigBroker Service configuration

Fix Msg: update the NLClient.cfg file

4. Desc Msg: Failed to Read SafServer Service configuration

Fix Msg: update the NLClient.cfg file

5. Desc Msg: Failed to read NLClient config file

Fix Msg: Contact next level of support

6. Desc Msg: Failed to register synchronous listen connection

Fix Msg: Contact next level of support

7. Desc Msg: Failed to initialize synchronous listen connection at service

Fix Msg: Contact next level of support

8. Desc Msg: Communications not initialized

Fix Msg: Contact next level of support

9. Desc Msg: Failed to register for connection to safServer at service  
<safConnectService>

Fix Msg: Contact next level of support

10. Desc Msg: Input from unknown end point

Fix Msg: Contact next level of support

11. Desc Msg: Failed to register for connection to nlServer at service  
<nlConnectService>

Fix Msg: Contact next level of support

12. Desc Msg: Failed to register for connection to nlServer at port <portnum>

Fix Msg: Contact next level of support

13. Desc Msg: Receive from NLServer failed

Fix Msg: Contact next level of support

14. Desc Msg: Lost connection to Cfg Broker

Fix Msg: Check CfgBroker Processes

15. Desc Msg: Receive from Data Collector failed

Fix Msg: Contact next level of support

16. Desc Msg: Unknown command received from archive client

Fix Msg: Contact next level of support

17. Desc Msg: Can not read command from synchronous client

Fix Msg: Contact next level of support

18. Desc Msg: Error while doing a send, discarding send queue

Fix Msg: Check Client Processes

19. Desc Msg: exiting due to failure in memory allocation

Fix Msg: restart the process after verifying the memory availability in the  
system

## 20. Desc Msg: Failed to Read NLClient listenconfiguration

Fix Msg: update the NLClient.cfg file

The following warning/error/information messages in cutlog will be generated by the NLServer and nlSafServer to reflect various problems. These messages can be seen in /var/adm/custlog file on the CBM to find exact cause and fix.

### 1. Desc Msg: Failed to register for connection to export Server at service <service name>

Fix Msg: Contact next level of support

### 2. Desc Msg: Failed to register for connection to Data Server at port <port number>

Fix Msg: Contact next level of support

### 3. Desc Msg: Failed to register for connection to Data Server at service <service name>

Fix Msg: Contact next level of support

### 4. Desc Msg: Failed to register for signals

Fix Msg: Contact next level of support

### 5. Desc Msg: Failed to send error

Fix Msg: Check SAFServer Process

### 6. Desc Msg: Communications not initialized

Fix Msg: Contact next level of support

### 7. Desc Msg: Input from unknown end point

Fix Msg: Contact next level of support

### 8. Desc Msg: Failed to send registration message to Data Server

Fix Msg: Check Data Server Process

### 9. Desc Msg: Failed to send deregistration message to Data Server

Fix Msg: Check Data Server Process

### 10. Desc Msg: Invalid Message from archive.

Fix Msg: Contact next level of support.

11. Desc Msg: store is disconnected:deregister the connection

Fix Msg: Check Archive Process

12. Desc Msg: Receive from Archive failed

Fix Msg: Contact next level of support

13. Desc Msg: Unreadable Data Server message type

Fix Msg: Contact next level of support

14. Desc Msg: Unreadable OM report

Fix Msg: Contact next level of support

15. Desc Msg: Failed to send correlation error data to Archive

Fix Msg: Check Archive Process

16. Desc Msg: OM Registration failed

Fix Msg: Contact next level of support

17. Desc Msg: Unreadable registration response

Fix Msg: Contact next level of support

18. Desc Msg: OM DeRegistration failed

Fix Msg: Contact next level of support

19. Desc Msg: Unreadable deregistration response from Data Server

Fix Msg: Contact next level of support

20. Desc Msg: Failed to send CM info request to Data Server

Fix Msg: Check Data Access Layer Process

21. Desc Msg: Failed to send deferred registration message to Data Server

Fix Msg: Check Data Access Layer Process

22. Desc Msg: Failed to send re-registration message to Data Server

Fix Msg: Check Data Access Layer Process

23. Desc Msg: Fatal status change  
Fix Msg: Check Data Access Layer Process
24. Desc Msg: Unreadable OM status received from Data Server  
Fix Msg: Contact next level of support
25. Desc Msg: Could not get GroupInfo  
Fix Msg: Contact next level of support
26. Desc Msg: Failed to send nlGrpInfoRsp data to Archive  
Fix Msg: Check Archive Process
27. Desc Msg: Unreadable CM info message from Data Server  
Fix Msg: Contact next level of support
28. Desc Msg: Could not open License File  
Fix Msg: Verify file existence and permission
29. Desc Msg: Unexpected message type from Data Server  
Fix Msg: Contact next level of support
30. Desc Msg: Lost connection to Data Server  
Fix Msg: Check Data Server Process
31. Desc Msg: Receive from Data Server failed  
Fix Msg: Contact next level of support
32. Desc Msg: Communications not initialized  
Fix Msg: Contact next level of support
33. Desc Msg: Failed to send end\_of\_report msg to store  
Fix Msg: Check Archive Process
34. Desc Msg: Connection from unknown end point  
Fix Msg: Contact next level of support
35. Desc Msg: Switch name unknown

Fix Msg: Contact next level of support

36. Desc Msg: Arithmetic overflow in correlation <correlation name>

Fix Msg: Contact next level of support

37. Desc Msg: Failed to send OM data to Archive

Fix Msg: Check Archive Process

38. Desc Msg: Error while doing a send to the Agent, discard send queue

Fix Msg: Check Agent Process

39. Desc Msg: Port for the service <NLservice name> is not available.

Fix Msg: Please update /etc/services file & restart NLServer

40. Desc Msg: Failed to register for connection to export Server at service <service name>

Fix Msg: Contact next level of support

41. Desc Msg: Failed to register for connection to Data Server at port <port num>

Fix Msg: Contact next level of support

42. Desc Msg: Failed to register for connection to Data Server at service <service name>

Fix Msg: Contact next level of support

### 1.2.9.3 log Normalizer and logNormSAF Process

The fault data on being received from call server node is processed by logNormalizer process running on CEM. The logNormSAF process (running on the CBM platform) stores and forward this data to the CEM server.

The logNormalizer process generates error/warning/information messages in custlog whenever there is a problem encountered due to improper configuration, improper log formats etc. These messages can be seen in /opt/nortel/logs/coreEMS/custlog file to find the description and fix of the problem.

1. Desc Msg: Event file <EventFileName> was not found ...logNormalizer exiting

Fix Msg: Check Path.

2. Desc Msg: Event delimiter cannot be more than one charcter long  
...logNormalizer exiting

Fix Msg: check event formatter file for the delimiter after a event name and use it

3. Desc Msg: Event file "<<EventFileName<<" is empty ..logNormalizer exiting

Fix Msg: check path, file name and/or read write permission

4. Desc Msg: Event file "<<EventFileName<<" had errors ..logNormalizer exiting

Fix Msg: please look at the event file to check errors

5. Desc Msg: Mapper file "<<MapperFileName<<" was not found  
...logNormalizer exiting

Fix Msg: check path, file name and/or read write permission

6. Desc Msg: Mapper delimiter cannot be more than one charcter long  
...logNormalizer exiting

Fix Msg: check mapper file for the delimiter after a log name and use it

7. Desc Msg: Mapper file "<<MapperFileName<<" is empty ..logNormalizer exiting

Fix Msg: check path, file name and/or read write permission

8. Desc Msg: Mapper file "<<MapperFileName<<" has errors  
.."<<argv[0]<<" exiting

Fix Msg: please check the mapper file errors

9. Desc Msg: Mapping information parsing error for log "<<logName<<"  
empty information or wrong delimiter used

Fix Msg:

10. Desc Msg: output file "<<outputFileName<<" could not be opened

Fix Msg: No action possible

11. Desc Msg: lostLogFile "<<lostLogFileName<<" could not be opened

Fix Msg: Call Nortel Personal

12. Desc Msg: lostLogFile "<<outputFileName<<" is empty

Fix Msg: Call Nortel Personal

13. Desc Msg: lostLogFormat string is empty

Fix Msg: Call Nortel Personal

14. Desc Msg: lostLogTriggerSize is empty

Fix Msg: Call Nortel Personal

15. Desc Msg: lostLogVisibleMsg string is empty

Fix Msg: Call Nortel Personal

16. Desc Msg: lostLogVisLog string is empty

Fix Msg: Call Nortel Personal

17. Desc Msg: sdmLogList is empty

Fix Msg: Call Nortel Personal

18. Desc Msg: probeTimer string is empty

Fix Msg: No probe is assumed

19. Desc Msg: checkLen string is empty

Fix Msg: No checkLen is assumed

20. Desc Msg: No Lost Log Trigger message has been specified

Fix Msg: Call Nortel Personal

21. Desc Msg: Could not send events to agent. Agent removed from output list.

Fix Msg: No agents connected .. start an agent

22. Desc Msg: Unknown log format. No mapping will be done for input

Fix Msg: Contact Nortel Personal

### 1.3 Hardware Requirements or Dependencies

An IEMS server is required.

SDM/CBM is required

## 1.4 Software Requirements or Dependencies

IEMS Load is required

CEM Server software (GEM18) is required

SDM/CBM (GEM18) software is required

SN08 is required.

## 1.5 Limitations and restrictions

None

## 1.6 Interactions

This feature interacts with A00007304

## 1.7 Glossary

| Term    | Description                                      |
|---------|--------------------------------------------------|
| CEM     | Core Element Manager                             |
| IEMS    | Integrated Element Management System             |
| SDM     | Supernode Data Manager                           |
| CBM     | Core Billing Manager                             |
| PAM     | Pluggable Authentication Module                  |
| OM      | Operational Measurements                         |
| DMS-MSC | Digital Multiplex Switch-Mobile Switching Center |

## 1.8 Appendix A for A00007302: List of Supported Logs

| Log     | Event | Event Label              |
|---------|-------|--------------------------|
| ESA120  | INFO  | ESA DATA GENERATION      |
| ESA121  | INFO  | ESA DATA GENERATION FAIL |

## ***Product = IEMS***

### **A00007304--SN08 CEM I & C on IEMS**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

#### **1.2 Description**

The CEM server functionality will be provided in conjunction with the IEMS server. CEM will be installed as an overlay on IEMS and SSPFS.

The CEM server is an element manager for the DMS node. It provides powerful fault, performance and configuration management toolsets. This server works in conjunction with the CEM browser which will be integrated into the IEMS product (see feature A00007302).

This feature covers the installation of the CEM server onto the IEMS server. This feature also covers the installation of the CEM components on the SDM and CBM. This feature will also incorporate the Synchronized Backup Manager to be used by CEM (for information about the Backup Manager see feature A00006979)

## 1.3 CEM Installation

The procedure for adding a CEM software package to the server are as follows:

- 1 Obtain the cem tar file and untar it.
- 2 Run the cem\_setup script. Use the full path to start it.
- 3 Use pkgadd to install the Help Package.
- 4 Start the CEM server using /opt/servman/bin/servstart CEM

### 1.3.1 Removing the CEM software

The procedure for removing a CEM software package from the server are as follows:

1. Stop the CEM server using /opt/servman/bin/servstop CEM. Note: It may take a few minutes for CEM to stop completely.
2. Run the cem\_setup uninstall script.
3. Use pkgrm to remove the help package.

## 1.4 CEM Commissioning Manager

The CEM Commissioning Manager is a Java-based graphic user interface tool for configuring managed node instances. A command line interface is also available. The following sections describe in detail how to use the Commissioning Manager.

### 1.4.1 Launch The Commissioning Manager

To launch the Commissioning Manager, do the following:

1. Login on the IEMS server as root.
2. Change directory to /opt/nortel/cem/data/coreEMS/nodes/server/bin/
3. Issue the command “.configCEMS -c” for the command line interface.

The Commissioning Manager main menu will be displayed on the screen after the command line interface being invoked.

#### 1.4.1.1 Create A Managed Node Instance

To create a new managed node instance:

1. Select “1” (Commission a new node) from the Commissioning Manager Command Line Interface main menu.

```
Nortel Networks coreEMS Commissioning Manager
Main menu
-----
[1] Commission a new node
[2] Reconfigure an existing node
[3] Delete an existing node
[4] Add a mated pair monitor
[5] Delete a mated pair monitor
[6] SDM to CBM migration
[0] Exit
Selection: 1
```

2. Then select DMS for the new node when prompted for the device type.

```
*** Configure a Node Instance ***
[1] DMS
[2] HLR200
[3] MDM
[4] NSP
[5] SESM
[6] USP_NES
[7] DS
Select a device type for the new node: 1
```

3. Input a name for the new node when prompted for the “Element Name” of the node. The element name should be a string up to 15 characters drawn from the alphabet (a-z), digits(0-9) and minus sign(-). The first character must be an alpha character and the last character must not be a minus sign. The element name can’t be “server”, “localhost”, “loghost” or the hostname of the localhost.

Hint: Input a string up to 15 characters drawn from "-a-z0-9". The 1st character must be an alpha character; the last one must not be a minus sign. Element name cannot be “server”, “localhost”, “loghost” or the hostname of the localhost.  
Mandatory input.  
Element Name: **SDMA2**

4. Input the region name when prompted:

Hint: Enter the region path to the node or select one from the list.  
Valid path characters include alpha-numeric and the '/' characters.  
Mandatory input.  
List of existing regions:  
Nortel  
Region: **Nortel**

5. Select GEM18 for this new node when prompted for “Software Release”.

Hint: Choose a software version.  
Mandatory input.  
[1] GEM18  
Software Release (1): **1**

6. Input the target IP address when prompted for the “Target SDM IP Address”. The target IP address should be in dot-decimal format.

Hint: Input a dot-decimal representation of an IP address or the string 'localhost'.  
Mandatory input.  
Target SDM IP Address: **47.142.106.26**

7. Enter No Call Trace will not be used.

Hint: Answer Yes if the SDM has Call Trace installed, otherwise answer No.  
Mandatory input.  
[1] Yes  
[2] No  
Enable Call Trace (1): **2**

8. Enter No do not install Billing Manager

Hint: Answer Yes if this DMS is an MSC/TriNode, No if this DMS is an HLR.  
Mandatory input.  
[1] Yes  
[2] No  
Install Billing Manager (1): **2**

**9. Answer No to USP**

Hint: Answer Yes if this DMS has USP, otherwise answer No. Not valid if Billing Manager = Yes  
Mandatory input.  
[1] Yes  
[2] No  
Does This DMS Have USP (2): **2**

**10. Answer “y” at the prompt “Proceed to create this node?”.**

Proceed to create this node? [y/n](n):**y**

**11. Answer yes the SDM is already in server mode.**

Commissioning node, please wait...  
Commissioning node completed successfully!  
  
Is sdma2 already in server mode? [y/n](n): **y**

**12. Answer Y to start the nodes applications**

Start all applications of node susan? [y/n](n): **y**

**13. Wait till you get the rts completed message**

Returning to service all applications of node susan.  
This action may take a few minutes.  
Please wait...  
Busy/Rts action completed!

## 14. Exit configCEMS

```
Nortel Networks coreEMS Commissioning Manager
Main menu
-----
[1] Commission a new node
[2] Reconfigure an existing node
[3] Delete an existing node
[4] Add a mated pair monitor
[5] Delete a mated pair monitor
[6] SDM to CBM migration
[0] Exit
Selection: 0
```

### 1.4.1.2 Delete A Managed Node Instance

Users can delete a managed node instance, and all data and configuration for that node would be permanently removed from the system.

To delete a managed node instance:

1. Select “3” (Delete an existing node) from the Commissioning Manager Command Line Interface main menu.
2. Then select the node instance to be deleted.
3. Answer “y” at the prompt “Proceed to delete this node?”

## 1.5 Backup of CEM

CEM will be backed up using the Synchronized Backup Manager (Feature A00006979). When this backup is run, the information needed by CEM to restore will be located in /opt/nortel/cem/data/coreEMS/configBackup.

## 1.6 Restore of CEM

To restore CEM, make sure that the /opt/nortel/cem/data/coreEMS/configBackup directory contains the following: data\_dir, ldapConfig.tar, nodes.tar and server. Make sure CEM is stopped with servquery -status -group CEM command. If CEM is not stopped run servstop CEM. Then run /opt/nortel/cem/data/coreEMS/nodes/server/bin/postRestore.sh.

## 1.7 CEM SAF (Store and Forward) Process on SDM/CBM

### 1.7.1 Introduction

CEM SAF (Store and Forward Process) Framework has been designed to serve two purposes:

1. Storing and Forwarding the SDM/CBM data on to the appropriate CEM Server process.
2. Synchronization after disconnection from the CEM server process and SDM/CBM.

### 1.7.2 Process Interaction Diagram

Data flow diagram

By default SAF process on the SDM/CBM will not be in service after CEM is installed. It has to be turned on to be “in service” state.

### 1.7.3 IEMS and CEM succession architecture

In SN08, the CEM integration with IEMS is taken to the next level, pulling the CEM and IEMS into a combination load and the launching capabilities are further refined and integrated. Additionally, the fault handling and interface between the two management systems will be extended and enhanced to provide uniform handling of alarms between the two.

The Figure below provides an overview of IEMS and CEM succession architecture.

### 1.8 CEM SAF logs on SDM/CBM

The processes included in CEM SAF Framework throw a number of logs depicting any Trouble or Information regarding CEM processes.

The Description of all the SAF Framework processes, warning and info logs thrown by them is documented in the FM section.

### 1.9 File Sets and Directory structure for CEM Processes

The File sets on sdm including CEM processes are:

SDM\_CEM.SAF

SDM\_GEM.dmsDataSrv

SDM\_TntFTPHndl.TntFTPHndl

### 1.9.1 Directory Structure for SAF Data

Data Storage:

SAF Server stores data in “SAF.DB”

SAF Client stores data in the field specified in “serverConfig.dat” and stores it in the path specified in the file.

### 1.9.2 Directory Structure for SAF package

Directory Structure for SAFServer package (on sdm)

From /mscomc/OMC\_S\

Directory Structure for SAFClient package (on server)

From /opt/nortel/data/coreEMS/nodes/<node name>

## 1.10 Ports assigned for the CEM processes

**Table 2:**

| Application      | Port   | Protocol | Description                                       |
|------------------|--------|----------|---------------------------------------------------|
| switchExport     | 7788   | tcp      | switch Mass Export service                        |
| NLServer         | 7982   | tcp      | PM service                                        |
| admind           | 8102   | tcp      | SDM process/link/logic volume information service |
| dmsDataServer    | 8449   | tcp      | tuple service                                     |
| dmsDataServer    | 8450   | tcp      | table schema service                              |
| dmsDataServer    | 8614   | tcp      | table change notification service                 |
| rpcServer        | 22333  | tcp      | rpc service                                       |
| migrationClient  | 22395  | tcp      | control port for Migration Client                 |
| TelnetFTPHandler | 22397  | tcp      | MAPCI pass-through to MSC/HLR                     |
| TelnetFTPHandler | 22398  | tcp      | ftp pass-through to MSC/HLR                       |
| TelnetFTPHandler | 22399  | tcp      | telnet to SDM                                     |
| TelnetFTPHandler | 22400  | tcp      | ftp to SDM                                        |
| TelnetFTPHandler | 22402* | tcp      | telnet access to 3PC application                  |
| tpcStsQuery      | 22403* | tcp      | telnet access to 3PC application status           |
| TelnetFTPHandler | 22404  | tcp      | non-secure ftp access to CM                       |
| TelnetFTPHandler | 22405  | tcp      | non-secure ftp access to SDM/FT                   |
| exportLog        | 23000  | tcp      | CAP log export service                            |
| nlSafServer      | 26002  | tcp      | NLServer store and forward port                   |

**Table 2:**

| Application | Port  | Protocol | Description                          |
|-------------|-------|----------|--------------------------------------|
| logNormSAF  | 26003 | tcp      | logNormalizer store and forward port |

### 1.12 Hardware Requirements or Dependencies

An IEMS server is required.

An SDM and CBM are also required.

### 1.13 Software Requirements or Dependencies

SN08 is required.

### 1.14 Limitations and restriction

SN08 is required.

### 1.15 Interactions

This feature interacts with A00007302 and A00006979

### 1.16 Glossary

| Term | Description                          |
|------|--------------------------------------|
| CEM  | Core Element Manager                 |
| DMS  | Digital Multiplex Switch             |
| IEMS | Integrated Element Management System |

## ***Fault Management for A00007304***

### **2.1 Logs**

#### **2.1.1 CEM SAF Processes logs**

CEM SAF (Store and Forward) Framework throws a number of logs depicting any Trouble or Information regarding CEM processes.

All these logs will fall under two categories:

TROUBLE log or INFO log.

TROUBLE log will be identified in the range TMN300~399

INFO log will be identified in the range TMN600~699

For example:

TMN600: Information only

TMN601: File IO info

TMN604: Application status

TMN630: DataServer OK

TMN302: System error

TMN301: Application error

TMN303: Communication error

TMN309: Data Server error

TMN311: Fatal error

#### **2.1.2 Data Server process logs**

The dmsDataServer process runs on the SDM/CBM, connects to call server node (core) and receives both the Performance and Configuration data through Base APIs (Table Access Service and OM Access Service). Depending on whether its operational measurements (OM) or configuration data, it forwards it to performance manager or configuration manager respectively.

The following warning/error/information messages are generated in custlog to reflect various problems. These messages can be seen in /var/adm/custlog file to find exact cause and fix.

1. Desc Msg: Could not read switch name  
Fix Msg: Check state of switch
2. Desc Msg: Could not create tuple  
Fix Msg: Check state of switch
3. Desc Msg: Could not read VRINV table  
Fix Msg: Check state of switch
4. Desc Msg: Could not initialize OM Access  
Fix Msg: Contact system administrator
5. Desc Msg: Could not initialize OM Access  
Fix Msg: Contact system administrator
6. Desc Msg: Could not get keyinfo object, excluding group, <group>  
Fix Msg: Check OM group for bad key/info type
7. Desc Msg: Could not get key, excluding group, <group>  
Fix Msg: Check OM group for bad key type
8. Desc Msg: Could not get info, excluding group, <group>  
Fix Msg: Check OM group for bad info type
9. Desc Msg: Could not register initialization timer  
Fix Msg: Contact administrator
10. Desc Msg: Rejecting register request for excluded group: <group>  
Fix Msg: Check group key/info for validity
11. Desc Msg: "Could not open listening connection  
Fix Msg: Check /etc/services
12. Desc Msg: Could not open listening connection: <service name>  
Fix Msg: Check services file

### 2.1.3 NLClient and NLServer logs

The operational measurements (OMs) are available on the CEM server for graphing, dashboard, thresholding, mass export and correlation. The CEM server gets all the performance data from SDM/CBM through NLServer and nlSafServer processes running on SDM/CBM. The nlClient process running on the IEMS server receives OM data from nlSafServer and NLServer, processes it and forwards it to the upstream processes. All these processes makes the handling of OM data easier and faster and offloads the load on CEM server in processing OM data.

The following warning/error/information messages in custlog will be generated by the NLServer and nlSafServer to reflect various problems. These messages can be seen in /var/adm/custlog file on the SDM/CBM to find exact cause and fix.

1. Desc Msg: Failed to register for connection to export Server at service <service name>

Fix Msg: Contact next level of support

2. Desc Msg: Failed to register for connection to Data Server at port <port number>

Fix Msg: Contact next level of support

3. Desc Msg: Failed to register for connection to Data Server at service <service name>

Fix Msg: Contact next level of support

4. Desc Msg: Failed to register for signals

Fix Msg: Contact next level of support

5. Desc Msg: Failed to send error

Fix Msg: Check SAFServer Process

6. Desc Msg: Communications not initialized

Fix Msg: Contact next level of support

7. Desc Msg: Input from unknown end point

Fix Msg: Contact next level of support

8. Desc Msg: Failed to send registration message to Data Server

Fix Msg: Check Data Server Process

9. Desc Msg: Failed to send deregistration message to Data Server

Fix Msg: Check Data Server Process

10. Desc Msg: Invalid Message from archive.

Fix Msg: Contact next level of support.

11. Desc Msg: store is disconnected:deregister the connection

Fix Msg: Check Archive Process

12. Desc Msg: Receive from Archive failed

Fix Msg: Contact next level of support

13. Desc Msg: Unreadable Data Server message type

Fix Msg: Contact next level of support

14. Desc Msg: Unreadable OM report

Fix Msg: Contact next level of support

15. Desc Msg: Failed to send correlation error data to Archive

Fix Msg: Check Archive Process

16. Desc Msg: OM Registration failed

Fix Msg: Contact next level of support

17. Desc Msg: Unreadable registration response

Fix Msg: Contact next level of support

18. Desc Msg: OM DeRegistration failed

Fix Msg: Contact next level of support

19. Desc Msg: Unreadable deregistration response from Data Server

Fix Msg: Contact next level of support

20. Desc Msg: Failed to send CM info request to Data Server

Fix Msg: Check Data Access Layer Process

21. Desc Msg: Failed to send deferred registration message to Data Server  
Fix Msg: Check Data Access Layer Process
22. Desc Msg: Failed to send re-registration message to Data Server  
Fix Msg: Check Data Access Layer Process
23. Desc Msg: Fatal status change  
Fix Msg: Check Data Access Layer Process
24. Desc Msg: Unreadable OM status received from Data Server  
Fix Msg: Contact next level of support
25. Desc Msg: Could not get GroupInfo  
Fix Msg: Contact next level of support
26. Desc Msg: Failed to send nlGrpInfoRsp data to Archive  
Fix Msg: Check Archive Process
27. Desc Msg: Unreadable CM info message from Data Server  
Fix Msg: Contact next level of support
28. Desc Msg: Could not open License File  
Fix Msg: Verify file existence and permission
29. Desc Msg: Unexpected message type from Data Server  
Fix Msg: Contact next level of support
30. Desc Msg: Lost connection to Data Server  
Fix Msg: Check Data Server Process
31. Desc Msg: Receive from Data Server failed  
Fix Msg: Contact next level of support
32. Desc Msg: Communications not initialized  
Fix Msg: Contact next level of support
33. Desc Msg: Failed to send end\_of\_report msg to store

Fix Msg: Check Archive Process

34. Desc Msg: Connection from unknown end point

Fix Msg: Contact next level of support

35. Desc Msg: Switch name unknown

Fix Msg: Contact next level of support

36. Desc Msg: Arithmetic overflow in correlation <correlation name>

Fix Msg: Contact next level of support

37. Desc Msg: Failed to send OM data to Archive

Fix Msg: Check Archive Process

38. Desc Msg: Error while doing a send to the Agent, discard send queue

Fix Msg: Check Agent Process

39. Desc Msg: Port for the service <NLservice name> is not available.

Fix Msg: Please update /etc/services file & restart NLServer

40. Desc Msg: Failed to register for connection to export Server at service <service name>

Fix Msg: Contact next level of support

41. Desc Msg: Failed to register for connection to Data Server at port <port num>

Fix Msg: Contact next level of support

42. Desc Msg: Failed to register for connection to Data Server at service <service name>

Fix Msg: Contact next level of support

#### **2.1.4 log Normalizer and logNormSAF Process logs**

The fault data on being received from call server node (core) is processed by logNormalizer process running on CEM. The logNormSAF process (running on the SDM/CBM) stores and forward this data to the CEM server.

The logNormalizer process generates error/warning/information messages in custlog whenever there is a problem encountered due to improper

configuration, improper log formats etc. These messages can be seen in /opt/nortel/logs/coreEMS/custlog file on the CEM server to find description and fix of the problem.

1. Desc Msg: Event file <EventFileName> was not found ...logNormalizer exiting

Fix Msg: Check Path.

2. Desc Msg: Event delimiter cannot be more than one character long...logNormalizer exiting

Fix Msg: check event formatter file for the delimiter after a event name and use it

3. Desc Msg: Event file "<<EventFileName<<" is empty..logNormalizer exiting

Fix Msg: check path, file name and/or read write permission

4. Desc Msg: Event file "<<EventFileName<<" had errors..logNormalizer exiting

Fix Msg: please look at the event file to check errors

5. Desc Msg: Mapper file "<<MapperFileName<<" was not found...logNormalizer exiting

Fix Msg: check path, file name and/or read write permission

6. Desc Msg: Mapper delimiter cannot be more than one character long...logNormalizer exiting

Fix Msg: check mapper file for the delimiter after a log name and use it

7. Desc Msg: Mapper file "<<MapperFileName<<" is empty..logNormalizer exiting

Fix Msg: check path, file name and/or read write permission

8. Desc Msg: Mapper file "<<MapperFileName<<" has errors.."<<argv[0]<<" exiting

Fix Msg: please check the mapper file errors

9. Desc Msg: Mapping information parsing error for log "<<logName<<" empty information or wrong delimiter used

Fix Msg:

10. Desc Msg: output file "<<outputFileName<<" could not be opened

Fix Msg: No action possible

11. Desc Msg: lostLogFile "<<lostLogFileName<<" could not be opened

Fix Msg: Call Nortel Personal

12. Desc Msg: lostLogFile "<<outputFileName<<" is empty

Fix Msg: Call Nortel Personal

13. Desc Msg: lostLogFormat string is empty

Fix Msg: Call Nortel Personal

14. Desc Msg: lostLogTriggerSize is empty

Fix Msg: Call Nortel Personal

15. Desc Msg: lostLogVisibleMsg string is empty

Fix Msg: Call Nortel Personal

16. Desc Msg: lostLogVisLog string is empty

Fix Msg: Call Nortel Personal

17. Desc Msg: sdmLogList is empty

Fix Msg: Call Nortel Personal

18. Desc Msg: probeTimer string is empty

Fix Msg: No probe is assumed

19. Desc Msg: checkLen string is empty

Fix Msg: No checkLen is assumed

20. Desc Msg: No Lost Log Trigger message has been specified

Fix Msg: Call Nortel Personal

21. Desc Msg: Could not send events to agent. Agent removed from output list.

Fix Msg: No agents connected.. start an agent

22. Desc Msg: Unknown log format. No mapping will be done for input

Fix Msg: Contact Nortel Personal

## 2.2 References

Please refer to the following NTP document for more detailed format of the above logs:

411-8111-511.01.01 : GSM/UMTS VCN OAM Reference Manual

# SN08 Feature Deltas

***Product = IEMS***

## **A00007341--MS2000 IEMS Configuration Integration**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

#### **1.2 Description**

In SN06.2, Nortel made a decision to begin phasing out the UAS (Universal Audio Server) and begin replacing them with a set of Media Server devices, the MS2010 and MS2020. These devices are referred to as MS2000 Series Nodes (Media Server 2000 Series Nodes). In SN06.2 the IP version of the Media Server (MS2010) was deployed. In order to provision and maintain the MS2010 node the MS2000 CLUI (Command Line User Interface) was developed. The MS2000 CLUI ran on the SESM server. In SN08 the MS2000 CLUI was enhanced to handle the provisioning and maintenance of the ATM Media Server (MS2020).

With this feature in SN08, the existing functionality of the MS2000 CLUI will be migrated to reside on the IEMS platform. All of the existing functionality that is captured in the MS2000 CLUI will be migrated to the new MS2000 EM GUI. The existing command line interface will be removed from the SESM software.

##### **1.2.1 MS2000 EM Functionality**

Below is a breakdown of the functionality that is provided by the existing MS2000 CLUI that will be migrated to the MS2000 EM.

##### **1.2.1.1 Configuration**

The following windows will be needed for configuration.

- General Configuration
  - Megaco Call Agent IP Address
  - Is Megaco Call Agent Used
  - Number of Conference Ports
  - Number of TestTrunk Ports
  - Number of Lawful Intercept Ports
  - Number of Announcement Ports
  - APS IP Address
  - Primary Language
  - Secondary Language
- SNMP config (community strings, trusted managers, trap destinations)
- WebServer config (username and password for web interface)
- Network Time Protocol (NTP) settings

The following tables can also be configured for the MS2020 ATM node

- ATM loopback table
- SVC Connection table
- ATM port table
- Remote Gateway table (AAL2 only)
- AAL2 PVC table (AAL2 only)
- SVC Profile table (AAL2 only)

#### **1.2.1.2 Maintenance**

The following maintenance activities will be supported from the client.

- Lock/Unlock of device
- Backup of INI file
- Upload of load files. (CMP, INI, DAT, XML)
- Soft Reset of device

#### **1.2.1.3 User Access Privileges (Authorization)**

The following lays out the access that a user must have to issue the following functions:

**Table 4: User Authorization required for functionality**

| Access                    | Functionality                              |
|---------------------------|--------------------------------------------|
| mg groups with any access | List of any configuration                  |
| mgrw, mgadm               | Change Configuration                       |
| mgmtc, mgrw, mgadm        | Lock/Unlock of device                      |
| mgmtc, mgrw, mgadm        | Backup of INI file                         |
| mgmtc, mgrw, mgadm        | Upload of load files. (CMP, INI, DAT, XML) |
| mgmtc, mgrw, mgadm        | Soft Reset of device                       |
| mgadm, mgrw               | Change SNMP Passwords                      |
| mgadm, mgrw               | Change File Transfer Passwords             |

### 1.2.2 New functionality in SN08

Some new functionality that did not exist on the CLUI will be provided in the SN08 MS2000 EM release. These are briefly outlined below:

- The MS2000 EM will make use of the existing IEMS audit logging functionality to provide a log of what user issued a command against an MS2000 node.
- The MS2000 EM will make use of the existing IEMS alarming system to generate an alarm against the EM whenever a configuration of maintenance action by the EM has an unrecoverable failure.

### 1.2.3 Upgrading SN06.2 and SN08 data

Data that existed in SN06.2 and SN08 on the SESM server will need to be transferred to the SN08 IEMS. The data that needs to be transferred is contained in a properties file.

In SN06.2 the file is:

`/opt/nortel/NTsesm/bin/ams.properties`

In SN08 the file is

`/opt/nortel/NTsesm/bin/ms2000.properties`

Either a manual procedure or a script will be written to help the end user with this data migration. TBD.

### **1.3 Hardware Requirements or Dependencies**

The MS2000 EM will run on IEMS and inherits any requirements and dependencies for hardware.

### **1.4 Software Requirements or Dependencies**

The MS2000 EM will run on IEMS and inherits any requirements and dependencies for software.

### **1.5 Limitations and restrictions**

The existing MS2000 CLUI will be removed from the SESM software and all of its functionality will be migrated to the MS2000 EM.

### **1.6 Interactions**

The MS2000 EM will be built into the IEMS tool such that the EM can be launched by selecting the MS2000 EM from the right click device menu as seen below.

The MS2000 Configuration and Maintenance tool is used to configure and perform some maintenance activities on an MS2010 or MS2020 device. The tool automatically adjusts the display components, behavior, and configuration

options based on the node type (MS2010 or MS2020) and the software version.

The following screen is the display of the tool just after launching. The left hand side displays the Device specific information. The name given in IEMS, the associated IP address entered when the node was added into the system, and the device type (this is determined by querying the MS node).

In the mid section of the left hand side is the Maintenance panel where the following functions can be performed.

- **Soft Reset of the node** - A soft reset of the node is essentially a re-initialization of the software running on the node. For an SN06.2 MS2000 load, only a burn reset was allowed. Starting in SN08 the user could select either to perform a configuration settings burn or to re-initialize with the previous burned settings. When a soft reset is done on the node with the burn option, the existing configuration settings are burned into flash memory and then the node goes through an initialization cycle. This will take the node out of service for a short period of time and will drop any resources in use.
- **Lock/Unlock the node** - The lock function will prevent any audio resources from being allocated on the node. In an SN06.2 MS2000 load, only a graceful lock was supported. A graceful lock will signal to the node that a lock has been requested. This will cause the node to stop allocating new audio resources and will wait for the last resource to be freed before actually locking the node. A force lock will cause the node to immediately free up any resources in use and lock the node.
- **Backup of the INI file** - The initialization file is a configuration data file used by the system to setup the node in event of a reboot. The file contains all of the user defined configuration changes. The tool allows the user to save the initialization file back to the IEMS server or to the tftp server (the SDM or CBM). By saving the INI file back to the IEMS server the user has simply saved a backup copy of the configuration changes for later use. The tool will save up to 5 initialization files for each node, deleting the oldest file once the maximum number of files have been saved. By saving the file to the tftp server, this updates the initialization file that the MS2000 node will retrieve should a hard reset occur. It is recommended that whenever configuration changes are made that the user backup the latest settings in an INI file to the tftp server.

The bottom panel on the main screen shows status logs of the activities that the tool is performing. This provides the user with feedback on what actions have been taken and also displays error when they occur.

**MS2020 Maintenance and Configuration Tool**

Device Name: MS2020\_PV  
IP Address: 47.142.89.60

Java Application Window

On the right hand side of the screen there are a series of tab selected panels for other configuration and maintenance functions that the user can perform.

### **1.6.1 General Configuration**

The first tab is the General Configuration tab where the basic setup of the node is performed. (Please reference the NTP for MS2010 and MS2020 for a complete description of the configuration parameters). The configurable fields have either a pulldown menu for the configuration options or a tooltip displaying the syntax and range of the field. Once the user makes the appropriate changes to the fields they can send the changes to the node by selecting the “SET” button.

| General Configuration            |                                                        | Load Management | Password Management | SNMP Setup | Atm Configuration |

Should the user have entered in invalid data they will be prompted with a warning displaying which data is at issue. Below is an example of this.

Once corrected the user can again attempt to change the data. If successful, then the user will be prompted to save the configuration changes made by backing up the INI file. The user is given the option to either backup to just the IEMS node or to the tftp server.

Once the INI backup has been done the user will be prompted to perform a soft reset on the node in order to burn the configuration changes that were just made into flash.

### 1.6.2 Load Management

The MS2000 Configuration and Maintenance tool provides a way for the user to download some of the file types used by the device. The files displayed that can be downloaded must be located on the IEMS server in the /data/loads/audiocodes directory.

The screenshot shows the 'Load Management' tab of the MS2000 Configuration and Maintenance tool. The interface includes a navigation bar with tabs for 'al Configuration', 'Load Management', 'Password Management', 'SNMP Setup', and 'Atrn Configuration'. Below the navigation bar, there are four distinct sections for selecting files to send to the node:

- Section 1:** A heading 'To reload the node select the "CMP" load and "INI" initialization files to send to the node'. It contains two dropdown menus: 'MS2010.cmp' (labeled 'CMP File') and '2004-11-01\_21:35:53.Board.ini' (labeled 'INI File'). A 'Send Files' button is to the right.
- Section 2:** A heading 'Select a "INI" initialization file to send to the node'. It contains a dropdown menu with '2004-11-01\_21:35:53.Board.ini' (labeled 'INI File') and a 'Send File' button.
- Section 3:** A heading 'Select a "DAT" call progress tones file to send to the node'. It contains a dropdown menu with 'usa\_cpt.dat' (labeled 'DAT File') and a 'Send File' button.
- Section 4:** A heading 'Select a "VXML" file to send to the node'. It contains a dropdown menu with 'testtrunk.xml' (labeled 'VXML File') and a 'Send File' button.

The tool provides the user with a way to remotely reload the device by downloading a CMP load file and an INI initialization file. The following display is shown when a user selects this option:

Similarly, the tool also provides the ability to download other node specific files such as a previously saved INI file (located on the IEMS server in the /data/loads/audiocodes/< node ip>/ directory).

### 1.6.3 Password Management

This panel allows the user to change the passwords on the node. The tool supports changing the SNMP read and write community strings as well as the node's web server username and password. Both of these panels have descriptions of the passwords and what they are used for.

The configuration tool stores the community strings that are used when communicating with the node. This screen allows you to both change the community strings on the node (provided the tool is already communicating with the correct community strings) and stores the updated strings for the tools later use. The password must be alpha-numeric and can be up to 255 characters long.

| SNMP                                                                                                                                                                                                                                                                                                                                                                                                | Web Server                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The configuration tool stores the community strings that are used when communicating with the node. | <p>Read Community String</p> <p>Read String <input type="text"/></p> <p>Confirm <input type="text"/></p> <p><input type="button" value="Change Read String"/></p>                                                                                                                                                                                                                                   | <p>Write Community String</p> <p>Write String <input type="text"/></p> <p>Confirm <input type="text"/></p> <p><input type="button" value="Change Write String"/></p> |

### 1.6.4 SNMP Setup

This panel allows the user to manage the Trusted Managers table and the Trap Destination Table. The node can handle up to 5 entries in each of these tables. Each of these panels has a description of the table and its use.

#### 1.6.4.1 Trusted Managers

A trusted manager is an Element Manager (EM) from which the node accepts SNMP requests. By default, if there are no trusted managers defined then the

node accepts requests from any manager that provides a valid SNMP community string.

Once a single trusted manager is configured, requests from any IP address not in the trusted managers table will be rejected. Because of this the first IP address added to the trusted managers table should be the IP address of the server where this Configuration Tool is running. If it is not then the tool will no longer be able to communicate with the device.

#### **1.6.4.2 Trap Destinations**

The Trap Destination table defines where the node should send it's SNMP traps. Most of the traps originating from the node are alarm related. The node is capable of routing these traps to multiple destinations should the user want the traps logged by different trap collection systems. Only five trap destinations may be defined.

General Configuration Load Management Password Management SNMP Setup Atm Configuration

Trap Destinations Trusted Managers

The Trap Destination table defines where the node should send it's SNMP traps. Most of the traps originating from the node are alarm related. The node is capable of routing these traps to multiple destinations should the user require the traps logged by different trap collection systems. Only five trap destinations may be defined.

|   | Trap Destinations | Port |

### 1.6.5 ATM Configuration

This tab selection will only appear for MS2020 ATM devices. The number of tables displayed for configuration varies depending on if the MS2020 application type (AAL1 or AAL2). The panels provide both table edit, add, and delete buttons where applicable.

Please refer to the MS2020 NTP for explanation of the various fields in the tables.

## 1.7 Glossary

# SN08 Feature Deltas

*Product = IEMS*

## **A00007343--PP8600 Extended Fault Mapping**

*Functional Description*

### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

### **1.2 Introduction**

This document outlines the proposed implementation details for PP8600 Extended Fault Mapping in IEMS. In pre SN08 a minimal number of PP8600 events were supported in IEMS. All other events received from the PP8600 device were mapped as IEMS 602 “unknown” events.

This feature is to extend the PP8600 logs in IEMS to be transparent with the pre SN08 MDM implementation so that customers with previously deployed PP8600s that feed through MDM to SDM will have transparent cutover/migration to IEMS managed PP8600s.

### **1.3 Hardware Requirements or Dependencies**

Not applicable.

### **1.4 Software Requirements or Dependencies**

IEMS must have the relevant MIBs from the PP8600. This is expected to be 3.7.x.

### **1.5 Limitations and restrictions**

Because this feature is intended to mirror the behavior of the MDM-SDM system, fault codes etc. will be used in accordance with previously decided conventions and values.

### **1.6 Interactions**

The log format will change for all PP8600 originated logs.

### 1.6.1 Example old log (pre-SN08)

## 1.7 Description

IEMS needs to support all the events indicated in the above table. As it is required to support such an extensive number of events, it is proposed that the Event mapping details be maintained in XML format in the IEMS server side. This will also provide additional flexibility in supporting any further events.

### 1.7.1 Implementation Details

Processing that occurs the IEMS in order to map the events received from the PP8600 device are detailed below:

- 1 The IEMS server, on addition of the first PP8600 device, initializes the event mapping details by reading them from the XML.
- 2 On receipt of an event from the PP8600 device, the event mapping details are retrieved based on the OID received in the trap.
- 3 Log/Alarm is generated by IEMS based on the event mapping details.

### 1.7.2 Proposed Format for persisting Event Mapping in XML

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<TRAPS>
  <TRAP
    oid = ".1.3.6.1.4.1.2272.1.21.0.11"
    name = "rcn2kCardDown"
    severity = "2"
    logName = "PP"
    logNumber = "326"
    eventType = "TBL"
    eventLabel = "PP Fault"
    category = "equipment"
    entity = "$ip_2KCardStatus"
    componentID="cardIndex=$1"
    alarmClear = "3"
    probableCause=" "
    description= "Card Down: cardIndex = $1( AdminStatus = $2 OperationStatus = $3)"
    specificProblem value = "RC 2K Card Status" >
      <VARBINDS>
        <varbind name = ".1.3.6.1.4.1.2272.1.4.9.1.1.1" property = "$1"/>
        <varbind name = ".1.3.6.1.4.1.2272.1.4.9.1.1.5" property = "$2"/>
        <varbind name = ".1.3.6.1.4.1.2272.1.4.9.1.1.6" property = "$3"/>
      </VARBINDS>
    </TRAP>
  </TRAPS>
```

## 1.8 Glossary

| Term   | Description                          |

| IEMS   | Integrated Element Management System |
| PP8600 | PassPort 8600                        |

***Product = IEMS***

## **A00007344--IEMS Robustness/Southbound Event Throttling** ***Functional Description***

### 1.1 Applicable Solution(s)

UA-IP

### 1.2 Introduction to OMs

This document brings out the various Operational Measurements of IEMS. These measurements greatly help the craft person in monitoring and maintaining the IEMS, as it being the heart of managing the succession network.

### 1.3 High Level Design

The following table lists out the OMs that are to be collected by the IEMS. A separate MIB (IEMS OM MIB) will be defined for capturing all these OMs. Users can create templates by loading the IEMS OM MIB (Reusing the existing performance UI) and a Job can be created for periodically collecting the data. All these are done over the existing IEMS performance collection framework. These collected data will be transferred to the OSS in XML or CSV format. No SNMP Agent Implementation will be provided for querying these data as of now).

**IEMS Operational Measurements:**

| Collection Attribute Name | Value<br>reset<br>for next<br>collect.<br>interval | Comments |
|---------------------------|----------------------------------------------------|----------|
| database                  |                                                    |          |

|                                                                                                                        |     |                                                                                                                                                                                                                                                        |

### 1.2.1 OM Configurations & Table Definitions

| JobConfigurationTable |                                                                         |           |                |               |                     |
|-----------------------|-------------------------------------------------------------------------|-----------|----------------|---------------|---------------------|
| Attribute Name        | Attribute Description                                                   | Data Type | Allowed Values | Default Value | Optional/ Mandatory |
| <b>ID</b>             | ID which is internally generated as and when a row is getting inserted. | Integer   |                |               | Mandatory           |
| NUMOFJOBS             | Number of longest duration jobs to be collected..                       | Integer   |                |               | Mandatory           |

## 1.4 IEMS Overload Control

This functionality is aimed at reducing the impact on the IEMS when event/message rate from devices exceeds the support/affordable rate. Since IEMS plays a prominent role in managing the succession network, it should be protected from such unusual message rates. This document brings out the design for achieving the same.

### 1.4.1 High Level Design

One of the ways of controlling the IEMS overload is by constantly monitoring the Event Streams of managed devices.( i.e for identifying the rouge devices). This can be achieved by implementing the following items.

- Component that monitors the message buffer size of the IEMS. This monitoring of message buffer will be done for every “n” events. (This number “n” can be configured).
- Component that captures the incoming rates of different devices/EMS, which is used by the system for identifying event babblers.
- Component that applies Event Shedding Policies for protecting the IEMS
  - Throttled State
    - Dropping the Events from UnProvisioned Devices(i.e. Devices not managed by the System)
    - Identifying the top fault interfaces
    - UnManaging and Changing the System's State to “Throttled”.
    - Generating Alarms to indicate the “Throttled” State
    - Dropping the incoming events received from this device

- Changing the device's state to Manage after a specified timeout
- UnManaged State
  - Changing the device state to “UnManage” if the device is in a Throttled State for a specified number of times. (This number can be configured)
  - Generating Alarms to indicate the “UnManaged” State

### 1.4.2 Low Level Design

Below diagram depicts the *important* sequence of events while monitoring and controlling the incoming messages to the IEMS.

( IEMS MessageOverload Controller uses the data maintained by the IEMS MessageListener, for determining the top fault interfaces of IEMS System )

### 1.4.3 IEMS MessageListener

This component (part of IEMS Fault Manager) listens for the incoming messages (for identifying top fault interfaces) of the various devices managed by the IEMS. Whenever an event is received by the IEMS, IEMS Message

Listener will be notified about this event. This component just have a count on the number of events received for a specific device. No Time consuming work will be handled in this component as it may affect the EventProcessing rate of the IEMS.

#### 1.4.4 IEMS MessageBufferMonitor

This component periodically monitors the message buffer of IEMS for every “n” events. A separate configuration that captures the following details will be defined for triggering the Message Shedding Policies.

- EnableMessageOverloadControl.
  - Boolean Value that decides whether incoming messages to the IEMS need to be monitored or not. i.e OverloadControl should be enabled or not.
- AcceptableEventBufferSize
  - Int Value representing the max number of messages in the buffer that IEMS can handle.
- MessageMonitorCount
  - Int Value representing the number of messages to be received by the IEMS before checking the buffer size of the IEMS. i.e checking the Message Buffer for every “n” messages.
- ThrottleStatePeriod
  - Time in MillisSeconds that a ManagedObject(MO) will be placed be in the Throttle State. After the ThrottleStatePeriod, the IEMS automatically switches the MO back to the Managed State.
- ThrottleStateCount
  - Int Value that represents the max number of times, a Managed Object will be put in the Throttle State. Afterwards the IEMS automatically makes the MO to “System UnManaged” state.

If the Message Buffer Size exceeds the given max value (at the end of a given message count), it notifies the IEMS MessageOverload Controller to take corrective actions like triggering of Message Shedding Policies.

#### 1.4.5 IEMS MessageOverloadController

This component triggers message shedding policies like shutting down of the fault interfaces having high message incoming rates, preventing IEMS from storing events from the unprovisioned devices etc. (It uses the data maintained by the IEMS EventListener for identifying the top fault interfaces Identifying top fault interfaces is done by taking average incoming message rate for each

device.) After a specified timeout, it also take actions for receiving messages from devices, that are being identified as rogue previously.

#### 1.4.6 New Fields in Managed Object

**FISState** (FaultInterface State) - String or Integer that captures the exact state of the Device.

- Normal
- Throttle UnManage
- System UnManage

| <i>Manage/<br/>UnManage<br/>State</i> | <i>FaultInterface<br/>State</i> | <i>Comments</i>                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manage                                | Normal                          | Indicates normal functioning of the device.                                                                                                                                                                                                                       |
| UnManage                              | Normal                          | Indicates the Unmanage State of the device, which is being triggered by the User, but the device may be functioning normally.                                                                                                                                     |
| UnManage                              | Throttled                       | Indicates the Unmanage State of the device, which is being triggered by the IEMS Overload Controller.                                                                                                                                                             |
| UnManage                              | UnManage                        | Indicates the Unmanage State of the device, which is being triggered by the IEMS Overload Controller, as the device is behaving as a rogue.<br><br>This value will be automatically updated to "Normal" if the User updates the status of the device to "Manage". |

**UnManage** - Boolean Value that captures whether IEMS is allowed to change the MO's state from "Throttled" to "UnManaged".

#### 1.4.7 Table Definitions

Name: **MessageOverloadControlConfiguration**

| Column Name | Data Type | Allowed Values | Default Values | Optional/<br>Mandatory |
|-------------|-----------|----------------|----------------|------------------------|
| MOCID       | Integer   |                | 1              | Mandatory              |

|                                 |         |        |      |           |
|---------------------------------|---------|--------|------|-----------|
| ENABLE MESSAGE OVERLOAD CONTROL | Integer | 0 or 1 |      | Mandatory |
| MESSAGE_BUFFER_SIZE             | Integer |        | 500  | Mandatory |
| MESSAGE_MONITOR_COUNT           | Integer |        | 1000 | Mandatory |
| THROTTLE_STATE_PERIOD           | Integer |        | 5000 | Mandatory |
| THROTTLE_STATE_COUNT            | Integer |        | 3    | Mandatory |

**A00007345--MDM Enhancements for IEMS**

## ***Functional Description***

### **1.1 Applicable Solution(s)**

UA-IP

### **1.2 Introduction**

This document presents the functional specification for the new enhancements to be done for the Preside MDM 8.0 in SN08.

### **1.3 Descriptions**

#### **1.3.1 Auto Discovery of Client set and Server set platforms**

In SN08, the client sets and the server sets platforms will be automatically discovered when the Preside MDM 8.0 is added. IEMS discovers the client sets and the server sets platforms with the help of the following API's

IEMS registers with the Preside MDM Server with the following API,

- `_cmd: REGISTER`
- `_user_id: chris`

After registering with the Preside MDM, IEMS sends the following API to retrieve the devices (Passports, Platforms and VSPs) residing under this Preside MDM EM.

- `_cmd: GET`
- `_obj_class: network`
- `_obj_id: networkId S compRoot`
- `_scope: NEXT`
- `_filter: objectClass EQ S node`
- `_attr_id: ALL`

and the response message for the above API looks like the following one.

```
_obj_class: node
_obj_id: compId NI EM CLEVELAND
_attr: rawState E INSV
_attr: compAckState E notAcked
_attr: compCriticality I 90
```

```
_obj_class: node
_obj_id: compId NI NMS FT1400-2
_attr: rawState E INSV
_attr: compAckState E notAcked
```

\_attr: compCriticality I 80

If the response message contains “NMS” in the obj id, then it is modeled as MDM platforms (since there is no unique way to distinguish between the client sets/server sets platforms we are modeling it as a MDM platform). This auto discovery of client sets and server sets functionality are supported only for SN08 release and not for the pre-SN08 versions.

Just like other devices (Element Managers, platforms, Applications), the auto discovered MDM client sets and server sets platforms are also modeled as a ManagedObject and refer “Map representation of Client set and Server set platforms” for the Map display for these platforms.

**Note:** No support will be provided to provision the MDM platform 8.0 version from the “Add Platforms” menu.

### 1.3.2 Map representation of Client set and Server set platforms

The client sets and the server sets will be displayed to the topology tree under the “EMS Platforms -> MDM”. Representation for the same is shown below

```
EMS Platforms
|
|
| __ MDM
```

In the right side work area of the “MDM”, IEMS displays both client sets and the server sets platforms of all discovered Preside MDM Servers. In order to identify to which the Preside MDM Server the client sets/server sets belong, IEMS appends the displayName of the Preside MDM Server along with the displayName of the client sets/server sets platform in the right side work area.

### 1.3.3 Map representation of Preside MDM Mgr and its associated NEs

The existing grouping of Preside MDM Mgr and its associated NE's are as follows

```
Element Manager
|
| __ Preside MDM (displayName)
```

In the right side work area of the “Element Manager”, IEMS displays all discovered Preside MDM EM's. In the right side work area of the “Preside MDM (displayName)”, IEMS displays both the Units (Unit0 and Unit1) for duplex whereas for simplex it doesn't display anything.

```
Network Elements
|
| __ Passports
```

In the right side work area of the “Passports”, IEMS displays the Passport devices (MSS15K, MSS Unknown etc) of all discovered MDM Servers, whereas in the right side work area of the “MSS15K” and “MSSUnknown”, IEMS displays the respective Passport devices.

The new grouping of Preside MDM Mgr and its associated NEs are as follows

In order to maintain consistency across the IEMS, the same tree structure is retained as like pre-SN08 release. In order to identify to which MDM Server the Passports/MG15000 (previously PVG)'s belongs, IEMS appends the displayName of the MDM Servers along with the displayName of the Passports/MG15000 (previously PVG)'s in the right side work area.

### 1.3.4 Fault mapping for auto discovered MDM Platforms

IEMS listens for the client sets and server sets alarms and correlates the same against the corresponding platforms. The correlation used is the same as like that of Preside MDM EM Passports etc.

Procedure to generate the Warning fault for MDM Platform from the *wcary3r6* - Preside MDM Server

- 1 Invoke the *nmstool* from *wcary3r6* (the absolute path is */opt/MagellanNMS/bin/nmstool*)
- 2 From the GUI invoke *System* menu
- 3 From the menus invoke *Administration* menu
- 4 From the menus invoke *Server Administration* menu
- 5 From the menus invoke *Security* menu
- 6 From the menus invoke *Authorize* menu
- 7 Click ‘ok’ without entering the password – This will generate a Warning alarm for the WCARY3R6 MDM platform.

### 1.3.5 Operator Client GUI Launch

A new menu item “MDM Operator Client GUI” will be provided to the context menu for Preside MDM Mgr. This menu will be available on the right click of the Map Symbol of Preside MDM Mgr 8.0 version. This menu is supported only for SN08 release and not for the pre-SN08 versions.

On clicking this menu item, IEMS will invoke the following URL in the client browser,

**http://<ipaddress>:8080/UI**

where <ipaddress> is the Preside MDM Server IP Address.

### 1.3.6 MDM X11 Client launch

In SN08, X11 communication is secured via SSH using MindTerm tool. The X11 Client launch requires X server needs to be run in the local client machine. In the case of Solaris/Linux, Xserver runs by default and in the case of Windows, Hummingbird or Exceed is used as Xserver.

A new menu item “Legacy MDM Tools” will be provided to the context menu for Preside MDM Mgr. This menu will be available on the right click of the Map Symbol of Preside MDM 8.0 version. This menu is supported only for SN08 release and not for the pre-SN08 versions.

On clicking this menu, IEMS will launch a “LegacyMDMTools” dialog, which captures the following attributes

- Text field to enter the Exceed executable file path (for Windows OS only).
- Text fields to enter Username/Password.
- Radio buttons with the following options
  - Server-Set Administrative Tools
  - Client-Set Administrative Tools
  - Client-Set Operational Tools

All the above options will invoke the nmstool with the parameter as said below

- 1 Server-Set Administrative Tools -- > "/opt/MagellanNMS/bin/nmstool admin"
- 2 Client-Set Administrative Tools -- > "/opt/MagellanNMS/bin/nmstool admin"

- 3 Client-Set Operational Tools -- > "/opt/MagellanNMS/bin/nmstool operation"

On executing the launch with proper configuration, the launch triggers an X11 connection from the corresponding device back to your desktop, and brings up the nms toolset menu with the given option.

**Note:** Since “LegacyMDMTools” has the same functionality of “MDM GUI Mgr”, the menu “MDM GUI Mgr” is disabled for Preside MDM 8.0 devices.

### 1.3.7 Command Line launch for MDM Passport

A new menu item “Command Line” will be provided to the context menu for Passport Network Elements that belong to Preside MDM 8.0 version. This menu will be available on the right click of the Map Symbol of Passport Network Elements. This menu is supported only for SN08 release and not for the pre-SN08 versions.

For “Command Line” launch, IEMS will initiate one-step login between the IEMS client and the Preside MDM server, that is IEMS will invoke an SSH client to log in to the Preside MDM Server. For this launch, IEMS will not use the SSO token for login into the Preside MDM Server. Instead, IEMS will gather credentials for login by prompting for entry of userid and password.

### 1.3.8 Testing Considerations

The following are some of the test considerations to be captured along with the new enhancements for backward compatibility in the test plans.

- Provision a Preside MDM 6.2 system in IEMS
- IEMS launching of the preside MDM 6.2
- Provision a Preside MDM 7.0 system in IEMS
- IEMS launching of the preside MDM 7.0
- Provision a Preside MDM 8.0 system in IEMS
- IEMS launching of the preside MDM 8.0

## 1.4 Glossary

## **A00007346--Backward Compatibility in IEMS**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

## 1.2 Introduction

IEMS serves as an integrated platform for managing various devices. This module is for providing Backward Compatibility in IEMS so that all the SN08 device versions and the previous device versions are supported in IEMS. This document lists the IEMS design changes required for the devices where an interface change was identified.

The IEMS must maintain backwards compatibility with its managed components for N-2 Succession releases. This SN08 activity required a Succession-IEMS Prime to perform the research with the help of IEMS managed component design primes to identify changes to their management interfaces that would impact their backwards compatibility with the IEMS.

The primary interfaces that needed to be analyzed through this activity included the topology, fault, performance, security (authentication and authorization), and client launch (CLUI and GUI) interfaces. Changes to the High Availability model of the IEMS managed component were also analyzed. If there were no “currently known” changes to an IEMS managed component's interface, it was so documented in the DID.

Where component interface changes have occurred, the Succession-IEMS Prime acquired information about the changes to the management interfaces of the IEMS managed components and provided the specifics to the Adventnet team.

In light of the details provided to Adventnet, design changes will be made to the IEMS to ensure that the IEMS can manage the new SN08 component version variants while being able to manage the older component versions (i.e., SN6.2, and SN07).

A regression test plan has been created in light of the research conducted for this feature. This activity is primarily targeted to perform the necessary regression testing with the IEMS managed components to ensure that backwards compatibility is maintained.

A request for information was made to various component primes for information on interface changes towards IEMS in SN08. The results of this research are documented in the DID. The DID was reviewed and updated with comments. It should be considered a snapshot in time and is based on the information available.

The following components were identified to have some SN08 changes that needed to be further explored.

- In SN08, the USP NE component had plans to make a Syslog feed available to the IEMS. USP will make the security and audit streams available to the IEMS. It is expected that the custlog stream will still not be made available to the IEMS in SN08.
- MDM related changes are being covered by a SN08 feature A00007345.
- MSS2000 related changes are being covered by a SN08 feature A00007341.
- CEM related changes are covered by a SN08 feature A00007347. In SN08, the CS2K Core Manager will provide faults to IEMS via CEM. Any SN08 changes to provisioning the CS2K Core Manager in IEMS will fall under the above-mentioned CEM feature.
- The version of MCS that lines up with SN08 is MCS4.0. A number of IEMS changes needed to cater to MCS4.0 architectural changes are slated to be addressed in SN08. The appropriate portion of the FN will address those MCS related changes.

### 1.3 Acronyms Used

IEMS -Integrated Element Management System  
EM -Element Managers  
HA -High Availability.  
SM -System Manager  
FPM -Fault Performance Manager.  
SSH-Secure Shell

### 1.4 MCS Changes

SN08 lines up with MCS version 4.0.

There can potentially be more than one independent MCS network in a Central Office being monitored by IEMS.

MCS follows a HA model and may be deployed in the field in a simplex or a duplex configuration. In SN08, IEMS is adding support for the HA model (both simplex and duplex configuration).

Each independent MCS system will be represented by an “MCS NE” object in the “Network Elements” folder. This “MCS NE” is an opaque BLOB that will be the central point for aggregating faults from all corresponding SM and FPM objects provisioned into IEMS. (Note: An independent MCS system may be managing an RTP Media Portal in which case the parent object representing an entire MCS System will be an RTP Media Portal object in the “Network Elements” folder.)

The changes for MCS are divided into two categories. The first describes the changes for the System Manager and the second describes the changes related to the Fault Performance Manager.

#### 1.4.1 System Manger

An MCS System Manager will always provide Fault and Performance capabilities.

A simplex MCS system will be represented in IEMS by a managed object signifying a logical SM and a managed object signifying a physical active System Manager.

A duplex MCS system will be represented in IEMS by a managed object signifying a logical, SM and two managed objects signifying a physical active and a physical alternate System Manager. The section below covers the various requirements for the MCS system manager.

#### 1.4.2 Topology

The System Managers should be shown under the “Element Manager” node of the topology tree.

There can be more than one independent MCS network in the CO, each having a unique virtual IP (which will be entered into IEMS when configuring the System Managers). Therefore, the EM navigation tree will contain as many System Manager nodes under it.

In the new model, physical and logical SM servers will be displayed in the navigation tree. Logical System Managers (which represent the Virtual IP of the MCS SM) are parents to Physical SMs. The logical System Managers will be shown directly under the EM node. The physical active and alternate System Managers will be shown as sub-nodes of a logical System Manager.

The naming convention of the System Manager is MCS\_SM (UserAssignedNameOfSM).

The topology tree for the MCS system managers will be displayed as

```

Element Managers +-
                  |
                  +- MCS SM1 (logical) +-
                  |                     |
                  |                     | SM1 (physical - active)
                  |                     +- SM1 (physical - alternate)
                  |
                  +- MCS SM2 (logical) +-
                  |                     |
                  |                     | SM2 (physical - active)

```

+ - SM2 (physical - alternate)

**Note:** Each logical SM represents an independent MCS system.

Each MCS system will be represented by a Managed Object under the Network Element and will be an opaque BLOB. Faults from ALL SMs and FPMs should be resolved to the corresponding MCS object in the Network Elements folder.

The naming convention of the MCS Network Elements is MCS/CSE (UserAssignedNameOfTheCorrespondingSM)

**Note:** An independent MCS system may be managing an RTP Media Portal in which case the parent object representing the entire MCS System will be an RTP Media Portal object in the “Network Elements” folder.

The tree representation of the NE is as follows:

Network Elements

```
|
+- MCS/CSE (UserAssignedNameOfTheCorrespondingSM)
|
+- RTP Media Portal (UserAssignedNameOfTheCorrespondingSM)
|
+- MCS/CSE (UserAssignedNameOfTheCorrespondingSM)
|
```

### 1.4.3 Modifications to the “Add EM” GUI:

When adding an MCS System Manager, the IP that is given initially is the Virtual IP of the system.

The GUI should contain a combo box to enable a user to select a “Simplex” or a “Duplex” MCS system.

If the “Simplex” mode is selected, there should be a provision to enter one IP addresses, the physical IP of the active system manager.

If “Duplex” mode is selected, there should be provision to enter two IP addresses representing physical IP addresses of the active and the physical IP of the alternate System Manager.

Text-entry GUI elements should be introduced to let the operator enter a username and password (employed for SM CLUI launch).

#### 1.4.4 Fault

In SN08 the protocol for the SM's fault interface continues to be SNMP traps. The fault data will be collected from the physical active SM. For data collection (resynchronize/pull), the physical IP of the SM will be used. The active System Manager will have an SNMP agent running in it while the alternate System Manager will not have an SNMP agent running in it.

The System Manager object representing the physical active system manager will show the highest severity fault status of the physical active System Manager. The System Manager object representing the physical alternate System Manager will be in an unknown state. IEMS will continue to listen for events from the alternate SM server and will thereby be able to recognize that a SWACT has taken place between mates within a MCS SM pair.

The System Manager object representing the logical system manager will display the highest severity fault status of the physical active System Manager. If IEMS is not able to contact both physical SM servers (active and alternate), the object representing the logical System Manager will display an unknown state until such time that IEMS regains contact. A "Comm. Failure" fault will be issued by IEMS if the both physical SM servers of a duplex system cannot be contacted.

**Note:** A "Comm. Failure" fault will be issued by IEMS if the physical SM server of a simplex system cannot be contacted.

An operator will retain the capability of manually toggling a **physical** SM server between an Unmanaged and Managed state. IEMS will not collect fault or performance data from a server in an unmanaged state. If an MCS SWACT takes place during the time a server has been set to Unmanaged via IEMS, the icons for the server in unmanaged state will only be updated after the operator manually brings back the server to a Managed state.

The MCS Object under the Network Elements will be automatically updated with the corresponding fault status due to the parent-child relationship. If IEMS is able to contact at least one physical SM server (active and alternate) or an FPM server, the object representing the Network Element will display the highest severity fault status of the aggregate SM and FPM servers. Otherwise, the MCS NE icon will be in an unknown state.

##### 1.4.4.1 Notes:

- 1 All managed objects corresponding to MCS physical servers (SM and FPM) should have manage/unmanage capability.
- 2 All managed objects corresponding to MCS logical components (logical SM and MCS NE) should have manage/unmanage capability.
- 3 Cascading of Managed/Unmanaged state

- When a user sets the logical SM managed object to “Unmanaged state”, the MCS SM physical servers should be forced into “Unmanaged state”.
- When a user sets the logical SM managed object to “Managed state”, the MCS SM physical servers should be forced into “Managed state”.
- When a user sets the MCS NE managed object to “Unmanaged state”, the MCS SM logical, MCS SM physical and FPM physical servers should be forced into “Unmanaged state”.
- When a user sets the MCS NE managed object to “Managed state”, the MCS SM logical, MCS SM physical and FPM physical servers should be forced into “Managed state”.

### 1.4.5 Detecting the Active SM Server

- 1 Polling the SNMP agent for the System Managers. The alternate system manager will not have an SNMP agent running. The SM, which has the SNMP agent running, is the active System Manager. An SNMP query to the inactive server will result in a time-out. A “Comm. Failure” fault will be issued by IEMS if the both physical SM servers of a duplex system cannot be contacted.

**Note:** A “Comm. Failure” fault will be issued by IEMS if the physical SM server of a simplex system cannot be contacted.

- 2 IEMS will receive a coldstart from MCS object with the active server's IP address. IEMS will use this to identify the active system manager.
- 3 If a SWACT has taken place, the fault will be received from the physical IP of the previously alternate system manager. IEMS should recognize this change in the IP and determine that a SWACT had taken place.

### 1.4.6 Performance

The protocol for MCS SM's performance interface in SN08 continues to be sftp. An MCS System Manager will always provide Fault and Performance capabilities. The performance data will be collected from the physical IP's of the active physical System Manager.

IEMS should have a work item to change the current way we configure our collection job for MCS. Currently we can set up only one file filter for the MCS device (as it is associated with the MCS SM MO, not the collection job). This does not allow us to collect unique sets of data with multiple MCS collection jobs in the IEMS. The ability of specifying unique directory and file filters will help in two ways:

- MCS4.0 can be configured for collecting different sets of data with multiple collection intervals (i.e., 5 min and 30 min) at the same time, and the csv files reside in different directories. An operator should have the ability to collect and report data for multiple collection intervals.
- The MCS system monitors a number of devices and the csv files for different devices reside in different directories. An operator should have the ability to collect and report data for individual devices.

Previous to MCS4.0, performance data used to reside in:

“/IMS/tss/data/oss/OM/b643net/MgmtSite/\*/\*”

For MCS 4.0 release, the performance data are in the directory:

“/var/mcp/oss/om/MCP\_4.0/<fault-performance manager instance id>/<network element instance id>/<file format option name>”, e.g. “/var/mcp/oss/om/MCP\_4.0/FPM1\_0/\*/\*/csv-file” where \* is a wildcard representing “network element instance id”.

#### 1.4.7 CLUI Launch

The SM will support GUI and CLUI launch. The GUI launched will be the MCP System Management Console running on the SM.

There is a CR (#Q00963269: Menu entries for GUI launch ignore device variant) related to the SN07 device variant not being taken into consideration when a pop-up menu is invoked off an MCS Manager object. This CR will be addressed and the deficiency it points out retested during SN08 IT of MCS enhancements.

There is a CR (#Q00964269: Need unique instance of GUI launch file-chooser for each MCS Manager Object) related to the same instance of file-chooser being launch for all MCS Manager objects. This CR will be addressed and the deficiency it points out retested during SN08 IT of MCS enhancements.

In spite of the fact that the MCS4.0 SM GUI is a Java Web Start Client, the MCS team has made a decision not to support MCS SM GUI Launch on a Unix console. The MCS4.0 SM GUI (called the MCP System Manager Console) will only be launched on Windows platforms. If a Windows Client does not have the correct version of JRE needed for the MCS SM GUI, an automatic download (of the JRE) from the MCS SM server will be initiated.

The CLUI launch should proxy to the IEMS server and then SSH to the IP of the SM.

## 1.5 Fault Performance Manager (FPM)

A new device called the FPM is introduced in SN08. This will supplement the MCS SM in very large COs. Accordingly, there may be zero, one or more FPMs present in the MCS system. The FPMs are designed to provide fault and performance data. When the CO gets larger, more FPMs will be added to the system. FPMs DO NOT abide by the HA model followed by MCS SM.

As the FPM supplements an SM in the system, the user should not be able to provision an FPM in IEMS until an SM is added. When provisioning an FPM in IEMS, the user should choose the SM with which this FPM is associated. The FPMs that supplement the SM will need to be added manually into IEMS.

### 1.5.1 Topology

Similar to SMs, the FPMs will be shown under the “Element Manager” node in the topology tree. As there can be more than one FPMs in the system, there will be as many FPMs under the “Element Manager” node in the topology tree.

The naming convention of the FPM is MCS\_FPM  
(UserAssignedNameOfSM\_UserAssignedNameOfFPM)

The tree representation of the FPMs will be as follows.

```
Element Managers +-  
                  |  
                  +- MCS FPM1 (utilizing a physical IP)  
                  |  
                  +- MCS FPM2 (utilizing a physical IP)  
                  |  
                  +- MCS FPM3 (utilizing a physical IP)
```

### 1.5.2 Introduction of a new “Add EM” GUI

The ability to provision an FPM into IEMS as a separate EM will be provided via the new “Add EM” GUI. The IP that is entered by the user is the physical IP address of the FPM.

As FPMs are subordinate to SMs, an FPM should always be associated to an MCS4.0 SM. Hence, if an MCS4.0 SM is not already added in IEMS, the user should not be able to add an FPM object in IEMS. Accordingly, in the FPM addition GUI, a combo box will be shown that will list the already added MCS4.0 SMs in IEMS. The user should associate this FPM with one of the listed MCS4.0 SMs by choosing an MCS4.0 SM from the combo box.

**Note:** Note: An SM which is not for an MCS4.0 Solution should NOT appear in the combo-box.

Text-entry GUI elements should be introduced to let the operator enter a username and password (employed for FPM CLUI launch).

### 1.5.3 Fault

The fault interface (SNMP traps) used to collect the fault information for SMs can be used for FPMs too. The fault data can be pulled (resynchronized) from the IP address of the FPMs. The MCS object in the Network Elements folder will be automatically updated with the corresponding fault status due to the parent-child relationship.

### 1.5.4 Performance

The protocol for MCS FPM's performance interface in SN08 will be sftp. The performance data will be collected from the physical IP's of the FPM (Fault and Performance Manager).

FPMs should be listed as a distinct entity (i.e. in addition to the SM in the "Device type" comboBox on the IEMS PM CollectionJob GUI panel

Previous to MCS4.0, performance data used to reside in:

`"/IMS/tss/data/oss/OM/b643net/MgmtSite/*/0"`

For MCS 4.0 release, the performance data are in the directory:

`"/var/mcp/oss/om/MCP_4.0/<fault-performance manager instance id>/<network element instance id>/<file format option name>"`, e.g. `"/var/mcp/oss/om/MCP_4.0/FPM1_0/*/csv-file"` where \* is a wildcard representing "network element instance id".

### 1.5.5 GUI/CLUI Launch

The FPM will support GUI and CLUI launch. The GUI launched will be the MCP System Management Console running on the SM.

The following CRs and GUI information were discussed earlier and are repeated here for ease of reference.

There is a CR (#Q00963269: Menu entries for GUI launch ignore device variant) related to the SN07 device variant not being taken into consideration when a pop-up menu is invoked off an MCS Manager object. This CR must be addressed and the deficiency it points out must be retested during SN08 IT of MCS enhancements.

There is a CR (#Q00964269: Need unique instance of GUI launch file-chooser for each MCS Manager Object) related to the same instance of file-chooser

being launch for all MCS Manager objects. This CR must be addressed and the deficiency it points out must be retested during SN08 IT of MCS enhancements.

In spite of the fact that the MCS4.0 SM GUI is a Java Web Start Client, the MCS team has made a decision not to support MCS SM GUI Launch on a Unix console. The MCS4.0 SM GUI (called the MCP System Manager Console) will only be launched on Windows platforms. If a Windows Client does not have the correct version of JRE needed for the MCS SM GUI, an automatic download (of the JRE) from the MCS SM server will be initiated.

The CLUI launch should proxy to the IEMS server and then SSH to the IP of the FPM.

## 1.6 Deleting the Managed Objects

### 1.6.1 Deletion of an FPM

To delete an FPM, the user can right-click on the FPM object and click on the “Delete” menu item. This will delete the selected FPM.

### 1.6.2 Deletion of an SM

To delete an SM, the user can right-click in the SM object and click the “Delete” menu item. This will delete the selected SM object. However, since an SM can have zero or more FPMs under it, the user should not be able to delete an SM unless all the FPMs that are associated with the SM are deleted. If a user chooses to delete an SM that contains one or more FPMs under it, the user should be informed to delete all the FPMs under it and then delete the SM.

*Note:* Cascade deletion of an SM and all the FPMs under it is not provided to make the user realize the effects of the operation.

### 1.6.3 Deletion of the NE

Since the user is not adding the NE manually, there will not be any manual deletion option for the NE. Once an SM object is deleted, the associated NE will be automatically deleted from the “Network Elements” folder.

### 1.6.4 Changing the IP address of the Logical or Physical System Manager

The user will be able to change the IP address of a Logical or Physical System Manager that has one or more FPMs without actually deleting and re-adding an SM object (since deletion of an SM object is disallowed for SMs with corresponding FPMs).

## ***Product = IEMS***

### **A00007347--CEM Integration with IEMS**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

##### **1.2.1 Alarm Properties**

There is a new field within IEMS in the alarm properties which indicate whether the alarm is manually clearable as documented here by the IEMS design team:

IEMS Alarm Properties Dialog would include alarmClear property from now on to identify manually clearable and non clearable alarms.

The alarmClear attribute would now be shown in the Alarm Properties Dialog. The value of this would be mapped to

other (1),  
forbidden (2),  
required (3),  
optional (4)

"This object provides guidance to a mid-level manager on the handling of this alarm. A value of forbidden indicates that a mid-level manager MUST NOT allow this alarm to be manually cleared. A value of required indicates that this alarm has no corresponding clear so MUST always be manually cleared. A value of optional indicates that this alarm does have a corresponding clear, but that it MAY also be cleared manually. A value of other indicates that the manual clear status is either unknown or not one of the specified values."

This attribute can potentially be used to identify the manually clearable events.

## 1.2.2 Configuring a CEM

To configure a CEM is like any other NE, simply choose tools, add EMS/NE

Enter the DNS name, or IP address along Host Name / IP Address. Display name should be the “Element Name” chosen when configuring the CEM on the SSPFS using configCEMS. Change Device Type to CEM Mgr. Click Next, Next and Finish.

## 1.3 Hardware Requirements or Dependencies

## *Product = IEMS*

## **A00007359--USP/USP-Compact: Log Delivery Stream to IEMS**

### *Functional Description*

#### 1.1 Applicable Solution(s)

PT-IP, UA-IP, IAC, IAW, PT-AAL2

#### 1.2 Description

This feature enhances the functionality of USP by supporting the delivery of security and audit logs to the IEMS syslog server or any other application. However, this feature will be tested with IEMS based syslog server. USP log data is sent to IEMS in unformatted manner using syslog.

Currently, the USP only sends Alarms via the SNMP interface (integrated into IEMS, Micromuse and some customer OSS's). This functionality will remain unchanged.

No new logs will be introduced under this feature. The current USP log format and the data contained in the USP logs will not be changed under this feature

The user could provision the following parameters from the USP GUI panel to deliver the logs to syslog server.

- Log-delivery Enable/Disable option.
- Primary IP address of the IEMS server.

- An optional backup/secondary IP address of the IEMS server.
- Non editable transport protocol used (i.e. UDP/TCP) to deliver the logs
- Non editable port number [defaulted to 514].
- Select the category of logs (i.e. security and audit logs) to be delivered.

Following mockup snapshots show how the log delivery panel can be launched and how the user can modify log-delivery information.

**Figure 1 IEMS Log Delivery Feature Launch Panel**

**Figure 2 IEMS Data Provisioning Panel**

Two categories of logs i.e. Audit Logs and Security Logs are supported.

The user has the flexibility of selecting to deliver either security logs or audit logs or both categories of logs to IEMS server.

USP follows syslog format for sending Audit and Security Logs.

Following is the Syslog format used for delivering security and audit logs to IEMS server.

Syslog Format:

```
<PRI> "date-time" "system name" "Message-
Version" ... USP log data with fields delimited by ;
...
```

- The <PRI> field or priority represents the Facility and Severity. The priority is a one, two or three decimal integer enclosed in an angular braces "<>"
- Date-time field follows the "<yyyymmdd>T<hhmmss.ssss>{+|Z|-}hh" format and >{+|Z|-}hh refers to daylight savings time.
- System name refers to the source device's hostname.
- Message Version indicates the USP/USP-Compact messaging version.

- USP Log data fields will follow the order as follows:  
log-severity; log-group-name; log-number; system-node-name; log-description; log-date-time; data; module-name; line-number; task-name; sending-node-name; shelf; slot; context-id; log-group-id

Following are the samples of audit and security logs on USP which shall be delivered to IEMS:

Example of the security log in syslog format

```
<157> 19970101T04:23:28.0000Z-05 USP1 1 77;LOG_INFO;FTP Server;  
1;sco1_12;full access enabled for user-id FIELD : ID=0x0; ;01/01/1997  
04:20:18;ftpServer.cc; 892;tdbgServerTask;sco1_12; 0; 12;0x0; 46;
```

Example of the audit log in syslog format

```
<133> 19970101T05:10:24.0000Z-05 USP1 1 127;LOG_INFO;Journal Files;  
1;sco1_12;FIELD@192.219.223.243:system mod:success;0x620 0x0 1 SCORPIO1  
direct ;01/01/1997 05:10:24;oamUtils.c; 114;oamSrvTask;sco1_12; 0; 12;0x0; 41;
```

### 1.3 Hardware Requirements or Dependencies

This feature requires IEMS server and USP platforms [USP and USP-Compact].

### 1.4 Software Requirements or Dependencies

This feature requires USP10.0 or later of the USP software with enhanced IEMS software SN08 or later.

### 1.5 Limitations and restrictions

This feature does not support TCP based log-delivery.

### 1.6 Interactions

This feature does not change the existing functionality of USP GUI or the USP system software. There is an impact of software upgrade on this feature. If an upgrade is performed from older versions to USP10.0 or later, a new table in the RDM database will get added. This table will have information about the IEMS server.

USP interacts with IEMS server over UDP socket for sending audit and security logs.

### 1.7 Glossary

## **A00007388--IEMS Performance Phase II**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Triggering Support**

To achieve minimum time for OM collection attributes, execution of data collection, report generation and transferring the same to OSS can be combined together using triggering support of Performance interface. An easier and simple GUI will be provided in order to configure collection, reporting and transfer job details in one shot with triggering support. After the completion of data collection, report generation will be triggered while data is being written to the database in order that the report can be generated without reading data from the database. Once report generation has been completed, a transfer job will be triggered so that all the reports are transferred to OSS.

##### **1.2.1 Triggering data collection**

CollectionJob should be triggered by a configured event of the device, if the device supports the same, or as the usual way based on the granularity period of the Collection Job. Say, for a particular device MG9000, if an event of category Performance has been added from CORBA notification, then CollectionJob should be triggered for that device. If the device doesn't support these kind of notifications, then the Collection Job would be executed based on the granularity period.

### 1.2.2 Triggering report generation

Report jobs can be configured to run as scheduled mode based on the granularity period, as well as by triggered mode by the configured Collection job. Mode of executing the reports, either scheduled mode or triggered mode, would be captured in Report Job itself by using the *executionMode* property. In the case of triggered mode, name of the Collection job which would trigger the report would be identified by using *colJobList* parameter. It should be noted that only one Collection Job would be allowed to associate with the Report Job for triggering the same.

For Report jobs created with triggered mode, *executionMode* property will be set to 'triggered' and 'colJobList' property will be set to the name of the Collection Job, on whose completion this report should be triggered. For Report jobs created with scheduled mode, *executionMode* property will be set to 'scheduled' and *colJobList* should be set to 'none'.

In the scheduled mode, reports are generated based on the granularity period. For triggered mode, after the Collection job's completion, a report configured with trigger mode for this Collection Job will be triggered. Report generation will be triggered while data is being written to the database in order that the report can be generated without reading data from databases. This will reduce the time required to read the data from database for report generation.

### 1.2.3 Triggering report transfer to OSS

Transfer jobs can be configured to run as scheduled mode based on the granularity period, as well as by triggered mode by the Report job. Mode of executing transfer jobs, either scheduled mode or triggered mode, should be captured in Transfer Job itself by using the *executionMode* property. In the case of triggered mode, name of the Report job which should trigger the transfer job would be identified by using *reportJobList* parameter. It should be noted that only one Report Job would be allowed to be associated with Transfer Job for triggering the same.

For Transfer jobs created with triggered mode, *executionMode* property will be set to 'triggered' and 'reportJobList' property will be set to the name of the Report job, on whose completion this Transfer job should be triggered. For Transfer jobs created with scheduled mode, *executionMode* property will be set to 'scheduled' and *reportJobList* should be set to 'none'.

In the scheduled mode, transfer has been done based on the granularity period. For triggered mode, after the Transfer job's completion, transfer jobs configured with trigger mode for this Report job will be triggered.

## 1.3 Performance interface support for new devices

| S.No | Device Type | Supported Performance Interfaces |
|------|-------------|----------------------------------|
| 1    | GWC         | SNMP                             |
| 2    | UAS         | SNMP                             |
| 3    | SAM 21 SC   | SNMP                             |
| 4    | SSPFS       | SNMP                             |
| 5    | MG9000      | CSV                              |
| 6    | USP         | CSV                              |

## 1.4 Logging support

- Log of the Unauthorized Access Attempt: Any unauthorized configuration access attempts of measurement collection jobs should be logged in security log.
- Log of the Unauthorized Access Attempt: Any unauthorized configuration access attempts of measurement transfer jobs should be logged in security log.
- Log of the Unauthorized Access Attempt: Any unauthorized configuration access attempts of measurement report jobs should be logged in security log.

## 1.5 Enhanced GUI support

- Easier and simple GUI for configuring Collection job, Report job and Transfer job in single shot with built in triggering capability. (low priority)
- Current Measurement Collection job display should also include the status of the current/previous collection activity and the scheduled time of the next collection (if applicable)
- The display of Current Measurement Transfer job should also include the status of the current/previous transfer activity and the scheduled time of the next transfer (if applicable).
- The display of current Measurement Report jobs should also include the status of the current/previous report job activity and the scheduled time of the next report generation (if applicable).

## 1.6 Intuitive Reports

Presentation of Analysis Result: IEMS shall provide the mechanism through which the result of performance analysis can be shown as intuitive formats (e.g. graphical performance report, report/table forms etc).

## 1.7 Suspending Collection Jobs

Support would be given such that Collection job would be suspended, if topology component corresponds to this Collection job gets unmanaged.

## 1.8 Multiple folder support for CSV devices (MAS & MCS)

“Currently when we configure the MCS and MAS devices in our topology we are prompted for the device’s performance interface attributes. These attributes include collection directory, file name, transfer type (sftp, ftp or push), userid, pw. These attributes are used for all collection jobs defined against these managed object types. The current issue is that we are unable to define multiple collection jobs for these devices that use unique file collection criteria (file filters). In the case of MCS, it is a rather complex device with ~ 25 sub directories where data could be collected from. While customers may want to configure multiple collection jobs in the IEMS for these devices to collect portions of the data with different collection intervals it can not be done with our current design.”

To overcome the above design issue, the IEMS Performance Metrics Collection Job wizard should be able to get the Directory Name and File Name for the MCS and MAS devices (CSV collection devices).

Java Application Window

IEMS Performance Metrics CollectionJob Details

Name: mcsJob

Status: Enabled

Start Time: Aug 19 2004 05 : 42 : 13 : PM

☐ StopTime: Aug 20 2004 09 : 46 : 44 : AM

Device Type: MAS

Excluded Device List:

- ☐ 192.168.112.108
- ☐ 192.168.112.217

Granularity Period: 5 min

Offset: 0 (mins.)

Template Name

OK Close Help

In the above image, the red highlighted portion will be changed based upon the selected “Device Type”. If the selected device type is SNMP-collection-based device, then the red highlighted portion should be changed to ask associated Template Name. If the selected device type is CSV-collection-based device (MAS or MCS), then the red highlighted portion should be changed to ask the Directory Name and the File Name. By default IEMS will take the directory

name and file name provided in the collection job. If there is no configuration (directory name, file name) made in the collection job, the IEMS will automatically get the directory name and file name from the topology module which configured during the Add device operation.

## ***Product = IEMS***

### **A00007717--Health Monitor Logs** ***Fault Management***

#### **1.1 Applicable Solution(s)**

PT-IP, PT-AAL2

*Note:* At the time of publication, this feature consists of the Fault Management (FM) section only.

#### **1.2 Logs**

##### **1.2.1 Radius Server Health Monitor (EMSS 313)**

###### **1.2.1.1 Format**

*Note 1:* This log is sent directly to syslog via 'logger' UNIX utility.

*Note 2:* Replace all 'carriage returns' below with '^M' characters in code that generates the log.

```
May 10 18:03:56 host1 radsvrHealthMonitor.ksh[pid]: EMSS313 NONE INFO  
EMSS
```

```
Location: 191.1.1.1
```

```
Time: May 10 18:03:56
```

```
Category: processingErrorAlarm
```

```
Probable Cause: outOfService
```

```
Component Id: CLASS=SYS;SYSTYPE=SECMon;SECMonComp=RADSVR
```

```
Description: RADSVR is unhealthy, will restart if currently running.
```

###### **1.2.1.2 Field Descriptions**

**Table 1 Field descriptions**

| Field          | Value                |
|----------------|----------------------|
| Category       | processingErrorAlarm |
| Severity       | NONE                 |
| LogName        | EMSS                 |
| LogNumber      | 313                  |
| EventType      | INFO                 |
| Probable Cause | outOfService         |

### 1.2.1.3 Description / Explanation

This log is produced when ever the radius server health monitor detects the radius process is not functional.

### 1.2.1.4 Recovery Action

The health monitor will automatically try to restart the radius server if it is running already.

### 1.2.1.5 Additional information

Not applicable.

## 1.2.2 Identity Server Health Monitor (EMSS 314)

### 1.2.2.1 Format

*Note 1: This log is sent directly to syslog via 'logger' UNIX utility.*

*Note 2: Replace all 'carriage returns' below with '^M' characters in code that generates the log.*

```
May 10 18:03:56 host1 isHealthMonitor.ksh[pid]: EMSS314 NONE INFO EMSS
Location: 191.1.1.1
Time: May 10 18:03:56
Category: processingErrorAlarm
Probable Cause: outOfService
Component Id: CLASS=SYS;SYSTYPE=SECMon;SECMonComp=IS
Description: Identity Server (IS) is unhealthy, will restart if
currently running.
```

### 1.2.2.2 Field Descriptions

**Table 1 Field descriptions**

| Field          | Value                |
|----------------|----------------------|
| Category       | processingErrorAlarm |
| Severity       | NONE                 |
| LogName        | EMSS                 |
| LogNumber      | 314                  |
| EventType      | INFO                 |
| Probable Cause | outOfService         |

### 1.2.2.3 Description / Explanation

This log is produced when ever the identity server health monitor detects the identity server process is not functional.

### 1.2.2.4 Recovery Action

The health monitor will automatically try to restart the identity server if it is running already.

### 1.2.2.5 Additional information

Not applicable.

## 1.2.3 PAM Login Servlet Health Monitor (EMSS 315)

### 1.2.3.1 Format

*Note 1:* This log is sent directly to syslog via 'logger' UNIX utility.

*Note 2:* Replace all 'carriage returns' below with '^M' characters in code that generates the log.

```
May 10 18:03:56 host1 pamloginservletHealthMonitor.ksh[pid]: EMSS315  
NONE INFO EMSS
```

```
Location: 191.1.1.1
```

```
Time: May 10 18:03:56 2004
```

```
Category: processingErrorAlarm
```

```
Probable Cause: outOfService
```

```
Component Id: CLASS=SYS;SYSTYPE=SECMon;SECMonComp=WEBSERVICES
```

```
Description: PAM login servlet is unhealthy, restarting WEBSERVICES.
```

### 1.2.3.2 Field Descriptions

Table 1 Field descriptions

| Field          | Value                |
|----------------|----------------------|
| Category       | processingErrorAlarm |
| Severity       | NONE                 |
| LogName        | EMSS                 |
| LogNumber      | 315                  |
| EventType      | INFO                 |
| Probable Cause | outOfService         |

### 1.2.3.3 Description / Explanation

This log is produced when ever the PAM login servlet health monitor detects the PAM login servlet is not functional.

### 1.2.3.4 Recovery Action

The health monitor will automatically try to restart WEBSERVICES via servman if it is running already.

### 1.2.3.5 Additional information

Not applicable.

***Product = IEMS***

## **A00007785--MFT backend Security Services Integration into IEMS**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Introduction**

SN07 IEMS application maintains all the user and group related information in IEMS database. In SN08 the centralized Security Service is provided by MFT backend Security Services. The MFT backend Security Services will be

maintaining all the user and group related information, **information that is stored in NSSwitch PASSWORD (including SHADOW) DB and GROUP DB.** This document covers the changes required for the integration of MFT backend Security Services into IEMS.

### 1.3 Acronyms Used

IEMS - Integrated Element Management System

MFTBSS - Management Framework Technologies Backend Security Services

### 1.4 Overview of MFTBSS Integration

In the above diagram the Security GUI related operations will be split into the following two types,

- create, update and delete users (or) groups
- add or delete operations for a group

The create, update and delete users (or) groups will be performed using MFT API's and add or delete operations for a group using our security framework. In the create group case, we have to first add the Group using MFT API's and if the group add success then we add the group related operations using our security framework. We assumed that, the MFT Backend server should be in the **High Availability** mode on a redundant IEMS cluster, **that is, if the local MFT Backend server's DB is not responding the MFT APIs will automatically fail over to use the other MFT Backend server's DB on the inactive unit.** In

case of MFT API calls fails to respond, we will log the MFT failure information.

### 1.4.1 Location of IEMS Server logs:

/opt/nortel/iems/current/logs/secout\*.txt.

Since IEMS Server has log rotation, the name of the file starts with secout.

Sample log would be as below.

“Problem in communicating with MFT Server.Unable to proceed SecurityAdmin operations.”

Similar error messages will be shown in the requesting client. Users will be able to use only the emergency user account, to login into IEMS without the MFT backend Security Services.

## 1.5 Changes

### 1.5.1 Client Side Changes

#### 1.5.1.1 Changes in the Add User Wizard

In the second screen of the Add User Wizard, we can provide the account expiry as an absolute date field, whereas the earlier approach was to enter the number of days from the date of user creation. **Note that this account expiry GUI will be hidden until MFT provides the actual account expiry support.** The password expiry day field, 'The password expires every', now indicates how often (number of days) the user password will expire and not how soon the next password expiry will occur. The password expiry change will take effect after the next password expiry **or the next password change.**

In the Advanced Properties screen which is invoked by clicking on the “Advanced” button in the 3<sup>rd</sup> screen of Add User Wizard, the following fields are present during user addition.

**Note:** Starting SN08, all usernames must be 8 characters or less and must consist of lowercase letters or numeric digits only.

### 1.5.2 Additional User Attributes

- 1 UID: This will have the “AUTO GENERATED” since numerical uid's will be auto-generated for all users. This field will display a read-only UID value for already created accounts.

- 2 **GID:** The primary GID is given as a selectable drop down menu (ComboBox). The default primary GID selected will be “succssn” **for** all the users added during user addition. The administrator can change the primary Group name which is selected by default.
- 3 **GECOS:** Administrator can enter any information in this field, for example the actual full name of the user.
- 4 **LoginShell:** Administrator are given the following options to select for each user created. They are given below.
  - no-access: Users created with this shell, do not have permission to invoke a shell in the system. No-access accounts are mainly for GUI-only user accounts. The actual value of LoginShell in this case is /usr/bin/nash.
  - restricted: Users created with this shell, has command line access to the systems. The actual value of LoginShell in this case is /usr/bin/rash.
- 5 **Home Directory:** The home directory for each user varies according to the Login Shell selected for each user.
  - no-access: /export/home/tmp
  - restricted: /export/home/<username> The <username> is the login name of the created user.
- 6 **MIN:** This is the minimum number of days required between password changes. The default will be (0) days.
- 7 **Password Expiry Date:** This field is a read only field which will indicate the absolute date on which the current password for the user expires.
- 8 **LastChange:** This field show the absolute date on which the password was most recently changed.

**Note:** Account Expiry support is removed from IEMS Security Client GUI. This feature will be enabled after MFT Security Server provides support for Account Expiry

### 1.5.3 Add Group Wizard

In the group add wizard, the administrator has the provision to manually provide a GID for the newly created group. If a value is not provided in the GID field, IEMS will pick a value from the range **specified** in the configuration file.

#### 1.5.3.1 Access permissions to IEMS Security Client GUI

**Only** members of the “secadm” group have access to IEMS Security Client GUI. This applies to JWS Client and the HTML Client. SN07 users who are

present in emsadm group will be automatically be provisioned in secadm group in SN08 during the upgrade process.

*Note:* Starting SN08, all group names must be 8 characters or less and must consist of lowercase letters or numeric digits only.

## 1.6 Server Side Configurable parameters

### 1.6.1 User ID configuration:

The users in MFT BSS are identified by a unique numerical identifier which is generated by IEMS and MFT. This is achieved by providing a UID range in the following configuration file.

```
/opt/nortel/iems/current/conf/NmsProcessesBE.conf
```

The configurable user ID range is highlighted in bold.

```
#java com.adventnet.security.authentication.SecurityProcess
PROCESS com.adventnet.security.authentication.SecurityProcess
ARGS SecurityServerPort 7777 maximum_allowed_login_failed_count 0
userIdRange 10001-12000 groupIdRange 12001-14000
```

The default UID range is 10001-12000.

The above can be changed by the user. When IEMS Server starts up, this value will be read by the IEMS Server. If a user changes the user id range, then IEMS Server must be restarted for the changes to take effect. During each useradd operation from the IEMS Security GUI, a value from the provided range will be automatically selected by IEMS Server and provided to MFT for the user. If the generated user id is exhausted, the user will receive a failure message indicating security database is full. The numerical UID for each user will be generated only by IEMS Server. It cannot be provided by the secadm user. The list of UID's which are freed up as a result of user deletions will be available for enumeration after the enumeration process reaches the upper bound and re-enters the lower bound for finding out free slots.

*Note:* At most 1000 user accounts can be provisioned and managed by IEMS Server. IEMS Server does not support more than 1000 user accounts.

### 1.6.2 Group ID configuration:

The groups in MFT Security Services are identified by a numerical group identifier. The range for the generated group identifier can be provided in the following configuration file in IEMS.

```
/opt/nortel/iems/current/conf/NmsProcessesBE.conf
```

The configurable group ID range is highlighted in bold.

```
#java com.adventnet.security.authentication.SecurityProcess
PROCESS com.adventnet.security.authentication.SecurityProcess
ARGS SecurityServerPort 7777 maximum_allowed_login_failed_count 0
userIdRange 10001-12000 groupIdRange 12001-14000
```

The default GID range can be changed by the user. When IEMS Server starts, this range is read by the IEMS Server. If a user changes the group Id range, then IEMS Server must be restarted for the changes to take effect. During each group add operation, IEMS Server picks up an identifier for the group which is added from the IEMS Security Client GUI from the provided range. If the range is exhausted, then the user will receive a failure message indicating group ID range is exhausted. The secadm user can provide a numerical GID.

### 1.6.3 Password Attributes Support.

The following are the attributes supported by MFT Backend Security Server.

- **sp\_max** - Maximum number of days a password is valid. Password expiration is disabled if sp\_max is set to -1. **It is settable on a per user basis.**
- **sp\_min** - Minimum number of days required between password changes. The restriction is lifted if sp\_min is set to 0. **It is settable on a per user basis.**
- **sp\_warn** - Maximum number of days before the password expiry, the user will be warned. It is supported only as a global configuration, which means that warning value can be set only at the MFT Security Services level common for all users in MFT Security database. Please refer to MFT Security Services documentation on how to change this global parameter via an MFT-provided CLI interface.
- **sp\_expire** - Absolute date (number of days since 1/1/1970) after which the account is disabled. **It is settable on a per user basis.** Account expiry is disabled if sp\_expire is set to -1.

**Note:** sp\_inact –Maximum number of days of inactivity allowed for a user. It is not supported by MFT Security Services.

## 1.7 Migration:

Security Data migration is actually performed in SN08 as a three-part operation. They are given below.

- 1 Data Extraction from IEMS database
- 2 Data Import into MFT Security Services
- 3 Data Clean up in the IEMS database

### 1.7.1 Data Extraction.

This step is performed as part of the installation process. After the installation of MFT & IEMS binaries, this script will be invoked. This will identify the list of users, groups, and the user group relationship. After identifying the information this process will export all the identified data as an XML file in the following location. The script will take the location of the export xml file as an argument. After successful data extraction, the data import will be called by the combo load script which will import data into MFT Security Services.

After the above step, IEMS will be started in the backward compatible mode, with all user and group information in the IEMS DB. During this time the IEMS Security Client cannot be started both in the JWS Client and the Web Client. After the stability of MFT Security Services is ensured, then the clean up script will be called

The following data will be exported to MFT Security Services.

#### 1.7.1.1 List of Data to be exported.

- 1 User with only groups in IEMS DB
- 2 Users with only success group and Solaris groups
- 3 Users with IEMS groups and Solaris groups
- 4 Emergency user is NOT migrated
- 5 IEMS groups
- 6 Solaris groups (non-reserved) containing above listed users
- 7 Migration of user-group associations involving above listed users
- 8 Ability to login via IEMS central account during upgrade (07 backward compatibility mode)

When groups created in IEMS are exported, new GID's will be generated for each group exported to MFT Security Services. Each of the GID will be enumerated from the range provided from the configuration file given below.

```
/opt/nortel/iems/current/conf/NmsProcessesessBE.conf
```

If any group ID is already present in MFT then user has to manually provision the GID for that group. Groups that are imported from Solaris, due to the user group relationship in IEMS, will have the same GID in the XML file which is exported by IEMS.

### 1.7.2 Notes

- 1 During data export process, all usernames/groupnames whose length (no of characters in username/groupname) exceeds 8 characters, will be dropped after generating a security log. Their corresponding user-->group relationship will also be dropped. After each drop a security log will be generated along with all the details of the user / group which are dropped. The admin user can take corrective measures with the input data from the logs.
- 2 During data export process all usernames/groupname will be changed to their corresponding lowercase characters. This change will be reflected in their corresponding user-->group relationship also.
- 3 During data export process all users who are present in emsadm group will be automatically be added to secadm group.
- 4 In SN08, a new authorization group, secadm, is introduced. Members of the secadm group can perform Security Administration functions such as:
  - Adding/Deleting/Users.
  - Adding/Deleting/Modifying Groups
  - Modifying user profiles
  - Modifying IEMS system security settings

## 1.8 Data Import into MFT Security Services.

After data is successfully exported from IEMS database and an XML file created as a result of successful export operation, the combo load script will invoke, the data import script provided by the MFT. Combo load script/MFT team will take care of importing the data successfully into MFT Server.

IEMS Server assumes that all data is successfully exported to MFT when the clean up script is called.

## 1.9 Data Clean up in the IEMS database

During data export all the above given users/groups/user-->group relationship present in the IEMS database is exported to the MFT Security Services through an XML file. After this step, the exported data will be redundant in IEMS

database. So the clean up script is provided to clean up IEMS database of the redundant information. When this script is called, it will clean up the user, group & user group relationship except the emergency user account details from the IEMS database.

All the information given in the (**List of Data to be exported**) section will be cleaned up by the provided clean up script.

**Note:** IEMS Security Client GUI services will not be available when IEMS Server is started in the backward compatible mode. Existing IEMS users will be able to use IEMS Client GUI with the existing account and password information.

But the IEMS Security Client GUI cannot be invoked when the IEMS Server is running in the backward compatible [SN07] mode.

The following message will be shown to the user who invokes the IEMS Security Client when the server is running in backward compatible mode.

*“IEMS is in Upgrade Mode. Cannot allow SecurityAdmin operations”*

### 1.9.1 Emergency User Account:

IEMS Server provides its users with a special account called the emergency user account. This account has all administrative privileges for the IEMS Server, including security administration. The details of this account are maintained by the IEMS Server. When emergency user logs in and if MFT Security Server is available providing service, emergency user [iemsadm] will be able to use IEMS Security GUI interface. If MFT Security Services is not running, then if IEMS Security GUI is invoked, the error message provided by MFT will be displayed to the user.

UserName: iemsadm

Default Password : public

Since the details of this user account are maintained by IEMS Server, this account can be used when the MFT backend Security Service is not available. The administrator should not change the group association of this user. The password may be changed for this account.

### 1.9.2 Password Complexity:

When a user sets/changes his password, the following rules need to be followed. There are 4 class of characters that are allowed in a password. They are listed below.

- Lowercase characters
- Uppercase characters

- Numeric characters
- Special characters.

It is recommended that the password complexity rule requires 3 out of 4 of the above class of characters to be present in any password. The password complexity rules are configurable in the IEMS Server.

The provision for configuration is provided in a configuration file present in the following location.

```
/opt/nortel/iems/current/defaultUserAttribute.prop
```

In addition to the character set restrictions above, the password cannot be the same as the user name or the existing password, and must be at least 6 characters long by default and at most 256 characters long by default.

The following variables are used to configure the password complexity.

- PASSWD\_MIN\_LENGTH=6
- PASSWD\_MAX\_LENGTH=256
- LOWERCASE\_COUNT=1
- UPPERCASE\_COUNT=1
- SPECIAL\_CHAR\_COUNT=0
- NUMBER\_COUNT=1
- SPECIAL\_CHARS=~!@#\$%^&\*()-\_+=[]{}\\|;:'",<.>/?

PASSWD\_MIN\_LENGTH=6 - specifies that the password should have a minimum of 6 characters.

PASSWD\_MAX\_LENGTH=256 - specifies that the password can have a maximum of 256 characters.

LOWERCASE\_COUNT=1 - specifies that the password should have atleast one lowercase character.

UPPERCASE\_COUNT=1 - specifies that the password should have atleast one uppercase character.

SPECIAL\_CHAR\_COUNT=0 - specifies that password need not have a special character.

NUMBER\_COUNT=1 - specifies that the password should have atleast one of the numeric characters.

SPECIAL\_CHARS=~!@#%&\*()-\_+=[]{}\\|;:'",<.>/?

When the password is scanned for special characters, each of the above characters is considered as a special character.

In the above sample the lowercase, uppercase & numeric characters are expected out of the 4(lowercase,uppercase,numeric & special characters).

**Note:** When one of these variables is changed the IEMS JWS Client should be restarted for the changes to take effect.

### 1.10 HTML Client Side:

Since HTML Client provides only minimal support for Security & User administration, Group, Operation provisioning is not provided in the HTML Client. In the HTML Client GUI the administrator will have the options given in Additional User Attributes section above in this document.

## *Product = IEMS*

## **A00007786--IEMS Configuration of RADIUS Secret** *Functional Description*

### 1.1 Applicable Solution(s)

UA-IP

### 1.2 Introduction

This document provides an overview of configuring RADIUS secret through IEMS client. The IEMS currently provides provisioning of Network Elements, Element Managers, EMS Platforms, or EMS Applications in one step. Then provisioning of the RADIUS secrets through the CLI in a second step.

The SN08 IEMS will allow provisioning of RADIUS secrets directly through the IEMS in one step, eliminating the need of CLI for RADIUS secrets. IEMS will allow RADIUS secrets to be added, modified, and deleted from the Security Server. The RADIUS Server will be required to store all RADIUS device parameters, and they must be encrypted. No security data will be stored in the IEMS other than the default secrets.

This document also captures the different scenarios of Passport discovery along with the IP Address retrieve for RADIUS secret provisioning.

### 1.3 Acronyms Used

RADIUS - Remote Authentication Dial-In User Service

IEMS - Integrated Element Management System

GUI - Graphical User Interface

EM - Element Manager

NE - Network Element

CLI - Command Line Interface

PAM - Pluggable Authentication Module

### 1.4 RADIUS Secret Provisioning

The RADIUS device parameters for each device are IP address, Type and RADIUS secret. In SN08, IEMS will provide the ability to provision RADIUS secrets directly from the IEMS GUI. All provisioning of RADIUS device parameters including add, modify and delete will be supported while the RADIUS Server is running. Provisioning of RADIUS secrets need to be added to the specific IEMS GUI for the platforms, Element Managers, and NEs that require RADIUS secrets.

The list of PAM-RADIUS clients and RADIUS clients are -

| Security Client Type | Platform/EM/NE                       | RADIUS Device Type | IEMS Version | Comments                                                    |
|----------------------|--------------------------------------|--------------------|--------------|-------------------------------------------------------------|
| PAM-RADIUS           | SSPFS Platform, except CBM           | IEMS               | SN07         | Provision RADIUS secret for cluster IP and units.           |
| PAM-RADIUS           | SDM Platform                         | IEMS               | SN08         |                                                             |
| PAM-RADIUS           | MDM Platform                         | IEMS               | SN08         |                                                             |
| PAM-RADIUS           | Preside MDM Element Mgr              | IEMS               | SN08         | Provision RADIUS secret for the server and client sets too. |
| PAM-RADIUS           | CS2K Core Element Mgr (SDM Platform) | IEMS               | SN08         |                                                             |
| RADIUS               | Passport/MG15000 (previously PVG)    | PASSPORT           | SN08         |                                                             |
| RADIUS               | PP8600                               | PP8600             | SN07         |                                                             |
| RADIUS               | MG9K                                 | MG9K               | SN08         |                                                             |

|  |                 |   |   |                                                                                                                                       |
|--|-----------------|---|---|---------------------------------------------------------------------------------------------------------------------------------------|
|  | CEM Element Mgr | - | - | It is part of the IEMS bundle. It runs on the security server and thus does not use PAM-RADIUS. Hence will not be supported for SN08. |
|--|-----------------|---|---|---------------------------------------------------------------------------------------------------------------------------------------|

RADIUS secrets cannot be provisioned for 6.2 devices. For devices that are newly integrated in SN08, the RADIUS secret cannot be provisioned for their SN07 version. Moreover, only IEMS users belonging to 'SECADM' group, can provision or view the RADIUS secrets. The default RADIUS secret must be encrypted via 3DES/DES and stored in IEMS. In case of RADIUS secret being exchanged between IEMS & MFT Security Services (add, update, retrieve), the secret will be in plaintext, unencrypted format.

## 1.5 Default RADIUS secret

IEMS will provide a GUI for an IEMS admin user to enter the default RADIUS secret for each type of RADIUS device. The various RADIUS device types supported for SN08 are IEMS, MG9k, Passport and PP8600. This screen will be launched from the Security Administration. Only IEMS users with SECADM privilege will have access to this screen.

The default RADIUS secret for each type will be undefined initially. The user will enter the default secret for each type through the GUI. When the value is entered, this RADIUS secret will be encrypted and stored in the IEMS database. It will then be displayed as default secret value for the RADIUS devices that are newly added, according to their type. The Admin user will choose to use the default secret, change it or blank it out (remove it).

The following are the steps to be followed:

- The default RADIUS secret will be entered by the user, in the client GUI. The IEMS client will communicate the default RADIUS secret entered by the user for each type to the IEMS server.
- The IEMS server will store the default secret for each type in the Database in encrypted form.

## 1.6 Operations to be handled

The following operations are to be handled for the RADIUS secret:

### 1.6.1 Add An EMS/EMS Platform/NE

The Tools->Add platform/NE/EM screen has to be modified by including an attribute for the RADIUS secret. A check box will be provided for the attribute. The check box and the attribute should be shown only when the user selects version 7.0 or higher (and not when version 6.2 is selected). For devices that

are newly integrated in SN08, the RADIUS secret attribute will not be applicable to their SN07 version. By default the check box will be enabled, indicating the device uses RADIUS authentication and thus a secret must be provided. IEMS should display the default unencrypted secret value, which the user can modify, if required or clear it. The secret should be displayed only for IEMS users with SECADM privilege.

- On enabling the check box, the secret value must be provided which will be added to the RADIUS server. If a secret value is not provided, IEMS will pop up an error dialog indicating that a secret value should be provided for the device.
- On disabling the check box, IEMS will delete the RADIUS secret if it is already configured for the device.

When the RADIUS secret is set, add a tuple for the IP in the MFT database. IEMS client will send the request for Add operation to the IEMS server. The IEMS server will in turn execute the `configure_radius.sh` with the IP address, type and secret. The script will add the secret corresponding to the IP address in MFT Security Services.

When a tuple is added for the IP address, IEMS will log the same in the security log. A sample security log entry for a successful add operation for user 'IEMSADM' is shown below –

E.g.: *IEMS class\_security.ver01 STAT=SUCCESS SRC.USER=IEMSADM EVNT.TYPE=Radius Parameters added for IP 192.168.4.3, device type IEMS*

The SSPFS Platform and PP8600 NE come under this category.

- **SSPFS Platform:** When manually adding a SSPFS platform with a version that supports RADIUS,
  - All three IP-addresses of a duplex SSPFS platform must be associated with the same RADIUS secret. The RADIUS configuration thus should be associated with the SSPFS cluster and not individual unit.
  - Adding the RADIUS secret for the cluster IP (in duplex case) automatically affects the two other UNIT-IP entries.
  - RADIUS configuration is not available to SSPFS units.

### 1.6.2 Adding Auto-discovered EMS Platforms/NEs

In the case of Auto-discovered EMS Platforms/NEs, IEMS will automatically interface with the Security server to provision the its RADIUS device parameters when the EM is added. The auto-discovered EMS Platforms/NEs that will be supported by this feature for SN08 are MDM Platform, SDM Platform, MG9k, MG15000 (previously PVG)7k, MG15000 (previously PVG)15k and PP15k.

When the EMS is added (whose version supports RADIUS secret)

- The RADIUS check-box will be enabled and the currently configured default RADIUS secret of this EMS device type is displayed.
- The user can optionally modify the default RADIUS secret or accept the default secret of this EMS device type
  - The secrets for its auto-discovered EMS Platforms will be automatically added using the same RADIUS secret specified for their EMS above and RADIUS configuration will be enabled for them, if either IEMS does not know the versions of the auto-discovered EMS Platforms or if their versions do support RADIUS
  - The secrets for its auto-discovered NEs will be automatically added using the current default RADIUS secret of the respective NE device type and RADIUS configuration will be enabled for them, if either IEMS does not know the versions of the auto-discovered NEs or if their versions do support RADIUS
- A requirement for this auto-provisioning to be done for auto-discovered EMS Platforms/NEs is that IEMS must be able to determine their IP addresses. If IEMS cannot determine the IP addresses of the discovered EMS Platforms/NEs, RADIUS secret configuration for them will not be done automatically at discovery. They will be manually provisioned when the IP addresses for the MDM client-server are provisioned
- If the version information is not available for the discovered EMS Platforms/NEs, IEMS should base the decision on the version of the EMS being added.

However, the same is not applicable for Passports/MG15000 (previously PVG)s. There could be many IEMS servers that will have the MDM provisioned but only one will handle the authentication. Hence for an auto-discovered passport, the RADIUS parameters cannot be automatically added. For more details, refer Section 3.3.

When a tuple is added for the IP address in the security server, IEMS will log the same in the security log.

### 1.6.3 Update RADIUS Secrets

The PAM-RADIUS and RADIUS clients (platform/NE/EM) should contain a menu item called “Modify RADIUS secret” that will be used to update the RADIUS secret. For all RADIUS devices, their corresponding unencrypted RADIUS secret value should be fetched from security server and displayed in the RADIUS secret field. The ‘Modify RADIUS secret’ menu item should be shown only to IEMS users with SECADM privilege, when the user selects an EMS/EMS Platform/NE whose version supports RADIUS.

For objects (platform/NE/EMS) that support RADIUS, a check box will also be shown next to the RADIUS secret.

- It will be in DISABLED state if the MFT RADIUS server does not have a secret associated with the IP address of the client.
- Otherwise, the check box will be in ENABLED state with the current unencrypted secret shown.
- When the user wants to provision RADIUS secret for a device for which the secret is not yet provisioned, the check-box needs to be enabled first. It will display a warning message “Radius secret not configured for the device in Radius server, displaying the default value” and display the default Radius secret for the device type. When the user clicks modify, RADIUS secret will be provisioned for the device.

RADIUS secrets for all the EMS/EMS Platforms/NEs can be individually updated. The exception is when EMS and the underlying platform are associated with the same IP address, or when the different IP addresses may be associated with the same host. In this case updating the secret of one automatically affects the other.

When the user modifies the secret value:

- 1 Retrieve the secret value for the IP address from the security server.
- 2 If the secret value is set for a different type than the one existing in the MFT DB, display error. For example, if a secret already exists for the IP with type IEMS, the following will be the error message - “Error: RADIUS secret already existing for IP address 192.168.5.54, device type IEMS. Can not be set for a different type”.
- 3 If the check box is unselected in the GUI, the tuple should be removed from the database.
- 4 Else, a RADIUS secret must be provided and IEMS should update the secret value given in the field, in the security server.

When the RADIUS secret is updated for the IP address in the security server, IEMS will log the same in the security log. A sample log entry for a successful update operation for user IEMSADM is given below –

E.g.: *IEMS class\_security.ver01 STAT=SUCCESS  
SRC.USR=IEMSADM EVNT.TYPE=Radius Parameters updated for IP  
192.168.5.54, device type PP8600*

#### 1.6.4 Delete A RADIUS Device

When a RADIUS device (Platform/NE/EM) is deleted via the existing “Delete Object and Traces” menu item (on right click), check should be done if an

entry exists for the IP address in the MFT DB. If it exists, the tuple corresponding to the IP address should be removed from the MFT DB. If the device is an EM (parent object), the entries corresponding to its NEs (children) should also be removed from the MFT DB. When a duplex SSPFS of version 7 or above is deleted, all three RADIUS entries must be removed. When the EMS is removed, all its auto-discovered EMS platforms or NEs and their RADIUS secrets should be removed automatically.

The delete operation for the IP address should also be logged by IEMS in the security log. A sample log entry for a failed delete operation for user IEMSADM is given below –

*E.g.: IEMS class\_security.ver01 STAT=SUCCESS SRC.USER=IEMSADM  
EVNT.TYPE=Radius Parameters deleted for IP 192.168.4.3, device type  
IEMS*

### 1.6.5 Up-Versioning An EMS/EMS Platform/NE

When the user modifies the version of a non-RADIUS device to a higher version that supports RADIUS secret, using the “Managed Object Property” sheet available on right click of the object, the “Update Radius Secret” menu item of the device should be enabled (on right click).

- On invoking the menu item, the check-box for RADIUS secret will be in disabled state. To provision RADIUS secret for the device, the user should enable it. On enabling, it will display a warning message indicating that Radius secret not configured for the device and display the default RADIUS secret of the device type. The user can optionally modify the default RADIUS secret or accept the default secret of this device type.
- Specific rules for adding SSPFS Platform and auto-discovered EMS Platform/NE apply in the case of up-versioning a device. In particular,
  - When a duplex SSPFS is up-versioned to version 7 or above, all three RADIUS entries must be added and RADIUS configuration enabled.
  - In case of auto-discovered EMS platforms/NEs (except Passports/MG15000 (previously PVG)s)
    - The secrets for its auto-discovered EMS Platforms will be automatically added using the same RADIUS secret specified for their EMS above and RADIUS configuration will be enabled for them, if either IEMS does not know the versions of the auto-discovered EMS Platforms or if their versions do support RADIUS

- The secrets for its auto-discovered NEs will be automatically added using the current default RADIUS secret of the respective NE device type and RADIUS configuration will be enabled for them, if either IEMS does not know the versions of the auto-discovered NEs or if their versions do support RADIUS.
- The secrets for auto-discovered Passports/MG15000 (previously PVG)s will not be automatically added. The devices will be displayed in the 'Passport RADIUS Authentication' tool and need to be manually selected and configured for RADIUS secrets.

#### **1.6.6 Down-Versioning An EMS/EMS Platform/NE**

When the user modifies the version of a RADIUS device to a lower version that does not support RADIUS secret, using the "Managed Object Property" sheet available on right click of the object, the "Update Radius Secret" menu item of the device should be disabled (on right click). Also the RADIUS secret provisioned for the device should be removed automatically.

When a duplex SSPFS is down-versioned to version 6.2 or below, all three RADIUS entries must be deleted and RADIUS configuration disabled.

When MDM Mgr is down-versioned to version 7 or below, all MDM Platforms and Passports/MG15000 (previously PVG)s that were auto-discovered through this MDM Mgr and were selected for authentication by this running IEMS security server will have their RADIUS secrets removed from this IEMS security server and RADIUS configuration disabled.

### **1.7 Centralized MDM/Passport Authentication**

Since there can be many IEMS servers with the MDM provisioned and only one of IEMS servers manages different Passports/MG15000 (previously PVG)s under the MDM manager, in order to enable only one to handle the authentication, the RADIUS parameters for the Passports/MG15000 (previously PVG)s will not be added to the security server during auto-discovery. A centralized RADIUS authentication for Passports/MG15000 (previously PVG)s will be supported in the IEMS GUI. A screen "Passport RADIUS Authentication", which will display all discovered Passports for the MDM, will be provided. This screen will be launched from IEMS client->Tools menu.

The passport devices will have an "authenticate" checkbox against each of them. The user will check all the Passports/MG15000 (previously PVG)s that will be authenticated by the running IEMS security server. The RADIUS device parameters for all the checked Passports will be added to the security server. For all unchecked Passports, the RADIUS device parameters will be deleted from the Security Server.

The add and delete operations of RADIUS device parameters for Passports is feasible only if they are discovered with IP-Address. Before SN08, IEMS does not retrieve the IP-Address of the MDM auto-discovered Passports/MG15000 (previously PVG)s. In SN08, the IP-Address of the Passports will be required for functionalities such as Passport Command Line launch and RADIUS secret provisioning.

The add and delete operations of RADIUS device parameters for Passports will be logged by the IEMS in the security log.

## 1.8 Passport Discovery

The different scenarios of the Passport discovery and the IP Address retrieve are as follows:

### 1.8.1 Retrieval of IP-Address

IEMS will use the following API to populate the IP-Address of the Passports/MG15000 (previously PVG)s

- `_cmd: ACTION`
- `_obj_type: server`
- `_obj_id: serverId S GMDR`
- `_action_type: queryProperty`
- `_attr: compId NI EM *`
- `_attr: propName S NortelMomsProxyIPAddress`

A sample response message is given below -

```
_obj_class: server
_obj_id: serverId S FMDR_AESTEST@wcary3r6
_time: 2004 10 06 02 01 29
_attr: compId NI EM NEPALX
_attr: propName S NortelMomsProxyIPAddress
_attr: propValue S 47.138.180.194
```

```
_obj_class: server
_obj_id: serverId S FMDR_RTP@wcary3r6
_time: 2004 10 06 02 01 29
_attr: compId NI EM CAPEFEAR
_attr: propName S NortelMomsProxyIPAddress
_attr: propValue S 47.142.102.138
```

```
_obj_class: server
_obj_id: serverId S FMDR_RTP@wcary3r6
_time: 2004 10 06 02 01 29
```

```
_attr: compId NI EM CLEVELAND  
_attr: propName S NortelMomsProxyIPAddress  
_attr: propValue S 47.43.160.59
```

IEMS will parse the response to retrieve the IP-Address and assign it against the corresponding Passports.

### 1.8.2 Various Scenarios In Passport Discovery

- **Adding Passports:** Administrator or Craft person has to initiate the Resynchronization of Inventory manually in order to add the newly discovered Passport in the IEMS database.
- **When Passport name changes:** Administrator or Craft person has to initiate the Resynchronization of Inventory manually in order to update the new name of that Passport in the IEMS database.
- **When Passport IP-Address changes:** Administrator or Craft person has to initiate the Resynchronization of Inventory manually in order to update the new IP-Address of that Passport in the IEMS database.
- **When the Passport removed:** Administrator or Craft person has to initiate the Resynchronization of Inventory manually in order to remove that Passport from IEMS database.

## 1.9 Test Considerations

- Duplex IEMS servers are required running version 7.0 or greater.
- The different scenarios in Passport discovery should be captured while testing so that the Passports in the Network are always in sync with the IEMS Database.

## 1.10 Open Items

The IP-Address of MDM Platforms is not obtained. Provisioning of RADIUS secrets for MDM platforms can be done only if their IP-Address is obtained.

### **A00008907--Key Changes for CEM Logs**

#### ***Corrective CAF***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Purpose**

This corrective CAF is being created to churn in late requirements received while doing the ICAF A00007347, IEMS - CEM INTEGRATION INTO IEMS (POI 2050). The requirements concern a change of format for northbound events on the log feeds of IEMS, Integrated Element Management System, when used in conjunction with CEM, Core Element Manager. Also it addresses the functionality addition of addrep and delrep of logs from the SSPFS machine so the CEM will or will not process the logs.

#### **1.3 Description of Changes**

There are three main places the craft person will see differences with this corrective CAF.

- 1) The log in the IEMS GUI will be altered to CSEM 300, reflecting #2 immediately following.
- 2) The northbound feeds from IEMS will have new fields placed in them:
  - populate the logkey field with logname/number
  - populate the logname field with “CSEM”
  - populate the lognumber field with “300” for alarm sets and clears and “600” for info logs or unmapped logs
  - populate the eventtype field with “TBL” on raise and “INFO” on clear and “INFO” for unmapped logs
  - populate the eventlabel field with “Alarm set” on raise and “Alarm clear” on clear and “Log” for unmapped logs
  - populate the specificproblem field with the probable cause
  - populate the “bodytext” field with:
    - Equipment Id: <equipmentID>
    - Notification Id: <alarmindex>
    - Category: <category>

- Cause: <probablecause>
- Severity: <severity>
- Component Id: <componentid>
- Log Key: <logkey>
- Description:
- <mmessage>

each line should have eight leading blanks

3) The user can addrep/delrep logs that the CEM will receive from the CORE.

## 1.4 Description of Fix

### 1.4.1 Log Key changes:

The design was a printstring of the new fields listed above at the head of the body field. Then the data was written to the database as previously done.

### 1.4.2 Addrep/Delrep

#### 1.4.2.1 CEM Server process:

A new process is introduced to collect input from the user on whether to add or drop logs. Also the log type and log number to add or drop is taken as input. The process writes the log type and number along with the format so it can be mapped into the CEM GUI.

#### 1.4.2.2 SDM/CBM process:

A new process is introduced which waits for a message from the server process. On receiving the message the desired operation of adding or dropping logs is performed with the help of a script (newly written). The script updates part of the SDM/CBM base and restarts the logDelivery process.

# SN08 Feature Deltas

***Product = MG 9000***

## **A00005561--MG9K Internet Protocol Security**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

This feature implements IP security and user authentication capabilities on the MG9K. There are two broad goals, first is to ensure that all users, local and remote, are validated before access is granted to a MG9K node. Secondly, all IP traffic between the MG9K and a remote peer (Element Manager or Gateway Controller) will be authenticated. These goals will be accomplished by authenticating user through a RADIUS client/server network. IP traffic will be protected with IP Security suites. As a result of this feature all peers connecting to the MG9K will also need to enable IP Security unless an explicit bypass policy is in place. Notably, the Element Manager and the Gateway Controller are affected and are the only devices that currently have to implement IPSec. Other devices that access the MG9K will do so with other secure protocols such as SSL, or SFT. See the following figure. The MG9K Security parameters can be configured from the LCI at initial commissioning or from the Element Manager.

**Figure 9 IP Security Network**

The security features are enabled when the MG9K node is commissioned via the Local Craft Interface (LCI). One of the first steps is to configure the shared keys between the MG9K and its Element Manager and the key shared with GWC if known. Shared keys are protected in three ways by the MG9K. The key, of size TBD, is protected from being displayed on the LCI and EM. The same key has to be entered twice before it is accepted by the GUI, and it is stored in an encrypted format. The key is also never transmitted insecurely over the network.

The Local Craft Interface and the Element Manager are used to enable and configure MG9K security features. Configuration is done on a per-network element basis. There is no flow thru of the security options. Therefore careful coordination is required when security is enabled on codependent devices.

Below are sample LCI Security configuration screen shots. The Element Manager interfaces will be discussed in a separate document.

***Product = MG 9000***

## **A00005646--IPSEC with MG9000 Element Manager**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

This feature implements IPSec for MG9000 Element Manager to MG9000 Line Gateway OAMP communications. The craftsperson will be able to independently manage IPSec parameters for all OAM&P communications to and from MG9000 network elements. This feature will enable/disable/modify IPSec on the OAM&P messaging channel from the MG9000 EM to an MG9000. Encryption (Confidentiality) may not be enabled in this release as it is not supported by the MG9000 Line Gateway.

The MG9K Element Manager will be used to manage IPSec security associations on the server-side portion of the OAM&P communications. The

MG9000's LCI will be used to manage IPsec security associations on the gateway-side of the OAM&P communications. See Figure 1.

**Figure 13 Desired Behavior Diagram**

For securing the OAM&P communications channel on the MG9000EM, a new **Security View** will be made available from the MG9000 EM subnet. This GUI will manage the IPsec (and Internet Key Exchange) configuration file(s) that are present in the SSPFS common platform. Parameters in these files are used to setup security associations, keys, and protection mechanisms. Enforcement of IPsec policies will be system-wide and per-socket as provided by the Solaris IPsec implementation. The craftsman will not be limited to securing the EM to GW connection, but will be able to manage all network connectivity in and out of the MG9000 Element Manager Server.

Also the **Office Wide Defaults View** is changed to support IPsec. This will enable the customer to configure one set of IPsec parameters and have them applied to all, or a subset of, the provisioned MG9000s.

This feature does not affect security on the MG9000 Element Manager Mid-Tier or client machines. All security views in the MG9000EM will only be accessible from EMSADM login class.

For proper operation of IPsec, all security parameters provisioned for an MG9000 Network Element in the Element Manager **MUST** also be

provisioned in the corresponding MG9000 Line Gateway. **IF THE PARAMETERS DO NOT MATCH, COMMUNICATIONS BETWEEN THE GATEWAY AND ELEMENT MANAGER WILL NOT BE POSSIBLE.**

### 1.3 Hardware Requirements or Dependencies

No new hardware is being introduced by this feature. Existing Sun Microsystems T1400 and N240 hardware used as MG9000 EM server platform will be used.

Figure 14 Hardware Layout

### 1.4 Software Requirements or Dependencies

SN008 release or later of the MG9000EM application will support IPsec.

Software loads in the MG9000 Line Gateway will be SN008 release or later.

### 1.5 Limitations and restrictions

#### 1.5.1 Security

For proper operation of IPsec, all security parameters provisioned for an MG9000 Network Element in the Element Manager **MUST** also be

provisioned in the corresponding MG9000 Line Gateway. **IF THE PARAMETERS DO NOT MATCH, COMMUNICATIONS BETWEEN THE GATEWAY AND ELEMENT MANAGER WILL NOT BE POSSIBLE.**

### 1.5.2 IPsec Precedence Order

If the IPsec configuration contains multiple policy entries, for example, they are assumed to be listed in the order in which they are to be applied. In cases of multiple entries matching the outbound and inbound datagram, the first match will be taken. The system will reorder the policy entry, that is, add the new entry before the old entry, only when:

- The level of protection is “stronger” than the old level of protection. Currently, strength is defined as:

AH and ESP > ESP > AH

Entries with both AH and ESP present in the policy entry protection are ordered after all the entries with AH and ESP and before any AH-only and ESP-only entries.

- If the new entry has bypass as action, bypass has the highest precedence. It can be added in any order, and the system will still match all the bypass entries before matching any other entries.

In all other cases the order specified by the user is not modified, that is, newer entries are added at the end of all the old entries.

A new entry is considered duplicate of the old entry if an old entry matches the same traffic pattern as the new entry.

### 1.5.3 IP Addresses

No IPv6 128 bit format IP addresses will be supported, only IPv4 (xxx.xxx.xxx.xxx) format 32 bit addresses will be supported.

## 1.6 Interactions

No interactions between IPsec and existing features will be seen by the craftsperson.

## 2: Fault Management for A00005646

### 2.1 Fault management strategy

The standard MG9k EM Fault Management strategy will apply to the faults for MG9kEM IPSec and Overload Controls. Alarms will be displayed by the MG9K EM Alarm Browser, logged in NT standard format to the SSPFS CUST logs and forwarded to northbound OSS.

In support of the MG9K EM - MG9K IPSec connection, there will be new faults added to indicate threshold crossing and link issues.

For the MG9k EM Overload Controls feature there will not be any new faults added. However, existing faults for the DCC which indicate threshold crossing and overload detection will now also apply to the ITP and ABI.

### 2.2 Fault management tools and utilities

TBD (IPSEC)

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date, time, the NE Id, the generating resource information, the severity and the probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

## 2.3 Logs

### 2.3.1 IPsec syslog messages

The Solaris implementation of IPsec automatically sends all failure logs to syslog /var/adm/messages. We do not have control over this. However when the servlet makes any changes to the IPsec security rules, the wrapper scripts will output any attempted changes to /var/log/securitylog.

The Solaris IPsec itself does not seem to generate any failure messages because security could be compromised, however IKE does seem to generate failure messages to syslog.

Sample IKE failure message would look like this.

```
messages.0:Mar 25 15:40:04 wnc1s01h /usr/lib/inet/in.iked: [ID
313954 daemon.notice] IKE_DELETE_PAYLOAD_RECEIVED:

### 2.3.2 ITP/ABI Overload Controls.

The behavior for the logs for the ITP/ABI Overload Controls will be exactly the same as that implemented for the DCC Card in SN06.2. Please refer to the document titled Fault Management - MG9k EM Overload Controls (A00002007) for more details regarding these logs.

These are new alarms that will be generated by the MG9000.

- Unable to communicate with RADIUS Server
- Secure link Down w GWC
- Packet Discard (depends on the threshold set)
- Overload Controls. The alarms for the ABI and ITP Overload Controls are exactly same as those documented for the DCC Card in 6.2. The only difference being that these alarms will now also apply to the ABI & ITP Card as well as the DCC Card. Please refer to the document titled Fault Management - MG9k EM Overload Controls (A00002007) for more details regarding these alarms.

The following logs will be thresholds in the MG9000. When the threshold is crossed an alarm will be generated

**1. Logging Event**

- Sequence\_Number\_Overflow
- Life\_Time\_Expired, Type = SoftlHard

**2. Security Policy Database**

- SAD\_Discard\_Policy:- Direction (in/outbound)
- SAD\_Lookup\_Fail, info needed:- Direction (in/out bound):- Sub-info field invalid SPI, Replayed packet

**3. IKE**

- IKE\_Main\_Mode-Failed, Mismatched PSK
- IKE\_Quick\_Mode-Failed, Proposal mismatch, NULL ESP & authentication = null, en/decryption failures
- IKE\_Packet Discarded, decryption errors, Auth errors

**4. IPsec Security Association**

- SA\_Decryption\_Error
- SA\_Authentication\_Error

## **2.4 Related documentation**

1. Fault Management - MG9kEM Overload Controls (A0002007) Bobby Robinson (SN06.2)

## **3: Configuration for A00005646**

## 3.1 Hardware and Software Requirements

SN08 or later software load for both the MG9000 and Element manager.

## 3.2 Initial Configuration

### 3.2.1 Security

From a high-level here are the steps to enable security on the OAM&P and call control links.

1. Load both MG9000 and MG9000 Element Manager with required software.
2. When commissioning the MG9000, thru the LCI, the craftsperson will enable security on the management link to the Element Manager.
3. The craftsperson will then use a web browser and connect to the MG9000 Element Manager server machine. (Not the Mid-Tier machine) After logging in, the craftsperson will enable security on communications with the MG9000 IP address.
4. Cold start from MG9000 or manual discovery from Element Manager.
5. This will complete securing the OAM&P link.
6. From SESM, enable security on the Gateway Controller.
7. From the SLOA GUI, provision a VMG. Enable security on the GW Controller Config tab.
8. This will complete securing the Call Control link.

#### 3.2.1.1 MG9000

The LCI's IPSec and IKE security parameters must match the parameters provisioned through the SSPFS security servlet.

VMG IKE configuration parameters that are provisioned, via the Element Manager's SLOA GUI, must match the corresponding IKE parameters on the GWC.

#### 3.2.1.2 MG9000 Element Manager

IPSec and IKE configuration parameters that are provisioned, via the SSPFS security servlet, must match the corresponding IPSec and IKE parameters on the MG9000, provisioned via the LCI.

### 3.2.2 MG9kEM SN008 Installation

If a user is upgrading from SN06.2 to SN008, the steps to upgrade are the same as they would be for SN06.2 to SN07.

If the user is upgrading from SN07 to SN008 - an additional step will be added to prompt the user to backup the table space for SN07.

As of SN008 the MG9kEM will continue to use the same tablespace as the previous release - with alters applied. Therefore in order to be able to roll back a MG9kEM release to SN07 from SN008 (if necessary)- the table space must be backed up prior to starting the SN008 MG9kEM.

### 3.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable

## 3.4 Upgrade Impact

### 3.4.1 Dump and Restore

If the user is upgrading from SN06.2 to SN008 - the steps for upgrade are the same as they would be for SN06.2 to SN07.

If the user is upgrading from SN07 to SN008, things change. As of SN008, we no longer will be running multiple versions of the EM. The EM will now use ONE tablespace from SN07 forward - with alters applied to support each new release. This means that the data from that tablespace for SN07 must be backed up prior to starting up the SN008 product. The script to backup the table space, mg9kem\_db\_backup.sh, and a mechanism to invoke this script will be provided.

If it is necessary to rollback to SN07, the use of the script mg9kem\_db\_restore.sh must be employed to restore the tablespace to its previous SN07 database schema and data set.

For SN06.2 to SN008 upgrades - the mechanism for exporting from SN06.2 and importing to SN008 will still be required. (See CN document for A00003074 which documents these steps.)

For SN07 to SN008 - no data export or import is necessary. The SN008 will attach to the existing SN07 tablespace and recover and use the network elements and data directly from that space.

### 3.4.2 Element Management Major Upgrade

If upgrading from SN06.2 directly to SN008 - the upgrade steps are exactly the same as they would be for SN06.2 to SN07.

If upgrading from SN07 to SN008, one modification to the way upgrades work is that the user is no longer required to move from one MG9kEM version to another if upgrading a MG9k from SN07 to SN008. The SN008 MG9kEM suite can handle discover and management of a MG9k Gateway running an SN07 load.

For SN07 to SN008, the steps will be install the SN008 package, backup the SN07 tablespace, start the SN008 MG9kEM. No data transfer steps are required.

One break in the way the MG9kEM can be run is that once SN008 has been started - the user cannot go back to using the SN07 Element Manager without restoring the previous database. It is not allowed to have SN07 MG9kEM and SN008 EM running at the same time, or to switch back and forth.

The Major upgrade from SN07 to SN008 is intended to be very similar in steps to that of a MR Upgrade.

### 3.4.3 Element Management MR Upgrade

The same steps as were done to support an SN07 MR Upgrade will apply to SN008.

## 3.5 Data schema (DS) (CM, MIBS, RDB)

The NORTEL-UEMG-PERFMON-MIB will be modified so the simple names of the items for Thresholds and Overload will be modified to no longer reference the DCC.

New Mib for the VMG provisioning of IP Sec: TBD

## 3.6 OSS Changes

In previous releases the northbound interfaces were required to change the prefix for their event channels and fault manager entries. In SN06.2 the prefix was Subnet\_62. With SN07 the entry changed to Subnet\_7.

As of SN08, there will NO LONGER be the need to change this prefix in the northbound interfaces. As of SN08 - the MG9kEM will henceforth use Subnet\_7 as its prefix.

Example ORB entry changes:

SN06.2

EventChannel = "Subnet\_62.ec.Oss"

FaultServiceManger = "Subnet\_62.Service.FaultServiceManager"

SN07

EventChannel = "Subnet\_7.ecc.Oss"

FaultServiceManager = "Subnet\_7.Services.FaultServiceManager"

SN08

EventChannel = "**Subnet\_7**.ecc.Oss"

FaultServiceManager = "**Subnet\_7**.Services.FaultServiceManager"

The reason we can now do this is that SN07 and SN08 will NEVER be running at the same time. When SN08 is deployed - it will also use the same prefix (Subnet\_7). This is because at any given time only ONE instance of these (SN07, SN08) - may be running on a server.

### 3.7 External Interface Changes

With SN07 the TL1 Adaptor for SN07 was required to change its connecting port to 2363. This port will not be required to change for SN08 and will remain at 2363.

In SN07, the EM's SNMP listening port was modified to be 8002. This will not change for SN08. The SNMP port will be 8002.

### 3.8 MG9000 Element Management

#### 3.8.1 New/modified GUIs

From the current SLOA GUI, the craftsperson will be able to enable or disable IPSec and IKE on the call control channel from the MG9000's ITP to gateway controller.

The craftsperson will have the option of using Office Wide Defaults for the VMG security parameters. The defaults will be managed from, oddly enough, the current Office Wide Defaults GUI.

A new HTML security web page is available for the craftsperson to use to secure the MG9000 Element Manager server machine. Using the interface, secure communication with the MG9000 is possible.

In regards to the addition of ABI/ITP Overload Controls, the same Overload Threshold Pane that is now in existence for the DCC Cards will be applied to the ITP/ABI Cards. The user may access this via the existing Manage Thresholds functionality.

#### 3.8.2 GUI information

##### 3.8.2.1 GUI name: Office Wide Defaults

Office Wide Defaults

##### 3.8.2.1.1 Functional description

This GUI will be used to define default security parameters that may be used during VMG provisioned. These parameters will be used in securing the call control link between the VMG and the gateway controller.

Added to the Office Wide Defaults GUI will be a section for Security. This section will have three parameters:

1. Security OFF, ON
2. IKE preshared key
3. IKE time to live

### 3.8.2.1.2 GUI usage and implications

Office Wide defaults should be assigned first before provisioning VMGs.

### 3.8.2.1.3 GUI fields

The following table lists the security fields for Office Wide Defaults GUI.

**Table 1 GUI field descriptions**

| Field            | New or Changed | Subfield | Entry                | Explanation and action                                                     | Associated MIB entry |
|------------------|----------------|----------|----------------------|----------------------------------------------------------------------------|----------------------|
| Security         | New            | No       | OFF, ON              | Default = OFF<br><br>Indicates whether or not security is enabled.         | TBD                  |
| IKE Preshare key | New            | No       | 26 digit HEX string? | Preshared key used in the IKE establishment of a secure call control link. | TBD                  |
| IKE Time To Live | New            | No       | Non-negative integer | How long the currently established security session will last?             | TBD                  |

### 3.8.2.1.4 Usage example

The following example shows sample datafill for the Office Wide Defaults GUI:

*Screenshot of the Office Wide Defaults GUI with IPSec parameters shown to be provided later.*

### 3.8.2.1.5 GUI release history update

The following information was added:

Security section added to Office Wide Defaults GUI.

### 3.8.2.1.6 Supplementary information

None

**3.8.2.1.7 CLUI Interface**

Not applicable

**3.8.2.2 GUI name: SLOA**

Switched Line Services for MG9000

**3.8.2.2.1 Functional description**

This GUI will be used to define security parameters to be used in securing the call control link between the VMG and the gateway controller.

Added to the GW Controller Config tab will be a section for Security. This section will have three parameters:

1. Security OFF, ON or OfficeWide Default
2. IKE preshared key
3. IKE time to live

**3.8.2.2.2 GUI usage and implications**

GUIs must be used in the following sequence:

Optional: Office Wide defaults should be assigned first before provisioning VMGs.

**3.8.2.2.3 GUI fields**

The following table lists the security fields for SLOA GUI on the GW Controller Config tab.

**Table 2 GUI field descriptions**

| Field            | New or Changed | Subfield | Entry                        | Explanation and action                                                                                                                                                                        | Associated MIB entry |
|------------------|----------------|----------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| Security         | New            | No       | OFF, ON, Officewide Defaults | Default = OFF<br><br>Indicates whether or not security is enabled. Option is to use the office wide defaults.<br><br>If OfficeWide Defaults are selected the remaining fields are grayed out. | TBD                  |
| IKE Preshare key | New            | No       | 26 digit HEX string?         | Preshared key used in the IKE establishment of a secure call control link.                                                                                                                    | TBD                  |

**Table 2 GUI field descriptions**

| Field            | New or Changed | Subfield | Entry                | Explanation and action                                         | Associated MIB entry |
|------------------|----------------|----------|----------------------|----------------------------------------------------------------|----------------------|
| IKE Time To Live | New            | No       | Non-negative integer | How long the currently established security session will last? | TBD                  |

**3.8.2.2.4 Usage example**

The following example shows sample datafill for the SLOA GUI:

*Screenshot of SLOA GUI with IPSec parameters shown to be provided later.*

**3.8.2.2.5 GUI release history update**

The following information was added:

Security section added to GW Controller Config tab.

**3.8.2.2.6 Supplementary information**

None

**3.8.2.2.7 CLUI Interface**

Not applicable

**3.8.2.3 GUI name: SSPFS Security**

SSPFS Security Interface

**3.8.2.3.1 Functional description**

This HTML webpage will be used to define security parameters to secure communications into and out from this SSPFS Machine. This includes MG9000 Element Manager to MG9000 OAM&P communications.

The craftsperson will be presented with a number of tables representing currently provisioned security parameters. Options to add and delete parameters are available. Adding parameters will be performed using HTML forms.

**3.8.2.3.2 GUI usage and implications**

Primary usage of this interface is to secure the OAM&P communications channel between the MG9000 and Element manager.

This interface provides for securing all communications and not just Element Manager communications. Care must be taken when provisioning or deleting the security parameters, so as not to effect other essential communications.

**3.8.2.3.3 GUI fields**

The following table lists the security fields for SSPFS Security Interface.

**Table 3 GUI field descriptions**

| Field | New or Changed | Subfield | Entry | Explanation and action | Associated MIB entry |
|-------|----------------|----------|-------|------------------------|----------------------|
| TBD   | TBD            | TBD      | TBD   | TBD                    | TBD                  |

**3.8.2.3.4 Usage example**

The following example shows sample datafill for the SSPFS Security Interface.:

*Screenshot of the SSPFS Security Interface with IPSec parameters shown to be provided later.*

**3.8.2.3.5 GUI release history update**

The following information was added:

Initial availability.

**3.8.2.3.6 Supplementary information**

None

**3.8.2.3.7 CLUI Interface**

Not applicable

**3.9 Command interface changes**

TBD

**3.10 Security****3.10.1 Network configuration**

No changes to the network are necessary to support the IPSec implementation.

**3.10.2 Key management****3.10.2.1 VMG IKE Preshared key**

VMG IKE preshared keys will be input by the user when provisioning a VMG. The key will be stored encrypted in the Oracle database. The will be sent the the MG9000 encrypted and stored in the MIB encrypted.

**3.10.2.2 SSPFS IKE Preshared key**

The SSPFS IKE preshared key be input by the user in the SSPFS Security Servlet. This key is secured by the use of secure http from the browser to the server. *Solaris stores all keys XXXXX.*

### 3.10.3 Protocol

IPSec is being used on the Solaris machine.

### 3.10.4 Authentication

Succession login will be used for SSPFS Security Servlet.

## 3.11 Configuration Walkthrough

### 3.11.1 OAM&P Security

From a high-level here are the steps to enable security on the OAM&P links.

1. Load both MG9000 and MG9000 Element Manager with required software.
2. When commissioning the MG9000, thru the LCI, the craftsperson will enable security on the management link to the Element Manager.
3. The craftsperson will then use a web browser and connect to the MG9000 Element Manager server machine. (Not the Mid-Tier machine) After logging in, the craftsperson will enable security on communications with the MG9000 IP address.
4. Cold start from MG9000 or manual discovery from Element Manager.
5. This will complete securing the OAM&P link.

### 3.11.2 VMG Security

From a high-level here are the steps to enable security on the call control links.

1. From SESM, enable security on the Gateway Controller.
2. From the SLOA GUI, provision a VMG. Enable security on the GW Controller Config tab.
3. This will complete securing the Call Control link.

***Product = MG 9000***

## **A00006894--InterNodal Emergency Stand Alone (ESA) for MG9K**

### ***Functional Description***

### **1.1 Applicable Solution(s)**

UA-IP

## 1.2 Description

InterNodal ESA provides the ability to make calls while in ESA between MG9K nodes. In doing so, the Telcos also provide the ability to provision a “Community of Interest” (COI), which defines which MG9K nodes can make ESA calls between one another. Calls cannot be made between the two communities, only within a given community. If an MG9K does not have access to a LAN Switch, it will operate in the pre-SN08 manner of routing calls between VMGs within a single MG9K node. Also, although a Community of Interest is defined, each node must be in ESA for it to participate in the community. Nodes are not forced to enter ESA.

### 1.2.1 Hardware Requirements or Dependencies

This feature applies to all supported hardware platforms, per the SN08 Succession server platform foundation software specification. No new hardware is required. A MG9K node in a community must have access to a LAN Switch (i.e. Passport 15000 or equivalent) in order for InterNodal ESA calls to complete.

### 1.2.2 Passport 15000 Configuration

The inter-MG9000 communication will be provided by the Passport 15000 switch, using the Virtual Router capability to route the IP-based ESA traffic between MG9K gateways.

To deploy this feature in the field, the existing Passport 15000 switches must be configured to support it. This configuration/provisioning consists of: provisioning the Passport 15000 software component and the required engineering to configure the Passports in the field.

A typical deployment scenario for this feature is a collapsed office (“a remote”), which typically consists of a single Passport 15000 switch connecting a group of MG9K gateways to a set of PNNI links back to the CS2000 site. If necessary, the collapsed office can use several Passport 15000 switches.

Each MG9K will now have a separate Vcc to connect to the Passport 15000 Virtual Router; RFC 1483 llc-snap IP encapsulation.

A list of possible deployment scenarios are:

- MG9000 connected to 4pOC3 FP card with ipRoutes > 0
- MG9000 connected to 16pOC3 FP card with ipRoutes > 0
  - Configured based on the tables defined in the Configuration section.
- MG9000 connected to 16pOC3 FP card with ipRoute = 0; either:
  - A hairpin is required that can do IP services. Setup on that hairpin, configuring a simple PVC on the MG9000 port to the hairpin, is described in the Configuration section.
- MG9000 STS-1 connected to 12pDS3 FP cards (which don't support IP)
- MG9000 IMA connected to 4pDS3 FP cards (which don't support IP)
  - For MG9000 on these cards, an IP hairpin is required.
  - PVC is needed between the MG9000 to the hairpin port.

Hairpins can be provisioned on:

- A new pair of 4pOC3 cards.
- Spare pair of 1+1 OC12 or OC3 ports on either 4pOC12 (PQC12) or 4pOC3 (assume ipRoutes > 0)

- Pair 16pOC3 with ipRoutes enabled - there are actually 26 free protected connection entries available when cards are loaded up with the “maximum” of 14 ports.
- Change lp eng arc apc ov to use those 26 connection entries on that APC (pre-SN09 use eggshell command or HCA in SN09 to do this in service)
- Connect port 14 to 15 on both cards
- Provision AtmIf, can theoretically support up to 26 MG9000 with this.

### 1.3 Software Requirements or Dependencies

This ESA activity on the MG9K is dependent upon two additional activities for successful completion:

- InterNodal Emergency Standalone (ESA) Element Manager (A00007415).
- Passport 15000 Support for MG9000 Inter-node ESA.

### 1.4 Limitations and restrictions

- No security will be implemented on the ESA SIP Callp Messaging for SN08.
- InterNodal ESA is designed to support a maximum of 15 MG9K nodes. Each node can support a maximum of 4 ABI pairs on the primary shelf and a maximum of 15 sub-tending shelves for a total of 20 VMGs per node. Each COI must be restricted to containing no more than 170 VMGs.
- A ESA Community of Interest (COI) must have access to a LAN Switch (i.e. Passport 15K or equivalent) in order for InterNodal ESA calls to complete.
- If an MG9K does not have access to a IP router (Passport VR), it will operate in the pre-SN08 manner of routing calls between VMGs within a single MG9K node.
- Although a Community of Interest is defined, each node must be in ESA for it to participate in the community. Nodes are not forced to enter ESA.
- A MG9K node can belong to only one Community of Interest at a time.
- All VMGs in a MG9K node must belong to the Community of Interest.
- All VMGs in a MG9K node can independently enter ESA.
- VMGs configured for ESA as either Basic (North American) or Enhanced will be supported within the same Community of Interest. However, VMGs configured as Basic will not be able to handle MADN, hunt group, or other feature specific behaviors included in the Enhanced feature suite.
- Emergency numbers should be provisioned per MG9K node. It is not recommended to rely on accessibility of remote nodes within the community.
- VMGs configured on non-North American Callservers only support ESA Basic (International). Therefore, InterNodal ESA on international switches will only support VMGs configured for ESA Basic within the Community of Interest.

- InterNodal ESA will be supported for the SLOA (ATM), SLOIP (IP), and SLOG (GigE) solutions in the SN08 time frame.
- InterNodal ESA will be supported for both the SLOA (ATM) and SLOIP (IP) solutions. SLOG will not be supported in the SN08 time frame.

## 1.5 Interactions

None. InterNodal ESA must not inhibit existing ESA functionality. InterNodal ESA must support the Enhanced ESA line services feature set across all nodes in the Community of Interest (COI).

## 1.6 Glossary

| Term  | Description                          |
|-------|--------------------------------------|
| ABI   | Access Bridge Interface              |
| COI   | Community of Interest                |
| ESA   | Emergency Stand Alone                |
| I-ESA | InterNodal ESA                       |
| LAN   | Local Area Network                   |
| MG9K  | Media Gateway 9000                   |
| PVC   | Permanent Virtual Circuit            |
| PVR   | Passport Virtual Router              |
| SLOA  | Switched Lines Over ATM              |
| SLOG  | Switched Lines Over Gigabit-Ethernet |
| SLOIP | Switched Lines Over IP               |
| SVC   | Switched Virtual Circuit             |
| VMG   | Virtual Media Gateway                |
| VR    | Virtual Router                       |

## 2: Configuration

### 2.1 Hardware and Software Requirements

This feature applies to all supported hardware platforms, per the SN08 Succession server platform foundation software specification. No new hardware is required. A MG9K node in a community must have access to a LAN Switch (i.e. Passport 15000 or equivalent) in order for InterNodal ESA calls to complete.

## 2.2 Initial Configuration

The inter-MG9000 communication will be provided by the Passport 15000 switch, using the Virtual Router capability to route the IP-based ESA traffic between MG9K gateways.

To deploy this feature in the field, the existing Passport 15000 switches must be configured to support it. This section covers the following:

- Details of the Passport 15000 software component provisioning.
- Engineering required to configure the Passports in the field.
- List of possible deployment scenarios.

## 2.3 Upgrade Considerations

For the InterNodal ESA feature using a Passport virtual router (PVR), it is expected that the Passport 15000 can be field upgraded to support inter-MG9000 communications.

For a MG9000 connected to Passport 16pOC3 FP cards without IP already enabled for in-band OAM, it can be a service impacting action to enable the PVR on the PP15K.

- Turning on IP reduces the card's ATM connection capacity such that only 14 ports can be supported. Fully populated cards would have to have some MG9000s migrated to other cards.
- atmif ca attributes on all ports on the FP need to be re-engineered from 3300 to 2100.
- Both of these changes (turning on IP and atmif ca) are "critical" changes - the former currently causes a dual-FP reboot.

Since an outage can not be allowed during an upgrade of existing field installations, the chosen solution is to put a hairpin on the shelf on a card that already supports IP, or can be IP enabled without service interruption (new hardware).

The MG9000 can have either a DS-1 IMA or an STS-1 interface which terminates on the Passport as a DS-3.

As IP is not supported on the 4pDS3ChIMA card, and carrier grade IP is not supported on the 12pDS3ATM FP card, these cards can only terminate the ATM layer, and an optical "hair-pin" must be used for IP forwarding.

**Figure 1 Electrical interface hair-pin IP connectivity**

This optical hair-pin can be deployed on a pair of cards deployed expressly for this purpose, or it can be deployed on spare ports of an optical pair with spare capacity. For instance, a pair of PQC12 4pOC12 FP cards with only two OC12 trunks will have enough spare ATM connection space and IP routing capacity to support over 100 MG9000 gateways for ESA traffic.

- A spare pair of ports on a card with available space can be used to deploy an IP hairpin that can do IP services.
- A new pair of cards (example: 4pOC3 FP) can be provisioned with an IP hairpin.

## 2.4 Security

No security will be implemented on the ESA SIP Callp Messaging for SN08.

## 2.5 Configuration Walkthrough

A typical deployment scenario for this feature is a collapsed office (“a remote”), which typically consists of a single Passport 15000 switch connecting a group of MG9K gateways to a set of PNNI links back to the CS2000 site. If necessary, the collapsed office can use several Passport 15000 switches.

Each MG9K will now have a separate Vcc to connect to the Passport 15000 Virtual Router; RFC 1483 llc-snap IP encapsulation.

For reference, this chapter contains all the components that are required for adding MG9000 InterNode ESA support to an already commissioned Passport 15000 in the Succession UA-AAL1 Solution. Not all components are required for all configurations. There is a table for each related group of components that must be created or changed. The “type” field means the following:

- **set:** the attribute is pre-engineered by Succession design and is the same for all switches at all sites for all customers.
- **default:** the attribute value is customer defined and/or must be engineered depending on the switch or network configuration.
- **link:** an attribute that is a link to another component.

## 2.5.1 CP and Shelf Commissioning

The following components are to be created or changed when a Passport 15000 shelf is first being commissioned for InterNode ESA.

### 2.5.1.1 Software and Features

The following software packages and lpt for the CP are required. They are not configured by an NP template but as part of the Passport 15000 base IM24-9095.

**Table 1 Software Component Provisionable Attributes**

| Attribute                  | Type    | Value                                                         |
|----------------------------|---------|---------------------------------------------------------------|
| <b>Software</b>            |         |                                                               |
| avList                     | default | ip_CF01XXX, wanDte_CF01XXX<br><i>add if not already there</i> |
| <b>Sw Lpt/CP</b>           |         |                                                               |
| featureList                | set     | ip, mvr<br><i>add if not already there</i>                    |
| <b>Sw Lpt/ATM&lt;n&gt;</b> |         |                                                               |
| featureList                | set     | ip, atmmpe<br><i>add if not already there</i>                 |

### 2.5.1.2 Virtual Router

**Table 2 Virtual Router component provisioning attributes**

| Attribute                                                                                             | Type | Value           |
|-------------------------------------------------------------------------------------------------------|------|-----------------|
| <b>VirtualRouter/ESA</b>                                                                              |      |                 |
| vpnMode                                                                                               | set  | customer        |
| vrp                                                                                                   | set  | lp/0            |
| <b>VirtualRouter/ESA Ip</b>                                                                           |      |                 |
| preConfigFwdPath                                                                                      | set  | enabled         |
| <b>VirtualRouter/ESA Ip Static<sup>a</sup></b>                                                        |      |                 |
| maxEcmpNextHops                                                                                       | set  | 1               |
| <b>VirtualRouter/ESA Ip Static Route/&lt;sub-net&gt;<sup>b</sup> nextHop/&lt;next-hop-address&gt;</b> |      |                 |
| metric                                                                                                | set  | 1               |
| <b>VirtualRouter/ESA Ip Static DiscardRouteEntry/0.0.0.0,0.0.0.0,0</b>                                |      |                 |
| discardRouteEntry                                                                                     | add  | 0.0.0.0,0.0.0.0 |

a. required to route traffic between Passport 15000 in the case where InterNode ESA groups span more than one Passport 15000.

b. <sub-net> is a triplet of the form <address>,<mask>,0

## 2.5.2 FP Cards

To carry the InterNodal ESA IP traffic, the FP cards that are directly connected to the MG9000 or supporting the hairpin connection for MG9000 connected to FP cards that cannot support IP traffic, the following FP level configuration changes must be made.

### 2.5.2.1 4pOC3SmlrATM

**Table 3 4pOC3SmlrAtm Component Provisionable Attributes**

| Attribute Name            | Type | Value |
|---------------------------|------|-------|
| <b>Lp Eng Ferc Pqc Ov</b> |      |       |
| ipRoutes                  | Set  | 4096  |

### 2.5.2.2 16pOC3SmlrAtm

**Table 4 16pOC3SmlrAtm Component Provisionable Attributes**

| Attribute Name                  | Type    | Value         |
|---------------------------------|---------|---------------|
| <b>Lp Eng Arc Ov</b>            |         |               |
| connectionPoolCapacity          | Default | <num>         |
| protectedConnectionPoolCapacity | Default | 29440 - <num> |
| <b>Lp Eng Ferc Pqc Ov</b>       |         |               |
| ipRoutes                        | Set     | 4096          |

### 2.5.2.3 4pOC12SmlrATM

**Table 5 4pOC12SmlrAtm (NTHW86 only) Component Provisionable Attributes**

| Attribute Name            | Type | Value |
|---------------------------|------|-------|
| <b>Lp Eng Ferc Pqc Ov</b> |      |       |
| ipRoutes                  | Set  | 4096  |

### 2.5.2.4 4pDS3ChAtm

No change to the FP configuration to add InterNodal ESA.

### 2.5.2.5 12pDS3Atm

No change to the FP configuration to add InterNodal ESA.

## 2.5.3 Interfaces

### 2.5.3.1 MG9000 OC-3 interface

The following component needs to be provisioned to support a InterNodal ESA IP MG9000 on a 1+1 OC-3 interfaces. Note that since MG9000 does not support ARP, there must be a static ARP entry provisioned into the Passport for each IP “host” on the MG9000.

**Table 6 MG9000 OC-3 interface component configuration**

| Attribute Name                                                              | Type    | Value                          |
|-----------------------------------------------------------------------------|---------|--------------------------------|
| <b>AtmIf Vcc/16.32 Nep</b>                                                  |         |                                |
| applicationName                                                             | Set     | AtmMpe/<n> Ac/1                |
| <b>AtmIf Vcc/16.32 vcd Tm</b>                                               |         |                                |
| atmServiceCategory                                                          | Set     | rtVbr                          |
| txPacketWiseDiscard                                                         | Set     | enabled                        |
| txTrafficDescriptorType                                                     | Set     | 6                              |
| txTrafficDescriptorParameters                                               | Default | 1 12000 2 6000 3 32            |
| <b>AtmMpe/&lt;n&gt;</b>                                                     |         |                                |
| linkToProtocolPort                                                          | Link    | Vr/ESA Pp/9K<n>_ESA            |
| <b>AtmMpe/&lt;n&gt; Ac/1</b>                                                |         |                                |
| atmConnection                                                               | Link    | AtmIf/<n> Vcc/<vpi.vci><br>nep |
| <b>Vr/ESA Pp/9K&lt;n&gt;_ESA</b>                                            |         |                                |
| linkToMedia                                                                 | Link    | AtmMpe/<n>                     |
| <b>Vr/ESA Pp/9K&lt;n&gt;_ESA ipport LogicalInterface/&lt;ESA_IPaddr&gt;</b> |         |                                |
| netMask                                                                     | Set     | 255.255.255.224                |
| <b>Vr/ESA Ip Arp Host/&lt;ESA_IPaddr+m&gt;,0<sup>a</sup></b>                |         |                                |
| pvc                                                                         | Set     | 1                              |

a. ARP entries must be provisioned for the 16 MG9000 ITP IP addresses

### 2.5.3.2 MG9000 DS-1 IMA interface

The following component needs to be provisioned to support MG9000 InterNodal ESA on a DS-1 IMA interface. This consists of a Vcc Network Relay Point (NRP) to a Hairpin ATM Interface.

**Table 7 MG9000 DS-1 IMA interface Component Provisionable Attributes**

| Attribute Name                    | Type    | Value                         |
|-----------------------------------|---------|-------------------------------|
| <b>AtmIf Vcc/16.32 Nrp</b>        |         |                               |
| nextHop                           | Default | AtmIf/<HAI> Vcc/<vpi.vci> Nrp |
| <b>AtmIf Vcc/16.32 Nrp Vcd Tm</b> |         |                               |
| atmServiceCategory                | Set     | rtVbr                         |
| txPacketWiseDiscard               | Set     | enabled                       |
| txTrafficDescriptorType           | Set     | 6                             |
| txTrafficDescriptorParameters     | Default | 1 950 2 380 3 32              |

### 2.5.3.3 MG9000 STS-1/DS3 interface

The following component needs to be provisioned to support MG9000 InterNodal ESA on a DS-3 interface This consists of a Vcc Network Relay Point (NRP) to a Hairpin ATM Interface.

**Table 8 MG9000 STS-1/DS-3 interface Component Provisionable Attributes**

| Attribute Name                    | Type    | Value                         |
|-----------------------------------|---------|-------------------------------|
| <b>AtmIf Vcc/16/32 Nrp</b>        |         |                               |
| nextHop                           | Default | AtmIf/<HAI> Vcc/<vpi.vci> Nrp |
| <b>AtmIf Vcc/16.32 Nrp Vcd Tm</b> |         |                               |
| atmServiceCategory                | Set     | rtVbr                         |
| txPacketWiseDiscard               | Set     | enabled                       |
| txTrafficDescriptorType           | Set     | 6                             |
| txTrafficDescriptorParameters     | Default | 1 ?? 2 ?? 3 32                |

### 2.5.3.4 Hairpin ATM interface

Table 11, “Optical HII interface component configuration.” documents all the components and attributes to be provisioned for the optical Hairpin ATM Interface (HAI) from scratch. Table 12, “MG9000 Vcc and Vr HII component configuration.” covers the Vcc Nrp components required to support one

MG9000. As a single hairpin interface can support many MG9000s, those components will typically be applied several times.

**Table 9 Optical HAI interface component configuration**

| Attribute Name                         | Type    | Value                                                |
|----------------------------------------|---------|------------------------------------------------------|

a. values depend on whether the MG9000 is IMA or DS3

### 2.5.3.5 Hairpin IP interface

Table 11, “Optical HII interface component configuration.” documents all the components and attributes to be provisioned for the optical Hairpin IP Interface (HII) from scratch. Table 12, “MG9000 Vcc and Vr HII component configuration.” covers the Vcc, AtmMpe and Vr components required to support one MG9000. As a single hairpin can support many MG9000,s those components will typically be applied several times.

**Table 11 Optical HII interface component configuration**

## **A00006906--SN08 Clock Sync Enhancements**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

This Feature covers the software development on the Succession MG9000 (MG9K) node and specifically on the DCC and ITP cards. The clock sync code on the DCC is used to recover a synchronization signal from a Building Integrated Timing Source (aka. BITS, BITS is North American usage) or a Synchronization Supply Unit (aka SSU, International usage) signal. This signal is forwarded to the MG9K ITP card which uses the signal to synchronize the MG9K node.

Prior to SN08, the MG9K only supports the North American standard timing reference (BITS). This system uses DS-1 interfaces which are incompatible with the international standard 2048kHz interface. Lack of 2048kHz interfaces complicates the introduction of MG9K into international markets.

This feature introduces the capability for the NY45FA GiGE DCC circuit pack to connect to an International standard Synchronization Supply Unit (SSU) using 2048kHz interfaces. The NY45FA can use an SSU or BITS signal as a timing reference.

### 1.3 Hardware Requirements or Dependencies

The new content provided by this feature is only activated if the MG9K NY45FA GiGE card is present in the node. The content of this feature will actually exist in the other DCC loads but will not be activated. Software will determine what behavior (BITS or SSU) to activate based on the PEC code of the DCC hardware along with provisioning information.

### 1.4 Software Requirements or Dependencies

There are no software feature dependencies required by this feature. This feature is stand alone.

### 1.5 Limitations and restrictions

Include only those limitations and restrictions that are visible to any user. Describe the incompatibilities, limitations and restrictions imposed by this feature that may affect the end user.

- This feature will only be activated if the MG9K has a NY45FA GiGE DCC card(s) in the node.
- This feature only supports 2048kHz signal formats that conform to G703 section 13 and 120 ohm (twisted pair) interfaces. This signal is a 2048 kHz signal, i.e. it does not conform to G.704 frame format. Therefore the following is NOT supported
  - 75 ohm load impedance is NOT supported.
  - 2048 kbit/s interface is NOT supported. (G.704 frame format)
- This feature is not backward compatible, i.e. downgrading the DCC to a load previous to SN08 will result in a loss of SSU synchronization since that functionality is not provided by previous software releases.
- GiGE DCC cards will not have the ability to obtain a timing reference from the network interface. Provisioning for network timing will be blocked.

### 1.6 Interactions

In SN08, the MG9K Element Manager (EM) is planning to implement a GUI for the GiGE circuit pack. As part of that GUI is included a Clock sync

interface. The intent of the GUI is to represent all of the information that is currently displayed on the clock sync LCI pages plus the inclusion of the new SSU information. The infrastructure for the data is already in place so the interaction with the Element Manager takes place using standard SNMP Gets and Puts. No functionality changes to the Clock Sync code are expected as a result of this related but independent feature.

## 1.9 Alarms

Two new alarms are created that indicate a DAC voltage error:

- "DACV at Rail", Major alarm. This alarm means that the ITP clock circuitry has attempted to acquire sync and has traversed the frequency range to the extreme end of its capture range. When this occurs it typically indicates that the incoming clock reference is not synchronized to a good reference and is out of the MG9K's acceptable frequency range. The corrective action would be to investigate and solve the incoming clock reference frequency.  
If this alarm occurs on the active ITP, and the inactive ITP is not in the same state, then a SWACT will occur.
- "DACV Out of Range", Major alarm. This alarm means that the ITP 's DACV clock circuitry is in an invalid condition and the values are out of range. When this occurs it typically indicates that the ITP DACV circuitry is not functional. In most cases this means the ITP card should be replaced. If a "Lock, Restart Flash Primary" action does not clear this fault then definitely this indicates a faulty ITP card.  
If this alarm occurs on the active ITP and the inactive ITP is not in the same state then a SWACT will occur.

***Product = MG 9000***

## **A00007000--GIGE Network Interface EM Portion**

### ***Functional Description***

#### **1.1 Feature name**

GIGE Network Interface EM Portion

## 1.2 Applicable Solution(s)

UA-IP

## 1.3 Description

This document describes the functional description of the new Gigabit Ethernet interface for MG9000. Existing VOIP MG9000 is an ATM based IP network Interface. The GigE interface will provide IP connectivity to the MG9000. A new SuperCore Gigabit Ethernet card (known as SCG) that has four ports (one WAN port, other three subtending ports) is being introduced to support GigE configuration. In SN08, subtending ports are not supported.

### 1.3.1 Display

The user can view the following GigE related parameters:

- 1 Card data (physical attributes, activity status and software load)
- 2 Link data (physical attributes, link attributes)
- 3 Link protection status
- 4 Performance parameters through the Performance Browser:
  - PM/ OM per link
  - RMON per link
  - SMON per VLAN
- 5 GigE card and link alarms through the Alarm Browser.
- 6 Network interface bandwidth data through the Bandwidth Manager:
  - Current ITP voice usage (in bits/second)
  - Current ABI voice usage (in bits/second)
  - Overall network interface utilization (in bits/second)

NOTE: In SN08, only Switched Lines and ABI services are supported.

- 7 Clock synchronization status:
  - Clock status (active/inactive)
  - Chosen reference
  - DAC voltage

### 1.3.2 Provisioning

The user can view and provision the following attributes:

- 1 Card state (administrative and configuration state)
- 2 Link state (administrative and configuration state)

NOTE: the user cannot lock the active WAN port from EM.

- 3** Facility loopback (enable/disable)
- 4** Frequency and loss rate for Link Integrity Monitoring
- 5** Tx RFI and Rx RFI:

Tx RFI and Rx RFI will be ON by default. On disabling, a warning message will be displayed to the user.
- 6** SES to generate UAS
- 7** Soak time for UAS count
- 8** The SSU format is supported by GigE, but the user cannot provision it from the EM.
- 9** For Link reversion, preferred and non-preferred links need not be specified. The user needs to specify the Protection group number and the wait time.
- 10** Clock synchronization:

The user can provision the Primary and Alternate clock references and their encoding formats. The available references are DCC BITS, ITX BITS and NETWORK (supported by SCO and SCI cards). GigE does not support the NETWORK reference. Besides supporting SF and ESF encoding formats (as supported by the SCO and SCI cards), GigE also supports SSU format.
- 11** Link Reversion:

The user needs to specify the preferred and non-preferred link along with the wait to revert time for link reversion.
- 12** VLAN data:

The user can view and modify the peak rate and priority for the following VLANs: OAM&P, Bearer, Call Control, 1 for the fixed IP addresses of the active and inactive cards.
- 13** Inactive WAN configuration:

The WAN port can be changed for only the inactive SCG card from EM.

**Figure 2 Use Case Diagram**

## 1.4 Hardware Requirements or Dependencies

A new SuperCore card to support the GigE configuration is required.

## 1.5 Software Requirements or Dependencies

The MG9K GIGE load is required to test EM code changes.

## 1.6 Limitations and restrictions

None

## 1.7 Interactions

None

| DAC  | Digital to Analogue Converter     |

## ***Fault Management for A00007000***

### **2.1 Fault management strategy**

The standard MG9K EM Fault management strategy will apply to the new faults raised by this feature. Alarms will be displayed by the MG9K EM alarms browser, logged in NT standard format to the SSPFS cust logs and forwarded to the northbound OSS and IEMS.

“A00007000 - GIGE network Interface” feature introduces new faults.

## 2.2 Fault management tools and utilities

The Alarm Browser reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

The Log Adaptor generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

## 2.3 Logs

### 2.3.1 Formats

The Log Delivery application for this feature generates logs in the Number 2 Switch Control Center (SCC2) format and the NT standard (STD) format.

The log type for GIGE alarms will be ‘GIGE’ and the log ids will start from 301.

## 2.4 Alarms

The new alarms introduced in this feature are:

### 1 LOS

- Alarm Format: - 301 LOS
- Associated alarm message - Loss of Signal
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an LOS with faultdefinition - clear is received.

### 2 RFI

- Alarm Format: - 302 RFI
- Associated alarm message - Remote Failure Indication
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an RFI with faultdefinition - clear is received.

### 3 TxF

- Alarm Format: - 303 TxF
- Associated alarm message - Transmit Failure
- Severity: Critical

- Cause: Network Problem
- Action: This alarm will be cleared when an TxF with faultdefinition - clear is received.

#### **4 TEM**

- Alarm Format: - 304 TEM
- Associated alarm message - Temperature Threshold Exceeded
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when a TEM with faultdefinition - clear is received.

#### **5 POW**

- Alarm Format: - 305 POW
- Associated alarm message - Low power indicated
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an POW with faultdefinition - clear is received.

#### **6 RxSD**

- Alarm Format: - 306 RxSD
- Associated alarm message - Receive Signal Degraded
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an POW with faultdefinition - clear is received.

#### **7 RxEED**

- Alarm Format: - 307 RxEED
- Associated alarm message - Receive Excessive Error Ratio
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an RxEED with faultdefinition - clear is received.

**8 TBC**

- Alarm Format: - 308 TBC
- Associated alarm message - Transmit Bias Current
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an TBC with faultdefinition - clear is received.

**9 LINT**

- Alarm Format: - 309 LINT
- Associated alarm message - Link initialization
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an LINT with faultdefinition - clear is received.

**10 OPT**

- Alarm Format: - 310 OPT
- Associated alarm message - Transmit Optical Power
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an OPT with faultdefinition - clear is received.

**11 OPR**

- Alarm Format: - 311 OPR
- Associated alarm message - Receive Optical Power
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an OPR with faultdefinition - clear is received.

**12 GARP**

- Alarm Format: - 312 GARP

- Associated alarm message - GARP Failure
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an GARP with faultdefinition - clear is received.

### **13 LKINT**

- Alarm Format - 313 LKINT
- Associated alarm message - Link Integrity Failure
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an LKINT with faultdefinition - clear is received.

### **14 AUTONEG**

- Alarm Format: - 314 AUTONEG
- Associated alarm message - Auto Negotiation Failure
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an AUTONEG with faultdefinition - clear is received.

### **15 NONPREFLINK**

- Alarm Format: - 315 NONPREFLINK
- Associated alarm message - Non Preferred Link is active
- Severity: Critical
- Cause: Network Problem
- Action: This alarm will be cleared when an NONPREFLINK with faultdefinition - clear is received.

## **2.5 Related documentation**

None

## ***Configuration for A00007000***

### **3.1 Hardware and Software Requirements**

The MG9000 and MG9000 software load that supports GIGE should be available.

### **3.2 Initial Configuration**

The MG9000 should be configured as GIGE from the LCI. The EM user will be able to view the link details once the MG9000 is configured.

### **3.3 Upgrade Considerations**

Since a new SCG card has been added to support this feature in SN08, there will not be any upgrade changes.

### **3.4 Element Management**

MG9000 Element manager will be used to manage the GigE MG9000.

The EM user will be able to view the GigE link configuration details, GigE alarms, PMs and OMs. The user will also be able to view and provision clock sync data, link protection data, and VLAN related data for the GigE ports and links. Details are provided in the respective sections

The audit on the administrative status of the GigE cards and links will be done if a mismatch is found. The data audit will be done if mismatch is found in any data provisioned from EM for clock sync, thresholds and bandwidth. The MG9000 will be the master in all these cases.

#### **3.4.1 New/modified GUIs**

**Table 1 New or modified GUIs**

| <b>GUI name</b>     | <b>NEW, CHANGED, or DELETED</b> |
|---------------------|---------------------------------|
| GigECardView        | NEW                             |
| GigEPortView        | NEW                             |
| GigELinkProtection  | NEW                             |
| BandWidthManager    | NEW                             |
| VLAN                | NEW                             |
| Performance Browser | CHANGED                         |
| LinkIntegrityView   | NEW                             |

## **3.4.2 GUI information**

### **3.4.2.1 GUI name: GigeCardView**

#### **3.4.2.1.1 Functional description.**

Each SCG card has four ports. The card view can be opened from the shelf view. The card view shows totally four ilog graphics for the ports as shown in the following figure. Clicking on each of them opens the GigePortView.

**Figure 3 Card view**

#### 3.4.2.2 GUI name: GigePortView

The GigePortView will be opened when the user double clicks on the SCG card's port icon in the card view. The port view displays port/link attributes and its provisioning information as shown in Figures 2 and 3.

#### **3.4.2.2.1 Functional description.**

The port/Link attributes are shown in 'Link Details' tab.

The 'Link Controls' tab allows the user to provision link information. Once the WAN ports (active and inactive) are configured from the LCI, the EM user will be able to set any port as the inactive WAN port on the inactive GIGE card. To change the inactive port, the current WAN port should be offlined and the new port should be online. The port can be online in the 'Link Controls' tab.

If the user tries to change the inactive WAN port (i.e. online the new port) without changing the existing WAN port's configuration status to offline, an error message that 'the existing WAN port should be offlined' will be displayed to the user.

If the user tries to change the WAN port on the active card, an error message 'The WAN port is active, port cannot be changed' will be displayed to the user.

The user will be able to change administrative status and configuration status for the port. The EM user will not be able to change the administrative and configuration status of the active WAN port.

The loopback status is not modified in SN08 as loopback is not supported. The Tx RFI and Rx RFI will be 'ON' by default. When it is enabled, RFI alarms will be raised and receiving an RFI alarms will result in sparing activity. When the RFI is disabled the RFI alarms will not be sent to EM.

The user should specify the number of SES to 1 UAS. It will not be set by default. When the value is changed a warning message that the '<number> of SES set to one UAS' will be displayed to the user.

The Rx excessive error ratio and Rx signal degrade thresholds can be provisioned for each port.

### 3.4.2.3 GUI name: GigeLinkProtection

#### 3.4.2.3.1 Functional description

The Link Protection Group should be enabled for the link protection to be enabled. The Link protection can be invoked from the shelfview. The user will be able to specify the protection group number, protection group type, working (preferred) link and protected (non-preferred) link. In SN08, only one protection group of type 1:1 is supported. The user can also enable/disable

Link Reversion mode. When it is enabled, the working channel is always preferred. The system will swact to it when it is available again. The wait to revert time should be specified by the user. By default, the Wait to revert time is 600 sec. This option will be available only for the active and inactive WAN ports. To switch to the other link, the cards need to be swacted.

.Link Protection Provisioning

The screenshot shows a window titled "GigE Protection Provisioning View" with a sub-header "MG9000". The window contains several input fields and buttons. The "Protection Group Number" is set to "1". The "Select Group Number" dropdown is also set to "1". The "Protection Group Type" is set to "1:1". The "Protection Mode" is set to "Revertive". The "Wait To Revert in sec:" field is set to "200". Below these fields are three buttons: "Create Group", "Delete Group", and "Modify Group". At the bottom of the window are two buttons: "Refresh" and "Close".

The Link protection status can be viewed for each link from the GigELinkProtectionView from the Actions submenu of GigePortView as shown in the following figure.

**Figure 6 Link Protection status**

### 3.4.2.3.3 GUI size

**Table 4 New or modified GUIs**

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| GigeProtection       | 1                 | 2                 |                       |
| GigeProvisioning     | 1                 | 1                 |                       |

### 3.4.2.3.4 GUI fields

The GUI fields for the GigePortLinkView.

**Table 5 GUI field descriptions**

| Field           | New or Changed | Subfield | Entry | Explanation and action  | Associated MIB entry    |
|-----------------|----------------|----------|-------|-------------------------|-------------------------|
| protGroupNumber | New            | -        | -     | Protection Group Number | nnGLinkProtGrpType      |
| protGroupType   | New            | -        | -     | protection group type   | nnGLinkProtGrpType      |
| protMode        | New            | -        | -     | Protection mode         | nnGLinkProtGrpRevertive |

**Table 5 GUI field descriptions**

| Field        | New or Changed | Subfield | Entry | Explanation and action  | Associated MIB entry   |
|--------------|----------------|----------|-------|-------------------------|------------------------|
| waitToRevert | New            | -        | -     | No.of seconds to revert | nnGLinkProtGrpWaitTime |
| prefLink     | New            |          |       | Preferred link          |                        |
| nonPrefLink  | New            | -        | -     | Non preferred link      |                        |

### 3.4.2.4 GUI name: Bandwidth Manager

#### 3.4.2.4.1 Functional description

In SN08, the Private lines and DSL services are not supported. The following network interface bandwidth data will be monitored: current ITP voice usage, current ABI voice usage and Overall network interface utilization. The data will be displayed in bits/second for GIGE systems. Bandwidth partitioning will also be supported in GIGE. The bandwidth manager panel can be viewed from the Services submenu. The bandwidth manager view has the following details:

**Figure 7 Bandwidth Partitioning View**

NE-160 Bandwidth Manager

MG9000

Managing

Partition Threshold

Maximum Partitionable Bandwidth

Partition Enabled ☐ Yes ☒ No

Bearer  %  bits/sec

Upper Bound  bits/sec

Network Interface  bits/sec

Apply

Refresh

**Figure 8 Bandwidth threshold managing**

The screenshot shows the NE-160 Bandwidth Manager interface. At the top, there is a title bar with a small icon and the text "NE-160 Bandwidth Manager". Below this is a green header bar with the text "MG9000". The main content area has a green background and contains the following elements:

- A "Managing" label at the top center.
- Two tabs: "Partition" (selected) and "Threshold".
- A "Managing Threshold Setting" label in the center.
- A "Bandwidth Congestion Threshold" label followed by a text input field containing "80.0" and a "%" symbol.
- An "Apply" button below the input field.
- A "Refresh" button at the bottom right.

**Figure 9 Bandwidth network Interface View**

The screenshot shows the Bandwidth network Interface View. At the top, there are three tabs: "Network Interface", "Per Shelf", and "Utilization" (selected). The main content area has a green background and contains the following elements:

- A "Currently Reserved Bandwidth" label in the center.
- A table with three rows and four columns:

|            |                                |   |                                         |
|------------|--------------------------------|---|-----------------------------------------|
| ITP Bearer | <input type="text" value="0"/> | % | <input type="text" value="0"/> bits/sec |
| ABI Bearer | <input type="text" value="0"/> | % | <input type="text" value="0"/> bits/sec |
| Total      | <input type="text" value="0"/> | % | <input type="text" value="0"/> bits/sec |

**Figure 10 Bandwidth reserved per shelf**

Monitoring

Network Interface Per Shelf Utilization

### 3.4.2.5 Bandwidth Manager IP solution

There is slight modification in bandwidth manager GUI for IP solution

Earlier the bandwidth manager GUI was same for both AAL1 and IP solutions. The existing GUI holds good for AAL1 solution. There are slight changes in IP solution bandwidth manager GUI. The changes are in Partition panel, Priority panel and the Network Interface panel.

Partition panel: There are 2 partitions, Bearer and DSL.

Each of the partitions will have three fields: percent, bandwidth in cps, and max value in cps (this is the upper bound).

When provisioning a partition percent, the corresponding bandwidth is calculated from the upper bound,

i.e.  $\% * \text{upperbound} = \text{partition bandwidth}$ .

Total partitionable and the interface capacity will be displayed. The total percent will not be displayed in this case.

**Figure 12 Bandwidth manager partition panel for IP solution**

The screenshot shows the 'Managing' section of the 'NE-18 Bandwidth Manager' GUI. The 'Partition' tab is selected. The 'Maximum Partitionable Bandwidth' section contains a 'Partition Enabled' checkbox set to 'No'. Below this, there are two rows for partition settings: 'Bearer' and 'Guaranteed DSL'. Each row has three input fields: a percentage field (both set to 0), a bandwidth in cps field (both set to 0), and an upper bound field (both set to 340657). To the right of these fields, the 'Upper Bound' is displayed as 340657 cells/sec. Below the partition settings, the 'Total Partitionable' is shown as 340657 cells/sec, and the 'Network Interface' capacity is shown as 353207 cells/sec. At the bottom of the panel are 'Apply' and 'Refresh' buttons.

| Partition      | Percent | Bandwidth (cps) | Upper Bound (cells/sec) |
|----------------|---------|-----------------|-------------------------|
| Bearer         | 0       | 0               | 340657                  |
| Guaranteed DSL | 0       | 0               | 340657                  |

Total Partitionable: 340657 cells/sec  
Network Interface: 353207 cells/sec

Priority Panel: PLOA holding priority data is removed (as compared to AAL1 priority panel)

Network Interface Panel: PLOA data is removed from Network Interface tab (as compared to AAL1 Network Interface panel)

### 3.4.2.5.1 GUI usage and implications

### 3.4.2.5.2 GUI size

**Table 6** New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| BandwidthGige View   | 1                 | 1                 |                       |
| BandwidthView        | 1                 | 1                 |                       |

### 3.4.2.6 GUI name: VLAN

#### 3.4.2.6.1 Functional description

The user will be able to view the VLAN provisioning data from 'VLAN provisioning' view in the shelf view as shown in the figure. There are totally four VLAN IDs in SN08 release. The user will be able to change the Vlan name and peak rate for VLANs. The VLAN details will be displayed as shown in the following figure. If the Vlans are not provisioned, a message that "the vlan information is not provisioned yet" will be displayed to the user. There is VLAN browser provided from the subnet 'Configuration Submenu' to view the VLAN details for the GIGE nodes on the submenu.

**Figure 13 VLAN information**

The screenshot shows a window titled "NE-160 Vlan Manager" with a sub-header "MG9000". The main area is titled "Vlan Data" and contains a list of configuration fields for a VLAN. The fields are arranged in two columns. The first column lists the field names, and the second column contains the corresponding values in input boxes. The values are: VLAN\_ID: 5, VLAN\_NAME: man9, VLAN\_TYPE: OAMP, PRIORITY: 5, PEAK\_RATE: 900, PRIM\_SUBNET\_ADDR: 0.0.0.0, PRIM\_SUBNET\_MASK: 0.0.0.0, SEC\_SUBNET\_ADD: 0.0.0.0, and SEC\_SUBNET\_MASK: 0.0.0.0. At the bottom of the window, there are three buttons: "Refresh", "Apply", and "Close".

| Field            | Value   |
|------------------|---------|
| VLAN_ID          | 5       |
| VLAN_NAME        | man9    |
| VLAN_TYPE        | OAMP    |
| PRIORITY         | 5       |
| PEAK_RATE        | 900     |
| PRIM_SUBNET_ADDR | 0.0.0.0 |
| PRIM_SUBNET_MASK | 0.0.0.0 |
| SEC_SUBNET_ADD   | 0.0.0.0 |
| SEC_SUBNET_MASK  | 0.0.0.0 |

Buttons: Refresh, Apply, Close

### 3.4.2.8 GUI name: Link Integrity

#### 3.4.2.8.1 Functional description

The Link Integrity test can be invoked from the shelfview Maintenance submenu 'Link Integrity View'. The link integrity test will be run on a protection group. The details as shown in the following figure are displayed. The user should specify the threshold and the threshold interval. If the user does not specify any value, default values will be taken. The link integrity test can be enabled or disabled using the integrity monitoring field in the Link Integrity Monitoring View. The test will run every interval specified in the view. If the threshold crosses, an Link Integrity alarm will be raised. If there are no protection groups created, it gives a message that "The Link protection information is provisioned yet".

## *Performance Management for A00007000*

### 4.1 Performance management strategy

This follows the existing MG9K EM performance strategy wherein the data is collected 15 or 5/30 minutes for 96 intervals.

### 4.2 Performance management tools and utilities

The performance data can be viewed from the Performance browser.

### 4.3 Performance Measurements (PM), Operational Measurements (OM), and stats.

#### 4.3.1 OM Statistics

The new OM performance parameters introduced in this feature are:

##### 4.3.1.1 Errored Seconds

Component: OM Statistics

Performance measurement name: Errored Seconds

The Performance measurement description: counter associated with Errored Seconds

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

**4.3.1.2 Severely Errored Seconds**

Component: OM Statistics

Performance measurement name: Severely Errored Seconds

Performance measurement description: The counter associated with SES

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

**4.3.1.3 Unavailable seconds**

Component: OM Statistics

Performance measurement name: Unavailable Seconds

Performance measurement description: The counter associated with UAS

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

**4.3.1.4 Optical Power Transmit**

Component: OM Statistics

Performance measurement name: Optical Power Transmit

Performance measurement description: The counter associated with Optical Power Transmit

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

**4.3.1.5 Optical Power Receive**

Component: OM Statistics

Performance measurement name: Optical Power Receive

Performance measurement description: The counter associated with Optical Power Receive

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

**4.3.1.6 Transmit Bias Current**

Component: OM Statistics

Performance measurement name: Transmit Bias Current

Performance measurement description: The counter associated with Transmit Bias Current

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.7 Temperature**

Component: OM Statistics

Performance measurement name: Temperature

Performance measurement description: The counter associated with Temperature

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.8 Voltage**

Component: Generic OM

Performance measurement name: Voltage

Performance measurement description: The counter associated with Voltage

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.9 nnGLinkCurrTxFifoOverruns**

Component: Generic OM

Performance measurement name: Number of Tx Fifo Overruns

Performance measurement description: The counter associated with Number of Tx Fifo Overruns

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.10 nnGLinkCurrTxFifoUnderruns**

Component: Generic OM

Performance measurement name: Number of Tx Fifo Underruns

Performance measurement description: The counter associated with Number of Tx Fifo Underruns

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.11 nnGLinkCurrTxBytesOverflow**

Component: Generic OM

Performance measurement name: Number of Tx Bytes OverFlow

Performance measurement description: The counter associated with Number of Tx bytes overflow

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.12 nnGLinkCurrTxBytes**

Component: Generic OM

Performance measurement name: Number of Tx Bytes

Performance measurement description: The counter associated with Number of Tx bytes

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.13 nnGLinkCurrRxFcsFail**

Component: Generic OM

Performance measurement name: Number of Rx FCS Fails

Performance measurement description: The counter associated with Number of Rx fails

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.14 nnGLinkCurrRxFcsFail**

Component: Generic OM

Performance measurement name: Number of Rx FCS Fails

Performance measurement description: The counter associated with Number of Rx fails

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.15 nnGLinkCurrRxLenTypeFail**

Component: Generic OM

Performance measurement name: Number of Rx Len type fail

Performance measurement description: The counter associated with Number of Len type fails

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.16 nnGLinkCurrRxGoodPause**

Component: Generic OM

Performance measurement name: Number of Rx Good Pause

Performance measurement description: The counter associated with Number of Rx good pause

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.17 nnGLinkCurrRxGoodPause**

Component: Generic OM

Performance measurement name: Number of Rx Good Pause

Performance measurement description: The counter associated with Number of Rx good pause

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.18 nnGLinkCurrRxBadOpCntlFrames**

Component: Generic OM

Performance measurement name: Number of Rx bad op cntl frames

Performance measurement description: The counter associated with Number of Rx bad OpCntl frames

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

#### **4.3.1.19 nnGLinkCurrRxPauseFrames**

Component: Generic OM

Performance measurement name: Number of Rx control frames

Performance measurement description: The counter associated with Number of Rx control frames

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - OM Statistics

### **4.3.2 Ethernet OM**

#### **4.3.2.1 AlignErr**

Component: Ethernet OM

Performance measurement name: Number of Alignment Errors

Performance measurement description: The counter associated with AlignErr

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistics

#### **4.3.2.2 FcsErr**

Component: FcsErr

Performance measurement name: Number of FCS Errors

Performance measurement description: The counter associated with FcsErr

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistics

#### **4.3.2.3 Internalmacrxerr**

Component: Ethernet OM

Performance measurement name: Number of Internal MAC Receive Errors

Performance measurement description: The counter associated with Internalmacrxerr

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistics

#### **4.3.2.4 Frtoolongs**

Component: Ethernet OM

Performance measurement name: Number of Frame Too Longs

Performance measurement description: The counter associated with Frtoolongs

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistics

#### **4.3.2.5 Internalmactxerr**

Component: Ethernet OM

Performance measurement name: Number of Internal MAC TX Errors

Performance measurement description: The counter associated with Internalmactxerr

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistics

#### **4.3.2.6 Symbolerr**

Component: Ethernet OM

Performance measurement name: Number of Symbol Errors

Performance measurement description: The counter associated with Symbolerr

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistics

#### **4.3.2.7 Inpausefr**

Component: Ethernet OM

Performance measurement name: Number of Inpause Frames

Performance measurement description: The counter associated with Inpausefr

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistics

#### **4.3.2.8 Outpausefr**

Component: Ethernet OM

Performance measurement name: Number of Outpause Frames

Performance measurement description: The counter associated with Outpausefr

Element Manager Screen Name: MG9kEM Performance Browser

Collection Interval: NA

Element Manager Screen Name: GIGE Card/Port xx - Ethernet OM Statistic

### **4.3.3 RMON Data**

#### **4.3.3.1 etherStatsDropEvents**

Component: RMON

Performance measurement name: Number of Drop Events

Performance measurement description: The current data associated with etherStatsDropEvents

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.2 etherStatsBroadcastPkts**

Component: RMON

Performance measurement name: Number of Broadcast Packets

Performance measurement description: The counter data associated with etherStatsBroadcastPkts

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.3 etherStatsMulticastPkts**

Component: RMON

Performance measurement name: Number of Multicast Packets

Performance measurement description: The counter associated with etherStatsMulticastPkts

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.4 etherStatsCRCAlignErrors**

Component: RMON

Performance measurement name: Number of CRC Alignment Errors

Performance measurement description: The counter associated with etherStatsCRCAlignErrors

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.5 etherStatsUndersizePkts**

Component: RMON

Performance measurement name: Number of Undersize Packets

Performance measurement description: The counter associated with etherStatsUndersizePkts

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.6 etherStatsOversizePkts**

Component: RMON

Performance measurement name: Number of Oversize Packets

Performance measurement description: The counter associated with etherStatsOversizePkts

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.7 etherStatsFragments**

Component: RMON

Performance measurement name: Number of Fragments

Performance measurement description: The counter associated with etherStatsFragments

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.8 etherStatsJabbers**

Component: RMON

Performance measurement name: Number of Jabbers

Performance measurement description: The counter associated with etherStatsJabbers

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

#### **4.3.3.9 etherStatsCollisions**

Component: RMON

Performance measurement name: Number of Collisions

Performance measurement description: The counter associated with etherStatsCollisions

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON Statistics

### **4.3.4 RMON HC Statistics**

#### **4.3.4.1 HC Overflow Packets**

Component: RMON HC

Performance measurement name: Number of HC overflow packets

Performance measurement description: The counter associated with HC Overflow Packets

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON HC Statistics

#### **4.3.4.2 Packets Received**

Component: RMON HC

Performance measurement name: Number of packets received

Performance measurement description: The counter associated with number of packets received

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON HC Statistics

#### **4.3.4.3 Overflow octets**

Component: RMON HC

Performance measurement name: Number of overflow octets

Performance measurement description: The counter associated with HC number of Overflow octets

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON HC Statistics

#### **4.3.4.4 Octets of data received**

Component: RMON HC

Performance measurement name: Number of octets of data received

Performance measurement description: The counter associated with number of octets of data received.

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON HC Statistics

**Note:** These data will be displayed only in RMON HC History data.

#### **4.3.4.5 etherHistoryOctets**

Component: RMON HC

Performance measurement name: Number of ether history octets

Performance measurement description: The counter associated with number of ether history octets received.

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON HC History Statistics

#### **4.3.4.6 etherHistoryPkts**

Component: RMON HC

Performance measurement name: Number of ether history packets

Performance measurement description: The counter associated with number of ether history packets received.

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON HC History Statistics

#### **4.3.4.7 etherHistoryUtilization**

Component: RMON HC

Performance measurement name: Number of ether history utilization

Performance measurement description: The counter associated with number of history utilization received.

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: GIGE Card/Port xx - RMON HC History Statistics

### **4.3.5 SMON Statistics**

#### **4.3.5.1 VLAN ID**

Component: SMONVlanStats

Performance measurement name: VLAN ID

Performance measurement description: The VLAN ID

Element Manager Screen Name: VLANxx/SMONVLANStatistics

#### **4.3.5.2 Total number Packets**

Component: SMONVlanStats

Performance measurement name: Total number Packets

Performance measurement description: The counter associated with Total number Packets

Element Manager Screen Name: VLANxx/SMONVLANStatistics

#### **4.3.5.3 Total Number of HC Packets**

Component: SMONVlanStats

Performance measurement name: Total Number of HC Packets

Performance measurement description: The counter associated with Total Number of HC Packets

Element Manager Screen Name: VLANxx/SMONVLANStatistics

#### **4.3.5.4 Create Time**

Component: SMONVlanStats

Performance measurement name: Create time

Performance measurement description: create time

Element Manager Screen Name: VLANxx/SMONVLANStatistics

#### **4.3.5.5 Total Number of Octets**

Component: SMONVlanStats

Performance measurement name: Total Number of Octets

Performance measurement description: The counter associated with Total Number of Octets

Element Manager Screen Name: VLANxx/SMONVLANStatistics

#### **4.3.5.6 Total Number of HC Octets**

Component: SMONVlanStats

Performance measurement name: Total Number of HC Octets

Performance measurement description: The counter associated with Total Number of HC Octets

Element Manager Screen Name: VLANxx/SMONVLANStatistics

**4.3.5.7 Total number of non unicast packets**

Component: SMONVlanStats

Performance measurement name: Total number of non unicast packets

Performance measurement description: The counter associated with Total number of non unicast packets

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: VLANxx/SMONVLANStatistics

**4.3.5.8 Total number of non unicast HC octets**

Component: SMONVlanStats

Performance measurement name: Total number of non unicast HC octets

Performance measurement description: The counter associated with Total number of non unicast HC octets

Element Manager Screen Name: VLANxx/SMONVLANStatistics

**4.3.5.9 Total number of non unicast octet**

Component: SMONVlanStats

Performance measurement name: Total number of non unicast octet

Performance measurement description: The counter associated with Total number of non unicast octet

Element Manager Screen Name: VLANxx/SMONVLANStatistics

Total number of non unicast over flow octet

Total number of non unicast over flow octet

**4.3.5.10 Total Number of Non Unicast Over Flow Octet**

Component: SMONVlanStats

Performance measurement name: Total number of non unicast over flow octets

Performance measurement description: The counter associated with Total number of non unicast over flow octets

Collection Interval: 15 or 5/30 mins

Element Manager Screen Name: VLANxx/SMONVLANStatistics

#### **4.3.5.11 Total number of non unicast HC octets**

Component: SMONVlanStats

Performance measurement name: Total number of non unicast HC octets

Performance measurement description: The counter associated with Total number of non unicast HC octets

Element Manager Screen Name: VLANxx/SMONVLAN Statistics

### **4.3.6 SMON Priority Statistics**

#### **4.3.6.1 Total number of packets**

Component: SMON Priority Statistics

Performance measurement name: Total number of packets

Performance measurement description: It displays the total number of packets

Element Manager Screen Name: VLANxx/SMON Priority Statistics

#### **4.3.6.2 Total number of overflow packets**

Component: SMON Priority Statistics

Performance measurement name: Total number of overflow packets

Performance measurement description: It displays the total number of overflow packets

Element Manager Screen Name: VLANxx/SMON Priority

#### **4.3.6.3 Total number of HC packets**

Component: SMON Priority Statistics

Performance measurement name: Total number of HC packets

Performance measurement description: It displays the total number of HC packets

Element Manager Screen Name: VLANxx/SMON Priority Statistics

#### **4.3.6.4 Total number of octets**

Component: SMON Priority Statistics

Performance measurement name: Total number of octets

Performance measurement description: It displays the total number of octets

Element Manager Screen Name: VLANxx/SMON Priority Statistics

#### **4.3.6.5 Total number of overflow octets**

Component: SMON Priority Statistics

Performance measurement name: Total number of overflow octets

Performance measurement description: It displays the total number of overflow octets

Element Manager Screen Name: VLANxx/SMON Priority Statistics

#### **4.3.6.6 Total number of HC octets**

Component: SMON Priority Statistics

Performance measurement name: Total number of HC octets

Performance measurement description: It displays the total number of HC octets

Element Manager Screen Name: VLANxx/SMON Priority Statistics

***Product = MG 9000***

## **A00007074--GigE Link Maintenance**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

Link maintenance provides two major areas of functionality for the GigE physical link, configuration and monitoring.

##### **1.2.1 Configuration**

Attributes for each of the links are provisioned by the LCI and maintained by Link Maintenance. Attributes include the auto-negotiation parameters and service state for a given link.

Link protection groups are managed as well. Protection group types and the link to protection group mappings are associated in link maintenance. Currently only 1+1 protection groups are supported in SN08. Revertive behavior is provided allowing preferred paths through the network.

A complete listing of the setable attributes can be found in the MIB section of the CN.

### **1.2.2 Monitoring**

Link maintenance provides the operational interface for each of the GigE ports. The service state of each port can be changed and the operational state reported. On going service metrics are collected and reportable through the MIBs. Threshold crossings are also reported if so provisioned.

When configured, link maintenance provides a means to ensure that each link in a protection group is both transmitting and receiving data. This heartbeat is bi-directional between the links and uses a layer 2 frame. Frames are sent periodically between the links and verified at the receiving link. Manual testing is available through the LCI.

Link maintenance maintains and reports fault conditions of each port. These include events such as loss of signal. Recovery actions are taken if possible to provide continuing service. Types of faults and actions are detailed in the FM section of this document.

## **1.3 Hardware Requirements or Dependencies**

Not Applicable

## **1.4 Software Requirements or Dependencies**

Not Applicable

## **1.5 Limitations and restrictions**

Not applicable.

## **1.6 Interactions**

Link Maintenance interacts with the following systems for configuration and operational management:

- CMT
- LCI

## 1.7 Glossary

| Term | Description           |
|------|-----------------------|
| GigE | Gigabit Ethernet      |
| LCI  | Local Craft Interface |

### *Fault Management for A00007074*

## 2.1 Fault management strategy

Currently the GigE interfaces uses a 1+1 protection group redundancy model. A link is provisioned on each of the SGC cards into a protection group. When a service affecting fault is detected on the active link the SGC cards will be spared if possible to gain service on the other link. Crossovers are not supported so the link and card activity match.

## 2.2 Fault management tools and utilities

The EM and LCI provide an interface for viewing the faults currently and historically on an interface. Tools are provided fault isolation including traceroute. The link intergroup test is available to provide information and isolation of faults both within the NE and the connected network.

## 2.3 Logs

Logs are generated for threshold crossings that occur and system errors. Logs are sent through the EM to the log stream. The log stream can then be monitored for craft to take appropriate action including contacting Nortel Networks for analysis.

The format is detailed in A00007000, GigE EM.

## 2.4 Alarms

The following alarms and recovery actions can occur:

**Table 5: GigE alarms**

| Alarm | Severity | Description             | System Action | Craft Action |
|-------|----------|-------------------------|---------------|--------------|
| LOS   | Critical | Loss of signal          | Spare         | None         |
| RFI   | Critical | Remote fault indication | Spare         | None         |
| TXF   | Critical | Transmit failure        | Spare         | None         |

**Table 5: GigE alarms**

| Alarm        | Severity       | Description                           | System Action        | Craft Action                                    |
|--------------|----------------|---------------------------------------|----------------------|-------------------------------------------------|
| AutoNeg      | Critical       | Autonegotiation failed                | Spare                | None                                            |
| RxEER        | Major          | Receive excessive errors              | Spare                | None                                            |
| LINT         | Link Integrity | failure of one link to communicate    | Spare if active link | None                                            |
| LKINT        | Major          | external failure for link integrity   | None                 | isolate fault hosting network                   |
| TEM          | Minor          | Temperature                           | None                 | replace card                                    |
| POW          | Minor          | Power                                 | None                 | replace card                                    |
| RxSD         | Minor          | Receive signal degraded               | None                 | isolate path introducing errors                 |
| TBC          | Minor          | Bias Current                          | None                 | replace card                                    |
| OPT          | Minor          | Optical transmit                      | None                 | replace card                                    |
| OPR          | Minor          | Optical receive                       | None                 | replace far end equipment                       |
| NONPRE-FLINK | Minor          | active link is not the preferred link | None                 | isolate and recover fault on the preferred link |

The format is detailed in A00007000, GigE EM.

## 2.10.2 Table/MIB/Remote Database Schema information

### 2.10.2.1 Name: ifEntry table

#### 2.10.2.1.1 Functional description

A list of interface entries. The number of entries is given by the value of ifNumber. This table has been modified to allow for Gige specific values. See RFC2863 for details.

#### 2.10.2.1.2 Size

**Table 13 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| ifEntry                | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

#### 2.10.2.1.3 Fields/OIDs

The following table lists fields/OIDs for ifEntry Table.

**Table 14 Table field descriptions**

| Field  | Default                                 | Read/Write Access | Size          | Note |
|--------|-----------------------------------------|-------------------|---------------|------|
| ifDesc | “Nortel-pec-frame-shelf-slot-port-gige” | Read              | DisplayString |      |
| ifType | ethernetCsmacd                          | Read              | IANAifType    |      |
| ifMtu  | 1600                                    | Read              | Integer32     |      |

**Table 14 Table field descriptions**

| Field                  | Default                   | Read/Write Access | Size        | Note |
|------------------------|---------------------------|-------------------|-------------|------|
| ifSpeed                | 1000000000<br>bps         | Read              | Gauge32     |      |
| ifPhysAddress          | “mac<br>address”          | Read              | PhysAddress |      |
| ifAdmin                | Down                      | Read/Write        | Integer     |      |
| ifOper                 | notPresent                | Read              | Integer     |      |
| ifLastChange           | 0                         | Read              | Timeticks   |      |
| ifName                 | “protgroup-<br>slot-port” | Read              |             |      |
| ifLinkUpDownTrapEnable | enabled                   | Read/Write        | Integer     |      |
| ifHighSpeed            | 1000                      | Read              | Gauge32     |      |
| ifConnectorPresent     | true                      | Read              | Truth value |      |
|                        |                           |                   |             |      |

### 2.10.2.2 Name: ifMauEntry table

#### 2.10.2.2.1 Functional description

Table of descriptive and status information about MAU(s) attached to an interface. See RFC3636 for details

#### 2.10.2.2.2 Size

**Table 15 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| ifMauEntry             | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

#### 2.10.2.2.3 Fields/OIDs

The following table lists fields/OIDs for ifMauEntry Table.

**Table 16 Table field descriptions**

| Field                             | Default                     | Read/Write Access | Size               | Note |
|-----------------------------------|-----------------------------|-------------------|--------------------|------|
| ifMauIfIndex                      | ifindex<br>from rfc<br>2863 | read              | InterfaceIn<br>dex |      |
| ifMauIndex                        | 0                           | read              | ifMauIndex         |      |

Note 1) Unknown whether the hardware can support this counter

Note 2) bits b1000baseXFD(22),b1000baseLXFD(24),b1000baseSXFD(26), and b1000baseCXFD(28) will be set.

### 2.10.2.3 Name: ifJackEntry table

#### 2.10.2.3.1 Functional description

Information about the external jacks attached to MAUs attached to an interface. See RFC3636 for details

### 2.10.2.3.2 Size

**Table 17 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| <b>ifJackEntry</b>     | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.3.3 Fields/OIDs

The following table lists fields/OIDs for ifJackEntry Table.

**Table 18 Table field descriptions**

| Field                | Default | Read/Write Access | Size      | Note |
|----------------------|---------|-------------------|-----------|------|
| ifJackIndex          | ifIndex | Not-accessible    | Integer32 |      |
| ifJackType           | 0       | read              | JackType  | 1    |
| ifMauHCFALSECarriers |         |                   | Counter64 | 1    |

Note 1) if unsupported jack type raise fault and don't allow link to unlock

## 2.10.2.4 Name: IfMauAutoNegEntry table

### 2.10.2.4.1 Functional description

Configuration and status objects for the auto-negotiation function of MAUs attached to interfaces. The ifMauAutoNegTable applies to systems in which auto-negotiation is supported on one or more MAUs attached to interfaces. Note that if auto-negotiation is present and enabled, the ifMauType object reflects the result of the auto-negotiation function." See RFC3636 for details

### 2.10.2.4.2 Size

**Table 19 Table size**

| Abbreviated table name   | Minimum tuples | Maximum tuples | Information on memory                                    |
|--------------------------|----------------|----------------|----------------------------------------------------------|
|                          |                |                |                                                          |
| <b>IfMauAutoNegEntry</b> | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.4.3 Fields/OIDs

The following table lists fields/OIDs for IfMauAutoNegEntry Table.

**Table 20 Table field descriptions**

| Field                             | Default     | Read/Write Access | Size    | Note |
|-----------------------------------|-------------|-------------------|---------|------|
| ifMauAutoNegAdminStatus           | enabled     | Read-write        | INTEGER |      |
| ifMauAutoNegRemoteSignaling       | notdetected | read              | INTEGER |      |
| ifMauAutoNegConfig                | configuring | read              | INTEGER |      |
| ifMauAutoNegRestart               | norestart   | Read-write        | INTEGER |      |
| ifMauAutoNegCapabilityBits        |             | read              | BITS    | 1    |
| ifMauAutoNegCapAdvertisedBits     |             | Read-write        | BITS    | 1    |
| ifMauAutoNegCapReceiveBits        | 0           | read              | BITS    |      |
| ifMauAutoNegRemoteFaultAdvertised | offline     | Read-write        | INTEGER |      |
| ifMauAutoNegRemoteFaultReceived   | noerror     | read              | INTEGER |      |

Note 1) bits

bfdxPause(8),bfdxAPause(9),bfdxSPause(10),bfdxBPause(11),bfdxbaseXFD(13) will be set

### 2.10.2.5 Name: dot3stats table

#### 2.10.2.5.1 Functional description

Configuration and status objects for the Dot3 stats function of each interface. See RFC3635 for details

### 2.10.2.5.2 Size

**Table 21 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| <b>dot3stats</b>       | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.5.3 Fields/OIDs

The following table lists fields/OIDs for dot3stats Table.

**Table 6: RFC3635 dot3stats table**

| ifdot3StatsEntryField                | Default Value | Read/Write Access | size           |
|--------------------------------------|---------------|-------------------|----------------|
| dot3StatsIndex                       | ifIndex       | read              | InterfaceIndex |
| dot3StatsSingleCollisionFrames       | 0             | read              | Counter32      |
| dot3StatsMultipleCollisionFrames     | 0             | read              | Counter32      |
| dot3StatsSQETestErrors               | 0             | read              | Counter32      |
| dot3StatsDeferredTransmissions       | 0             | read              | Counter32      |
| dot3StatsLateCollisions              | 0             | read              | Counter32      |
| dot3StatsExcessiveCollisions         | 0             | read              | Counter32      |
| dot3StatsCarrierSenseErrors          | 0             | read              | Counter32      |
| dot3StatsDuplexStatus                | fullDuplex    | read              | INTEGER        |
| dot3StatsRateControlAbility          | true          | read              | TruthValue     |
| dot3StatsRateControlStatus           | unknown       | read              | INTEGER        |
| dot3HCStatsAlignmentErrors           | 0             | read              | Counter64      |
| dot3HCStatsFCSErrors                 | 0             | read              | Counter64      |
| dot3HCStatsInternalMacTransmitErrors | 0             | read              | Counter64      |
| dot3HCStatsFrameTooLongs             | 0             | read              | Counter64      |
| dot3HCStatsInternalMacReceiveErrors  | 0             | read              | Counter64      |
| dot3HCStatsSymbolErrors              | 0             | read              | Counter64      |

## 2.10.2.6 Name: dot3pauseentry Table

### 2.10.2.6.1 Functional description

Configuration and status objects for the Dot3 pause function of each interface.  
See RFC3635 for details

### 2.10.2.6.2 Size

**Table 22 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| <b>dot3pauseentry</b>  | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.6.3 Fields/OIDs

The following table lists fields/OIDs for dot3PauseEntry Table.

**Table 7: RFC3635 dot3PauseEntry table**

| ifdot3PauseEntryField | Default Value     | Read/Write Access | size      |
|-----------------------|-------------------|-------------------|-----------|
| dot3PauseAdminMode    | enabledXmitAndRcv | Read-write        | INTEGER   |
| dot3PauseOperMode     | enabledXmitAndRcv | read              | INTEGER   |
| dot3InPauseFrames     | 0                 | read              | Counter32 |
| dot3OutPauseFrames    | 0                 | read              | Counter32 |
| dot3HCInPauseFrames   | 0                 | read              | Counter64 |
| dot3HCOutPauseFrames  | 0                 | read              | Counter64 |

indexed by ifIndex

## 2.10.2.7 Name: Etherstatsentry Table

### 2.10.2.7.1 Functional description

Configuration and status objects for the ethernet statistics function of each interface. See RFC2819 for details

### 2.10.2.7.2 Size

**Table 23 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| <b>etherstatsentry</b> | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.7.3 Fields/OIDs

The following table lists fields/OIDs for EtherStatsEntry Table.

**Table 8: RFC 2819 EtherStatsEntry**

| Attribute       | Default  | Access | Type      | Note |
|-----------------|----------|--------|-----------|------|
| etherStatsIndex | IF index | Read   | Integer32 |      |

|                          |                         |      |                   |   |
|--------------------------|-------------------------|------|-------------------|---|
| etherStatsDataSource     | 0                       | Read | OBJECT IDENTIFIER |   |
| etherStatsDropEvents     | 0                       | Read | Counter32         |   |
| etherStatsBroadcastPkts  | 0                       | Read | Counter32         |   |
| etherStatsMulticastPkts  | 0                       | Read | Counter32         |   |
| etherStatsCRCAlignErrors | 0                       | Read | Counter32         |   |
| etherStatsUndersizePkts  | 0                       | Read | Counter32         |   |
| etherStatsOversizePkts   | 0                       | Read | Counter32         |   |
| etherStatsFragments      | 0                       | Read | Counter32         |   |
| etherStatsJabbers        | 0                       | Read | Counter32         | 1 |
| etherStatsCollisions     | 0                       | Read | Counter32         | 1 |
| etherStatsOwner          | “Frame,shelf,slot,port” | Read | OwnerString       |   |
| etherStatsStatus         | invalid                 | Read | EntryStatus       |   |

Note 1: Not collected, always zero

### 2.10.2.8 Name: MediaIndependentEntry Table

#### 2.10.2.8.1 Functional description

Configuration and status objects for the Media Independent statistics function of each interface. See RFC3273 for details

#### 2.10.2.8.2 Size

Table 24 Table size

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| MediaIndependentEntry  | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

#### 2.10.2.8.3 Fields/OIDs

The following table lists fields/OIDs for MediaIndependentEntry Table.

**Table 9: RFC 3273 MediaIndependentEntry**

| Attribute                                 | Default                                        | Access | Type              |
|-------------------------------------------|------------------------------------------------|--------|-------------------|
| mediaIndependentIndex                     | IF index                                       | Read   | Integer32         |
| mediaIndependentDataSource                | ifIndex.y where y is one of our port ifindexes | Read   | OBJECT IDENTIFIER |
| mediaIndependentDropEvents                | 0                                              | Read   | Counter32         |
| mediaIndependentDroppedFrames             | 0                                              | Read   | Counter32         |
| mediaIndependentInOverflowPkts            | 0                                              | Read   | Counter32         |
| mediaIndependentInHighCapacityPkts        | 0                                              | Read   | Counter64         |
| mediaIndependentOutOverflowPkts           | 0                                              | Read   | Counter32         |
| mediaIndependentOutHighCapacityPkts       | 0                                              | Read   | Counter64         |
| mediaIndependentInOverflowOctets          | 0                                              | Read   | Counter32         |
| mediaIndependentInHighCapacityOctets      | 0                                              | Read   | Counter64         |
| mediaIndependentOutOverflowOctets         | 0                                              | Read   | Counter32         |
| mediaIndependentOutHighCapacityOctets     | 0                                              | Read   | Counter64         |
| mediaIndependentInNUCastOverflowPkts      | 0                                              | Read   | Counter32         |
| mediaIndependentInNUCastHighCapacityPkts  | 0                                              | Read   | Counter64         |
| mediaIndependentOutNUCastOverflowPkts     | 0                                              | Read   | Counter32         |
| mediaIndependentOutNUCastHighCapacityPkts | 0                                              | Read   | Counter64         |
| mediaIndependentInErrors                  | 0                                              | Read   | Counter32         |
| mediaIndependentOutErrors                 | 0                                              | Read   | Counter32         |
| mediaIndependentInputSpeed                | 1000000                                        | Read   | Gauge32           |
| mediaIndependentOutputSpeed               | 1000000                                        | Read   | Gauge32           |
| mediaIndependentDuplexMode                | fullduplex(2)                                  | Read   | INTEGER           |
| mediaIndependentDuplexChanges             | 0                                              | Read   | Counter32         |
| mediaIndependentDuplexLastChange          | 0                                              | Read   | TimeStamp         |
| mediaIndependentOwner                     | "Frame,shelf,slot,port"                        | Read   | OwnerString       |
| mediaIndependentStatus                    | ???                                            | Read   | RowStatus         |

### 2.10.2.9 Name: EtherStatshighCapacityEntry Table

#### 2.10.2.9.1 Functional description

Configuration and status objects for the Ethernet high capacity statistics function of each interface. See RFC3273 for details

#### 2.10.2.9.2 Size

**Table 25 Table size**

| Abbreviated table name             | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------------------|----------------|----------------|----------------------------------------------------------|
| <b>EtherStatshighCapacityEntry</b> | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.9.3 Fields/OIDs

The following table lists fields/OIDs for EtherStatshighCapacity Table.

**Table 10: RFC 3273 EtherStatshighCapacityEntry**

| Attribute                                          | Default | Access | Type      | Note |
|----------------------------------------------------|---------|--------|-----------|------|
| etherStatsHighCapacityOverflowPkts                 | 0       | Read   | Counter32 |      |
| etherStatsHighCapacityPkts                         | 0       | Read   | Counter64 |      |
| etherStatsHighCapacityOverflowOctets               | 0       | Read   | Counter32 |      |
| etherStatsHighCapacityOctets                       | 0       | Read   | Counter64 |      |

### 2.10.2.10 Name: EtherHistoryEntry Table

#### 2.10.2.10.1 Functional description

Configuration and status objects for the Ethernet historical statistics function of each interface. See RFC2819 for details

#### 2.10.2.10.2 Size

**Table 26 Table size**

| Abbreviated table name   | Minimum tuples | Maximum tuples | Information on memory                                    |
|--------------------------|----------------|----------------|----------------------------------------------------------|
| <b>EtherHistoryEntry</b> | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

#### 2.10.2.10.3 Fields/OIDs

The following table lists fields/OIDs for EtherHistoryEntry Table.

**Table 11: RFC 2819 EtherHistoryEntry**

| Attribute                  | Default  | Access | Type      | Note |
|----------------------------|----------|--------|-----------|------|
| etherStatsIndex            | IF index | Read   | Integer32 |      |
| etherHistorySampleIndex    | 0        | Read   | Integer32 |      |
| etherHistoryIntervalStart  | 0        | Read   | TimeTicks |      |
| etherHistoryDropEvents     | 0        | Read   | Counter32 |      |
| etherHistoryBroadcastPkts  | 0        | Read   | Counter32 |      |
| etherHistoryMulticastPkts  | 0        | Read   | Counter32 |      |
| etherHistoryCRCAlignErrors | 0        | Read   | Counter32 |      |
| etherHistoryUndersizePkts  | 0        | Read   | Counter32 |      |
| etherHistoryOversizePkts   | 0        | Read   | Counter32 |      |
| etherHistoryFragments      | 0        | Read   | Counter32 |      |
| etherHistoryJabbers        | 0        | Read   | Counter32 | 1    |
| etherHistoryCollisions     | 0        | Read   | Counter32 | 1    |
| etherHistoryUtilization    | 0        | Read   | Integer32 |      |

Note 1: Not collected, always zero

### 2.10.2.11 Name: EtherHistoryHighCapacityEntry Table

#### 2.10.2.11.1 Functional description

Configuration and status objects for the Ethernet High Capacity historical statistics function of each interface. See RFC2819 for details

#### 2.10.2.11.2 Size

**Table 27 Table size**

| Abbreviated table name               | Minimum tuples | Maximum tuples | Information on memory                                    |
|--------------------------------------|----------------|----------------|----------------------------------------------------------|
| <b>EtherHistoryHighCapacityEntry</b> | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

#### 2.10.2.11.3 Fields/OIDs

The following table lists fields/OIDs for EtherHistoryHighCapacityEntry Table.

**Table 12: RFC 3273 EtherHistoryHighCapacityEntry**

| Attribute                              | Default | Access | Type                | Note |
|----------------------------------------|---------|--------|---------------------|------|
| etherHistoryHighCapacityOverflowPkts   | 0       | Read   | Integer32           |      |
| etherHistoryHighCapacityPkts           | 0       | Read   | CounterBasedGauge64 |      |
| etherHistoryHighCapacityOverflowOctets | 0       | Read   | Gauge32             |      |
| etherHistoryHighCapacityOctets         | 0       | Read   | CounterBasedGauge64 |      |

indexed by etherStatsIndex and etherHistorySampleIndex

## 2.10.2.12 Name: nnGLinkConfigTable table

### 2.10.2.12.1 Functional description

The GiGE Link Config Table contains management information for each GigE Link. Allows the Manager to config and Manage these links. There is one entry per GigE Link (port). See NORTEL-UEMG-GIGE-MIB for details. It can be found at <http://triweb/smg500/mibDir/mibList.html>

### 2.10.2.12.2 Size

**Table 28 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| nnGLinkConfigTable     | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.12.3 Fields/OIDs

The following table lists fields/OIDs for nnGLinkConfigTable Table.

**Table 29 Table field descriptions**

| Field                       | Default      | Read/Write Access | Size       | Note |
|-----------------------------|--------------|-------------------|------------|------|
| nnGLinkConfigIfIndex        | ifIndex      | Not-accessible    | Integer32  |      |
| nnGLinkConfigWorkOrProt     | notUsed      | Read-write        | INTEGER    |      |
| nnGLinkConfigNiOrSubtending | notUsed      | Read-write        | INTEGER    |      |
| nnGLinkProtGrpNum           | nullprtgrp=0 | Read-write        | Unsigned32 |      |
| nnGLinkConfigTxRfi          | enabled      | Read-write        | INTEGER    |      |
| nnGLinkConfigRxRfi          | enabled      | Read-write        | INTEGER    |      |
| nnGLinkConfigIfPromMode     | notPromMode  | Read-write        | INTEGER    |      |
| nnGLinkConfigIfMtu          | 1600         | Read              | Integer32  |      |
| nnGLinkConfigLoopBack       | noLoop       | Read-write        | INTEGER    |      |

**Table 29 Table field descriptions**

| Field                      | Default | Read/Write Access | Size      | Note  |
|----------------------------|---------|-------------------|-----------|-------|
| nnGLinkConfigStatusCurrent | 0       | Read              | INTEGER   |       |
| nnGLinkConfigPriority      | 1       | Read-write        | Integer32 |       |
| nnGLinkConfigOnlineStatus  | offLine | Read-write        | INTEGER   |       |
| nnGLinkConfigLaserStatus   | off     | Read              | INTEGER   |       |
| nnGlinkForce               | false   | Read-write        | INTEGER   | new   |
| nnGlinkBandWidth           | 1000?   | Read-write        | INTEGER   | new 1 |

Note 1) In megabits to 2 decimal points, i.e. 1.67????

### **2.10.2.13 Name: nnGLinkFaultConfigTable**

#### **2.10.2.13.1 Functional description**

The Fault Config Table maps Faults/Alarms to desired Severity. It allows manager to modify the alarmSeverity and to shutdown notification of these alarms, on each interface and for each Fault/Alarm type. There is one entry in this table for each Link and FaultType Pair, indexed by the ifIndex of the Link, and FaultType. See NORTEL-UEMG-GIGE-MIB for details. It can be found at <http://triweb/smg500/mibDir/mibList.html>. In SN08 this table will be filled in with defaults only as the Element Manager will have interface to change them.

**2.10.2.13.2 Size****Table 30 Table size**

| Abbreviated table name  | Minimum tuples | Maximum tuples | Information on memory                                                       |
|-------------------------|----------------|----------------|-----------------------------------------------------------------------------|
| nnGLinkFaultConfigTable | 8x16           | 8x16           | Memory is automatically allocated for 8 GigE interfaces and 16 fault types. |

**2.10.2.13.3 Fields/OIDs**

The following table lists fields/OIDs for nnGLinkFaultConfigTable.

**Table 31 Table field descriptions**

| Field                      | Default | Read/Write Access | Size             | Note |
|----------------------------|---------|-------------------|------------------|------|
| nnGLinkFaultConfigType     |         | na                | NnGLinkFaultType |      |
| nnGLinkFaultConfigNotify   |         | Read-write        | INTEGER          | 1    |
| nnGLinkFaultConfigSeverity |         | Read-write        | INTEGER          | 1    |
| nnGLinkFaultConfigSoak     |         | Read-write        | INTEGER          | 1    |
| nnGLinkFaultConfigAlmDef   |         | Read-write        | INTEGER          | 1    |

Note 1) defaults are dependent of fault type.

**2.10.2.14 Name: nnGLinkThresholdTable****2.10.2.14.1 Functional description**

The Threshold Table allows the Manager to configure Performance Thresholds for which the Agent will generate a Threshold Notifications when the performance Counter (Type) is crossed. There is one entry in this table for each Link / Threshold Counter Type pair (doubly indexed) default ratios:

| Type | ShortPeriod Crossing | LongPeriod Crossing |
|------|----------------------|---------------------|
| ES   | 5%                   | 5%                  |
| SES  | 5%                   | 5%                  |

UAS            1%            1%

See NORTEL-UEMG-GIGE-MIB for details. It can be found at <http://triweb/smg500/mibDir/mibList.html>.

#### 2.10.2.14.2 Size

**Table 32 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                                          |
|------------------------|----------------|----------------|--------------------------------------------------------------------------------|
| nnGLinkThresholdTable  | 8x3            | 8x3            | Memory is automatically allocated for 8 GigE interfaces and 3 Threshold types. |

#### 2.10.2.14.3 Fields/OIDs

The following table lists fields/OIDs for nnGLinkThresholdTable.

**Table 33 Table field descriptions**

| Field                    | Default | Read/Write Access | Size                 | Note |
|--------------------------|---------|-------------------|----------------------|------|
| nnGLinkThreshType        |         | na                | NnGLinkThresholdType |      |
| nnGLinkThreshShortPeriod |         | Read              | Unsigned32           |      |
| nnGLinkThreshShortRatio  |         | Read-write        | NnGLinkPercent       | 1    |
| nnGLinkThreshLongPeriod  |         | Read              | Unsigned32           |      |
| nnGLinkThreshLongRatio   |         | Read-write        | NnGLinkPercent       | 1    |
| nnGLinkThreshNotify      | notify  | Read-write        | NnGLinkPercent       |      |

Note 1) defaults are dependent of threshold type.

### 2.10.2.15 Name: nnGLinkSoakTable

#### 2.10.2.15.1 Functional description

The Soak Table allows the Manager to configure Performance Counter soak times/values. There is one entry in this table for each GigE Link. The GR 253, GR 474 defines the standard soak times for performance counters but since

certain customer networks run at different network quality levels where such networks require the soak times to be configurable so that management stations do not get flooded with PM threshold crossings.

See NORTEL-UEMG-GIGE-MIB for details. It can be found at <http://triweb/smg500/mibDir/mibList.html>.

### 2.10.2.15.2 Size

**Table 34 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| nnGLinkSoakTable       | 8              | 8x3            | Memory is automatically allocated for 8 GigE interfaces. |

### 2.10.2.15.3 Fields/OIDs

The following table lists fields/OIDs for nnGLinkSoakTable.

**Table 35 Table field descriptions**

| Field                 | Default | Read/Write Access | Size       | Note |
|-----------------------|---------|-------------------|------------|------|
| nnGLinkSoakCountUAS   |         | Read-write        | Unsigned32 |      |
| nnGLinkSoakPercentSES |         | Read-write        | Unsigned32 |      |

## 2.10.2.16 Name: nnGLinkProtGroupTable

### 2.10.2.16.1 Functional description

The GigE Protection Group Table manages the Link Protection Group Configuration. There is one entry in this table for each protection Group, typically 1 per MG9k. This is a Manager Create Table.

See NORTEL-UEMG-GIGE-MIB for details. It can be found at <http://triweb/smg500/mibDir/mibList.html>.

**2.10.2.16.2 Size****Table 36 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory |
|------------------------|----------------|----------------|-----------------------|
| nnGLinkProtGroupTable  | 0              | 8              | only 1 in sn08        |

**2.10.2.16.3 Fields/OIDs**

The following table lists fields/OIDs for nnGLinkProtGroupTable.

**Table 37 Table field descriptions**

| Field                        | Default | Read/Write Access | Size       | Note |
|------------------------------|---------|-------------------|------------|------|
| nnGLinkProtGrpNumber         |         | Read-create       | Unsigned32 |      |
| nnGLinkProtGrpRevertive      |         | Read-create       | INTEGER    |      |
| nnGLinkProtGrpType           |         | Read-create       | INTEGER    |      |
| nnGLinkProtGrpWaitTime       |         | Read-create       | Unsigned32 |      |
| nnGLinkProtGrpIntegThreshold |         | Read-create       | Unsigned32 |      |
| nnGLinkProtGrpIntegInterval  |         | Read-create       | Unsigned32 |      |
| nnGLinkProtGrpIntegEnable    |         | Read-create       | INTEGER    |      |
| nnGLinkProtGrpStatus         |         | read-only         | INTEGER    |      |
| nnGLinkProtGrpLastChg        |         | read-only         | TimeStamp  | new  |
| nnGLinkProtGrpRowStatus      |         | Read-create       | RowStatus  |      |

### 2.10.2.17 Name: nnGLinkOmCurrTable

#### 2.10.2.17.1 Functional description

The GigE Link OM Table contains Operational Measurements per Link, there is one entry per Link

See NORTEL-UEMG-GIGE-MIB for details. It can be found at <http://triweb/smg500/mibDir/mibList.html>.

**Table 38 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                    |
|------------------------|----------------|----------------|----------------------------------------------------------|
| nnGLinkOmCurrTable     | 8              | 8              | Memory is automatically allocated for 8 GigE interfaces. |

#### 2.10.2.17.2 Fields/OIDs

The following table lists fields/OIDs for nnGLinkOmCurrTable.

**Table 39 Table field descriptions**

| Field            | Default | Read/Write Access | Size       | Note |
|------------------|---------|-------------------|------------|------|
| nnGLinkCurrESs   |         | read-only         | Unsigned32 |      |
| nnGLinkCurrSESSs |         | read-only         | Unsigned32 |      |
| nnGLinkCurrUASs  |         | read-only         | Unsigned32 |      |
| nnGLinkCurrOPT   |         | read-only         | Unsigned32 |      |
| nnGLinkCurrOPR   |         | read-only         | Unsigned32 |      |
| nnGLinkCurrTBC   |         | read-only         | Unsigned32 |      |
| nnGLinkCurrVCC   |         | read-only         | Unsigned32 |      |
| nnGLinkCurrTEMP  |         | read-only         | Unsigned32 |      |
| txFifoOverruns   |         | read-only         | Unsigned64 | new  |
| txFifoUnderruns  |         | read-only         | Unsigned64 | new  |
| txBytesOverFlow  |         | read-only         | Unsigned32 | new  |
| txBytes          |         | read-only         | Unsigned64 | new  |

**Table 39 Table field descriptions**

| Field                 | Default | Read/Write Access | Size       | Note |
|-----------------------|---------|-------------------|------------|------|
| rxFcsFail             |         | read-only         | Unsigned64 | new  |
| rxLenTypeFail         |         | read-only         | Unsigned64 | new  |
| rxGoodPause           |         | read-only         | Unsigned64 | new  |
| rxBadOpcodeCntlFrames |         | read-only         | Unsigned64 | new  |
| rxControlFrames       |         | read-only         | Unsigned64 | new  |
| txPauseFrames         |         | read-only         | Unsigned64 | new  |

**2.10.2.18 Name: nnGLinkOmIntervTable****2.10.2.18.1 Functional description**

The GigE Link OM Table contains Operational Measurements per Link, there is one entry per Link, 96 interval entries per Link.

See NORTEL-UEMG-GIGE-MIB for details. It can be found at <http://triweb/smg500/mibDir/mibList.html>.

**Table 40 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                                    |
|------------------------|----------------|----------------|--------------------------------------------------------------------------|
| nnGLinkOmIntervTable   | 8x96           | 8x96           | Memory is automatically allocated for 8 GigE interfaces by 96 intervals. |

**2.10.2.18.2 Fields/OIDs**

The following table lists fields/OIDs for nnGLinkOmCurrTable.

**Table 41 Table field descriptions**

| Field             | Default | Read/Write Access | Size       | Note |
|-------------------|---------|-------------------|------------|------|
| nnGLinkInterval   |         |                   |            |      |
| nnGLinkIntervESs  |         | read-only         | Unsigned32 |      |
| nnGLinkIntervSESs |         | read-only         | Unsigned32 |      |

**Table 41 Table field descriptions**

| <b>Field</b>          | <b>Default</b> | <b>Read/Write Access</b> | <b>Size</b> | <b>Note</b> |
|-----------------------|----------------|--------------------------|-------------|-------------|
| nnGLinkIntervUASs     |                | read-only                | Unsigned32  |             |

## ***Product = MG 9000***

### **A00007107--Media Gateway 9000 5/30 Minute Operational Measurements**

#### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP

#### **1.2 Description**

The OM collector currently collects OMs from different tables on a fixed 15 minute schedule. The MG9K stores the previous 96 15-minute interval data so it covers 24 hours of information. This feature changes the timing of these intervals to be configurable from the EM. The user can select any number of minutes as the standard interval. Also, the MG9K will be changed to store only 48 of blocks of interval data for non RFC-driven MIB tables. RFC-compliant tables will continue to have 96 blocks of intervals stored. The feature also provides for a second or extended OM interval. This extended interval is longer than the standard interval and is a time that is a multiple of the time in a standard interval. The data in the extended interval is computed based on the data for the appropriate number of standard intervals.

The new interval requirement does not apply to all OMs. It only applies to those that are collected by the OM collector. These tables are listed in the following table.

**Table 1 Impacted OM Tables**

| <b>OM Table</b>                 | <b>Subsystem</b> |
|---------------------------------|------------------|
| SNMP miscellanies               | SNMP             |
| nnPmSnmpOmIntervTable           | SNMP             |
| nnPmUtilOmIntervTable           | PerfMon          |
| nnPmOvldRscIntervTable          | PerfMon-Ovld     |
| nnPmOvldConnDenyIntervTable     | PerfMon-Ovld     |
| norCarrSonetMediumIntervalTable | Carrier-Sonet    |
| sonetSectionIntervalTable       | Carrier-Sonet    |
| sonetLineIntervalTable          | Carrier-Sonet    |
| sonetPathIntervalTable          | Carrier-Sonet    |
| apsChanStatusTable              | Carrier-Sonet    |
| imaGroupIntervalTable           | Carrier-IMA      |
| imaLinkIntervalTable            | Carrier-IMA      |

|                                       |           |
|---------------------------------------|-----------|
| nnClkSyncSignalTable                  | ClkSync   |
| nnClkSyncRefTable                     | ClkSync   |
| nnBwShelfCurrentSloaBandwResrvdTable  | Bandwidth |
| nnBwShelfIntervalSloaBandwResrvdTable | Bandwidth |
| nnBwAbiCurrentBandwResrvdTable        | Bandwidth |
| nnBwAbiIntervalBandwResrvdEntry       | Bandwidth |
| nnBwIntervalBandwUtilTable            | Bandwidth |
| nnBwIntervalQueueFillTable            | Bandwidth |
| nnMegacoOMDSPIntervalTable            | Megaco    |
| nnMegacoOMCESIntervalTable            | Megaco    |
| nnMegacoOMECHANIntervalTable          | Megaco    |
| nnMegacoOMMedGwyIntervalTable         | Megaco    |
| nnRelMsgSctpAssocOmIntervalTable      | SCTP      |
| nnMegacoQoSIntervalTable              | Megaco-IP |
| nnIpsecOmIntervalTable                | IpSec     |

A user can change the OM interval at any time. The most common usage is expected to be a change from 15 minute intervals to 5 minute intervals. If the user makes a change at 9:37 then at the next hour boundary (10:00), the historical data for OM intervals is flushed. The first interval with the new timing will be from 10:00 to 10:05. If the user also configures an extended interval of 30 minutes, then the first extended interval will be 10:00 to 10:30 and will just be a rollop of the six 5-minute intervals.

### 1.3 Hardware Requirements or Dependencies

There are no new hardware requirements for this feature.

### 1.4 Software Requirements or Dependencies

The only other software required for this feature is the regular SN08 version of the MG9K EM which contains the functionality to configure the OM intervals.

### 1.5 Limitations and restrictions

There are restrictions on the values that may be configured for the standard and extended intervals. Both intervals are specified in minutes and the extended interval must be evenly divisible by the standard interval. The minimum standard interval is 1 minute.

When the intervals are changed at the EM, the historical values for the previous 96 intervals are flushed from the MG9K. Also, the change to the new interval is not made until the hour boundary following the EM change. For example, if a user changes from 15 minute to 5 minute intervals at 9:37, the transition will be delayed until 10:00.

## 1.6 Interactions

***Product = MG 9000***

## **A00007140A--Succession Upgrade Manager (Phase 1)**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

#### **1.2 Description**

This feature introduces a CLUI interface on the MG9k Element Manager to drive upgrades of the MG9k devices such as MTA, XDSL, DS1, ABI, ITP, ITX, SCO and SCI. This CLUI interface can be leveraged by IEMS so the upgrade of the MG9k devices can be driven from a centralized location.

The feature prevents the customer from making any provisioning changes during an MG9k upgrade. It also automates the patching of the devices after the upgrade completes.

The pre-download feature of the CLUI will be added as an enhancement to the existing upgrade GUI. The pre-download prepare phase separates the downloading of the card loads from the actual upgrade of the MG9k cards. The customer will now be able to download all cards outside of a maintenance window. Then once inside the maintenance window, the upgrade of the cards can be performed. Thus allowing the customer to utilize the on-site personnel's

time more effectively since they would not have to be on-site and wait for all of the cards to be downloaded.

This feature does not cover upgrade automation of single card replacement (i.e. load from mate). It does not cover node growth (i.e. card pair installation). It does not cover upgrade automation of a protection group. It does not provide a reset upgrade functionality nor a resume capability. It does not provide automatic image functionality.

### 1.3 Hardware Requirements or Dependencies

None

### 1.4 Software Requirements or Dependencies

None

### 1.5 Limitations and restrictions

- 1 This version will not support multiple users. For example, a 10 node office would not be able to ask 2 crafts people to upgrade 5 nodes each at the same time. The second person will receive an error message.
- 2 This version will not support progress or status type messages back to the user during the execution of an *mg9kuptool* command. The user will need to create a new telnet session and issue a *mg9kuptool -query* command to obtain this type of information.
- 3 This design does not prevent two users from modifying the config data.
- 4 This design does not go to the SDM and give the user a list of loadnames to choose from. The customer has to enter the loadname manually.
- 5 We are not validating that the customer actually has put the patch files on NPM.
- 6 We are not validating that the NE alarms have been cleared as part of the prepare phase. NE alarms are checked in the precheck and upgrade phases since they could change between the prepare phase and the precheck phase.
- 7 A comparison between the NPM patchlist and the prepatched loads on the SDM are not performed in order to calculate the patch times. For example, if the NPM knows that an ITP card has 15 patches and the prepatched load contains 14 patches, the patching time is calculated based on 15 patches and therefore is a worst case estimate. This can be refined in a future release. With prepatched loads patching time should be considerably shorter.

- 8 The number of simultaneous NE upgrades is limited to four, to prevent overload of SDM.
- 9 The configuration data, created by the configure command, is used for the upgrade. If the GUI is used to prep download, the config command must be re-executed to ensure upgrading of the correct NE. GUI changes do not update the CLUI plan. They are separate interfaces.
- 10 When the user performs a prep download, the gateway will download the specified load -- even if the gateway already has that load.
- 11 After a successful prep download on a card, a normal download will download a new patched image (PI) only if the requested PI base loadname is different from the PI base loadname specified for the prep download. Note that patch content does not alter the PI base loadname.
- 12 If the customer creates a new image of a load that already exists on the gateway, the only way the customer can download the new load to the cards is to use the prep download functionality.
- 13 The validation performed prior to a prep download is the same as the validation performed prior to a regular download.
- 14 Prep download is not supported for card types MTA and XDSL.
- 15 The user cannot perform a prep download on an individual card basis. The user cannot perform a prep download on a protection group basis.
- 16 The mate load functionality on the MG9k gateway does not copy over prep download files.
- 17 The reset upgrade system functionality on the MG9k gateway, which should only be used as a last resort, may remove any prep download files. Therefore, the customer should check each card after performing a reset upgrade system request to ensure the prep download file required is shown in the Restart Flash Backup field on the card view in the Software Load area on the GUI. Anew prep download should be performed if the Restart Flash Backup field does not show the proper prep download loadname.
- 18 The *mg9kuptool* only provides support for a full node upgraded. It does not allow single cards to be upgraded. It does not allow protection group upgrades. And it does not allow load from mate.
- 19 If an upgrade fails, there is no retry mechanism in this release.

- 20 The customer does not receive any autonomous updates showing the upgrade status or patching status. The customer can query to find out where the upgrade/patching process is at. The customer can also look at the existing upgrade GUI and see the upgrade progress. We are not including patching progress in any GUI. The only way to see the patching status is to perform a query or look at the customer logs.
- 21 The abort command stops processing the card type which is upgrading. If other card types are already upgraded, they remain on the upgraded or downgraded load. This is the same as if the customer invoked the abort from the GUI.
- 22 Auto processes on the NPM are not automatically turned off nor automatically turned on. The customer must turn off auto processing at the NPM prior to upgrading. The precheck only alerts the customer to ensure auto processes are turned off in the NPM. The post check alerts the customer to manually check and turn auto processing on again.
- 23 The down load and upgrade times are only rough estimates generated by simple calculations using static timings collected from lab tests. To obtain more accurate estimates or progress status would require significant development effort in the Mg9K which is out of the scope of this release.
- 24 This feature does not allow patching of cards which have completed upgrading while other cards are upgrading. For example, if the ABI cards complete upgrades and the ITP cards are being upgraded, patching of the ABI cards is not started.
- 25 There is no indication to the customer showing which patches are already in the imaged load and which patches are going to be applied after upgrading is complete.
- 26 If the prepatched image contained an obsolete patch, NPM does not remove the patch. An NPM alarm indicating that there is an obsolete patch is raised and the customer can see the obsolete patch in the postcheck.
- 27 Prior to upgrading MTA or XDSL cards, the EM verifies that all the cards are in an unlocked/enabled state. If any card is not in the correct state, the EM will not perform the upgrade.
- 28 To upgrade MTA and XDSL cards, the EM will lock the card, download the load and then unlock the card. The order in which the EM upgrades XDSL cards cannot be specified as part of the upgrade.
- 29 If the upgrade of any MTA or XDSL card fails, the EM halts the upgrade process. If the lock or unlock of any card fails, the EM halts the upgrade process.

- 30** If an MTA or XDSL card already has the specified load file, the EM will consider the card already upgraded and move on to the next card to upgrade.
- 31** If the user aborts an upgrade while the EM is upgrading the XDSL cards, the EM will return all cards to an unlocked state. However, the EM will not roll back the loads on any of the cards. For instance, assume the user is upgrading all five XDSL cards on a given node. Assume the user aborts the upgrade after the first two cards have upgraded and a third card is in the process of upgrading. The EM halts the upgrade process after the third card completes its upgrade. In the end, three XDSL cards are running the new load and two XDSL cards are running the old load.
- 32** The “Software History” window does NOT display entries for MTA and XDSL card upgrades. The following figure shows an example of the “Software History” window.

- 33** The existing GUI will not allow the user to perform the specific phases that are defined in the CLUI.
- 34** The existing GUI will not allow the user to perform the following imbedded functions that are available in the CLUI:
- audit of flash data
  - autpatching

- 35** When the user attempts an upgrade, the GUI prints the following warning message:

Each card will download the specified load ONLY IF the specified load file does not already exist in the card's file system. If the card has the specified file, the gateway will NOT download the file -- even if the card's load has different patch content.

This warning applies to all upgrade types: nodal upgrade, card-type upgrade (excluding MTA and XDSL cards), card-specific upgrade (excluding MTA and XDSL cards) and protection group upgrade.

- Consider the following scenario:
  - The user creates a new patched image for the ITP card ITPA07BV\_GZ
  - The user attempts a card type upgrade and specifies load ITPA07BV\_GZ

Since the ITP cards already have this load, the user's upgrade will not change the load file on the ITP cards. Furthermore, the GUI will not warn the user that the request upgrade will not result in any changes.

## 1.6 Interactions

### 1.6.1 Existing GUI Upgrade Tool

Currently, the user of the MG9K EM GUI can initiate an upgrade from either the frame view or the card view:

- From the frame view, the user can select “Actions” and “Software Upgrade”. From this selection the user can perform a nodal upgrade to upgrade cards of various card types on a given node.
- From the card view of an upgradable card, the user can select “Actions” and “Software Upgrade”. From this selection the user can perform three types of upgrade: card only, protection group only, and single card type only.

This feature impacts the user interface for nodal upgrade only.

When the user selects “Actions” and “Software Upgrade” from the frame view, the user sees the “MG 9000 Software Upgrade Element” GUI. On this GUI, the user clicks “Configure” to set up an upgrade request. When the user clicks “Configure”, the GUI displays the “MG Upgrade Wizard”.

In SN08, the “MG Upgrade Wizard” has significant changes. First, the wizard asks the user if the EM should perform a “prep download” or a “complete upgrade”. The panel displaying this prompt is shown below.

**Figure 22 MG Upgrade Wizard - Card Type Selection**

When the user clicks “Next”, the “MG Upgrade Wizard” displays the “Card Type Selection” panel. This panel allows the user to choose the card types to upgrade. In addition to the existing choices such as “DS1”, “ITP”, “ITX”, and others, in SN08 the user can also choose “XDSL Cards” and “MTA Cards”. If the user selected “prep download” on the previous screen, the buttons for “XDSL Cards” and “MTA Cards” are disabled. (If the node being configured does not have any cards of a particular type, the Card Type Selection panel does not even display that card type as a choice.) The following figure shows the Card Type Selection Panel when the user has selected to upgrade a node that does not have any ABI cards and the user has selected to perform a “prep download” only.

**Figure 23 MG Upgrade Wizard - Card Type Selection**

MG Upgrade Wizard: garyf\_col9 19

Card Type Selection: Step 2 of many.

☐ All Applicable Card Types

A list of MG 9000 upgradeable card types is provided. Check the card types to upgrade, or check 'All Applicable Card Types' to upgrade all upgradeable card types in this MG 9000.

|                                     |                                              |
|-------------------------------------|----------------------------------------------|
| <input type="checkbox"/> XDSL Cards | <input type="checkbox"/> MTA Cards           |
| <input type="checkbox"/> DS1 Cards  | <input type="checkbox"/> ITP Cards           |
| <input type="checkbox"/> ITX Cards  | <input type="checkbox"/> Supercore OC3 Cards |

☒ Use one load server only.

Remove Entries Previous Next Cancel Finish

Once the user clicks “Next” on the “Card Type Selection” panel, the “MG Upgrade Wizard” prompts the user for the load information for each of the selected card types. The order in which the GUI gathers the load data for the different card types does not matter.

The prompts for the load information have not changed. Assuming the user selected “one load server” on the “Card Type Selection Panel”, the following two figures show the next two panels displayed by Upgrade Wizard.

**Figure 24 MG Upgrade Wizard: Load Server Selection**

MG Upgrade Wizard: gsf\_col 9 19

Select a load server for selected cards: Step 3 of 7

Please enter a new load server address or select from existing addresses. Also, specify a user identifier and password for the selected server.

Server Address: 47.142.106.220 ▼

Server User Identifier: maint

Server Password: \*\*\*\*\*

Remove Entries Previous Next Cancel Finish

**Figure 25 MG Upgrade Wizard: Load Name Selection for Card Type**

MG Upgrade Wizard: gsf\_col 9 19

Specify a load for DS1: Step 4 of 7

Please specify a software load directory and load name

Directory: /swd/mg9k ▼ List

DS1 Load Name: DS1G07BV\_GZ ▼

Remove Entries Previous Next Cancel Finish

Once the user has entered the load information for all of the selected card types, the user clicks “Finish” on the last panel. The “MG Upgrade Wizard” goes away and the GUI redisplay the “MG 9000 Software Upgrade Element” GUI with the settings the user has entered. Field “Upgrade Type” indicates if the user selected a “prep download” or a “complete upgrade”. The subsection “Upgrade Type Data” contains a tab for each selected card type. The user can click the tabs to see the load information for each card type. Finally, the user can click the “Upgrade” button at the bottom of the screen to start the upgrade. The following figure shows the top portion of the “MG 9000 Software Upgrade Element” GUI.

**Figure 26 MG 9000 Software Upgrade Element**

The screenshot displays the "MG 9000 Software Upgrade Element: 19" GUI. The window title is "gsf\_co19 [19]". The main content area is divided into several sections:

- Upgrade Originator:**
  - MG 9000 Name: gsf\_co19 19
  - Originating View: MG9000 Element 19
- Upgrade State:**
  - Upgrade Status: Configure step completed.
  - Upgrade Action: Configure
  - Upgrade Type: Card Type -- prep download only!
- Upgrade Type Data:**
  - Upgrading: DS1 Card Type
  - DS1 | ITP | ITX | Supercore OC3 (selected)
  - Load Server: 47.142.106.220
  - Load Server User Id: maint
  - Load: /swd/mg9k/DS1G07BV\_GZ
- Upgrade Instructions & Results:**
  - performing abort

## 1.6.2 CLI Interface

Command Syntax:

`mg9kuptool <option> <-n NE_number_list>`

| Command Options | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -configure      | This option provides the configuration of the upgrade tool. This includes the list of NEs to upgrade, the name and location of the card loads, etc.                                                                                                                                                                                                                                              |
| -prepare        | This option is largely informative to allow the user to determine if they are prepared to upgrade the system. It is executed for each node in the target node list <-n>.                                                                                                                                                                                                                         |
| -precheck       | This option reviews the overall system health of each node defined in the target node list <-n> in preparation for the upgrade. Any problems discovered are returned so that action can be taken to correct the issue before the upgrade begins.                                                                                                                                                 |
| -download       | This option down loads the card loads as defined in the upgrade plan. It is executed for each node in the target node list <-n>.                                                                                                                                                                                                                                                                 |
| -upgrade        | This option executes the actual upgrade process defined in the upgrade plan. It is executed for each node in the target node list <-n>. This may include the down loading of card loads if that was not executed earlier as a separate step.<br><br>When the upgrade is complete all available patches will be applied. If patches are applied, a new image of the patched load will be created. |
| -postcheck      | This option checks to see if any alarms were raised, asks the customer to run any test calls or test scripts and reports any patches that were not applied. It is executed for each node in the target node list <-n>.                                                                                                                                                                           |
| -query          | This option provides status information regarding the upgrade process for each node in the target node list <-n>.                                                                                                                                                                                                                                                                                |
| -abort          | This option terminates the upgrade step being executed for each node in the target node list <-n>.                                                                                                                                                                                                                                                                                               |
| -n              | This option describes the list of nodes on which to apply the operation. This is a comma separated list of numbers. If the list is specified as '*' then the operations is applied to all nodes in the plan. This option may be used on all commands except <configure>.                                                                                                                         |

### 1.6.2.1 CLI - Interactive Mode No Options

Issuing the *mg9kuptool* command without options will result in an interactive conversation with the user to determine which command option to process.

`mg9kuptool`

```
1 configure
2 prepare
3 precheck
4 download
5 upgrade
6 postcheck
7 abort
8 query
x exit
```

Please select an option:

### 1.6.2.2 CLI - Interactive Mode configure Option

Issuing the *mg9kuptool -configure* command or selecting this option from the interactive list will bring up the following dialog:

NOTE: All input is case sensitive.

In which directory on the imaging server do the loads reside?

/swd/mg9k

Enter MTA loadname:

MTAG07EJ\_1\_GZ

Enter XDSL loadname:

DSLA06\_2EI

Enter DS1 loadname:

DS1G08BV\_GZ.tar

Enter ABI loadname:

ABIG08BV\_GZ.tar

Enter ITP loadname:

ITPA08BV\_GZ.tar

Enter ITX loadname:

ITXA08BV\_GZ.tar

Enter SCO loadname:

SCOA08BV\_GZ.tar

Enter SCI loadname:

SCIA08BV\_GZ.tar

Verifying loads on SDM.....

Loads valid.

Which NE(s) do you want to upgrade/downgrade? Enter NE number. If more than 1 NE separate with commas (e.g. 8,9):

8

Plan name is /data/mg9kem/persistdata/MG9kUpgradePlan.dat

### 1.6.2.3 CLI - Interactive Mode prepare Option

Issuing the *mg9kuptool -prepare* command or selecting this option from the interactive list will bring up the following dialog:

Have you put the patch files on the NPM? Y/N

Y

Upgrading to loads:

/swd/mg9k/MTAG07EJ\_1\_GZ

/swd/mg9k/DSLA06\_2EI

/swd/mg9k/DS1G08BV\_GZ.tar

patchlist:

none

/swd/mg9k/ABIG08BV\_GZ.tar

patchlist:

AMZ005

/swd/mg9k/ITPA08BV\_GZ.tar

patchlist:

AMZ006

HDD013

HDD014

HDD015

```
/swd/mg9k/ITXA08BV_GZ.tar
```

```
patchlist:
```

```
none
```

```
/swd/mg9k/SCOA08BV_GZ.tar
```

```
patchlist:
```

```
AMZ007
```

```
AMZ008
```

```
HDD016
```

```
/swd/mg9k/SCIA08BV_GZ.tar
```

```
patchlist:
```

```
AMZ008
```

Please compare the patchlists above against the Nortel web page.

NE# 8: time to download is 1 hour

time to upgrade is 1.5 hours

time to patch is 27 minutes

#### 1.6.2.4 CLI - Interactive Mode precheck Option

Issuing the *mg9kuptool -precheck* command or selecting this option from the interactive list will bring up the following dialog:

- Enter the node number or node number list for the precheck request:  
<the displayed default is the list of all NEs in the plan>

#### 1.6.2.5 CLI - Interactive Mode download Option

Issuing the *mg9kuptool -download* command or selecting this option from the interactive list will bring up the following dialog:

- Enter the node number or node number list for the download request:  
<the displayed default is the list of all NEs in the plan>

#### 1.6.2.6 CLI - Interactive Mode upgrade Option

Issuing the *mg9kuptool -upgrade* command or selecting this option from the interactive list will bring up the following dialog:

This process will affect DSL traffic and should be performed during a maintenance window only.

- Enter the node number or node number list for the upgrade request:

<the displayed default is the list of all NEs in the plan>

### 1.6.2.7 CLI - Interactive Mode postcheck Option

Issuing the *mg9kuptool -postcheck* command or selecting this option from the interactive list will bring up the following dialog:

- Enter the node number or node number list for the postcheck request:

<the displayed default is the list of all NEs in the plan>

### 1.6.2.8 CLI - Interactive Mode abort Option

Issuing the *mg9kuptool -abort* command or selecting this option from the interactive list will bring up the following dialog:

- Enter the node number or node number list for the abort request:

<the displayed default is the list of all NEs in the plan>

### 1.6.2.9 CLI - Interactive Mode query Option

Issuing the *mg9kuptool -query* command or selecting this option from the interactive list will bring up the following dialog:

- Enter the node number or node number list for the query request:

<the displayed default is the list of all NEs in the plan>

## 1.6.3 Customer Logs

Customer logs will be created each time the *mg9kuptool* is executed. A new NT standard log number will be defined as follows:

- MGEM714

### 1.6.3.1 Format

Here is an example of the new MGEM 714 log:

- Aug 18 15:07:28 apex-unit0 MGEM: 714 Executing mg9kuptool command precheck

### 1.6.3.2 Field descriptions

| Field            | Description                       | Example         |
|------------------|-----------------------------------|-----------------|
| Date/Time        | Date and time stamp of the log    | Aug 18 15:07:28 |
| Host Name        | Host machine name                 | apex-unit0      |
| Application Name | The application producing the log | MGEM            |
| Log Number       | The log number                    | 714             |

| Field    | Description            | Example                                     |
|----------|------------------------|---------------------------------------------|
| Log Text | The action being taken | Executing<br>mg9kuptool<br>command precheck |

## 1.7 Glossary

| Term | Description                       |

# SN08 Feature Deltas

***Product = MG 9000***

## **A00007140B--Upgrade Manager Phase 1 - GWC and SC parts** ***Functional Description***

### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

### **1.2 Description**

As of SN08, Succession CallServer subnetwork upgrades have been performed using a purely manual process which has required a significant amount of human power to orchestrate. Also, the upgrade technician has been forced to navigate hundreds of pages of documentation in order to successfully plan and complete the end-to-end system upgrade. As a result, Succession CallServer subnetwork upgrades have been extremely difficult to manage and have been a constant source of concern/dissatisfaction with Nortel customers.

The SN08 Succession Upgrade Manager delivers:

- a robust SC upgrade tool.
- a robust GWC upgrade tool.
- a robust MG9K upgrade tool. (This FN covers only the GWC and SC upgrade tools. The MG9K is in another document.)

The SC and GWC upgrade tools serve as the underlying per-network element tools for the end architecture. The intent for SN08 is to focus as much effort as required to make these underlying tools as robust and complete as possible.

As part of the SN08 Succession upgrade tools, the SC and GWC upgrade tools both provide a pure CLI for the customer or upper-level coordinator to invoke upgrade functionalities. In addition, an interactive CLUI is also provided to customers for easy use of the tool. The following content will give a detailed description on SC and GWC.

### 1.2.1 Internally used options

SC and GWC upgrade tools are designed to work with the upper level MOP automation tool. So there are some internally used options which will not appear in the customer documentation.

## 1.3 Deployment

Basically the GWC and SC upgrade tools will be packaged within the GWC and SC element manager servers.

### 1.3.1 SC upgrade tool

The tool will be part of the NTsam21em package, when the SAM21EM is configured and running properly, the SC upgrade tool is ready to use.

In the SSPFS running environment, the SC upgrade tool is located in:

- `/opt/nortel/sam21em/bin/scuptool.sh` -- Program entry
- `/opt/nortel/sam21em/classes` -- Jar files

### 1.3.2 GWC upgrade tool

The GWC uptool will be part of the NTsesm package, and it is located in:

- `/opt/nortel/NTsesm/gwcuptool` -- Base directory
- `/opt/nortel/NTsesm/gwcuptool/bin` -- All scripts
- `/opt/nortel/NTsesm/gwcuptool/jars` -- Jar files
- `/opt/nortel/NTsesm/gwcuptool/bin/gwcuptool.sh` -- Program entry

If you want to use the GWC upgrade tool the following applications must be configured and running properly:

- SAM21EM is running.
- SESM Service is running.
- NPM/PSE is configured properly.

### 1.3.3 Running restriction

Users must belong to one of these groups “mgcmte, mgcadm, emsmte, emsadm”, who have permission to run the upgrade tools.

## 1.4 GWC Upgrade Tool

In SN08, GWC will provide a basic CLI interface and an interactive CLUI that is based on the basic CLI interface.

The GWC upgrade tool provides the basic functions that GWC upgrading needs. They are:

- Start the GWC upgrade manager server prior to client launching.
- Configure the upgrade options before the actual upgrade.

- Prepare the necessary steps for getting the tool and system ready prior to the actual upgrade.
- Pre-check the relevant EM and configured GWC states including alarms.
- Upgrade the configured GWC with configured options.
- Post-check the upgraded GWC states including alarms.
- Query the GWC upgrade states in progress.
- Query the GWC information and list them by profile types.
- Query the configurations currently used.
- Stop the upgrade manager server.
- The help facility provided with the functions.

All these functions are provided by a shell named ***gwcuptool.sh***. The end user should run the corresponding commands in an order which is given in the appendices. The order ensures you encounter, as little as possible, any warnings and errors. The order is mandatory.

#### 1.4.1 Restriction for GWC upgrade

Because the GWC upgrade tool needs SESM, SAM21EM, and NPM to execute the real device operations, while the GWC upgrade is in progress, the following functions will be disabled to prevent any unexpected problems:

- All provisioning actions in SESM.
- All (CS2k/V5.2/Trunk/Line) Data Integrity Audits.
- GWC auto imaging in GWCEM.
- GWC auto patching in NPM.

When the upgrade is finished, provisioning functions will be enabled automatically by the GWC upgrade tool.

Before using this tool, the end user must make sure that PSE in the same SSPFS is configured properly.

When the user/password is required, the end user must make sure that the login user belongs to one of these groups “mgcmte, mgcadm, emsmte, emsadm”. Otherwise, the operation is denied.

#### 1.4.2 Interactive CLUI

The interactive CLUI is a shell that wraps basic CLI. It provides a “restricted” tool to achieve the upgrade goal.

Issue “gwcuptool.sh” to launch the GWC upgrade tool CLUI. The main menu is as follows:

```
$ gwcuptool.sh
Starting .....

Main menu for GWC upgrade tool
1 - Display all GWC nodes
2 - Configure upgrade related options
3 - List current upgrade configurations
4 - Enter Upgrade Menu

x - Stop upgrade tool and exit CLUI

Enter selection (1-4,x):
```

There are a total of five selections in the main menu. There are:

**1 Display all GWC nodes**

This selection queries all GWC nodes information, including name, ip and state.

**2 Configure upgrade related options**

This selection configures upgrade options manually. CLUI will prompt the end user to input necessary information step by step. These options are effective in the whole upgrade process.

**3 List current upgrade configurations**

This selection lists all options currently used.

**4 Enter upgrade menu**

This selection enters the upgrade submenu.

**5 Stop upgrade tool and exit CLUI**

This selection stops the GWC upgrade tool and exits CLUI.

When selection 4 is selected, the end user will enter the upgrade submenu to do the real upgrade process. The following figure illustrates the upgrade submenu:

```
Console
Window Edit Options Help
$ gwcuptool.sh
Starting .....

Main menu for GWC upgrade tool
1 - Display all GWC nodes
2 - Configure upgrade related options
3 - List current upgrade configurations
4 - Enter Upgrade Menu

x - Stop upgrade tool and exit CLUI

Enter selection (1-4,x):4

Upgrade menu for GWC upgrade tool
1 - Prepare
2 - Pre-check
3 - Upgrade
4 - Query upgrade status
5 - Post-check

x - exit

Enter selection (1-5,x):
```

There are a total of six selections in the upgrade submenu. All these selections are based on the options configured in the main menu.

- **Prepare**

This selection is the preparation prior to the actual upgrade.

- **Pre-check**

This selection does the pre-check prior to the actual upgrade.

- **Upgrade**

This selection does the real upgrade.

- **Query upgrade status**

This selection queries the upgrade status.

- **Post-check**

This selection does the post-check after the actual upgrade.

- **exit**

This selection exits the upgrade submenu and enters the main menu.

### 1.4.3 Basic CLI

Corresponding functions to the above are achieved using the `gwcuptool.sh` command. The details are as follows.

#### 1.4.3.1 Start GWC upgrade manager server prior to client launching.

```
gwcuptool.sh -start [-gwcem ip:port] [-sam21em ip:port] [-sid sid]
```

Command description:

Start the GWC upgrade tool server, in order to do the following actions:

- 1 Request the end user to input a user name/password if not applying the session ID in the command.
- 2 Connect to GWCEM / SAM21EM through CORBA.
- 3 Check whether this user has permission to perform the upgrade operations.

Options:

[1] -gwcem

**Requirement:** Internally used options.

**Description:** Provides CORBA server ip and the port GWCEM server registered.

**Default:** localhost:2001

[2] -sam21em

**Requirement:** Internally used options.

**Description:** Provides CORBA server ip and the port SAM21EM server registered.

**Default:** localhost:2001

[3] -sid

**Requirement:** Internally used options.

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
gwcuptool.sh -start
```

If the end user only issues “`gwcuptool.sh -start`”, only the user who belongs to one of “`mgcmte`, `mgcadm`, `emsmte`, `emssadm`” groups, can run the tool.

### 1.4.3.2 Configure upgrade options before actual upgrade.

```
gwcuptool.sh -config [-n <GWC list>] [-o [value]] ...
```

Command description:

Configure the upgrade options. These options are useful to upgrade, pre-check, post-check and query commands.

Note:

- 1 All configurations' default value will be stored in a property file on the upgrade manager server machine. We do not support customers who modify it themselves.
- 2 When only “gwcuptool.sh -config -list” is issued, the upgrade manager server will return all current configurations. Its functionality is query configuration.
- 3 If the end user only issues “gwcuptool.sh -config”, the shell will prompt the end user to input necessary information step by step.
- 4 When the second configuration command is issued, all prior configurations will be replaced.

The options are as follows:

[1] -pa load\_directory\_name

**Requirement:** Optional

**Description:** Specify the load file path in SDM/CBM. If no directory name is applied, the default directory '/swd/gwc/' will be used.

**Default:** “/swd/gwc/”

**Example:**

```
-pa /swd/gwc/
```

[2] -f new\_load\_file\_name

**Requirement:** Mandatory

**Description:** Target load file name. The user must specify a load file name here. Otherwise, the config function will return an error message.

**Default:** "".

**Example:**

```
-f gn080ak.imag
```

[3] -l new\_load\_name

**Requirement:** Optional

**Description:** Target the load name of the given GWC load file. The new load name will be used to query the patch list from NPM. If the file name does not contain the GWC load name, the end user MUST specify a valid GWC load name here.

**Default:** new load file name except “.imag”

**Example:**

```
-l GN080AK
```

```
[4] -o old_load_name
```

**Requirement:** Optional

**Description:** The load upgrade from. If the end user ignores it, the upgrade manager server will bypass the old load checking. By default users do not need to specify the old load name, and all selected GWC nodes will be upgraded automatically.

**Default:** "".

**Example:**

```
-o GN070BK
```

```
[5] -m <single | bulk | mix>
```

**Requirement:** Optional

**Description:** Upgrade mode

- Single: all GWC nodes will be upgraded one by one ordered by the GWC profile type and GWC ID.
- Bulk: All GWC nodes within the same service group (e.g. TRUNK, LINE) will be upgraded at the same time. If patching is needed, the first selected “seed” GWC node which is used to create the soak image will use single mode and the others that do not need patching will use bulk mode.
- Mix: In the same GWC profile group (e.g. TRUNK GWCs, Line GWCs), one GWC node will be upgraded first. (Purpose: the end user can do verification on the specified type of GWC.) After it is upgraded successfully, all other GWC nodes within the same profile group will be upgraded at the same time.

See “Appendix 3: Upgrade mode examples in GWC upgrade tool” on page 2200.

**Default:** bulk.

**Example:**

```
-m bulk
```

```
[6] -p [0,1,2,3,4,5,6]
```

**Requirement:** Optional

**Description:** Upgrade pause points. If the end user does not provide this option, no pause points are done during upgrading.

The following shows what the number means:

- For the first GWC node within the same GWC group:
  - 1 - before lock the first upgrade unit of the “seed” node.
  - 2 - after patch applied to the “seed” unit.
  - 3 - before warm-swact.

- 4 - after “seed” node upgraded.
- 5 - pause on all the above conditions.

- For bulk upgrade GWC nodes with the same GWC profile type:  
6, before warm-swact.

**Default:** 0, without any pause points.

**Example:**

```
-p '1,3,4'
```

The example option means the upgrade will pause on conditions 1,3, 4.

```
[7] -d [VRB | MAJ | MNR | CRT ]
```

**Requirement:** Optional

**Description:** Define logging level for the upgrade log file.

VER: Logging verbose information.

MAJ: Logging major information.

MNR: Logging minor information.

CRT: Logging critical information.

**Default:** MAJ.

**Example:**

```
-d MNR
```

```
[8] -s
```

**Requirement:** Optional. Internally used by the designer.

**Description:** Skip patching because the given load is soaked. Do not apply patches on the new GWC load.

**Example:**

```
-s
```

```
[9] -n <GWC list>
```

**Description:** Define the GWC list that should be upgraded. It will be the default GWC list for pre-check, upgrade, post-check and query commands.

**Default:** all

**Example:**

```
-n 'GWC-1,GWC-2,GWC-3,GWC-5'
```

```
[10] -t <mins>
```

**Description:** Define a time limitation for doing the upgrade. If the upgrade cannot complete all nodes within the given time slot, the un-upgraded GWC nodes will be kept there. The upgrade will finish. If “0” is specified as the time limitation, the limitation check will be disabled.

**Default:** 0

**Example:**

```
-t 180
```

Note: The time begins when the “gwcuptool.sh -up” command is executed. A second “gwcuptool.sh -up” command does not reset the time slot.

[11] -np <max parallel number>

**Requirement:** Optional. Internally used by the designer.

**Description:** Max parallel number during the bulk upgrade.

**Default:** 32

Example:

-np 16

[12] -a [CRT | MAJ] -an [number]

**Requirement:** Optional.

**Description:** The allowed highest alarm level during the upgrade, and the allowed max alarm number during the upgrade. It is a dynamic alarm checking values. If the current alarm state has higher priority than is defined here, the upgrade program will be paused and the end user is notified of this.

For examples, if we specify “-a MAJ -an 2” in config step:

- If there are 3 MAJ alarms raised in the EM Server for this node, the upgrade tool will be paused
- If there is 1 MAJ alarm raised in the EM Servers for this node, the upgrade tool will ignore it and continue the upgrade process.
- If there is 1 CRT alarm raised in the EM Server for this node, the upgrade tool will be paused too because the CRT has high priority than the MAJ alarms.

**Default:** MAJ 2

Example:

-a CRT -an 2

[13] -sid sid

**Requirement:** Optional, internally used by the MOP automation tool,

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide valid session ID to avoid re-login. The end user need not input this option. This option is not a part of the configuration

**Default:** 0

Example:

```
gwcuptool.sh -config -f gn080ak.imag -sid
312308CDA87F5C7ECD3185F639892BC2
```

An example of a whole command format:

```
gwcuptool.sh -config -f gn080ak.imag -o GN070BV -m bulk -p '1,3,4' -d CRT -n 'GWC-1'
-t 120 -a CRT -an 4 -sid 312308CDA87F5C7ECD3185F639892BC2
```

### 1.4.3.3 Prepare necessary steps for getting the tool and system ready prior to the actual upgrade.

```
gwcuptool.sh -prep [-sid sid]
```

Command description:

Shows the end user the necessary preparations that include upgrade steps and order, notes and warnings.

The following actions should be checked in the prepare command:

- 1 Check the load available in SDM/CBM.
- 2 Get the patch list from NPM, display the patch list to the end user, and ask the end user to confirm:
  - The name is based on the load name specified in the “-config” step, by default the load file name will be used as the load name.
  - The GWC Upgrade tool will use the load name to query the list of patches that NPM knows about.
  - The list of patches will be presented to the user.
  - Prompt the user to tell them that they need to go to the Nortel web site and verify that the list they have is the list that they should have. Also make them type “Y”/”yes” to confirm that they have verified this before we allow the preparation to succeed.
- 3 Display the upgrade plan for the GWC.
- 4 Calculate the estimated time of the upgrade.

Options:

[1] -sid sid

**Requirement:** Optional, internally used by the MOP automation tool.

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option. This option is not part of the configuration

**Default:** 0

**Example:**

```
gwcuptool.sh -prep -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.4 Pre-check relevant EM and configured GWC states including alarms.

```
gwcuptool.sh -precheck [-n <GWC List>] [-sid sid]
```

Command description:

Pre-check the necessary conditions before the upgrade.

If there is no given GWC list, the configured GWC list will be used instead. Perform the following actions:

- 1 GWCEM, SAM21EM and NPM server status.
- 2 Load is available on the load server. (Get from SAM21EM server.)
- 3 Alarm status.
- 4 Hardware level health check. If the node has two physical units, check both of them are in service.
- 5 Software level health check. The inactive unit is in hot-standby.

[1] -n <GWC List>

**Requirement:** Internally used by the MOP automation tool

**Description:** GWC nodes that should be upgraded. If there is no given GWC list, the configured GWC list will be used instead.

[2] -sid sid

**Requirement:** Optional, internally used by the MOP automation tool,

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
gwcuptool -precheck -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.5 Upgrade configured GWC with configured options.

```
gwcuptool.sh -up [-n <GWC list>] [-sid sid]
```

Command description:

Does the real upgrade work? Still perform the pre-check / post-check using this command. During the upgrade the client side will display the logs sent from the server side. The client side may need to answer some questions or do some confirmation for different conditions. If the end user enabled break points, this tool will work in interactive mode.

When the “seed” GWC node’s inactive unit is patched, the GWC upgrade tool will invoke the function provided by NPM to query the patch applying status. The status is displayed to the end user.

[1] -n <GWC List>

**Requirement:** Internally used by the MOP automation tool

**Description:** GWC nodes that should be upgraded. If there is no GWC list, the configured GWC list will be used instead.

[2] -sid sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
gwcuptool.sh -up -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.6 Post-check upgraded GWC states including alarms.

```
gwcuptool.sh -postcheck [ -n <GWC list> ] [-sid sid]
```

Command description:

Do the post-check for the given GWC nodes.

If there is no GWC list, the configured GWC list will be used instead.  
The following status will be checked:

- Application status from GWCEM.
- Alarm state
- Query the patch applied status from NPM

[1] -n <GWC List>

**Requirement:** Internally used by the MOP automation tool

**Description:** GWC nodes which should be upgraded. If there is no GWC list, the configured GWC list will be used instead.

[2] -sid sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
gwcuptool.sh -postcheck -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.7 Query upgrade states in progress.

```
gwcuptool.sh -query [ -n <GWC list> ] [-sid sid]
```

Command description:

Query the status of the GWC units and upgrade status.

The status includes two parts. If there is no upgrading GWC, no part A status exists.

If there is no GWC list, the configured GWC list will be used instead.

- Upgrade status report.

Report includes following items:

- GWC-ID: e.g. GWC-3
- Current upgrade step: e.g. SWACT (7 / 12)
- Spent time: e.g. 10 minutes
- Time left: e.g. about 13 minutes.

- B. Unit status report

Report items.

- GWC Unit name: GWCUnit IP
- GWC type and profile.
- GWC load information. Upgraded or not.
- Status from GWCEM
- Status from SAM21EM

[1] -n <GWC List>

**Requirement:** Optional

**Description:** Only the specified GWC node status will be shown.

[2] -sid sid

**Requirement:** Internally used by the MOP automation tool.

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
gwcuptool.sh -query -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.8 Query GWC information and list them by profile types.

```
gwcuptool.sh -query -n all [-sid sid]
```

Command description:

Query all GWC information including name, ip and state.

This command reuses “gwcuptool.sh -query” interface, it can list all GWCs’ information and show them by profile types.

Example:

```
gwcuptool.sh -query -n all -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.9 Query configurations currently used.

```
gwcuptool.sh -config -list [-sid sid]
```

Command description:

Query current configurations. It reuses the “gwcuptool.sh -config” interface.

Example:

```
gwcuptool.sh -config -list -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.10 Stop upgrade manager server.

```
gwcuptool.sh -stop [-sid sid]
```

Command description:

Stop upgrade server.

Options:

[1] -sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

Example:

```
gwcuptool.sh -stop -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.4.3.11 Help facilities of the functions.

```
gwcuptool.sh -start -h  
gwcuptool.sh -config -h  
gwcuptool.sh -prep -h  
gwcuptool.sh -precheck -h  
gwcuptool.sh -up -h  
gwcuptool.sh -postcheck -h
```

```
gwcuptool.sh -query -h
```

```
gwcuptool.sh -stop -h
```

Command description:

Shows the end user the help facilities of the functions. It includes function description, option meaning and usage.

How to use the above separate commands to achieve a complete upgrade task. Appendix 1 gives you an example.

## 1.5 SC Upgrade Tool

In SN08, SC will provide a basic CLI interface and an interactive CLUI that is based on the basic CLI interface.

### 1.5.1 Interactive CLUI

The interactive CLUI is a shell that wraps basic CLI. It provides a “restricted” tool to achieve the upgrade goal.

Issue “scuptool.sh” to launch the SC upgrade tool CLUI. The main menu is as follows:

```
$ scuptool.sh
Starting .....

Main menu for SC upgrade tool
1 - Display all SC pairs
2 - Configure upgrade related options
3 - List current upgrade configurations
4 - Enter Upgrade Menu

x - Stop upgrade tool and exit CLUI
Enter selection (1-4,x):
```

There are a total of five selections in main menu. There are:

**1** Display all SC pairs

This selection queries all SC nodes information, including name, ip and state.

**2** Configure upgrade related options

This selection configures upgrade options manually. CLUI will prompt the end user to input the necessary information step by step. These options are effective during the whole upgrade process.

**3** List current upgrade configurations

This selection lists all options currently used.

**4** Enter the upgrade menu

This selection enters the upgrade submenu.

## 5 Stop upgrade tool and exit CLUI

This selection stops the SC upgrade server and exits CLUI.

When selection 4 is selected, the end user enters the upgrade submenu to do the real upgrade process. The follow figure is the upgrade submenu:

```
Console
Window Edit Options Help
$ sulptool.sh
Starting .....

Main menu for SC upgrade tool
1 - Display all SC pairs
2 - Configure upgrade related options
3 - List current upgrade configurations
4 - Enter Upgrade Menu

x - Stop upgrade tool and exit CLUI
Enter selection (1-4,x): 4

Upgrade menu for SC upgrade tool
1 - Prepare
2 - Pre-check
3 - Upgrade
4 - Query upgrade status
5 - Post-check

x - exit
Enter selection (1-5,x):
```

There are a total of six selections in the upgrade submenu. All these selections are based on the options configured in the main menu.

- **Prepare**

This selection does the preparation prior to the actual upgrade.

- **Pre-check**

This selection does the pre-check prior to the actual upgrade.

- **Upgrade**

This selection does the real upgrade.

- **Query upgrade status**

This selection queries the upgrade status.

- **Post-check**

This selection does the post-check after the actual upgrade.

- **exit**

This selection exits the upgrade submenu and enters the main menu.

### 1.5.2 Basic CLI

The basic CLI provides the basic functions that the SC upgrading needs. They are:

- Start SC upgrade manager server prior to launching the client.
- Configure the upgrade options before the actual upgrade.
- Prepare the necessary steps for getting the tools and system ready prior to the actual upgrade.
- Pre-check relevant EM and configured SC states including the alarms.
- Upgrade configured SC with configured options.
- Post-check upgraded SC states including alarms.
- Query SC upgrade states in progress.
- Query SC information and list them.
- Query configurations currently used.
- Stop the upgrade manager server.
- The help facilities of the functions.

All these functions are provided by a shell named *scuptool.sh*. Although the end user can use every function in any order, we recommend that you should run the corresponding commands in an order which is given in the appendices. The order ensures you encounter, as little as possible, any warnings and errors. The order is mandatory

Corresponding functions to the above are achieved using the *gwcuptool.sh* command. The details are as follows.

#### 1.5.2.1 Start the SC upgrade manager server prior to client launching.

```
scuptool.sh -start [-sam21em ip:port] [-sid sid]
```

Command description:

Start the SC upgrade tool server, it does the following:

- 1 Request the end user to input a user name/password if not applying the session ID in the command.
- 2 Connect to SAM21EM through CORBA;
- 3 Check whether this user has permission to perform the upgrade operations.

Options:

[1] -sam21em

**Requirement:** Internally used options.

**Description:** Provides the CORBA server ip and port SAM21EM server registered.

**Default:** localhost:2001

[2] -sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

Example:

```
scuptool.sh -start -sam21em localhost:2001 -sid  
312308CDA87F5C7ECD3185F639892BC2
```

If the end user only issues “scuptool.sh -start”, only the user who belongs to one of “mgcmte, mgcadm, emsmte, emsadm” groups, can run the tool.

### 1.5.2.2 Configure the upgrade options before the actual upgrade.

```
scuptool.sh -config [-n <SC list>] [-o [value]] ...
```

Command description:

Configure upgrade options. These options are useful to upgrade, pre-check, post-check and query.

Note:

- 1 All configurations' default value will be stored in a property file on the upgrade manager server machine.
- 2 When only “scuptool.sh -config -list” is issued, the upgrade manager server will return all current configurations.

- 3 If the end user only issues “scuptool.sh -config”, shell will prompt the end user to input necessary information step by step.
- 4 When the second configuration command is issued, all prior configurations will be replaced.

The following are detailed options.

[1] -pa load\_directory\_name

**Requirement:** Optional

**Description:** Specify the load file path in SDM/CBM. If no directory name is applied, the default directory '/swd/sam21/' will be used.

**Default:** “/swd/sam21/”

**Example:**

-pa “/swd/sam21/”

[2] -f new\_load\_file\_name

**Description:** Target load file name. This option is mandatory.

**Default:** “”.

**Example:**

-f “11.0.0.047231351”

[3] -o old\_load\_name

**Requirement:** Optional

**Description:** The load upgrade from. If the end user ignores it, the upgrade manager server will bypass old load checking. By default the user does not need to specify the old load name, and all the selected SC pairs will be upgraded automatically.

**Default:** “”.

**Example:**

-o “10.0.0.047231351”

[4] -m <single | bulk >

**Description:** Upgrade mode (Optional)

single: all SC pairs will be upgraded one by one as ordered by the SC ID.

bulk: All other SC pairs will be upgraded at the same time.

**Default:** bulk.

**Example:**

-m bulk

[5] -p [0,1,2,3,4,5]

**Description:** Upgrade pause points. (Optional). If the end user does not provide this option, no pause points are done during upgrading.

The following list shows what the number means:

- For the first SC pair:
  - 1, before lock the first upgrade unit of “seed” pair.
  - 2, before warm-swact.

- 3, after “seed” pair upgraded.
- 4, pause on all above conditions.

- For bulk upgrade SC pairs:
  - 5, before warm-swact.

**Default:** 0, without any pause points.

**Example:**

```
-p '1,2,3'
```

The example option means the upgrade will pause on conditions 1,2,3.

```
[6] -d [VRB | MAJ | MNR | CRT ]
```

**Requirement:** Optional

**Description:** Define logging level for the upgrade log file.

VER: Logging verbose information.

MAJ: Logging major information.

MNR: Logging minor information.

CRT: Logging critical information.

**Default:** MAJ.

**Example:**

```
-d MNR
```

```
[7] -n <SC list>
```

**Description:** Provides a SC list for pre-check, upgrade, post-check and query.

**Default:** all

**Example:**

```
-n 'SC1,SC2,SC3,SC5'
```

```
[8] -t <mins>
```

**Description:** Define a time limitation for doing the upgrade. If the upgrade cannot complete all pairs within the given time slot, the un-upgraded SC pairs will be kept there. The upgrade will finish. If “0” is specified as the time limitation, the limitation check will be disabled

**Default:** 0

**Example:**

```
-t 180
```

Note: The time begins when “scuptool.sh -up” command is executed. A second “scuptool.sh -up” command does not reset the time slot.

```
[9] -np <max parallel number>
```

**Requirement:** Optional. Internally used by the designer.

**Description:** Max parallel number during the bulk upgrade.

**Default:** 8

**Example:**

```
-np 8
```

```
[10] -a [CRT | MAJ] -an [number]
```

**Requirement:** Optional.

**Description:** The allowed highest alarm level during the upgrade, and the allowed max alarm number during the upgrade. It is a dynamic alarm checking values. If the current alarm state has higher priority than is defined here, the upgrade program will be paused and the end user is notified of this.

For examples, if we specify “-a MAJ -an 2” in config step:

- If there are 3 MAJ alarms raised in the EM Server for this pair, the upgrade tool will be paused.
- If there is 1 MAJ alarm raised in the EM Servers for this pair, the upgrade tool will ignore it and continue the upgrade process.
- If there is 1 CRT alarm raised in the EM Server for this pair, the upgrade tool will be paused too because CRT has high priority than the MAJ alarms.

**Default:** MAJ 2

**Example:**

```
-a CRT -an 2
```

```
[11] -sid sid
```

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
scuptool.sh -config -f 11.0.0.047231351 -sid  
312308CDA87F5C7ECD3185F639892BC2
```

Note: This option is not a part of configuration.

A whole command format likes:

```
scuptool.sh -config -f 11.0.0.047231351 -o 10.0.0.047231351 -m bulk -p '1,3' -d CRT -  
n 'SC1' -t 120 -np 16 -a CRT -an 4 -sid 312308CDA87F5C7ECD3185F639892BC2
```

### 1.5.2.3 Prepare the necessary steps for getting the tool and system ready prior to the actual upgrade.

```
scuptool.sh -prep [-sid sid]
```

Command description:

Shows the end user the necessary preparations that include upgrade steps and order, notes and warnings.

The following actions should be checked in prepare command:

- 1 Check the load available in SDM/CBM.
- 2 Make an upgrade plan for the SC and calculate the estimated time of the upgrade.

Options:

[1] -sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
scuptool.sh -prep -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.5.2.4 Pre-check relevant EM and configured SC states including alarms.

```
scuptool.sh -precheck -n <SC list>] [-sid sid]
```

Command description:

Pre-check the necessary conditions before upgrade.

If there is no SC list, the configured SC list will be used instead.

Perform the following actions:

- 1 SAM21EM server status
- 2 Load is available on the load server.
- 3 Alarm status.
- 4 Hardware level health check. If the pair has two physical units, check both of them are in service.
- 5 Whether the inactive unit is in hot-standby.

[1] -n <SC List>

**Requirement:** Internally used by the MOP automation tool

**Description:** SC pairs which should be upgraded. If there is no given SC list, the configured SC list will be used instead.

[2] -sid sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
scuptool.sh -precheck -sid  
312308CDA87F5C7ECD3185F639892BC2
```

### 1.5.2.5 Upgrade configured SC with configured options.

```
scuptool.sh -up [ -n <SC list>] [-sid sid]
```

Command description:

The command does the real upgrade work. You still perform the pre-check / post-check in this command. During the upgrade, the client side will display the logs sent from the server side. Also, the end user may need to answer some question or do some confirmation for different conditions. If the end user enabled break points, this tool will work in interactive mode.

If there is no SC list, the configured SC list will be used instead.

Note: Must prompt the end user to do the pre-check before upgrading. The pre-checked SC list is stored in the server side. If there is no pre-checked SC, the server will refuse upgrading.

[1] -n <SC List>

**Requirement:** Internally used by the MOP automation tool

**Description:** SC pairs which should be upgraded. If there is no given SC list, the configured SC list will be used instead.

[2] -sid sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
scuptool.sh -up -sid  
312308CDA87F5C7ECD3185F639892BC2
```

### 1.5.2.6 Post-check upgraded SC states including alarms.

```
scuptool.sh -postcheck [ -n <SC list>] [-sid sid]
```

Command description:

Do the post-check for the given SC pairs.

If there is no SC list, the configured SC list will be used instead.

The following status will be checked:

- Hardware status from SAM21EM.

- Alarm state

[1] -n <SC List>

**Requirement:** Internally used by the MOP automation tool

**Description:** SC pairs which should be upgraded. If there is no given SC list, the configured SC list will be used instead.

[2] -sid sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
scuptool.sh -postcheck -sid  
312308CDA87F5C7ECD3185F639892BC2
```

### 1.5.2.7 Query upgrade states in progress.

```
scuptool.sh -query [ -n <SC list> ] [-sid sid]
```

Command description:

Query the status of SC pairs and the upgrade status.

The status includes two parts. If there is no upgrading SC, then no part A status exists.

If there is no SC list, the configured SC list will be used instead.

- Upgrade status report.

The report includes the following items:

- SC-ID: e.g. SC3
- Current upgrade step: e.g. SWACT.
- Spent time: e.g. 4 minutes
- Time left: e.g. about 5 minutes.

- B. Unit status report

The report items:

- SC Unit name: SC Unit IP
- SC load information. Upgraded or not.
- Status from SAM21EM

[1] -n <SC List>

**Requirement:** Internally used by the MOP automation tool

**Description:** SC pairs which should be upgraded. If there is no given SC list, the configured SC list will be used instead.

[2] -sid sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
scuptool.sh -query -sid  
312308CDA87F5C7ECD3185F639892BC2
```

### 1.5.2.8 Query SC information and list them.

```
scuptool.sh -query -n all [-sid sid]
```

Command description:

Used to query all SC information including name, ip and state.

This command reuses the “scuptool.sh -query” interface, it can list all SCs’ information.

**Example:**

```
scuptool.sh -query -n all -sid  
312308CDA87F5C7ECD3185F639892BC2
```

### 1.5.2.9 Query configurations currently used.

```
scuptool.sh -config -list [-sid sid]
```

Command description:

Queries current configurations. It reuses the “scuptool.sh -config” interface.

**Example:**

```
scuptool.sh -config -list -sid  
312308CDA87F5C7ECD3185F639892BC2
```

### 1.5.2.10 Stop upgrade manager server.

```
scuptool.sh -stop [-sid sid]
```

Command description:

Stop upgrade server.

Options:

[1] -sid

**Requirement:** Internally used by the MOP automation tool

**Description:** Provides session ID upgrade manager uses. The upper-level upgrade manager can provide a valid session ID to avoid re-login. The end user need not input this option.

**Default:** 0

**Example:**

```
scuptool.sh -stop -sid  
312308CDA87F5C7ECD3185F639892BC2
```

#### 1.5.2.10.1 Help of the functions.

```
scuptool.sh -start -h  
scuptool.sh -config -h  
scuptool.sh -prep -h  
scuptool.sh -precheck -h  
scuptool.sh -up -h  
scuptool.sh -postcheck -h  
scuptool.sh -query -h  
scuptool.sh -stop -h
```

Command description:

Shows the end user the help facilities of the functions. It includes function description, option meaning and usage.

Appendix 2 gives you an example of how you use these separate commands to achieve a complete upgrade task.

## 1.6 Hardware Requirements or Dependencies

No new hardware or hardware dependencies are introduced.

## 1.7 Software Requirements or Dependencies

No new customer software or firmware dependencies are introduced in this feature.

## 1.8 Limitations and restrictions

The limitations and restrictions work on both the GWC and SC upgrade manager except for the items specified.

- 1 For Upgrade Manager Phase I, the upgrade tools must be running in the same SSPFS box with GWCEM/SESM and SAM21EM.
- 2 This version will not support multiple users. But the end user can upgrade GWC nodes or SC pairs in parallel.
- 3 This version does not support automatically downgrade. The end user must downgrade NE manually.
- 4 Both the GWC and SC upgrade server only provide support for a full node upgrade. They do not allow a single card/unit to be upgraded.

## 1.9 Interactions

No interactions between this feature and existing features.

## Appendix 1: An example of how to use gwcuptool.sh to complete GWC upgrade in an office.

For SN08, the GWC upgrade order is:

- 1 Audio
- 2 BICC (UA-AAL1 solutions only)
- 3 VRDN
- 4 Session Server (SN08 to SN08 upgrades only)
- 5 SIP-T/APG/RA
- 6 APG/RA
- 7 SIP-T/APG
- 8 APG
- 9 SIP-T
- 10 Trunk
- 11 H.323 (new in SN06.2)
- 12 Proxy [RTP MP])
- 13 V5.2 Trunk
- 14 Lines (includes CICM)

Assumption:

- |         |                      |
|---------|----------------------|
| 1 Audio | GWC-1, GWC-3, GWC-5  |
| 2 BICC  | GWC-7, GWC-9, GWC-11 |

|    |                       |                        |
|----|-----------------------|------------------------|
| 3  | VRDN                  | GWC-13, GWC-15, GWC-17 |
| 4  | SIP-T/APG/RA          | GWC-19, GWC-21, GWC-23 |
| 5  | APG/RA                | GWC-25, GWC-27, GWC-29 |
| 6  | SIP-T/APG             | GWC-31, GWC-33, GWC-35 |
| 7  | APG                   | GWC-37, GWC-28, GWC-39 |
| 8  | SIP-T                 | GWC-32, GWC-34, GWC-36 |
| 9  | Trunk                 | GWC-26, GWC-28, GWC-30 |
| 10 | H.323 (new in SN06.2) | GWC-20, GWC-22, GWC-24 |
| 11 | Proxy [RTP MP])       | GWC-14, GWC-16, GWC-18 |
| 12 | V5.2 Trunk            | GWC-8, GWC-10, GWC-12  |
| 13 | Lines (includes CICM) | GWC-2, GWC-4, GWC-6    |

**Note:** You also can get the information by using the “gwcuptool.sh query -n all” command.

**Step 1: Create a soak image on GWC-1. (Which GWC is selected is determined by yourself.)**

Create the SSH communication channel.

```
ssh
```

//start um server by inputting the following command:

```
gwcuptool.sh -start
```

//If this fails, upgrade-man checks the CORBA naming service and EM server state.

///Retry after checking.

//configure all options for upgrading the first GWC and creating the soak image:

```
gwcuptool.sh -config -pa "/swd/gwc/" -f pn080ak.imag  
-m single -p 5 -d VRB -n "GWC-1" -t 120 -a CRT -an 4
```

//If this fails, check retry or abort.

//print what upgrade-man needs to prepare:

```
gwcuptool.sh -prep
```

//Pre-check configured GWC;

```
gwcuptool.sh -precheck
```

//If this fails, check and retry or abort.

```
//Upgrade configured GWC:
gwcuptool.sh -up
//If this fails, check and retry or abort.

//Post-check configured GWC:
gwcuptool.sh -postcheck
//If this fails, check and retry or abort.

//Stop um server:
gwcuptool.sh -stop
//If this fails, check and retry or abort.
```

**Step 2: Using the soak image to upgrade other GWCs.**

Create the SSH communication channel.

```
ssh

//start um server.
gwcuptool.sh -start
//If this fails, check and retry or abort.

//Query available GWC. Shell will print out name, ip etc.:
gwcuptool.sh -query -n all

//Configure all options for upgrading. Pause points are removed for bulk
//upgrading. Upgrade-man can select the GWC list for configuration by above
//one command:
gwcuptool.sh -config -pa "/swd/gwc/" -f pn080ak.imag
-m bulk -d VRB -n 'GWC-7,GWC-9,GWC-11' -t 120 -a CRT
-an 4
//If this fails, check and retry or abort.

//Print what upgrade-man needs to prepare:
gwcuptool.sh -prep

//Pre-check configured GWC:
gwcuptool.sh -precheck
//If this fails, check and retry or abort.

//Upgrade configured GWC:
gwcuptool.sh -up
//If this fails, check and retry or abort.
```

//Upgrade-man can query the upgrading state until the upgrade completes:

```
gwcuptool.sh -query
```

//If this fails, check and retry or abort.

//Post-check configured GWC:

```
gwcuptool.sh -postcheck
```

//If this fails, check and retry or abort.

//Stop um server:

```
gwcuptool.sh -stop
```

//If this fails, check and retry or abort.

## Appendix 2: An example of how to use scuptool.sh to complete SC upgrade in an office.

Assumption: There are a total of 8 SC pairs in an office. They are from SC1 to SC8.

### Step 1: Upgrade one SC. Pause at all pause points to make upgrade-man has chance to verify.

Create the SSH communication channel:

```
ssh
```

//start um server by inputting the following command:

```
scuptool.sh -start
```

//If this fails, upgrade-man checks the CORBA naming service and EM server state. Retry after checking.

//configure all options for upgrading the first SC:

```
scuptool.sh -config -pa "/swd/sam21/" -f  
11.0.0.0.2222 -m single -p 4 -d VRB -n SC1 -t 120 -a  
CRT -an 4
```

//If this fails, check, retry or abort.

//print what upgrade-man needs to prepare:

```
scuptool.sh -prep
```

//Pre-check configured SC:

```
scuptool.sh -precheck
```

//If this fails, check and retry or abort.

//Upgrade configured SC:

```
scuptool.sh -up
```

```
//If this fails, check and retry or abort.
```

```
//Post-check configured SC:
```

```
scuptool.sh -postcheck
```

```
//If this fails, check and retry or abort.
```

```
//Stop um server:
```

```
scuptool.sh -stop
```

```
//If this fails, check and retry or abort.
```

## **Step 2: Bulk upgrading other SCs. No pause point.**

Create the SSH communication channel:

```
ssh
```

```
//start um server:
```

```
scuptool.sh -start
```

```
//If this fails, check and retry or abort.
```

```
//Query SC information:
```

```
scuptool.sh -query -n all
```

```
//Configure all options for upgrading:
```

```
scuptool.sh -config -pa "/swd/sam21/" -f  
11.0.0.0.2222 -m bulk -d VRB -n 'SC1,SC2,SC3' -t 120  
-a CRT -an 4
```

```
//If this fails, check and retry or abort.
```

```
//Print what upgrade-man needs to prepare:
```

```
scuptool.sh -prep
```

```
//Pre-check configured SC:
```

```
scuptool.sh -precheck
```

```
//If this fails, check and retry or abort.
```

```
//Upgrade configured SC:
```

```
scuptool.sh -up
```

```
//If this fails, check and retry or abort.
```

```
//Upgrade-man can query upgrading state until upgrade completes:
```

```
scuptool.sh -query
```

```
//If this fails, check and retry or abort.
```

```
//Post-check configured SC:  
  
scuptool.sh -postcheck  
//If this fails, check and retry or abort.  
  
//Stop um server:  
  
scuptool.sh -stop  
//If this fails, check and retry or abort.
```

### Appendix 3: Upgrade mode examples in GWC upgrade tool

Here is an example where we can explain the GWC upgrade mode much more clearly.

In the customer office, there are the following GWCs:

Audio GWC: GWC-1

Trunk GWC: GWC-12, GWC-13, GWC-14

Line GWC: GWC-5, GWC-6, GWC-7, GWC-8, GWC-9, GWC-10

Based on the “Upgrading the Gateway Controller, NN10196-461”, we need to upgrade the Audio GWC first, then the Trunk GWCs, and the Line GWCs last.

#### **In the single mode: running with “gwcupptool.sh -config -f NewLoadFileName -m single”**

GWCs will be upgraded one by one, and obey the service type order. So the upgrade order will be:

- 1 GWC-1 (Audit GWC. apply patch; create soak image for other GWCs)
- 2 GWC-12 (Trunk GWC)
- 3 GWC-13 (Trunk GWC)
- 4 GWC-14 (Trunk GWC)
- 5 GWC-5 (Line GWC)
- 6 GWC-6 (Line GWC)
- 7 GWC-7 (Line GWC)
- 8 GWC-8 (Line GWC)
- 9 GWC-9 (Line GWC)
- 10 GWC-10 (Line GWC)

#### **In the bulk mode: running with “gwcupptool.sh -config -f NewLoadFileName -m bulk”**

All GWCs within the same service type will be upgraded at the same time. the upgrade order will be:

- 1 GWC-1 (Audit GWC. apply patch; create soak image for other GWCs)
- 2 GWC-12, GWC-13, GWC-14 (Trunk GWC)
- 3 GWC-5, GWC-6, GWC-7, GWC-8, GWC-9, GWC-10 (Line GWC)

**In mix mode: running with “gwcuptool.sh -config -f NewLoadFileName -m mix”**

The first GWC node within the same service type group will be upgraded first, then all other GWCs in the same group will be upgraded in parallel at the same time. The upgrade order will be:

- 1 GWC-1 (Audit GWC, apply patch, create the soak image for other GWCs)
- 2 GWC-12 (Trunk GWC)
- 3 GWC-13, GWC-14 (Trunk GWC)
- 4 GWC-5 (Line GWC)
- 5 GWC-6, GWC-7, GWC-8, GWC-9, GWC-10 (Line GWC)

## 1.10 Glossary

| Term     | Explanation                                    |
|----------|------------------------------------------------|
| CS2M     | CS2000 Management Components                   |
| SESM     | Succession Element Sub-element Manager         |
| SAM21 EM | CS2000 SAM21 Manager                           |
| NPM      | Network Patch Manager                          |
| SSPFS    | Succession Server Platform Foundation Software |
| CLUI     | Command line user interface                    |
| CLI      | Command line interface.                        |
| SDM      | SuperNode Data Manager                         |

***Product = MG 9000***

**A00007213--MG9000 5/30 minutes OMs**

## ***Functional Description***

### **1.1 Applicable Solution(s)**

UA-IP

### **1.2 Description**

This feature consists of following deliverable.

1. This feature allows the user to configure Sample interval and Summary intervals on SN08 MG9K from MG9KEM. This configuration is supported through a new configuration GUI "Configure Collection Interval", which will be introduced under the submenu option MG9KEM Subnet view ->Performance. All the MG9Ks in a Subnet are configured with same intervals.

In SN08, user is allowed to select following combinations of Sample and Summary intervals from GUI.

- Sample and Summary intervals of 5 and 30 minutes respectively.
- Sample interval of 15 minutes and no Summary interval.

In the new configuration GUI, Sample and Summary intervals are specified in terms of minutes.

Example: For the Sample and Summary intervals of 5 and 30 minutes, user has to select the value "5/30 minutes" in the GUI. For the 15 minutes Sample interval, user has to select the value "15 minutes" in the GUI.

2. Whenever Collection intervals are changed, Performance browser and OM Collector behave as follows.
  - OM Collector will start collecting OMs at new collection intervals, starting from next collection interval.
  - After Collection interval is changed, if User tries to collect performance data, Performance browser will collect OMs at new Sample collection interval.

Refer to the limitation mentioned in section 2.5.

3. Following changes are done in Performance browser.
  - The intervals shown in Performance browser are based on the Sample interval. That means, intervals shown in the fields "From" and "To" of Performance browser are based on Sample interval.

Note that, Only Sample intervals are shown on Performance browser. 96 intervals are shown irrespective of sample interval value.

4. OM Collector generates CSV files named with appropriate tag to indicate the collection interval of the OM data, which is stored in CSV file. To be inline with the tag used today for 15 minutes interval, following tags will be used for new intervals in SN08.

For 5 minutes interval: 5\_MIN\_TRAFFIC

For 30 minutes interval: 30\_MIN\_TRAFFIC

CSV filename convention:

<NEType>.<NodeName>.OMs.<ReportName>.<Year>.<Month>.<Day>\_<Hour>.<Minute>\_<TimeZone>.<fileextension>

Example CSV file names:

- MG9000.CO18.OMs.5\_MIN\_TRAFFIC.2003.06.06\_13.15\_EDT.csv
  - MG9000.CO18.OMs.15\_MIN\_TRAFFIC.2003.06.06\_13.15\_EDT.csv
  - MG9000.CO18.OMs.30\_MIN\_TRAFFIC.2003.06.06\_13.15\_EDT.csv
5. Once CSV file is generated successfully, OM Collector sends CORBA notification with following information.
    - Source IP address (IP address of the EM workstation, where CSV file is available. In a HA system, this is the Virtual IP address).
    - CSV filename with complete path
    - NE IP address (IP address of the NE for which the CSV file is generated)
  6. When OMs are not available, reason for the same would be available in the SFTP response. When OMs are not available, OM Collector will raise a minor alarm. OM Collector will try to extract the reason from SFTP response and will put the same in appropriate field/s of the alarm. OM Collector also logs these alarms in Customer log. OM Collector will clear the alarm when OMs are available again.
  7. OM Collector is integrated with MG9KEM as detailed below
    - Configuration of OM Collector will be integrated with that of MG9KEM server.
    - OM Collector will be started and stopped along with MG9KEM server.

Even though OM Collector is brought inside MG9KEM, OM Collector is retained as a separate JAR and is delivered as a separate package.

### 1.3 Hardware Requirements or Dependencies

None

### 1.4 Software Requirements or Dependencies

This feature depends on A00007107 (MG9K feature to support 5/30 minutes).  
This feature requires A00007107 at least by the time of its Integration testing.

With reference to the requirement #5 mentioned in [1], this feature sends a notification. The IEMS feature A00007388 (MG9K Performance integration) uses this notification. Hence, IEMS feature A00007388 depends on the delivery of A00007213.

### 1.5 Limitations and restrictions

When MG9KEM changes Collection interval, any data collected by OM Collector and/or Performance browser till the end of current collection interval after MG9KEM changes collection intervals, may not be accurate. Following paragraphs explain the reason for this.

#### Example #1:

Let us consider that, MG9KEM changes the collection intervals say from 15 to 5/30 minutes, at 9:06 AM. In this scenario, MG9KEM and OM Collector will switch over starting from next collection interval time as explained below.

- OM Collector will collect new Sample interval (i.e, 5 min in this example) starting from 9:10 AM and Summary interval starting from 9:30 AM.
- Performance browser will changeover immediately. i.e, it will show Collection time period in terms of new Sample collection interval.

However, MG9K changes over to new collection interval at end of current collection interval (i.e., at 9:15 AM in the scenario explained above). Also, MG9K flushes its history performance data at 9:15 AM.

Because of this behavior difference between MG9K and MG9KEM PM components (i.e., performance browser and OM Collector), any data collected by OM Collector and/or Performance browser till and including 9:15 AM, may not be accurate.

#### Example #2:

Let us consider that, MG9KEM changes the collection intervals say from 5/30 to 15 minutes, at 9:06 AM. In this scenario, MG9KEM and OM Collector will switch over starting from next collection interval time as explained below.

- OM Collector will collect new Sample interval (i.e, 15 min in this example) starting from 9:15 AM.

- Performance browser will changeover immediately. i.e, it will show Collection time period in terms of new Sample collection interval.

However, MG9K changes over to new collection interval at end of current collection interval (i.e., at 9:10 AM in the scenario explained above). Also, MG9K flushes its history performance data at 9:10 AM.

Because of this behavior difference between MG9K and MG9KEM PM components (i.e., performance browser and OM Collector), any data collected by OM Collector and/or Performance browser till and including 9:15 AM, may not be accurate.

## 1.6 Interactions

This feature interacts with the SN07 feature, A00003531 (MG9KEM - Frame location enhancements) as follows;

- The SN07 feature A00003531 replaces Internal frame number by Office frame number in the CSV files for 15 minutes interval. This capability is utilized in SN08 for the new intervals 5 and 30 minutes also.
- This feature uses the capability introduced by A00003531 to either enable or disable OM data collection for a particular MG9K.

## 1.7 Glossary

| Term                            | Description                                                                                                                                                                                                                                                                                                              |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
