## March 2006

Re-release of the Standard version of this document, 01.07, for the following changes:

- clarified that PVG OMs do not report fields/registers that contain blank or no data from the MDM, per CR Q01292367.
- updated information on USP logs 398 and 399 and added new log examples, per CR Q01310725-04.

## January 2006

Re-release of the Standard version of this document, 01.06, for the following changes:

- included updated NTP references for the MSS15000/MG15000 products per CR Q01279851.
- removed obsolete DPT operational measurement information, per CR Q01211610.

## November 2005

Re-release of the Standard version of this document, 01.05, to remove references to the M3UA tool which was discontinued in SN07.

## June 2005

Re-release of the Standard version of this document, 01.04, for SN08 FVS release. The following sections have been updated since the previous Standard version:

- IEMS Functionality
- Performance Measurements

**May 2005**

Re-release of the Standard version of this document for SN08 at FVS due to churn. The following feature has been updated for clarification: A00007785, MFT Backend Security Server Integrating into IEMS.

**March 2005**

Re-release of the Standard version of this document, 01.03, for SN08 due to churn. The following features or CRs have been added since the previous Standard version, and multiple others have been updated:

- A00006269--OSSGate Password No Echo
- A00007244--GIC and GIAC Support on CICM and MG9K
- A00007253--MADN Ring Forward Support for CICM and MG9K
- A00007270--Session Server Call Processing Overload Controls
- A00007282--Configurable Threshold for Failed Login Attempts
- A00007393--Session Policy Controller
- A00007417--Ethernet link overload Control
- A00007709--MCS CD Phase 2 Support

**January 2005**

Standard release 01.02 of this document for SN08. All appropriate sections are updated for this release. The following features or CRs have been added since the Preliminary version:

- A59039138 -- (Visual) Message Waiting Indicator (V)MWI/CFX (IAC)
- A89007809--GWC-EM Support for the Internet Transparency Solution
- A00002644--Common Topology Identifier Provisioning
- A00006893--TLS Support for NGSS
- A00006979--Synchronized Backup Restore Manager
- A00007135--GWC DPT Audits and Counter Drift Prevention
- A00007268--NGSS OM Subsystem Enhancement

- A00007275--Session Server - Session/Application Mgmt Framework and Support for Multiple HTTPS connection to the Session Server through SSPFS
- A00007277--LOGs Throttling
- A00007383 - DNH Enhancements: Pilot DN Charge and Display
- A00007394--Network VCAC CallP
- A00007548--SN08 Packet Cable Electronic Surveillance
- A00007752--Universal Billing Correlation ID
- Q00720293--Change in SWREL value
- A00002512--GWC-EM Internet Transparency VCAC Provisioning
- A00007327--Media Proxy 5 and 30 minute Operational Measurements
- A00006570--CS2M Robustness enhancement - Moving SDM IP & CLI input to SSPFS
- A00006635--SESM Support for Cable Gateway Event Messaging
- A00007242--SESM support for SPC topology
- A00007300--Enable by default IPSec on All GWC Profiles
- A00007927--SAM21 Enhancements from Bell Canada
- A00004981--VCAC Provisioning Support for CICM Gateways
- A00006756--NSSwitch Implementation in IEMS
- A00006757--IEMS Secure Launch to PP8600
- A00006759--Secure Launch of MDM X11 Client Application
- A00007359--USP/USP-Compact: Log Delivery Stream to IEMS
- A00006906--SN08 Clock Sync Enhancements
- A00007074--GigE Link Maintenance
- A00007107--Media Gateway 9000 5/30 Minute Operational Measurements

- A00007263--LCI for Gigabit Ethernet
- A00008387--GLC-32 AB Card Support

**December 2004**

Preliminary release 01.01 of this document for SN08. The following sections are updated for this release:

- Mapping tables (ACTID-to-solutions; ACTID-to-OAM&P impacts)
- New or changed per release
- Feature deltas by product/network element
- Baseline information for Logs/Faults
- Baseline information for OMs/PMs
- Appendices

## Appendices

Appendix A: Ethernet Routing Switch 8600 Performance Metrics

Appendix B: MG9000 MIB OMs

Appendix C: Multiservice Switch 15000 and MDM Alarm Logs Summary

Appendix D: USP OMs

Appendix E: MG9000 Alarms, Event Logs, Audit Logs

Appendix F: CICM Logs

Appendix G: Ethernet Routing Switch 8600 List of Traps

Appendix H: SNMP-based PM Poller

Appendix J: IEMS Fault Transparency with SDM/CBM

# About this document

## When to use this document

This document supports the SN08 release of Carrier VoIP Solutions. It provides SN08 design documents that contain Operations Support Systems (OSS) information. It also provides information on what is new and changed in SN08, related to the following areas:

- Logs/faults
- Data schema tables/MIBs
- Commands/User Interface
- Service Orders
- Office Parameters
- Operational/performance measurements (OMs/PMs)
- AMA/billing
- Software optionality control (SOC)

In addition, it provides a baseline of the Logs/Alarms and Operational Measurements (OMs)/Performance Measurements (PMs) that are available in Carrier VoIP, organized by network element.

Information in this document is believed to be accurate at the time of publication, but it is subject to change. Use of this document should be restricted to resource planning and estimating for SN08. **Do not use this document to make changes to existing software.**

## How this document is organized

This document is divided into the following sections:

- Mapping tables
  - Mapping network elements to ACTIDs to solutions
  - Mapping network elements to ACTIDs to OAM&P documentation elements
- New/changed information for SN08
  - Logs and faults
  - Data Schema/MIBs
  - Commands/User Interface
  - Service Order
  - Office Parameters
  - Operational Measurements/Performance Measurements
  - AMA/Billing
  - Software Optionality Control (SOC)
- SN08 features, organized by network element
- Baseline information
  - Logs/faults available, organized by network element
  - OMs/PMs available, organized by network element
- Appendix A: Ethernet Routing Switch 8600 Performance Metrics
- Appendix B: MG9000 MIB OMs/PMs
- Appendix C: Media Gateway 15000 and MDM Alarm Log Summary
- Appendix D: USP OMs/PMs
- Appendix E: MG9000 Alarms, Event Logs, Audit Logs
- Appendix F: CICM Logs and Alarms
- Appendix G: Ethernet Routing Switch 8600 Trap List
- Appendix H: SNMP-based PM Poller
- Appendix J: IEMS Fault Transparency with SDM/CBM

## Audience

This document is intended for Nortel Networks personnel, third-party OSS vendors, and customers who need to plan resources and estimate network impacts for this release.

## How to check the version and issue of this document

The document release information on the title page and the footers of this document indicate the version and issue, for example, 01.01.

The first two digits indicate the version. The version number increases each time the document is updated to support a new software release. For example, the first release of a document is 01.01. In the next software release cycle, the first release of the same document is 02.01.

The second two digits indicate the issue. The issue number increases each time a document is revised but re-released in the same software release cycle. For example, the second release of a document in the same software release cycle would be 01.02.

## Writing conventions

Descriptions of commands, parameters, and responses in this document use the following conventions:

### Input prompt

An input prompt (> or #) indicates that the information that follows is a command:

>LIST

### Commands and fixed parameters

Commands and fixed parameters that are entered at the MAP terminal are shown in uppercase letters:

>LIST ALL

### Variables

Variables that are entered at a MAP terminal are shown in lowercase letters:

>TABLE table\_name

# SN08 Feature Mapping Tables

## Introduction

This document contains advance information about differences in operations, administration, maintenance, and provisioning (OAM&P) for SN08. The purpose of this document is to provide early information about new, modified or deleted items related to the following areas:

- Faults, including logs and alarms
- Data schema tables
- Office parameters
- User interface/human-machine interface
- Operational/performance measurements
- Software optionality control (SOC)
- Service orders
- AMA/billing

## Solution Applications

Although this OSS Guide is intended for IP solutions it also covers ATM AAL2 solutions. The main difference between IP solutions and ATM AAL2 solutions is that the Media Gateways are setup to transport the bearer path using ATM AAL2 instead of IP.

The signaling functionality for both ATM AAL2 and IP solutions is the same.

## Mapping Table: Network elements-to-ACTID-to-documentation elements

This table illustrates mapping from the network elements to their related ACTIDs to documentation elements (logs/faults, data schema, office parameters, servord, alarms, user interface/HMI, OMs/PMs, AMA/billing, and SOC (Software Optionality Control)).

| SN08 Solutions |           | Documentation Elements |             |               |                |                          |         |             |             |
|----------------|-----------|------------------------|-------------|---------------|----------------|--------------------------|---------|-------------|-------------|
| PRODUCT        | ACTID     | Logs/Faults            | Data Schema | Office Params | Service Orders | Commands/User Interf/HMI | OMs/PMs | AMA/Billing | Optionality |
| CS 2000        | A59039138 |                        | X           |               |                |                          |         |             |             |
| CS 2000        | A89007809 |                        |             |               |                | X                        |         |             |             |
| CS 2000        | A00002644 |                        |             |               |                | X                        |         |             |             |
| CS 2000        | A00004741 |                        |             |               |                |                          | X       |             |             |

## Mapping Table: Network elements-to-ACTID-to-solution

This table illustrates mapping connections between the network elements, their related ACTIDs, and the applicable solutions.

## New or changed per release

### New or changed for SN08

This section of the document describes the feature-based changes occurring in the SN08 release for the following categories:

- Logs/alarms
- Data Schema and MIBs
- Commands
- Service order
- Office parameters
- Operational measurements (OMs) and performance measurements (PMs)
- AMA/Billing
- Software Optionality Control (SOC)

### Solutions Application

Although this OSS Guide is intended for IP solutions it also covers ATM AAL2 solutions. The main difference between IP solutions and ATM AAL2 solutions is that the Media Gateways are setup to transport the bearer path using ATM AAL2 instead of IP.

The signaling functionality for both ATM AAL2 and IP solutions is the same.

### SSH Compatibility statement

Access to some functions requires the use of SSH compatible client software for access to secure telnet and ftp services (via the SSH standard). SSH clients are supplied bundled with some operating systems, but may need to be obtained separately. Sources for SSH clients include (but are not limited to):

- PUTTY - freeware
- OpenSSH - freeware
- SSH Inc. - commercial

- Secure CRT - commercial
- WinSCP - freeware

Nortel does not supply or recommend a particular supplier.

### SSH Compatibility statement

### Logs/faults changes overview

The following logs/faults are new or changed for SN08. They also appear in the logs-by-product tables in the Baseline section of this document with descriptions/cause for generation. This section also offers general log changes. Additional information is available in the Feature Deltas section of this document.

#### Summary of new or changed Logs/Faults for SN08

| Log/Fault Type                              | Log/Fault Name         | New/Modified/Deleted, ACTID and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b>                    |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Transport Level Security (TLS) alarms (new) | (refer to next column) | <p>Feature A00006893 (UA-IP, PT-AAL2) creates the following alarms.</p> <ul style="list-style-type: none"> <li>• TLS connection request comes in above the connection throttle limit (and above the threshold for the alarm - the defined thresholds are: 10 for minor, 50 for major, and 100 for critical).</li> <li>• TLS connection handshake failures (the thresholds are: 1 for minor, 2 for major, and 5 for critical).</li> <li>• TLS local certificate expiration (expiry in 31 days or less - minor, 15 days or less - major, and 5 days or less - critical).</li> </ul> |

**Summary of new or changed Logs/Faults for SN08**

| Log/Fault Type  | Log/Fault Name | New/Modified/Deleted, ACTID and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| SIPS logs (new) | SIPS300        | <p>Feature A00006893 (UA-IP, PT-AAL2) creates the following logs.</p> <ul style="list-style-type: none"> <li>SIPS300 is generated during the alarming of dropped connection requests (due to either the threshold being crossed for throttling connections, or due to attempting to use TLS when TLS is not enabled). The severity of the alarm indicates the threshold that was crossed, 10 dropped connection requests in a minute for a MINOR, 50 dropped requests for a MAJOR, and 100 dropped requests (or more) for a critical. The alarm is raised for a minimum of 30 minutes.</li> <li>SIPS301 is generated during authentication failure events. The alarmd process log indicates the level of trouble (CRIT indicates a very serious problem, MINOR may be transient or the beginning of a series of authentication failures).</li> <li>SIPS302 is generated as a result of the alarm process check to ensure the Local Server certificate continues to be valid. The expiration date contained in the certificate is checked on a daily basis, and when the expiration of the certificate will occur within 31 days (MINOR), 15 days (MAJOR), or 5 days (CRIT), the alarm is raised, with this log. For certificates that have already expired, the CRIT alarm and log is generated, and authentication failures will be output for any connections that are attempted.</li> <li>SIPS305 is generated during the initialization of the Call Processing application (i.e. during the unlock). If one of these critical logs comes out, it means that there is a problem with the initialization, and the application is unable to start.</li> <li>SIPS600 is generated during the connection set up of the Call Processing application. When the 'monitor OMs' log comes out, ensure that the threshold levels set for connection throttling are reasonable for the size of the office. If the 'TLS is not enabled' message comes out, ensure that the initialization of the call processing application worked correctly.</li> </ul> |

| SAM21 alarms (New)          | UnderlyingResourceUnavailable (2)<br><br>BootServerUnavailable<br><br>NFSMountsDown | Feature A00007424 (PT-IP, UA-IP, IAC, IAW, PT-AAL2) introduces the following alarms: <ul style="list-style-type: none"> <li>UnderlyingResourceUnavailable is a minor alarm when it indicates that an application card is locked and is not available.</li> <li>UnderlyingResourceUnavailable is a major alarm when it indicates that an application card is being autorecovered.</li> <li>BootServerUnavailable indicates that the boot server cannot be reached. Severity may vary.</li> <li>NFSMountsDown is raised for any mounts that remain down after the check and attempt to re-mount.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| RTP Media Portal logs (New) | RTP101<br><br>RTP102<br><br>RTP103<br><br>RTP104<br><br>RTP105                      | Document NN10383-900 explains the following logs in detail: <ul style="list-style-type: none"> <li>RTP101 (Critical) from alarm "Blade Out of Service." Occurs when Managed IP or MCP Service network difficulties (communication problems) are encountered when attempting to communicate with the Media Blade specified by BladeName.</li> <li>RTP102 (Critical/Major) from alarm "RTP Media Portal Out of Service." Occurs when timer activated event checks availability of Media Blades that are currently configured or when a OutOfServiceAlarm is raised.</li> <li>RTP103 (Critical) from alarm "Best Blade Selection." Occurs during session setup when the host attempts to determine which media blade should handle the session.</li> <li>RTP104 (Critical/Major/Minor) from alarm "Port Usage." Occurs when timer activated event checks to see what percentage of the configured Managed IP Network ports are in use.</li> <li>RTP105 (Major) from alarm "Host Interface Failure." Occurs when a timer activated event checks the status of host network interfaces.</li> </ul> |

| IAA logs (new)         | IAA314                             | Feature A00007465 (IAC, DMS) introduces the following logs: <ul style="list-style-type: none"> <li>• IAA314 is generated whenever an IAA module fails to initialize. The reason text field may contain one of 7 possible strings.</li> <li>• IAA342 is generated whenever an IAA module cannot communicate with other IAA modules, i.e., EMDA.</li> <li>• IAA343 is generated when a PCEM processing error occurs. The reason text field may contain one of 6 possible strings.</li> <li>• IAA344 is generated when an IAA module cannot create an audit entry.</li> <li>• IAA345 is generated when an IAA module detects a configuration problem. The reason text field may contain one of 2 possible strings.</li> <li>• IAA346 is generated when an IAA cannot communicate to the downstream RKS pair or DF. The reason text field may contain one of 4 possible strings.</li> <li>• IAA347 is generated when an IAA module detects a problem when trying to manage its filesystem storage.</li> <li>• IAA641 is generated when an IAA module goes into service.</li> <li>• IAA646 is generated when communications between the IAA and the downstream RKS pair or DF has been restored.</li> <li>• IAA701 is generated when the data being process by the IAA is corrupted.</li> </ul> |
|                        | IAA342                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| SDM security log (new) | Authentication succeeded or failed | Feature A00007489 (DMS, PT-AAL2) introduces the SN08 Authentication and Authorization Security Syslog, generated when a security event occurs on a SDM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Summary of new or changed Logs/Faults for SN08**

| <b>Log/Fault Type</b>          | <b>Log/Fault Name</b>                | <b>New/Modified/Deleted, ACTID and Solution</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDM file integrity audit (new) | N/A                                  | Feature A00007491 (DMS, PT-AAL2) monitors the files on the SDM and records file change events to log files. File change events will be logged to one of two log files, auditlog, and securitylog. File changes resulting from regular configuration changes will be recorded in the auditlog file. File changes which are abnormal will be recorded in the securitylog file.                                                                                                                                                                                                                            |
| USNBD logs (new)               | UNB300<br>UNB302<br>UNB304<br>UNB305 | Feature A00007548 (IAC) introduces the following logs. Access to UNB logs is only provided to PCES users through LOGUTIL's OPENSECRET command. <ul style="list-style-type: none"> <li>• UNBD300 reports problems with USNBD shared resources used by PCES.</li> <li>• UNB302 reports problems with USNBD processes used by PCES.</li> <li>• UNB304 reports success and failure of surveillance activation and deactivation, and problems with surveillance activation.</li> <li>• UNB305 reports problems that affect PCES administration data and reports all user creations and deletions.</li> </ul> |
| SDM patch check alarm (new)    | N/A                                  | Feature A00007602 (DMS, PT-AAL2) introduces a new minor alarm generated under the "sdmmtc sys" level, raised upon a patch signature check failure.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SDM security logs (new)        | SDM337<br>SDM637                     | Feature A00007602 (DMS, PT-AAL2) introduces security logs generated to report patch signature check failures and manual alarm clearing. <ul style="list-style-type: none"> <li>• SDM337 indicates that the patch failed signature checking.</li> <li>• SDM637 indicates that patch check status is cleared by the user.</li> </ul>                                                                                                                                                                                                                                                                      |

**Summary of new or changed Logs/Faults for SN08**

| Log/Fault Type                   | Log/Fault Name                                                                                   | New/Modified/Deleted, ACTID and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

The description format is the same for each of these logs, although the fields differ depending on the condition being logged. When not in Geographic Survivability mode, the logs appear as documented previously.                                                                      |

**Summary of new or changed Logs/Faults for SN08**

| <b>Log/Fault Type</b>          | <b>Log/Fault Name</b>                                                                                                                | <b>New/Modified/Deleted, ACTID and Solution</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CCA CON alarms (changed)       | LnkCon<br>MatCon<br>NetCon                                                                                                           | Feature A00008431 (PT-IP, UA-IP, IAC, IAW, CHS, PT-AAL2) modifies these three alarms. They describe the connectivity map for the monitored connections. In Geographic Survivability mode, the description is extended to show the enhanced connection monitoring. The description fields are identical to the corresponding CCA logs.                                                                                                                                                                                                                                                                                         |

| Media Proxy alarm (new)                   | Media Proxy Communications Failure                                           | <p>Feature A00007327 (CHS) introduces this alarm based on the number of media proxies that are out of service as compared to the number of media proxies provisioned checked on a 5-minute polling period. Media proxies are considered out of service when they fail to respond to messages sent from the GWC, and returned to service when the regular RSIP message is received by the GWC. The severity varies as follows:</p> <ul style="list-style-type: none"> <li>• Critical - Over 50% of media proxies disabled.</li> <li>• Major - Over 20% of media proxies disabled.</li> <li>• Minor - Any media proxies disabled.</li> </ul> |

| CICM logs (new)               |                             | Feature A00003953 (CHS) creates the following INFO logs for normal start-up events: <ul style="list-style-type: none"> <li>• Component initializes on master.</li> <li>• Component initializes on slave.</li> <li>• Slave component requests a bulk sync.</li> <li>• Bulk sync of data completes; ready for SWACT.</li> </ul>                                                                                                                                                                                            |
| CICM logs (new)               |                             | Feature A00003953 (CHS) creates the following INFO logs as components perform operator-initiated switch of activity: <ul style="list-style-type: none"> <li>• Component on master receives notification to SWACT.</li> <li>• Component on slave receives request from its counterpart to assume the role of the master.</li> <li>• Component on slave completes transition to active.</li> <li>• Component on master receives acknowledgment from mate that it is now active; completes transition to active.</li> </ul> |
| <b>Product = IEMS</b>         |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IEMS northbound SCC2 log feed | All Logs in the SCC2 stream | CR Q01091683 in SN09 has changed the IEMS SCC2 northbound log stream to the OSS. This change affects only the Start of Log delimiter. Previously, the Start of Log delimiter was just a carriage return (0D in hexadecimal). With this CR implementation, the Start of Log string has been changed to be a line feed followed by a carriage return. (0A0D in hexadecimal). This change has been patched back to SN08 via CR Q01091683-01 and to SN07 as well via CR Q01091683-02.                                        |
| IEMS supported logs           |                             | Feature A00007302 (PT-IP, PT-AAL2) lists IEMS-supported logs in its Appendix A.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Relates to log NPM360.</li> <li>• PFRSGENREPORT, a Major alarm raised when the PFRS GETPATCH task has failed. Relates to log NPM360.</li> </ul>           |

### Data Schema/MIBs changes overview

The following Data Schema tables or MIBs are new or changed for SN08. More complete descriptions will appear in the Feature Deltas section of this document.

#### Summary of new/changed Data Schema/MIBs information for SN08

| Table or MIB name                 | New or changed | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = Call Server 2000</b> |                |                                                                                                                                                                                                                                                                                                                                                            |
| IBNFEAT                           | Changed        | Feature A59039138 (IAC) adds the new announcement field MWT_ANNOUNCEMENT to the MWT feature in table IBNFEAT.                                                                                                                                                                                                                                              |
| RECEIVER                          | Changed        | Feature A00005932 (DMS) modifies table RECEIVER to use the DTMF digit receiver in DISA calls.                                                                                                                                                                                                                                                              |
| NT POLL                           | New            | Feature A00006226 (DMS) creates new table NT POLL which contains a visual representation of the poll steps to be done during the next polling, as well as the ability to modify, add, or delete poll steps at the user's discretion via Table Control.                                                                                                     |
| IBNLINES                          | Changed        | Feature A00006731(DMS) modifies IBNLINES by adding line option EOF to the OPTLIST subfield under field RESULT.                                                                                                                                                                                                                                             |
| LGRPINV                           | Changed        | Feature A00007071 (IAW) modifies LGRPINV by adding a new value of "LL_3rdparty" to field GRPTYPE and adding new optional field GTWYKEY to field LGRPOPTS (visible, not provisionable).                                                                                                                                                                     |
| SERVSINV                          | Changed        | Feature A00007120 (PT-IP, PT-AAL2) modifies SERVSINV by adding new entry PKTMA_MAX_CALLS with subfield PKTMA_MAX_CALLS under the OPTIONS field.                                                                                                                                                                                                            |
| ACDMISPL                          | Changed        | Feature A00007250 (DMS) modifies ACDMISPL to define the relationship between the ACDMIS pool and the transport type, X.25 or TCP/IP by adding new field LINKSEL. This field will serve a dual purpose of defining which remote IP addresses are allowed access to the DMS-100/CS2K as well as defining the relationship between the pool and session link. |

**Summary of new/changed Data Schema/MIBs information for SN08**

| Table or MIB name              | New or changed | Description                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOGTHROT                       | New            | Feature A00007277 (DMS) creates table LOGTHROT to implement LOGs throttling functionality for XA-Core, thus allowing the customer to specify on Time Units and Thresholds per Report Name. Only core logs can be throttled.                                                                                                   |
| ISERVOPT                       | Changed        | Feature A00007383 (DMS) modifies ISERVOPT as follows: <ul style="list-style-type: none"> <li>• Entry DNH_OPTS is added to field SOPTSKEY</li> <li>• Entry DNH_OPTS is added to field SOPTSVAR/OPTION</li> <li>• New subfields PILOT_CHARGE and PILOT_DISPLAY are added to entry DNH_OPTS in field SOPTSVAR/OPTION.</li> </ul> |
| SDMBILL                        | Changed        | Feature A00007464 (IAC, DMS) modifies this table to include additional field EXPEDITE to provide delivery of PacketCable Event Messages (billing data) to CBM.                                                                                                                                                                |
| AMAOPTS                        | Changed        | Feature A00007752 (DMS) modifies this table by adding option CORRID to capture the Universal Billing Correlation ID for BC AMA format.                                                                                                                                                                                        |
| CDRTMPLT                       | Changed        | Feature A00007752 (DMS) modifies this table by adding parameter CORRID to the list of parameters which can be datafilled in table CDRTMPLT, thus allowing the capture and recording of the Universal Billing Correlation ID for CDR.                                                                                          |
| KSETINV                        | Changed        | Feature A00007790 (PT-IP, DMS) modifies this table to increase the maximum table size from 31,743 to 150,000.                                                                                                                                                                                                                 |
| NSCPMAP                        | New            | Feature A00007934 (DMS, PT-AAL2) introduces table NSCPMAP to provide a mapping from the originator's STDPRT name to a new STDPRT name for use by the E800 Response translation.                                                                                                                                               |
| NSCDEFS                        | Changed        | Feature A00007934 (DMS, PT-AAL2) modifies table NSCDEFS to add new option PRETRANMAP as a provisioning trigger for activating a lookup in new table NSCPMAP. It also provides equivalent functionality to the existing NSCDEF's option PRETRAN.                                                                               |
| <b>Product = CS 2000 - GWC</b> |                |                                                                                                                                                                                                                                                                                                                               |

**Summary of new/changed Data Schema/MIBs information for SN08**

| Table or MIB name                                                     | New or changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| OFFICE_WIDE_DEFAULTS         | Changed            | Feature A00007213 (UA-IP) modifies this table as follows: one more entry is made in this existing database table to store Collection intervals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NORTEL-UEM-G-BASE.mib        | Changed            | Feature A00007213 (UA-IP) modifies this MIB to add the following attributes: <ul style="list-style-type: none"> <li>nnUemgOMStandardInterval</li> <li>nnUemgOMExtendedIntervalMulti</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| nnGLinkVLANTable             | New                | Feature A00007293 (UA-IP) creates this MIB to create, modify, and delete VLANs on the MG9K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| nnCommunityOfInterest        | New                | Feature A00007415 (UA-IP) creates this MIB to support groupings of MG nodes into “communities of interest” (COI).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Commands and User Interface changes overview

The following Commands and/or User Interface are new or changed for SN08. More complete descriptions appear in the Feature Deltas section of this document.

| Affected Area                     | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| GWC Network Devices GUI (changed) | <p>Feature A89007809 (IAW, IAC) modifies the following GUIs:</p> <ul style="list-style-type: none"> <li>• Network Configuration Panel is extended to pre-provision the two new data entries: NAT devices and Media Proxy devices.</li> <li>• GWC Provisioning Panel adds a tabbed pane “<b>MediaProxy</b>” in order to manage association/disassociation to MGs.</li> <li>• Associate Media Gateway window allows the user to associate a NAT with a Media Gateway.</li> </ul> |
| GWC Network Devices GUI (changed) | <p>Feature A00002644 (IAW, IAC) modifies these NAT browser GUIs within the GWC Network Devices GUI:</p> <ul style="list-style-type: none"> <li>• Maintenance Settings Panel</li> <li>• Change Maintenance Settings Dialog</li> <li>• Network Devices Panel, NATs tab</li> <li>• Add NAT middlebox Dialog</li> <li>• Delete NAT confirmation Dialog</li> </ul> <p>This feature also adds the NAT middlebox ID display dialog GUI.</p>                                           |
| XML Commands (changed, and new)   | <p>Feature A00002644 (IAW, IAC) modifies the following XML commands:</p> <ul style="list-style-type: none"> <li>• queryNAT</li> <li>• addNAT</li> </ul> <p>This feature also adds the following XML commands:</p> <ul style="list-style-type: none"> <li>• queryCallAgentId</li> <li>• setCallAgentId</li> </ul>                                                                                                                                                               |

| Affected Area                      | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| POLL CI command (changed)          | <p>Feature A00006226 (DMS) adds three new options to the POLL CI command:</p> <ul style="list-style-type: none"> <li>• POLL RESTORE_DEFAULTS allows the user to return the state of Table NTPOLL to its system default.</li> <li>• POLL DOSTEP xx allows the user to execute a single step from Table NTPOLL.</li> <li>• POLL DOSTEP xx allows the user to execute a single step from Table NTPOLL.</li> <li>• POLL PUSH (ON/OFF) allows the user to specify FTP storing of files on a remote system.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Call Forwarding for CEPT (changed) | <p>Feature A00006271 (DMS) makes available the activation, deactivation and interrogation of CFB per Key (Call Forwarding Busy per Key), CFD per Key (Call Forwarding Don't Answer per Key) and CFK (Call Forwarding Unconditional per Key) features based on the CEPT Dialing Sequence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CAPACITY MAPCI (changed)           | <p>Feature A00006693 (DMS, PT-AAL2) modifies the existing CAPACITY MAPCI level to provide a new IOCAP MAPCI level in XA-Core only. The new IOCAP level will provide IO utilization and IO messaging throughput information for HCMIC and HIOP IO cards. It includes the following new commands:</p> <ul style="list-style-type: none"> <li>• IOCAP--This new IOCAP MAPCI level will be giving the IO utilization values and messaging throughput information for each IO service type (CMIC, ETHR and AMDI). The information on this new MAPCI level will be updated once every minute.</li> <li>• QUIT--This new IOCAP QUIT command is available in XA-Core only and allows the user to exit IOCAP MAPCI.</li> <li>• IOMAX--This command displays the hourly high watermark value captured for each IO service type (CMIC, ETHR or AMDI). The value is captured every hour of day for the last 31 days. The data survives all types of restarts (warm, cold and reload).</li> <li>• IOAVG--This command displays the hourly average value captured for each IO service type (CMIC, ETHR or AMDI). The value is captured every hour of day for the last 31 days. The data survives all types of restarts (warm, cold and reload).</li> <li>• STATUS--This command displays all status information including current version of IOCAPCI tool, timestamp in terms of hour and minute, the current IO utilization values of all IO services (CMIC, ETHR, AMDI), the current value of the IO_WARNING_THRESHOLD office parm.</li> </ul> |

| Affected Area                                  | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NGSS Tomcat Web Server (changed)                        | <p>Feature A00006893 (UA-IP, PT-AAL2) modifies this GUI, which is an NGSS-specific management tool, as follows:</p> <ul style="list-style-type: none"> <li>• A new “Security” subfolder has been added to the Provisioning folder.</li> <li>• Under the “Security” subfolder a “Config Data” option has been added.</li> <li>• Clicking on the “Security Params” option brings up the Security Params configuration page.</li> <li>• Under the “Security” subfolder, a new “Certificates” subfolder has been added.</li> <li>• Under the “Certificates” subfolder, the “Server Certificate”, “Remote Trusted Certificate”, and “Add Remote Trusted Certificates” options have been added.</li> <li>• Clicking on the “Server Certificate” option brings up the Display Local Server Certificate page.</li> <li>• Clicking on the “Remote Trusted Certificates” option brings up the Certificates Provisioned page.</li> <li>• Clicking on the “Add Remote Trusted Certificates” option brings up the Add Trusted Certificate page.</li> <li>• Changes to the “Add Server” and “Modify Server” section of the SIP Gateway GUI allow for the provisioning of servers using the TLS protocol, in addition to the TCP and UDP protocols.</li> </ul> |
| Certificate Management Tool CLI Interface (changed)     | <p>Feature A00006893 (UA-IP, PT-AAL2) describes use of the certificate management tool that provides a common interface for provisioning certificates for use by Apache, Tomcat, and the NGSS Sip application. The tool provides the following functions:</p> <ul style="list-style-type: none"> <li>• Create a new self-signed certificate for the host.</li> <li>• Create a certificate signing request. The craftsperson would manually send the signing request to the Certificate Authority (CA) where it will be signed.</li> <li>• Provision a trusted certificate (CAcertificate) and a CA-signed certificate produced from the signing request.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| InterNodal Emergency Stand Alone for MG9K (new)         | <p>Feature A00006894 (UA-IP) provides the ability to make calls while in ESA for MG9K nodes. Telcos are also given the ability to provision a “Community of Interest” to define which MG9K nodes can make ESA calls between one another.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IEMS System Backup Command Rejection Error Dialog (new) | <p>Feature A00006979 (PT-IP, UA-IP, IAW) creates this new GUI which presents the user with a general error dialog when the user attempts to perform actions which are incompatible with Synchronous Backup Restore Manager activity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Affected Area                                 | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLUI for Synchronous Backup Restore Manager   | Feature A00006979 (PT-IP, UA-IP, IAW) creates this CLUI to invoke the Synchronous Backup Restore Manager. Once the user has entered the CLUI, only Synchronous Backup Restore Manager Commands are available to the user.                                                                                                                                                                                                                     |
| Core Element Manager (CEM) patching (changed) | Feature A00007024 (PT-IP, UA-IP, IAC, PT-AAL2) modifies the patchid for CEM patches from 8 characters up to 32 alpha-numeric characters. It also modifies the patch file format to implement the incremental cumulative nature of CEM patching.                                                                                                                                                                                               |
| Gateway Profile Categories (new)              | Feature A00007071 (IAW) defines two categories of profiles for customer use: <ul style="list-style-type: none"> <li>Nortel profiles are built into CMT software, are automatically populated in the "Nortel" certificate directory, and are not user modifiable.</li> <li>Third Party profiles are defined and created by Nortel Interop personnel. These profiles are flexible within the bounds of predefined fields and values.</li> </ul> |
| Change Gateway GUI (changed)                  | Feature A00007071 (IAW) modifies this GUI by adding new item "Change gateway profile" in the pick list.                                                                                                                                                                                                                                                                                                                                       |
| Change GW Profile OSSGate command (changed)   | Feature A00007071 (IAW) modifies the Change GW command to remove the Change Protocol command and support Change Profile only. It now provides a new choice of "mgProfile." This functionality would be used to assign a different profile to an existing GW.                                                                                                                                                                                  |
| Get Certificate List OSSGate command          | Feature A00007071 (IAW) introduces two commands that can be issued via the OSSGate interface.                                                                                                                                                                                                                                                                                                                                                 |
| Get Certificate Data OSSGate command (new)    | <ul style="list-style-type: none"> <li>Get Certificate List provides a means to retrieve profiles that have been imported into CMT software. Valid profile names are returned in a list and can be used with the associate GW command.</li> <li>Get Certificate Data will list the certificate that was used to generate a profile. This Certificate can be used to understand datafill options when creating a new GW.</li> </ul>            |
| Access to PMDebug (changed)                   | Feature A00007101 (PT-IP, UA-IP, IAW, PT-AAL2) replaces the existing login mechanism for accessing the PMDebug on the GWC (telnet to GWC IP address, "gonow", or use serial port) with a user-id/password login system which has a standard look and feel.                                                                                                                                                                                    |
| GWC Directory (new)                           | Feature A00007120 (PT-IP, PT-AAL2) creates a new MAPCI interface to monitor the availability of Announcement, Conference, Lawful Intercept and Packet Media Anchor resources subtending from a particular GWC. Posts the GWC peripherals and provides commands for viewing the status of GWC peripherals. No maintenance actions, such as BSY and RTS, can be performed from this MAP level.                                                  |

| Affected Area                                 | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Core Element Manager (CEM) patching (changed) | Feature A00007121 (UA-IP, PT-IP) creates a new MAPCI level, BRGTMCE, which allows the craftsperson to post the information for the IW bridges associated with a specific SPM. The user view dynamic usage/state and can perform maintenance functions on these bridges such as BSY and RTS.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Command Line Interface of SSPFS (changed)     | Feature A00007282 (PT-IP, PT-AAL2) modifies the SSPFS CLI to provide an additional option to change the login retries limit value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| USP GUI panel (changed)                       | <p>Feature A00007359 (PT-IP, UA-IP, IAC, IAW, PT-AAL2) modifies this GUI to support the delivery of USP security and audit logs to the IEMS syslog server. The user can provision the following parameters from the USP GUI panel to deliver the logs to syslog server:</p> <ul style="list-style-type: none"> <li>• Log-delivery Enable/Disable option.</li> <li>• Primary IP address of the IEMS server.</li> <li>• An optional backup/secondary IP address of the IEMS server.</li> <li>• Non-editable transport protocol used (i.e. UDP/TCP) to deliver the logs.</li> <li>• Non-editable port number [defaulted to 514].</li> <li>• Select the category of logs (i.e. security and audit logs) to be delivered.</li> </ul> |
| Network VCAC Provisioning                     | Feature A00007394 (CHS) introduces Network Virtual Call Admissions Control (Network VCAC), a Quality of Service (QoS) mechanism that allows the CS 2000 to cancel post-dial, pre-ringing calls that would overload a segment of the packet network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| New Platform Type value                       | Feature A00007404 (UA-IP, PT-AAL2) introduces a new platform type value of SCTY which can be queried as part of report generation from the NPM GUI or CLUI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| IAA modules GUIs (new)                        | <p>Feature A00007465 (IAC, DMS) creates the following GUIs:</p> <ul style="list-style-type: none"> <li>• Scheduler</li> <li>• RKS Output Destination--used to configure the downstream RKS pairs which the EMDA sends event messages as well as the protocol to use.</li> <li>• DF Output Destination--used to configure the downstream DF which the EMDA sends LI event messages as well as the protocol to use.</li> <li>• Global System Parameters--used to configure the NE providing the Accounting messages.</li> </ul>                                                                                                                                                                                                   |

| Affected Area                             | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IAA command (new)                         | Feature A00007465 (IAC, DMS) creates the <b>iaa_config</b> command which provides the user with a means to configure the IAA modules from the command line user interface (CLUI).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| GR70 functionality (changed)              | Feature A00007483 (DMS) provides a new means of securing GR740 TCP/IP connections between the OSS and the CBM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SDM Config level (changed)                | Feature A00007489 (DMS, PT-AAL2) modifies the SDM Config level by presenting a new configuration screen for selecting security servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SDM maintenance (changed)                 | Feature A00007492 (DMS, PT-AAL2) eliminates the requirement to be the <i>root</i> user in order to do SDM maintenance procedures. Two new user groups are created to enable increased authorization granularity: <ul style="list-style-type: none"> <li>• <b>emsadm</b> for system administration</li> <li>• <b>secadm</b> for security administration</li> </ul>                                                                                                                                                                                                                                                                                                                     |
| SDM maintenance user level (changed)      | Feature A00007492 (DMS, PT-AAL2) adds two new commands and modifies others as follows: <ul style="list-style-type: none"> <li>• Dispuser (new) enables the operator to display all the users on the system or to display information about a specific user.</li> <li>• Dispgrp (new) allows the operator to display all the role groups, the user in a specific role group and the actions that a specific role group can do.</li> <li>• Add and change commands are modified so that now they prompt the user for each piece of information needed to create a user. The information asked for includes the following items: primary groups, groups, shell, and password.</li> </ul> |
| PCES CI (new)                             | Feature A00007648 (IAC) introduces a new CI which is used to provision PacketCable surveillances. Refer to the Configuration section of the feature for details on available commands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| VERIFYLOAD command (new)                  | Feature A00007602 (DMS, PT-AAL2) introduces the VERIFYLOAD command to perform a signature check on the ESD load. The VERIFYLOAD command is packaged within the ESD load and is invoked manually from the command line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Product = CS 2000 Compact</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SAM21 EM 3PC provisioning Panel (changed) | Feature A00008431 (PT-IP, UA-IP, IAC, IAW, CHS, PT-AAL2) modifies this GUI which is used for provisioning a 3PC card by adding a new sub panel for provisioning GR backup WAN IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Affected Area                                                         | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Product = CS 2000 GWC</b>                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| GWC-EM Network Panel GUI (changed)                                    | Feature A00002512 (IAC, IAW) modifies this GUI by putting the existing three subsections into tabbed panes. VCAC Resource Usage data is provisioned via the new RU table in a fourth tab in the upper section. NATs are provisioned as before, except that the tab is renamed "IP-VPNs (Virtual NATs)" and a new field is added to provision a "Parent" (northbound neighbor) middlebox in the topology. LBLs are provisioned via a table in a new tab added to the central section of the Network Panel.                                                                                                                              |
| Gateway Controller Element Management GUI (changed)                   | Feature A00007102 (PT-IP, UA-IP, IAW, IAC, CHS, PT-AAL2) modifies this GUI with changes to the following panels: <ul style="list-style-type: none"> <li>GWC Network Display--modified to accommodate the C-Side IP addresses, which have been shifted here in respect of the requirement to have C-Side IP common to the entire network rather than to individual GWC's.</li> <li>GWC Display--modified in the "Controller" panel to remove the display for the Message Router IP address.</li> <li>Add GWC Node Interface--modified in the Add GWC Node Interface to remove the display for the Message Router IP address.</li> </ul> |
| New MAP level BRGMTCE                                                 | Feature A00007102 (PT-IP, UA-IP, IAW, IAC, CHS, PT-AAL2) introduces this new IW Bridge Maintenance MAP level to provide a method for deloading call processing from IW bridges. <b>Offl</b> , <b>Bsy</b> , <b>Rts</b> , <b>FrIs</b> , <b>Post</b> and <b>Next</b> commands will be provided at this command subdirectory.                                                                                                                                                                                                                                                                                                              |
| <b>Product = CS 2000 Management Tools</b>                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SESM OSSGate configuration (changed)                                  | Feature A00006269 (PT-IP) modifies the OSSGate configuration interface so that the user has to manually configure to turn on the OSSGate Password Control option. Once this option is turned on, when attempting to login to OSSGate, it will prompt for the username first and then the password; the password being entered will not be displayed to the screen.                                                                                                                                                                                                                                                                     |
| Line Maintenance Manager and Trunk Maintenance Manager GUIs (changed) | Feature A00006570 (UA-IP, PT-AAL2) modifies both of these GUIs under "Set CS CLLI" in LMM and under "CM CLLI" for TMM to let the user input SDM IP instead of CM CLLI to transfer to another core server.                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Affected Area                                                                                      | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Gateway Controller Element Management (GWCEM) GUI (changed) | <p>Feature A00007242 (IAW, IAC, CHS) modifies this GUI with changes to the following panels:</p> <ul style="list-style-type: none"> <li>• Network Devices Panel</li> <li>• Network Devices Panel, NATs tab</li> <li>• Network Devices Panel, LBLs tab</li> <li>• Add/change/delete NAT Dialogs</li> <li>• Add/change/delete LBL dialogs</li> <li>• change adjacent MB dialogs</li> <li>• change root mb dialogs</li> </ul> <p>It also creates the following sub-panel GUIs:</p> <ul style="list-style-type: none"> <li>• SPC provisioning network panel</li> <li>• Add/change/delete SPC dialogs</li> <li>• Network Zone tabbed Panel</li> <li>• Composite NAT/LBL zone tabbed Panel</li> <li>• Add/change/delete composite NAT/LBL zone dialogs</li> </ul> |
| XML Command (new)                                           | Feature A00007242 (IAW, IAC, CHS) creates the XML commands to Add/Change/Delete/Query Network Zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SIP messaging (changed)                                     | Feature A00007275 (PT-IP, PT-AAL2) implements light-weight thread-safe message queues for communicating between SIP Gateway Application threads, replacing the Unix Sockets and Inter-Process Communication (IPC) Message Queues used in Session Server Release 07. These new Message Queues provide the framework to make thread recovery and overload controls possible.                                                                                                                                                                                                                                                                                                                                                                                  |
| CS2K Mgmt Tools GUI (changed)                               | Feature A00007300 (PT-IP, UA-IP, CHS, PT-AAL2) modifies this GUI so the IPSec provisioning tab is now available for all GWC profiles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SAM21 EM GUI (changed)                                      | Feature A00007564 (UA-IP, PT-AAL2) modifies the “Equip” panel to include support for the MCPN 905 card.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SAM21 EM GUI (changed)                                      | <p>Feature A00007927 (UA-AAL1) modifies this GUI as follows:</p> <ul style="list-style-type: none"> <li>• change the label of “Administrative” to “Card Status” in every card view on SAM21 EM GUI</li> <li>• change the behavior of the EM on pulling/inserting the NSS card: if a Locked/Disabled NSS card is pulled, when it is re-inserted, the card will come back in Locked/Disabled status. However, if an Unlocked/Enabled NSS card is pulled, when it is re-inserted, SAM21 EM will automatically unlock this card.</li> </ul>                                                                                                                                                                                                                     |

| Affected Area                             | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| TOPSPOS POST command (changed)            | Feature A00007713 (PT-IP, DMS) modifies POST command under TOPSPOS to add parameter AC which creates a post set of all in-service IP positions with voice auto-compression turned on. The listset command is then used to display the position list.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Product = CICM</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CICM EM system status page (changed)      | Feature A00003953 (CHS) modifies the “virtual media gateways” section of this GUI so that the states are no longer displayed as In Service, Out of Service, Hot Standby, or Stopped. Instead, it now splits the active vs. inactive state of the component from the overall VMG state to make things clearer and more explicit. On the maintenance page, the “VMG status” combines this information into a summary and now reports the status as one of these: Active (in service), Active (out of service), Inactive (in sync), Inactive (out of sync), Swacting master to slave, Swacting slave to master, or Stopped.                                                                  |
| CICM EM maintenance status page (changed) | Feature A00003953 (CHS) modifies this GUI as follows: <ul style="list-style-type: none"> <li>• The “Node status” field is renamed as “Status.”</li> <li>• A new “VMG status” field shows the current state of the virtual media gateway component on the node in question.</li> <li>• Related to the VMG and just beneath it is the “Active half calls” field.</li> <li>• Similarly, the “Terminals status” field shows the overall state of this component</li> <li>• When the Terminals component on the node is active, two other fields appear: active terminals, and Logged-in users.</li> <li>• During a SWACT, a “Terminals recovered” field appears to track progress.</li> </ul> |
| GWC-EM Gateways GUI (changed)             | Feature A00004981 (IAW, IAC) modifies this GUI to display the rootMiddleboxes that are provisioned against the CICM gateways and modifies these sub-panels: <ul style="list-style-type: none"> <li>• Associate Media Gateway Dialog, modified to display a new internet transparency panel when a CICM gateway has been selected.</li> <li>• Change Gateway Dialog, modified to allow the user to modify (or remove) the Root Middleboxes associated with an already provisioned CICM gateway.</li> </ul>                                                                                                                                                                                 |

| Affected Area                    | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| XML Commands (changed)           | <p>Feature A00004981 (IAW, IAC) modifies the following XML commands:</p> <ul style="list-style-type: none"> <li>• AssocMG, to allow/display root middleboxes.</li> <li>• ChangeRootMiddleBoxes, new interface added.</li> <li>• QueryMG, to allow/display root middleboxes.</li> </ul>                                                                                                                                                                                                                                                                                                 |
| <b>Product = Integrated EMS</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IEMS Client GUI (changed)        | <p>Feature A00006756 (UA-IP) modifies the CreateUser Wizard to prompt for additional User Attributes, such as descriptive text about the user, days required between password changes, when the warning appears before password expiration, allowed days of inactivity before the account is disabled, and the login shell that is invoked after a successful login.</p>                                                                                                                                                                                                               |
| IEMS Secure Launch to PP8600     | <p>Feature A00006757 (UA-IP) defines security measures to be applied to communications between Succession management applications (IEMS and JDM) and the Passport 8600 Routing Switch. Configuration procedures are provided.</p>                                                                                                                                                                                                                                                                                                                                                      |
| IEMS Secure Launch to PP8600     | <p>Feature A00006759 (UA-IP) explains the functional details of X11 Port Forwarding for MDM in IEMS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CEM integrated to IEMS (changed) | <p>Feature A00007304 (UA-IP) covers the installation of the CEM server onto the IEMS server and installation of the CEM components on the SDM and CBM.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MS2000 CLUI (changed)            | <p>Feature A00007341 (UA-IP, PT-AAL2) migrates the existing functionality of the MS2000 CLUI to reside on the IEMS platform. The following is newly added for SN08:</p> <ul style="list-style-type: none"> <li>• The MS2000 EM will make use of the existing IEMS audit logging functionality to provide a log of what user issued a command against an MS2000 node.</li> <li>• The MS2000 EM will make use of the existing IEMS alarming system to generate an alarm against the EM whenever a configuration of maintenance action by the EM has an unrecoverable failure.</li> </ul> |

| Affected Area                                                          | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MDM Manager GUI on IEMS (changed)                                      | <p>Feature A00007345 (UA-IP) modifies the MDM Manager GUI within IEMS as follows:</p> <ul style="list-style-type: none"> <li>• New menu item “MDM Operator Client GUI” is available on the right click of the Map Symbol of Preside MDM Mgr.</li> <li>• New menu item “Legacy MDM Tools” is available on the right click of the Map Symbol of Preside MDM Mgr. Since “LegacyMDMTools” has the same functionality of “MDM GUI Mgr”, the menu “MDM GUI Mgr” is disabled in SN08.</li> <li>• New menu item “Command Line” is available on the right click of the Map Symbol of Preside MDM Mgr which initiates one-step login between the IEMS Client and the Preside MDM Server.</li> </ul>                                                                                                                                                                                                                                                                             |
| MCS System Manager and MCS Fault Performance Manager on IEMS (changed) | <p>Feature A00007346 (UA-IP) modifies the MCS System-related GUIs within IEMS as follows:</p> <ul style="list-style-type: none"> <li>• System Managers are shown under the “Element Manager” node of the topology tree. Logical System Managers are parents to Physical SMs.</li> <li>• An independent MCS system may be managing an RTP Media Portal in which case the parent object representing the entire MCS System will be an RTP Media Portal object in the “Network Elements” folder.</li> <li>• The “Add EM” GUI allows the user to select a Simplex or Duplex MCS System which then prompts for either 1 or 2 IP addresses, respectively. It also allows the user to provision an FPM and associate it to a known MCS SM.</li> <li>• A new device called the Fault Performance Manager (FPM) is introduced in SN08. This will supplement the MCS SM in very large COs. The FPMs that supplement the SM will need to be added manually into IEMS.</li> </ul> |
| IEMS alarm properties (changed)                                        | <p>Feature A00007347 (UA-IP) adds a new alarmClear property in the IEMS Alarm Properties Dialog to identify manually clearable and non clearable alarms.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IEMS Performance interface (changed)                                   | <p>Feature A00007388 (UA-IP) adds triggering support to the IEMS Performance interface to speed data collection, reports, and transfer to OSS. Report jobs can be run from a scheduled mode or a triggered mode based on the collection job. Transfer jobs can occur from a scheduled mode or a triggered mode based on the report job.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| MFT Backend Security Add User Wizard (changed)   | <p>Feature A00007785 (UA-IP) enhances the MFT Backend Security Add User Wizard as follows:</p> <ul style="list-style-type: none"> <li>In the second screen the account expiry is now an absolute date, not number of days from user creation. Also, the password expiry field now indicates how often (number of days) the user password will expire and not how soon the next password expiry will occur.</li> <li>In the Advanced properties screen (from the “Advanced” button on the third screen) the following additional user attributes are now present: <ul style="list-style-type: none"> <li>UID is a read-only UID value for existing accounts.</li> <li>GID is selected from a drop-down menu. The default primary GID is “succssn” for all users added.</li> <li>GECOS can accept any information, such as the actual full name of the user.</li> <li>LoginShell allows the administrator to select “no-access” or “restricted” options for each user.</li> <li>Home Directory depends on the Login Shell selected.</li> <li>MIIN is the minimum number of days required between password changes.</li> <li>Password Expiry Date is a read-only field which will indicate the absolute date on which the current password for the user expires</li> <li>LastChange shows the absolute date on which the password was most recently changed.</li> </ul> </li> </ul> |
| Configuring RADIUS secret through IEMS (changed) | <p>Feature A00007786 (UA-IP) provides an overview of configuring RADIUS secret through IEMS client in one step. All provisioning of RADIUS device parameters including add, modify and delete will be supported while the RADIUS Server is running. The RADIUS device types supported for SN08 are IEMS, MG9k, Passport and PP8600.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Product = MG 9000</b>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MG9K security (changed)                          | <p>Feature A00005561 (UA-IP) implements IP security and user authentication capabilities on the MG9K to ensure that all users are validated before access is granted, and that all IP traffic between the MG9K and a remote peer (Element Manager or Gateway Controller) is authenticated through a RADIUS client/server network. The MG9K Security parameters can be configured from the LCI at initial commissioning or from the Element Manager.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Affected Area                                                                                                                                 | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| IPSec for MG9K EM (changed)                                                                                                                   | Feature A00005646 (UA-IP) implements IPSec for MG9000 Element Manager to MG9000 Line Gateway OAMP communications. The craftsperson will be able to independently manage IPSec parameters for all OAM&P communications to and from MG9000 network elements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Security View GUI for MG9K EM (new)<br><br>Office Wide Defaults View GUI for MG9K EM (changed)<br><br>SLOA GUI<br><br>SSPFS Security web page | <p>Feature A00005646 (UA-IP) creates a new Security View GUI available from the MG9000 EM subnet. This GUI will manage the IPSec (and Internet Key Exchange) configuration file(s) that are used to set up security associations, keys, and protection mechanisms.</p> <p>This feature also modifies the Office Wide Defaults View to support IPSec. This will enable the customer to configure one set of IPSec parameters and have them applied to all, or a subset of, the provisioned MG9000s. The three parameters are Security OFF/ON, IKE preshared key, IKE time to live.</p> <p>The SLOA GUI is used to define security parameters to be used in securing the call control link between the VMG and the gateway controller. Added to the GW Controller Config tab will be a section for Security with parameters of Security OFF/ON or OfficeWide Default, IKE preshared key, IKE time to live.</p> <p>The SSPFS Security web page is used to define security parameters to secure communications into and out from this SSPFS Machine. This includes MG9000 Element Manager to MG9000 OAM&amp;P communications.</p> |
| Passport 15K for ESA on MG9K (changed)                                                                                                        | Feature A00006894 (UA-IP) describes the configuration and provisioning needed for ESA for MG9K. The inter-MG9000 communication will be provided by the Passport 15000 switch, using the Virtual Router capability to route the IP-based ESA traffic between MG9K gateways.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DCC and ITP cards                                                                                                                             | Feature A00006906 (UA-IP) introduces the capability for the NY45FA GiGE DCC circuit pack to connect to an International standard Synchronization Supply Unit (SSU) using 2048kHz interfaces. The NY45FA can use an SSU or BITS signal as a timing reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| IPSec for MG9K EM (changed)                                                                                                                   | Feature A00006906 (UA-IP) introduces the capability for the NY45FA GiGE DCC circuit pack to connect to an International standard Synchronization Supply Unit (SSU) using 2048kHz interfaces. The NY45FA can use an SSU or BITS signal as a timing reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Affected Area                                                   | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| GIGE GUIs (new)                                                 | <p>Feature A00007000 (UA-IP) introduces the following GUIs:</p> <ul style="list-style-type: none"> <li>GigECardView--Each SCG card has four ports. The card view can be opened from the shelf view. The card view shows totally four ilog graphics for the ports. Clicking on each of them opens the GigePortView.</li> <li>GigEPortView--The GigePortView will be opened when the user double clicks on the SCG card's port icon in the card view. The port view displays port/link attributes and its provisioning information.</li> <li>GigELinkProtection--The Link protection can be invoked from the shelfview. The user will be able to specify the protection group number, protection group type, working (preferred) link and protected (non-preferred) link. In SN08, only one protection group of type 1:1 is supported.</li> <li>BandWidthManager--. The bandwidth manager panel can be viewed from the Services submenu. The following network interface bandwidth data will be monitored: current ITP voice usage, current ABI voice usage and Overall network interface utilization. The data will be displayed in bits/second for GIGE systems. Bandwidth partitioning will also be supported in GIGE.</li> <li>VLAN--VLAN provisioning data is accessed from the 'VLAN provisioning' view in the shelf view. There are a total of four VLAN IDs in SN08 release.</li> <li>LinkIntegrityView--The Link Integrity test can be invoked from the shelfview Maintenance submenu 'Link Integrity View'. The link integrity test will be run on a protection group.</li> </ul> |
| GIGE GUIs (changed)                                             | <p>Feature A00007000 (UA-IP) modifies the Performance Browser GUI to introduce Generic OM, Ethernet OM, RMON and PM data. The SMON data related to the VLAN is also displayed in the performance browser.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MG9K EM GUI (changed)                                           | <p>Feature A00007140 (UA-IP, PT-AAL2) modifies the "MG Upgrade Wizard" portion of this GUI during a nodal upgrade as follows:</p> <ul style="list-style-type: none"> <li>The wizard asks the user if the EM should perform a "prep download" or a "complete upgrade".</li> <li>"XDSL Cards" and "MTA Cards" are added as choices in the "Card Type Selection" panel.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| GWC Upgrade Tool GUI (new)<br><br>CallServer Upgrade Tool (new) | <p>Feature A00007140 (UA-IP, PT-AAL2) creates a new GWC Upgrade Tool GUI and a new CallServer Upgrade Tool GUI. The tools provide a pure CLI for the customer or upper-level coordinator to invoke upgrade functionalities, plus an interactive CLUI for easy use of the tools.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Affected Area                            | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Configure Collection Interval (new)      | Feature A00007213 (UA-IP) introduces this GUI to configure Sample and Summary intervals uniformly for all the MG9Ks in a Subnet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Performance Statistics Browser (changed) | Feature A00007213 (UA-IP) modifies this GUI so that the two date range fields also show dates in steps of 5 minutes, in addition to the existing displays of 15 minutes and 1 day.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Performance Measurements (changed)       | <p>Feature A00007213 (UA-IP) modifies the following information elements in SN08:</p> <ul style="list-style-type: none"><li>• Collection Interval: Periodic collection interval may be configured to a combination of Sample and Summary intervals. In SN08, “5/30 Minutes” and “15 Minutes” are supported.</li><li>• OSS delivery (and interface) or Local only: OM Collector sends appropriate CORBA notification whenever it succeeds or fails to generate CSV file.</li><li>• OSS Collection Interval: As and when CSV file is generated, OM Collector sends a CORBA notification. OSS can use appropriate mechanism to collect CSV file as and when it receives this notification.</li><li>• File Name: Directory wherein CSV are generated, are configurable in SN08.</li></ul> |

| Affected Area                              | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GigE Network Interface (changed)           | <p>Feature A00007263 (UA-IP) modifies the LCI software to support the new Gigabit Ethernet Network Interface for MG9K. Modifications include the following:</p> <ul style="list-style-type: none"> <li>• Card maintenance of the SCG card</li> <li>• Carrier maintenance – where the GigE link can be: <ul style="list-style-type: none"> <li>— Provisioned – also includes the ability to request for auto-negotiation.</li> <li>— Controlled – the admin and config state of the links can be controlled.</li> <li>— Status can be viewed – the alarm(s) on the links will be displayed.</li> <li>— Perform OOS (Out of Service) test and monitor Link-Integrity.</li> <li>— Have Link Protection – to be able to set the working (preferred) and non-working (non-preferred) links and also enable/disable link-reversion.</li> </ul> </li> <li>• Connection side changes -- VLAN – to be able to provision (set the VLAN ids.), shape (set the peak rate) and also prioritize the different types of VLANS (OAMP, Bearer, Call-Control and for the fixed IP addresses of the SCG cards) from the connections button on the LCI.</li> <li>• Dynamic updating of the alarm severities at the N.E and Net.Carrier links on LCI.</li> <li>• Update several terms applicable to GigE.</li> </ul> |
| Internodal ESA Configuration (new)         | <p>Feature A00007415 (UA-IP) creates this GUI to allow the customer to configure communities of interest. Internodal ESA allows groupings of MG nodes into “communities of interest” (COI). All nodes in a community can communicate with each other during ESA, allowing calls to complete inside the community during ESA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Line Coefficient View (changed)            | <p>Feature A00008387 (UA-IP) modifies this GUI to display the Line Coefficient information in a table format. It also adds 8 new fields: PEC, Country Info, CRAM, Vinetic version, Loop Info, Metering, Service Type, and Default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Bulk Provisioning Service Types View (new) | <p>Feature A00008387 (UA-IP) creates this GUI to bulk provision all the line circuits on a GLC card to the same service type. This GUI is only enabled when the card is deprovisioned.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Affected Area                                                         | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Product = Network Patch Manager (NPM)</b>                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p>PFRS configuration (changed)</p> <p>NPM GUI and CLUI (changed)</p> | <p>Feature A00006901 (PT-IP, UA-IP, IAC, PT-AAL2) makes the following changes:</p> <ul style="list-style-type: none"> <li>• Moves PFRS configuration from the CLI tool into the NPM GUI and CLUI.</li> <li>• The user may now set up the PFRS drop box information via a preferences window in the NPM GUI and via a preferences command in the NPM CLUI.</li> <li>• The user may also execute a PFRS GENREPORT and a PFRS GETPATCH on demand through the NPM.</li> <li>• The user may also execute a PFRS GENREPORT and a PFRS GETPATCH on demand through the NPM.</li> <li>• This feature also provides new functionality for the PFRS user. The user can now decide if they would like the NPM to “clean up” or delete patches from the drop box that have been transferred to the NPM after the PFRSGETPATCH task has been executed.</li> <li>• The NPM GUI has been modified to include a new “View” button on specific NPM GUI panels and a new PatchFile Retrieval Preferences tab as part of the Preferences GUI.</li> <li>• System defined information in the NPM GUI can now only be viewed and cannot be edited.</li> <li>• A new refine or filter button will be available on the NPM GUI which will allow the user to quickly determine which patch(es) are applicable to which device(s) and vice versa.</li> <li>• A process monitor has been added to the NPM GUI which will provide a visual indicator to the user that a submitted request is in progress. This monitor will be specific to each instance of the NPM GUI and will not indicate activity of multiple GUIs.</li> <li>• The CM CLLI will appear on each NPM GUI window. This will provide clarification when the user is performing patching operations on multiple offices.</li> </ul> |

### Servord changes overview

The following Service Order items are new or changed for SN08. More complete descriptions will appear in the Feature Deltas section of this document.

| Area                     | New or changed | ServOrd Description                                                                                                                                                                                                                     |
|--------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b> |                |                                                                                                                                                                                                                                         |
| OPTION                   | New prompt     | Per feature A00006731 (DMS), new line option EOF can be assigned to an LCC of IBN, enabling the subscriber on the assigned line to exit on flash.                                                                                       |
|                          | New prompt     | Feature A000059039138 (DMS) creates a new SERVORD prompt called MWT_ANNOUNCEMENT.                                                                                                                                                       |
| ADO command              | Changed        | Feature A00007244 (UA-IP, IAW) allows the assignment of options GIC (group intercom) and/or GIAC (group intercom all call) to a Meridian Business Set (MBS) using the ADO command.                                                      |
| ADO command              | Changed        | Feature A00007253 (UA-IP, IAW) allows the addition of MADN Ring Forward to an existing SCA MADN line using the ADO command. The system prompts the end user for the MRF_RING option to assign special ringing to the MADN group member. |

### Office Parameter changes overview

The following office parameters are new or changed for SN08. More complete descriptions will appear in the Feature Deltas section of this document.

#### Summary of new/changed Office Parameters for SN08

| Status                   | Name                     | Description                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b> |                          |                                                                                                                                                                                                                                                                                                                                                                                        |
| New                      | IO_WARNING_THRE<br>SHOLD | Feature A00006693 (DMS, PT-AAL2) creates this parameter in Table OFCENG to define a utilization warning threshold for all IO service types (CMIC, ETHR, AMDI) in the system. The IOCAP monitoring toolset uses the value of this parameter to peg the IOTHRESH register of the IOCAP OM whenever the IO utilization level of any IO service has exceeded this threshold on the switch. |

**Summary of new/changed Office Parameters for SN08**

| Status                        | Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New                           | OSS_PROV_VERSION         | <p>Feature A00006780 (UA-IP, IAW, CHS) creates this parameter in Table OFCVAR to enable/disable the Line Query Commands enhancements. The default value is always SN07, which ensures that the user needs to explicitly change the value from SN07 to any other value in the permitted range of values, to get access to functionality provided by feature code which enhances Line Query Commands. In the process, the Warning messages the user gets will ensure that the new functionality is enabled, only after upgrading the OSS software for the switch to be in sync with the command enhancements.</p> <p>Refer to the section on Commands/User Interface for more information on the QOSSVER command.</p> |
| Changed                       | SITELABEL                | <p>Per CR Q00720293, SITELABEL in Table OFCVAR now obtains the SWREL value from the actual product load of the switch. This value is not transferred with an ONP. The NCSxx/UCSxx names are no longer used for the actual load names. They are now all SNxx. The value can be observed by using the command IMAGENAME.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Product = CS 2000 TOPS</b> |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Deleted                       | (See description column) | <p>Feature A00007271 (PT-IP) verifies that office parameters LANG_ERROR_SCREEN_DISPLAY, ADAS_ENABLE, and DA_BP_HOTEL_ROOM_REQUIRED were deleted in SN08, and that office parameters OPR_0PLUS_3RD_DISPLAY, OPR_0PLUS_COL_DISPLAY, OPR_0PLUS_3RDCON_DISPLAY, OPR_0PLUS_CLDCON_DISPLAY, TOPSACD_DASERV_INSTANCE, and TOPSACD_INTCSEV_INSTANCE were deleted in SN08.</p>                                                                                                                                                                                                                                                                                                                                               |

### OM/PM changes overview

The following OMs/PMs are new or changed for SN08. They also appear in the OMs/PMs-by-product tables later in this document with lists of registers and descriptions.

#### Summary of new or changed OMs/PMs for SN08

| OM Group or PM name               | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = Call Server 2000</b> |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MNGEMLNK<br><br>MNGEMTRF          | New            | <p>Feature A00004741 (PT-IP, UA-IP) creates the following OM groups for IW-IP nodes:</p> <ul style="list-style-type: none"> <li>• MNGEMLNK (Multiservice Node Gigabit Ethernet Module Link Bandwidth Engineering) provides Gigabit Ethernet Link usage statistics to assist with network bandwidth Engineering. In this OM group, the pegs include: <ul style="list-style-type: none"> <li>— The number of packets/octets transmitted/received on the Gigabit Ethernet Link connected to a MG4K-IP/IW-IP node.</li> <li>— The number of packets/octets transmitted/received with different types of error.</li> </ul> </li> <li>• MNGEMTRF (Multiservice Node Gigabit Ethernet Module Traffic Engineering) provides statistics of Nodal traffic usage. In this OM group, the pegs include: <ul style="list-style-type: none"> <li>— The number of RTP packets/octets transmitted/received for bearer traffic.</li> <li>— The number packets/octets transmitted/received for different types of connections.</li> </ul> </li> </ul> |
| IOCAP                             | New            | Feature A00006693 (DMS, PT-AAL2) creates OM group IOCAP to provide information on IO capacity such as utilization and utilization high watermark and IO throughput information on a per IO service type (CMIC, ETHR and AMDI).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Summary of new or changed OMs/PMs for SN08**

| OM Group or PM name                  | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRK2NET1<br>TRK2NET2                 | Changed        | Feature A00006780 (UA-IP, IAW, CHS) enhances OM groups TRK2NET1 and TRK2NET2 so that tuples are allocated for all bearer networks provisioned in table BEARNETS for each Trunk Group datafilled in table TRKGRP, even if there are no Trunk Members against the Trunk Group in a bearer network. This results in pegging attempts to access a trunk member of a bearer type which is not provisioned in order to assist in engineering of multi-bearer trunk groups.                                                                                                                            |
| PKTMA                                | New            | Feature A00007120 (UA-IP, PT-AAL2) introduces OM group Packet Media Anchor (PKTMA) with three registers to track usage counts for Dynamic Packet Trunk Anchor resources on a GWC basis.                                                                                                                                                                                                                                                                                                                                                                                                         |
| DPTOFC<br>DPTNODE<br>DPTOFCP         | Changed        | Feature A00007135 (UA-IP) enhances OM groups DPTOFC, DPTNODE, and DPTOFCP as follows: <ul style="list-style-type: none"> <li>For registers DPTNODE::DPTGTAT and DPTOFC::DPGTAT/DPGTAT2, the pegging is changed such that both the nodal level and the office level are counted at the same point (except in cases where the code exits prior to knowing a particular node).</li> <li>The DPTOFC::DPGTFLO/DPGTFLO2 registers &amp; DPTNODE::DPTGTFLO registers will be changed such that failed optimized attempts on nodes "not DPT-enabled" are not pegged against these registers.</li> </ul> |
| TRK<br>TRNK2<br>TRK2NET1<br>TRK2NET2 | Changed        | Feature A00007135 (UA-IP) clarifies the use of register MAXBU in DPT trunk groups. Register MAXBU is effectively disabled for DPT trunk groups. The value of the MAXBU register for a DPT trunk group will always be equal to zero. The MAXBU register was designed to be used with non-DPT trunks. The DPTOFC and DPTNODE usage registers and high water registers are directly applicable to DPT trunks and should be used in the place of the MAXBU register.                                                                                                                                |

**Summary of new or changed OMs/PMs for SN08**

| OM Group or PM name                                 | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PCEM                                                | New            | <p>Feature A00007196 (IAC) introduces OM group Packet Cable Event Messaging (PCEM) which pegs a success or failure for every event message generated by the core for Accounting with the following registers:</p> <ul style="list-style-type: none"> <li>• EMENT--Event message successfully generated.</li> <li>• EMFAIL--Failed to build event message.</li> <li>• EMSYSFL--System unable to send event message.</li> <li>• EMENT2--Overflow register for EMENT</li> <li>• EMFAIL2--Overflow register for EMFAIL.</li> <li>• EMSYSFL2--Overflow register for EMSYSFL</li> </ul>                                                                        |
| SIPGW_CALL<br>P<br>SIPGW_SERV<br>ICES<br>SIPGW_MISC | Changed        | <p>Feature A00007268 (PT-IP, PT-AAL2) enhances these OM groups to track measurements based on SIPLINK. It also enhances OMSHOW to support querying of OM peg counts based on tuples.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SIPGW_CALL<br>P                                     | Changed        | <p>Feature A00007270 (PT-IP, PT-AAL2) adds new register OVRLD_CALLS_REJECTED to this OM group to track the number of incoming calls that are rejected due to SIP CallP being in overload.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Session Policy<br>Controller<br>(SPC) OMs           | New            | <p>Feature A00007393 (CHS) creates the following OM:</p> <ul style="list-style-type: none"> <li>• SPC Reservation Request--records reservation request events on the SPC signaling interface.</li> <li>• SPC Commit Request--records commit request events on the SPC signaling interface.</li> <li>• SPC Deletion Request--records deletion request events on the SPC signaling interface.</li> <li>• SPC CallP--records SPC CallP OM.</li> <li>• Topology Update--records topology update event in the topology manager.</li> <li>• CAC Request on Network Segment--is a per-instance OM that records CAC requests to each network segment.</li> </ul> |

## Summary of new or changed OMs/PMs for SN08

| OM Group or PM name | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IAA modules OMs     | New            | <p>Feature A00007465 (IAC, DMS) creates the following OMs:</p> <ul style="list-style-type: none"> <li>• Records In</li> <li>• Records Out</li> <li>• Channel Type (EMDA Module Only)</li> <li>• Channel ID (EMDA Module Only)</li> <li>• Events Sent (EMDA Module Only)</li> <li>• Acknowledgements Received (EMDA Module Only)</li> <li>• Events Retransmitted (EMDA Module only)</li> <li>• Events Written to File (EMDA Module only)</li> <li>• Events Rejected (EMDA Module Only)</li> <li>• Last Event Message Header Sequence Number (EMDA Module Only)</li> </ul>                                             |
| UNBMISC             | Changed        | <p>Feature A00007548 (IAC) describes these registers that are used by PCES:</p> <ul style="list-style-type: none"> <li>• RELCPCTY counts the number of monitored calls for which monitoring was stopped because monitoring capacity is exceeded.</li> <li>• RELNMON counts the number of calls for which monitoring was stopped because of non-monitorable features. <b>All features supported by the CS2K PacketCable solution are monitorable.</b></li> <li>• UNBMCALL counts the number of calls monitored by USNBD. Register UNBMCALL determines the real-time impact monitored calls make on the CM.</li> </ul> |
| TRK                 | Changed        | Feature A00008350 (PT-IP, PT-AAL2) adds new register MIDFAIL to provide established bearer path failure counts on a per-trunk group basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TRNK2               | Changed        | Feature A00008350 (PT-IP, PT-AAL2) adds new register MIDFAIL2 as an extension register of MIDFAIL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TRK2NET1            | Changed        | Feature A00008350 (PT-IP, PT-AAL2) adds new register MIDFAIL3 to provide established bearer path failure counts on a per-bearer network per-trunk group basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Software Optionality Control (SOC) changes overview**

The following SOC information is new or changed for SN08. More complete descriptions appear in the Feature Deltas section of this document.

**Summary of new or changed SOC information for SN08**

| SOC code                 | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b> |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SVBI0035                 | New            | Feature A00007383 (DMS) creates tracked SOC DNH Pilot Enhancement to track the DNH Pilot Number for CLI and Billing.                                                                                                                                                                                                                                                                                                                                                                              |
| MCD00002                 | New            | Feature A00007709 (DMS) creates this SOC to provide the presence-indication and call logging services for non-MCS (i.e., switch-based) subscribers. It does so by adding incremental AIN support for CONTINUE response to the AIN 0.1 Off Hook Delay (OHD) trigger query message. The SOC option MCD00002 is dependent on AIN Essentials software; order code AIN00006. It may only be enabled and used in conjunction with MCS Converged Desktop and is not supported for any other application. |

**Summary of new or changed SOC information for SN08**

| <b>SOC code</b> | <b>New or Changed</b> | <b>Description</b>                                                                                                                                                                                                                                                                            |
|-----------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NBD00005        | New                   | Feature A00007548 (IAC) creates this SOC to support PCES, and it has been added into the NBD SOC group. NBD00005 requires NBD00003 (USNBD) to have SOC state ON.                                                                                                                              |
| NTS00030        | New                   | Feature A00007934 (DMS, PT-AAL2) creates this SOC, "E800 Pretran Mapping." This SOC is always at ON state and does not control the feature functionality. This SOC has an RTU of A/P (Always Present) and the state cannot be changed to IDLE. SOC NTS00030 requires SOC NTS00005, "E800-US". |

# Integrated EMS Functionality

## Integrated EMS Northbound Interfaces

### General Information

The Integrated EMS provides a consolidated location to manage the Fault, Configuration, Performance Collection and Security account domains for devices (Network Elements, Element Managers, Management Applications and Platforms) in a CS 2000 central office. A brief description of its capabilities include the following:

- **Topology:** The Integrated EMS provides a graphical representation of the managed devices in a central office. The IEMS client comes with default views (Network Elements, Element Managers, Applications and Platforms) of the managed network and provides flexible interfaces that allow a craftsperson to create customized views of the network. The alarm state of each of the managed devices in the Integrated EMS topology is dynamically depicted by the associated background color (Red= Critical, Red=Major, Amber=Minor, Yellow=Warning, Green=Clear) of the managed device.
- **Fault:** The Integrated EMS aggregates the event streams received from the various EMSs, NEs, applications, and platforms that it manages. It normalizes the events received from these streams and forwards the events over its northbound interfaces (such as SCC2, NTSTD, SNMP, and SYSLOG). The Integrated EMS alarm and event browsers provide a consolidated real-time and historical view of the events that have occurred in a CS 2000 central office. It provides tools to view and page through the events and alarms in a common graphical interface. The Alarm and event browsers provide a wide range of features to manage, sort, filter and view events in a single centralized location. For detailed information on the IEMS fault management features please refer to the Integrated EMS Fault Management document (NN10334-911).
- **Performance:** The Integrated EMS provides a centralized location for collecting, storing and forwarding performance data in a CS 2000 central office. Its performance collection sub-system provides some basic tools for viewing and graphing the collected performance attributes. In addition, it

does provide interfaces to configure the generation of threshold alarms for the collected Operation Measurement data. For detailed information on the IEMS performance management features please refer to the Integrated EMS Performance Management document (NN10327-711).

- **Configuration:** The Integrated EMS provides a centralized location to launch the various Succession Configuration management interfaces. For detailed information on the IEMS performance management features please refer to the Integrated EMS Configuration Management document (NN10330-511).
- **Security:** The Integrated EMS provides a centralized graphical interface to configure and manage the user accounts in a Succession Central Office. The Integrated EMS Security subsystem provides centralized authentication and authorization server for many of its managed devices. It also provides centralized security logging for successful and failed authentications. In addition it provides Single Sign-on support enabling a user to log in to the IEMS client once and access multiple Succession Management interfaces without requiring the user to re-enter a userid and password. For detailed information on the IEMS Security management features please refer to the Integrated EMS Security and Administration document (NN10336-611).

## IEMS Northbound Fault Interface

### User Setup, Administration, and Customization of Views

For information on initial setup and customization of the Northbound fault feed from IEMS see:

- IEMS Fault Management Guide - NN10334-911

### Device Fault Mapping References for Northbound Interface

The following table shows the log identification criteria for each device, manager, and application supported by IEMS. Log references for table entries defined in *italics* can be found in:

NN10275-909 - Succession Fault Management Logs Reference (volumes 1-3)

See the table below for additional fault documentation

## IEMS Northbound Fault Specifications

Fault events are available from any of four Northbound interfaces. Log formats supported in this release are: NTSTD, SCC2, Syslog, and SNMP. A description of each of these interfaces is given in the sections that follow.

OSS clients can receive faults in **SCC2** and **NTSTD** formats from IEMS by initiating a TCP socket connection to designated ports on the IEMS server. When a connection attempt is made by a remote host, the IEMS validates the connecting OSS as an authorized client. It then forwards all logs that satisfy

the configured filter criteria to the OSS. The port numbers and remote clients eligible to connect to these log streams are configured by the administrator.

**Note:** In legacy environments, the **ECORE** option was used to include the originating node name in the log header for SCC2 and NTSTD formats. This option is NOT supported with Nortel Networks Carrier VoIP solution. All references to **ECORE** in the following sections will assume this option is disabled.

Faults can be delivered to hosts via **SNMP** by configuring the IP address and port of the remote management application.

**Note 1:** By default, the following attribute values are used for configuring **SNMP** northbound fault feed. The administrator can change the above attribute values. Refer to the “Changing **SNMP** attributes for **SNMP** fault feeds” section to modify these values.

**Note 2:** • **SNMP port:** 8001

**Note 3:** • **read community:** public

**Note 4:** • **write community:** public

**Note 5:** • **SNMP version:** v2c

The standard **Syslog** interface can also be configured as a fault stream for remote management systems.

The following table summarizes the characteristics of the four Northbound fault feeds from IEMS.

**IEMS Northbound Fault Stream Characteristics**

| <b>Fault format</b> | <b>Port</b> | <b>OSS Connection</b>                              | <b>Stream type</b>          | <b>IEMS Config required</b> |
|---------------------|-------------|----------------------------------------------------|-----------------------------|-----------------------------|
| NTSTD               | 8555        | Incoming. IEMS waits for connection by remote host | ASCII stream over TCP, push | OSS IP address or hostname  |
| SCC2                | 8556        | Incoming. IEMS waits for connection by remote host | ASCII stream over TCP, push | OSS IP address or hostname  |

| Fault format | Port                                     | OSS Connection                                                                                                                                                                                                                                                                                                                                                             | Stream type                  | IEMS Config required                                                                                                                                                        |
|--------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNMP         | user-defined on remote listener          | IEMS forwards SNMP faults as SNMP traps to OSS. OSS can also query IEMS for active alarm data. By default, the following attribute values are used for configuring SNMP northbound fault feed. The administrator can change the attribute values.<br><b>Default Settings:</b><br>SNMP port: 8001<br>read community: public<br>write community: public<br>SNMP version: v2c | SNMP trap events (UDP), push | IP address and port of listener on OSS                                                                                                                                      |
| Syslog       | designated port for Syslog service (514) | IEMS forwards log events to remote host                                                                                                                                                                                                                                                                                                                                    | ASCII data over UDP, push    | syslog.conf requires forwarding entry for log facility<br><br><b>Fault:</b><br>local7.notice<br><br><b>Audit:</b><br>local0.notice<br><br><b>Security:</b><br>local3.notice |

Each fault interface is discussed in the sections that follow.

## Northbound SCC2 Specification

SCC2 is an ASCII stream delivered to a Northbound receiving application. The stream is delivered over a TCP socket and is configured by the administrator.

This section provides a detailed description of the SCC2 log format delivered by IEMS.

### SCC2 Format Summary:

```
<Alarm Severity><Minute Indicator><Log Name><Log
Number><Threshold>< Sequence Number><Event Type><Event
Label><Equipment Identifier><Body Text>
```

### SCC2 Header Formats

SCC2 Header format:

-----

```

12345678901234567890123456789012345678901234567890123456789012
3456789
-----|-----|-----|-----|-----|-----|
-----
aabb\ccccdddeffff\gggg\h.../i.../j...
-----|-----|-----|-----|-----|-----|
-----

```

- 1 The backslash sign (\) signifies a space.
- 2 The forward slash sign (/) signifies a space that only appears if the preceding optional field exists.
- 3 The periods (...) signify variable length data.
- 4 The 'greater than' sign followed by periods (>...) signifies variable length indentation determined by the application.
- 5 The vertical lines do not appear on the actual report, they are used for presentation purposes in the above figure.
- 6 This notation only represents the header and does not include the application data area (i.e. the rest of the log report).

An example of a SCC2 log header is given below. It is also used in explaining the individual fields in the log header.

#### SCC2 Log Header Example:

```

* 03 PM 128+0417 TBL ISTB LIU7 348
      ISTb      From InSv

```

#### SCC2 Field Descriptions

| Fld | Name                    | Description                                                                                                                                                                                                               | Example |
|-----|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| a   | <b>Alarm Severity</b>   | The severity level of the log report. This is a 2 character field left justified and padded with blanks. Possible values are:<br>'*C' = critical alarm,<br>'***' = major alarm,<br>'* ' = minor alarm,<br>' ' = no alarm. | '*C'    |
| b   | <b>Minute Indicator</b> | This value represents the minutes after the hour. It consists of 2 numeric characters, right justified and padded with zeroes. It ranges from 00 to 59.                                                                   | '03'    |
| c   | <b>Log Name</b>         | This value can be 2 to 4 non blank characters. Within this fixed 4 characters, it is left justified and padded with blanks.                                                                                               | 'PM '   |

| Fld | Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Example   |
|-----|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| d   | <b>Log Number</b>           | This value is always 3 digits ranging from 000 to 999. It is right justified and padded with zeroes. For PROTOLOGs (i.e. TRAP, SWERR, INIT, INFO, and LOCK logs) it is a string of 3 spaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                         | '128'     |
| e   | <b>Threshold</b>            | Indicates whether a threshold was set for the given log report. A threshold can be temporarily set by using LOGUTIL. Thresholding will survive any restart by turning on the office parameter threshold_is_sampling in table OFCVAR and datafilling threshold value for individual log report in table LOGCLASS and RLOGCLAS on the CallServer. If THRESHOLD_IS_SAMPLING is on (Y), a log report is generated for every n-th instance of the log report generated. If threshold_is_sampling is off (N), every log report after the n-th report is generated.<br><br>Possible values are:<br>'+' = a threshold was set,<br>'' = no threshold was set. | '+'       |
| f   | <b>Sequence Number</b>      | This field defines the unique sequence for each log report. It is right justified and padded with zeroes. It represents 4 numeric characters ranging from 0000 to 9999.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | '0417'    |
| g   | <b>Event Type</b>           | Log report event type which is a string of 4 uppercase characters, left justified and padded with blanks. This field is defined by the applications that generate the log report.<br><br>Possible values include:<br><br>' ', 'CBSY', 'EXC ', 'FAIL', 'FLT ', 'INFO', 'INIT', 'LO ', 'MANB', 'OFFL', 'PASS', 'PBSY', 'RTS ', 'SUMM', 'SYSB', 'TBL ', 'TRAN', 'TRAP', 'UNEQ'.                                                                                                                                                                                                                                                                         | 'TBL '    |
| h   | <b>Event Label</b>          | A variable length character string that represents application event description. It is an optional field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 'ISTB'    |
|     |                             | <i>The following fields are defined by the applications that generate the log report. These fields are optional and independent of each other.</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |
| i   | <b>Equipment Identifier</b> | A conditional equipment identifier determined by the application. It is a variable length character string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 'LIU7348' |

| Fld | Name             | Description                                                                                                                                                                                                                      | Example                |
|-----|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| j   | <b>Body Text</b> | Application specific log body text starts here. This may contain several lines. Each new line is indented by eight spaces. Most log bodies start with a carriage return character so that none of it appears on the header line. | 'ISTb<br>From<br>InSv' |

### Examples of Logs with SCC2 Header

The sample logs below are shown for example only. They are syntactically correct but field contents may vary.

#### 1 Gateway Controller example

**\*\*14 GWC 307 7250 TBL GWC Fault**

Location: GWC-2-UNIT-0

NotificationID: 4

State: Raise

Category: Communications

Cause: Communications subsystem failure

Time: Jan 23 15:15:59 2004

Component Id: GWC=GWC-2-UNIT-0;Version=PGC92BA;Unit=unit\_0;Software=NODE MTC

Specific Problem: EM not responding, provisioned data loaded from local Flash

Description: Element Manager communication failure.

#### 2 Call Server example:

**56 LINE138 3778 INFO TRMT**

SLOA 21 1 02 01 DN 2145202111

TREATMENT SET = BUSY CALLED NO = 5202111

CALLID= 01BE 036D

### Northbound NTSTD

NTSTD is an ACSII stream delivered to a Northbound receiving application. The stream is delivered over a TCP socket and is configured by the administrator.

This section provides a detailed description of the NTSTD log format delivered by IEMS.

#### NTSTD Format Summary:

<Office Identifier><Alarm Severity><Threshold><Log Name><Log Number><Time MMMMDD hh:mm:ss>< Sequence Number><Event Type><Event Label><Equipment Identifier><Body Text>

## Standard Header Formats

ECORE Format OFF:

```
-----
-----
12345678901234567890123456789012345678901234567890123456789012
3456789
----- | ----- | ----- | ----- | ----- | ----- | --
-----
a...#cccdeeeefff\ggghh\ii:jj:kk\llll\nnnn\o.../p.../q...
----- | ----- | ----- | ----- | ----- | ----- | --
-----
```

### Notes:

- 1 The placeholder represented by the pound sign (#) is non-existent if both office parameter log\_office\_id and ecore\_format in table OFCVAR are turned off. The pound sign (#) represents a space in other cases (i.e. log\_office\_id is datafilled and ecore\_format is turned off; and whenever ecore\_format is turned on regardless of log\_office\_id).
- 2 The backslash sign (\) signifies a space.
- 3 The forward slash sign (/) signifies a space that only appears if the preceding optional field exists.
- 4 The periods (...) signify variable length data.
- 5 The vertical lines do not appear on the actual report, they are used for presentation purposes in the above figure.
- 6 This notation only represents the header and does not include the application data area (i.e. the rest of the log report).

An example of a standard log header is given below. It is also used in explaining the individual fields in the log header.

### Standard log header example:

```
SCP2B *+ PM128 OCT20 10:03:42 0417 TBL ISTB LIU7 348
          ISTb      From InSv
```

## NTSTD format field descriptions

| FId | Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Example |
|-----|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| a   | <b>Office Identifier</b> | Identifies the switch generating the Identifier log. This is an optional field. It is output if the office parameter log_office_id in table OFCVAR on the CallServer is datafilled. It has variable length from 0 up to 12 characters.                                                                                                                                                                                                                                                                                                                                                                                                                    | 'SCP2B' |
| b   | <b>Ecore Node Name</b>   | Originating node name where this log Node Name report is generated. It is an eight character field, its contents are left justified and padded with blanks. It is contained in the header if the office parameter ecore_format in table OFCVAR is turned on. <b>As of SN07, this option is not supported</b>                                                                                                                                                                                                                                                                                                                                              | 'CM'    |
| c   | <b>Alarm Severity</b>    | The severity level of the log report. This is a 3 character field right justified and padded with blanks. Possible values are:<br>'***' = critical alarm,<br>' **' = major alarm,<br>' *' = minor alarm,<br>' ' = no alarm.                                                                                                                                                                                                                                                                                                                                                                                                                               | ' *'    |
| d   | <b>Threshold</b>         | Indicates whether a threshold was set for the given log report. A threshold can be temporarily set by using LOGUTIL. Thresholding will survive any restart by turning on the office parameter threshold_is_sampling in table OFCVAR and datafilling threshold value for individual log report in table LOGCLASS and RLOGCLAS on the CallServer. If threshold_is_sampling is on (Y), a log report is generated for every n-th instance of the log report generated. If threshold_is_sampling is off (N), every log report after the n-th report is generated.<br><br>Possible values are:<br><br>'+' = a threshold was set,<br>' ' = no threshold was set. | '+'     |
| e   | <b>Log Name</b>          | This value can be 2 to 4 non blank characters. Within this fixed 4 characters, it is right justified and padded with blanks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | ' PM'   |
| f   | <b>Log Number</b>        | This value is always 3 digits ranging from 000 to 999. It is right justified and padded with zeroes. For PROTOLOGs, (i.e. TRAP, SWERR, INIT, INFO and LOCK logs) it is a string of 3 spaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | '128'   |

| <b>Fld</b> | <b>Name</b>                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                    | <b>Example</b>         |
|------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| g          | <b>Month Indicator</b>      | Consists of 3 uppercase characters ranging from 'JAN' to 'DEC' that represent the month.                                                                                                                                                                                                                                                                              | 'OCT'                  |
| h          | <b>Day Indicator</b>        | Consists of 2 numeric characters ranging from 01 to 31 that represent the day of the month                                                                                                                                                                                                                                                                            | '20'                   |
| i          | <b>Hour Indicator</b>       | Consists of 2 numeric characters ranging from 00 to 23 that represent the hour of the day.                                                                                                                                                                                                                                                                            | '10'                   |
| j          | <b>Minute Indicator</b>     | Consists of 2 numeric characters ranging from 00 to 59 that represent the minute of the hour.                                                                                                                                                                                                                                                                         | '03'                   |
| k          | <b>Second Indicator</b>     | Consists of 2 numeric characters ranging from 00 to 59 that represent the second of the minute.                                                                                                                                                                                                                                                                       | '42'                   |
| l          | <b>Sequence Number</b>      | This field defines the unique sequence for each log report. It is right justified and padded left with zeroes. Represents 4 numeric characters ranging from 0000 to 9999.                                                                                                                                                                                             | '0417'                 |
|            |                             |                                                                                                                                                                                                                                                                                                                                                                       |                        |
| n          | <b>Event Type</b>           | Log report event type which is a string of 4 uppercase characters, left justified and padded with blanks. This field is defined by the applications that generate the log report.<br><br>Possible values include: ' ', 'CBSY', 'EXC ', 'FAIL', 'FLT ', 'INFO', 'INIT', 'LO ', 'MANB', 'OFFL', 'PASS', 'PBSY', 'RTS ', 'SUMM', 'SYSB', 'TBL ', 'TRAN', 'TRAP', 'UNEQ'. | 'TBL'                  |
| o          | <b>Event Label</b>          | A variable length character string that represents application event description. This field is optional.                                                                                                                                                                                                                                                             | 'ISTB'                 |
|            |                             | <i>The following fields are defined by the applications that generate the log report. These fields are optional and independent of each other.</i>                                                                                                                                                                                                                    |                        |
| p          | <b>Equipment Identifier</b> | A conditional equipment identifier determined by the application. It is a variable length character string.                                                                                                                                                                                                                                                           | 'LIU<br>7<br>348'      |
| q          | <b>Body Text</b>            | Application specific log body text starts here. This may contain several lines. Each new line is indented by eight spaces. Most log bodies start with a carriage return character so that none of it appears on the header line.                                                                                                                                      | 'ISTb<br>From<br>InSv' |

## Examples of Logs with Standard Header

The sample logs below are shown for example only. They are syntactically correct but field contents may vary.

### 1 Gateway Controller example:

```
RTPU07BU  **  GWC307 Jan23 20:14:38 7250 TBL  GWC Fault
Location: GWC-2-UNIT-0
NotificationID: 4
State: Raise
Category: Communications
Cause: Communications subsystem failure
Time: Jan 23 15:15:59 2004
Component Id: GWC=GWC-2-UNIT-0;Version=PGC92BA;Unit=unit_0;Software=NODEMTC
Specific Problem: EM not responding, provisioned data loaded from local
Flash
Description: Element Manager communication failure.
```

### 2 Call Server example:

```
RTPU07BR      LINE138 Jan23 16:56:30 3778 INFO TRMT
SLOA 21 1 02 01      DN 2145202111
TREATMENT SET = BUSY   CALLED NO =          5202111
CALLID= 01BE 036D
```

## Northbound Syslog

Syslog is a standardized UDP protocol defined by the IETF working group:  
**Syslog Protocol (RFC 3164): <http://www.ietf.org/rfc/rfc3164.txt>**

This ACSII fault stream is delivered to a Northbound receiving Syslog host over the local 7 facility. On the IEMS server, Syslog routing is configured through the SSPFS command line interface. This interface manages any required changes to syslog.conf.

This section covers the vendor-specific information on the format and content of Syslog messages not covered under RFC3164.

The following shows a breakdown of the components of the MSG portion of a Syslog message provided by the IEMS Northbound interface:

```
<Time> <Host> IEMS:
_V2_~I=<NodeId>~H=<Host>~A=<ApplicationName>~S=<Seq.Number>
```

```
~~ <LogName><LogNumber> <AlarmSeverity> <EventType> <Label> ^M
<LogBody>
```

The following Syslog message will be used to discuss the structure of Syslog messages from IEMS:

```
Feb 23 12:38:54 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=4317~~
MGEM302 NONE TBL MG9K InvalidEMIPAddress^M Location: MG9k EM
Comm Network^M Notification Id: 17180020453^M State:
Cleared^M Category: communications^M Cause: Communications
Subsystem Failure^M Invalid EM IP Address - An invalid EM IP
address has been set on the GW^M Component Id: MG9k EM Comm
Network^M specificProblem: Invalid EM IP Address - An invalid
EM IP address has be^M en set on the GW^M Description:
An invalid EM IP address has been set on the GW
```

**Note:** See “MG9000 Manager” for comparison of this log in all IEMS Northbound formats.

### RFC3164 MSG Fields

Each Syslog message is prefixed by a timestamp and hostname. These fields are shown in *italics* in the example above. Section 4.1.2 of RFC3164 defines these fields as follows:

The **TIMESTAMP** field is the local time and is in the format of “Mmm dd

hh:mm:ss” (without the quote marks) where:

Mmm is the English language abbreviation for the month of the year with the first character in uppercase and the other two characters in lowercase. The following are the only acceptable values:

*Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec*

dd is the day of the month. If the day of the month is less than 10, then it **MUST** be represented as a space and then the number. For example, the 7th day of August would be represented as “Aug 7”, with two spaces between the “g” and the “7”.

hh:mm:ss is the local time. The hour (hh) is represented in a 24-hour format. Valid entries are between 00 and 23, inclusive. The minute (mm) and second (ss) entries are between

00 and 59 inclusive.

*A single space character MUST follow the TIMESTAMP field.*

The **HOSTNAME** field will contain only the hostname, the IPv4 address,

or the IPv6 address of the originator of the message. The preferred value is the hostname. If the hostname is used, the HOSTNAME field MUST contain the hostname of the device as specified in STD 13 [4].

It should be noted that this MUST NOT contain any embedded spaces.

The Domain Name MUST NOT be included in the HOSTNAME field. If the IPv4 address is used, it MUST be shown as the dotted decimal notation as used in STD 13 [5]. If an IPv6 address is used, any valid representation used in RFC 2373 [6] MAY be used.

*A single space character MUST also follow the HOSTNAME field.*

### IEMS Header

After the timestamp and hostnames fields, the following constants can be found in the next two fields - separated by a space:

**IEMS:** Indicates the start of fault-specific information

**\_V2\_** - Syslog format version

Immediately following this tag are several attributes specified as name-value pairs (NVPs). NVP tags are prefixed by a tilde '~' <tag>=<value> for easy identification by downstream parsers.

### NVPs for IEMS Syslog message

| Tag name | Description                                                                                                                                               | example                                                  |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| ~I       | Node Identifier                                                                                                                                           | ~I=                                                      |
| ~H       | Host name of                                                                                                                                              | ~H=znc0s0jh                                              |
| ~A       | Reporting Application name                                                                                                                                | ~A=IEMS                                                  |
| ~S       | Log Sequence number                                                                                                                                       | ~S=4317                                                  |
| ~~       | Indicates start of formatted log header from originator.<br><br>**Note: This indicator is NOT actually an NVP. It is followed by a single space character | ~~ MGEM302<br>NONE TBL<br>MG9K<br>InvalidEMI<br>PAddress |

**Parsing Conventions for Formatted Log Data:**

The format of the log header and body follow a number of conventions to facilitate parsing by downstream applications:

- 1 Line feeds in message text are identified by the ^M character sequence (this denotes a sequence of the two printable characters: caret and upper case M).
- 2 The log header start can be identified by the ~~ sequence followed by a space. The header is delimited by the line feed indicator (discussed in the previous bullet).
- 3 The log body is separated into lines using ^M sequences defined in bullet 1. Each line is prefixed with eight (8) space characters.
- 4 Line length (including leading spaces) will not exceed 80 characters. See example log above.
- 5 All text in the log header and body will consist of printable ACSII characters.
- 6 Blank lines are not allowed in the formatted log message. This includes both header and body components.

**Log Header**

The log header consists of the following fields. These fields map to the corresponding fields defined in both SCC2 and NTSTD.

A typical log header will appear in the following format ( ' ' indicates a space character):

```
~~\<logname>\<lognumber>\<AlarmSeverity>\<EventType>\<Label>^M<LogBody>
```

**Log Header fields in Syslog message**

| Name              | Description                                                                                                                                                                                  | Example |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| <b>Log Name</b>   | This value can be 2 to 4 non blank characters. Within this fixed 4 characters, it is right justified and padded with blanks.                                                                 | ' MGEM' |
| <b>Log Number</b> | This value is always 3 digits ranging from 000 to 999. It is right justified and padded with zeroes. For PROTOLOGs, (i.e. TRAP, SWERR, INIT, INFO and LOCK logs) it is a string of 3 spaces. | '302'   |

| Name                  | Description                                                                                                                                                                                                                                                                                                                                                           | Example                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Alarm Severity</b> | This field defines the alarm severity and consists of one of the following text strings:<br><br>NONE, MINOR, MAJOR, CRIT                                                                                                                                                                                                                                              | 'NONE'                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Event Type</b>     | Log report event type which is a string of 4 uppercase characters, left justified and padded with blanks. This field is defined by the applications that generate the log report.<br><br>Possible values include: ' ', 'CBSY', 'EXC ', 'FAIL', 'FLT ', 'INFO', 'INIT', 'LO ', 'MANB', 'OFFL', 'PASS', 'PBSY', 'RTS ', 'SUMM', 'SYSB', 'TBL ', 'TRAN', 'TRAP', 'UNEQ'. | 'TBL '                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Label</b>          | A variable length character string that represents application event description. This field is optional.                                                                                                                                                                                                                                                             | 'MG9K<br>InvalidEMIPAddress'                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Log Body</b>       | Application specific log body text starts here. This may contain several lines. Each new line is indented by eight spaces and delimited by the ^M (caret-M) character sequence.                                                                                                                                                                                       | '       Location: MG9k<br>EMCommNetwork^M<br>Notification Id:<br>17180020453^M<br>State: Cleared^M<br>Category:<br>communications^M<br>Cause:<br>Communications<br>SubsystemFailure^M<br>Invalid EM IP Address -<br>An invalid EM IP<br>address has been set<br>on the GW^M<br>Component Id: MG9k<br>EMCommNetwork^M<br>specificProblem:<br>Invalid EM IP Address -<br>An invalid EM IP<br>address has be^M<br>en set on the GW^M<br>Description: An invalid<br>EM IP address has<br>been set on the GW' |

### Notes on Log Body Text

The remainder of the message consists of the log body. The message text in this portion of the message is defined by the originating source. The presentation of this text is constrained only by the rules outlined in [“Parsing Conventions for Formatted Log Data:” on page 99](#).

**Note:** See Syslog Protocol (RFC 3164):  
<http://www.ietf.org/rfc/rfc3164.txt> for full details on this specification.

### Security and Audit logs

IEMS Security and Audit logs are managed through Syslog and can be forwarded to a remote Syslog host in the same way as fault events. Note that some Solaris applications forward security logs to authlog (/varlog/authlog). Sample content of each follow:

#### Audit log sample ( /var/log/auditlog ):

```
Jan 16 10:37:55 sspfs_svr ID[SUNWcluster.pmf.1020]: "CorbaNotification" requeued
Jan 16 10:38:06 sspfs_svr ID[SUNWcluster.pmf.1018]: "CorbaNotification" Failed to stay up.
Jan 16 10:38:06 sspfs_svr ID[SUNWcluster.pmf.1019]: "CorbaNotification" restarting too often ... sleeping 30 seconds.
Jan 16 10:38:36 sspfs_svr ID[SUNWcluster.pmf.1020]: "CorbaNotification" requeued
Jan 16 10:38:46 sspfs_svr ID[SUNWcluster.pmf.1018]: "CorbaNotification" Failed to stay up.
Jan 16 10:38:46 sspfs_svr ID[SUNWcluster.pmf.1019]: "CorbaNotification" restarting too often ... sleeping 30 seconds.
Jan 16 10:39:16 sspfs_svr ID[SUNWcluster.pmf.1020]: "CorbaNotification" requeued
Jan 16 10:41:42 sspfs_svr ID[SUNWcluster.pmf.1018]: "snmpp" Failed to stay up.
Jan 16 10:42:16 sspfs_svr ID[SUNWcluster.pmf.1018]: "ompush" Failed to stay up.
Jan 16 10:42:41 sspfs_svr ID[SUNWcluster.pmf.1018]: "CorbaNotification" Failed to stay up.
Jan 16 10:42:41 sspfs_svr ID[SUNWcluster.pmf.1020]: "CorbaNotification" requeued
Jan 16 10:42:49 sspfs_svr ID[SUNWcluster.pmf.1018]: "PropServer" Failed to stay up.
```

#### Security log sample ( /var/log/securitylog ):

```
Feb  6 22:03:16 wnc0s0qh IEMS: IEMS class_security.ver01 STAT=SUCCESS SRC.USR=root

```

```
Feb 11 10:15:53 wnc0s0qh IEMS: IEMS class_security.ver01 STAT=SUCCESS SRC.USR=root
EVNT.TYPE =Authentication
Feb 11 10:15:53 wnc0s0qh last message repeated 1 time
```

### Security log sample ( /var/log/securitylog ):

```
Dec 15 06:48:37 comp5iems su: 'su oracle' succeeded for root on /dev/???
Dec 15 06:48:56 comp5iems sshd[12755]: Accepted publickey for root from 192.168.47.2 port 64329
ssh2
Dec 15 08:42:36 comp5iems su[1200]: 'su root' failed for maint on /dev/pts/4
Dec 15 08:42:53 comp5iems su[2685]: 'su root' succeeded for maint on /dev/pts/4
```

The following table shows a summary of all Syslog facilities used by IEMS.

**Note:** Only *Fault*, *Audit*, and *Security* streams are supported for use by downstream systems. Shaded entries are intended for support purposes only.

### IEMS Northbound Syslog Facilities

| Log Stream   | Log file location on IEMS Server                           | Syslog facility |
|--------------|------------------------------------------------------------|-----------------|
| Fault        | /var/log/iemsCustomerlog                                   | local7          |
| Audit        | /var/log/auditlog                                          | local0          |
| Security     | /var/log/securitylog<br>/var/log/authlog/, auth (facility) | local3          |
| Customer log | /var/log/customerlog                                       | local1          |
| Debug        | /var/log/debuglog                                          | local2          |
| SSPFS        | /var/log/sspfslog                                          | local4          |
| NPM          | /var/log/npm_designlog                                     | local5          |

### Northbound SNMP - IETF MIB specification

IEMS provides an SNMP interface that forwards faults in trap messages and responds to SNMP requests.

The SNMP Northbound interface is based on the IETF RFC 3877 standard which includes features such as alarm synchronization not available with NTSTD or SCC2.

This section provides a high-level description of how to support the IETF Alarm MIB draft defined in the DISMAN working group of the IETF. See the

MIBs on the server in the locations specified in the table below. In this document, IEMS is the agent implementing the MIBs for the manager at the OSS level.

### MIB Loading Sequence

The MIB loading sequence for a manager application is as follows:

These MIBs are available on the IEMS server in the locations noted in the following table.

#### MIB Loading Sequence

| Load Order | MIB Name            | IEMS Server File location                                     |
|------------|---------------------|---------------------------------------------------------------|
| 1          | SNMPv2-CONF         | (Not required by the IEMS server)                             |
| 2          | SNMPv2-SMI          | /opt/nortel/iems/current/mibs                                 |
| 3          | SNMPv2-TC           | /opt/nortel/iems/current/mibs                                 |
| 4          | SNMPv2-MIB          | /opt/nortel/iems/current/mibs<br>SNMPv2-MIB.txt               |
| 5          | SNMP-FRAMEWORK-MIB  | /opt/net-snmp/share/snmp/mibs/<br>SNMP-FRAMEWORK-MIB.txt      |
| 6          | INET-ADDRESS-MIB    | /opt/net-snmp/share/snmp/mibs/<br>INET-ADDRESS-MIB.txt        |
| 7          | RFC1212             | (Not required by the IEMS server)                             |
| 8          | RFC1155-SMI         | /opt/nortel/iems/current/mibs                                 |
| 9          | RFC1213-MIB         | /opt/nortel/iems/current/mibs<br>RFC1213-MIB.txt              |
| 10         | RMON-MIB            | /opt/nortel/iems/current/mibs/cicm<br>RMON-MIB.txt            |
| 11         | TOKEN-RING-RMON-MIB | /opt/nortel/iems/current/mibs/cicm<br>TOKEN-RING-RMON-MIB.txt |
| 12         | RMON2-MIB           | /opt/nortel/iems/current/mibs/cicm<br>RMON2-MIB.txt           |
| 13         | ALARM-MIB           | /opt/nortel/iems/current/mibs/usp/<br>ALARM-MIB-disman-18.txt |

| <b>Load Order</b> | <b>MIB Name</b>            | <b>IEMS Server File location</b>                                       |
|-------------------|----------------------------|------------------------------------------------------------------------|
| <b>14</b>         | IANA-ITU-ALARM-TC          | /opt/nortel/iems/current/mibs/usp/<br>IANA-ITU-ALARM-TC-disman-18.txt  |
| <b>15</b>         | ITU-ALARM-TC               | /opt/nortel/iems/current/mibs/usp/<br>ITU-ALARM-TC-disman-18.txt       |
| <b>16</b>         | ITU-ALARM-MIB              | /opt/nortel/iems/current/mibs/usp/<br>ITU-ALARM-MIB-disman-18.txt      |
| <b>17</b>         | ITU-IANA-ALARM-TC          | /opt/nortel/iems/current/mibs/usp/<br>ITU-IANA-ALARM-TC-disman-04.txt  |
| <b>18</b>         | NOTIFICATION-LOG-MIB       | /opt/nortel/iems/current/mibs/usp/<br>NOTIFICATION-LOG-MIB-rfc3014.txt |

| <b>24</b>         | NORTEL-NMI-MIB             | /opt/nortel/iems/current/mibs/usp/<br>nortelNMI-smi2.smi               |
| <b>25</b>         | NORTEL-NMI-ALARM-CLEAR-MIB | /opt/nortel/iems/current/mibs/usp/<br>nortelNMIalarmClear_smi.txt      |

Support for the IETF Alarm MIB is new to IETF. The MIBs defined by the DISMAN working group of IETF are designed to allow surveillance of network elements. We have used this set of MIBs to present the state of our

softswitch. The ALARM MIB presents a set of tables that contain the current alarm information for the device. The alarm MIB does not prescribe the notifications used to set and clear alarms on the device.

Nortel has provided an extension MIB to allow a manager to monitor the system alarm changes through SNMP notifications. These notifications are the primary interface for monitoring faults in the Succession node.

### Nortel Alarm Extension MIB

This MIB defines notifications used for alarm asserts and clears in addition to data type definitions and tables related to notifications that can be sent.

A complete listing and description of our fault management MIB may be found in “IEMS Appendix 2: Nortel Alarm Extension MIB”.

### TABLE SUPPORT IN NORTEL ALARM EXTENSION MIB

The table `nnExtAlarmActiveTable` along with the `AlarmActiveTable` contains all the information required to resynchronize the northbound SNMP agent and to give the OSS a complete view of the active alarms within the scope of the Integrated EMS.

The `nnExtAlarmStateTable` is not supported at this time.

### NOTIFICATION SUPPORT IN NORTEL ALARM EXTENSION MIB

All notifications defined in this MIB are supported. All OIDs defined within the notifications are also populated. The alarm notifications include sequence numbers so the SNMP manager can determine if a message is missed. Specific formats are supported as described in the following table.

#### Alarm Notifications Varbinds

| Variable name                                      | Format                           | OID                           |
|----------------------------------------------------|----------------------------------|-------------------------------|
| <code>alarmActiveResourceId</code>                 | OID                              | .1.3.6.1.2.1.118.1.2.2.1.10   |
| <code>alarmActiveDateAndTime</code>                | DateandTime                      | .1.3.6.1.2.1.118.1.2.2.1.2    |
| <code>alarmActiveDescription</code>                | Human readable string            | 1.3.6.1.2.1.118.1.2.2.1.11    |
| <code>nnExtAlarmActiveEventType</code>             | Enum                             | .1.3.6.1.4.1.562.29.6.1.1.1.1 |
| <code>nnExtAlarmActiveProbableCause</code>         | Enum                             | .1.3.6.1.4.1.562.29.6.1.1.1.2 |
| <code>nnExtAlarmActiveAdditionalText</code>        | String                           | .1.3.6.1.4.1.562.29.6.1.1.1.3 |
| <code>nnExtAlarmActiveDocumentation Pointer</code> | String: up to 4 chars + 3 digits | .1.3.6.1.4.1.562.29.6.1.1.1.4 |

| Variable name                       | Format                                                                                                                             | OID                           |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| nnExtAlarmActiveResourceDescription | compType=compname;<br>subcompType=subcompName;<br>..... for as many levels of hierarchy is required to identify the alarmed entity | .1.3.6.1.4.1.562.29.6.1.1.1.5 |
| nnExtAlarmActiveManualClear         | enum                                                                                                                               | .1.3.6.1.4.1.562.29.6.1.1.1.6 |
| nnExtAlarmActiveSequenceNumber      | Numeric                                                                                                                            | .1.3.6.1.4.1.562.29.6.1.1.1.7 |

These varbinds are included in all 5 of the alarm notifications supported by the Integrated EMS. As defined all notifications in SNMP, *sysUpTime* and the OID of the notification are included in the varbinds for all notification types (see the following table). Each of the notifications signifies a different severity of the specified alarm. Notifications are defined for critical, major, minor, warning and cleared alarms. The notifications are defined in the table below.

#### Trap OIDs and Alarm Severity

| Trap OID                      | Severity           |
|-------------------------------|--------------------|
| .1.3.6.1.4.1.562.29.6.1.0.306 | nnExtAlarmMessage  |
| .1.3.6.1.4.1.562.29.6.1.0.305 | nnExtAlarmCritical |
| .1.3.6.1.4.1.562.29.6.1.0.304 | nnExtAlarmMajor    |
| .1.3.6.1.4.1.562.29.6.1.0.303 | nnExtAlarmMinor    |
| .1.3.6.1.4.1.562.29.6.1.0.302 | nnExtAlarmWarning  |
| .1.3.6.1.4.1.562.29.6.1.0.301 | nnExtAlarmClear    |

The nnExtAlarmMessage notifications can be used to send informational messages from IEMS. Because these notifications are information, reliability is not addressed. As illustrated in the table below, we populate with information in the message header and bodytext of our NTSTD and CUSTLOG feeds.

#### Message Notification Varbinds

| Variable name             | Format | OID                           |
|---------------------------|--------|-------------------------------|
| nnExtAlarmMessageResource | OID    | .1.3.6.1.4.1.562.29.6.1.3.1.1 |

| Variable name                         | Format      | OID                           |
|---------------------------------------|-------------|-------------------------------|
| nnExtAlarmMessageResourceDescription  | String      | .1.3.6.1.4.1.562.29.6.1.3.1.2 |
| nnExtAlarmMessageDateAndTime          | DateAndTime | .1.3.6.1.4.1.562.29.6.1.3.1.3 |
| nnExtAlarmMessageDocumentationPointer | String      | .1.3.6.1.4.1.562.29.6.1.3.1.4 |
| nnExtAlarmMessageInfo                 | String      | .1.3.6.1.4.1.562.29.6.1.3.1.5 |
| nnExtAlarmMessageResource             | OID         | .1.3.6.1.4.1.562.29.6.1.3.1.1 |

### OTHER DEFINITIONS IN THIS MIB

This MIB also defines OSI state variables that are not defined in the IETF Entity State MIB. These variables and tables are not supported at this time.

### IETF RFC 3877 MIB Tables

There are several tables introduced by the IETF Alarm MIB Model. This document will discuss each table and intended use.

#### ALARM MODEL TABLE

This table defines the notifications used by IEMS to express alarm events. Notifications to communicate alarm asserts and clears have been defined by NortelNetworks in a separate MIB. These new notifications are defined in “Nortel Alarm Extension MIB” on page 105.

This table is not currently supported. This table is a static table and we will look to support this in some future release. This table provides model documentation to OSSes.

#### ALARM ACTIVE TABLE

This table contains a list of active alarms on IEMS and is supported. It, along with 2 other tables - the alarm active variable table and the Nortel Alarm Extension Table - provide a complete view of the active alarms within the scope of the Integrated EMS.

Indexes into this table are: *alarmListName*, *alarmActiveDateAndTime*, *alarmActiveIndex*. *alarmListName* matches the index *nlmLogName* for *nlmLogTable* from RFC3014 (Notification Log MIB). For our Succession IEMS table we use the string “NorCarrFault”.

The following table describes expected values for entries in this table.

**IETF Alarm Active Entry**

| Sequence Field               | Default Value                                                                        |
|------------------------------|--------------------------------------------------------------------------------------|
| alarmListName                | Nortel_fault                                                                         |
| alarmActiveDateAndTime       | none                                                                                 |
| alarmActiveIndex             | Numerical index defined by agent, unique in table                                    |
| alarmActiveEngineID          | IEMS agent engine ID in SNMPv3; empty string in SNMPv2                               |
| alarmActiveEngineAddressType | Inet address type (IPv4)                                                             |
| alarmActiveEngineAddress     | IPv4 address of active IEMS agent                                                    |
| alarmActiveContextName       | ""                                                                                   |
| alarmActiveVariables         | 12 = number of fields in our alarm set notifications + 2 mandatory entries per alarm |
| alarmActiveNotificationID    | OID of notification sent for this alarm set                                          |
| alarmActiveResourceID        | OID that describes this entry in the Active Alarm Table                              |
| alarmActiveDescription       | none                                                                                 |
| alarmActiveLogPointer        | not implemented - default = 0.0                                                      |
| alarmActiveModelPointer      | not implemented - default = 0.0                                                      |
| alarmActiveSpecificPointer   | not implemented - default = 0.0                                                      |

**ALARM ACTIVE VARIABLE TABLE**

Alarm Active variable table contains the varbinds for all the active alarm notifications. The indexes to the table are: *alarmListName*, *alarmActiveIndex*, *alarmVariableIndex*. For each alarm in the alarm active table there will be 12 entries in the alarm active variable table. The index *alarmVariableIndex* will be from 1 to 12 (also from 1 to *alarmActiveVariables* in the *alarmActiveTableEntry*). The notifications contain some varbinds that are not in the standard table so the OSS can index into this table to get the additional data. (Similarly, the OSS can index into the Nortel Extension Active Alarm Table for the additional information as well.)

Fields in this table for each alarm are as follows:

**Alarm Active Variable Table**

| Alarm Active Variable Entry | Notification Varbind | Default Value |
|-----------------------------|----------------------|---------------|
| alarmActiveVariableIndex 1  | sysUpTime            | sysUpTime     |

| Alarm Active Variable Entry | Notification Varbind                 | Default Value                                           |
|-----------------------------|--------------------------------------|---------------------------------------------------------|
| alarmActiveVariableIndex 2  | snmpTrapOID                          | snmpTrapOID                                             |
| alarmActiveVariableIndex 3  | alarmActiveResourceId                | OID that describes this entry in the Active Alarm Table |
| alarmActiveVariableIndex 4  | alarmActiveDescription               | none                                                    |
| alarmActiveVariableIndex 5  | alarmActiveDateAndTime               | none                                                    |
| alarmActiveVariableIndex 6  | nnExtAlarmActiveEventType            | none                                                    |
| alarmActiveVariableIndex 7  | nnExtAlarmActiveProbableCause        | none                                                    |
| alarmActiveVariableIndex 8  | nnExtAlarmActiveAdditionalText       | none                                                    |
| alarmActiveVariableIndex 9  | nnExtAlarmActiveDocumentationPointer | This is often logname & number                          |
| alarmActiveVariableIndex 10 | nnExtAlarmActiveResourceDescription  | none                                                    |
| alarmActiveVariableIndex 11 | nnExtAlarmActiveManualClear          | none                                                    |
| alarmActiveVariableIndex 12 | nnExtAlarmActiveSequenceNumber       | none                                                    |

### ALARM CLEAR TABLE

This table provides an interface for SNMP managers to clear alarms on devices which support this operation. Manual clears are performed with SNMP SET operations using the alarmActiveIndex of the alarm to be cleared. See section “Manual Clear” on page 119 for details.

### ACTIVE ALARM STATS TABLE

Not supported.

### ITU ALARM ACTIVE TABLE

Not supported.

### ITU ALARM ACTIVE VARIABLE TABLE

Not supported.

### ITU ALARM ACTIVE STATS TABLE

Supported.

## NLM LOG TABLE (RFC 3014)

NLM Log Table is defined in IETF RFC 3014. Implementation of the MIB is provided to support incremental resynchronization of the OSS. The OSS SNMP managers can reach into the *nlmLogTable* to get missed events. See [Notification Log MIB \(RFC 3014\)](http://www.ietf.org/rfc/rfc3014.txt?number=3014):  
<http://www.ietf.org/rfc/rfc3014.txt?number=3014>.

The Notification Log MIB has 3 different MIB groups:

- configuration parameters dealing with log storage and reporting
- statistics of log reporting
- the actual history of notifications

### Configuration

Configuration defines the size and the aging criteria of the *nlmLogTable*. Table *nlmConfigLogTable* also defines the named log entries supported in the *nlmLogTable*. We use a specific named log entry for allowing fault resync. This table also defines filtering of these logs.

Each entry in the config log table contains: *nlmLogName*, *nlmConfigLogFilterName*, *nlmConfigLogEntryLimit*, *nlmConfigLogAdminStatus*. This table enables Alarm notification resynchronization. The first and only entry in this table has an *nlmLogName* that matches the *alarmListName* index for the active alarm tables above. This index is "Nortel\_fault."

*nlmConfigLogFilterName* is defined as "default". We do not support the correlation of this value to any specific data in the *snmpNotifyFilterTable* in the SNMP Notification MIB.

*nlmConfigLogEntryLimit* defines the size of the log table. This defines the number of alarm events that are available to the SNMP manager through the SNMP agent. Since there is only one entry in this table for Nortel\_fault, this value is over-ridden by *nlmConfigGlobalEntryLimit*.

**Note:** It is recommended that *nlmConfigGlobalEntryLimit* be set to a minimum value as it maintains this history in memory. Do **not** set this value to zero. Setting this value to zero will lead to unlimited entries being saved and lead to potential resource issues in the system.

*nlmConfigLogAdminStatus* is set to enabled (1).

*nlmConfigLogOperStatus* is set to noFilter (3).

*nlmConfigLogStorageType* is a storageType OID. Data associated with this entry is considered volatile and will be lost when the agent is restarted.

SNMP sets for the configuration items in this table are not supported.

### Statistics

The statistics group contains two scalars and a table. The table is required for the resync algorithm. The table *nlmStatsLogTable* augments the *nlmConfigLogTable* and has only two values in each entry: *nlmStatsLogNotificationsLogged* and *nlmStatsLogNotificationsBumped*. Because this table augments the *nlmConfigLogTable*, the index for these notifications uses the same key - "Nortel\_fault"

*nlmStatsLogNotifications* for the named logs in Nortel\_fault is the sequence number (*nnExtAlarmActiveSequenceNumber*) sent in Integrated EMS notifications of the faults. This also provides the secondary index into the *nlmLogTable* for notifications that have been missed - as detected through sequence numbers in those notifications.

It is the responsibility of the SNMP agent sending fault notifications to increment the *nlmStatsLogNotificationsLogged* and include the value in the varbinds of that notification as documented.

*nlmStatsGlobalNotificationsBumped* defines the number of logs that have been removed or "bumped" from the log table due to the limits imposed by the *nlmConfigGlobalEntryLimit* setting.

### Log Table

The *nlmLogTable* contains the history of notifications sent to the manager. The indices are: *nlmLogName* and *nlmLogIndex*. *nlmLogName* is "Nortel\_fault" and the *nlmLogIndex* is the sequence number in the proprietary notifications.

This section defines two tables: *nlmLogTable* and *nlmLogVariableTable*. The first provides the indices for retrieving missed notifications, and the second contains the varbinds for the notifications. We have 2 different size alarm notifications (in terms of number of varbinds)- alarm assert notifications are all the same size, and alarm clear notifications are slightly smaller (1 varbind). Only alarm notifications are stored in the log table, message notifications are not logged in this table.

The structure and implementation of the *nlmLogVariableTable* is the same as that of the *alarmActiveVariableTable* and is not described further.

### Connecting to the NB feed:

The default SNMP Port in which the agent is listening is 8001. This port is configurable through the IEMS client. User can also disable the SNMP agent if he wishes. OSS has to register its SNMP manager host and port to which the traps are to be sent.

### Connection Reliability

There are several scenarios which must be considered by an SNMP manager to ensure that the alarms presented at the OSS layer will be in sync with the actual alarms maintained on the device. Resynchronization will be required when either the OSS or the IEMS system goes through a restart, or when a lost trap is detected. See section “ Message Sequences and Manager Operations” on page 117 for details on resynchronization of active alarms.

### Lost Traps

If the OSS detects a lost trap via an out-of-order sequence number, the OSS must either try to recover the lost sequence numbers from the notification log table or re-synchronize from the active alarm table. The notification log MIB will contain the last 25 traps sent. If the sequence number delta is within this range, the notification log table can be used to obtain missed traps. Otherwise, a read of the active alarm table must be used to determine the active alarms in the system.

Additionally, OSS can poll the sequence number of the last alarm or clear sent from the agent. The sequence number of last notification sent will be in the *nlmStatsLogNotifications* table in the *nlmStatsLogNotificationsLogged* variable in the “Nortel\_fault” entry as described above.

**Note:** Since there is only one entry in this table, the scalar *nlmStatsGlobalNotificationsLogged* can also be used to obtain this value.

### SNMP Alarm Events & Correlation

The *alarmActiveResourceID* uniquely identifies an alarm occurrence in the system. To correlate a clear notification to the appropriate assert, the *alarmActiveResourceID* must be used.

### Event Types and Probable Causes

Each alarm notification and record in the alarm table includes event type and probable cause. Values for these fields are defined in the IANA-ITU-ALARM-TC MIB table. These values come from both the X.7xx and M.3100 series of standards.

#### Alarm Event Type Format:

IANAItuEventType - Valid values for this entry are provided here for convenience.

- other (1),
- communicationsAlarm (2),
- qualityOfServiceAlarm (3),
- processingErrorAlarm (4),
- equipmentAlarm (5),

environmentalAlarm (6),  
integrityViolation (7),  
operationalViolation (8),  
physicalViolation (9),  
securityServiceOrMechanismViolation (10),  
timeDomainViolation (11)

**Probable Cause Format:**

IANAItuProbableCause - Valid values for this entry are provided here for convenience.

aIS (1), callSetUpFailure (2), degradedSignal (3),  
farEndReceiverFailure (4), framingError (5), lossOfFrame (6),  
lossOfPointer (7), lossOfSignal (8), payloadTypeMismatch (9),  
transmissionError (10), remoteAlarmInterface (11), excessiveBER  
(12), pathTraceMismatch (13), unavailable (14), signalLabelMismatch  
(15), lossOfMultiFrame (16), receiveFailure (17), transmitFailure (18),  
modulationFailure (19), demodulationFailure (20),  
broadcastChannelFailure (21), connectionEstablishmentError (22),  
invalidMessageReceived (23), localNodeTransmissionError (24),  
remoteNodeTransmissionError (25), routingFailure (26),  
backplaneFailure (51), dataSetProblem (52),

## Message Sequences and Manager Operations

### Raise Alarm

This sequence applies to the following alarm event types:

- nnAlarmWarning
- nnAlarmMinor

- nnAlarmMajor
  - nnAlarmCritical
- 1 IEMS forwards alarm from device. The trap contains references to the 12 varbinds depicted in Table , “Alarm Active Variable Table,” on page 108.
  - 2 The OSS receives the alarm and notes the resource ID of the alarm event to allow correlation with a subsequent alarmClear event. IEMS adds the alarm entry to the *alarmActiveTable*, *alarmActiveVariableTable*, and *nnExtAlarmActiveTable*. The *nlmLogTable* and *nlmLogVariableTable* also maintain a rolling log of the last n alarm events received - where n is defined by the variable *nlmConfigGlobalEntryLimit*.

### Clear Alarm

- 1 IEMS forwards clearAlarm event from device. The trap contains references to all varbinds listed in Please refer to “ Alarm Active Variable Table” on page 108. except for *nnExtAlarmActiveManualClear* - which is not included in this message.
- 2 The OSS receives the clear event and matches its resource ID in **alarmActiveResourceId** against the ID of its corresponding alarm event in the *alarmActiveTable*.

The corresponding alarm entry is removed from all active alarm tables:

*alarmActiveTable*

*alarmActiveVariableTable*

*nnExtAlarmActiveTable*

An entry is made in the log notification tables for the CLEAR event.

*nlmLogTable*

*nlmLogVariableTable*

## Alarm Raise &amp; Clear Correlation

IEMS

OSS

Alarm event forwarded to OSS

## Manual Clear

Each alarm event contains information that indicates whether it can be manually cleared. The value in the varbind *nnExtAlarmActiveManualClear* makes this determination and can have the following values:

- other (1),
- forbidden (2),
- required (3),
- optional (4)

**Note:** Alarms with a value of *forbidden* in this field cannot be manually cleared.

Eligible alarms can be manually cleared by sending a SET request to the alarm clear interface variable *nortelNMIALarmClear* (.1.3.6.1.4.1.562.29.1.8.1) in the NORTEL\_NMI-ALARM-CLEAR-MIB. The alarm to be cleared can be specified by using the *alarmActiveIndex* of the target alarm. The value of the *alarmActiveIndex* is stored as the last element in the *alarmActiveResourceId*.

**Example:** An alarm is generated and stored in the *alarmActiveTable* with the following values:

*alarmsListName*: **Nortel\_fault**

*alarmActiveDateAndTime*: 2004-1-8,3:21:57.1,+05:30

*alarmActiveIndex*: **10**

The resulting *alarmActiveResourceId* will be:

*alarmActiveResourceId*.12.78.111.114.116.101.108.95.102.97.117.108.1  
 16.25.50.48.48.52.45.49.45.56.44.51.58.50.49.58.53.55.46.49.44.43.48.5  
 3.58.51.48.10

**Note:** *alarmActiveResourceId* is shown fully encoded.

The SET request will be sent with a value of 10. The corresponding alarm entry is removed from the *alarmActiveTable*, *alarmActiveVariableTable*, and *nnExtAlarmActiveTable*. A corresponding entry for the manual clear is then made in *nlmLogTable* and *nlmLogVariableTable*. See the following figure.

#### Manual Clear of Alarm Event

IEMS

OSS

#### Detecting System Restarts

Before an alarm event is forwarded to a downstream manager, the IEMS assigns the current system up-time of the server to the alarm contents. As discussed previously, it can be found in the *sysUpTime* varbind of the alarm. On restart of the IEMS server, this value is initialized to 0 to signal downstream systems of the event. The OSS can use *sysUptime* to monitor system restarts as follows:

#### Correlation with sequence numbers

Since *sysUpTime* will always increase with each sequential alarm event, restart conditions can be detected if the following condition is met:

$(sysUpTime \text{ of current event}) < (sysUpTime \text{ of previous event})$

### Restart Recovery

When the OSS determines that IEMS has been restarted, it must perform a full reload of the active alarms in the system to synchronize its data with the agent. See [“Full Resync of Active Alarms” on page 121](#) for details.

### Detection of Missing Logs

Each alarm event generated by IEMS contains a unique sequence number that can be used to detect lost notifications. Once an OSS identifies a missing sequence number, it can be re-queried from the IEMS server if the following condition is met:

(sequence# of latest event) - (sequence# of missing event)

$\leq nlmConfigGlobalEntryLimit$  (default = 25)

If this condition is met, then the missing log can be recovered. See “Incremental Resync of missing logs”.

Otherwise, a full resynchronization of the alarm tables will be required. See [“Full Resync of Active Alarms” on page 121](#).

### Full Resync of Active Alarms

There are two scenarios for which an SNMP manager will be required to perform a complete reload of the active alarms from IEMS:

- on startup of the management application
- when missing alarm notifications are sufficiently old to have been rotated out of the *nlmLogTable*. This table maintains a snapshot of the most recent 25 alarm events. If the missing sequence number cannot be found in this table, then a reload of all active alarms is required.

Active alarm data resides in:

*alarmActiveTable*

*nnExtAlarmActiveTable*

A full table read must be performed on the varbinds in Please refer to “Required Varbinds for Active Alarm resync” on page 121. to perform the resync:

#### Required Varbinds for Active Alarm resync

| Varbind                | OID                         |
|------------------------|-----------------------------|
| snmpTrapOID            | .1.3.6.1.6.3.1.1.4.1        |
| alarmActiveResourceId  | .1.3.6.1.2.1.118.1.2.2.1.10 |
| alarmActiveDateAndTime | .1.3.6.1.2.1.118.1.2.2.1.2  |
| alarmActiveDescription | .1.3.6.1.2.1.118.1.2.2.1.11 |

| Varbind                              | OID                           |
|--------------------------------------|-------------------------------|
| nnExtAlarmActiveEventType            | .1.3.6.1.4.1.562.29.6.1.1.1.1 |
| nnExtAlarmActiveProbableCause        | .1.3.6.1.4.1.562.29.6.1.1.1.2 |
| nnExtAlarmActiveAdditionalText       | .1.3.6.1.4.1.562.29.6.1.1.1.3 |
| nnExtAlarmActiveDocumentationPointer | .1.3.6.1.4.1.562.29.6.1.1.1.4 |
| nnExtAlarmActiveResourceDescription  | .1.3.6.1.4.1.562.29.6.1.1.1.5 |
| nnExtAlarmActiveManualClear          | .1.3.6.1.4.1.562.29.6.1.1.1.6 |
| nnExtAlarmActiveSequenceNumber       | .1.3.6.1.4.1.562.29.6.1.1.1.7 |

**Note:** These varbinds are retrieved from the *alarmActiveVariableTable*

The manager can perform a full resync with the *alarmActiveTable* in a similar way to that used when performing an incremental resync from the *nlmLogVariableTable* (see “Incremental Resync of missing logs”). As stated earlier, each alarm entry in the *alarmActive* table has a corresponding entry for all of the alarm components in the *alarmActiveVariable* table. The complete set of alarm data can be retrieved for each alarm by first retrieving the *alarmActiveIndex* of the entry in the *alarmActiveTable*, and then using this index to request its corresponding entries from the *alarmActiveVariableTable*. These steps can be summarized as follows:

- 1 Poll the IEMS server for the latest sequence number. Issue a GET request on *nlmStatsLogNotificationsLogged*. Perform steps 2 to 3 until all alarms have been retrieved from IEMS.
- 2 Derive the list of indices to the *alarmActive* table by performing a series of GETNEXT requests on any one of its columns. The *alarmActiveIndex* for entries can be parsed from this data.
- 3 For each *alarmActiveIndex* derived in step 2, determine the alarm type perform a GET request on the *alarmActiveVariableTable* all index fields for the alarm type. The specific index fields requested will be based on the alarm type specified by the *snmpTrapOID* in index 2. See “Incremental Resync of missing logs” for a description of varbinds used in the different event types. This step essentially performs repeated incremental resync operations until complete.
- 4 Based on the alarm type determined in step 3, request all varbinds (GET) in the *alarmActiveVariableTable* for the constructed index

*alarmListName* = Nortel\_fault

*alarmActiveIndex* = (derived in step 2)

*alarmActiveVariableIndex* (1-n) - depends on alarm type found in step 3

**Note:** The *alarmActiveVariableTable* and *nlmLogVariableTable* contain the same indexed alarm information and are accessed in similar ways. The main difference between the two is that *alarmActiveVariableTable* uses the *alarmActiveIndex* as one of its key components, whereas the *nlmLogVariableTable* uses the sequence number.

### Incremental Resync of missing logs

An OSS can monitor sequence numbers from alarm events to detect missing notifications. If a missing notification is found (as described in “Detection of Missing Logs”), then it can be queried from the *nlmLogVariableTable* using the sequence number.

- 1 OSS detects missing sequence number
- 2 Missing alarm events can be recovered from the *nlmLogVariableTable* using the sequence number. Depending on the alarm event type, different numbers of varbinds will be present in the table for the entry.

The following table shows an example of the varbinds that would be used to recover a missing RAISE event with a sequence number of “1390”. RAISE events include the following alarm types:

*nnExtAlarmWarning* (.1.3.6.1.4.1.562.29.6.1.0.302)

*nnExtAlarmMinor* (.1.3.6.1.4.1.562.29.6.1.0.303)

*nnExtAlarmMajor* (.1.3.6.1.4.1.562.29.6.1.0.304)

*nnExtAlarmCritical* (.1.3.6.1.4.1.562.29.6.1.0.305)

Table , “nlmLogVariableTable varbinds for recovery of lost CLEAR notification,” on page 125 shows an example of the varbinds that would be used to recover a missing CLEAR event with a sequence number of “1390”. CLEAR events are specified by the following OID:

*nnExtAlarmClear* (.1.3.6.1.4.1.562.29.6.1.0.301)

The alarm type can be determined by examining the value of the *snmpTrapOID* of the missed alarm. For both alarm types, this value is assigned index 2 of the *nlmLogVariable* table and can be queried with the OIDs shown in the following table. The alarm type will determine the mapping for the remaining fields in the notification message.

### Recovery of missing alarm by sequence number

**IEMS**

**OSS**

## Northbound Performance Interface

### IEMS Performance Interface Specification

The Northbound performance interface provides the customer a single reporting interface for the managed network. This has been achieved through the definition of a “Common Performance Record format” (CPR-F). The common format maps operational statistics from across network elements to a common set of metrics to provide a network-level view of performance.

The Common Performance Record format specification is defined using a standardized XML interface. It provides a full definition of the normalized containment hierarchy describing performance statistics for reporting network components. PM collection jobs configured in IEMS can report device metrics in either XML or CSV formats.

The following is a list of devices that support collection of performance data in the SN08 release, PP8600, STORM, MS2000, Session Server-Trunks (platform PMs only), MAS, MCS, MCS Mgr, FPM, MG15000, SAM21, IEMS, UAS, GWC, USP, MG9K, and SSPFS.

### XML

If XML is selected as the output format, then the data is collected and saved as an ACSII file in the format defined by the CPR-F XML Schema Document. The format specification below provides a full description of the normalized representation of PM data for supported network elements.

### Conversion to CSV

When CSV output is configured in the collection job, data is initially transformed to the XML format described above. An additional step then converts the XML file to its corresponding CSV representation. There is no loss of information during this process. Net content represented by each output is identical.

The next section defines the CPR-F in terms of its XML structure followed by a discussion of its *conversion* to CSV format.

Also, collected CSV and XML performance files can be transferred from IEMS to an OSS system by configuring a transfer job for the performance files. The transfer can be done using FTP or SFTP.

For more information on configuring, retrieving, and transferring performance measurements through IEMS, see NN10327-711 - IEMS Performance Management Guide.

## The Common Performance Record Format

### Overview

The Common Performance record is an XML document specified using an XML Schema Document (XSD).

There are two major aspects to encoding performance measurements – identifying the source of the measurements within the network and recording the measurement data itself.

The CPR-F uses an XML containment structure to indicate the source point in the network of the performance measurements. A typical performance measurement may have originated in an NE and then been passed up to an element management system (EMS). The EMS in turn may have passed the measurements along to an Operations Support System (OSS).

For this particular case, the common record would contain an XML element representing the management system (the OSS) which ultimately received the set of performance measurements. Within this OSS element would be an element representing the EMS which forwarded the measurements to the OSS.

And within this EMS element, there would be an XML element representing the NE (network element) from which the PMs were obtained. The NE element may itself contain another XML element representing the sub-component in the NE which generated the measurement.

The measurement data itself would also be encoded in one or more XML elements. These data elements would be contained within the sub-component element above.

### XML Elements

The common performance record format uses thirteen major elements to encode performance information:

The *PMFile* element is the top-level element and contains all other elements.

The *System* element, *Entity* element and *SubEntity* element are used to relate the measurements to some origination point in the network and to capture their path through the management systems.

The *SingleValues* & *SingleValue* elements, the *GroupOfValues* & *GroupValue* elements and the *Table*, *Labels*, *Label*, *RowOfValues* & *RowValue* elements may all be used to capture the performance measurement information itself.

### Encoding Source Identification for Performance Measurements

A performance measurement (PM) originates in some device in the network which records the measured value. This measurement may be combined with

other measurements within the device and forwarded to a management system. The management system may combine the PMs from many devices into a single grouping and may forward this grouping of PMs to some superior management system. Again this superior management system may combine groupings of measurements from many domains in the network and forward the combined package of measurements to yet another management system.

This path that PMs take as they move from the network device level to the management level is encoded in the CPR. Three elements are used to indicate this path:

*System* element

*Entity* element

*SubEntity* element.

The intent of the Entity element is to represent the NE itself. What constitutes an NE and what device granularity determines an NE is an implementation choice for any particular product or technology. The System, Entity and SubEntity form a hierarchy. In this hierarchy, the Entity element may appear only once.

A Network Element may contain many sub-components and these sub-components may themselves contain sub-components and so on to some arbitrary level of decomposition. The SubEntity element represents a sub-component within the NE. A SubEntity element may contain other SubEntity elements to reflect the component structure within the NE. What constitutes a sub-component within an NE is, again, an implementation choice for any particular product or technology.

A set of performance measurements may traverse one or more management systems as it travels to some final destination system. Each of these intermediate management systems may be represented by a System element. A System element may contain another System element encoding the sequence of management systems which handle the performance measurement data.

The CPR may be emitted by a management system or by a network element. When an NE emits the record, the top-most XML element within the PMFile element will be an Entity element representing the NE which is sending the measurements. When a management system emits the CPR, the top-most XML element within the PMFile element will be a System element representing the management system.

**OSS/EMS/NE hierarchy encoded in XML elements****Encoding the Performance Measurement Data****Measurement Descriptors**

In general, a performance measurement is some number which is bound to a measurement identifier such as: numberOfPackets = 23145. As well as these two items, a performance measurement may contain contextual information indicating the circumstances under which the measurement was taken or giving some further information as to the meaning of the measurement or its interpretation. The following information items are used in the common performance record format to describe measurement information:

**Measurement Identifier:** This is the name or label which uniquely identifies the measurement.

**Measurement Value:** This is (generally) the numerical value of the measurement (such as an integer or decimal number). Or it could be a string or some enumerated value

Measurement Kind: There are two kinds of performance measurement: 'snapshot' and 'period-based'.

A 'snapShot' measurement is one in which the measurement quantity (for example, some counter in a network device) is sampled at an instant in time and is being reported to the management system. There is no time significance attached to this sampled value. To derive information from a snapshot value, it may need to be compared to some previous snapshot of the counter or gauge and conclusions drawn about the change, if any, between the two values.

In contrast, a period-based measurement represents the value of some measurement quantity in the network device over a specified period of time. The measurement value relates only to activity which occurred within the measurement period.

Capture Time: This is the time at which the measurement value was captured. For a period-based measurement, this is the time at which measurement accrual stopped. For a snapshot measurement, it represents the time at which the measurement was sampled.

Interval Duration: This is the length of the time interval governing the performance measurement. For a period-based measurement, this interval is the duration between the time the measurement was started and the time the measurement was stopped. For a snapshot measurement, the interval indicates the duration between the time the current value was sampled and the time of the previous sample.

Last Record: If true this indicates that the performance measurement is the last value for the reporting time interval (indicated in IntervalDuration).

Reliability: This is an indicator of the quality or reliability of the measurement. It can take values such 'valid', 'invalid' and so on.

Unit: This names the unit in which the measurement is expressed (for example, packets, bytes and so on).

Value Type: This indicates the type of data contained in the Measurement Value. It can take on values such as 'integer', 'decimal', 'string' and so on).

Register Type: A register is the generic name given to the hardware or software capability in an NE which actually records the performance measurement. For numeric values the RegisterType property indicates whether the register behaves as a counter or a gauge or some other numeric register. (A counter is a register which accumulates a count of some defined event such as the arrival

of a packet. A gauge is a register which holds a state of usage sample – for example, the number of items in a queue).

Maximum Value: This property indicates the highest value the register can hold.

Reset Time: This is the register reset time. For numeric values this is the date/time when the register was last reset to zero.

Monitored Time: This indicates the actual duration of the period over which the measurements were taken. This property is used for cases where the actual measurement period is less than the period indicated in the Interval Duration value.

Intervals Covered: As an efficiency mechanism, it may be decided not to forward measurements when they have a value of zero at the end of the measurement period (for example, no events of interest occurred in the measurement period). This practice is called zero-suppression. In the case where a zero suppression representation is used, this attribute specifies the number of consecutive intervals over which a zero value was obtained for the measurement.

### **Table and Group Identifiers**

Performance measurements may be stored within the common format as tables of values or as groups of values. The properties below are used to identify these tables and groups.

Table Identifier: This is the name or label for a particular table of measurements. This property is only used in the Table element.

KeyOfRow: This is a property specific to a column label used in representing tabular measurements. When it has a value of 'true' it indicates that this particular column of the table contains the key of the row of data values. The key is the identity of the object to which the row measurements pertain. This would generally refer to a sub-component in the network element.

Group Identifier: This is the name or label for a particular group of measurements. This property is only used in the GroupOfValues element.

### **Supplementary Identifiers**

In many cases the identity of a network element, NE sub-component or performance measurement can be expressed in a single identifier. In other cases the identity will be contained in a number of individual identifiers. The approach taken in the common performance record format is to use supplementary identifiers to hold any additional identification information required in an element.

In the case of an *Entity* element (which is used to hold measurements for a particular NE), there are two identifiers: an EntityId (Entity Identifier) and an EntitySuppId (Entity Supplementary Identifier).

Likewise, the *SubEntity* element (which holds measurements for a sub-component of the NE) has a SubEntityId and three supplementary identifiers – SubEntitySuppId1, SubEntitySuppId2 and SubEntitySuppId3. Note that in the case of the *SubEntity* supplementary identifiers, it is not stipulated in which order or in which combination they are to be used. This is left as an implementation decision for any particular product/technology.

The performance measurement itself has a supplementary identifier – MeasureSuppId1. Both the *Table* element and *GroupOfValues* element also have a supplementary identifier – respectively TableSuppId1 and GroupSuppId1.

Some of these identifiers are mandatory and some are optional. See section [“Optionality” on page 138](#) for more information.

#### Example of Identifiers and Supplementary Identifiers

#### Measurement Elements

There are three ways to encode performance measurements in the common format – using a *SingleValues* approach, a *GroupOfValues* approach or a *Table* approach.

## Single Values Approach

With this approach each performance measurement is considered as a standalone value with no explicit relationship to any other measurement value which may accompany it. Each measurement is encoded in a *SingleValue* element. One or more *SingleValue* elements are contained in a *SingleValues* element which specifies the kind of measurements contained within it (period-based or snapshot) and the interval duration for those measurements (for example, whether they are measurements for a 5-minute, 15-minute or 24-hour interval).

### A SingleValues element containing two values

## Group Values Approach

Like the *SingleValues* element, the *GroupOfValues* element contains one or more individual measurements. However, there is an explicit relationship between the measurements in the element. They are part of a group of measurements with a collective identity. The *GroupId* value contains the identity of the group. As with the *SingleValues* element, the *GroupOfValues* element specifies the kind of measurements it contains and their interval duration. In addition, many of the individual measurement properties such as *CaptureTime* and *Reliability* are common to the group and these are encoded once in the *GroupOfValues* element itself rather than being encoded for each measurement in the individual *GroupValue* element.

**A GroupOfValues element containing two measurements****Table Approach**

The table approach encodes performance measurements in a tabular format. A Table element will contain a Labels element to hold the column headings for the table. The Table element will also contain one or more RowOfValues elements. Each RowOfValues element contains a row of individual data items with a one-to-one correspondence to the labels in the Labels element. One or more of the data items in a row may contain key information indicating the source of the measurements (that is, the data item will identify the sub-component from which the measurements were taken). This facet is indicated using the KeyOfRow property in the Label element.

A table may be explicitly identified using a TableId property or it may be an anonymous table with no name.

**A Table element containing two rows of values****Interface Packet Count Table**

| <u>SubComponent</u> | <u>PacketsIn</u> | <u>PacketsOut</u> |
|---------------------|------------------|-------------------|
| Interface 1         | ----             | ----              |

**Top Level Properties**

The performance measurements encoded in the common format constitute an XML string. This set of values will have high level properties in common. These are captured in the PMFile element. The term ‘file’ as used below is intended to designate the XML string containing the performance measurements.

MeasurementCategory: This property describes the type of measurements contained within the PM file (its value is always “PM” indicating the file contains performance measurements).

PMReportType: This describes the type of performance measurement report contained in the file (for example, this property could be used in the case where it is desired to distinguish between different types of PM reports).

FileCreationTime: This specifies the date/time when the PM file was created.

FileSchema: The FileSchema contains information which describes the format of a source non-CPR format PM file or the mapping file used to translate the source file into the common format.

FileSequenceNumber: The position of this file in some sequence of related PM files.

EarliestStartTime: This is set to the start time of the earliest measurement contained in the file.

LatestCaptureTime: This is set to the capture time of the latest measurement in the file.

#### PM File element contents

```
PMFile element
  MeasurementCategory:
  ReportType:
  FileCreationTime:
  FileSequenceNumber:
  EarliestStartTime:
  LatestCaptureTime:
  ValueTypeDefault:
  MaxValueDefault
  RegisterTypeDefault:
```

#### Default Values

ValueType, MaxValue and RegisterType are three properties which may be specified for a measurement (See Measurement Descriptors on page 11). It is possible to set defaults for these values in the file using the ValueTypeDefault, MaxValueDefault and RegisterTypeDefault properties in the top-level *PMFile* element. The scope of these default values is the entire PM file.

It is also possible to specify one or more of ValueType, MaxValue and RegisterType for each *SingleValue* element, each *GroupValue* element or each *Label* element (contained in a *Table* element). This local specification overrides the default value in *PMFile* for the particular element which contains the local specification.

If the property is not locally specified in the *SingleValue*, *GroupValue* or *Label* element, then the default value specified in the *PMFile* element is used.

If a default property is not specified in the *PMFile* element, then the following implicit default values are assumed. These implicit values function as if they were explicitly specified in *PMFile*.

RegisterTypeDefault: “counter”

ValueTypeDefault: “integer”

MaxValueDefault: 4,294,967,295 (that is,  $2^{32} - 1$ )

**Optionality**

It is possible to qualify a performance measurement with very many properties as shown above. Most of these properties are optional and are used in specific technologies or are needed to accommodate specific product performance management practices.

The following is the minimum set of properties required to identify a performance measurement. These are the required properties in a PM file:

**PMFile Element:** MeasurementCategory

**System Element:** SystemId

**Entity:** EntityId

**SubEntity:** SubEntityId

**SingleValues Element:** MeasurementKind

**SingleValue Element:** MeasureId; Value; CaptureTime

**GroupOfValues Element:** GroupId; CaptureTime; MeasurementKind

**GroupValue Element:** MeasureId; Value

**Table Element:** CaptureTime; MeasurementKind

**Labels Element:** N/A

**Label Element:** N/A

**RowOfValues Element:** N/A

**RowValue Element:** Value

So a minimal CPR file would look like this:

**Minimal Common Record Performance Record file**

The figure below shows the hierarchical relationship of the major XML elements in the common performance record.

### Hierarchy of the major XML elements

### Attribute and Element Encoding

In the common performance record format some information is encoded as element data while other information is encoded using attributes. The approach followed is that attributes are used to encode metadata while elements are used for instance values.

Metadata is data which describes or qualifies some piece of information in terms of its class. So, in the common performance record, the *MeasurementKind* property differentiates between period-based measurements and snapshot measurements. This property is coded as an attribute.

Data which identifies or describes a specific instance of information rather than a class of information is encoded using an element. So the *CaptureTime*

property describes the time instant when a specific measurement was taken and so is not metadata. It is encoded as an element.

It also needs to be mentioned that the common performance record format adopts the approach of encoding the measurement name or label using an XML element. For instance:

**Example 1:** `<MeasureId> numberOfPackets </MeasureId>`

This is in contrast to the approach of directly coding the measurement name as an element tag:

**Example 2:** `<numberOfPackets> </numberOfPackets>`

The requirement for the common performance record format is to have standard fields for measurement information which could be used across all of Nortel (see the Performance Strategy requirements on page 5). This has been achieved using the current approach as shown in Example 1 above.

In order to use a direct coding of the measurement name as the element tag (Example 2 above) would require alignment across Nortel on the identification and semantics of all performance measurements which could possibly be encoded in the common performance record format. This alignment task has not been undertaken yet. It is envisaged that upon completion of such a convergence, the common performance record would be able to evolve to use measurement identifiers as tag names.

An additional concern is sometimes raised concerning the use of tables in the common performance record format. From a theoretical viewpoint, these tables are considered to constitute a lower quality of XML encoding than other means of encoding the data. However the common performance record format has opted to allow a tabular representation of data for pragmatic reasons. Tabular format measurement data has been the norm in most products for many years. Many operations systems expect their performance data to arrive in this customary format. In addition, industry standards for performance measurements such as 3GPP (Third Generation Partnership Project) mandate the use of tables for transporting performance data.

### **Layout of Elements and Attributes in the Common Format**

The two figures below indicate which properties are expressed as elements and which are expressed via attributes. The figures represent one of many combinations of element types which are possible in the common performance record format. (Attributes are shown as *blue italicized* text. Elements are represented as boxes).

## Common Performance Record Comma Separated Values (CSV) format

The following is an abbreviated generic description of the CPR CSV format. The CPR format is designed to be parsable into or from CPR XML format without loss of information.

The following elements are treated as 'blocks': PMFile, System, Entity, SubEntity, Table, GroupOfValues, SingleValues.

The start and end of these elements are marked or indicated in CSV with unique 'Begin' and 'End' markers. The format of an element block is as follows:

`{element_name}=Begin`

... CSV heading row for attributes & child text element nodes children of <element> ...

... CSV value row for attributes & child text element nodes of <element> ...

... recursive handling of all complex sub-elements (element children that are not text nodes) ...

`{element_name}=End`

For each element, a specific property (attribute or text element) has been selected as the identifier for that element. The identifier will always appear as the *first* of the comma separated values in the CSV representation of that element.

Values that contain commas are enclosed in double quotes in CSV format.

### Element blocks and identifiers

| Element     | Block? | Identifier          |
|-------------|--------|---------------------|
| PMFile      | Y      | MeasurementCategory |
| System      | Y      | SystemId            |
| Entity      | Y      | EntityId            |
| SubEntity   | Y      | SubEntityId         |
| Table       | Y      | TableId             |
| Labels      | N      | Label               |
| RowOfValues | N      | RowValue/Value      |

| Element       | Block? | Identifier      |
|---------------|--------|-----------------|
| GroupOfValues | Y      | GroupId         |
| GroupValue    | N      | MeasureId       |
| SingleValues  | Y      | MeasurementKind |
| SingleValue   | N      | MeasureId       |

As not all identifiers are in fact mandatory, when the identifier is not found in the XML being translated the value of `_Unnamed_` is used in the CSV output where the value of the identifier would normally appear.

For reference, “[Layout of elements & attributes in the Common Performance Record](#)” and “[Layout of elements & attributes in the CPR-F \(cont'd\)](#)” (which had been presented earlier) are shown below. The two figures indicate which properties are considered identifiers for each element, and therefore will always appear as the first comma separated value within a row. (Mandatory identifiers are shown in **red**. Optional identifiers are shown in **blue**. Attributes are shown as *italicized* text. Elements are represented as boxes.)

**Layout of Elements & Attributes in the CPR-F**

## Layout of elements &amp; attributes in the CPR-F (cont'd)

## Note on CSV Examples

All CSV examples are with header information suppressed by default. This is the default behavior for all CSV performance reports in the SN08 release.

To have the header information included in the CSV performance reports, the user must change the “suppress-headers” option from “true” to “false”. The “suppress-headers” option is located in the `cprxml2csv.properties` file in the `/opt/nortel/iems/current/resources` directory.

CSV with header information example:

```
PMFile=Begin
MeasurementCategory,noNamespaceSchemaLocation,FileCreationTime
PM,commonFormat.xsd,2004-06-23T12:45:04EST
System=Begin

**Note:** Collected performance files (in CSV and XML format) can be forwarded from the IEMS server to an OSS system by configuring an IEMS transfer job. Transfer jobs can be configured to forward these files using FTP or the secure SFTP protocols.

## Inventory/Topology Interface

### Overview

The IEMS provides the ability to perform an ACSII dump of provisioned network inventory/topology information for use by 3rd party systems. The snapshot is initiated from the IEMS user interface and outputs full configuration details of the component hierarchy to the IEMS server as a text file. By default, the data is placed in the file */opt/nortel/iems/current/logs/inventoryData.txt*. This information can then be retrieved and processed by third parties. For a full description of the format and content of these topology listings see the section titled “Dumping Inventory Details” in:

NN10330-511 - Integrated EMS Configuration Management

## Network Security

### Centralized Security Administration (Network Security)

#### Overview

The Integrated EMS provides a comprehensive security architecture based on PAM (Pluggable Authentication Module) and NSSwitch (Name Services Switch). The following figure shows the Nortel Networks VoIP Security Architecture.

## Centralized Security Architecture

### Features

This architecture provides the following features:

- Support for central administration of user accounts and user groups
- Support for central authentication: authentication of centrally administered user accounts is performed by the IEMS Security Server.
- Support for central authorization: authorization information needed to support user access control is securely managed and provided by the IEMS Security Server.
- Support for Single Sign-on (SSO)- This capability enables the user to access multiple network elements, applications, and features from a single login session. Session information for a user is shared between IEMS and network elements supporting SSO.
- Customer Plug-ability - provides the ability for third parties to plug-in its own Authentication/Authorization solutions on IEMS. Client authentication and authorization information are provided by the customer's security backend via the IEMS Security Server.

The following table lists the devices and applications supporting these features:

## Authentication and Authorization

Network Elements and Applications can be configured to use Centralized Security Administration. To enable a device to use Centralized Security Administration, the device must be configured to use the IEMS central security server to authenticate users and access user profile information.

The IEMS Central Security Server uses PAM (Pluggable Authentication Module) to process the authentication requests and NSSwitch (Name Services Switch) to return user privilege and user profile information to Network Elements and Applications.

### **PAM Services**

PAM provides authentication services for clients in the managed network. Customers have the option to use the PAM services that come pre-bundled with the security server or to provide their own. When customers use the PAM services provided by the IEMS Security Server, the user accounts are managed via the IEMS security and administration GUI.

When a request is forwarded to the IEMS PAM SPI (PAM Service Provider), then authentication is performed against data provisioned and administered by the Security Administration application on the IEMS client.

Conversely, when a PAM services are provided by a customer, incoming authentication requests are forwarded to the customer SPI for resolution against their remote database.

### **NSSwitch Services**

NSSwitch provides services to obtain group and profile information for users. Centralized access to network resources depends on the definition of a common set of user groups to map security access for each user. The Nortel Networks solution provides a number of predefined user groups to address the full range of OAM&P functions required across a managed network. For a full discussion of these user groups and their categorization, see *NN10281-600 - ATM/IP Administration and Security*.

Customers can configure NSSwitch to use the service pre-bundled with IEMS or, as with PAM services, provide their own service remotely. When the pre-bundled service is used, group and user profile information is administered via the IEMS security and administration GUI. See NN10336-611 - IEMS Administration and Security.

If NSSwitch services are configured on a third party system, it is important to note that this security solution supports *only* the NSSwitch group and password databases. Although other database types may be defined in NSSwitch, they are not used by the central security feature.

See the References section for additional information on PAM and NSSwitch.

### **Single Sign-on (SSO)**

The Single Sign-on feature allows users transparent access to multiple network elements and applications through a single login.

Once a user has been successfully authenticated for the first time (by user login), an SSO token is created by the IEMS security server that will be used to authenticate the same user on subsequent login attempts.

Network Elements and Applications use a Single Sign-On (SSO) interface on the Central Security Server to request SSO tokens whenever authentication is required.

For full details on the interface specification, see *NN10336-611 - IEMS Administration and Security*.

## Configuring Security Administration

### Managing Accounts

It is recommended practice that all user accounts be managed centrally with the following exceptions:

- accounts required to provide emergency access to a device.
- super user accounts (for example ‘root’ users)

For more information on adding a centrally managed user, refer to the “Adding New Users” section of *IEMS Administration and Security*.

**Note:** Detailed procedures for these steps can be found in *NN10336-611 - IEMS Administration and Security*.

### Configuring Centralized Security Administration on NEs and EMS Platforms

An OSS must configure NEs and EMS Platforms to use centralized security administration. To enable centralized security administration on a device, the OSS must follow the procedures outlined for the device. For security configuration information for a specific device, look for its listing in the “Supported Devices” section of this document.

**Note:** Detailed procedures for these steps can be found in *NN10336-611 - IEMS Administration and Security*.

# IEMS Supported Devices

The sections that follow contain a directory to provide customers a quick reference to device-specific information on faults, performance, interfaces, and other user documentation. The intended purpose is to allow customers to correlate IEMS Northbound interface events and behaviors with their originating source.

Each device in the listings below provide sample logs from all four Northbound fault streams: SCC2, NTSTD, Syslog, and SNMP. With the exception of the SNMP fault feed, these samples are shown as they appear from the Northbound interfaces.

## Understanding SNMP Fault samples

Since SNMP has no inherent display format, each event is presented in a format that displays the short name of the MIB variables populated by the event:

*<short MIB variable Name> => <value>*

for example:

**nnExtAlarmActiveResourceDescription =>**  
IEMS=nc0rtp2127.us.nortel.com-MS2000;

The following table provides a mapping of the displayed “short” variable name to its full form as well as its associated OID.

**OID Short Name Mapping in SNMP Log Samples**

|            |                                                                                                  |

## Call Agent Core

This section contains IEMS Northbound log samples and device documentation references for the Call Agent Core.

## Call Agent Core Fault Interface

### Fault documentation for Call Agent Core:

- NN10275-909 - Succession fault Management logs Reference
- NN10083-911 - Communication Server 2000 Fault Management

### DMS Standard (North America)

- 297-8021-840 - North American DMS100 Log Report Reference Manual Volumes 1 to 8

### International Succession

- 297-9051-8401 - DMS100 Log Report Reference Manual Volumes 1 to 7

### Fault Mapping for Call Agent Core

The following criteria can be used for looking up information on specific faults for Call Agent Core.

#### Fault Correlation for Call Agent Core

| NB format -><br>Device/EM | SCC2                    | NTSTD                   | SNMP                    | Syslog                  | Document Reference                                     |
|---------------------------|-------------------------|-------------------------|-------------------------|-------------------------|--------------------------------------------------------|
| <b>Call Agent Core</b>    | log name and log number | log name and log number | log name and log number | log name and log number | see section “Fault documentation for Call Agent Core:” |

### Northbound Fault Formats for Call Agent Core

#### SCC2

The following is an example of a Call Agent Core log in SCC2 format:

```
56 LINE138 3778 INFO TRMT
      SLOA 21 1 02 01      DN 2145202111
      TREATMENT SET = BUSY      CALLED NO =      5202111
      CALLID= 01BE 036D
```

#### NTSTD

The following is an example of a Call Agent Core log in NTSTD format:

```
RTPU07BR      LINE138 Jan23 16:56:30 3778 INFO TRMT
              SLOA 21 1 02 01      DN 2145202111
              TREATMENT SET = BUSY   CALLED NO =                5202111
              CALLID= 01BE 036D
```

## SNMP

The following is an example of a Call Agent Core log in SNMP format:

```
system.sysUpTime.0 => 19:51:46
snmpTrapOID.0 => nnExtAlarmMessage
nnExtAlarmMessageResource => .0.0
nnExtAlarmMessageResourceDescription => IEMS=wnc0y0m0.us.nortel.com-CS2K-Mgr;
nnExtAlarmMessageDateAndTime => 2004-1-23,11:56:30.0,
nnExtAlarmMessageDocumentationPointer => LINE138
nnExtAlarmMessageInfo => 56 LINE138 3778 INFO TRMT              SLOA 21 1 02 01
DN 2145202111
              TREATMENT SET = BUSY   CALLED NO =                5202111
              CALLID= 01BE 036D
```

## Syslog

The following is an example of a Call Agent Core log in Syslog format:

```
Feb 23 11:57:27 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=3835~~ LINE138 NONE INFO
TRMT^M      SLOA 21 1 02 01      DN 2145202111 ^M      TREATMENT SET = BUSY   CALLED
NO =                5202111 ^M      CALLID= 01BE 036D
```

## Performance

### OM and PM Documentation references for Call Agent Core

- NN10149-711 - Communications Server 2000 Performance Management

#### DMS Standard (North America)

- 297-8021-814P1 - North American DMS-100 Operational Measurements Reference Manual Volumes 1 to 6

#### International Succession

- 297-9051-8141 - DMS-100 Family Operational Measurements Reference Manual Volumes 1 to 6

## Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided

Performance measurements for Call Agent Core are available from the CS2K Core Manager. See NN10149-711 - Communications Server 2000 Performance Management for more information.

### XML

The following is an example of Performance data for Call Agent Core in XML format:

***Note:** The IEMS northbound performance interface does not support this device.*

### CSV

The following is an example of Performance data for Call Agent Core in CSV format:

***Note:** The IEMS northbound performance interface does not support this device.*

## GUI/CLUI Documentation for Call Agent Core

The Call Agent Core provides both command-line and MAP-based interfaces accessed through the CS2000 Core Manager.

### GUI/CLUI Launching and User procedures

- NN10018-111 - CS2000 Core Manager Basics  
see section “Accessing the Core”

| <b>Call Agent Platform</b> | logname and number | logname and number | logname and number | logname and number | NN10087-911<br>Call Agent Fault Management |

### Northbound Fault Formats for Call Agent Platform

#### SCC2

The following is an example of a Call Agent Platform log in SCC2 format:

```
* 41 CCA 355 6064 FLT Jam Inactive Unit
Unit Number : 0, ACTIVE
Description : Inactive JAMMED
```

## NTSTD

The following is an example of a Call Agent Platform log in NTSTD format:

```
COMPACT06BT * CCA355 JAN21 18:41:14 1864 FLT Jam Inactive Unit
Unit Number : 0, ACTIVE
Description : Inactive JAMMED
```

## SNMP

The following is an example of a Call Agent Platform log in SNMP format:

```
system.sysUpTime.0 => 1 day, 4:49:05
snmpTrapOID.0 => nnExtAlarmMinor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.20.50.48
.48.52.45.49.45.50.49.44.54.58.52.49.58.49.52.46.48.44.8995
alarmActiveDateAndTime => 2004-1-21,6:41:14.0,
alarmActiveDescription => The inactive unit is jammed.
Description : Inactive JAMMED
nnExtAlarmActiveEventType => 5
nnExtAlarmActiveProbableCause => 118

## Syslog

The following is an example of a Call Agent Platform log in Syslog format:

```
Jan 21 19:41:06 wnc0s0qh IEMS: _V2_~I=~H=wnc0s0qh~A=IEMS~S=2860~~ CCA355 MINOR FLT
Jam Inactive Unit^M Unit Number : 0, ACTIVE ^M Description : Inactive JAMMED
```

## Performance

### OM and PM Documentation references for Call Agent Platform

- NN10153-711 - Call Agent Performance Management

### Northbound OM/PM Formats

Performance measurements for Call Agent Platform are available only from the Call Agent Manager interface. See NN10153-711 - Call Agent Performance Management for more information.

#### XML

The following is an example of Performance data for Call Agent Platform in XML format:

***Note:** The IEMS northbound performance interface does not support this device.*

#### CSV

The following is an example of Performance data for Call Agent Platform in CSV format:

***Note:** The IEMS northbound performance interface does not support this device.*

## GUI/CLUI Documentation for Call Agent Platform

### GUI Launching and User procedures

- NN10175-611 - Call Agent Administration and Security

### Related documents

- NN10023-111 - Call Agent Basics
- NN10109-511 - Call Agent Configuration Management

## Core Element Manager (CEM)

This section contains IEMS Northbound log samples and device documentation references for the Core Element Manager.

## CEM Fault Interface

This section will provide references to customer documentation for Fault, Performance, Topology, GUI/CLUI, and Security for CEM.

### Fault documentation for CEM:

The document that describes CEM faults is CEM Logs and OMs - Integrated EMS Fault Management, NN10334-911- I.

### Fault Mapping for CEM

The following criteria can be used for looking up information on specific faults for CEM.

**Table 1 Fault Correlation for CEM**

| NB format -> | SCC2                                | NTStd                               | SNMP                 | Syslog                              | Document Reference |
|--------------|-------------------------------------|-------------------------------------|----------------------|-------------------------------------|--------------------|
| Device/EM    |                                     |                                     |                      |                                     |                    |
| <b>CEM</b>   | Description log name and log number | Description log name and log number | Device specific info | Description log name and log number | NN10334-911- I     |

## Northbound Fault Formats for CEM

### SCC2

The following is an example of a CEM log in SCC2 format:

#### info event:

```
58 CSEM600 0069 INFO Log
Equip Id: 250Q C7SP

### Northbound Fault Formats for CICM

#### SCC2

The following is an example of a CICM log in SCC2 format:

\* 02 CICM359 0001 FLT CICM Fault

Location: 47.165.168.120

Notification Id: 7

State: Raised

Category: equipment

Cause: equipmentMalfunction(15)

Time: Jun 17 09:02:08 2004

Component Id: CICM=CICM-120A;NodeType=Cicm;Component=Card;Card=7

Specific Problem: Card 7 has an alarm.

Description: Card Alarm

?

\*\*02 CICM500 0002 FLT CICM Fault

Location: 47.165.168.120

Notification Id: 5

State: Raised

Category: equipment

Cause: unspecifiedReason(118)

Time: Jun 17 09:02:08 2004

Component Id: CICM=CICM-120A;NodeType=Cicm;Component=Chassis

Specific Problem: Chassis card state change report for slot 7 in state

1

Description: Chassis Card State Change

?

**\*\*02 CICM339 0003 FLT CICM Fault**

Location: 47.165.168.120

Notification Id: 6

State: Raised

Category: equipment

Cause: IANError(25)

Time: Jun 17 09:02:13 2004

Component Id: CICM=CICM-120A;NodeType=Cicm

Specific Problem: Have not received a message from Node B for 1.5\*ALARM

\_POLL\_PERIOD Seconds. CPU\_CARD\_DOMAIN\_A

Description: No Message Received From B

### NTSTD

The following is an example of a CICM log in NTSTD format:

```
test * CICM359 JUN17 09:02:08 0004 FLT CICM Fault
      Location: 47.165.168.120

## Northbound Fault Formats for GWC

### SCC2

The following is an example of a GWC log in SCC2 format:

```
**14 GWC 307 7250 TBL GWC Fault
Location: GWC-2-UNIT-0
NotificationID: 4
State: Raise
Category: Communications
Cause: Communications subsystem failure
Time: Jan 23 15:15:59 2004
Component Id: GWC=GWC-2-UNIT-0;Version=PGC92BA;Unit=unit_0;Software=NODE
MTC
Specific Problem: EM not responding, provisioned data loaded from local
Flash
Description: Element Manager communication failure.
```

### NTSTD

The following is an example of a GWC log in NTSTD format:

```
COMPACT06BT ** GWC307 Jan23 20:14:38 7250 TBL GWC Fault
Location: GWC-2-UNIT-0
NotificationID: 4
State: Raise
Category: Communications
Cause: Communications subsystem failure
Time: Jan 23 15:15:59 2004
Component Id: GWC=GWC-2-UNIT-0;Version=PGC92BA;Unit=unit_0;Software=NODE
MTC
Specific Problem: EM not responding, provisioned data loaded from local
Flash
Description: Element Manager communication failure.
```

### SNMP

The following is an example of a GWC log in SNMP format:

```
system.sysUpTime.0 => 23:10:15
```

```

snmpTrapOID.0 => nnExtAlarmMajor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.
20.50.48
.48.52.45.49.45.50.51.44.51.58.49.52.58.51.56.46.48.44.42848
alarmActiveDateAndTime => 2004-1-23,3:14:38.0,
alarmActiveDescription => Communication with a gateway is down.
nnExtAlarmActiveEventType => 2
nnExtAlarmActiveProbableCause => 554
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => GWC304
nnExtAlarmActiveResourceDescription => IEMS=0x00000063000000a1ac101127-GWC-
19-UNIT-1;GWC=GWC-19-UNIT-1;Version=GN090CD;Unit=unit_1;Software=SSC
nnExtAlarmActiveManualClear => 0
nnExtAlarmActiveSequenceNumber => 9028

```

## Syslog

The following is an example of a GWC log in Syslog format:

```

Feb 23 15:15:56 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=7307~~ GWC307 MAJOR TBL
GWC Fault^M      Location: GWC-2-UNIT-0^M      NotificationID: 4^M      State:
Raise^M          Category: Communications^M      Cause: Communications subsystem

### Northbound Fault Formats for IEMS

#### SCC2

The following is an example of a IEMS log in SCC2 format:

##### Sample Raise:

```
*C55 IEMS398 0006 FLT Communication Lost
Location: 47.142.94.68
NotificationID: 0
State: Raised
Category: Communications
Cause: Communications subsystem failure
Time: Dec 13 13:55:15 2004
ComponentId: znc0s0jh-SSPFS-Unit-0
Specific Problem: Connection Lost
Description: IEMS Unable to communicate with managed device
```

##### Sample Clear:

**55 IEMS399 0007 FLT Communication Regained**

Location: 47.142.94.68

NotificationID: 0

State: Cleared

Category: Communications

Time: Dec 13 13:55:22 2004

ComponentId: znc0s0jh-SSPFS-Unit-0

Description: IEMS regained communication with the managed device

**NTStd**

The following is an example of a IEMS log in NTStd format:

**Sample Raise:**

office\_name \*\*\* IEMS398 DEC13 13:55:15 0006 FLT Communication Lost

Location: 47.142.94.68

NotificationID: 0

State: Raised

Category: Communications

Cause: Communications subsystem failure

Time: Dec 13 13:55:15 2004

ComponentId: znc0s0jh-SSPFS-Unit-0

Specific Problem: Connection Lost

Description: IEMS Unable to communicate with managed device

**Sample Clear:**

office\_name IEMS399 DEC13 13:55:22 0007 FLT Communication Regained

Location: 47.142.94.68

NotificationID: 0

State: Cleared

Category: Communications

Time: Dec 13 13:55:22 2004

ComponentId: znc0s0jh-SSPFS-Unit-0

Description: IEMS regained communication with the managed device

**SNMP**

The following is an example of a IEMS log in SNMP format:

**Sample Raise:**

system.sysUpTime.0 =&gt; 7:01:55

snmpTrapOID.0 =&gt; nnExtAlarmMajor

alarmActiveResourceId =&gt;

.1.3.6.1.2.1.118.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.19.50.48

## **GUI/CLUI Documentation for IEMS**

### **GUI Launching and User procedures**

- NN10329-111: Integrated EMS Basics

#### **Related documents**

- NN10334-911: Integrated EMS Fault Management
- NN10330-511: Integrated EMS Configuration Management
- NN10327-711: Integrated EMS Performance Management
- NN10336-611: Integrated EMS Security and Administration

## **Media Application Server (MAS)**

### **MAS Fault Interface**

This section will provide references to customer documentation for Fault, Performance, Topology, GUI/CLUI, and Security for MAS.

#### **Fault documentation for MAS:**

- NN10303-111 - MCP 2.0 MAS Meetme Basics
- NN10297-111 - MCP 2.0 MAS Adhoc Basics

#### **Fault Mapping for MAS**

The following criteria can be used for looking up information on specific faults for MAS.

**Fault Correlation for MAS**

| <b>NB format -&gt;<br/>Device/EM</b> | <b>SCC2</b>                               | <b>NTSTD</b>                              | <b>SNMP</b>                               | <b>Syslog</b>                             | <b>Document Reference</b>                                                                        |
|--------------------------------------|-------------------------------------------|-------------------------------------------|-------------------------------------------|-------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>MAS</b>                           | Event Id<br><br>Logname and<br>Log number | Event Id<br><br>Logname and<br>Log number | Event Id<br><br>Logname and<br>Log number | Event Id<br><br>Logname and<br>Log number | NN10303-111<br>MCP 2.0 MAS<br>Meetme<br>Basics<br><br>NN10297-111<br>MCP 2.0 MAS<br>Adhoc Basics |

**Northbound Fault Formats for MAS****SCC2**

The following is an example of a MAS log in SCC2 format:

```
*C00 MAS 330 2515 FLT Fault
Location: 47.104.11.120
Notification Id: 1001
State: Raised
Category: processingError
Cause: applicationSubsystemFailure
Time: Mar 23 10:46:51 2004
Component Id: MediaServer_CStore
Specific Problem: MAS;330
Description: Component Shutdown
```

**NTSTD**

The following is an example of a MAS log in NTSTD format:

```
RTPU07CAPT *** MAS330 MAR23 17:00:18 2310 FLT Fault
Location: 47.104.11.120
Notification Id: 1001
State: Raised
Category: processingError
Cause: applicationSubsystemFailure
Time: Mar 23 10:46:51 2004
Component Id: MediaServer_CStore
Specific Problem: MAS;330
Description: Component Shutdown
```

## SNMP

The following is an example of a MAS log in SNMP format:

```
sysUpTime.0 => 1:52:16
snmpTrapOID.0 => nnExtAlarmCritical
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.19.50.48
.48.52.45.51.45.50.51.44.48.58.48.58.49.56.46.54.44.
2572
alarmActiveDateAndTime => 2004-3-23,0:0:18.6
alarmActiveDescription => Component Shutdown
nnExtAlarmActiveEventType => 3
nnExtAlarmActiveProbableCause => 2
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => MAS330
nnExtAlarmActiveResourceDescription => IEMS=47.104.11.120-MAS;MediaServer_CStore
nnExtAlarmActiveManualClear => 1
```

## Syslog

The following is an example of a MAS log in Syslog format:

```
Mar 23 12:00:19 znc0s0jh IEMS: _V2_~I=~H=znc0s0jh~A=IEMS~S=3629~~ MAS330 CRIT FLT
Fault^M      Location: 47.104.11.120^M      Notification Id: 1001^M      State:
Raised^M      Category: processingError^M Cause: applicationSubsystemFailure^M
Time: Mar 23 10:46:51 2004^M      Component Id: MediaServer_CStore^M      Specific
Problem: MAS;330^M      Description: Component Shutdown
```

## Performance

### OM and PM Documentation references for MAS

- NN10303-111 - MCP 2.0 MAS Meetme Basics
- NN10297-111 - MCP 2.0 MAS Adhoc Basics

### Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided

## XML

The following is an example of Performance data for MAS in XML format:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
- <PMFile xmlns:xsi="http://www.w3.org/2000/10/XMLSchema-instance"

**Northbound Fault Formats for MCS****SCC2**

The following is an example of a MCS log in SCC2 format:

```

**55 LAM 102 0447 FLT  Fault
    Location: 47.104.23.117
    Notification Id: 1199
    State: Raised
    Category: communications
    Cause: communicationsSubsystemFailure
    Time: Mar 23 11:55:13 2004
    Component Id: Site=MgmtSite;Server=AppSvr;System.Sites.MgmtSite.Servers.
    Appsvr.Services.appsvr.BillingTransferAgent.BtaPrimaryConnectToAmLost
    Specific Problem: LAM;102
    Description: severity=MAJOR;probableCause=communications subsystem failure;
    addedText=Communication Error : Primary stream cannot connect to CAM;

```

**NTSTD**

The following is an example of a MCS log in NTSTD format:

```

RTPU07CAPT  **  LAM102 MAR23 16:55:13 0242 FLT  Fault
    Location: 47.104.23.117
    Notification Id: 1199
    State: Raised
    Category: communications
    Cause: communicationsSubsystemFailure
    Time: Mar 23 11:55:13 2004
    Component Id: Site=MgmtSite;Server=AppSvr;System.Sites.MgmtSite.Servers.
    Appsvr.Services.appsvr.BillingTransferAgent.BtaPrimaryConnectToAmLost

```

Specific Problem: LAM;102

Description: severity=MAJOR;probableCause=communications subsystem failure;  
addedText=Communication Error : Primary stream cannot connect to CAM;

## SNMP

The following is an example of a MCS log in SNMP format:

```
sysUpTime.0 => 2:19:58
snmpTrapOID.0 => nnExtAlarmMajor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.
21.50.48
.48.52.45.51.45.50.51.44.49.49.58.53.53.58.49.51.46.
48.44.2616
alarmActiveDateAndTime => 2004-3-23,11:55:13.0
alarmActiveDescription => severity=MAJOR;probableCause=communications
subsystem
failure;addedText=Communication Error : Primary stream cannot connect to CAM;
nnExtAlarmActiveEventType => 1
nnExtAlarmActiveProbableCause => 6
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => LAM 102
nnExtAlarmActiveResourceDescription => IEMS=47.104.23.117-
CSE;Site=MgmtSite;Server=AppSvr;System.Sites.MgmtSite.Servers.Appsvr.Service
s.appsvr
.BillingTransferAge
nt.BtaPrimaryConnectToAmLost
nnExtAlarmActiveManualClear => 1
nnExtAlarmActiveSequenceNumber => 533
```

## Syslog

The following is an example of a MCS log in Syslog format:

```
Mar 23 12:17:08 znc0s0jh IEMS: _V2_~I=~H=znc0s0jh~A=IEMS~S=1558~~ LAM102 MAJOR FLT

## Northbound Fault Formats for MG 9000

### SCC2

The following is an example of a MG 9000 log in SCC2 format:

```
* 37 SWLN302 4259 TBL MG9K NorLineFault
Location: Port.frame0.shelf1.slot5.WL32.port21
Notification Id: 330712652810
State: UnAcknowledged
Category: processingError
Cause: Underlying Resource Unavailable
      NorLineFault - Line Protection Fault
Component Id: Port.frame0.shelf1.slot5.WL32.port21
specificProblem: NorLineFault - Line Protection Fault
Description: Line Protection HighVoltageError      : 0,1,5,21 [suspect b
ad LineCard]
```

### NTSTD

The following is an example of a MG 9000 log in NTSTD format:

```
RTPU07BU * SWLN302 Jan23 17:37:31 4259 TBL MG9K NorLineFault
Location: Port.frame0.shelf1.slot5.WL32.port21
Notification Id: 330712652810
State: UnAcknowledged
Category: processingError
```

```

Cause: Underlying Resource Unavailable
      NorLineFault - Line Protection Fault
Component Id: Port.frame0.shelf1.slot5.WL32.port21
specificProblem: NorLineFault - Line Protection Fault
Description: Line Protection HighVoltageError      : 0,1,5,21 [suspect b
ad LineCard]

```

## SNMP

The following is an example of a MG 9000 log in SNMP format:

```

system.sysUpTime.0 => 17:59:11
snmpTrapOID.0 => nnExtAlarmClearalarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.19.50.48

### Related documents

- NN10276-500 ATM/IP Configuration Management

## MultiService Switch 7400, 15000, 20000

This section contains IEMS Northbound log samples and device documentation references for the MSS 7400, 15000, 20000.

Information for this device is covered in MDM documentation. *Please refer to Section “ Multi-Service Data Manager (MDM)” on page 608.* for more details.

### MSS 7400, 15000, 20000 Fault Interface

#### Fault documentation for MSS 7400, 15000, 20000 :

*Please refer to Section “ Fault documentation for MDM:” on page 608.*

#### Fault Mapping for MSS 7400, 15000, 20000

*Please refer to Section “ Fault Mapping for MDM” on page 608.*

### Northbound Fault Formats for MSS 7400, 15000, 20000

#### SCC2

The following is an example of a MSS 7400, 15000, 20000 log in SCC2 format:

```
19 PPEM302 8013 TBL
time: 2004 01 27 14 19 53
event: message
compId: EM PP04 LP 8
severity: indeterminate
faultcode: 70560000
alarmType: other
```

```
commentData: 1-7-200
0000
1;DBG_WARNING:R:21-L:18 stats timeout.
```

## NTSTD

The following is an example of a MSS 7400, 15000, 20000 log in NTSTD format:

```
RTPU07BU      PPEM302 Jan27 19:19:53 7467 TBL
time: 2004 01 27 14 19 53
event: message
compId: EM PP04 LP 8
severity: indeterminate
faultcode: 70560000
alarmType: other
commentData: 1-7-200
0000
1;DBG_WARNING:R:21-L:18 stats timeout.
```

## SNMP

The following is an example of a MSS 7400, 15000, 20000 log in SNMP format:

```
sysUpTime. => 0:28:39
snmpTrapOID. => nnExtAlarmMinor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.
20.50.48
.48.52.45.54.45.50.52.44.51.58.53.51.58.52.49.46.48.44.5248
alarmActiveDateAndTime => 2004-6-24,3:53:41.0
alarmActiveDescription => Far end has raised a Line Remote Failure Indication
alarm (rxRfiAlarm).
Check the operational attributes of the far-end.
nnExtAlarmActiveEventType => 1
nnExtAlarmActiveProbableCause => 118
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => 70115203
nnExtAlarmActiveResourceDescription => IEMS=wnc0y0m3.us.nortel.com-MDM-
Mgr;EM MANTEO
```

LP 3 SONET 2

nnExtAlarmActiveManualClear => 1

nnExtAlarmActiveSequenceNumber => 1375

### Syslog

The following is an example of a MSS 7400, 15000, 20000 log in Syslog format:

```
Feb 27 13:19:58 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=2202~~ PPEM302 NONE TBL ^M
time: 2004 01 27 14 19 53^M          event: message^M          compId: EM PP04 LP 8^M
severity: indeterminate^M          faultcode: 70560000^M          alarmType: other^M
commentData: 1-7-200^M          0000 ^M          1;DBG_WARNING:R:21-L:18 stats timeout.
```

## Performance

### OM and PM Documentation references for MSS 7400, 15000, 20000

*Please refer to Section “ OM and PM Documentation references for MDM” on page 611.*

### Northbound OM/PM Formats

Performance measurements for MSS 7400, 15000, 20000 are available only from the MDM directly. *Please refer to Section “ Northbound OM/PM Formats” on page 611.*

### XML

The following is an example of Performance data for MSS 7400, 15000, 20000 in XML format:

**Note:** *The IEMS northbound performance interface does not support this device.*

### CSV

The following is an example of Performance data for MSS 7400, 15000, 20000 in CSV format:

**Note:** *The IEMS northbound performance interface does not support this device.*

## MS2000 Series Node

This section contains IEMS Northbound log samples and device documentation references for the MS2000 Series Node.

### MS2000 Series Node Fault Interface

#### Fault documentation for MS2000 Series Node:

- NN10328-911 MS2000 Fault Management

#### Fault Mapping for MS2000 Series Node

The following criteria can be used for looking up information on specific faults for MS2000 Series Node.

##### Fault Correlation for MS2000 Series Node

| NB format -><br>Device/EM     | SCC2                  | NTSTD                 | SNMP                  | Syslog                | Document<br>Reference                     |
|-------------------------------|-----------------------|-----------------------|-----------------------|-----------------------|-------------------------------------------|
| <b>MS2000<br/>Series Node</b> | logname and<br>number | logname and<br>number | logname and<br>number | logname and<br>number | NN10328-911<br>MS2000 Fault<br>Management |

### Northbound Fault Formats for MS2000 Series Node

#### SCC2

The following is an example of a MS2000 Series Node log in SCC2 format:

34 AMS 501 0035 INFO MS2000 FAULT

Location: 47.142.134.127

State: Cleared

Time: 1086806097963

\*\*34 AMS 501 0036 FLT MS2000 FAULT

Location: 47.142.134.127

State: Raised

Category: processingError

Cause: 71

Time: 1086806097964

Component Id: System#0

Trap Name: 6

Description: Network element admin state change alarm. Gateway is locked

### NTSTD

The following is an example of a MS2000 Series Node log in NTSTD format:

```
Nortel-JH ** AMS501 JUN10 09:21:12 5707 FLT MS2000 FAULT
```

```
Location: 47.142.134.127
```

```
State: Raised
```

```
Category: processingError
```

```
Cause: 71
```

```
Time: 1086873672171
```

```
Component Id: System#0
```

```
Trap Name: 6
```

```
Description: Network element admin state change alarm. Gateway is shuttingDown
```

```
Nortel-JH AMS501 JUN10 09:21:12 5708 INFO MS2000 FAULT
```

```
Location: 47.142.134.127
```

```
State: Cleared
```

```
Time: 1086873672172
```

Nortel-JH \*\* AMS501 JUN10 09:21:12 5709 FLT MS2000 FAULT

Location: 47.142.134.127

State: Raised

Category: processingError

Cause: 71

Time: 1086873672174

Component Id: System#0

Trap Name: 6

Description: Network element admin state change alarm. Gateway is locked

Nortel-JH AMS501 JUN10 09:21:25 5710 INFO MS2000 FAULT

Location: 47.142.134.127

State: Cleared

Time: 1086873685240

## SNMP

The following is an example of a MS2000 Series Node log in SNMP format:

sysUpTime. => 1 day, 19:19:22

snmpTrapOID. => nnExtAlarmMessage

nnExtAlarmMessageResource => .0.0

nnExtAlarmMessageResourceDescription => IEMS=Unknown Device;

## GUI/CLUI Documentation for MS2000 Series Node

### GUI Launching and User procedures

- NN10323-111 MS2000 Basics

### Related documents

- NN10340-511 MS2000 Configuration
- NN10337-611 MS2000 Security

## Session Server Manager

This section contains IEMS Northbound log samples and device documentation references for the Session Server Manager.

### Session Server Manager Fault Interface

This section will provide references to customer documentation for Fault, Performance, Topology, GUI/CLUI, and Security for Session Server Manager.

#### Fault documentation for Session Server Manager:

- NN10322-911 - Session Server Manager Fault Management

#### Fault Mapping for Session Server Manager

The following criteria can be used for looking up information on specific faults for Session Server Manager.

#### Fault Correlation for Session Server Manager

| NB format -><br>Device/EM     | SCC2               | NTSTD              | SNMP               | Syslog             | Document Reference                                     |
|-------------------------------|--------------------|--------------------|--------------------|--------------------|--------------------------------------------------------|
| <b>Session Server Manager</b> | logname and number | logname and number | logname and number | logname and number | NN10322-911<br>Session Server Manager Fault Management |

### Northbound Fault Formats for Session Server Manager

#### SCC2

The following is an example of a Session Server Manager log in SCC2 format:

```
**57 SIPM302 2080 FLT SIPM Fault
Location: 47.142.123.43
Notification Id: 111
State: Raised
Category: communications
Cause: applicationSubsystemFailure
Time: Apr 12 21:57:55 2004
Component Id: NCGL=RTPF-SIP0;Unit=0;
Specific Problem: SIP Gateway Application State Not Synced With Mate
Description: SIP Gateway Application Mtc Out Of Sync
```

## NTSTD

The following is an example of a Session Server Manager log in NTSTD format:

```
znc0s0jh  ** SIPM302 APR12 21:57:55 2080 FLT  SIPM Fault
Location: 47.142.123.43
Notification Id: 111
State: Raised
Category: communications
Cause: applicationSubsystemFailure
Time: Apr 12 21:57:55 2004
Component Id: NCGL=RTPF-SIP0;Unit=0;
Specific Problem: SIP Gateway Application State Not Synced With Mate
Description: SIP Gateway Application Mtc Out Of Sync
```

## SNMP

The following is an example of a Session Server Manager log in SNMP format:

```
sysUpTime.0 => 2:34:22
snmpTrapOID.0 => nnExtAlarmMajor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.
20.50.48.48.52.45.52.45.49.50.44.57.58.53.55.58.53.53.46.48.44.3070
alarmActiveDateAndTime => 2004-4-12,9:57:55.0
alarmActiveDescription => SIP Gateway Application Mtc Out Of Sync
nnExtAlarmActiveEventType => 1
nnExtAlarmActiveProbableCause => 2
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => SIPM302
nnExtAlarmActiveResourceDescription => IEMS=47.142.123.48-SP2000-Unit-
0;NCGL=RTPFSIP0;
Unit=0;
nnExtAlarmActiveManualClear => 2
nnExtAlarmActiveSequenceNumber => 35
```

## Syslog

The following is an example of a Session Server Manager log in Syslog format:

Apr 12 22:13:03 znc0s0jh IEMS: V2\_~I=~H=znc0s0jh~A=IEMS~S=6213~~ SIPM302 MAJOR FLT  
 SIPM Fault^M Locationon:47.142.123.43^M Notification Id: 111^M State:  
 Raised^M Category: communications^M Cause: applicationSubsystemFailure^M  
 Time: Apr 12 21:57:55 2004^M Component Id: NCGL=RTPF-SIP0;Unit=0;^M Specific  
 Problem: SIP Gateway Application State Not Synced With Mate^M Description: SIP  
 Gateway Application Mtc Out Of Sync

## Performance

### OM and PM Documentation references for Session Server Manager

- NN10342-711 Session Server Manager Performance Management

### Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided.

#### XML

The following is an example of Performance for Session Server Manager in XML format:

## SAM21 Shelf Controller

This section contains IEMS Northbound log samples and device documentation references for the SAM21 Shelf Controller.

### SAM21 Shelf Controller Fault Interface

#### Fault documentation for SAM21 Shelf Controller:

- NN10089-911 - SAM21 Shelf Controller Fault Management

#### Fault Mapping for SAM21 Shelf Controller

The following criteria can be used for looking up information on specific faults for SAM21 Shelf Controller.

#### Fault Correlation for SAM21 Shelf Controller

| NB format -><br>Device/EM     | SCC2               | NTSTD              | SNMP               | Syslog             | Document Reference                                     |
|-------------------------------|--------------------|--------------------|--------------------|--------------------|--------------------------------------------------------|
| <b>SAM21 Shelf Controller</b> | logname and number | logname and number | logname and number | logname and number | NN10089-911<br>SAM21 Shelf Controller Fault Management |

### Northbound Fault Formats for SAM21 Shelf Controller

#### SCC2

The following is an example of a SAM21 Shelf Controller log in SCC2 format:

```
**37 SCU 350 0009 FLT Alarm Raised
Location: SAM21 1:CSAM01-01:sled 3
Time: Wed Jan 14 13:55:52 EST 2004
Reason: Temperature in Sled 3 is high
```

#### NTSTD

The following is an example of a SAM21 Shelf Controller log in NTSTD format:

```
COMPACT06BT ** SCU350 Jan15 00:37:17 0009 FLT Alarm Raised
```

```
Location: SAM21 1:CSAM01-01:sled 3
Time:      Wed Jan 14 13:55:52 EST 2004
Reason:    Temperature in Sled 3 is high
```

## SNMP

The following is an example of a SAM21 Shelf Controller log in SNMP format:

```
sysUpTime.0 => 9:14:20
snmpTrapOID.0 => nnExtAlarmMajor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.20.50.48
.48.52.45.49.45.50.49.44.54.58.52.49.58.49.52.46.48.44.8995
alarmActiveDateAndTime => 2004-1-21,6:41:14.0,
alarmActiveDescription => Temperature in Sled 3 is high.
Time:      Wed Jan 14 13:57:48 EST 2004
Reason:    Temperature in Sled 3 is high
nnExtAlarmActiveEventType => 5
nnExtAlarmActiveProbableCause => 118
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => SCU 350
nnExtAlarmActiveResourceDescription => IEMS=wnc0y0kz.us.nortel.com-SAM21-Mgr;
nnExtAlarmActiveManualClear => 2
nnExtAlarmActiveSequenceNumber => 1
```

## Syslog

The following is an example of a SAM21 Shelf Controller log in Syslog format:

```
Feb 12 18:30:19 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=7929~~ SCU350 MAJOR FLT
Alarm Raised^M      Location: SAM21 1:CSAM01-01:sled 3^M      Time:      Mon Jan 12
12:49:06 EST 2004^M      Reason:    Temperature in Sled 3 is high
```

## Performance

### OM and PM Documentation references for SAM21 Shelf Controller

- There are no OMs or PMs associated with this device.

## Northbound OM/PM Formats

Not applicable.

### CSV

Not applicable.

***Note:** The IEMS northbound performance interface does not support this device.*

## GUI/CLUI Documentation for SAM21 Shelf Controller

### GUI Launching and User procedures

- NN10025-111 - SAM21 Shelf Controller Basics
- NN10089-911 - SAM21 Shelf Controller Fault Management
- NN10111-511 - SAM21 Shelf Controller Configuration Management
- NN10177-611 - SAM21 Shelf Controller Administration and Security

## Storage Manager (STORM)

This section contains IEMS Northbound log samples and device documentation references for the STORM.

### STORM Fault Interface

#### Fault documentation for STORM:

- NN10024-111 - STORM Basics
- NN10088-911 - STORM Fault Management

#### Fault Mapping for STORM

The following criteria can be used for looking up information on specific faults for STORM.

**Fault Correlation for STORM**

| <b>NB format -&gt;<br/>Device/EM</b> | <b>SCC2</b>                            | <b>NTSTD</b>          | <b>SNMP</b>           | <b>Syslog</b>         | <b>Document<br/>Reference</b>            |
|--------------------------------------|----------------------------------------|-----------------------|-----------------------|-----------------------|------------------------------------------|
| <b>STORM</b>                         | logname and<br>number<br>e.g.: STM 800 | logname and<br>number | logname and<br>number | logname and<br>number | NN10088-911<br>STORM Fault<br>Management |

**Northbound Fault Formats for STORM****SCC2**

The following is an example of a STORM log in SCC2 format:

***Sample Clear:***

```
19 STM 801 0595 INFO
    Location: 47.166.56.10
    Notification Id: 13
    State: Cleared
    Time: Jan 24 19:19:49 2004
```

***Sample Raise:***

```
**19 STM 801 0596 FLT STM Fault
    Location: 47.166.56.10
    Notification Id: 14
    State: Raised
    Category: qualityOfService
    Cause: thresholdCrossed
    Time: Jan 24 19:19:49 2004
    Component Id: STORMIA=langley1
    Specific Problem:
    Description: Status: Alarm raised. Used memory percentage is 18.24. Major alarm threshold value is 6.00.
```

**NTSTD**

The following is an example of a STORM log in NTSTD format:

***Sample Clear:***

```
RTPU07BR      STM801 Jan25 00:19:49 0041 INFO
    Location: 47.166.56.10
```

Notification Id: 13  
State: Cleared  
Time: Jan 24 19:19:49 2004

### ***Sample Raise:***

RTPU07BR \*\* STM801 Jan25 00:19:49 0042 FLT STM Fault  
Location: 47.166.56.10  
Notification Id: 14  
State: Raised  
Category: qualityOfService  
Cause: thresholdCrossed  
Time: Jan 24 19:19:49 2004  
Component Id: STORMIA=langley1  
Specific Problem:  
Description: Status: Alarm raised. Used memory percentage is 18.24. Major alarm threshold value is 6.00.

## **SNMP**

The following is an example of a STORM log in SNMP format:

### ***Sample Clear:***

**system.sysUpTime.0 =>** 8:01:55  
**snmpTrapOID.0 =>** nnExtAlarmClear  
**alarmActiveResourceId =>**  
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.20.50.48  
.48.52.45.49.45.50.52.44.55.58.49.57.58.52.57.46.48.44.312  
**alarmActiveDateAndTime =>** 2004-1-21,6:41:14.0,  
**alarmActiveDescription =>** Alarm cleared. A new alarm with higher severity will be raised.  
**nnExtAlarmActiveEventType =>** 2  
**nnExtAlarmActiveProbableCause =>** 118  
**nnExtAlarmActiveAdditionalText =>**  
**nnExtAlarmActiveDocumentationPointer =>** STM 801  
**nnExtAlarmActiveResourceDescription =>** IEMS=zmdhh0jk.europe.nortel.com-STORM;STORMIA=langley1

## GUI/CLUI Documentation for STORM

### GUI Launching and User procedures

- NN10024-111 (STORM Basics)

### Related documents

- NN10066-461 (Understanding STORM)
- NN10110-511 (STORM Configuration)
- NN10054-711 (STORM Performance)
- NN10176-611 (STORM Administration and Security)

## Universal Audio Server (UAS)

This section contains IEMS Northbound log samples and device documentation references for the UAS.

### UAS Fault Interface

#### Fault documentation for UAS:

- NN10073-911 UAS Fault Management

#### Fault Mapping for UAS

The following criteria can be used for looking up information on specific faults for UAS.

##### Fault Correlation for UAS

| NB format -><br>Device/EM | SCC2                  | NTSTD                 | SNMP                  | Syslog                | Document<br>Reference                  |
|---------------------------|-----------------------|-----------------------|-----------------------|-----------------------|----------------------------------------|
| UAS                       | logname and<br>number | logname and<br>number | logname and<br>number | logname and<br>number | NN10073-911<br>UAS Fault<br>Management |

### Northbound Fault Formats for UAS

#### SCC2

The following is an example of a UAS log in SCC2 format:

```
*C59 UAS 301 0723 TBL UAS Fault
    Location: UAS12_Test
    NotificationID: 2109441
    State: Raise
    Category: Processing Error
    Cause: Software error
    Time: Jan 22 15:41:28 2004
    Component Id: UAS;UASUnit=MATTA-2;Software=Call_Engine_1
    Specific Problem: 12289
    Description: CallEngine test alarm critical number 1
```

## NTSTD

The following is an example of a UAS log in NTSTD format:

```
COMPACT506BT *** UAS301 Jan22 20:59:00 1149 TBL UAS Fault
    Location: UAS12_Test
    NotificationID: 2109441
    State: Raise
    Category: Processing Error
    Cause: Software error
    Time: Jan 22 15:41:28 2004
    Component Id: UAS;UASUnit=MATTA-2;Software=Call_Engine_1
    Specific Problem: 12289
    Description: CallEngine test alarm critical number 1
```

## SNMP

The following is an example of a UAS log in SNMP format:

```
sysUpTime.0 => 3:21:08
snmpTrapOID.0 => nnExtAlarmCritical
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.11
6.19.50.48.48.52.45.49.45.50.50.44.51.58.53.57.58.48.46.52.44.28556
alarmActiveDateAndTime => 2004-1-22,3:59:0.4,
alarmActiveDescription => CallEngine test alarm critical number 1
NotificationID: 2109441
State: Raise
```

Category: Processing Error

Cause: Software error

Time: Jan 22 15:41:28 2004

Component Id: UAS;UASUnit=MATTA-2;Software=Call\_Engine\_1

Specific Problem: 12289

Description: CallEngine test alarm critical number 1

## Syslog

The following is an example of a UAS log in Syslog format:

```
Jan 22 15:59:00 znc0s0jh IEMS: _V2_~I=~H=znc0s0jh~A=IEMS~S=3086~~ UAS301 CRIT TBL UAS
Fault^M      Location: UAS12_Test^M      NotificationID: 2109441^M      State:
Raise^M      Category: Processing Error^M      Cause: Software error^M      Time:
Jan 22 15:41:28 2004^M      Component Id: UAS;UASUnit=MATTA-
2;Software=Call_Engine_1^M      Specific Problem: 12289^M      Description:
CallEngine test alarm critical number 1
```

## Performance

### OM and PM Documentation references for UAS

- NTP NN10139-001 UAS Performance

### Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided  
each of the Northbound formats provided

## XML

The following is an example of performance data for UAS in XML format:

```

## **GUI/CLUI Documentation for UAS**

### **GUI Launching and User procedures**

- NTP NN10047-461 UAS Basics

### **Related documents**

- NTP NN10095-511 UAS Configuration
- NTP NN10161-611 UAS Security
- NTP NN10047-461 UAS Upgrades

## Universal Signaling Point (USP)

This section contains IEMS Northbound log samples and device documentation references for the USP.

### USP Fault Interface

#### Fault documentation for USP:

- NN10071-911 - USP Fault Management
- NN10072-911 - USP-Compact Fault Management

#### Fault Mapping for USP

The following criteria can be used for looking up information on specific faults for USP.

##### Fault Correlation for USP

| NB format -> Device/EM | SCC2                                                                                          | NTSTD                                                                                         | SNMP                                                                                            | Syslog                                                                                        | Document Reference                     |
|------------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------|
| <b>USP</b>             | Specific Problem: Log Group=<text> & Log Number=<number><br><br>Note: Log GroupID is not used | Specific Problem: Log Group=<text> & Log Number=<number><br><br>Note: Log GroupID is not used | Refer to the .1.3.6.1.4.1.5 62.29.6.1.1.1 .3 varbind: Log Group =<text> & Log Number =<number>. | Specific Problem: Log Group=<text> & Log Number=<number><br><br>Note: Log GroupID is not used | NN10071911<br><br>USP Fault Management |

**Note:** All USP alarm raise events are mapped to a USP398 event in the IEMS. In addition, all USP alarm clear events are mapped to a USP399. Refer to the USP device documentation for a detailed description of these events.

### Northbound Fault Formats for USP

#### SCC2

The following is an example of a USP log in SCC2 format:

```
**10 USP 398 0022 FLT  USP Fault
Location: 47.135.60.201
Notification Id: 526
State: Raised
Category: processingError
```

Cause: applicationSubsystemFailure(2)  
Time: Jan 20 07:10:29 2004  
Component Id: USP=autoimage;Shelf=0;Slot=15;ContextID=0x0  
Specific Problem: Log GroupID=13;Log Group=System Node Maintenance;Log Number=3  
Description: Transition to DISABLED Operational State.

## NTSTD

The following is an example of a USP log in NTSTD format:

znc0s0jh \* USP398 FEB17 01:09:59 0010 FLT USP Fault

Location: 47.142.87.127-Unit-0;47.142.87.127

Notification Id: 1034

State: Raised

Category: communications

Cause: communicationsSubsystemFailure

Time: Feb 17 01:09:59 2006

Component Id: USP=COMP4;Shelf=0;Slot=12;ContextID=0x1010101

Specific Problem: Log GroupID=32;Log Group=Network;Log Number=0

Description: Connectivity lost: 1 1.1.1.1

znc0s0jh USP399 FEB17 01:10:21 0011 INFO USP Fault

Location: 47.142.87.127-Unit-0;47.142.87.127

Notification Id: 1029

State: Cleared

Time: Feb 17 01:10:21 2006

Component Id: USP=COMP4;Shelf=0;Slot=15;ContextID=0x1010101

Description: netping entry deleted: 1 1.1.1.1

## SNMP

The following is an example of a USP log alarm raise and log alarm clear in SNMP format:

USP 398: Alarm Raise

### Syslog

The following is an example of a USP log in Syslog format:

```
Feb 22 01:50:39 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=0088~~ USP398 MAJOR FLT
USP Fault^M Location: 47.135.60.201^M Notification Id: 526^M State:
Raised^M Category: processingError^M Cause:
applicationSubsystemFailure(2)^M Time: Jan 20 07:10:29 2004^M Component
Id: USP=autoimage;Shelf=0;Slot=15;ContextID=0x0^M Specific Problem: Log
GroupID=13;Log Group=System Node Maintenance;Log N^M umber=3^M Description:
Transition to DISABLED Operational State.
```

## Performance

### OM and PM Documentation references for USP

- NN10137-711 - USP Performance Management
- NN10138-711 - USP-Compact Performance Management
- USP Logs & OMs - USP Logs and OMs

### Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided.

Note that for SN08, the OMs/PMs are provided in raw CSV format.

### XML

The following is an example of performance data for USP in XML format:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<PMFile xmlns:xsi="http://www.w3.org/2000/10/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="commonFormat.xsd" MeasurementCategory="PM">

## Northbound Fault Formats for XACore

### SCC2

The following is an example of a XACore log in SCC2 format:

```
* 47 XAC 305 0114 FLT RTIF (Reset Terminal Interface)
  DESCRIPTION: State has changed from INSV to SYSB by FAULT action
  PORT: Type State Site FL Row Bay    Shf/Slt/Pk/Pt    EqPEC/Serial
        RTIF SYSB  HOST 01 A00 DPCC:00 00 15R U   1 NTLX08AA/  NNTM17205KR8
  REASON: Device Fault: RTIF IPC Protocol Error.
  FAULT RECORD ID: 880166C7
```

### NTSTD

The following is an example of a XACore log in NTSTD format:

```
COMPACT06BT * XAC305 Feb15 00:47:43 0114 FLT RTIF (Reset Terminal Interface)
  DESCRIPTION: State has changed from INSV to SYSB by FAULT action
  PORT: Type State Site FL Row Bay    Shf/Slt/Pk/Pt    EqPEC/Serial
        RTIF SYSB  HOST 01 A00 DPCC:00 00 15R U   1 NTLX08AA/  NNTM17205KR8
  REASON: Device Fault: RTIF IPC Protocol Error.
  FAULT RECORD ID: 880166C7
```

### SNMP

The following is an example of a XACore log in SNMP format:

```
sysUpTime. => 0:28:39
snmpTrapOID. => nnExtAlarmMinor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.20.50.48
.48.52.45.54.45.50.52.44.51.58.53.51.58.52.49.46.48.44.5248
alarmActiveDateAndTime => 2004-6-24,3:53:41.0
alarmActiveDescription => Far end has raised a Line Remote Failure Indication alarm
(rxRfiAlarm)
event: set
compId: EM MANTEO LP 3 SONET 2
severity: minor
faultcode: 70115203
alarmType: communications
commentData: Far end has raised a Line Remote Failure Indication alarm (rxRfiAlarm).
```

Check the operational attributes of the far-end.

```
nnExtAlarmActiveEventType => 1
nnExtAlarmActiveProbableCause => 118

## Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided

Performance measurements for XACore are available from the CS2K Core Manager. See NN10149-711 - Communications Server 2000 Performance Management for more information.

### XML

The following is an example of Performance data for XACore in XML format:

***Note:** The IEMS northbound performance interface does not support this device.*

### CSV

The following is an example of Performance data for XACore in CSV format:

***Note:** The IEMS northbound performance interface does not support this device.*

## GUI/CLUI Documentation for XACore

The XACore provides both command-line and MAP-based interfaces accessed through the CS2000 Core Manager.

### GUI/CLUI Launching and User procedures

# Platforms

## SDM Platform

This section contains IEMS Northbound log samples and device documentation references for the SDM Platform.

### SDM Platform Fault Interface

#### Fault documentation for SDM Platform:

- NN10081-911 SDM Fault Management

## Fault Mapping for SDM Platform

The following criteria can be used for looking up information on specific faults for SDM Platform.

### Fault Correlation for SDM Platform

| NB format -><br>Device/EM | SCC2               | NTSTD              | SNMP               | Syslog             | Document Reference                  |
|---------------------------|--------------------|--------------------|--------------------|--------------------|-------------------------------------|
| SDM (Platform) - AIX      | logname and number | logname and number | logname and number | logname and number | NN10081-911<br>SDM Fault Management |

## Northbound Fault Formats for SDM Platform

### SCC2

The following is an example of a SDM Platform log in SCC2 format:

```
* 52 SDM 317 0162 TBL
    node SDM      SDM Base Maintenance
DCE problem detected
Reason: SEC Master Server 47.142.94.49 is down.
```

### NTSTD

The following is an example of a SDM Platform log in NTSTD format:

```
COMPACT06BT * SDM 317 Feb15 00:52:49 0162 TBL
    node SDM      SDM Base Maintenance
DCE problem detected
Reason: SEC Master Server 47.142.94.49 is down.
```

### SNMP

The following is an example of a SDM Platform log in SNMP format:

```
sysUpTime.0 => 9:27:56
snmpTrapOID.0 => nnExtAlarmMinor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.20.50.48
.48.52.45.49.45.50.49.44.54.58.52.49.58.49.52.46.48.44.8995
alarmActiveDateAndTime => 2004-1-14,7:52:49.1
```

```
alarmActiveDescription => SEC Master Server 47.142.94.49 is down.
Reason: SEC Master Server 47.142.94.49 is down.

nnExtAlarmActiveEventType => 5
nnExtAlarmActiveProbableCause => 118
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => SDM 317
nnExtAlarmActiveResourceDescription => IEMS=wnc0y0m0.us.nortel.com-SDM;
nnExtAlarmActiveManualClear => 2
nnExtAlarmActiveSequenceNumber => 35
```

## Syslog

The following is an example of a SDM Platform log in Syslog format:

```
Feb 14 19:52:49 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=9821~~ SDM317 MINOR TBL
^M      node SDM      SDM Base Maintenance^M      DCE problem detected^M      Reason:
SEC Master Server 47.142.94.49 is down.
```

## Performance

### OM and PM Documentation references for SDM Platform

- NN10147-711 SDM Performance Management

### Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided

#### XML

The following is an example of performance data for SDM Platform in XML format:

***Note:** The IEMS northbound performance interface does not support this device.*

#### CSV

The following is an example of performance data for SDM Platform in CSV format:

***Note:** The IEMS northbound performance interface does not support this device.*

## GUI/CLUI Documentation for SDM Platform

SDM Platform has a command line user interface that can be accessed via a secure shell.

### GUI/CLUI Launching and User procedures

- NN10017-111 SDM Basics (see User Interfaces Overview)

### Related documents

- NN10059-461 Upgrading the SDM

## Succession Server Platform Foundation Software (SSPFS)

This section contains IEMS Northbound log samples and device documentation references for the SSPFS platform.

### SSPFS Fault Interface

#### Fault documentation for SSPFS

- NN10440-450 - Upgrading a Carrier VoIP Network

#### Fault Mapping for SSPFS

The following criteria can be used for looking up information on specific faults for SSPFS.

##### Fault Correlation for SSPFS

| NB format -><br>Device/EM | SCC2                  | NTSTD                 | SNMP                  | Syslog                | Document<br>Reference                                 |
|---------------------------|-----------------------|-----------------------|-----------------------|-----------------------|-------------------------------------------------------|
| SSPFS                     | logname and<br>number | logname and<br>number | logname and<br>number | logname and<br>number | NN10440-450<br>Upgrading a<br>Carrier VoIP<br>Network |

#### Northbound Fault Formats for SSPFS

The SSPFS SNMP interface is not implemented yet.

**SCC2**

The following is an example of a SSPFS log in SCC2 format:

*Not available at time of publication*

**NTSTD**

The following is an example of a SSPFS log in NTSTD format:

*Not available at time of publication*

**SNMP**

The following is an example of a SSPFS log in SNMP format:

*Not available at time of publication*

**Syslog**

The following is an example of a SSPFS log in Syslog format:

*Not available at time of publication*

**Performance****OM and PM Documentation references for SSPFS**

The SSPFS platform does not generate and OM's or PM's, but it does collect such information from other network elements. For more information see:

- NN10276-500 - ATM/IP Configuration Management (Configuration of SNMP Poller)
- Upgrading a Carrier VoIP Network, NN10440-450.

**Northbound OM/PM Formats**

This section provides example output of Performance Measurement data in each of the Northbound formats provided

**XML**

The following is an example of performance data for SSPFS platform in XML format:

```

# Element Managers

## CS2000 Core Manager

This section contains IEMS Northbound log samples and device documentation references for the CS2K Core Manager.

## CS2K Core Manager Fault Interface

### Fault documentation for CS2000 Core Manager:

- NN10275-909 - Succession fault Management logs Reference
- NN10082-911 - CS 2000 Core Manager Fault Management

### Fault Mapping for CS2000 Core Manager

The following criteria can be used for looking up information on specific faults for CS2000 Core Manager.

#### Fault Correlation for CS2000 Core Manager

| NB format -><br>Device/EM | SCC2                   | NTSTD                  | SNMP                   | Syslog                 | Document<br>Reference                                                                                                                         |
|---------------------------|------------------------|------------------------|------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| CS2000 Core<br>Manager    | log name and<br>number | log name and<br>number | log name and<br>number | log name and<br>number | NN10275-909<br>Succession<br>fault<br>Management<br>logs<br>Reference<br><br>NN10082-911<br>CS 2000<br>Core<br>Manager<br>Fault<br>Management |

### Northbound Fault Formats for CS2000 Core Manager

#### SCC2

The following is an example of a CS2000 Core Manager log in SCC2 format:

```
* 06 SDM 550 1506 INFO Node Status Change
Node:   SDM 0
Status: ** ISTb          from ** ISTb
Reason: Application alarm set. SDM_ETA.eta
```

#### NTSTD

The following is an example of a CS2000 Core Manager log in NTSTD format:

```
COMPACT506BT    * SDM550 Feb15 03:07:00 1520 INFO Node Status Change
Node:          SDM 0
Status:        InSv          from    * ISTb
Reason:        Application alarm cleared. SDM_ETA.eta
```

## SNMP

The following is an example of a CS2000 Core Manager log in SNMP format:

```
sysUpTime. => 1 day, 19:19:26
snmpTrapOID. => nnExtAlarmMessage
nnExtAlarmMessageResource => .0.0
nnExtAlarmMessageResourceDescription => IEMS=wnc0y0m0.us.nortel.com-CS2K-Mgr;
nnExtAlarmMessageDateAndTime => 2004-6-9,3:4:9.1
nnExtAlarmMessageDocumentationPointer => PM 610
nnExtAlarmMessageInfo => 04 PM 610 3352 INFO ABI XPM C-side Link State Change
```

```
Node: SMA2 0      Link: 0      Plane: 0      Port: 0
```

```
From: SYSB      To: INSV
```

```
Reason: Link opened by MG9K/ABI
```

```
sysUpTime.0 => 1 day, 19:19:27
snmpTrapOID.0 =>
alarmActiveResourceId => .0.0
alarmActiveDateAndTime => 2004-6-9,3:4:9.3
alarmActiveDescription => Application alarm set. SDM_ETA.eta
Status:  ** ISTb          from  ** ISTb
Reason: Application alarm set. SDM_ETA.eta
```

## Syslog

The following is an example of a CS2000 Core Manager log in Syslog format:

```
Feb 14 22:06:01 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=1165~~ SDM550 MINOR INFO
Node Status Change^M          node CM          ^M          Node:  SDM 0^M          Status:  **
ISTb          from  ** ISTb          ^M          Reason: Application alarm set. SDM_ETA.eta
```

## Performance

### OM and PM Documentation references for CS2000 Core Manager

- NN10148-711 - CS 2000 Core Manager Performance Management

### Northbound OM/PM Formats

This section provides example output of Performance Measurement data in each of the Northbound formats provided

#### XML

The following is an example of performance data for CS2000 Core Manager in XML format:

***Note:** Northbound performance interface not supported for this component.*

#### CSV

The following is an example of performance data for CS2000 Core Manager in CSV format:

***Note:** Northbound performance interface not supported for this component.*

### GUI/CLUI Documentation for CS2000 Core Manager

The CS2000 Core Manager provides both command-line and MAP-based interfaces.

- NN10325-900 ATM/IP Fault Management

## **Multi-Service Data Manager (MDM)**

This section contains IEMS Northbound log samples and device documentation references for the MDM.

Information in this section also applies to the following Media Gateways: MSS 7400, 15000, 20000. All these devices are closely related and are covered by the same set of customer documentation.

## **MDM Fault Interface**

### **Fault documentation for MDM:**

- 241-6001-011 - MDM Fault Management User Guide
- NN10092-911 - Passport 15000 and MDM in Succession Networks Fault Management
- NN10600-500 - Nortel Networks Multiservice Switch 7400/15000/20000 Alarms Reference
- 241-6001-501 - MDM Proxy Alarms Reference Guide

### **Fault Mapping for MDM**

The following criteria can be used for looking up information on specific faults for MDM.

MDM and Media Gateway devices (6400, 7480, 15000, 20000) use fault code to identify different alarms. Fault codes are eight digits or letters and are grouped by type (first four digits of fault code). Documentation for each fault code group is provided in the following table.

**Fault Documentation for MDM**

| <b>Fault Code Group</b> | <b>Document Reference</b>                                                           |
|-------------------------|-------------------------------------------------------------------------------------|
| <b>0000</b>             | NN10600-500 - Nortel Networks Multiservice Switch 7400/15000/20000 Alarms Reference |
| <b>1100</b>             | NN10600-500 - Nortel Networks Multiservice Switch 7400/15000/20000 Alarms Reference |
| <b>70xx</b>             | NN10600-500 - Nortel Networks Multiservice Switch 7400/15000/20000 Alarms Reference |
| <b>0999</b>             | 241-6001-501 - MDM Proxy Alarms Reference Guide                                     |
| <b>301x</b>             | 241-6001-501 - MDM Proxy Alarms Reference Guide                                     |

# Applications

## Audio Provisioning Server (APS)

This section contains IEMS Northbound log samples and device documentation references for the APS.

### APS Fault Interface

**Fault documentation for APS:**

- NN10328-911 - MS 2000 Series Fault Management

**Fault Mapping for APS**

The following criteria can be used for looking up information on specific faults for APS.

**Fault Correlation for APS**

| NB format -><br>Device/EM | SCC2            | NTSTD           | SNMP            | Syslog          | Document<br>Reference                                |
|---------------------------|-----------------|-----------------|-----------------|-----------------|------------------------------------------------------|
| APS                       | SpecificProblem | SpecificProblem | SpecificProblem | SpecificProblem | NN10328-911<br>MS 2000<br>Series Fault<br>Management |

### Northbound Fault Formats for APS

**SCC2**

The following is an example of a APS log in SCC2 format:

```
*C02 APS 398 2759 TBL APS Fault
Location: rtp2aps
Notification Id: 28673
```

State: Raise  
Category: communications  
Cause: softwareError  
Time: Jan 27 07:02:30 2004  
Component Id: APS;APSUnit=nc0rtp170;Software=Audio\_Management\_0  
Specific Problem: 28673  
Description: DB is not available, or the user cannot get a connection to the DB

## NTSTD

The following is an example of a APS log in NTSTD format:

```
RTPU07BR *** APS398 Jan27 12:02:30 2207 TBL APS Fault
Location: rtp2aps
Notification Id: 28673
State: Raise
Category: communications
Cause: softwareError
Time: Jan 27 07:02:30 2004
Component Id: APS;APSUnit=nc0rtp170;Software=Audio_Management_0
Specific Problem: 28673
Description: DB is not available, or the user cannot get a connection to the DB
```

## SNMP

The following is an example of a APS log in SNMP format:

```
sysUpTime.0 => 2 days, 18:44:37
snmpTrapOID.0 => nnExtAlarmCritical
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.18.50.48
.48.52.45.49.45.50.55.44.5
5.58.49.58.54.46.48.44.11202
alarmActiveDateAndTime => 2004-1-27,7:1:6.0
alarmActiveDescription => DB is not available, or the user cannot get a connection to the DB
nnExtAlarmActiveEventType => 5
nnExtAlarmActiveProbableCause => 118
```

```
nnExtAlarmActiveAdditionalText =>  
nnExtAlarmActiveDocumentationPointer => APS 398  
nnExtAlarmActiveResourceDescription => IEMS=znc0s0j6-SSPFS-Unit-  
0;APS;APSUnit=nc0rtp170;Software=Audio_Management_0  
nnExtAlarmActiveManualClear => 4  
nnExtAlarmActiveSequenceNumber => 13458
```

## Syslog

The following is an example of a APS log in Syslog format:

```
Feb 27 07:02:24 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=6645~~ APS398 CRIT TBL APS  
Fault^M      Location: rtp2aps^M      NotificationID: 28673^M      State: Raise^M  
Category: Communications^M      Cause: Software error^M      Time: Jan 27 07:02:30  
2004^M      Component Id: APS;APSUnit=nc0rtp170;Software=Audio_Management_0^M  
Specific Problem: 28673^M      Description: DB is not available, or the user cannot  
get a connection to^M      the DB^M
```

## Performance

### OM and PM Documentation references for APS

- NN10331-711 - MS 2000 Series Performance Monitoring

### Northbound OM/PM Formats

#### XML

The following is an example of performance data for APS in XML format:

***Note:** Northbound performance interface not supported for this component.*

#### CSV

The following is an example of performance data for APS in CSV format:

***Note:** Northbound performance interface not supported for this component.*

## GUI/CLUI Documentation for APS

### GUI Launching and User procedures

- NN10340-511 - MS 2000 Series Configuration Management

### Related documents

- NN10320-100 - ATM Solutions Basics

- NN10300-100 - IP Solutions Basics

## **Line Maintenance Manager (LMM)**

This section contains IEMS Northbound log samples and device documentation references for LMM.

### **LMM Fault Interface**

#### **Fault documentation for LMM:**

There are no faults or logs associated with this application.

#### **Fault Mapping for LMM**

There are no faults or logs associated with this application.

### **Performance**

There are no OMs or PMs associated with this application.

### **GUI/CLUI Documentation for LMM**

**Northbound Fault Formats for NPM****SCC2**

The following is an example of an NPM log in SCC2 format:

```
38 NPM 360 6012 INFO Alarm Raised
Alarm ACT_NOT_APP has been raised.
Alarm Description: Activatable patches not applied.
```

**NTSTD**

The following is an example of an NPM log in NTSTD format:

```
RTPU07BU      NPM360 Jan27 15:38:44 5466 INFO Alarm Raised
Alarm ACT_NOT_APP has been raised.
Alarm Description: Activatable patches not applied.
```

**SNMP**

The following is an example of an NPM log in SNMP format:

```
system.sysUpTime.0 => 2 days, 22:22:15
snmpTrapOID.0 => nnExtAlarmMessage
nnExtAlarmMessageResource => .0.0
nnExtAlarmMessageResourceDescription => IEMS=znc0s0j6-SSPFS-Unit-0;
nnExtAlarmMessageDateAndTime => 2004-1-27,10:38:44.0
nnExtAlarmMessageDocumentationPointer => NPM 360
nnExtAlarmMessageInfo => 38 NPM 360 6012 INFO Alarm Raised           Alarm
ACT_NOT_APP has been raised.

Alarm Description: Activatable patches not applied.
```

## Syslog

The following is an example of an NPM log in Syslog format:

```
Feb 27 10:40:03 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=0201~~ NPM360 NONE INFO
Alarm Raised^M          Alarm ACT_NOT_APP has been raised.^M      Alarm Description:
Activatable patches not applied.
```

## Performance

### OM and PM Documentation references for NPM

There are no OMs or PMs associated with this application.

### GUI/CLUI Documentation for NPM

#### GUI Launching and User procedures

- NN10320-100 - ATM Solutions Basics
- NN10300-100 - IP Solutions Basics

## QoS Collector Application (QCA)

This section contains IEMS Northbound log samples and device documentation references for the QCA.

## QCA Fault Interface

### Fault documentation for QCA :

The QoS Collector reports faults as part of the CS2K Management Tools suite. The documents below contain information about QoS Collector faults.

- NN10083-911 - Communication Server 2000 Fault Management

### Fault Mapping for QCA

The following criteria can be used for looking up information on specific faults for QCA.

#### Fault Correlation for QCA

| NB format -><br>Device/EM | SCC2                  | NTSTD                 | SNMP                  | Syslog                | Document<br>Reference                                              |
|---------------------------|-----------------------|-----------------------|-----------------------|-----------------------|--------------------------------------------------------------------|
| QCA                       | logname and<br>number | logname and<br>number | logname and<br>number | logname and<br>number | NN10083-911<br>Communication<br>Server 2000<br>Fault<br>Management |

## Northbound Fault Formats for QCA

### SCC2

The following is an example of a QCA log in SCC2 format:

```
*C34 QCA 310 0052 TBL wnc0y0kz
  Location: wnc0y0kz
  NotificationID : 49
  State : Raise
  Category : Processing Error
  Cause : storageCapacityProblem
  Time : Jan 22 16:34:19 2004
  Component Id: /data/qca
  Specific Problem: checkDiskSpace() has shown that there is less than
  104857600 bytes available on the local disk.
  Description : More Disk space is required immediately.
```

### NTSTD

The following is an example of a QCA log in NTSTD format:

```
COMPACT06BT *** QCA 310 Jan22 21:34:19 0052 TBL wnc0y0kz
  Location: wnc0y0kz
  NotificationID : 49
  State : Raise
  Category : Processing Error
  Cause : storageCapacityProblem
  Time : Jan 22 16:34:19 2004
  Component Id: /data/qca
  Specific Problem: checkDiskSpace() has shown that there is less than
  104857600 bytes available on the local disk.
  Description : More Disk space is required immediately.
```

### SNMP

The following is an example of a QCA log in SNMP format for a raise alarm:

```
system.sysUpTime.0 => 0:28:36
snmpTrapOID.0 => nnExtAlarmCritical
```

```

alarmActiveResourceId =>
1.3.6.1.2.1.118.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.2
8.50.48.48.53.45.48.57.45.48.55.44.49.57.58.53.55.58.51.56.46.48.44.45.48.52
.58.48.48.140819
alarmActiveDateAndTime => 2004-1-22,4:34:20.0,
alarmActiveDescription => If 10 (or more) records with unsupported version are
received consecutively, Major fault log is generated and the connection is
closed
nnExtAlarmActiveEventType => 1
nnExtAlarmActiveProbableCause => 166
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => QCA 301
nnExtAlarmActiveResourceDescription => IEMS=rtp4cmt-QOS
nnExtAlarmActiveManualClear => 4
nnExtAlarmActiveSequenceNumber => 3

```

The following is an example of a QCA log in SNMP format for a clear alarm:

```

system.sysUpTime.0 => 0:28:36
snmpTrapOID.0 =>
alarmActiveResourceId =>
1.3.6.1.2.1.118.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.2
8.50.48.48.53.45.48.57.45.48.55.44.49.57.58.53.55.58.51.56.46.48.44.45.48.52
.58.48.48.140819
alarmActiveDateAndTime => 2004-1-22,4:34:20.0,
alarmActiveDescription => If 10 (or more) records with unsupported version are
received consecutively, Major fault log is generated and the connection is
closed
nnExtAlarmActiveEventType => 1
nnExtAlarmActiveProbableCause => 1024
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => QCA 399
nnExtAlarmActiveResourceDescription => IEMS=rtp4cmt-QOS
nnExtAlarmActiveManualClear => 4
nnExtAlarmActiveSequenceNumber => 3

```

## Syslog

The following is an example of a QCA log in Syslog format:

```

Feb 22 16:34:19 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=0062~~ QCA310 CRIT TBL

## Northbound Fault Formats for IW-SPM IP

### SCC2

The following is an example of a IW-SPM IP log in SCC2 format:

```
**17 SPM 313 4488 TBL Fault
      SPM    0 CEM    0 : A                               Time: 12:16:13.890
      Source: None           State: Insv           Type: None
      Reason:      Loadname mismatch.
      Diagnostic: Autonomous fault detection
      Comp:MCM           RegAddr:0           Exp:0           Act:0
```

### NTSTD

The following is an example of a IW-SPM IP log in NTSTD format:

```
RTPU07BU ** SPM313 Feb28 00:06:14 9091 TBL Fault
      SPM    0 CEM    1 : A                               Time: 19:05:14.820
      Source: None           State: Insv           Type: None
      Reason:      SYNC OOSpec: prim. ref. NA.
      Diagnostic: Autonomous fault detection
      Comp:TIC           RegAddr:0           Exp:0           Act:0
```

### SNMP

The following is an example of a IW-SPM IP log in SNMP format:

```
system.sysUpTime.0 => 3 days, 6:54:40
snmpTrapOID.0 => nnExtAlarmMajor
alarmActiveResourceId =>
.1.3.6.1.2.1.111.1.2.2.1.10.12.78.111.114.116.101.108.95.102.97.117.108.116.20.50.48
.48.52.45.50.45.50.55.44.55.58.49.50.58.50.55.46.54.44.14023
alarmActiveDateAndTime => 2004-2-27,7:12:27.6
alarmActiveDescription => No frame pulse from DS-512 #0
Time: 19:11:31.010
Source: None           State: Insv           Type: None
Reason:      SYNC OOSpec: prim. ref. NA.
Diagnostic: Autonomous fault detection
Comp:TIC           RegAddr:0           Exp:0           Act:0
```

```

nnExtAlarmActiveEventType => 5
nnExtAlarmActiveProbableCause => 118
nnExtAlarmActiveAdditionalText =>
nnExtAlarmActiveDocumentationPointer => SPM 313
nnExtAlarmActiveResourceDescription => IEMS=wnc0y0m0.us.nortel.com-CS2K-Mgr;
nnExtAlarmActiveManualClear => 3
nnExtAlarmActiveSequenceNumber => 18489

```

## Syslog

The following is an example of a IW-SPM IP log in Syslog format:

```

Feb 28 12:11:09 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=7983~~ SPM313 MAJOR TBL
Fault^M      SPM 0 CEM 1 : I      Time: 12:10:11.080^M      Source:
None      State: Insv      Type: None ^M      Reason:      No frame pulse from
DS-512 #0 ^M      Diagnostic: Autonomous fault detection ^M      Comp:TIC

## Northbound Fault Formats for MG9000 Mgr Mid-Tier

### SCC2

The following is an example of a MG9000 Mgr Mid-Tier log in SCC2 format:

```
52 MGEM703 0193 INFO Shutdown_Event
Status: Shutting MG 9K Midtier Server down ...
```

### NTSTD

The following is an example of a MG9000 Mgr Mid-Tier log in NTSTD format:

```
RTPU07BT      MGEM703 Feb02 20:52:08 0197 INFO Shutdown_Event
Status: Shutting MG 9K Midtier Server down ...
```

### SNMP

The following is an example of a MG9000 Mgr Mid-Tier log in SNMP format:

```
sysUpTime.0 => 1:30:14
snmpTrapOID.0 => nnExtAlarmMessage
nnExtAlarmMessageResource => .0.0
nnExtAlarmMessageResourceDescription => IEMS=wnc0y0nr.us.nortel.com-SSPFS-Unit-0;
nnExtAlarmMessageDateAndTime => 2004-2-2,3:52:8.0
nnExtAlarmMessageDocumentationPointer => MGEM703
nnExtAlarmMessageInfo => 52 MGEM703 0193 INFO Shutdown_Event      Status:
Shutting MG 9K Midtier Server down ...
```

### Syslog

The following is an example of a MG9000 Mgr Mid-Tier log in Syslog format:

```
Mar  4 15:27:47 wnc0s0pf IEMS: _V2_~I=~H=wnc0s0pf~A=IEMS~S=0682~~ MGEM703 NONE INFO
Shutdown_Event
Status: Shutting MG 9K Midtier Server down ...
```

## Performance

### OM and PM Documentation references for MG9000 Mgr Mid-Tier

There are no OMs or PMs associated with this component.

## GUI/CLUI Documentation for MG9000 Mgr Mid-Tier

### GUI Launching and User procedures

The MG9000 Mgr Mid-Tier is an application that runs on an SSPFS machine. See SSPFS platform for client launch details.

# IEMS Appendix 1: Northbound OSS Configurations

Depending on customer requirements, a single-source OSS interface can be provided from the IEMS server. As an alternate configuration, to support customer transition, some NE specific OSS interfaces can be provided via SDM in parallel with the interfaces provided by IEMS.

For some existing Nortel Networks ATM customers with no new equipment (such as VTOA-AAL1 solutions with only MG4K, PP15K-MSS and XA-Core), the SDM can provide the complete set external interface to third party OSSs. This configuration is only supported for solutions frozen in the SN06 hardware configuration.

In normal configuration, the IEMS is configured to forward all of its collected faults to the OSS through its aggregated interface. The aggregated interface can supply the feed in NTSTD, SCC2, Syslog or SNMP (v2 or v3) format.

The alternate SDM feed can optionally, in addition to the IEMS feed, provide fault streams equivalent to the SN06 streams for the following devices. Use of the optional SDM feed is not required:

- GWC - via GWC Mgr (SESM) on SSPFS via custlog to SDM
- SAM21 - via SAM21 Mgr on SSFPS via custlog to SDM
- UAS - via UAS Mgr (SESM) on SSPFS via custlog to SDM
- PVG (MG7K, MG15K) - via MDM to passport log streamer to SDM
- Passport 15K MSS - via MDM to passport log streamer to SDM

**Note:** All of the streams above also go into IEMS for proper IEMS GUI and security operation. OSSs will still connect to IEMS for any of the other equipment in the portfolio. IEMS can block OSS delivery of the alternate feeds northbound if the same OSS is also connected to the SDM to prevent duplication.

These are in addition to fault streams which can originate from SDM and are supported in all configurations, including TDM only and VTOA-AAL1 solutions:

- CM (XA-Core or Compact) - via SDM
- SDM platform and applications - via SDM

All other fault streams are only supported via IEMS as of SN07. (including but not limited to STORM, CICM, SSPFS Platforms, MS20x0, NGSS

(SSTrunks), SSLines, RTP MP (BCP 7100), MAS, PP8600, MCS System Manager).

**Fault flow with IEMS as Northbound interface (typical)**

**Note:** The SDM SCC2 and NTSTD logroute streams must be configured for SCC2\_old or NTstd\_old. This is a change from SN06.2

This figure shows the fault flows in an office where the IEMS will be the northbound interface. In this configuration, all the devices that have been implemented in IEMS forward their fault information to IEMS. The SDM will only be responsible for forwarding core faults to the IEMS.

**Note:** The SDM logroute stream must be configured from tcpin.

# IEMS Appendix 2: Nortel Alarm Extension MIB

# SN08 Feature Deltas

***Product = CS 2000***

## **A59039138 -- (Visual) Message Waiting Indicator (V)MWI/CFX (IAC)**

**Note:** This feature was developed in SN05 and SN06 but was not activated for those releases in the North American market. It is now active and available in the North American market starting in SN07.

### **Description**

#### **Overview**

This activity provides the following functionality for the Integrated Access Cable IP Solution:

- CMWI (Class Message Waiting Indicator) for CEPT and Bellcore lines on Succession.
- Announcement as an optional replacement for the MWT stuttered dial tone indications for MWT suboptions CMWI and STD.

#### **Background Information**

Message Waiting allows a user to have a list of messages stored against their station. When a message is queued for a station, the MWI (Message Waiting Indicator) associated with the line is activated. When the last message is retrieved, the MWI is deactivated.

The MWT option has several sub options (STD, MWL, CMWI, PRN, MWL\_STD). This activity focuses on STD and CMWI suboptions.

- CMWI (Class Message Waiting)<sup>1</sup> is used for sets which are capable of displaying a MWI request in a display or as a flashing lamp. In addition it

---

1. AG1954 'CLASS: VISUAL MESSAGE WAITING INDICATOR'

provides audible (stuttered dial tone) or ring splash notification. The last can be activated and deactivated by dialing an activation code.

- STD (Stuttered Dial Tone) This is only used for applying a stuttered dial tone if a message is waiting.

### Configuration VMWI

On MMP the Visual Message Waiting was signalled to the user by a special Line Class Tone. For Integrated Access Cable Media an NCS<sup>2</sup> message is used. For activating the MWI a VMWI(+) message is sent. For deactivation a VMWI(-).

In addition to this the Call Server should periodically refresh the CPE's (Customer Premise Equipment) visual indicator (Audit).

2. PKT-SP-EC-MGCP-I02-991201

### Agent Interworking

The Controlling user is a VMS (Voice Mail System) connected over

- PRI (MG15000 [previously PVG], PDTC)
- TCAP (LPP, USP)

to the Call Server.

The receiving user can be an IBN line connected via

- GWC - hosted on Motorola CG4500E MTA
- PLGC

### Provisioning of the MWT service

The message waiting service can be provisioned with the following options: {STD,MWL,CMWL,PRN,MWL\_STD}.

When the MWTANN announcement option is selected for MWT, datafill is required for the announcement. The CLLI for this announcement must be MWT. The CLLI can not be changed by the telco.

Below is sample datafill from a lab switch for the MWTANN feature:

```

> table clli
TABLE: CLLI
>pos mwt
MWT 433 5 TEST
>quit
CI:
>table anns
TABLE: ANNS
>pos mwt
MWT ALL 1 1 1 STND N 59 60
>quit
CI:
>table annmems
TABLE: ANNMEMS
>pos mwt 1
MWT 1
DRAM DRA
( 0 DTM 7 3)$
>quit
CI:
>table annphlst
TABLE: ANNPHLST
>pos mwt 0
MWT 0
( HAVE_MSG)$
>quit

***Create the announcement using DRAMREC***
> DRAMREC
> connect the HSET to a DRAM with available space.....
>Record have_msg 3 nopad 8 3 12
> QUIT

```

\*\*\*\*This in turn creates a tuple in table dramphrs in a SN06 and beyond load. \*\*\*\*

```

>table dramphrs
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: DRAMPHRS
>pos 8 have_msg

### Overview of the CMWI Service

CLASS Message Waiting Indicator (CMWI) was developed under feature AG1954. The CMWI allows a subscriber to combine the visual message waiting indicator with audible indication types.

- **STD - Stuttered Dial Tone**  
On active message waiting a stuttered dial tone is applied when the user goes off-hook
- **Ring Splash**  
On active message waiting a ring burst is applied to the users' phone
- **MWTANN - Announcement**  
On active message waiting an announcement is applied to the user.

For the Integrated Access Cable IP solution the signaling to the end user was shown in [“NCS messaging to the CPE” on page 673](#).

Figure [“CMWI Overview” on page 676](#) shows a functional overview on how the different indication components work together.

**CMWI Overview**

This feature creates a new SERVORD prompt called MWT\_ANNOUNCEMENT. The provisioning for the CMWI service looks as follows:

**SERVORD example for CMWI**

```
>DN_OR_LEN:
>8838441020

OPTION:
>mwt

NOTICE:
>cmwi

CMWISTD:
>y

MWT_ANNOUNCEMENT:

>y

CMWIRING:
>y

STATUS:
>act

CAR:
>y

CRRCFW:
>all

CRX:
>n

OPTION:
>$

COMMAND AS ENTERED:

ADO NOW 1 12 4 AM 8838441020 (MWT CMWI Y y Y ACT Y ALL N ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
```

The CMWI option must be activated in table RESOFC.

**Table RESOFC**

| KEY  | ENABLED | ACCESS      | FEATDATA |
|------|---------|-------------|----------|
| CMWI | Y       | SUBSCR CMWI | SINGLE 5 |

The datafill above shows an example of the CMWI entry where the feature is enabled, using the Single Data Message format and allows 5 retransmissions per activation/deactivation request.

### STD suboption

The STD option enables a subscriber to hear a stuttered dial tone if a message is waiting for them. This example shows the new SERVORD prompt called MWT\_ANNOUNCEMENT.

#### SERVORD example for STD suboption

```
>DN_OR_LEN:
>8838441020

OPTION:
>mwt

NOTICE:
>STD

MWT_ANNOUNCEMENT:

>Y

OPTION:
>$

COMMAND AS ENTERED:

ADO NOW 1 12 4 AM 8838441020 ( MWT STD Y Y ALL N ) $

ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
```

### Datafilling the Audit for CMWI

In table OFCENG two tuples have to be datafilled in order to start the audit.

#### OFCENG - Audit

| Tuple           | Value                                                  |
|-----------------|--------------------------------------------------------|
| LSCM_SYNC_BURST | # of lines audited per peripheral in one cycle (0..10) |
| LSCM_SYNC_DELAY | delay between audit cycles (5 to 6000 s)               |

The next figure shows the how the audit based on the two datafillable parameters works. LSCM\_SYNC\_BURST gives the number of lines on an each peripheral which is audited by one cycle. The LSCM\_SYNC\_DELAY defines the time between the cycles.

Engineering information is provided below.

The following variables are defined:

- $L_{Burst}$  (as datafilled)
- $L_{SyncDelay}$  (as datafilled)
- $N_{all}$  (Number of all Lines connected to Peripherals)
- $t_{circle}$  (Time for one complete Circle for all Lines)
- $t_{c1}$  (Time for one circle)

For the first calculation  $t_{c1} \ll 1s$  and is not be considered.

$$\left( \frac{L_{Burst}}{L_{SyncDelay} \cdot N_{all}} \right)^{-1} = t_{circle}$$

Diagram for Audit Process

A detailed view of the marked area is shown in the next figure.

**Diagram for Audit Process--detail**

If  $t_{c1}$  is not considered to be small in comparison with the complete cycle time the equation will change into:

$$\left( \frac{L_{Burst}}{(L_{SyncDelay} + t_{c1}) \cdot N_{all}} \right)^{-1} = t_{circle}$$

$t_{c1}$  is not only dependent on the time of the audit itself. Traffic and System Usage need to be considered.

### **Hardware Requirements or Dependencies**

n/a

### **Software Requirements or Dependencies**

n/a

## Limitations and restrictions

- SMDI as a Controlling User is not included in this activity.
- No CEPT style user activation/deactivation for CMWI Ring Splash supported
- V5.2 Receiving Users are not covered by this activity.
- MWT\_ANNOUNCEMENT will not be visible in KSETFEAT table for ISDN lines,
- Since MWT\_ANNOUNCEMENT is not supported for ISDN lines, this field automatically set to FALSE, during addition of MWT option to ISDN lines.

## Interactions

- CFIND: CFIND has precedence over MWI when Call Forwarding is active
- WML: The warm line timer is started after the announcement for MWT has finished playing.
- CEPT CFU (Call Forwarding Universal): CFU always gives a special dial tone to the user if CFU is active. If CFU and MWI are active and the user has the MWI announcement option, and first the announcement is played and then the user will hear the CEPT CFU tone.
- CEPT CFB/CFD: No interaction

### **A89007809--GWC-EM Support for the Internet Transparency**

#### **Solution Pre-Midcom**

#### *Functional Description*

#### **1.1 Applicable Solution(s)**

IAW, IAC

*Note:* This is an SN06 feature, included here by special request.

#### **1.2 Description**

The Pre-Midcom solution consists in provisioning Media Proxies and NATs to allow calls to take place across VPNs (Virtual Private Network) for SN06 on the CS2K.

The Media Proxy device will be used to allow a gateway in one domain to communicate with another gateway in another domain. A GWC will select and then setup the Media Proxy per call flow (a pool of Media Proxies will be available to perform the NAT traversal functions). The NAT provides the gateway with a temporary public address.

Through the GUI, one or more physical NATs are provisioned as a single logical NAT per Media Gateway.

The GUI will also provision the Media Proxies which resolve the addressing of the NATs.

The data for a NAT will be sent down to GWC when this NAT is associated to a MG.

The data for a Media Proxy will be sent down to the GWC when this MP is associated to a GWC.

Figure 1 shows a Network description. References to this Figure will be made through out the document.

**Figure 1 Network description**

- MG1 and MG2 are in the same domain as the Succession equipment: no NAT traversal is required for signalling (MP can act as a NAT to allow communication to the public domain).

- MG3 and MG4 are in the public area (with public routable addresses) but not in a VPN: no NAT traversal is required to reach the public network (and the call between MG3 and MG4 do not need the MP).
- MG5 and MG6 are in the private area in VPNs and behind NATs (that may need the MP to resolve their addressing).

### 1.3 Hardware Requirements or Dependencies

Figure 2 Functional Behavior Diagram

Note: The component outlined in blue will be describe in this document. It is the component affected by the provisioning activity.

#### Requirements for the whole Pre-midcom solution:

- CS2K.
- SESM Platform (Succession Element and Sub-Element Manager).
- IMS manager to handle provisioning of the Media Proxy.
- Uncontrolled NATs.
- Media Proxies.

- MGs.

## 1.4 Software Requirements or Dependencies

Dependencies:

- GWC should have the Pre-Midcom software
- Strict dependencies:
  - AT.89007657: GWC Pre-MIDCOM Internet Transparency: GWC tables and interfaces. Where the SNMP MIB interfaces are implemented.
  - AT.89008030: Gateway profile Service type.
- Other related features under the ICAF (AT.89007990):
  - AT.89007980: Internet Transparency Application Agent
  - AT.89007985: Control of Media Proxy.
  - AT.89009783: MG Protocol Through NAPTS & Provisioning for MG Name.
  - AT.89007809: GWCEM support for the Internet Transparency solution.
  - AT.89007814: PTM Support for the Internet Transparency solution. Where the OSSGATE interfaces and the modifications to Nodesprov are implemented.

## 1.5 Limitations and restrictions

There is only one NAT exit point from a local network. If two gateways are behind the same NAT then they can setup a call without requiring a Media Proxy.

The DQoS IAC solution (ACTID 59039082/59006771) uses PepServers.

The Internet transparency IAW solution uses Nat Middleboxes.

These two solutions are mutually exclusive as defined in the gateway profile service type.

e.g. DQOS and ITRANS cannot be defined together in a profile.

Thus, when associating Media Gateways to a GWC, the user can associate either Pep Servers (DQOS) or NATs (Pre-Midcom) to the Media Gateway. One choice excludes the other.

## 1.6 Interactions

The provisioning of Media proxies and NATs brought changes to the following GUIs:

- Network Configuration Panel (see 1.7.1.1.1 figure 3, 1.7.1.3.1 figure 6).
- GWC Provisioning Panel (see figure 4, figure 8).

- Associate Media Gateway window (see 1.7.1.3.2).

## 1.7 Applicable customer facing sections

### 1.7.1 User Interface - GUI

Media Proxies are provisioned on IMS manager. This application adds the pre-provisioning of the MIBs to the GWC. The network configuration GUI is extended to pre-provision the two new data entries: NAT devices and Media Proxy devices.

- Provisioning Media Proxies:

Support the addition, deletion and modification of the Media Proxy devices.

The following list defines the Media Proxy data structure: Device Name (FQDN), Device IP Address, Device Protocol and Device Protocol Version.

A Media Proxy can be associated with up to 5 GWCs, so to delete a Media Proxy the user must firstly remove all GWC associations (similar to the Pep and NAT functionality).

- Provisioning NATs:

Support the addition, deletion and display of the NAT devices.

The following list defines the NAT data structure: Device Name and Device NAT Type (None, Non-Controlled). NAT Type will be defaulted to “Non-Controlled NAT”.

### 1.7.1.1 Provisioning Media Proxy

#### 1.7.1.1.1 Media Proxy: Add, Change, Delete

In Network Configuration Panel, a tabbed pane is added for adding/deleting/modifying a Media Proxy.

**Figure 3 New configuration: “Media proxies” tabbed pane**

The user will be able to select among the three options: add a Media Proxy, delete a Media Proxy, or change a Media Proxy.

✎ **Add button:** Defines a new Media Proxy and adds it to the Database.

Media Proxy data structure - expectations for the different fields:

- Name: FQDN (unique)
- IP Address; format “<0-255>.<0-255>.<0-255>.<0-255>”
- Protocol: “MGCP”

- Protocol Version: “1.1”

✕ **Delete button:** Deletes a selected Media Proxy.

Select a Media Proxy by highlighting its line, click on '**Delete**' button, a dialog box will ask the user to confirm his/her choice.

**Note:** to delete a Media Proxy the user must firstly remove all GWC associations to this MP.

- If the user doesn't select a Media Proxy before clicking on '**Delete**' button, the following box appears:

✕ **Change button:** Changes the IPaddress of a selected Media Proxy.

- Select the Media Proxy to be modified by highlighting its line and click on ‘**Change**’ button. Then enter the new IP address as below.

- If the user doesn't select a Media Proxy before clicking on ‘**Change**’ button, the following box appears:

#### 1.7.1.2 Media Proxy: Associate/Disassociate to a GWC

In GWC Provisioning Panel a tabbed pane “**MediaProxy**” is added in order to manage association/disassociation to MGs.

**Figure 4 GWC Provisioning Panel: MediaProxy tabbed pane added**

When the tab button is selected the list of all Media Proxies which are already associated to this GWC will appear in the table (Figure 4).

#### **✎ ASSOCIATE a MEDIA PROXY to a GWC**

After the Media Proxies are provisioned the user must then select the Media Proxies to be associated to a selected GWC. The action of associating a Media Proxy to a GWC will send the Media Proxy devices down to the GWC tables. A Media Proxy can be associated with up to 5 GWCs.

1. After clicking on “Retrieve All” (Figure 4), the list of existing associated MPs appears.
2. When click on “Associate” from MediaProxy Panel (Figure 4) the window “Associate Media Proxy” (Figure 5) is opened:

**Figure 5 “Associate Media Proxy” window**

- a. The “Associate Media Proxy” window lists all the existing MPs which are not yet associated to five GWCs.
- b. The user must **highlight** the one to be associated to the GWC.
- c. By pressing “**Associate**” button in window of Figure 5, the selected MP is associated to the GWC and the Media Proxy data is sent down to the GWC tables.

**Note:** a maximum of 20 Media Proxies can be associated to one GWC.

**3. “Add” button** gives the option to create more Media Proxies: a click on this button allowed the user to create a new MP (defines a new Media Proxy and adds it to the Database) and to associate it to GWC at once.

### ✕ **DISASSOCIATE a MEDIA PROXY from a GWC**

It is through this interface that the user must firstly remove all GWC associations before deleting a Media Proxy.

1. After clicking on “**Retrieve All**” (Figure 4), the list of existing associated MPs appears.
2. Select in “**Media Proxy List**” (Figure 4) the Media Proxy to be disassociated (by highlighting its line).
3. When click on “**Disassociate**” from MediaProxy Panel (Figure 4) a confirm box appears to ask the user to confirm his/her choice. When clicking “OK” the Media Proxy is disassociated.

**Note:** If the user doesn't highlight the Media Proxies to be disassociated before clicking on “Disassociate” button the following dialog box appears:

## 1.7.1.3 Provisioning NATs

### 1.7.1.3.1 NAT: Add, Delete

In Network Configuration Panel, a tabbed pane is added for adding/deleting a NAT.

**Figure 6 New configuration: NATs tabbed pane**

A tabbed pane is added for NAT.

The user will be able to select among the two options: add a NAT and delete a NAT.

Change button: N/A.

✕ **Add button:** Defines a new NAT and adds it to the Database.

NAT data structure - expectations for the different fields:

- Name (unique)
- NAT type: “None” or “Non-Controlled”

✕ **Delete button:** Delete a selected NAT.

- Select a NAT by highlighting its line, click on '**Delete**' button, a dialog box will ask the user to confirm his/her choice.

**Note:** The delete command will only be carried out if the NAT has no associations to MGs.

- If the user doesn't select a NAT before clicking on '**Delete**' button, the following box appears:

#### 1.7.1.3.2 NAT: Associate to a Media Gateway

In Menu "Configuration" select "Associate Media Gateway".

**Figure 7 New default configuration**

The screenshot shows a dialog box titled "Associate Media Gateway" with a close button (X) in the top right corner. The dialog contains several input fields and dropdown menus for configuring a media gateway. The fields are organized into sections: Gateway information, Signal Protocol, and Selected Profile Contents. At the bottom are "OK" and "Cancel" buttons.

| Field                     | Value            |
|---------------------------|------------------|
| Gateway name:             |                  |
| Gateway IP address:       |                  |
| Gateway controller name:  | GWC-             |
| Gateway profile name:     |                  |
| Gateway site name:        | LG               |
| Signal Protocol           |                  |
| Protocol type:            | NCS_PROTOCOL (1) |
| Protocol port:            | 2427             |
| Protocol version:         | 1.0              |
| Selected Profile Contents |                  |
| Reserved terminations:    |                  |
| GWC profile number:       |                  |
| Service type:             |                  |
| Category:                 |                  |

According to the Gateway Profile selected in “**Gateway Profile Name**”, the content of the interface will dynamically change.

When the user selects a gateway profile supporting the “Internet Transparency” service type (ITRANS), the “Internet Transparency” panel appears. In this case, the user has got 3 possibilities of configuration, detailed in the 3 sub-paragraphs below.

For information, the selection of a gateway profile supporting the “DQoS” service type adds a “Gateway PEP server” text field to the interface.

#### **1.7.1.3.2.1 MGs in the same domain as the Succession equipment.**

When the user doesn't select any option in the "Internet Transparency" box, the window is as in the figure below.

An example can be seen on the Diagram **Figure 1**:

MG1 and MG2 are in the same domain as the Succession equipment: no NAT traversal is required for signalling (MP can act as a NAT to allow communication to the public domain).

**Associate Media Gateway**

Gateway name: MG1

Gateway IP address: 47.49.55.10

Gateway controller name: GWC-73

Gateway profile name: ASKEY\_LINE\_GW\_4

Gateway site name: LG

Internet Transparency

☐ MG outside CS2K VPN, not behind NAT

NAT MiddleBox:

Signal Protocol

Protocol type: NCS\_PROTOCOL (1)

Protocol port: 2427

Protocol version: 1.0

Selected Profile Contents

Reserved terminations: 4

GWC profile number: 49

Service type: LINE ITRANS

Category: 2

OK Cancel

- Box not ticked

- No NAT name entered

The Gateway profile supports ITRANS => the Internet Transparency Panel is made visible

### 1.7.1.3.2.2 MGs in the public area (with public routable addresses) but not in a VPN.

An example can be seen on the Diagram **Figure 1**:

MG3 and MG4 are in the public area (with public routable addresses) but not in a VPN: no NAT traversal is required.

**Associate Media Gateway**

Gateway name: MG3

Gateway IP address: 47.49.55.14

Gateway controller name: GWC-73

Gateway profile name: ASKEY\_LINE\_GW\_4

Gateway site name: LG

Internet Transparency

☒ MG outside CS2K VPN, not behind NAT

NAT MiddleBox:

Signal Protocol

Protocol type: NCS\_PROTOCOL (1)

Protocol port: 2427

Protocol version: 1.0

Selected Profile Contents

Reserved terminations: 4

GWC profile number: 49

Service type: LINE ITRANS

Category: 2

- Box ticked  
- not allowed to enter a NAT name (grayed out)

### 1.7.1.3.2.3 MGs in private area in VPNs and behind NATs.

An example can be seen on the Diagram **Figure 1**:

MG5 and MG6 are in the private area in VPNs and behind NATs (that may need the MP to resolve their addressing). The signalling has to go through the NAT.

**Associate Media Gateway**

Gateway name: MG5

Gateway IP address: 47.49.55.17

Gateway controller name: GWC-73

Gateway profile name: ASKEY\_LINE\_GW\_4

Gateway site name: LG

Internet Transparency

☐ MG outside CS2K VPN, not behind NAT

NAT MiddleBox: NAT1

Signal Protocol

Protocol type: NCS\_PROTOCOL (1)

Protocol port: 2427

Protocol version: 1.0

Selected Profile Contents

Reserved terminations: 4

GWC profile number: 49

Service type: LINE ITRANS

Category: 2

OK Cancel

The user selects a NAT by entering its name here

### 1.7.1.3.3 NAT: Disassociate Media Gateway

In Menu “**Configuration**” select “**Disassociate Media Gateway**”.

The disassociation of a NAT is done automatically when its associated MG is disassociated from the GWC.

Another way to disassociate a NAT could be to change it to “None” (see “Change” option in paragraph 1.7.1.3.4 for more details).

#### 1.7.1.3.4 Display Gateways information

The Capability of displaying the NAT used by the gateways is available. The user can access it by selecting, in GWC Provisioning Panel, the Gateways tabbed pane.

For each Media Gateways the NATs information is displayed as below.

**Figure 8 New configuration**

“Change” option:

1. highlight the MG(s) that you want to change

- click on the “Change” button and the following box is opened:

- Select the “Change” operation you want to perform:

- Select the field “Change NAT Middlebox” and Click “OK”. The user is able to modify the NAT middle box associated with the selected MG(s):

By default, the NAT middle box text field contains “[No middle box]”. This provides a way of disassociating a NAT from one/several gateway(s).

The user can also provide a valid NAT name or tick the “outside cs2k” checkbox.

***Product = CS 2000***

## **A00002644--Common Topology Identifier Provisioning**

### ***Functional Description***

#### **1.9 Applicable Solution(s)**

IAW, IAC

*Note:* This is an SN07 feature, included here by special request.

#### **1.10 Description**

The Internet Transparency feature, which allows Voice-Over-IP calls to take place in the presence of Network Address Translation (NAT)/IP VPNs, was introduced into Succession in release 6.1. This feature optimizes network resource utilization by determining whether the call path crosses NAT/VPNs and inserting Media Proxies if necessary.

However, calls spanning multiple Call Agents (CS2ks) may result in the insertion of one or more Media Proxies into the call path, even if the call is

contained within a single VPN. To avoid this, the inter-Call Agent trunks can be configured to be 'intra-domain' SIP-T trunks, thus causing the NAT/VPN information for both ends of the call to be compared. However, for this comparison to operate correctly, the following requirements must be met by the NAT's numerical identifier within the Call Agents (CS2ks), i.e. by the NAT's 'Middlebox ID':

- the middlebox ID for each NAT must be unique across all Call Agents
- each NAT must have the same Middlebox ID in all Call Agents

An example of this is shown in Figure 9.

This requirement on middlebox IDs is provided by the feature described in this note, hence allowing the configuration and use of intra-domain SIP-T trunks in SN07.

Each CS2k within the VoIP network must be allocated a unique Call Agent Identifier between 1 and 255. The user is responsible for administration of this number and its allocation among the CS2ks. Once a CS2k has been allocated a Call Agent ID, it should be provisioned into the CS2k Mgr using the capabilities provided by this feature. Ideally this should be coordinated with the CS2k upgrade to SN07, as described in 1.19.

When a NAT is provisioned, a middlebox ID is automatically generated by the CS2k Mgr. From SN07 onwards, the CS2k Mgr incorporates the Call Agent into this automatically generated number, using the provisioned Call Agent ID for that CS2k. This helps to ensure uniqueness of middlebox IDs across multiple CS2ks.

For the special case in which the same NAT is provisioned into multiple CS2ks, it is necessary to ensure that the middlebox ID used for this NAT is the same in all CS2ks. Hence the middlebox ID allocated when the NAT is first provisioned into a CS2k must be used when the NAT is provisioned in subsequent CS2ks. In order to enable this, this feature provides the capability to

- read the middlebox ID of a provisioned NAT
- specify the middlebox ID as part of the data when provisioning a NAT.

Alternatively, the user may manually allocate any valid unique middlebox ID to a NAT and provision this value into all CS2ks, by-passing the CS2k Mgr middlebox-ID-auto-generation step. The middlebox ID must be an integer between 2 and 16777215 (ID = 1 is reserved by the system for internal use).

An example of ID allocations for a VoIP network with 2 CS2ks is shown in Figure 9.

If a NAT is provisioned into a CS2k Mgr and the automatically generated middlebox ID is then provisioned into other CS2k Mgrs, care must be taken when deleting this NAT. The NAT must be deleted last from the CS2kMgr that generated the middlebox ID - i.e. only after it has been deleted from all other CS2k Mgrs.

**Figure 9 VoIP network with multiple Call Agents (CS2ks)**

Some MEs behind NAT-x belong to CS2kA & others belong to CS2kB, hence NAT-x is provisioned into both Call Agents. NAT-x must have the same ID in both these Call Agents. Therefore NAT-x's identifier as allocated by CS2kA's Mgr (ID = 110008) must be specified when NAT-x is provisioned into CS2kB.

The user operations provided by this feature, which are available via the GUI client and via the XML OSS interface, (Figure 10 ) are:

- Provision/set the Call Agent ID

- Display/list the Call Agent ID
- Specify the NAT middlebox ID during NAT provisioning
- Display/list the NAT Middlebox ID for a selected NAT
- Warning message on deletion of NAT middlebox.

In addition, the following internal functionality changes have been made as part of this feature:

- Automatic update of middlebox ids when Call Agent set for the first time
- Auto-generation of NAT and Pep Server middlebox id based on provisioned Call Agent ID

**Figure 10 GUI Client and OSSGate interfaces**

## 1.11 Hardware Requirements or Dependencies

No new hardware is required or introduced by this feature. The application components provided by this feature execute as part of the SESM.

## 1.12 Software Requirements or Dependencies

Dependencies:

- CR.Q00768898: Extend range in middlebox id in Gateway Controller

## 1.13 Limitations and restrictions

Upgrade to SN07 should be carried out as described in section 1.19

## 1.14 Interactions

The following existing GUIs have been modified:

- Maintenance Settings Panel (see Figure 13).
- Change Maintenance Settings Dialog (see Figure 14).
- Network Devices Panel, NATs tab (see Figure 20).
- Add NAT middlebox Dialog (see Figure 22, Figure 23)
- Delete NAT confirmation Dialog (see Figure 34)

The following existing XML commands have been modified:

- queryNAT (see Figure 26, Figure 28, Figure 30).
- addNAT (see Figure 32).

The following GUIs have been added:

- NAT middlebox ID display dialog (see Figure 21).

The following XML commands have been added:

- queryCallAgentId (see Figure 16)
- setCallAgentId (see Figure 18)

The on-line help facility will be updated with information on the use, syntax and valid values for all the above modifications/additions.

## 1.16 Call Agent Identifier

The Call Agent ID has an initial value of <not configured> in newly installed SN07 SESM systems. The Call Agent ID value should be set to a integer value between 1 and 255 by the user for normal operation. The Call Agent ID value must be set before the user can specify Middlebox IDs for NATs during NAT provisioning.

Note that in order to ensure optimum system operation is maintained during an upgrade, the Call Agent Id should be set just prior to upgrade of GWCs to SN07. Details of this are described in section 1.19.

The first time the Call Agent ID is set by the user, the system performs any necessary internal changes for NAT middleboxes which have already been provisioned, to incorporate the newly provisioned Call Agent ID into the NAT middlebox IDs. GWC units which need to be synchronized to this new data will be identified by having data synchronization alarms raised against them.

Ideally, the Call Agent ID should only be set once and then not changed. However, setting the Call Agent Id more than once is not prohibited by the CS2k mgr. Note that, for subsequent changes, the new Call Agent ID will only be used in the middlebox ID for NATs provisioned after the change has been made. The middlebox IDs of previously provisioned NATs are not modified. This ensures consistency, in case NATs have been provisioned into multiple Call Agents. If the user does attempt change the Call Agent ID, a warning confirmation message is displayed.

Figure 11

## 1.16.1 GUI Client

### 1.16.1.1 Display Call Agent ID

The Call Agent ID is displayed in the Gateway Controller Main Panel, in the 'Maintenance Settings' area. This is shown in Figure 12 and Figure 13.

Figure 12 Maintenance Setting Area, GWC management panel

**Figure 13 Call Agent ID display and Change button**

#### 1.16.1.2 Provision Call Agent ID

The Call Agent ID can be provisioned/set using the 'Change' button in the Maintenance Setting area display (Figure 13). This displays the Maintenance Settings change dialog (Figure 14), which allows the user to set the Call Agent ID to an integer value between 1 and 255. Other maintenance settings may optionally be changed at the same time.

**Figure 14 Change Maintenance Settings Dialog**

Tool tips for the Call Agent ID are displayed when the cursor is placed within the text field. If the entered value is invalid, the text field is outlined in red and the OK button is disabled (Figure 15).

**Figure 15 Invalid Call Agent Id value**

Change Maintenance Settings

## 1.16.2 XML Interface

### 1.16.2.1 List Call Agent ID

The Call Agent ID may be retrieved via the XML interface using the following command (Figure 16). If the request is unsuccessful, an error message is returned as described in Appendix B.

**Figure 16 XML command queryCallAgentId**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryCallAgentId usn="1" version="1.0"/>
    </Methods>
  </Command>
</CommandList>
```

**Figure 17 XML Response for queryCallAgentId**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryCallAgentId usn="1" version="1.0">
        <ReturnData>
          <CallAgentId>3</CallAgentId>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryCallAgentId>
    </Methods>
  </Response>
</CommandList>
```

#### 1.16.2.2 Provision Call Agent ID

The Call Agent ID can be specified via the XML interface using the setCallAgentId command (Figure 18). If the Call Agent Id cannot be set, an error message is returned as described in Appendix B:

**Figure 18 XML Command: setCallAgentId**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <setCallAgentId usn="1" version="1.0">
        <Parameters>
          <CallAgentId>3</CallAgentId>
        </Parameters>
      </setCallAgentId>
    </Methods>
  </Command>
</CommandList>
```

    <Methods>
      <setCallAgentId usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </setCallAgentId>
    </Methods>
  </Response>
</CommandList>
```

## 1.17 NAT middlebox Identifier

When the user provisions a NAT, the system will automatically allocate a NAT middlebox ID. However, some NATs are provisioned into multiple CS2k Mgrs. For these NATs, it is necessary for the user to override the automatic middlebox ID allocation when the NAT is provisioned into the second and subsequent CS2ks. This is done by specifying the NAT middlebox ID during provisioning of the NAT. The middlebox ID must be a unique integer between 2 and 16777215

### 1.17.1 GUI Client

#### 1.17.1.1 Display NAT middlebox ID

The middlebox ID for a NAT can be displayed via the 'Display ID' button on the NAT browser, which is available on the GWC Network Devices tabbed Panel

**Figure 20 NATs tab on Network Devices Panel**

This brings up an information box displaying the NAT middlebox ID Figure 21 ).

**Figure 21 NAT middlebox ID display dialog**

#### 1.17.1.2 Specify NAT middlebox ID during NAT provisioning

The middlebox ID for a NAT may be specified during NAT provisioning as follows:

- Use the 'Add' button on the NAT browser (see Figure 20) to open the NAT provisioning dialog box (Figure 22).

**Figure 22 Add NAT Middle Box dialog**

- Check the box marked 'Shared NAT'. This extends the dialog box to include the middlebox ID provisioning fields (Figure 23).
- Enter valid values for NAT name and NAT ID and press OK (Figure 24).

**Figure 23 Add NAT Middle Box dialog with Shared NAT checked**

**Figure 24 Add NAT Middle Box with valid entries & OK enabled.**

Tool tips are displayed when the cursor is placed over each text field. If invalid values are entered, the text field with invalid data is outlined in red and the OK button is disabled (Figure 25).

**Figure 25 Add NAT Middle Box dialog with invalid entry for NAT ID**

The screenshot shows a dialog box titled "Add NAT Middle Box". It contains the following fields and controls:

- Name:** A text field containing "VPN-SOUTH".
- NAT Type:** A dropdown menu showing "Non-Controlled".
- Shared NAT:** A checkbox that is checked.
- NAT ID:** A text field containing "1400234898". This field is outlined in red, indicating an invalid entry.
- Valid Values:** A tooltip at the bottom of the NAT ID field displays "Valid Values: 1 to 16777215".

## 1.17.2 XML Interface command

### 1.17.2.1 List NAT middlebox ID

The NAT middlebox ID can be listed as part of the information returned in the queryNAT request. This is done by including the <ListNATid> tag, set to 'true', in the XML command. If the tag is set to 'false', the NAT middlebox information is listed without the middlebox ID. If this tag is omitted, the NAT middlebox information again is listed without the middlebox ID, for backwards compatibility with previous releases. The XML for this command is shown in Figure 26, Figure 28, Figure 30. Error messages returned are described in Appendix B.

**Figure 26 XML command to query specified NAT, including middlebox ID**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <Parameters>
          <NATName>NAT-A</NATName>
          <ListNATid>true</ListNATid>
        </Parameters>
      </queryNAT>
    </Methods>
  </Command>
</CommandList>
```

        <ReturnData>
          <NATname>NAT-A</NATname>
          <NATid>131080</NATid>
          <NATname>NAT-B</NATname>
          <NATid>131081</NATid>
          <NATname>NAT-C</NATname>
          <NATid>131082</NATid>
          <NATname>NAT-D</NATname>
          <NATid>131083</NATid>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNAT>
    </Methods>
  </Response>
</CommandList>
```

#### 1.17.2.2 Specify NAT middlebox ID during NAT provisioning

The middlebox ID can be specified during NAT provisioning over the XML interface by including the <NATid> tag in the addNAT command, as shown in Figure 32. Valid values must be provided for all fields. Error codes are given in Appendix B.

**Figure 32 XML Command: addNAT, including middlebox id:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <Parameters>
          <NATname>nat1</NATname>
          <NATid>13378928</NATid>
        </Parameters>
      </addNAT>
    </Methods>
  </Command>
</CommandList>
```

**Figure 33 XML Response: addNAT, including middlebox id:**

```
X<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addNAT>
    </Methods>
  </Response>
</CommandList>
```

## 1.18 NAT deletion

If the user has provisioned a NAT into multiple CS2ks, care should be taken when deleting the NAT. If the NAT middlebox ID used for the shared NAT has been automatically generated by one CS2k Mgr, the NAT should not be deleted from that CS2k Mgr while it is still provisioned in other CS2ks. It must be deleted from all other CS2k Mgrs first. The GUI client displays a warning when deletion of a NAT whose middlebox id has been generated by this CS2k Mgr is requested, as shown in Figure 34.

**Figure 34 Confirm NAT Delete dialog**

For other NATs, a general reminder is given that the delete operation results in deletion of the NAT middlebox from this CS2k only.

**Figure 35 Confirm NAT Delete dialog**

## 1.19 Upgrade to SN07

During an upgrade to SN07, the need to upgrade the middlebox IDs of already provisioned NATs means that there is a possibility of temporary increase in usage of Media Proxies, depending on the exact network configuration. Hence if Media Proxy resources have been engineered so that this may cause problems, the period of time during which there are GWCs at different software versions should be minimized. It is suggested that one of the following sequences of operation, A or B, is used for upgrade. In steps A & B,

‘Upgrade the CS2k Mgr’ refers in particular to upgrade of the Node Provisioning and GWC EM applications.

### **A. Upgrade without soak test**

1. Upgrade CS2k Mgr to SN07
2. Set a unique Call Agent ID. This causes the SN07 CS2k Mgr to generate new middlebox IDs for already provisioned NATs (and Pep Servers).
3. Upgrade all GWCs that will support internet transparency Media Endpoints to SN07. As part of this upgrade (in particular because of the busy/RTS/SWACT), the new middlebox IDs for already provisioned NATs will be downloaded to each GWC. During this step, GWCs with different versions of software may have different middlebox IDs for the same NAT and hence some additional Media Proxy usage may take place (depending on the exact network configuration and order in which GWCs are upgraded). Hence, if a temporary increase in Media Proxy usage is undesirable (e.g. for network engineering reasons), this step should be done within as short as possible a time window and during a low traffic period.
4. Repeat steps 1-3 for all other CS2ks in the network.
5. Intra-domain SIP-T trunks may now be configured.

### **B Upgrade with soak test**

1. Upgrade CS2k Mgr to SN07
2. Upgrade a small number of GWCs that support internet transparency Media Endpoints to SN07 for soak test
3. Once soak test is complete, set a unique Call Agent ID. This causes the SN07 CS2k Mgr to generate new middlebox IDs for already provisioned NATs (and Pep Servers).
4. Carry out a busy/RTS/SWACT for the (SN07) GWCs that have been soak tested. This will cause the new middlebox IDs to be downloaded to both sides of these GWCs.
5. Upgrade all other GWCs that will support internet transparency Media Endpoints to SN07. As part of this upgrade (in particular because of the busy/RTS/SWACT), the new middlebox IDs for already provisioned NATs will be downloaded to each GWC. During steps 4 & 5, GWCs with different versions of software may have different middlebox IDs for the same NAT and hence some additional Media Proxy usage may take place (depending on the exact network configuration and order in which GWCs are upgraded). Hence, if a temporary increase in Media Proxy usage is undesirable (e.g. for network

engineering reasons), steps 4 & 5 should be done within as short as possible a time window and during a low traffic period.

6. Repeat steps 1-5 for all other CS2ks in the network.

7. Intra-domain SIP-T trunks may now be configured.

## 1.20 Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or 'Authorization' levels for commands. Each command is associated with one or more user groups. In order to execute a command, a user must belong to at least one of the associated user groups. The user groups associated with the new /modified commands associated with this feature are specified in the table below.

**Table 1 Internet Transparency Commands Authorization**

| Command                                         | User Group |       |        |          |       |
|-------------------------------------------------|------------|-------|--------|----------|-------|
|                                                 | mgcadm     | mgcrw | mgcmte | mgcsprov | mgcro |
| <b>Display Call Agent ID (queryCallAgentId)</b> | X          | X     | X      | X        | X     |
| <b>Change Call Agent ID (setCallAgentId)</b>    | X          | X     |        |          |       |
| <b>Display NAT ID (queryNAT)</b>                | X          | X     | X      | X        | X     |
| <b>Provision NAT (addNAT)</b>                   | X          | X     |        |          |       |

## 1.21 Glossary

| Term  | Description                        |
|-------|------------------------------------|
| GUI   | Graphical User Interface           |
| GWC   | Gateway Controller                 |
| GWCEM | Gateway Controller Element Manager |
| ID    | Identifier                         |
| ME    | Media Endpoint                     |
| NAT   | Network Address Translation        |
| VPN   | Virtual Private Network            |

## 1.23 Appendix B: Error codes and messages

**Table 2 Return codes when command is unsuccessful**

| Cause of error                                                                                                 | Return code | Example return messages                                  |
|----------------------------------------------------------------------------------------------------------------|-------------|----------------------------------------------------------|
| Platform applications internal error: OSS Interface applications cannot connect to required server application | 302         | Interfacing error                                        |
| Unable to provision requested NAT because a database error occurred                                            | 303         | Database error occurred during setting of Call Agent Id. |
| Unable to provision requested NAT/Call Agent Id of problem with the GWCEM component of the CS2k Mgr.           | 304         | Element Manager Initial is at ion in progress            |

| Cause of error                                                                                           | Return code | Example return messages                            |
|----------------------------------------------------------------------------------------------------------|-------------|----------------------------------------------------|
| No NAT data for this query. e.g. no NAT meets selection criteria or the NAT/GWC specified does not exist | 305         | NAT not found<br>No NAT found for GWC              |
| User is not a member of any of the user groups allowed to perform this action                            | 501         | Insufficient permissions to perform this operation |

### 1.23.1 Example Error Message

```

<?xml version='1.0'?>
  <CommandList>
    <Response>
      <Interface>ITransIf</Interface>
      <Methods>
        <queryNAT usn="1.0" version="1.0">
          <ReturnData>
            <NATName>nat1111</NATName>
            <ReturnCode value= "305" text="NAT not found"/>
          </ReturnData>
        </queryNAT usn="1.0">
      </Methods>
    </Response>
  </CommandList>

```

## 1.24 Appendix C: XML Commands: description of method parameters

### 1.24.1 Parameter definitions

- **encoding??**
- **version** - The version refers to the version of the method or operation - e.g., the addNAT operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parms X, Y, and Z. TYPE *decimal*.
- **usn** - Unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.
- **ReturnCode value**- A numeric value indicating the result of the attempted operation (see Table 3, for range and definitions of each possible value). TYPE *string*.
- **Return code text**- Appropriate text that describes the result of the operation. TYPE *string*.

- **CallAgentId** - The unique integer that has been assigned by the user to this Call Agent (e.g. this CS2k). This must be a value between 1 and 255. TYPE *integer*.
- **ListNATid** - Indication of whether the NAT id should be included in the response to this command. Set to 'true' if the NATid is required and 'false' if not. TYPE *NoSpaceNameType*.
- **NATname** - The name of the NAT that this command applies to. TYPE *NoSpaceNameType*. (32 character token without spaces, see xsd definitions in Appendix A, section 1.22)
- **NATid** - The unique middlebox id for this NAT. This must be an integer between 2 and 16777215. TYPE *integer*.
- **NATType** - Indicates the type of NAT, in particular, NATType = 1 indicates an uncontrolled NAT. No other values are used in this release. TYPE *string*.
- **GWCname** - The name of the GWC that this command applies to. TYPE *GWCNameType* (string of form GWC-xxxx, see xsd definitions in Appendix A, section 1.22)

#### 1.24.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **queryCallAgentId** - Method that gets the current value of the Call Agent Id for this Call Agent (CS2k). This method has the following parameters:
  - Input data:
    - usn
    - version
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - CallAgentId - The value of the Call Agent Id for this Call Agent (CS2k).
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
2. **setCallAgentId** - Method that sets to Call Agent Id for this Call Agent (CS2k) to the specified value. This method has the following parameters:
  - Input data:
    - usn
    - version

- CallAgentId - The desired value for the Call Agent Id for this Call Agent (CS2k).
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
- 3. **queryNAT** - Method that gets the information regarding a NAT or set of NATs, depending on the parameters specified. If neither a NATname nor a GWCname is included, then information is returned for ALL NATs provisioned in this CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - NATname (optional, cannot be included as well as GWCname) - indicates the NAT for which information should be returned
    - GWCname (optional, cannot be included as well as NATname) - returns information for all NATs associated with this GWC
    - ListNATid (optional) - if set to true, this returns the NAT id as part information for each NAT, if set to false or if the parameter is omitted the NAT id is not returned.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - NATname
    - NATType (returned only when the NATname is specified)
    - NATid (returned only when ListNATid is set to 'true' in the input data)
- 4. **addNAT** - Method that provision a NAT into the CS2k Mgr. This method has the following parameters: If the NAT id is not specified then the CS2k Mgr generates a NAT middlebox id for the NAT.
  - Input data:
    - usn
    - version
    - NATname - unique name for the NAT to be provisioned

- NATid (optional) - indicates the middlebox id that should be allocated to this NAT.
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode

***Product = CS 2000***

## **A00004741--Enabling TRKGRP OM on GEM and Support Nodal OMs**

### ***Functional Description***

#### **1.25 Applicable Solution(s)**

PT-IP, UA-IP

#### **1.26 Description**

This feature provides Nodal Based Operational Measurements for IW-IP nodes. These nodal statistics are necessary for Link Bandwidth Engineering and to determine the network usage and transmission errors.

The Nodal Based Operational Measurements includes the statistics for:

- Gigabit Ethernet Link usage
- Bearer traffic injected into the network.

To support above statistics two new Nodal Based OM groups are added by this activity:

- MNGEMLNK

This OM group has pegs for:

- The number of packets/octets transmitted/received on the Gigabit Ethernet Link connected to a IW-IP node.
- The number of packets/octets transmitted/received with different types of error.

- MNGEMTRF

This OM group has pegs for:

- The number of RTP packets/octetets transmitted/received for bearer traffic.
- The number of packets/octetets transmitted/received for different types of call.

## 1.27 Hardware Requirements or Dependencies

None

## 1.28 Software Requirements or Dependencies

This functionality requires SN08 load in the Call Server, and GEM RM.

## 1.29 Limitations and restrictions

- The OM peg counts stored in the IW-IP that have not been reported to the Call Server will not be maintained over IW-IP GEM Sparing and Restarts.
- The OM pegging for Voice Band Data connection shall be implemented in later release.

## 1.30 Interactions

None.

## 1.31 Glossary

| Term    | Description             |
|---------|-------------------------|
| CEM     | Common Equipment Module |
| GEM     | Gigabit Ethernet Module |
| IW Node | Interworking Node       |
| OM      | Operational Measurement |
| RM      | Resource Module         |

## 2: Performance for A00004741

### 2.1 Performance management strategy

This capability provides statistics which are necessary for Link Bandwidth Engineering and to determine the network usage and transmission errors.

### 2.2 Performance management tools and utilities

This feature provides Nodal Based Operational Measurements for IW-IP nodes.

Two new Nodal Based OM groups added by this activity are:

- MNGEMLNK - Statistics for Nodal Gigabit Ethernet Link usage.
- MNGEMTRF - Statistics for Nodal traffic usage and transmission errors.

To view the MNGEMLNK and MNGEMTRF, use the OMSHOW CI command as follows:

```
>OMSHOW MNGEMLNK ACTIVE
```

```
>OMSHOW MNGEMTRF ACTIVE
```

## 2.3 Performance Measurements (PM), Operational Measurements (OM), and stats

New Nodal Based OM groups added by this activity are:

- MNGEMLNK
- MNGEMTRF

### 2.3.1 PM, OM, and stats format

**Component:** IW-IP node

**Performance Measurement Name:** MNGEMLNK

**Performance Measurement Description:**

This OM group provides the statistics related to the Gigabit Ethernet Link connected to a particular IW-IP node. This information will be used for Gigabit Ethernet Link bandwidth Engineering.

**History:** Created in SN08

**Component:** IW-IP node

**Performance Measurement Name:** MNGEMTRF

**Performance Measurement Description:**

This OM group provides the usage statistics related to bearer traffic on the IW-IP nodes. These information will be used to identify the Nodal traffic usage in the network.

**History:** Created in SN08

## 2.3.2 OM Group - MNGEMLNK

### 2.3.2.1 OM description

OM Group MNGEMLNK

Multiservice Node Gigabit Ethernet Module Link Bandwidth Engineering

The purpose of this OM group is to provide Gigabit Ethernet Link usage statistics to assist with network bandwidth Engineering.

In this OM group, the pegs include:

- The number of packets/octets transmitted/received on the Gigabit Ethernet Link connected to a IW-IP node.
- The number of packets/octets transmitted/received with different types of error.

The Gigabit Ethernet Module (GEM) hardware is a Resource Module of IW-IP node. The GEM provides a 1 Gigabit/sec Ethernet network interface that will support up to 2016 DS0 voice channels over an IP based packet network.

### 2.3.2.2 Release history update

OM group MNGEMLNK is new in SN08

### 2.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

**Figure 1 MNGEMLNK OM Group Display**

```

>omshow mngemlnk active

MNGEMLNK

CLASS: ACTIVE
START:2004/06/10 10:30:00 MON; STOP: 2004/06/10 10:31:51 MON;

      TXEROCT  TXEROCT2  RXEROCT  RXEROCT2
      TXERPKT  RXERPKT   CRCERPKT  UNDERPKT
      OVERPKT  SHORTPKT  LONGPKT

0

      SPM    0
      0      0      0      0
      0      0      0      0
      0      0      0      0
      0      0      0      0
      0      0      0      0

```

### 2.3.2.4 Group structure

OM group provides one tuple for each IW-IP node.

Key field: SPM PM Number, a number in the range 0 - 85

Info field: SPM PM Number, a number in the range 0 - 85

### 2.3.2.5 Associated OM groups

None

### 2.3.2.6 Associated functional groups

None

### 2.3.2.7 Associated functionality codes

None

### 2.3.2.8 OM group registers logic flow chart

The Gigabit Ethernet Link usage statistics are available in GigMAC chip of the GEM RM. This information is used for incrementing the OM Registers for that IW-IP node.

### **2.3.2.9 Register - TXOCT, TXOCT2**

#### **2.3.2.9.1 Register description**

Register TXOCT (Transmitted Octets) provides count for total number of bytes transmitted on a Gigabit Ethernet Link connected to a particular IW-IP node. Register TXOCT2 is an extension register for TXOCT.

The count is represented in Kilo Bytes (Scaled by factor of 1024).

#### **2.3.2.9.2 Register TXOCT release history update**

Register TXOCT is new in SN08.

#### **2.3.2.9.3 Associated registers**

None

#### **2.3.2.9.4 Associated logs**

None

### **2.3.2.10 Register - RXOCT, RXOCT2**

#### **2.3.2.10.1 Register description**

Register RXOCT (Received Octets) provides count for total number of bytes received on a GigE Link connected to a particular IW-IP node. Register RXOCT2 is an extension register for RXOCT.

The count is represented in Kilo Bytes (Scaled by factor of 1024).

#### **2.3.2.10.2 Register RXOCT release history update**

Register RXOCT is new in SN08.

#### **2.3.2.10.3 Associated registers**

None

#### **2.3.2.10.4 Associated logs**

None

### **2.3.2.11 Register - TXPKT, TXPKT2**

#### **2.3.2.11.1 Register description**

Register TXPKT (Transmitted Packets) provides count for total number of packets transmitted on a GigE Link connected to a particular IW-IP node. Register TXPKT2 is an extension register for TXPKT.

The count is represented in Kilo Packets (Scaled by factor of 1000).

#### **2.3.2.11.2 Register TXPKT release history update**

Register TXPKT is new in SN08.

**2.3.2.11.3 Associated registers**

None

**2.3.2.11.4 Associated logs**

None

**2.3.2.12 Register - RXPKT, RXPKT2****2.3.2.12.1 Register description**

Register RXPKT (Received Packets) provides count for total number of packets received on a GigE Link connected to a particular IW-IP node. Register RXPKT2 is an extension register for RXPKT.

The count is represented in Kilo Packets (Scaled by factor of 1000).

**2.3.2.12.2 Register RXPKT release history update**

Register RXPKT is new in SN08.

**2.3.2.12.3 Associated registers**

None

**2.3.2.12.4 Associated logs**

None

**2.3.2.13 Register - TXEROCT, TXEROCT2****2.3.2.13.1 Register description**

Register TXEROCT (Transmitted Error Octets) provides count for total number of bytes transmitted in errored packets on a GigE Link connected to a particular IW-IP node. Register TXEROCT2 is an extension register for TXEROCT.

**2.3.2.13.2 Register TXEROCT release history update**

Register TXEROCT is new in SN08.

**2.3.2.13.3 Associated registers**

None

**2.3.2.13.4 Associated logs**

None

**2.3.2.14 Register - RXEROCT, RXEROCT2****2.3.2.14.1 Register description**

Register RXEROCT (Received Error Octets) provides count for total number of bytes received in errored packets on a GigE Link connected to a particular IW-IP node. Register RXEROCT2 is an extension register for RXEROCT.

**2.3.2.14.2 Register RXEROCT release history update**

Register RXEROCT is new in SN08.

**2.3.2.14.3 Associated registers**

None

**2.3.2.14.4 Associated logs**

None

**2.3.2.15 Register - TXERPCT****2.3.2.15.1 Register description**

Register TXERPCT (Transmitted Error Packets) provides count for total number of errored packets transmitted on a GigE Link connected to a particular IW-IP node.

**2.3.2.15.2 Register TXERPCT release history update**

Register TXERPCT is new in SN08.

**2.3.2.15.3 Associated registers**

None

**2.3.2.15.4 Associated logs**

None

**2.3.2.16 Register - RXERPCT****2.3.2.16.1 Register description**

Register RXERPCT (Received Error Packets) provides count for total number of errored packets received on a GigE Link connected to a particular IW-IP node.

**2.3.2.16.2 Register RXERPCT release history update**

Register RXERPCT is new in SN08.

**2.3.2.16.3 Associated registers**

None

**2.3.2.16.4 Associated logs**

None

**2.3.2.17 Register - CRCERPCT****2.3.2.17.1 Register description**

Register CRCERPCT (Cyclic Redundancy Check Error Packets) provides count for total number of packets received with Cyclic Redundancy Check (CRC) errors on a GigElink connected to a particular IW-IP node.

**2.3.2.17.2 Register CRCERPKT release history update**

Register CRCERPKT is new in SN08.

**2.3.2.17.3 Associated registers**

None

**2.3.2.17.4 Associated logs**

None

**2.3.2.18 Register - UNDERPKT****2.3.2.18.1 Register description**

Register UNDERPKT (Undersize Packets) provides count for total number of undersize packets received on a GigE Link connected to a particular IW-IP node.

Undersize packet is one with less than 64 bytes.

**2.3.2.18.2 Register UNDERPKT release history update**

Register UNDERPKT is new in SN08.

**2.3.2.18.3 Associated registers**

None

**2.3.2.18.4 Associated logs**

None

**2.3.2.19 Register - OVERPKT****2.3.2.19.1 Register description**

Register OVERPKT (Oversize Packets) provides count for total number of oversize packets received on a GigE Link connected to a particular IW-IP node.

Oversize Packet is one with more than 1518 bytes.

**2.3.2.19.2 Register OVERPKT release history update**

Register OVERPKT is new in SN08.

**2.3.2.19.3 Associated registers**

None

**2.3.2.19.4 Associated logs**

None

### 2.3.2.20 Register - SHORTPKT

#### 2.3.2.20.1 Register description

Register SHORTPKT (Short Packets) provides count for total number of short packets (aka fragments) received, on a GigE Link connected to a particular IW-IP node.

Short Packet is one with less than 64 bytes and CRC error or alignment error.

#### 2.3.2.20.2 Register SHORTPKT release history update

Register SHORTPKT is new in SN08.

#### 2.3.2.20.3 Associated registers

None

#### 2.3.2.20.4 Associated logs

None

### 2.3.2.21 Register - LONGPKT

#### 2.3.2.21.1 Register description

Register LONGPKT (Long Packets) provides count for total number of long packets (aka jabber) received on a GigE Link connected to a particular IW-IP node.

Long Packet is one with more than 1518 bytes and CRC error or alignment error.

#### 2.3.2.21.2 Register LONGPKT release history update

Register LONGPKT is new in SN08.

#### 2.3.2.21.3 Associated registers

None

#### 2.3.2.21.4 Associated logs

None

### 2.3.3 OM Group - MNGEMTRF

#### 2.3.3.1 OM description

OM Group MNGEMTRF

Multiservice Node Gigabit Ethernet Module Traffic Engineering

The purpose of this OM group is to provide statistics of Nodal traffic usage.

In this OM group, the pegs include:

- The number of RTP packets transmitted/received for bearer traffic.

- The number packets transmitted/received for different types connections.

### 2.3.3.2 Release history update

OM group MNGEMTRF is new in SN08

### 2.3.3.3 Registers

OM group registers display on the MAP terminal as follows:

      0          0          0          0
```

### 2.3.3.4 Group structure

OM group provides one tuple for each IW-IP node.

Key field: SPM PM Number, a number in the range 0 - 85

Info field: SPM PM Number, a number in the range 0 - 85

### 2.3.3.5 Associated OM groups

None

### 2.3.3.6 Associated functional groups

None

### 2.3.3.7 Associated functionality codes

None

### **2.3.3.8 OM group registers logic flow chart**

The registers in this group are incremented by the statistics collected at the end of each connection used for a call.

## **2.3.4 Register - TOTCONN**

### **2.3.4.1 Register description**

Register TOTCONN (Total Connections) provides count for total number connections handled by a particular IW-IP node.

### **2.3.4.2 Register TOTCONN release history update**

Register TOTCONN is new in SN08.

### **2.3.4.3 Associated registers**

None

### **2.3.4.4 Associated logs**

None

## **2.3.4.5 Register - G711MUCN**

### **2.3.4.5.1 Register description**

Register G711MUCN (G.711 MuLaw Connections) provides count for total number of G.711 MuLaw codec connections handled by a particular IW-IP node.

The IW-IP uses industry standard G.711 codec as a default codec for Mu-law and A-law at 10 and 20 milliseconds, to encode and decode TDM to and from packets transmitted via RTP over UDP over IP.

ITU-T G.711 is a standard to represent 8 bit compressed pulse code modulation (PCM) samples for signals of voice frequencies, sampled at the rate of 8000 samples/second. G.711 encoder will create a 64 Kbps bitstream. This standard has two forms, A-Law and  $\mu$ -Law.

### **2.3.4.5.2 Register G711MUCN release history update**

Register G711MUCN is new in SN08.

### **2.3.4.5.3 Associated registers**

None

### **2.3.4.5.4 Associated logs**

None

## **2.3.4.6 Register - G711ACN**

### **2.3.4.6.1 Register description**

Register G711ACN (G.711 A-Law Connections) provides count for total number of G.711 A-Law codec connections handled by a particular IW-IP node.

#### **2.3.4.6.2 Register G711ACN release history update**

Register G711ACN is new in SN08.

#### **2.3.4.6.3 Associated registers**

None

#### **2.3.4.6.4 Associated logs**

None

### **2.3.4.7 Register - G729CN**

#### **2.3.4.7.1 Register description**

Register G729CN (G.729 Connections) provides count for total number of G.729 connections handled by a particular IW-IP node.

#### **2.3.4.7.2 Register G729CN release history update**

Register G729CN is new in SN08.

#### **2.3.4.7.3 Associated registers**

None

#### **2.3.4.7.4 Associated logs**

None

### **2.3.4.8 Register - CCDCN**

#### **2.3.4.8.1 Register description**

Register CCDCN (Clear Channel Data Connections) provides count for total number of 64K Clear Channel Data (CCD) Connections handled by a particular IW-IP node.

Clear Channel Data (CCD) calls are raw data streams instead of digitized 8KHz audio.

#### **2.3.4.8.2 Register CCDCN release history update**

Register CCDCN is new in SN08.

#### **2.3.4.8.3 Associated registers**

### **2.3.4.11 Register - RF2833CN**

#### **2.3.4.11.1 Register description**

Register RF2833CN (RFC2833 Connections) provides count for total number of RFC2833 connections handled by a particular IW-IP node.

The RFC2833 is used for tone transmission in all codec types. The speech compression can greatly impair the ability of downstream systems to recognize in-band DTMF tones. RFC2833 provides solution for this problem. The special RTP data packets will be transmitted instead of generating the tones at the ingress gateway. These RTP packets will instruct the downstream gateway to generate the appropriate tones.

**2.3.4.11.2 Register RF2833CN release history update**

Register RF2833CN is new in SN08.

***Product = CS 2000***

**A00005932--Removing Loopback Trunks in CEPT DISA calls for Remote Feature Activation**

## ***Functional Description***

### **1.1 Applicable Solution(s)**

DMS

### **1.2 Description**

#### **1.2.1 Introduction**

This feature enhances the digit collection in DISA features which are CEPT Call Forwarding Remote Access (CFRA) and CEPT Remote Access (CEPTRA). In existing functionality, digit collection is performed via loopback CAS trunks for all originating agents although they have capability to use UTR; that means, following kinds of originating agents below, loopback trunk is inserted between the agent and DISA feature by default:

- ISDN BRI lines
- ETSI ISUP trunks
- ETSI PRI trunks

This feature changes this behavior, and provides flexibility in digit collection as in following hierarchical order.

- 1 collect digits via UTR if possible
- 2 collect digits via DTMF receiver (for PRI agents only)
- 3 collect digits via LOOPBACK trunk

This feature provides the possibility not to use superfluous loopback equipment and optimize the digit collection for mentioned agents on CEPT markets; when the user of CFRA/CEPTRA feature will need to send digits for remote call activation, UTR or DTMF receivers (on MTMs) will be used for it. If both of them are not available, loopback trunk will be inserted as in existing functionality.

*Note: Throughout this document, “originating agent” refers to the originating agent of the call in the switch where DISA feature is located on.*

#### **1.2.2 General Considerations**

This feature is applicable for only CEPT features related with DISA framework, and provides the algorithm as explained below.

- a. Firstly, digit collection via UTR is tried to perform if it's already available.
- b. Secondly, if UTR is not available for originating agent, digit collection via DTMF receiver on MTMs is tried to perform. (for PRI agents only)

- c. Thirdly, if both of them are not available, digit collection is performed via LOOPBACK trunks.

The following table illustrates the originating agents versus supported digit collection types.

**Table 1 Supported digit collection types versus originating agents**

| Originating Agents                | Digit collection type |                         |                     |
|-----------------------------------|-----------------------|-------------------------|---------------------|
|                                   | via UTR               | via DTMF digit receiver | via LOOPBACK trunks |
| ETSI ISUP                         | X                     |                         | X                   |
| ETSI PRI                          | X                     | X                       | X                   |
| R1 (NTLS01, 02, 09),<br>R2 (Base) | X                     |                         |                     |
| ETSI BRI lines                    | X                     |                         | X                   |
| IBN/EBS lines                     | X                     |                         |                     |

X abbreviates this type of digit collection is supported on that agent.

As seen from Table 1, Digit collection via DTMF digit receiver cards is supported for only ETSI PRI trunks on which digit collection can be performed by UTR or Loopback trunks also.

Algorithm of choosing of which digit collection type used is simple. UTR has the first priority, DTMF digit receiver has the second, whereas loopback trunk has the last priority. The functional behavior diagram is as shown below.

**Figure 3 Functional Behavior Diagram**

### 1.3 Hardware Requirements or Dependencies

The RCVRDGT pool will be used as DTMF digit receiver in this activity, and digit receiver cards (2X48xx, where xx refers to "AB, BA, CC") should be located in MTMs.

Table RECEIVER should be provisioned as illustrated in Figure 2 below for using DTMF digit receiver in DISA calls. In order to be in service, each RCVRDGT must be taken in service by "**bsy;rts**" using the "**mapci;mtc;trks;ttp**" level.

**Figure 4 DTMF digit receiver provisioning**

|                 |   |         |          |        |      |         |

## **A00006226--NTPOLL: Restructuring and Table Control**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS

#### **1.2 Description**

This feature, “NTPOLL: RESTRUCTURING and TABLE CONTROL” (A00006226), is scheduled for release in SN08.

##### **1.2.1 NTPOLL Background**

NTPOLL is an existing DMS feature which automatically polls various data from the switch and stores the results in data files on either SFDEV or NTDEV.

NTDEV is a virtual type DMS disk similar to SFDEV but which has been set aside specifically for storage of the poll data files. Typically, NTDEV stores the results of the polling, although the option to use SFDEV exists.

The output of the polling is one or several poll data files named POLLDATA, POLLDATA1, POLLDATA2, POLLDATA3, etc. The maximum size of each file is limited (to approximately 30,000 lines), so when a poll data file reaches its maximum length, it is closed and a new file (named with the next number in the numbering scheme) is opened. A small switch might only output one POLLDATA file during a polling. However, large switches have been known to output as many as four or five POLLDATA files. Optionally, these poll data files may be compressed automatically. Compressed files are denoted by the letter “Z” (ex. POLLDATAZ, POLLDATA1Z, POLLDATA2Z, etc.).

The data polled and collected by the system is currently defined by the system. There are two types of poll steps done during the polling. A “table step” is simply the collection of data from a DMS table (either listings of tuples or a count of tuples in the table). A “complex step” involves the collection of various other types of data from the switch, for example software version, patch, SOC, DMSMON, memory, and other configuration information. In a full polling, there are currently over 440 total polling steps. Approximately 85% of the steps are table steps.

Two CI commands are used in the administration of polling:

- POLLSCHD - used for the weekly scheduling of pollings, defining polling parameters (ex. date and time of the polling, disk devices to use and whether to compress or not), and querying scheduled polls
- POLL - used to do an immediate poll, define the parameters thereof (ex. disk devices to use and whether to compress or not), or query certain information about the polling system.

### **Script file background**

Because the polling steps are defined internally within the polling code, it can be expensive (i.e. requires a patch) to add a new desired polling step once a load is released. Special scripts have been designed, used, and maintained to supplement the base polling data. Special demarcations within the script files allow the polling code to recognize, run, and collect the output of these scripts as part of the regular polling when the script is placed on NTDEV

### **1.2.2 New Feature Functionality**

The purpose of this feature is to allow the user the ability to modify the NTPOLL data collection template and address known software deficiencies. Currently, the poll steps performed during a polling are set in stone at initialization time and are not subject to changes, additions, or deletions of

steps by the craftsperson. To enhance the NTPOLL polling system, the following will be implemented:

- Creation of a new table, NTPOLL, which contains a visual representation of the poll steps to be done during the next polling, as well as the ability modify, add, or delete poll steps at the users discretion via Table Control.
- Consolidate existing polling scripts into the NTPOLL tool.
- A series of smaller, internal fixes within the polling code to improve the robustness and security of the polling system.

NOTE 1: This feature is being done in conjunction with feature “NTDEV POLLING DEVICE and FTP ACCESSIBILITY FROM SDM” (A00006219). The two features are independent and can stand alone, but the ability to FTP to NTDEV (where poll files are stored) is an enhancement to the overall polling functionality.

NOTE 2: It is suggested that access to Table NTPOLL be privclassed so that only certain administrative users may change it.

### 1.2.2.1 Table NTPOLL

This feature adds a new table to the system, Table NTPOLL.

This table can be used to view or customize the poll steps that will be taken the next time a polling occurs (NOTE: the “pollschd qsched” command can be used to query when the next polling is scheduled for).

Assuming there are n polling steps, when a polling begins, it will start at tuple 0 (zero), in Table NTPOLL, execute that step, and proceed through tuple n-1 to complete the polling.

Table NTPOLL is automatically datafilled with the default polling template by the system upon initialization. It reflects the internal data structures which track all of the poll steps to be taken.

Because the polling steps will now be stored in a DMS table instead of just in internal data structures, any changes made by the user to the polling steps will be preserved over system restarts and upgrades (ONP).

The following shows sample portions of Table NTPOLL (NOTE: initially there may be more than 430 steps in the table). The table’s keys are kept in order from 0 to n-1 (n=total # of poll steps), even if changes are made to the table (i.e. steps added or deleted).

The key contains the step number and an “insert bool”. The insert bool is only necessary when a new step is being added between existing steps. For example, if a new step is being added as step 33, the current step 33 becomes step 34, 34 becomes 35, 35 becomes 36, and so on.

The next four booleans determine whether or not that step is included in each of the four report types (LONG, SHORT, USAGE, and MEMCALC).

Finally, the step type and associated data are listed:

- CMPLX = complex step. A string name of the step is listed. A complex step involves a single or series of CI commands which are executed. Please see the explanation below of complex step fields for more information.
- TABLE = table step. The name of the table and the option whether to list out the table or count it is included. Please see the explanation below of table step fields for more information.

### **Table NTPOLL fields**

Four types of tuples can be added to Table NTPOLL:

- Table step (COUNT) - counts the number of tuples in the table.
- Table step (LIST) - lists tuples in the table. There are several list options. Typically, a table step is simply to LIST ALL tuples in the table. However, options exist also to list the first or last n tuples in the table (ex. LIST FIRST 20 or LIST LAST 200).
- Complex step (INT) - an “internal” complex step. These are added to the table by the system and are not modifiable by the user (although they may be deleted). These complex steps execute a procedure internal to the code.
- Complex step (EXT) - an “external” complex step. These are defined by the user. the DMS command interface will attempt to execute, as a CI command, whatever string the user enters in the tuple.

The following fields are common to every tuple in Table NTPOLL:

NTPOLLKY - The key for Table NTPOLL. It is a two-part key:

- STEPNUM - The step number. The system will keep these numbered from 0 to n-1 (n = the total number of steps) whenever tuples are added or deleted.
- INSERT - This is a bool which is only used when a tuple is being inserted between two existing tuples. It should be set to ‘Y’ in that case, and ‘N’ any other time.

LONG - A bool which tells the system if this step is part of a long format polling report.

SHORT - A bool which tells the system if this step is part of a short format polling report.

USAGE - A bool which tells the system if this step is part of a usage format polling report.

MEMCALC - A bool which tells the system if this step is part of a memcalc format polling report.

STPTYP - The step type, either table or complex: {TABLE, CMPLX}

The following fields appear in the table based on the step type (STPTYP):

- **Table step fields**

TABNAME - The string name of the table

TSOPER - Table step operation - either list or count: {COUNT, LIST}

LISTOP - a LIST operation: {ALL, FIRST, LAST}

HOWMANY - If LISTOP is FIRST or LAST, this field will be prompted for and the number of tuples to be listed should be entered in this field

- **Complex step fields**

CMPLXTYP - An “internal” (code-defined) or “external” (user-defined) complex step: {INT, EXT}

CMPLXNAME - The string name of the complex step. For an internal complex step, this is just a name and the actual internal procedure which gets run is stored in internal data structures. For an external complex step, this string is actually run as if it was a CI command entered by the user.

NOTES on external complex steps: The maximum length string the user can enter is 40 characters. Also, because table control prompting only accepts everything up to the first space, the underscore, “\_”, should be used where spaces are desired. If a true underscore is desired, enter two consecutive underscores and the code will interpret this as an underscore rather than two spaces. For example, if “OPEN SWER” is the complex command the user wishes to be executed, “OPEN\_SWER” should be entered.

### **Table NTPOLL datafill examples**

Ex. 1 - Datafilling a “table count” step in Table NTPOLL

TABLE: NTPOLL

>

>add

MACHINES NOT IN SYNC - DMOS NOT ALLOWED

JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED

ENTER Y TO CONTINUE PROCESSING OR N TO QUIT

>y

NTPOLLKY:

>441 n

LONG: N

>y

SHORT: N

>y

USAGE: N

>

MEMCALC: N

>

STPTYP:

>table

TABNAME:

>MNATMIF

```
TSOPER:
>count
TUPLE TO BE ADDED:
  441 N      Y Y N N TABLE      MNATMIF COUNT
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
JOURNAL FILE INACTIVE
```

Ex. 2 - Datafilling a “table list all” step in Table NTPOLL

```
TABLE: NTPOLL
>
>add
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
NTPOLLKY:
>442 n
LONG: N
>y
SHORT: N
>
USAGE: N
>
MEMCALC: N
>
STPTYP:
>table
TABNAME:
>e911psap
TSOPER:
>list
LISTOP:
>all
TUPLE TO BE ADDED:
  442 N      Y N N N TABLE      E911PSAP LIST  ALL
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
JOURNAL FILE INACTIVE
```

Ex. 3 - Datafilling a “internal complex” step in Table NTPOLL

Internal complex commands are added by the system, but a “change” on a complex command tuple is below to show the different fields. For an internal complex command, the string name (CMPLXNAME) is merely a description of the command. The actual CI command(s) and/or procedure(s) to be run are stored internal to the code.

```
>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
LONG: N
>
SHORT: Y
>
USAGE: N
>
MEMCALC: N
>
STPTYP: CMPLX
>
CMPLXTYP: INT
>
CMPLXNAME: Display_IMAGENAME
>
TUPLE TO BE CHANGED:
      1 N          N Y N N CMPLX Display_IMAGENAME
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>n
DMO REJECTED
```

#### Ex. 4 - Datafilling a “external complex” step in Table NTPOLL

When a complex step is datafilled as EXT (external), the user is actually defining the exact CI command(s) which will run. The CMPLXNAME field will be run as a CI command at polling time. Note that due to table control prompting functionality, underscores must be used where spaces would normally be on the CI command line. Internally, the underscore will be converted to spaces. If a true underscore is desired in the CMPLXNAME, the user should enter a double underscore (i.e. two consecutive underscores).

The following example shows the addition of the “OPEN SWER” command to Table NTPOLL. This command is executed within the LOGUTIL CI level, so presumably the previous user-added step (step # 443) was an external complex command “LOGUTIL” to get into the LOGUTIL level so that OPEN SWER could be executed.

```
>add
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
NTPOLLKY:
>444 n
LONG: N
>y
SHORT: N
>
USAGE: N
>
MEMCALC: N
>

**1.2.2.2 Consolidation of polling scripts into polling code**

An official set of polling script files currently exists. These script files augment the data collection template for each release. With this feature, the functionality of these official polling script files will be replaced by polling steps executed from within the internal polling code. Thus, the script files should no longer be necessary. However, the polling system will continue to look for polling scripts applicable to this load and release and if found, will execute the script. Care should be taken by script writers not to duplicate commands in the scripts which are already done by the internal code.

**1.2.2.3 Restore Default Steps**

A new option to the POLL CI command is added so that the user can return the state of the polling system to its system default. For example, if tuples are accidentally deleted from Table NTPOLL, the associated poll steps will no longer be executed during polling. The "POLL RESTORE\_DEFAULTS" command can be used to restore the list of polling steps (and thus Table NTPOLL) to the way it was at system initialization time.

The steps for restoring the polling defaults are:

The steps for restoring the polling defaults are:

(1) Delete all existing tuples from Table NTPOLL.

HINT: There are several ways to do this. If the “override” and “verify off” commands are available, the simplest way to do this would be the following:..

```
TABLE: NTPOLL
> count
BOTTOM
SIZE = 437
> ove;ver off
> repeat 437 (del;up)
```

With most tables, only the “del” part would be required. The “up” is included for this table because for every tuple delete, the tuples are renumbered. A repeat loop like this would only delete half of the tuples because the next tuple to be deleted actually gets moved up in the ordering, and the delete happens on the next tuple.

(2) Perform the POLL RESTORE\_DEFAULTS command.

```
>poll restore_defaults
Deleting any existing poll steps and recreating from defaults...
Done - default poll_steps restored.
```

#### 1.2.2.4 Execute a step in Table NTPOLL

A new option to the POLL CI command is added so that the user can execute a single step from Table NTPOLL. For example, using the sample NTPOLL table in section 1.2.2.1 “Table NTPOLL” on page 754, step number 33 (a “list all” on Table OFCENG) is executed:

```
> POLL DO_STEP 33
```

#### 1.2.2.5 Minor changes to default polling template

Several minor changes are made to the default polling template defined internally by the system.

- Existing steps that are not currently part of the LONG report are added to the LONG report. The LONG report is the mostly commonly gathered poll report, and certain steps that desired in the LONG report were only in the SHORT report in the past. The names of these steps are:

Display BCS Number  
Display IMAGENAME  
Display Log Message  
DMSMON - LOGCOUNT,  
DMSMON - RESTARTINFO,  
DMSMON - PMCONFIG,  
DMSMON - PMLOADS,  
DMSMON - ASSESS,  
Display CM/MS IDPROM

The output of all of these commands is relatively short and should not increase the length of the LONG report by much.

- The “SOC DBAUDIT” command is added to the complex step that gathers various SOC information (the “Display SOC Data” complex step).
- The processor type the polling is running on is queried so that only commands applicable to that processor type (ex. 88k vs. XA-Core) will be executed.

#### 1.2.2.6 NTPOLL Robustness

While mostly invisible to the user, a number of internal robustness fixes have gone into the polling code for SN08. Among them are:

- A security fix for the POLLUSER remaining permitted after the polling. Each time a scheduled polling occurs, a new DMS user called POLLUSER is permitted to the system, is logged in, and the work of the polling is done under this login session. Problems in the field have been seen where POLLUSER is not properly unpermitted after the polling. A new fix that has gone into the TL21 stream addresses this and ensures the POLLUSER is unpermitted after polling occurs.
- The file compression algorithm will be changed so as to avoid disk space issues on NTDEV. For example, suppose that there is enough data on the switch that a polling has created three data files, POLLDATA, POLLDATA1, and POLLDATA2 and that the compression option was chosen when the polling was scheduled. Currently, the system will create the three files and then compress all three after the polling is done. Under the new algorithm, each file will be automatically compressed as soon as it is closed. This will allow more space for new files to be created and guard against running out of disk space.
- An issue has been discovered where a polling may prematurely halt under certain conditions when one of the poll data files reaches its maximum line limit (approx. 30,000 lines). Rather than close the file and create a new poll data file (as is normally the case), the polling simply stops. Safeguards will

be put in the code to monitor for this condition and properly close the file and create a new one in order to allow the polling to continue.

#### 1.2.2.7 “Push” poll data files to a network location (future)

**IMPORTANT NOTE: The POLL PUSH functionality was not implemented. The description is left here for reference as part of a potential future feature, but this functionality is not available at this time.**

A desired functionality of the polling system is for the code to automatically FTP the poll data files to a pre-specified network location once a polling has completed. The PUSH option is added to the POLL command. By default, poll pushing is OFF, but it may be turned on and configured with the IP address, userid, password, and remote directory that FTP would need to properly store the files at the remote location.

Ex. Turn automatic file pushing off.

```
> POLL PUSH OFF
```

Ex. Turn automatic file pushing on.

The format is:

```
POLL PUSH ON <ip_addr> <remote_userid> <passwd> <directory>
```

```
> POLL PUSH ON 47.142.211.3 myuserid mypasswd  
/home/poll dude/poll data
```

Entering valid parameters for the POLL PUSH command is entirely up to the user. The polling system will do no error checking on the parameters and if any of them are invalid, the FTP storing of the files on the remote system will simply fail.

### 1.3 Hardware Requirements or Dependencies

No new dependencies.

### 1.4 Software Requirements or Dependencies

This feature is being developed for SN08 (built on CSP21, which contains TL21 and BAS22).

### 1.5 Limitations and restrictions

N/A

### 1.6 Interactions

## 1.11 Upgrade Considerations

## 1.12 Data schema (DS) (CM, MIBS, RDB)

### 1.12.1 New/modified tables, MIBs, or Database Schema

Table 2 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| NTPOLL         | New                      | New                                |

### 1.12.2 Table/MIB/Remote Database Schema information

#### 1.12.2.1 Name: NTPOLL

##### 1.12.2.1.1 Functional description

Table NTPOLL is a new table which contains the steps (one per tuple) taken by the DMS polling system (administered by the POLL and POLLSCHD CI

commands). This type of polling is existing functionality which gathers various information about the switch and stores the results in output files on either SFDEV or NTDEV. Previously, the user could not add, delete, or manipulate the polling steps as they were defined internally by the system at initialization time. This table allows the user that flexibility. Initially, the polling steps are still defined by the system. These system defined steps will be automatically entered into Table NTPOLL by the system. After that, the user is free to add, delete, or manipulate the polling steps. The system defines over 430 polling steps, so initially Table NTPOLL will have that many tuples.

#### 1.12.2.1.2 Usage sequence and implications (CM Only)

Table NTPOLL has no dependencies on other tables.

#### 1.12.2.1.3 Size

**Table 3 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                           |
|------------------------|----------------|----------------|-------------------------------------------------|
|                        |                |                |                                                 |
| NTPOLL                 | 0              | 1023           | SEGSTOR and FREEMAPS are used to manage memory. |

#### 1.12.2.1.4 Fields/OIDs

The following table lists fields/OIDs for Table NTPOLL.

The following fields exist in all tuples.

**Table 4 Table field descriptions**

| Field   | New or Changed | Subfield or refinement | Entry     | Explanation and action                                                                                                                                                                                                        |
|---------|----------------|------------------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STEPNUM | new            | n/a                    | {0..1023} | Step number. With the INSERT field, this is part of the key for the table. If there are n polling steps, STEPNUM will range from 0 to n-1. The step numbers in the table will be kept in order and consecutive by the system. |

**Table 4 Table field descriptions**

| <b>Field</b> | <b>New or Changed</b> | <b>Subfield or refinement</b>                                     | <b>Entry</b>   | <b>Explanation and action</b>                                                                                                                                                        |
|--------------|-----------------------|-------------------------------------------------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSERT       | new                   | n/a                                                               | {N, Y}         | This bool is only meaningful and should only be set to Yes if the user wishes to add a new tuple between two existing tuples.                                                        |
| LONG         | new                   | n/a                                                               | {N, Y}         | A bool which tells the system if this step is part of a long format polling report.                                                                                                  |
| SHORT        | new                   | n/a                                                               | {N, Y}         | A bool which tells the system if this step is part of a short format polling report.                                                                                                 |
| USAGE        | new                   | n/a                                                               | {N, Y}         | A bool which tells the system if this step is part of a usage format polling report.                                                                                                 |
| MEMCALC      | new                   | n/a                                                               | {N, Y}         | A bool which tells the system if this step is part of a memcalc format polling report.                                                                                               |
| STPTYP       | new                   | This field has a refinement for TABLE and a refinement for CMPLX. | {TABLE, CMPLX} | The step type, either table or complex. Table steps gather information from other DMS tables. Complex steps gather information from the switch by executing one or more CI commands. |

The following fields apply when STPTYP=TABLE.

| <b>Field</b> | <b>New or Changed</b> | <b>Subfield or refinement</b> | <b>Entry</b>          | <b>Explanation and action</b>                         |
|--------------|-----------------------|-------------------------------|-----------------------|-------------------------------------------------------|
| TABNAME      | new                   | n/a                           | String (1 to 8 chars) | The name of the DMS table to gather information from. |

| Field  | New or Changed | Subfield or refinement      | Entry         | Explanation and action                                                                                     |
|--------|----------------|-----------------------------|---------------|------------------------------------------------------------------------------------------------------------|
| TSOPER | new            | Refinement if TSOPER = LIST | {COUNT, LIST} | Denotes whether to list tuples from, or count the tuples of the table denoted stored in the TABNAME field. |

IF TSOPER = LIST

| Field  | New or Changed | Subfield or refinement               | Entry              | Explanation and action                                                                                                             |
|--------|----------------|--------------------------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------|
| LISTOP | new            | Refinement if LISTOP = FIRST or LAST | {ALL, FIRST, LAST} | Determines whether all the tuples should be listed, or the FIRST or LAST n tuples (if FIRST or LAST, see the next field, HOWMANY). |

IF LISTOP = FIRST or LISTOP = LAST

| Field   | New or Changed | Subfield or refinement | Entry        | Explanation and action                                                                                                                                                                     |
|---------|----------------|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HOWMANY | new            | n/a                    | unsigned INT | The number of tuples to be listed from the table should be entered here. If LISTOP = FIRST, the first HOWMANY tuples are listed, and if LISTOP = LAST, the last HOWMANY tuples are listed. |

The following fields apply when STPTYP = CMPLX.

| Field     | New or Changed | Subfield or refinement | Entry                  | Explanation and action                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------|------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMPLXTYP  | new            | n/a                    | {INT, EXT}             | INT denotes an “internal” complex step. These tuples can ONLY be datafilled by the system and not by the user. EXT denotes an “external” complex step, i.e. one that is defined by the user. When an internal complex step is executed, an internal procedure in the code is run. When an external complex step is executed, the exact string in the CMPLXNAME field is executed as if it was a CI command typed by the user. |
| CMPLXNAME | new            | n/a                    | String (1 to 40 chars) | This string denotes the name of the complex step. In the case of an internal complex step, it is merely a name denoting the step. In the case of an external complex step, it is the actual command that will run at polling time.                                                                                                                                                                                            |

#### 1.12.2.1.5 Datafill example

The following example shows sample datafill for table NTPOLL.

The following example shows about 20 sample tuples from Table NTPOLL. Four types of tuples are shown:

- Table step (list)
- Table step (count)
- Complex step (internal)
- Complex step (external)

## NOTES:

(1) Note that in the CMXPLXNAME field (i.e. the string associated with complex steps), spaces are represented as underscores. Internally, these underscores are converted to spaces but since space is the field separator in table control, this is necessary to keep the whole CMPLXNAME in one field.

(2) The system keeps the steps in order and consecutive. If there are n steps in the polling, the table keys will always be numbered 0 to n-1.

PT-IP

#### **1.2 Description**

This document details the OSSGate login changes. It describes the changes being made to OSSGate application which is part of CS2K Management Tools (CMT).

This feature is introduced to make OSSGate consistent with other user interfaces in the CS2K Configuration Management System.

This feature provides the following new or amended functionality:

- No echo of password to the screen when logging in to OSSGate using telnet client
- Ability to turn on or off this functionality using SESM configuration option
- Change to BPT tool to support either login modes

An important change to point out as a consequence of this feature is that OSS vendor software will be impacted by this change. In order to get existing OSS software to work when this new functionality is turned on by SESM configuration, there are couple of changes which need to be implemented in the OSS software. The following are the changes, only if OSSGate Password Control option is turned on (default: off).

- recognize the new login prompt. Prior to SN07, the user name and password was prompted in the same line separated by space. Now, the username and password are prompted one after the other
- OSSGate sends telnet protocol bytes to client to tell it to turn off echo and turn on echo. This is needed for telnet client software. OSS vendor software just needs to ignore these bytes.

## ***Configuration for A00006269***

### **2.1 Upgrade Impact**

This activity is responsible for handling modifications to OSSGate login. By default the OSSGate login functionality will be same as in SN07 and to turn on the new functionality, the user has to manually turn on an option via SESM configuration.

Prior to the SN07 release, login to the OSSGate involved entering username and password in one line separated by space, and the password entered was visible on the telnet window. In SN08, the user has to manually configure to turn on the OSSGate Password Control option in the SESM's OSSGate configuration section. Once this option is turned on, when attempting to login to OSSGate, it will prompt for the username first and then the password and the password being entered will not be displayed to the screen.

The default value of this OSSGate Password Control option is off, meaning the OSSGate login will be similar to SN07. This is done to minimize the impact to OSS operations, since the new login prompts of OSSGate will require changes in OSS vendor software. With this approach, it gives the customer the flexibility to turn on OSSGate password control option, when they are ready with changes to OSS vendor software. There is no impact after upgrades other than this OSSGate Password Control option is now available in SESM's OSSGate configuration section and the user can turn it on (default is off).

### 2.5.1 OSSGate Login prompt changes

This section shows the new login prompt prompted by OSSGate. The other functionality of OSSGate does not change except for the login prompt changes.

The user has to manually turn on the OSSGate Password Control option in order for this login change to take affect, as it is turned off by default.

Shown below is the screen capture of logging into OSSGate from SESM box. (user input is shown in blue). The new login prompts are shown in red.

```
#telnet localhost 10023
Trying 127.0.0.1...
Connected to localhost.
Escape character is '^]'.
```

## 2.5.2 OSSGate configuration

In this section, the screen output below shows the new OSSGate Password Control option which needs to be turned on to enable OSSGate to not echo password to the screen. The new configuration option is available in SESM's OSSGate configuration section and is shown in **red**. The user input is shown in **blue**.

After logging into the SESM box as root,

```
#cd /opt/nortel/NTsesm/admin/bin
```

```
#./configure
```

SESM configuration

- 1 - SESM common configuration (IP addresses, Market, CM CLI)
- 2 - SESM database tools
- 3 - SESM related applications configuration (MG9K, LMM, CICM)
- 4 - SESM provisioning configuration
- 5 - SESM logging configuration (syslog, sesm debug log)
- 6 - view sesm configuration settings
- 7 - SESM refresh properties

X - exit

select - 4

SESM Provisioning Configuration

- 3 - Office Provisioning Type configuration

X - exit

select - 2

## SESM OSSGate Provisioning Configuration

Enter the Primary Port OSSGate will use for telnet connections (default: 10023):

Enter the Secondary Port OSSGate will use for telnet connections (default: 11023):

Enter the OSSGate Timeout period, in seconds (default: 600):

Do you wish to have OSSGate Port Forwarding on for SSH [y/n]: n

Do you wish to turn on/off OSSGate Password Control option  
( when this option is turned on, OSSGate will not echo  
password on screen when logging onto it) [default: off] : on

Updating the property files with changed values, please wait...

Reloading the changed property values into memory, please wait...

### 2.5.3 Login prompt change implications

Prior to the SN08 release, the user name and password was prompted in the same line. In this release, however, there are two main changes which impact clients of OSSGate. They are

1. Instead of looking for login prompt “Enter username and password”, clients should look for “Enter User Name” prompt from OSSGate first. Once it gets this, the user name should be sent to OSSGate. Ossgate will then send “Enter Password” prompt. After receiving this prompt, the password should be sent to OSSGate.
2. OSSGate sends telnet echo off byte sequence to clients (to tell telnet clients to not display password entered onto screen) after sending the “Enter Password” prompt. This echo off byte sequence is necessary to make telnet client software not echo a password typed on screen.

#### 2.5.3.1 Impact to BPT tool

There are no external interface changes to BPT. Internally, BPT tool will handle the different prompts and will also strip telnet bytes and ignore them. But for users of BPT tool, there are no changes in the interface.

#### 2.5.3.2 Impact to OSS vendor software

OSS software should be able to handle the new login prompts and also detect telnet bytes and strip these bytes and ignore them.

Shown in the Figure 1 below are the changes needed to be done to OSS vendor software to interact with OSSGate when the OSSGate password control option is enabled.

**Figure 1** OSS Vendor software and its interaction with OSSGate

In the above figure, the new prompts are shown in dark red. The telnet bytes sent are explained below.

The Telnet Echo Off byte sequence are 3 bytes shown below

#### IAC WILL ECHO

IAC byte value is 255  
WILL byte value is 251  
ECHO byte value is 1

OSS software should look for these bytes and when received, just ignore them

The Telnet Echo On byte sequence are 3 bytes shown below

#### IAC WONT ECHO

IAC byte value is 255  
WONT byte value is 252

ECHO byte value is 1

***Product = CS 2000***

## **A00006271--CEPT Act/Deact and Interrogation for ETSI BRI CFK, CFB/CFD K**

### ***Functional Description***

#### **2.1 Applicable Solution(s)**

DMS

#### **2.2 Description**

##### **2.2.1 Background**

Activation, deactivation and interrogation of CFB (Call Forwarding Busy), CFD (Call Forwarding Don't Answer) and CFU (Call Forwarding Unconditional) features based on the CEPT Dialing Sequence has been already implemented per loop (or a chosen DN keylist) (for more information, please refer to [1] (A59034125 "ISDN BRI CEPT Call Forwarding" in PLS FMDOC).

CFx and CFx per Key are administration assigned features but the subscriber as well as the administrator has the ability of activating, deactivating and interrogating the feature.

This activity is only interested in the activation, deactivation and interrogation of the previously assigned CFx per Key option based on CEPT Dialing Sequence and neither interested in the provisioning of the CFx per Key option nor the existing CFx per Key activation, deactivation and interrogation code (for more information, please refer to [2] A59028702 "Support of CFx for Multiple DNs for ETSI BRI" in PLS FMDOC).

##### **2.2.1.1 Existing CFB and CFD Types**

There are 4 types of CFB and CFD:

- N (Normal) - "Forwarded to DN" is specified during assignment of feature, and forwarding capability is immediately activated and remains activated.
- F (Fixed) - "Forwarded to DN" is specified during assignment of feature, but forwarding capability is activated and deactivated by the user from the set to which the feature is assigned.

- P (Programmable) - Similar to F type, but upon activation, user from set also specifies forwarded to DN. No “Forwarded to DN” is specified during assignment of the feature.
- K (Programmable per Key) - For every DN in the KEYLIST, a new tuple is created in table CFX (for the other types of CFB and CFD, a common tuple is created for all the DNs in the keylist). This means that each DN might have its own data.

The CFB and CFD call forwarding features are assignable only to KEY 1 of an ISDN BRI set. Those DN Keys which receive the functionality of such an assignment are specified in a KEYLIST.

### 2.2.1.2 Existing CFK Feature

The CFK (Call Forwarding per Key) feature can be assigned to KEY 1 or to any vacant key on a set. Again, those DN Keys which receive the functionality of such an assignment are specified in a KEYLIST. For CFK, the user can program a separate “Forwarded to DN” to each key specified in the KEYLIST.

This activity is only interested in CFK option and the K (Programmable per Key) type of the CFB and CFD options.

### 2.2.2 Feature Overview

This document describes the Functional Description of the ETSI BRI activity A00006271 “CEPT Act/Deact and Interrogation for ETSI BRI CFK, CFB/CFD K” in ISN08.

This feature is needed to make available the activation, deactivation and interrogation of CFB per Key (Call Forwarding Busy per Key), CFD per Key (Call Forwarding Don't Answer per Key) and CFK (Call Forwarding Unconditional per Key) features based on the CEPT Dialing Sequence.

In this document, CFD is used instead of ETSI CFD or CFNR (Call Forwarding No Reply). With the existing implementation, CFD is used in Servord and in provisioning tables, and CFNR is invisible to the crafts person. Therefore, only CFD is used in this document to mean CFNR.

In this document, “MSN A” is used to define the DN which is assigned to ISDN BRI set or IBN set by configuring the TA's (Terminal Adaptor) port as the first DN by subscriber and can be different from the primary DN (Key 1) provisioned at the exchange.

The following abbreviations are used in describing the activation, deactivation and interrogation control procedures of ETSI BRI CFX per Key in CEPT Dialing Sequence:

LH: Lift Handset, RH: Replace on Hook, DT: Dial Tone, ACK: Acknowledge Tone, NACK: Negative ACKnowledge Tone, AC: Access Code, DN: Directory Number, \*: Dialing Star, #: Dialing Octothorpe.

According to Turk Telecom tender, the feature CFx per Key is enhanced to function on ETSI BRI lines by using CEPT Dialing Sequence.

Although, subscriber can activate and deactivate a CFx per Key option by using ISDN BRI Set's menu options and keys (for more information, please refer to [2] A59028702 "Support of CFx for Multiple DNs for ETSI BRI" in PLS FMDOC), if there is an "Analog Telephone" on the loop which is connected to the ISDN loop over TA (Terminal Adaptor), user has no chance to use menu options and keys. So, this activity supplies CEPT dialing ability to the "Analog Telephone" user which is connected to the ISDN loop over TA (and also to the ISDN BRI user) to activate, deactivate and interrogate a CFx per Key option.

While explaining the desired behavior, refer to the example configuration in Figure. It is supposed that DN1, DN2, DN3, DN4 and DN5 of the "ISDN loop A" have CFx per Key options. If a subscriber has the configuration like Figure 1, subscriber might:

- d. Activate, deactivate or interrogate the CFx per Key option assigned to DN 1 by using "ISDN Telephone 1" (subscriber might activate, deactivate or interrogate a CFx per Key option assigned to DN of the MSN A of the ISDN BRI terminal which is used to dial CEPT sequence).
- e. Activate, deactivate or interrogate the CFx per Key option assigned to DN 4 by using "ISDN Telephone 1" (subscriber might activate, deactivate or interrogate a CFx per Key option assigned to DN of the MSN X (an MSN of the ISDN BRI set different than MSN A) of the ISDN BRI terminal which is used to dial CEPT sequence).
- f. Activate, deactivate or interrogate the CFx per Key option assigned to DN 3 by using "ISDN Telephone 1" (subscriber might activate, deactivate or interrogate a CFx per Key option assigned to DN of the MSN A of the other ISDN BRI terminal on the same ISDN loop).
- g. Activate, deactivate or interrogate the CFx per Key option assigned to DN 2 by using "Analog Telephone 1" (subscriber might activate, deactivate or interrogate a CFx per Key option assigned to DN of the MSN A of an Analog Telephone by dialing from that Analog Telephone which is connected to the ISDN loop over a TA).
- h. Activate, deactivate or interrogate the CFx per Key option assigned to DN 5 by using "Analog Telephone 1" (subscriber might activate, deactivate or interrogate a CFx per Key option assigned to DN of the MSN A of the other Analog Telephone on the same ISDN loop by

dialing from another Analog Telephone on the same loop which is connected to the ISDN loop over a TA).

- i. Activate, deactivate or interrogate the CFx per Key option assigned to DN 3 by using “Analog Telephone 1” (subscriber might activate, deactivate or interrogate a CFx per Key option assigned to DN of the MSN A of an ISDN BRI terminal on the same ISDN loop by dialing from an Analog Telephone on the same loop which is connected to the ISDN loop over a TA).

**Figure 2 Sample Configuration of an ISDN loop**

TA : Terminal Adaptor

### 2.2.2.1 Activating CFx per Key Option

- If subscriber wants to activate:  
a CFx per Key option assigned to DN of the MSN A of the ISDN BRI terminal which is used to dial CEPT sequence (item “a” of Section 1.3.2),  
or  
a CFx per Key option assigned to DN of the MSN A of an Analog Telephone by dialing from that Analog Telephone which is connected to the ISDN loop over a TA (item “d” of Section 1.3.2);

#### **LH DT \* AC \* Forwarded to DN # ACK RH**

The ETSI BRI Call Forward per Key option becomes active immediately after execution of this sequence. DN entered must be a translatable number, that means “Forwarded to DN” is validated.

Any incomplete activation sequence will result in NACK:

#### **LH DT \* AC \* invalid-dialing-sequence NACK RH**

The implementation of this behavior for the CFB per Key and CFD per Key options is already available in the existing code (if CFB per Key or CFD per Key options are assigned to MSN A of an ISDN BRI terminal which is used to dial CEPT sequence or assigned to DN of the MSN A of an Analog Telephone by dialing from that Analog Telephone which is connected to the ISDN loop over a TA, it already works). **This activity only implements this functionality for the CFK option.**

- If subscriber wants to activate,  
a CFx per Key option assigned to DN of the MSN X (an MSN of a terminal different than MSN A) of that terminal which is used to dial CEPT sequence (item “b” of Section 1.3.2),  
or  
a CFx per Key option assigned to DN of the MSN A of the other ISDN BRI terminal on the same ISDN loop (item “c” of Section 1.3.2),  
or  
a CFx per Key option assigned to DN of the MSN A of an Analog Telephone on the same ISDN loop by dialing from another Analog Telephone on the same loop which is connected to the ISDN loop over a TA (item “e” of Section 1.3.2),  
or  
a CFx per Key option assigned to DN of the MSN A of an ISDN BRI terminal on the same ISDN loop by dialing from an Analog Telephone on the same loop which is connected to the ISDN loop over a TA (item “f” of Section 1.3.2);

**LH DT \* AC \* Forwarded to DN \* DN of MSN X # ACK RH**

The ETSI BRI Call Forward per Key option becomes active immediately after execution of this sequence. DN entered must be translatable number, that means Call Forwarded to DN is validated.

Any incomplete activation sequence will result in NACK:

**LH DT \* AC \* invalid-dialing-sequence NACK RH****2.2.2.2 Deactivating CFx per Key Option**

- If subscriber wants to deactivate;  
a CFx per Key option assigned to DN of the MSN A of the ISDN BRI terminal which is used to dial CEPT sequence (item “a” of Section 1.3.2),  
or  
a CFx per Key option assigned to DN of the MSN A of an Analog Telephone by dialing from that Analog Telephone which is connected to the ISDN loop over a TA (item “d” of Section 1.3.2);

**LH DT # AC # ACK RH**

The ETSI BRI Call Forward per Key option becomes inactive immediately after execution of this sequence.

The implementation of this behavior for the CFB per Key and CFD per Key options are already available in the existing code (if CFB per Key or CFD per Key options are assigned to MSN A of an ISDN BRI terminal which is used to dial CEPT sequence or assigned to DN of the MSN A of an Analog Telephone by dialing from that Analog Telephone which is connected to the ISDN loop over a TA, it already works). **This activity only implements this functionality for the CFK option.**

- If subscriber wants to deactivate;  
a CFx per Key option assigned to DN of the MSN X (an MSN of a terminal different than MSN A) of that terminal which is used to dial CEPT sequence (item “b” of Section 1.3.2),  
or  
a CFx per Key option assigned to DN of the MSN A of the other ISDN BRI terminal on the same ISDN loop (items “c” of Section 1.3.2),  
or  
a CFx per Key option assigned to DN of the MSN A of an Analog Telephone on the same ISDN loop by dialing from another Analog Telephone on the same loop which is connected to the ISDN loop over a TA (item “e” of Section 1.3.2),

or

a CFx per Key option assigned to DN of the MSN A of an ISDN BRI terminal on the same ISDN loop by dialing from an Analog Telephone on the same loop which is connected to the ISDN loop over a TA (item “f” of Section 1.3.2);

**LH DT # AC \* DN of MSN X # ACK RH**

The ETSI BRI Call Forward per Key option becomes active immediately after execution of this sequence.

Any incomplete activation sequence will result in NACK:

**LH DT \* AC \* invalid-dialing-sequence NACK RH**

### 2.2.2.3 Interrogating CFx per Key Option

- If subscriber wants to interrogate a “Forwarded to DN” of;  
a CFx per Key option assigned to DN of the MSN A of the ISDN BRI terminal which is used to dial CEPT sequence (item “a” of Section 1.3.2),

or

a CFx per Key option assigned to DN of the MSN A of an Analog Telephone by dialing from that Analog Telephone which is connected to the ISDN loop over a TA (item “d” of Section 1.3.2);

if DN is equivalent to the DN stored,

**LH DT \*# AC \* Forwarded to DN # ACK RH**

if DN stored does not match the DN entered

**LH DT \*# AC \* Forwarded to DN # NACK RH**

The implementation of this behavior for the CFB per Key and CFD per Key options are already available in the existing code (if CFB per Key or CFD per Key options are assigned to MSN A of an ISDN BRI terminal which is used to dial CEPT sequence or assigned to DN of the MSN A of an Analog Telephone by dialing from that Analog Telephone which is connected to the ISDN loop over a TA, it already works). **This activity only implements this functionality for the CFK option.**

- If subscriber wants to interrogate a “Forwarded to DN” of;  
a CFx per Key option assigned to DN of the MSN X (an MSN of a terminal different than MSN A) of that terminal which is used to dial CEPT sequence (item “b” of Section 1.3.2),

or

a CFx per Key option assigned to DN of the MSN A of the other ISDN BRI terminal on the same ISDN loop (item “c” of Section 1.3.2),

or

a CFx per Key option assigned to DN of the MSN A of an Analog Telephone on the same ISDN loop by dialing from another Analog Telephone on the same loop which is connected to the ISDN loop over a TA (item “e” of Section 1.3.2),

or

a CFx per Key option assigned to DN of the MSN A of an ISDN BRI terminal on the same ISDN loop by dialing from an Analog Telephone on the same loop which is connected to the ISDN loop over a TA (item “f” of Section 1.3.2);

if DN is equivalent to the DN stored,

**LH DT \*# AC \* Forwarded to DN \* DN of MSN X # ACK RH**

if DN stored does not match the DN entered

**LH DT \*# AC \* Forwarded to DN \* DN of MSN X # NACK RH**

## 2.3 Hardware Requirements or Dependencies

N/A

## 2.4 Software Requirements or Dependencies

N/A

## 2.5 Limitations and restrictions

- Maximum number of digits for Forwarded-to-DN is 30.
- Restrictions for the maximum number of digits for DN-of-MSN<sub>X</sub> are as follows:
  - i. SNPA + OFC CODE + STN CODE ≤ 15
  - ii. OFC CODE + STN CODE ≤ 14
  - iii. STN CODE ≤ 8
  - iv. OFC CODE ≤ 7
- If dialed Forwarded-to-DN contains a DN which is available at the same office as the subscriber and if subscriber dials extra digits after the valid Forwarded-to-DN by following the restriction of the maximum number of digits for Forwarded-to-DN, extra digits are removed and the rest of the translatable digits are stored as Forwarded-to-DN.
- Since DN-of-MSN<sub>X</sub> must be a DN which is available ISDN loop of the subscriber (at the same office), if subscriber dials extra digits after the valid DN-of-MSN<sub>X</sub> by following the restriction of the maximum number of digits for DN-of-MSN<sub>X</sub>, it is acceptable.
- This activity is not supported for the Centrex offices.

- CEPT Act/Deact and Interrogation are not supported via Keypad Facility Messages.
- This activity is not affected from the “Flexible Digit Analysis”. Although this activity uses “Flexible Digit Analysis” until collecting first three digits (until translation finding the feature), digit collection part of the FPE does not use “Flexible Digit Collection”.
- If CEPT dialing sequence is not finished with octothorpe (#), after a time interval, a time-out message and a “last digit” message are received. When this message is received, it is evaluated as an error and a NACK (negative acknowledgement) tone is given to the user.

This time interval can vary for different CEPT dialing sequences (for example; according to number of digits dialed, between overlap and enblock dialing and between NDGT and STDCOLL digit collection types defined in NCOS table). Some of the test results for the available office settings (DGCOLNM: NDGT) are as follows:

|                            | <u>ENBLOCK</u> | <u>OVERLAP</u> |
|----------------------------|----------------|----------------|
| <b>*14*7831023</b>         | 40s            | 10s            |
| <b>*14</b>                 | 40s            | 40s            |
| <b>#14</b>                 | 40s            | 40s            |
| <b>*14*</b>                | 40s            | 10s            |
| <b>*14*7831023*7831093</b> | 40s            | 5s             |

## 2.6 Interactions

This activity follows the existing feature interaction rules. Existing interactions remain unchanged:

If RESL option types OTR and ORR are datafilled, Call Forward Deactivation and Interrogation are allowed. However, Activation of Call Forward is not allowed. If RESL option type TRR is datafilled, Call Forward Activation, Deactivation and Interrogation are allowed.

If OCB is active at the same DN, Call Forward Activation is not allowed according to restriction class of OCB. On the other hand, Deactivation and Interrogation are allowed to be programmed.

## ***Product = CS 2000***

### **A00006693--XA-Core IO Capacity Monitoring Toolset** ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS, PT-AAL2

#### **1.2 Description**

The IO Capacity monitoring toolset (IOCAP) provides the customer telemetry for messaging over HIOP and HCMIC.

XA-Core counts messages and bytes for each service. Software on the XA-Core accesses the measurements, calculates the messaging occupancy level, and displays the results on the IOCAP MAPCI level and the IOCAP OM group.

This feature will cause no more than 3% capacity degradation in IO capacity.

##### **1.2.1 IOCAP MAPCI display**

Following is a prototype of the IOCAP MAPCI display, which will subtend from the CAPACITY level. The display will be updated once per minute.

|          |        |            |     |         |        |          |      |
|----------|--------|------------|-----|---------|--------|----------|------|
| CATMP/HR | SMS/HR | VLR_UPD/HR | CAP | ENGBHCA | CCOVRD | CMICOVRD | PESC |
| 303001   | 180    | 398700     | 128 | 233643  | OFF    | OFF      | NO   |

|         |         |         |        |         |        |
|---------|---------|---------|--------|---------|--------|
| Service | IOUTIL% | TxMsg/s | TxSize | RxMsg/s | RxSize |
| ETHR    | 64      | 15324   | 107    | 13234   | 91     |
| CMIC    | 17      | 4102    | 202    | 1254    | 102    |
| AMDI    | 0       | 0       | 0      | 0       | 0      |

The Service column identifies the type of IO service (Ethernet, CMIC, or AMDI). IOUTIL is the calculated percentage utilization of the available system messaging capacity, based on the known IO system capacity, the average rate through other services on the same card, and the throughput on other cards. TxMsg/s, TxSize, RxMsg/s and RxSize report average transmit and receive message rates and sizes through that service. Because the MAPCI display is updated once per minute, high water mark information will not be displayed.

### 1.2.2 IOCAPCI tool

The information in the MAP display is also available through the IOCAPCI tool, in addition to the following tools:

- one month's history of hourly high water mark percent utilization for each service (Ethernet, CMIC, and AMDI), similar to DMSMON HIGHCAP.
- one month's history of hourly average percent utilization for each service.
- current hour and last hour utilization and throughput for each service

An example of the CMIC high water mark data follows. A similar output will be available for each service.

```
> iomax cmic
Maximum CMIC Utilization
```

### 1.2.3 IO capacity OM

The information displayed in the IOCAP MAP command is also recorded in the IOCAP operational measurement, as shown below.

IOCAP

CLASS: HOLDING

START:2003/12/03 09:30:00 WED; STOP: 2003/12/03 09:45:00 WED;

SLOWSAMPLES: 9 ; FASTSAMPLES: 90 ;

INFO (IO\_SERVICE\_TYPE)

|        | IOUTIL<br>RXMSGPS | IOHWM<br>RXSIZE | TXMSGPS<br>IOTHRESH | TXSIZE |
|--------|-------------------|-----------------|---------------------|--------|
| 1 ETHR | 64<br>13234       | 72<br>84        | 15204<br>0          | 105    |
| 2 CMIC | 17<br>1254        | 18<br>63        | 1254<br>0           | 102    |
| 3 AMDI | 0<br>0            | 0<br>0          | 0<br>0              | 0      |

The IOCAP OM provides measurements of messaging rates and sizes for each service. The IO\_SERVICE\_TYPE indicates the service provided. IOUTIL refers to percentage utilization of the services on the switch. IOHWM refers to the highest level that the corresponding utilization has reached in the sample period. TXMSGPS, TxSIZE, RXMSGPS and RxSIZE report the average transmit and receive message rates and sizes through the service. The IOTHRESH register is pegged every time the service average utilization for one minute exceeds the value of new OFCENG office parameter IO\_WARNING\_THRESHOLD. This register is intended to give the customer a flexible warning that they are approaching the need to upgrade their IO system.

**1.2.4 Office parameter**

A new office parameter in table OFCENG, IO\_WARNING\_THRESHOLD, indicates the minimum IO service utilization at which the IOTHRESH register in the IOCAP OM will be pegged.

**1.3 Hardware Requirements or Dependencies**

This feature is unavailable for CMIC, Ethernet and AMDI packets (NTLX05AB, NTLX09AA, NTLX05BA respectively).

This feature is supported on all versions of NTLX04 HIOP cards and NTLX17 HCMIC cards.

**1.4 Software Requirements or Dependencies**

None.

**1.5 Limitations and restrictions**

This feature will be submitted into CSP21 and patched back to CSP20.

When the system is in transition from IOP to HIOP, the utilization of all IO services will not be available.

**1.6 Interactions**

The MAPCI level display will sub tend from the CAPACITY MAP level. It will be shown as an option from that level.

## 1.8 Glossary

Table 5

| Term     | Description |
|----------|-------------|
| New term | Definition  |

## *Configuration for A00006693*

### 2.1 Hardware and Software Requirements

Not applicable.

### 2.2 Initial Configuration

Not applicable.

### 2.3 Office/Subnet parameters (OP/SP) (CM & SESM)

#### 2.3.1 New/modified office/subnet parameters

Table 6 New or modified parameter

| Parm table | Parameter name           | NEW/<br>CHANGED/<br>DELETED/<br>RELOCATED | Domain (CM or<br>Subnet<br>Management) |
|------------|--------------------------|-------------------------------------------|----------------------------------------|
| OFCENG     | IO_WARNING_<br>THRESHOLD | NEW                                       | XA-Core                                |

#### 2.3.2 Parameter information

##### 2.3.2.1 IO\_WARNING\_THRESHOLD

IO\_WARNING\_THRESHOLD

###### 2.3.2.1.1 Functional description

This parameter defines a utilization warning threshold for all IO service types (CMIC, ETHR, AMDI) in the system. The IOCAP monitoring toolset uses the value of this parameter to peg the IOTHRESH register of the IOCAP OM whenever the IO utilization level of any IO service has exceeded this threshold on the switch.

###### 2.3.2.1.2 Provisioning rules

There is no formula for provisioning this office parameter. However, this office parameter should be set by the customer in such a manner that will allow sufficient advance warning time for their maintenance personnel to upgrade or reconfigure their IO devices in case the condition re-occurs often.

### 2.3.2.1.3 Range information

**Table 7 Range Information**

| Minimum | Maximum | Default |
|---------|---------|---------|
| 1       | 100     | 100     |

### 2.3.2.1.4 Activation

Any change activation for this office parameter is immediate.

### 2.3.2.1.5 Dependencies

Not applicable.

### 2.3.2.1.6 Consequences

If this office parameter is set low, the IOTHRESH register might be in pegged more often than necessary. If this office parameter is set high, the customer may not have enough advance notice to upgrade their IO configuration.

### 2.3.2.1.7 Verification

To verify, users can modify and display the value of IO\_WARNING\_THRESHOLD on table OFCENG via table control.

### 2.3.2.1.8 Memory requirements

No memory impact.

### 2.3.2.1.9 Parameter release history update

New office parameter in CSP20.

## 2.4 Upgrade Impact

Not applicable.

## 2.5 Data schema (DS) (CM, MIBS, RDB)

Not applicable.

## 2.6 Service Orders (SO) (CM & SESM)

Not applicable.

## 2.7 Software optionality control (SOC)

Not applicable.

## 2.8 Element Management

Not applicable.

## 2.9 Command interface changes

The following new directories will be provided in this feature.

## 2.9.1 Directory: CAPACITY

This existing CAPACITY MAPCI level will be modified to provide a new IOCAP MAPCI level in XA-Core only. The new IOCAP level will provide IO utilization and IO messaging throughput information for HCMIC and HIOP IO cards.

### 2.9.1.1 Directory description

This new IOCAP MAPCI level will be giving the IO utilization values and messaging throughput information for each IO service type (CMIC, ETHR and AMDI). The information on this new MAPCI level will be updated once every minute.

### 2.9.1.2 Accessing directory: CAPACITY

#### 2.9.1.2.1 Access to directory or MAP level and return to CI

To access this directory, type:

```
> MAPCI; MTC; CAPACITY
```

To return to the CI environment, type:

```
> QUIT ALL
```

## 2.9.2 Command: IOCAP

This is a new command available under the CAPACITY MAPCI level in XA-Core only.

### 2.9.2.1 Command type: Listed MENU

### 2.9.2.2 Command target: XA-Core only

### 2.9.2.3 Command availability: RES

### 2.9.2.4 Command description

This new IOCAP MAPCI level will be giving the IO utilization values and messaging throughput information for each IO service type (CMIC, ETHR and AMDI). The information on this new MAPCI level will be updated once every minute.

### 2.9.2.5 Command syntax

**Table 8 IOCAP command parameters and variables**

| Command                  | Parameters and variables |
|--------------------------|--------------------------|
| IOCAP                    | none                     |
| Parameters and variables | Description              |

### 2.9.2.6 Qualifications and warnings

Not applicable.

### 2.9.2.7 Responses

#### 2.9.2.7.1 IOCAP response

**Table 9** MAP outputs with associated meanings and actions

| Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Service: The type of IO service of the values shown on the same line is captured.</p> <p><b>Meaning:</b> Possible IO service types are CMIC, ETHR and AMDI.</p> <p><b>System or user actions:</b> Not applicable</p> <p>IOUTIL%: The average utilization of all active links in the system captured in the previous minute.</p> <p><b>Meaning:</b> The value is given as a percent of total system and can take up to 3 digits.</p> <p><b>System or user actions:</b> Not applicable</p> <p>TxMsg/s: The average number of transmitted messages captured in the last minute for this IO service type.</p> <p><b>Meaning:</b> The unit is number of transmitted messages per second.</p> <p><b>System or user actions:</b> Not applicable</p> <p>TxSize: The average size (in bytes) of all transmitted messages in the last minute.</p> <p><b>Meaning:</b> The unit is in bytes.</p> <p><b>System or user actions:</b> Not applicable</p> <p>RxMsg/s: The average number of received messages captured in the last minute for this IO service type.</p> <p><b>Meaning:</b> The value unit is the number of received messages per second.</p> <p><b>System or user actions:</b> Not applicable</p> <p>RxSize: The average size (in bytes) of all received messages in the last minute.</p> <p><b>Meaning:</b> The unit is in bytes.</p> <p><b>System or user actions:</b> Not applicable</p> |

This MAPCI level can be used for monitoring current IO throughput. Under normal condition, there is no response required from maintenance personnel. The descriptions of all fields displayed under this level are given above. These responses are seen in XA-core only.

### 2.9.2.8 Example

**Table 10 Usage examples for IOCAP command**

|                      |                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description of task: | This new IOCAP MAPCI level will be giving the IO utilization values and messaging throughput information for each IO service type (CMIC, ETHR and AMDI). The information on this new MAPCI level will be updated once every minute. |
| Command:             | MAPCI; MTC; CAPACITY; IOCAP                                                                                                                                                                                                         |
| MAP response:        | See example output below.                                                                                                                                                                                                           |

An example output of this new MAPCI level is given below.

#### IOCAP MAPCI Level

| XACM         | MS       | IOD     | Net      | PM       | CCS      | Ins    | Trks     | Ext  | APPL |

| 17           |          |         |          |          |          |        |          |      |      |
| 18           |          |         |          |          |          |        |          |      |      |
| XMAP0        |          |         |          |          |          |        |          |      |      |
| Time 14:12 > |          |         |          |          |          |        |          |      |      |

### 2.9.3 Command: QUIT

This command will allow the user to exit IOCAP MAPCI level and to return to IOCAP higher MAPCI level (CAPACITY MAPCI level).

#### 2.9.3.1 Command type: Listed MENU

This QUIT command is listed in IOCAP menu.

#### 2.9.3.2 Command target: XA-Core only

This new IOCAP QUIT command is available in XA-Core only.

### 2.9.3.3 Command availability: RES

### 2.9.3.4 Command description

This command will allow the user to exit IOCAP MAPCI level and to return to IOCAP higher MAPCI level (CAPACITY MAPCI level).

### 2.9.3.5 Command syntax

**Table 11** QUIT command parameters and variables

| Command | Parameters and variables |
|---------|--------------------------|
| QUIT    | none                     |

### 2.9.3.6 Qualifications and warnings

Not applicable.

### 2.9.3.7 Responses

### 2.9.3.8 Example

**Table 13** Usage examples for QUIT command

|                     |                                                                                       |
|---------------------|---------------------------------------------------------------------------------------|
| Description of task | Exit the IOCAP MAPCI level and return the user to CI level or one MAPCI level higher. |
| Command:            | Example: QUIT ALL                                                                     |
| MAP response:       | Example: >                                                                            |

## 2.9.4 Directory: IOCAPCI

### 2.9.4.1 Directory description

This new IOCAPCI is provided to allow customers to display the IO utilization history data.

## 2.9.4.2 Accessing directory: IOCAPCI

### 2.9.4.2.1 Access to directory or MAP level and return to CI

To access this directory type:

> IOCAPCI

To return to CI environment, type:

> QUIT

## 2.9.5 Command: IOMAX

### 2.9.5.1 Command type: NON-MENU

### 2.9.5.2 Command target: XA-Core only

### 2.9.5.3 Command availability: RES

### 2.9.5.4 Command description

This command displays the hourly high watermark value captured for each IO service type (CMIC, ETHR or AMDI). The value is captured every hour of day for the last 31 days. The data survives all types of restarts (warm, cold and reload).

The date of the month will be in sequence. For every hour in the future (there is no data collected yet), a blank character will be displayed.

### 2.9.5.5 Command syntax

The command syntax for this command is as follows.

```
> q iomax
Display IO high watermark report.
Parms: <service> {CMIC,
                  ETHR,
                  ATM,
                  ALL}
```

**Table 14 IOMAX command parameters and variables**

| Command                  | Parameters and variables                    |
|--------------------------|---------------------------------------------|
| IOMAX                    | service                                     |
| IOMAX                    | <Service> (CMIC, ETHR, AMDI, ALL)           |
| Parameters and variables | Description                                 |
| Service                  | Possible values are CMIC, ETHR, AMDI or ALL |
| CMIC                     | Displays only CMIC hourly max history data  |
| ETHR                     | Displays only ETHR hourly max history data  |

**Table 14 IOMAX command parameters and variables**

| Command | Parameters and variables                                       |
|---------|----------------------------------------------------------------|
| AMDI    | Displays only AMDI hourly max history data                     |
| All     | Displays all hourly.max history data for CMIC, ETHR, and AMDI. |

### 2.9.5.6 Qualifications and warnings

Not applicable.

### 2.9.5.7 Responses

#### 2.9.5.7.1 IOMAX response

The following is the response if IOMAX CMIC is issued.

**Table 15 MAP outputs with associated meanings and actions**

| Command                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IOMAX CMIC: history data of CMIC hourly maximum utilization are displayed.<br><b>Meaning:</b> CMIC hourly maximum history data are displayed.<br><b>System or user actions:</b> Not applicable.                                       |
| IOMAX ETHR: history data of ETHR hourly maximum utilization are displayed.<br><b>Meaning:</b> history data of ETHR hourly maximum utilization are displayed.<br><b>System or user actions:</b> Not applicable.                        |
| IOMAX AMDI: history data of AMDI hourly maximum utilization are displayed.<br><b>Meaning:</b> history data of AMDI hourly maximum utilization are displayed.<br><b>System or user actions:</b> Not applicable.                        |
| IOMAX ALL: history data of CMIC, ETHR, AMDI hourly maximum utilization are displayed.<br><b>Meaning:</b> history data of CMIC, ETHR, AMDI hourly maximum utilization are displayed.<br><b>System or user actions:</b> Not applicable. |

### 2.9.5.8 Example

**Table 16 Usage examples for IOMAX command**

|                     |                                                        |
|---------------------|--------------------------------------------------------|
| Description of task | Display the history data of IO hourly max utilization. |
|---------------------|--------------------------------------------------------|

## 2.9.6 Command: IOAVG

### 2.9.6.1 Command type: NON-MENU

### 2.9.6.2 Command target: XA-Core only

### 2.9.6.3 Command availability: RES

### 2.9.6.4 Command description

This command displays the hourly average value captured for each IO service type (CMIC, ETHR or AMDI). The value is captured every hour of day for the last 31 days. The data survives all types of restarts (warm, cold and reload).

The date of the month will be in sequence. For every hour in the future (there is no data collected yet), a blank character will be displayed.

### 2.9.6.5 Command syntax

The command syntax for this command is as follows.

```
> q ioavg
Display IO average report.
Parms: <service> {CMIC,
                  ETHR,
                  ATM,
```

ALL}

**Table 17 IOAVG command parameters and variables**

| Command                  | Parameters and variables                                           |
|--------------------------|--------------------------------------------------------------------|
| IOAVG                    | service                                                            |
| IOAVG                    | <Service> (CMIC, ETHR, AMDI, ALL)                                  |
| Parameters and variables | Description                                                        |
| Service                  | Possible values are CMIC, ETHR, AMDI or ALL                        |
| CMIC                     | Displays only CMIC hourly average history data                     |
| ETHR                     | Displays only ETHR hourly average history data                     |
| AMDI                     | Displays only AMDI hourly average history data                     |
| All                      | Displays all hourly average history data for CMIC, ETHR, and AMDI. |

**2.9.6.6 Qualifications and warnings**

Not applicable.

**2.9.6.7 Responses****2.9.6.7.1 IOAVG response**

The following is the response if IOAVG CMIC is issued.

**Table 18 MAP outputs with associated meanings and actions**

| Command                                                                        |
|--------------------------------------------------------------------------------|
| IOAVG CMIC: history data of CMIC hourly average utilization are displayed.     |
| <b>Meaning:</b> CMIC hourly average history data are displayed.                |
| <b>System or user actions:</b> Not applicable.                                 |
| IOAVG ETHR: history data of ETHR hourly average utilization are displayed.     |
| <b>Meaning:</b> history data of ETHR hourly average utilization are displayed. |
| <b>System or user actions:</b> Not applicable.                                 |
| IOAVG AMDI: history data of AMDI hourly average utilization are displayed.     |
| <b>Meaning:</b> history data of AMDI hourly average utilization are displayed. |
| <b>System or user actions:</b> Not applicable.                                 |

## 2.9.7 Command: DISP

### 2.9.7.1 Command type: NON-MENU

### 2.9.7.2 Command target: XA-Core only

### 2.9.7.3 Command availability: RES

### 2.9.7.4 Command description

This DISP command displays the utilization and messaging throughput values of each IO service type of the last 60 minutes with option CURR (for example, when a command is issued at 2:35, displayed data is from 1:34 to 2:34) or previous full hour with option PREV (for example when a command is issued at 2:35, displayed data is from 1:00 to 2:00). This information survives all types of restarts (warm, cold and reload).

### 2.9.7.5 Command syntax

The command syntax for this command is as follows.

```
> q disp
Display table of IO utilization.
Parms: <when> {CURR,
               PREV}
        <service> {CMIC,
                   ETHR,
                   ATM,
                   ALL}
```

**Table 20 DISP command parameters and variables**

| Command                  | Parameters and variables                                                                              |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| DISP                     | <when> <service>                                                                                      |
| DISP                     | <when> (CURR, PREV)                                                                                   |
|                          | <service> (CMIC, ETHR, AMDI, ALL)                                                                     |
| Parameters and variables | Description                                                                                           |
| When                     | Possible values are CURR or PREV                                                                      |
| CURR                     | Displays the last 60 minutes utilization and messaging throughput of the specified IO service type    |
| PREV                     | Displays the previous full hour utilization and messaging throughput of the specified IO service type |
| Service                  | Possible values are CMIC, ETHR, AMDI or ALL                                                           |
| CMIC                     | Displays only CMIC utilization and messaging throughput                                               |
| ETHR                     | Displays only ETHR utilization and messaging throughput                                               |
| AMDI                     | Displays only AMDI utilization and messaging throughput                                               |
| ALL                      | Displays utilization and messaging throughput for CMIC, ETHR, and AMDI.                               |

**2.9.7.6 Qualifications and warnings**

Not applicable.

**2.9.7.7 Responses****2.9.7.7.1 DISP response**

The following is the response if DISP CURR CMIC is issued.

**Table 21 MAP outputs with associated meanings and actions**

| Command                                                                                           |
|---------------------------------------------------------------------------------------------------|
| DISP CURR CMIC: last 60 minutes of CMIC utilization and messaging throughput are displayed.       |
| <b>Meaning:</b> last 60 minutes data for CMIC utilization and messaging throughput are displayed. |
| <b>System or user actions:</b> Not applicable.                                                    |
| DISP CURR ETHR: last 60 minutes of ETHR utilization and messaging throughput are displayed.       |
| <b>Meaning:</b> last 60 minutes of ETHR utilization and messaging throughput are displayed.       |
| <b>System or user actions:</b> Not applicable.                                                    |

**Table 21 MAP outputs with associated meanings and actions**

| Command                                                                                     |
|---------------------------------------------------------------------------------------------|
| DISP CURR AMDI: last 60 minutes of AMDI utilization and messaging throughput are displayed. |
| Meaning: last 60 minutes of AMDI utilization and messaging throughput are displayed.        |
| System or user actions: Not applicable.                                                     |
| DISP CURR ALL: last 60 minutes of CMIC, ETHR, AMDI utilization are displayed.               |
| Meaning: last 60 minutes of CMIC, ETHR, AMDI utilization are displayed.                     |
| System or user actions: Not applicable.                                                     |

### 2.9.7.8 Example

**Table 22 Usage examples for DISP command**

|                     |                                                                         |         |         |        |         |        |
|---------------------|-------------------------------------------------------------------------|---------|---------|--------|---------|--------|
| Description of task | Display the last 60 minutes of IO utilization and messaging throughput. |         |         |        |         |        |
| Command:            | Example: DISP CURR CMIC                                                 |         |         |        |         |        |
| MAP                 | Example:                                                                |         |         |        |         |        |
| response:           | Time                                                                    | IOUTIL% | TxMsg/s | TxSize | RxMsg/s | RxSize |
|                     | 16:17                                                                   | 45      | 23421   | 34     | 23421   | 34     |
|                     | 16:18                                                                   | 39      | 22119   | 31     | 21228   | 32     |
|                     | 16:19                                                                   | 38      | 21228   | 32     | 22119   | 31     |
|                     | 16:20                                                                   | 39      | 23421   | 31     | 21221   | 31     |
|                     | . . .                                                                   | . . .   | . . .   | . . .  | . . .   | . . .  |
|                     | 17:14                                                                   | 41      | 20023   | 32     | 20019   | 33     |
|                     | 17:15                                                                   | 39      | 21221   | 31     | 21228   | 32     |
|                     | 17:16                                                                   | 38      | 20019   | 33     | 23421   | 34     |
| Command:            | Example: DISP CURR ETHR                                                 |         |         |        |         |        |
| MAP                 | Example:                                                                |         |         |        |         |        |
| response:           | Time                                                                    | IOUTIL% | TxMsg/s | TxSize | RxMsg/s | RxSize |
|                     | 16:17                                                                   | 45      | 23421   | 34     | 23421   | 34     |
|                     | 16:18                                                                   | 39      | 22119   | 31     | 21228   | 32     |
|                     | 16:19                                                                   | 38      | 21228   | 32     | 22119   | 31     |
|                     | 16:20                                                                   | 39      | 23421   | 31     | 21221   | 31     |
|                     | . . .                                                                   | . . .   | . . .   | . . .  | . . .   | . . .  |
|                     | 17:14                                                                   | 41      | 20023   | 32     | 20019   | 33     |
|                     | 17:15                                                                   | 39      | 21221   | 31     | 21228   | 32     |
|                     | 17:16                                                                   | 38      | 20019   | 33     | 23421   | 34     |
| Command:            | Example: DISP CURR AMDI                                                 |         |         |        |         |        |
| MAP                 | Example:                                                                |         |         |        |         |        |
| response:           | Time                                                                    | IOUTIL% | TxMsg/s | TxSize | RxMsg/s | RxSize |
|                     | 16:17                                                                   | 45      | 23421   | 34     | 23421   | 34     |

|           | 17:15                  | 39       | 21       | 31       |
|           | 17:16                  | 38       | 19       | 33       |

## 2.9.8 Command: STATUS

### 2.9.8.1 Command type: NON-MENU

### 2.9.8.2 Command target: XA-Core only

### 2.9.8.3 Command availability: RES

### 2.9.8.4 Command description

This command displays all status information including current version of IOCAPCI tool, timestamp in terms of hour and minute, the current IO utilization values of all IO services (CMIC, ETHR, AMDI), the current value of the IO\_WARNING\_THRESHOLD office parm.

### 2.9.8.5 Command syntax

The command syntax for this command is as follows.

```
> q STATUS
Display current IOCAP status.
```

**Table 23 STATUS command parameters and variables**

| Command | Parameters and variables |
|---------|--------------------------|
| STATUS  | no parameter             |

### 2.9.8.6 Qualifications and warnings

Not applicable.

### 2.9.8.7 Responses

#### 2.9.8.7.1 STATUS response

The following is the response if STATUS is issued.

**Table 24** MAP outputs with associated meanings and actions

| Command                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------|
| STATUS: Status information such as IOCAPCI version, current utilizations and IO_WARNING_THRESHOLD office parm are displayed.         |
| <b>Meaning:</b> Status information such as IOCAPCI version, current utilizations and IO_WARNING_THRESHOLD office parm are displayed. |
| <b>System or user actions:</b> Not applicable.                                                                                       |

### 2.9.8.8 Example

**Table 25** Usage examples for STATUS command

|                     |                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description of task | Display status information such as IOCAPCI version, current utilizations and IO_WARNING_THRESHOLD office parm.                                              |
| Command:            | Example: DISP CURR CMIC                                                                                                                                     |
| MAP                 | Example:                                                                                                                                                    |
| response:           | <pre>&gt; status IOCAP Version 1.0 Time    CMICUTIL  ETHRUTIL  AMDIUTIL 17:16      32      29      15 IO_WARNING_THRESHOLD office parm is set to 100.</pre> |

## 2.10 Security

Not applicable.

### 2.10.1 Network configuration

Not applicable.

### 2.10.2 Key management

Not applicable.

### 2.10.3 Protocol

Not applicable.

### 2.10.4 Authentication

Not applicable.

## 2.11 Configuration Walkthrough

Not applicable.

## 3: Performance for A00006693

## 3.1 Performance management strategy

## 3.2 Performance management tools and utilities

The new OM group can be displayed and collected via OMSHOW interface regularly by Telcos to monitor system IO throughput.

## 3.3 Performance Measurements (PM), Operational Measurements (OM), and stats

This feature will provide a new OM group IOCAP.

### 3.3.1 PM, OM, and stats format

#### 3.3.2 OM Group template (applies only to DMS)

New OM group IOCAP provides information on IO capacity such as utilization and utilization high watermark and IO throughput information on a per IO service type (CMIC, ETHR and AMDI).

##### 3.3.2.1 OM description

OM group IOCAP provides one tuple per IO service type available in the office. Possible IO service types are CMIC, ETHR and AMDI.

Key field: IO\_SERVICE.

Info field: none.

##### 3.3.2.2 Release history update

The OM group is being created in CSP21 and will be patched backed to CSP20.

##### 3.3.2.3 Registers

OM group registers display on the MAP terminal as follows:

**Figure 1 OM Group Display**

|            |          |       |         |        |         |
|------------|----------|-------|---------|--------|---------|
| IO_SERVICE | IOUTIL   | IOHWM | TXMSGPS | TXSIZE | RXMSGPS |
| RXSIZE     | IOTHRESH |       |         |        |         |

##### 3.3.2.4 Group structure

OM group provides one tuple for each IO service type. There are 3 possible IO service types (CMIC, ETHR, AMDI).

Key field: IO\_SERVICE indicates the IO service type the information is captured. Possible IO service types are CMIC, ETHR, and AMDI. The service type is displayed as a 4 character string (CMIC, ETHR, AMDI).

Info field: None.

#### **3.3.2.5 Associated OM groups**

Not applicable.

#### **3.3.2.6 Associated functional groups**

The following functional groups are associated with OM group: none

#### **3.3.2.7 OM group registers logic flow chart**

Not applicable.

### **3.3.3 Register (applies only to DMS)**

IOHWM

#### **3.3.3.1 Register description**

IOHWM is a high watermark register holding the highest utilization value of the specified IO service type over the OM transfer period.

#### **3.3.3.2 Register release history update**

The register is being created in CSP21 and patched back to CSP20.

#### **3.3.3.3 Associated registers**

None.

#### **3.3.3.4 Associated logs**

None.

### **3.3.4 Register (applies only to DMS)**

IOTHRESH

#### **3.3.4.1 Register description**

IOTHRESH is a peg register holding the number of one minute intervals in the transfer period the IO utilization has exceeded the value of the IO\_WARNING\_THRESHOLD office parm.

#### **3.3.4.2 Register release history update**

The register is being created in CSP21 and patched back to CSP20.

#### **3.3.4.3 Associated registers**

None.

#### **3.3.4.4 Associated logs**

None.

### **3.3.5 Register (applies only to DMS)**

IOUTIL

**3.3.5.1 Register description**

IOUTIL is a usage register holding the average utilization value of the specified IO service type. This value is accumulated every minute and the average is calculated for every OM transfer period.

**3.3.5.2 Register release history update**

The register is being created in CSP21 and patched back to CSP20.

**3.3.5.3 Associated registers**

None.

**3.3.5.4 Associated logs**

None.

**3.3.6 Register (applies only to DMS)**

RXMSGPS

**3.3.6.1 Register description**

RXMSGPS is a usage register holding the average total system number of received messages of the specified IO service type. This value is accumulated every minute and the average is calculated for every OM transfer period. The unit is the number of messages per second.

**3.3.6.2 Register release history update**

The register is being created in CSP21 and patched back to CSP20.

**3.3.6.3 Associated registers**

None.

**3.3.6.4 Associated logs**

None.

**3.3.7 Register (applies only to DMS)**

RXSIZE

**3.3.7.1 Register description**

RXSIZE is a usage register holding the average incoming message size of the specified IO service type. This value is accumulated every minute and the average is calculated for every OM transfer period. The message size unit is in bytes.

**3.3.7.2 Register release history update**

The register is being created in CSP21 and patched back to CSP20.

**3.3.7.3 Associated registers**

None.

**3.3.7.4 Associated logs**

None.

**3.3.8 Register (applies only to DMS)**

TXMSGPS

**3.3.8.1 Register description**

TXMSGPS is a usage register holding the average total number of outgoing messages of the specified IO service type. This value is accumulated once every minute and the average is calculated for every OM transfer period. The unit is in number of messages per second.

**3.3.8.2 Register release history update**

The register is being created in CSP21 and patched back to CSP20.

**3.3.8.3 Associated registers**

None.

**3.3.8.4 Associated logs**

None.

**3.3.9 Register (applies only to DMS)**

TXSIZE

**3.3.9.1 Register description**

TXSIZE is a usage register holding the value of average size of outgoing messages of the specified IO service type. This value is accumulated once every minute and the average is calculated for every transfer period. The value unit is in bytes.

**3.3.9.2 Register release history update**

The register is being created in CSP21 and patched back to CSP20.

**3.3.9.3 Associated registers**

None.

**3.3.9.4 Associated logs**

None.

# SN08 Feature Deltas

***Product = CS 2000***

## **A00006731--Handle Flash on Exit**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

DMS

#### **1.2 Description**

On TMX100 switches, hook flash is only enabled on those RES lines that have flash features assigned. Most customers do not use flash features. RES customers without hook flash features who flash are treated as exiting the current call and receive standard dial tone allowing them to initiate a new call.

When TMX100 sites migrate to ISN04 or later, customers are converted from RES to IBN line functionality and by default have hook flash enabled and will get second dial tone if they Flash (go on/off hook) instead of Exit. This difference in behavior is causing confusion and customer complaints at the Coteor site in Bolivia, the first local exchange migrating from TMX100 to ISN04. Similar complaints are expected when other sites convert (100-150 sites).

The purpose of the Exit on Flash (EOF) option is to resolve these customer complaints and to provide for a more seamless migration from TMX100 to ISN04.

Customer requirement of this activity is to develop a new line option that treats Flash as EXIT for IBN lines.

#### **Without EOF:**

A Calls B

B Answers

A Flashes  
A gets Special Dial Tone  
A Calls C  
A Receives Feature Not Allowed (FNAL) treatment

**With EOF:**

A has EOF option  
A Calls B  
B Answers  
A Flashes  
A and B Disconnect  
A gets Dial Tone  
A calls C  
A to C call is established

This feature uses line option datafill. The advantages of offering this as a line option are:

- consistency with the current FIG (Flash Ignore) option
- ability to define option compatibilities using OPTOPT table

### 1.3 Hardware Requirements or Dependencies

There is no hardware dependency. The option can be added to any line with an LCC of IBN.

### 1.4 Software Requirements or Dependencies

None.

### 1.5 Limitations and restrictions

EOF feature is only applicable to IBN lines in NA and WT.

EOF feature is not compatible with the following options:

CHD, CNF, CWI, CWX, CWT, CXR, FXR, DCBX, HLD, LDSA, LDSO, LDSR, LDST, LNPTST, MPB, PCWT, PRK, 3WC, 3WCPUB, VOWDN.

### 1.6 Interactions

CWO and CWD compatible with EOF feature. If another agent imposes CWT on an agent with EOF, this agent still has the ability to flash to the waiting call and maintain the original call.

A has EOF option

A Calls B

B Answers

C with CWO/CWD calls A and imposes CWT on A

A Flashes

A to C call established while B is on hold

A flashes again and A to B call established while C is on hold

## 2: Configuration for A00006731

### 2.1 Hardware and Software Requirements

There is no hardware or software dependencies.

### 2.2 Upgrade Impact

No impact on upgrades.

## 2.3 Data schema (DS) (CM, MIBS, RDB)

### 2.3.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| IBNLINES       | changed                  | unchanged                          |

### 2.3.2 Table/MIB/Remote Database Schema information

#### 2.3.2.1 Name: IBNLINES

IBN Line Assignment Table

##### 2.3.2.1.1 Functional description

Table IBNLINES contains the line assignments for each 500/2500 set assigned to an Integrated Business Network (IBN), Residential Enhanced Services (RES), and Multiple Appearance Directory Number (MADN) station number. This table also contains the line assignments for the IBN attendant consoles (AC).

##### 2.3.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

##### 2.3.2.1.3 Size

Unchanged.

##### 2.3.2.1.4 Fields/OIDs

The following table lists fields/OIDs for IBNLINES.

Table 2 Table field descriptions

| Field  | New or Changed | Subfield or refinement | Entry | Explanation and action                                                                        |
|--------|----------------|------------------------|-------|-----------------------------------------------------------------------------------------------|
| RESULT | Changed        | OPTLIST                | EOF   | Option List. Added EOF to OPTLIST as another line option. Enter EOF for Exit On Flash option. |

### 2.3.2.1.5 Datafill example

The following example shows sample datafill for table IBNLINES.

```
>table ibnlines
>list
LEN  DNNO  RESULT
-----
HOST 00 0 00 01 0 DT STN IBN 6210201 350 819_P621_2 L819_NILLA_2 819 (EOF) $
```

### 2.3.2.1.6 Table release history update

ISN08 - Feature (A00006731) Handle Flash on Exit adds new OPTLIST option EOF.

## 2.4 Service Orders (SO) (CM & SESM)

### 2.4.1 Service order change details

#### 2.4.1.1 LCC and options

New line option, EOF, can only be assigned to LCC of IBN.

Option EOF is not compatible with the following options and features:

CHD, CNF, CWI, CWX, CWT, CXR, FXR, DCBX, HLD, LDSA, LDSO, LDSR, LDST, LNPTST, MPB, PCWT, PRK, 3WC, 3WC PUB, VOWDN.

### 2.4.2 New commands

#### 2.4.2.1 How service order options are presented

##### 2.4.2.1.1 Description

The EOF option enables the subscriber on the assigned line to exit on flash.

### 2.4.2.1.2 Example

**Figure 1 Example of the EOF option in prompt mode**

```

SERVORD
SO:
>ado
SONUMBER:      NOW    4    1 14 PM
>
DN_OR_LEN:
>6137220110
OPTION:
>eof
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 4 1 14 PM 6137220110 ( EOF ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>Y
MACHINES ARE OUT OF SYNC, SERVICE ORDERS NOT ALLOWED
JOURNAL FILE IS INACTIVE, SERVICE ORDERS NOT ALLOWED
SHOULD ORDER BE DONE ANYWAY? (Y OR N)
>Y

```

**Figure 2 Example of the EOF option in no-prompt mode**

```

SERVORD
SO:
>ado $ 6137220110 eof $ Y Y

```

### 2.4.2.1.3 Option prompts

**Table 3 System prompts for EOF option**

| Prompt | Valid input | Description                           | Areas affected by prompt |
|--------|-------------|---------------------------------------|--------------------------|
| OPTION | EOF         | Assigns Exit On Flash feature to line | None                     |

### 2.4.2.1.4 Line class code compatibility

**Table 4 EOF compatibility to LCC**

| Line class code | Compatible? |
|-----------------|-------------|
| IBN             | Yes         |

### 2.4.2.1.5 Option prerequisites

EOF has no prerequisites

**2.4.2.1.6 Notes**

None.

**2.4.2.1.7 Feature identification**

Feature number: A00006731

***Product = CS 2000***

**A00006780--Trimodal Call Server OAM&P Enhancements*****Functional Description*****1.1 Applicable Solution(s)**

UA-IP, IAW, CHS

**1.2 Description**

Trimodal Call Server is a Nortel Networks Call Server which supports all the following three Bearer Network Fabric types: ATM, IP and TDM. It is a solution being provided by Nortel Networks to its customers who want to:

- Make a smooth transition from VoATM Carriers to a VoIP network solution.
- Move into the IP Space, leveraging the already existing ATM equipment at their premises.

This activity is in continuation of the Enhancements done in SN07 under the following ACTIDs:

- A00003487: Tri Modal Provisioning
- A00003947: Tri Modal Logs and OMs

The SN08 Trimodal Enhancements include:

- OAMP Enhancements
  - TRK2NET2 and TRK2NET1 OM tuple allocation enhancement.
  - Enhancements to include Bearer Network information on (a) SPM PM, Carrier and Perfmon MAPs (b) ABI XPM MAPs (c) GWC MAP (d) TTP, LTP MAPs and (e) DPT MAPs.
  - Enhancements to the Servord Query Commands QDN, QLEN, QLENWRK, QDNWRK, QHASU, QGRP, QLT and QCUST command outputs to include Bearer Network Information.

- When a tuple is added in table NETBRDGE, a Bridge Pool without members is allocated.
- Introduce restriction in the table NETBRDGE to the DISPLAY field contains unique and non-null values, as these values are used in the MAP display and query command enhancements.
- New table OFCVAR parameter OSS\_PROV\_VERSION is added to enable/disable the Servord Query Command enhancements.
- Tool QOSSVER is introduced to print out the list of activity IDs of features delivered in various loads which have OSS impact.

### 1.2.1 OMs Enhancement

TRK2NET2 and TRK2NET1 OM tuples are allocated for all bearer networks provisioned in table BEARNETS, for each Trunk Group datafilled in table TRKGRP i.e. even if there are no Trunk Members against the Trunk Group in a bearer network.

Details are captured in the Performance Management Document for the feature.

### 1.2.2 MAP Enhancements

The following MAP enhancements are implemented as a part of this feature.

- Posting of nodes on a Bearer Network basis
- Refining the trunk post set based on the bearer network
- Display of Bearer Network Information on (a) SPM PM, Carrier and Perfmon MAP displays, (b) ABI XPM MAP displays as a part of QUERYPM MENU command, (c) GWC MAP display as a part of QUERYPM MENU command (d) TTP CktInfo MENU command, (e) LTP MAP displays and (f) DPT MAP displays.
  - The value displayed in new display field “Bear” is picked up from the DISPLAY field of the table BEARNETS tuple corresponding to the Bearer Network.
  - The value displayed in new display field “Netbrdge” is picked up from the DISPLAY field of the table NETBRDGE tuple corresponding to the Bridge Pool CLLI of the Bridge Pool to which an IW SPM belongs.

#### Notes:

- Refresh of the MAP displays of a currently posted PM or Line does not automatically update when table BEARNETS or NETBRDGE is changed. Reposting the PM or line reflects the change.

### 1.2.2.1 PM MAP level enhancements

The enhancements at the MAPCI;MTC;PM level enable the user to do the following:

- To display all PMs associated with a bearer network. This is applicable to all packet node types including SPMs, GWCs and ABI hosted XPMs which are currently maintained from PM MAP level.
- To post SPM type nodes based on the associated bearer network and the SPM node class. The valid SPM node classes for this command are SMG4 and DPT.

**Note:** All enhancements/additions are displayed in **BOLD** in figures.

#### Enhancements to post command:

The following figure shows the enhancements to the post command at the PM level.

- The new option <BN> allows the query by bearer network datafilled in DISPLAY field of the table BEARNETS tuple for a bearer network.

**Note 1:** The Parms <PM Type> and the Parm <PM BEARNETS> cannot be used together.

**Note 2:** For the user inputs and the MAP responses please refer the Configuration Document for the feature (CN Document). For more information see “User interface changes” on page 92.

**Note 3:** The Bearer Networks displayed in the Parameter list for new option <BN> does not include Bearer Network for fabric=ENET.

**Figure 3 POST command with the new parameters**

```
Post:Post specified PMs for maintenance
Parms: [<All PMs> {AllPMs}]
      [<PM Type>... {TM2 [<All> {All}]}
      ....
      [<PM State>... {SysB,
      ....
      InSv}]
      [<PM Alarm>... {Minor,
      Major,
      Crit}]
      [<BN> {A1_P [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]}}]
      A1_S [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]}}],
      IP_P [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]}}],
      IP_S [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]}}]}}
```

#### QUERYPM command for ABI XPMs:

The querypm command for on posting a ABI XPM from the MAPCI;MTC;PM level is enhanced to display the bearer network of the GWC from where it subtends.

This enhancement is for PMs datafilled in the following tables: LTCINV, LTCRINV, RCCINV, LCMINV, RDTINV, LGRPINV, SERVINV (except DPT GWCs) and RMMINV. Also the QueryPM command of ESA nodes has been enhanced to display Bearer Network information.

E.g., Datafill from Table LTCINV for an ABI hosted XPM:

```
SMA2 4 62 MVDD 1 57 21 R 21 MX85AB XM220CE (POTS POTSEX) (KEYSET KSETEX)
$ (4 16) (4 17) (4 18) (4 19) $ (UTR6 ) (MSGMX76 HOST ) (ISP 4) $
NORTHAA AX74AA AX74AA 0 NILLOAD ( EXTDS512 HOST ABI 5 ) $ 6X40FB N
```

**1.2.2.2 Enhancements to SPM MAP display (mapci;mtc;pm;post spm <spm no>)****Enhancements to Non-Menu POSTCLS command:**

To post SPM type nodes based on the SPM node class. In case of IW SPM (Bridge \_only Type), nodes are posted based on their associated bridge pool.

The following figure shows the enhancements to the post command at the PM level.

- Enhancements to the existing command POSTCLS.
  - To Post the IW DPT SPMs
  - To POST IW SPMs associated with a specific Bridge Pool CLLI. Parameters which are passed to POSTCLS command are linked to the values datafilled in DISPLAY field of table NETBRDGE tuples.

**Note:** For the user inputs and the MAP responses please refer the Configuration Document for the feature (CN Document). For more information see “User interface changes” on page 92.

**Figure 14 POSTCLS command Enhancements**

### 1.2.2.3 Enhancements to CARRIER MAP display

The CARRIER level of MAPCI is enhanced for SPM PMs to display the SPM node type and the Bearer Network or Network Bridge Information as appropriate.

In the case of DMSCP, SMG4 and IW DPT node types, the additional information displayed is the SPM node class type and the value datafilled in DISPLAY field of the table BEARNETS tuple corresponding to the Bearer Network associated with the node.

In the case of Bridge Only IW nodes, the additional information displayed is the SPM node class type and the value datafilled in DISPLAY field of the table NETBRDGE corresponding to the bridge pool CLI with which the IW SPM is associated.

**Carrier MAP Display for IW bridge only SPM node:**

Below is the carrier level map display of a IW bridge only SPM node. The Class of the SPM Node and the value datafilled in DISPLAY field of table NETBRDGE tuple corresponding to the Bridge Pool CLLI with which the SPM node is associated, are displayed in the new fields 'Type' and 'Netbridge'.

**Figure 23 Carrier MAP display for IW Bridge only SPM**

**1.2.2.4 Enhancements to CARRIER PERFMON MAP display**

The CARRIER/PERFMON level of the MAP is enhanced for SPM PMs to display the SPM node type and the Bearer Network or Network Bridge Information as appropriate.

In the case of DMSCP, SMG4 and IW DPT node types, the additional information displayed is the SPM node class type and the value datafilled in the DISPLAY field of the table BEARNETS tuple corresponding to the Bearer Network associated with the node.

In the case of IW Bridge nodes, the additional information displayed is the SPM node type and the value datafilled in the DISPLAY field in table NETBRDGE corresponding to the Bridge Pool CLLI with which the node is associated.

**Figure 25 MAP display for DMSCP/SMG4/DPT node**

### 1.2.2.7 Enhancements to TTP MAP level

The Enhancements to the MAPCI;MTC;TRKS;TTP level to be able to post trunk members associated with a bearer network, within a existing POST set. After a post set has been created using any of the existing POST commands, the post-set can be refined to POST the trunk members of a particular bearer network. The parameter range BEARNETS\_DISPLAY for parameter passed to POST command for new Option BN, is the values datafilled in DISPLAY field of table BEARNETS tuples. Refer to Figure 26 below.

The CktInfo command at MAPCI;MTC;TRKS;TTP level is enhanced to display Bearer network as shown in Figure 27 below.

**Figure 28 POST command with new parameters**

```

POST-- POST A NEW SET
Parms: [<SET TYPE> {T [<CLLI1> STRING
                    [<CNRI1> {0 TO 9999}}]
                    [<....> STRING],
      G <CLLI> STRING
        [<CLNR> {0 TO 9999}}]
        [<TO> {TO}}]
      ....
      WB <CLLI> STRING
        <CKTN> {0 TO 9999}},
      BN [<ENET> STRING]
        [<A1_P> STRING]
        [<A1_S> STRING]
        [<IP_P> STRING]
        [<IP_S> STRING]]]

```

**Figure 29 TTP level MAP display**

```

Ckt Bearer net : A1_P

```

### 1.2.3 Enhancements to LTP MAP display

The MAP screen displayed on accessing the MAPCI;MTC;LNS;LTP level is enhanced to display the bearer network of the posted line.

**Figure 30 LTP level MAP display**

| XAC       | MS   | IOD                 | Net  | PM    | CCS                 | Lns  | Trks             | Ext    | APPL  |

## 1.2.4 Line Query Command Enhancements

### 1.2.4.1 Overview

Enhanced output of Line Query commands QDN, QLEN, QDNWRK, QLENWRK, QHASU, QGRP and QCUST to display Bearer Network Information associated with a subscriber line.

- Bearer Network Information for a subscriber line is added to the command outputs for CI commands QDN, QLEN, QDNWRK, QLENWRK, QHASU, QGRP, QLT and QCUST.
- In case of CI commands QLENWRK, QDNWRK and QHASU, the query run on a range of lines can be restricted to a Bearer Network.

No Servord Commands are being enhanced.

Details are captured in the Configuration Document for the feature.

### 1.2.5 New table OFCVAR Parm OSS\_PROV\_VERSION

A new table OFCVAR Parm OSS\_PROV\_VERSION has been introduced. The value of this Parm can be used as an ON/OFF feature switch control mechanism for features delivered on the Nortel Succession XA\_CORE which impact the OSS interface. This is so that these kind of features are turned

ON/OFF on the switch using this OFCVAR Parm, only when OSS software for switch is upgraded to accommodate the feature code changes.

Details are provided in the User Interface Section of Configuration Document for the feature.

### 1.2.6 New CI Tool QOSSVER

A new CI tool, QOSSVER, is made available to user on the Nortel Succession XA-CORE. This tool lists the feature ACTIDs of features delivered in an XA-CORE software load which have an impact on the OSS interface and which make use of the table OFCVAR Parm OSS\_PROV\_VERSION control mechanism described above. Feature ACTIDs which do not use this mechanism will not be listed.

Details about the new tool are provided in the User Interface Section of Configuration Document for the feature.

### 1.2.7 Tables MNNODE, BEARNETS and NETBRIDGE Table Control Response Messages

There are some changes to the Response messages to Users for table control operations performed on tables MNNODE, BEARNETS, NETBRIDGE.

Changes are listed in User Interface Section of Configuration Document for feature.

## 1.3 Hardware Requirements or Dependencies

All variants of bearer networks and SPMs to be data filled in the lab.

## 1.4 Software Requirements or Dependencies

Succession release SN08 software load lineup.

## 1.5 Limitations and restrictions

In SN08, if number of OM Tuples belonging to OM Groups TRK2NET2 or TRK2NET1 exceeds 16,000 during the OM Tuple creation:

No more OM tuples will be created and the following Warnings are displayed to the user:

- **While adding tuple in table TRKGRP**

“Warning: Maximum number of allowed TRK2NET2 and TRK2NET1 OM tuples has been exceeded.

Require 4 tuples

Only 3 tuples are available

The OM tuples for TRK2NET1 and TRK2NET2 could not be allocated and this

OM data will not collected for any bearer network for the newly added trunk group when MULTINET\_DISPLAY\_ACTIVE is on”

- **While adding tuple in table BEARNETS**

“Warning: Maximum number of allowed TRK2NET2 and TRK2NET1 OM tuples has been exceeded.

Require 5000 tuples

Only 1000 tuples are available

The OM tuples for TRK2NET1 and TRK2NET2 could not be allocated and this

OM data will not be collected for trunk groups using this new Bearer Network when MULTINET\_DISPLAY\_ACTIVE is on”

- **All SN07 limitations and restrictions as documented in A00003487 are inherited by this activity, unless specifically noted otherwise.**

## 1.6 Interactions

Not Applicable.

## 1.7 Glossary

| Term  | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| ABI   | Access Bridge Interface                                                                                                             |
| APG   | Anchor Packet Gateway                                                                                                               |
| CDIS  | Call Discrimination Service. This is a service provided by the Broadcom DSP that differentiates normal voice calls from VBD or Fax. |

## 2: Configuration for A00006780

### 2.1 Hardware and Software Requirements

This functionality requires release SN08 or higher loads on the call server<sup>1</sup>

### 2.2 Initial Configuration

### 2.3 Office/Subnet parameters (OP/SP) (CM & SESM)

#### 2.3.1 OSS\_PROV\_VERSION (New Parameter in table OFCVAR)

A new parameter OSS\_PROV\_VERSION is being added in table OFCVAR in SN07. This Parameter's value can be used by Features delivered on Core, which have an OSS Impact, to keep the feature functionality Switched ON/OFF on Switch Core till the time OSS software is upgraded to be in sync with feature code changes.

---

1. Call Server in the Succession network.

Currently the Line Query Command enhancements (Described in Section 12.9.1 of this document) being done as part of this feature, is being controlled using this table OFCVAR Parm.

#### Example of an OSS\_PROV\_VERSION tuple in OFCVAR:

```

.....
.....
OSR_FOR_IMT                      N
OSR_FOR_ISUP                     N
OSS_PROV_VERSION               SN07
OVL_P_ID_TIME                    3
.....
.....

```

##### 2.3.1.0.1 Default value

Default value for OSS\_PROV\_VERSION is SN07.

For this feature, by default the code for the Line Query command enhancements listed under Section 12.9 of this document stays inert on the Trimodal Call Server. (The code stays inert if OSS\_PROV\_VERSION has a value of SN07)

This ensures that user needs to explicitly change the value from SN07 to any other value in permitted range of values, to get access to functionality provided by feature code which enhances Line Query Commands.

In the process, the Warning messages the user gets will ensure that the new functionality is enabled, only after upgrading the OSS software for switch.

##### 2.3.1.0.2 Permitted range of values for new OFCVAR parameter

```

>cha
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
PARMVAL: SN07
>SN02
PARM VALUE IS WRONG TYPE
TYPE IS OSS_VERSION MULTIPLE WITH
      VER      {SN07,SN08,SN09,SN10,SN11,SN12,SN13,SN14,SN15,SN16,SN17}
TUPLE TO BE CHANGED:
      OSS_PROV_VERSION                      SN02
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

### 2.3.1.0.3 Meaning of OSS\_PROV\_VERSION in SN08

ACT.A00006780(SN08 Trimodal OAMP Enhancements) uses the Office Parm OSS\_PROV\_VERSION.

- **OSS\_PROV\_VERSION = 'SN07'**

Default value of SN07, means that the functionality provided by Line Query Command enhancements made under feature and described in Section 12.9 of this document is disabled

- **OSS\_PROV\_VERSION is anything greater than 'SN07' in permitted range**

If the Parameter has a any permitted value other than SN07 i.e. greater than SN07, then it means that the functionality provided by Line Query Command enhancements made under feature and described in Section 12.9 of this document is enabled.

User needs to ensure before setting value of parameter to anything permitted other than SN07, that the OSS software for switch is upgraded to be in sync with the Line Query Commands enhancements described in Section 12.9 of this document. User receives a Warning message to the same effect before he changes value from SN07 to any other permitted value.

### 2.3.1.0.4 Warning/Error Messages

- **If user enters a value outside of permitted range**

Change shall fail and user will get an error message as shown below. Also, user will be prompted to enter correct value with a Yes/No Prompt:

```
>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
PARMVAL: SN08
>sn60
PARM VALUE IS WRONG TYPE
TYPE IS OSS_VERSION MULTIPLE WITH
VER
{SN07, SN08, SN09, SN10, SN11, SN12, SN13, SN14, SN15, SN16, SN17}
TUPLE TO BE CHANGED:
                OSS_PROV_VERSION                SN60
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
```

- **If user tries to change parameter value from default value of SN07 to any other value within permitted range i.e. greater than SN07 but a permitted value:**

Change shall pass. User would get following Warning message, just before the Yes/No Prompt:

```
>pos OSS_PROV_VERSION
                                OSS_PROV_VERSION          SN07

>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
PARMVAL: SN07
>sn08
Changing from a lower to a higher version.
Check if the OSS Software has been upgraded to support
all OSS impacting feature enhancements contained
in the load corresponding to higher version.
Use QOSSVER tool to get list of OSS impacting features
in various loads.
TUPLE TO BE CHANGED:
                                OSS_PROV_VERSION          SN08
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
```

- **If user tries to change parameter value from default value of SN07 to any other value within permitted range i.e. greater than SN07 but a value which is also greater than the current running load (SN08):**

Change shall fail. User would get following Warning messages, just before

the

Yes/No Prompt:

```
>pos OSS_PROV_VERSION
                                OSS_PROV_VERSION          SN07

>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
PARMVAL: SN07
>sn09
ERROR: HIGHEST RELEASE ACTIVATED BY THIS PARM IS SN08
TUPLE TO BE CHANGED:
                                OSS_PROV_VERSION          SN09
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
ERROR: HIGHEST RELEASE ACTIVATED BY THIS PARM IS SN08
```

```

DATA CONSISTENCY ERROR
UNEXPECTED ERROR CONDITION
TUPLE TO BE CHANGED:
                                OSS_PROV_VERSION          SN09
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

- **If user tries to change the value from any valid value back to SN07, which is default value:**

Change shall pass. User will get a Warning message which is shown below, just before the Yes/No Prompt:

```

>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
PARMVAL: SN08
>sn07
Changing from a higher to a lower version.
Some OSS impacting feature enhancements in
the load corresponding to higher version will stop
working after the change.
Check if the OSS Software needs to be downgraded
Use QOSSVER tool to get list of OSS impacting
features in various loads.
TUPLE TO BE CHANGED:
                                OSS_PROV_VERSION          SN08
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

## 2.4 Upgrade Considerations

### 2.4.0.1 OM Groups TRK2NET1 and TRK2NET2

In the event that the maximum numbers of OM tuples for OM groups TRK2NET1 and TRK2NET2 has been exceeded on the dump side, or will be exceeded on the restore side due to the tuple allocation enhancement provided by this feature, the tuples which are allocated are likely to be different between the two sides, due to the order in which they were allocated. On the ONP, the affected tables will restore in the order: BEARNETS, TRKGRP, OMKEYORD.

The OM tuples for TRK2NET1 and TRK2NET2 in table OMKEYORD are not transferred during the ONP since they are recreated by the transfer of tables BEARNETS and TRKGRP.

### 2.4.0.2 DISPLAY field of Tables BEARNETS and NETBRDGE

In SN08, the DISPLAY field of tables BEARNETS and NETBRDGE are required to be non-empty and unique for each Bearer Network (Table

BEARNETS) and each Network Bridge CLI(NETBRDGE). Due to enforcement of these criteria, if these fields were not provisioned accordingly in the DUMP side datafill, a warning will be provided indicating that these values should be changed in the SN08 datafill to conform. The warning message will be recorded in the standard TRACE file on XACORE during the execution of TABXFR. Refer to section 12.8.8 for further details.

## 2.5 Data schema (DS) (CM, MIBS, RDB)

Not Applicable.

## 2.6 Service Orders (SO)

Not Applicable.

### 2.9.1.1 QDN Command

#### 2.9.1.1.1 Description

Line Query command QDN is used to display information about a Directory Number (DN).

Command is enhanced to display Bearer Network Information as part of the Command Output.

A new field **BEARERNET** is added to the Command Output.

The information printed in the BEARERNET FIELD is in the following format:-

**BEARERNET: <FABRIC> <DISPLAY>**

where,

- **DISPLAY:** Value datafilled in DISPLAY field of the table BEARNETS tuple, corresponding to the Bearer Network to which the DN belongs.
- **FABRIC:** Value datafilled in FABRIC field of the table BEARNETS tuple, corresponding to the Fabric of the Bearer Network to which the DN belongs.

**Examples (Refer to the “Sample BEARNETS table datafill” on page 850):**

**Figure 2 Enhanced QDN command output for a DN**

```

## 2.9.1.2 QLT Command

### 2.9.1.2.1 Description

Line Query command QLT is used to display information about a Logical Terminal ID(LTID).

Command is enhanced to display Bearer Network Information as part of the Command Output, if LTID is mapped to a LEN in table LTMAP.

A new field **BEARERNET** is added to the Command Output.

The information printed in the BEARER NET FIELD is in the following format:-

**BEARER NET: <FABRIC> <DISPLAY>**

where,

- **DISPLAY:** Value datafilled in DISPLAY field of the table BEARNETS tuple, corresponding to the Bearer Network to which the DN belongs.
- **FABRIC:** Value datafilled in FABRIC field of the table BEARNETS tuple, corresponding to the Fabric of the Bearer Network to which the DN belongs.

**Examples (Refer to the “Sample BEARNETS table datafill” on page 850):**

**Figure 3 Enhanced QLT command output for a LTID**

### 2.9.1.3 QLEN Command

#### 2.9.1.3.1 Description

Line Query command QLEN is used to display information about a Line Equipment Number (LEN).

Command is enhanced to display Bearer Network Information as part of the Command Output.

A new field **BEARERNET** is added to the Command Output.

The information printed in the BEARERNET FIELD is in the following format:-

**BEARERNET: <FABRIC> <DISPLAY>**

where,

- **DISPLAY:** Value datafilled in DISPLAY field of the table BEARNETS tuple, corresponding to the Bearer Network to which the LEN belongs.
- **FABRIC:** Value datafilled in FABRIC field of the table BEARNETS tuple, corresponding to the Fabric of the Bearer Network to which the LEN belongs.

### Examples:

```

#### 2.9.1.4 QDNWRK Command

Line Query Command QDNWRK displays information about a range of working lines using Directory Numbers, which meet the conditions specified by the query parameters passed to the command the user.

The command format is enhanced to include a mandatory query parameter called **BEARNETWORK**.

The range of DNs passed to command is refined such that the output includes DNs which belong to the Bearer Network passed as BEARNETWORK and which meet the specifications set by the values passed for the other command parameters

As mentioned earlier, BEARNETWORK Parm selects only DNs which are physically associated to a LEN, directly or indirectly(e.g. LTIDs which are MAPPED to a LEN in table LTMAP). This is because only if DN is associated/attached to a LEN, can it be said that DN is part of a particular Bearer Network.

**Table 1 New Mandatory Command Parameter “BEARNETWORK”**

| Parameter Name | Valid input                                                                                                                                                                                                                                                                                           | Description                                                                                                                                                                                                                                                                                                                   | Areas affected by prompt |

### 2.9.1.5 QLENWRK Command

Line Query command QLENWRK displays information about a range of working lines using Line Equipment Numbers (LENs), which meet the conditions specified by the query parameters passed to the command the user.

The command format is enhanced to include a mandatory query parameter called **BEARNETWORK**.

The range of LENs passed to command is refined such that: The output includes LENs which belong to the Bearer Network passed as BEARNETWORK and which meet the specifications set by the values passed for the other command parameters

**Table 2 New Mandatory Command Parameter “BEARNETWORK”**

| Parameter Name | Valid input                                                                                                                                                                                                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                          | Areas affected by prompt |

### 2.9.1.6 QHASU Command

Line Query command QHASU displays hardware assigned and software unassigned Line Equipment Numbers in a specified range. Enhance the command QHASU to allow querying by the Bearer Network.

The command format is enhanced to include a mandatory query parameter called **BEARNETWORK**.

The range of LENSs passed to command is refined such that: The output includes LENSs which belong to the Bearer Network passed as BEARNETWORK and which meet the specifications set by the values passed for the other command parameters

**Table 3 New Mandatory Command Parameter “BEARNETWORK”**

| Parameter Name | Valid input                                                                                                                                                                                                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                         | Areas affected by prompt |

### 2.9.1.7 QGRP Command

Line Query command QGRP queries information about Members belonging to Line Groups like CPU, SCU, QBS etc. and displays the information to the user.

The command output is enhanced to display against each Group member, the information about the Bearer Network to which the member belongs.

The enhanced output format for a Group member has bearer network information added as **<FABRIC> <DISPLAY>**:

where,

- **FABRIC:** Value datafilled in FABRIC field of the table BEARNETS tuple, corresponding to the Fabric of the Bearer Network to which the LEN belongs.
- **DISPLAY:** Value datafilled in DISPLAY field of the table BEARNETS tuple, corresponding to the Bearer Network to which the LEN belongs.

This enhancement holds true for the following command options of QGRP command only, as listed below:

QGRP CPU <LINE EQUIPMENT NUMBER>

QGRP QBS <LINE EQUIPMENT NUMBER> <KEY>

QGRP MDN <LINE EQUIPMENT NUMBER OR LOGICAL TERMINAL ID> <KEY>

QGRP MDN <DIRECTORY NUMBER>

QGRP MDN <DIRECTORY NUMBER> <BRIEF FULL OR CA <CALL APPEARANCE NUMBER>>

QGRP HNT <DIRECTORY NUMBER OR LINE EQUIPMENT NUMBER> <KEY>

QGRP HNT <DIRECTORY NUMBER OR LINE EQUIPMENT NUMBER>

QGRP BLF <DIRECTORY NUMBER>

For ISDN agents which are not attached to a LEN, the message 'UNATTACHED TO A LEN' is displayed.

### 2.9.1.7.1 Examples:

**Figure 35 Enhanced QGRP command output for CPU Command Option**

```
>qgrp cpu SLOA 23 3 08 07

CPU GROUP
-----

LINKLEN:      SLOA  23 3 08 07 KEY 1    BEARERNET: AAL1 A1_S      9097500036
               SLOA  23 3 08 07 KEY 8    BEARERNET: AAL1 A1_S
               SLOA  23 3 08 07 KEY 2    BEARERNET: AAL1 A1_S      9097500074

The number of members in the CPU GROUP is 3.

### 2.9.1.8 QCUST

QCUST command displays all Line Equipment Numbers (LENs) corresponding to a Customer Group. The command output is enhanced to display the corresponding Bearer Network against each of the LENs.

The command output is enhanced such that the Bearer Network information for each LEN in a Customer Group is displayed against the LEN in the QCUST output.

A new Line of output (RECORD 22 i.e. We have “22” at start of LINE) showing **BEARERNET** field is introduced in the QCUST command output against each LEN.

The format of the new field BEARERNET is as follows:

#### 22 BEARERNET: <FABRIC> <DISPLAY>

where,

- **DISPLAY**: Value datafilled in DISPLAY field of the table BEARNETS tuple, corresponding to the Bearer Network to which the LEN belongs.
- **FABRIC**: Value datafilled in FABRIC field of the table BEARNETS tuple, corresponding to the Fabric of the Bearer Network to which the LEN belongs.

These enhancements hold for the whole of the command menu applicable to QCUST command. The Command menu being:

```
COMMAND QCUST : QUERY CUSTOMER DATA
COMMAND FORMAT : QCUST <CUSTGRP> $
                  OR
                  QCUST LEN <LINE EQUIPMENT NUMBER/
                  LOGICAL TERMINAL IDENTIFIER>
                  OR
                  QCUST ALL
                  OR
                  QCUST OWNEDBY <CUSTNAME> INITIAL
                  OR
                  QCUST ALL <CUSTNAME> INCR
                  OR
                  QCUST ALL <CUSTNAME> DONE
```

### 2.9.1.8.1 Examples:

```

### 2.9.1.9 Restrictions & Special Cases

The Line Query Command Enhancements described in this Section **do not** apply to following:

- MTX DNs/LENs
- Cellular DNs/LENs
- Synonym DNs/LENs
- Virtual DNs
- Unassigned and free DNs
- DNs not associated to a LEN
- GSF DNs/LENs

These Enhancements are aimed at the North American (NA) Markets. It is not supported for MSL loads and other non-NA loads

These enhancements become active only when value datafilled for table OFCVAR Parm OSS\_PROV\_VERSION is greater than SN07

The Enhancements to QLEN command do not hold true for LEN corresponding to Free slot i.e. without a Line Card physically present in slot, of the 2 Slots in a two slot Line Card

For QGRP Command Options enhanced, if a given DN is not attached to a LEN, in place of the “BEARER NET: “field display, following will be displayed: “UNATTACHED TO A LEN”

For Offices with a JNET:-

- The BEARER NET field in enhanced command puts for QDN, QLEN, QCUST, QGRP (Options enhanced), QLT commands will be as follows:- “BEARER NET: JNET “
- The Displayed options list for BEARNETWORK Command Parm for QDNWRK, QLENWRK and QHASU commands will contain only “ALL”

## 2.9.2 Sample Datafills for PM MAP level and other MAP level enhancements described below

**Figure 42 Sample BEARNETS table datafill**

```

## 2.9.3 Directory: PMLEVEL

This feature enhances a command in the PMLEVEL directory, but does not modify the directory itself.

### 2.9.3.1 Directory description

The commands in this directory help operating company personnel to operate and maintain the Peripheral Module (PM) at the node level.

### 2.9.3.2 Accessing directory: PMLEVEL Directory

#### 2.9.3.2.1 Access to directory or MAP level and return to CI

To access the PMLEVEL level from the CI environment, type:

```
>MAPCI ; MTC ; PM ;
```

To return to the CI environment, type:

```
>QUIT ALL
```

## 2.9.4 Command: POST

### 2.9.4.1 Command type: Listed MENU

### 2.9.4.2 Command target: All

### 2.9.4.3 Command availability: RES

### 2.9.4.4 Command description

The POST command Displays the Peripheral Modules. This command is used to post the various Peripheral modules for Maintenance.

This feature introduces a new parameter PM BEARNETS. This parameter in POST command allows the craft to post all the PMs hosted on a given bearer network. The valid entries for this new parameter are the entries for the bearer network in the table BEARNETS.

The PMs can be posted by:

- Bearer network and PM type. The PM type allowed is limited to SPM type for this release.
- The PMs can be posted by Bearer network and PM type and the SPM node class type. The SPM node class types allowed is limited to SMG4 and IWDPT type of SPMs for this release.

Following is not supported(Description given further below, can be referred to for more details):

- The PMs being posted by Bearer network *and* PM type *and* the PM state.
- The PMs being posted by Bearer network *and* PM type *and* the PM alarm.

### 2.9.4.5 Command syntax

The command syntax is as shown in Figure 44.

**Figure 44 PM POST command syntax**

```
Post:Post specified PMs for maintenance
Parms: [<All PMs> {AllPMs}]
      [<PM Type>... {TM2 [<All> {All}]
      .....
      [<PM State>... {SysB,
      .....
      InSv}}]
      [<PM Alarm>... {Minor,
      Major,
      Crit}]
      [<BN> {A1_P [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]]}]
      A1_S [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]],
      IP_P [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]],
      IP_S [<PM Type> {SPM [<SPM Type> {SMG4,
      DPT}}]]}]
```

**Note:** The Parms <PM Type> and the Parm <BN> cannot be used together.  
E.g. POST SPM BN 0 is invalid command.

**Figure 45 PM POST command parameters and variables**

| Command                  | Parameters and variables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Class   | (optional) SPM node class. This command posts all the SPMs of the specified class and Bearer network data filled in the DMS Switch. |
| SMG4    | Post all the SMG4 class SPM nodes hosted on the Switch                                                                              |
| DPT     | Post all the DPT class SPM nodes hosted on the Switch                                                                               |

#### **2.9.4.6 Qualifications and warnings**

No warnings are displayed.

#### **2.9.4.7 Responses**

Neither the POST command nor any of its options have required parameters; therefore, the user is never prompted for additional information when issuing any variant of the POST command.

##### **2.9.4.7.1 POST <BN> response**

The command and response for 'POST <BN>' is as shown in Table 4, "MAP outputs for POST <PM BEARNETS> with associated meanings and actions," on page 880.

**Table 4 MAP outputs for POST <PM BEARNETS> with associated meanings and actions**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>RESPONSE:</b><br><br>All the SPMs of node class type as DPT hosted on the specified bearer network are posted.<br><br><b>Meaning:</b><br><br>The Parameter PM BEARNETS is the value datafilled in DISPLAY field of a table BEARNETS tuple corresponding to a Bearer Network. All the DPT SPMs hosted on the specified bearer network are posted as post-set at the MAP level. The MAP level is changed to the SPM MAP level. The maintenance commands available off the SPM MAP can be executed on this posted SPM.<br><br><b>System or user actions:</b><br><br>N/A<br><br><b>User actions:</b> Menu/Non menu commands available off the specific SPM MAP for maintenance can be executed. |

#### 2.9.4.7.7 POST <BN> SPM <class>

The command and response for 'POST <BN> SPM <class>' where the entry for parameter class is other than SMG4 or DPT is as shown in Table 10, "MAP outputs for POST <BN> SPM <class> with associated meanings and actions," on page 886. SMG4 and DPT are the only SPM class Types supported for this release.

**Table 10 MAP outputs for POST <BN> SPM <class> with associated meanings and actions**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The only valid entries for this parameter are SMG4 and DPT. So no PMs are posted for this command.<br><br><b>User actions:</b><br><br>The SPM Node class Type has to given as SMG4 or DPT. |

### 2.9.4.8 Examples

**Table 11 Examples for the POST command at PM MAP**

|                           |                                                                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description of task       | Post all the PMs hosted on an specified bearer network                                                                                                            |
| Command:<br>MAP response: | POST A1_P<br>A post-set with of all the PMs which are hosted on the bearer network which has “A1_P” datafilled in table BEARNETS tuple is created.                |
| Description of task       | Post all the SPMs hosted on an specified bearer network                                                                                                           |
| Command:<br>MAP response: | POST A1_P SPM<br>A post-set with of all the SPMs which are hosted on the bearer network which has “A1_P” datafilled in table BEARNETS tuple is created.           |
| Description of task       | Post all the SPM nodes by class SMG4 on specified bearer network                                                                                                  |
| Command:<br>MAP response: | POST A1_S SPM SMG4<br>A post-set with of all the SMG4 SPMs which are hosted on the bearer network which has “A1_S” datafilled in table BEARNETS tuple is created. |
| Description of task       | Post all the SPM nodes by class DPT on specified bearer network                                                                                                   |

|                           |                                                                                                                                                                 |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command:<br>MAP response: | POST A1_P SPM DPT<br>A post-set with of all the DPT SPMs which are hosted on the bearer network which has "A1_P" datafilled in table BEARNETS tuple is created. |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 2.9.5 Command: POSTCLS

### 2.9.5.1 Command type: Hidden

### 2.9.5.2 Command target: All

### 2.9.5.3 Command availability: RES

### 2.9.5.4 Command description

This feature enhances an existing functionality POSTCLS at SPM level to post the PMTYPE by SPM node class type. This enables the craft to post the SPMs by the node class type (such as DMSCP, SMG4, IWDPT, IWB RG). The POST command, when posted by SPM node class type (E.g SMG4) creates a post set which contains all the SMG4 SPMs data filled in the DMS Switch.

### 2.9.5.5 Command syntax

The command syntax is as shown in Figure 46.

**Figure 46 POSTCLS command Enhancements**

```
POSTCLS: Post SPM by CLASS for maintenance.
Parms: <Class Type> {DMSCP,
                    IWB RG [<Netbrdge_clli>...{E_AP,E_AS}]
                    SMG4,
                    IWDPT}
```

**Figure 47 POSTCLS command parameters and Variables**

| Command                      | Parameters and variables                                                                                                                                                                |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POSTCLS                      | Parms: <Class Type> {DMSCP,<br>IWB RG [<Netbrdge_clli>...{E_AP,E_AS}]<br>SMG4,<br>IWDPT}                                                                                                |
| Parameters and variables     | Description                                                                                                                                                                             |
| <b>Class</b>                 | <b>(optional) SPM node class. This command posts all the SPMs of the specified class data filled in the DMS Switch.</b>                                                                 |
| DMSCP                        | Post all the DMSCP class SPM nodes hosted on the Switch                                                                                                                                 |
| IWB RG                       | Post all the IWB RG class SPM nodes hosted on the Switch                                                                                                                                |
| IWB RG<br><NETBRDGE_DISPLAY> | (optional) Post all the IWB RG class SPM nodes hosted on the Switch which use the Netbrdge CLLI, corresponding to the table NETBRDGE tuple whose DISPLAY field has the specified value. |
| SMG4                         | Post all the SMG4 class SPM nodes hosted on the Switch                                                                                                                                  |

| Command | Parameters and variables                                |
|---------|---------------------------------------------------------|
| IWDPT   | Post all the IWDPT class SPM nodes hosted on the Switch |

### 2.9.5.6 Qualifications and warnings

No warnings are displayed.

### 2.9.5.7 Responses

#### 2.9.5.7.1 POSTCLS <class> response when class is specified is DMSCP

The command and response for 'POSTCLS DMSCP' is as shown in Table 12, "MAP outputs for POSTCLS <class> with associated meanings and actions," on page 888.

**Table 12 MAP outputs for POSTCLS <class> with associated meanings and actions**

|                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command</b>                                                                                                                                                                   |
| MAPCI;MTC;PM;POST SPM;                                                                                                                                                           |
| POSTCLS DMSCP                                                                                                                                                                    |
| <b>RESPONSE:</b>                                                                                                                                                                 |
| Map screen will be at SPMDIR. The DMSCP SPMs data filled in the DMS switch are posted on the SPM MAP.                                                                            |
| <b>Meaning:</b>                                                                                                                                                                  |
| All the SPMs of SPM node class type as DMSCP are posted as post-set at the SPM MAP level. All the maintenance commands available off a SPM MAP can be executed on this post-set. |
| <b>System or user actions:</b>                                                                                                                                                   |
| N/A                                                                                                                                                                              |
| <b>User actions:</b> Menu/Non menu commands available off the SPM MAP for maintenance can be executed.                                                                           |

#### 2.9.5.7.2 POSTCLS <class> response when class is specified is SMG4

The command and response for 'POSTCLS SMG4' is as shown in Table 13, "MAP outputs for POSTCLS <class> with associated meanings and actions," on page 889.

**Table 13 MAP outputs for POSTCLS <class> with associated meanings and actions**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### 2.9.5.8 Examples

**Table 19 Examples for the POSTCLS command at SPM MAP level**

|                           |                                                                    |
|---------------------------|--------------------------------------------------------------------|
| Description of task       | Post all the DMSCP SPM nodes                                       |
| Command:<br>MAP response: | POSTCLS DMSCP<br>A post-set with of all the DMSCP SPMs is created. |
| Description of task       | Post all the SMG4 SPM nodes                                        |
| Command:<br>MAP response: | POSTCLS SMG4<br>A post-set with of all the SMG4 SPMs is created.   |
| Description of task       | Post all the DPT SPM nodes                                         |
| Command:<br>MAP response: | POSTCLS IWDPT<br>A post-set with of all the DPT SPMs is created.   |
| Description of task       | Post all the IW SPM nodes                                          |
| Command:<br>MAP response: | POSTCLS IWBRG<br>A post-set with of all the IW SPMs is created.    |

|                           |                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description of task       | Post all the IW SPM nodes belonging to a Netbridge CLI whose corresponding table NETBRIDGE tuple's DISPLAY field contents are passed as parameter to the command.                      |
| Command:<br>MAP response: | POSTCLS IWBRG E_AP<br>A post-set with of all the IW SPMs using the NetBridge CLI corresponding to the table NETBRIDGE tuple whose DISPLAY field contains a value of "E_AP" is created. |

## 2.9.6 Directory: TTP MAP

This feature enhances a command in the TTP MAP directory, but does not modify the directory itself.

### 2.9.6.1 Directory description

The commands in this directory helps operating company personnel to operate and maintain the trunks at the TTP MAP level.

### 2.9.6.2 Accessing directory: TTP

#### 2.9.6.2.1 Access to directory or MAP level and return to CI

To access the TTP MAP level from the CI environment, type:

```
>MAPCI;MTC;TRKS;TTP;
```

To return to the CI environment, type:

```
>QUIT ALL
```

## 2.9.7 Command: POST

### 2.9.7.1 Command type: Listed MENU

### 2.9.7.2 Command target: All

### 2.9.7.3 Command availability: RES

### 2.9.7.4 Command description

The POST command Displays the trunk members. This command is used to post the various trunks for Maintenance.

This feature introduces a new parameter "BN" in the POST command to refine posted set of the trunks by a specified bearer network. This command can be used only on a already created post-set using any of the existing post commands. This enables the craft to use maintenance commands available at the TTP level on the trunk members of a specific bearer network.

### 2.9.7.5 Command syntax

The command syntax is as shown in "POST command at TTP MAP level with new parameters" on page 896.

**Figure 48 POST command at TTP MAP level with new parameters**

```

POST-- POST A NEW SET
Parms: [<SET TYPE> {T [<CLLI1> STRING
                        [<CNRI1> {0 TO 9999}}
                        [<....> STRING]},
      G <CLLI> STRING
        [<CLNR> {0 TO 9999}}
        [<TO> {TO}]]
      <CLNR> {0 TO 9999},
      ....
      WB <CLLI> STRING
        <CKTN> {0 TO 9999}},
      BN [<ENET> STRING]
          [<A1_P> STRING]
          [<A1_S> STRING]
          [<IP_P> STRING]

```

### Figure 49 TTP POST command parameters and variables

| Command                   | Parameters and variables                                                                               |
|---------------------------|--------------------------------------------------------------------------------------------------------|
| POST                      | Parms: BN [<ENET> STRING]<br>[<A1_P> STRING]<br>[<A1_S> STRING]<br>[<IP_P> STRING]<br>[<IP_S> STRING]] |
| Parameters and variables  | Description                                                                                            |
| BN                        | (optional) option to specify that the trunks are to be posted by bearer network.                       |
| BEARNETS_DISPLAY [STRING] | value datafilled in DISPLAY field of a table BEARNETS tuple                                            |

#### 2.9.7.5.1 POST BN <BEARNETS DISPLAY>

The command and response for ‘Post BN <BEARNETS\_DISPLAY>’ is as shown in Table 20, “MAP outputs for POST BN <BEARNETS\_DISPLAY> with associated meanings and actions,” on page 897.

**Table 20 MAP outputs for POST BN <BEARNETS\_DISPLAY> with associated meanings and actions**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command</b><br><br>MAPCI;MTC;TRKS;TTP;POST A IDL;<br><br>POST BN <BEARNETS_DISPLAY>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>RESPONSE:</b><br><br>The trunk members in the given post-set hosted on the specified bearer network are posted on the TTP MAP.<br><br><b>Meaning:</b><br><br>All the trunks of a specified bearer network in the given post-set are posted at the TTP MAP level. All the maintenance commands available off a TTP MAP can be executed on this post-set.<br><br><b>System or user actions:</b><br><br>N/A<br><br><b>User actions:</b> Menu/Non menu commands available off the TTP MAP for maintenance can be executed. |

#### **2.9.7.5.2 POST BN <BEARNETS\_DISPLAY> when bearer network entered is invalid**

The command and response for 'Post BN <BEARNETS\_DISPLAY>' when a invalid bearer network is as shown in Table 21, "MAP outputs for POST BN NET with associated meanings and actions," on page 898.

**Table 21 MAP outputs for POST BN NET with associated meanings and actions**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command</b><br><br>MAPCI;MTC;TRKS;TTP;POST A IDL;<br><br>POST BN <INVALID BEARNETS_DISPLAY VALUE>                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>RESPONSE:</b><br>“EITHER incorrect optional parameter(s) OR too many parameters.”<br>PARM <no> INVALID<br>POST -- Wrong number of parameters.”<br><br><b>Meaning:</b><br><br>The entry for the BEARNETS_DISPLAY is either not data filled in the DISPLAY field of any table BEARNETS tuples or is invalid.<br><br><b>System or user actions:</b><br><br>N/A<br><br><b>User actions:</b> Craft has to enter a valid value from the DISPLAY fields of any datafilled BEARNETS tuples. |

#### **2.9.7.5.3 Repetitive use of POST BN <BEARNETS\_DISPLAY> is invalid**

The command and response for ‘Post BN <BEARNETS\_DISPLAY>’ when a invalid bearer network is as shown in Table 22, “MAP outputs for repetitive POST BN NET with associated meanings and actions,” on page 899.

**Table 22 MAP outputs for repetitive POST BN NET with associated meanings and actions**

|                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command</b><br><br>MAPCI;MTC;TRKS;TTP;POST G <TRUNK NAME>;POST BN BNET<br><br>POST BN BNET                                                                                                                                                                                                   |
| <b>RESPONSE:</b><br>“REPOST FOR NEW CONDITIONAL SELECTION”<br><br><b>Meaning:</b><br><br>Repetitive use of POST BN command is invalid.<br><br><b>System or user actions:</b><br><br>N/A<br><br><b>User actions:</b> Craft has to repost the Trunk to post the members of the new Bearer Network |

#### **2.9.7.5.4 POST BN <BEARNETS\_DISPLAY> when no bearer network is entered**

The command and response for ‘Post BN <BEARNETS\_DISPLAY>’ when no bearer network is entered as shown in Table 23, “MAP outputs for POST BN with associated meanings and actions,” on page 900.

**Table 23 MAP outputs for POST BN with associated meanings and actions**

|                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command</b><br><br>MAPCI;MTC;TRKS;TTP;POST A IDL;<br><br>POST BN                                                                                                                                                                                                                                                                                              |
| <b>RESPONSE:</b><br>“INVALID BEARER NETWORK ENTRY”<br><br><b>Meaning:</b><br><br>The selection of trunk members by bearer network is turned off.<br><br><b>System or user actions:</b><br><br>N/A<br><br><b>User actions:</b> Craft has to enter contents of the DISPLAY field in any of the table BEARNETS tuples, in the post BN command to activate it again. |

**Table 24 Examples for POST command at TTP MAP**

|                           |                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description of task       | Select all the trunk members hosted on a bearer network in the given post-set. The value datafilled in DISPLAY field of corresponding table BEARNETS tuple being passed to the Command as parameter. |
| Command:<br>MAP response: | POST BN A1_P<br>Selects all trunk members of Bearer Network, the table BEARNETS tuple corresponding to which has a value of A1_P datafilled in the DISPLAY field.                                    |

## 2.9.8 New CI Tool called QOSSVER available to User on Core

A new CI tool QOSSVER is made available to user on the Nortel Switch Core. This tool helps list the CAF ACTIDs of Nortel features delivered in a load which has OSS impact.

### 2.9.8.1 Help Command for Tool

**>q qossver**

Displays list of Feature ACTIDs introduced in a load, which impact OSS. If no parameters are passed, the list displayed is for value of Parm OSS\_PROV\_VERSION in table OFCVAR.

Parms: [<LOAD RELEASE> {ALL,  
                                   SN07,  
                                   SN08,  
                                   SN09,  
                                   SN10,  
                                   SN11,  
                                   SN12,

```
SN13,
SN14,
SN15,
SN16,
SN17}]
```

### 2.9.8.2 Response message on passing an invalid Parm

```
>qossvr sn60
EITHER incorrect optional parameter(s) OR too many parameters.
QOSSVER -- Wrong number of parameters.
```

### 2.9.8.3 Output when “ALL” Parameter is passed to Tool

Tool lists CAF ACTIDs of all OSS impacting features delivered in all loads.

As stated earlier the ACTID of the features has to be entered against appropriate load, by the Nortel design team delivering the feature in the software database used by tool on Core, via feature code.

In case the software database used by tool, does not have any Feature ACTIDs entered for a load: There are no messages to the user to the effect that there are no OSS impacting features in a load.

A sample output in SN08 load (This feature's actid A00006780 has been entered in software database against SN08):

```
>qossvr all
OSS Impacting Features in SN08 are:
A00006780
```

### 2.9.8.4 Output when a valid load within permitted range is passed as Parm to QOSSVER:

- If there are one or more ACTIDs entered in database against load

```
>qossvr sn08
OSS Impacting Features in SN08 are:
A00006780
```

- If there are on ACTIDs entered in database against load

```
>qossvr sn09
No OSS Impacting Features in SN09
```

### 2.9.8.5 Output when no Parameter is passed to tool

Tool prints out ACTIDs entered in database against a load, which is same as load datafilled as value of table OFCVAR parm OSS\_PROV\_VERSION

Outputs when no Parameter is passed to QOSSVER

- If value of the OFCVAR Parm is SN07(No feature ACTIDs in database against SN07)

```
>qossvr
No OSS Impacting Features in SN07
```

- If value of the OFCVAR Parm is SN08(ACTID of this feature i.e. A00006780 is entered in database against SN08)

```
>qossvr
OSS Impacting Features in SN08 are:
```

A00006780

## 2.9.9 User Responses for Table Control Operations

### 2.9.9.1 Table BEARNETS

#### 2.9.9.1.1 Tuple Addition Failure with Non-unique DISPLAY field

Attempting to add a tuple to table BEARNETS which includes a DISPLAY field value which is already used by an existing tuple in the table will be rejected as shown below.

Existing BEARNETS tuple

| NETIDX | BNETNAME | DISPLAY | FABRIC | OPTIONS |
|--------|----------|---------|--------|---------|
| NET 1  | NET_AAL1 | A1_P    | AAL1   | \$      |

```
>add net 4 NET_AAL2      A1_P      AAL1 $
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
DISPLAY field for a Bearer Network must be unique
TUPLE TO BE ADDED:
  NET 4                      NET_AAL3  A1_P  AAL1  $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
```

**Note:** Following are the Warning Messages provided to the user for a tuple in Table BEARNETS having a Non-Unique 'Display' field:

During TABXFR, the tuple will be transferred and the warning generated:

```
"DISPLAY fields in Table BEARNETS are not unique
Change the DISPLAY field values to be unique after RESTORE."
```

During TABAUDIT,

```
"DISPLAY fields in Table BEARNETS are not unique
Change the DISPLAY field values to be unique."
```

#### 2.9.9.1.2 Tuple Change Failure with Non-unique DISPLAY field

Attempting to change a tuple to table BEARNETS which includes a DISPLAY field value which is already used by an existing tuple in the table will be rejected as shown below. Assume existing BEARNETS tuple as shown in 2.8.9.1.1.

```
>pos net 0
  NET 0                      TDM_ENET  ENET  ENET  $
>cha
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
BNETNAME: TDM_ENET
>
DISPLAY: ENET
>A1_P
FABRIC: ENET
>
```

```

OPTIONS:
>$
DISPLAY field for a Bearer Network must be unique
TUPLE TO BE CHANGED:
  NET 0          TDM_ENET    A1_P    ENET      $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

**Note:** Following are the Warning Messages provided to the user for a tuple in Table BEARNETS having a Non-Unique 'Display' field:

During TABXFR, the tuple will be transferred and the warning generated:

```

"DISPLAY fields in Table BEARNETS are not unique
Change the DISPLAY field values to be unique after RESTORE."

```

During TABAUDIT,

```

"DISPLAY fields in Table BEARNETS are not unique
Change the DISPLAY field values to be unique."

```

### 2.9.9.1.3 Tuple Addition Failure with Empty DISPLAY field

Attempting to add a tuple to table BEARNETS which includes an empty DISPLAY field value will be rejected as shown below.

```

>add net 7
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
BNETNAME:
>net_ip
DISPLAY:
>$
FABRIC:
>ip
OPTIONS:
>$
DISPLAY field value is not valid.
TUPLE TO BE ADDED:
  NET 7          NET_IP      $      IP      $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

**Note:** Following are the Warning Messages provided to the user for a tuple in Table BEARNETS having a Empty 'Display' field:

During TABXFR, the tuple will be transferred and the warning generated:

```

"DISPLAY fields of table BEARNETS tuples are empty
Change the DISPLAY field value to be non-empty after RESTORE."

```

During TABAUDIT,

```

"DISPLAY fields of table BEARNETS tuples are empty
Change the DISPLAY field value to be non-empty."

```

## 2.9.9.2 Table NETBRDGE

### 2.9.9.2.1 Tuple Addition Failure with Non-unique DISPLAY field

Attempting to add a tuple to table NETBRDGE which includes a DISPLAY field value which is already used by an existing tuple in the table will be rejected as shown below.

**Existing NETBRDGE tuple:**

```

BRDGCLLI      BRDGTYPE      DISPLAY      BEARNETS
-----
--
ENET_TO_AAL1  CORE_BRDGE      E_A1          TDM_ENET NET_AAL1

>add ENET_TO_AAL3 CORE_BRDGE E_A1 TDM_ENET NET_AAL1
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y

TUPLE TO BE ADDED:
      ENET_TO_AAL3 CORE_BRDGE      E_A1 TDM_ENET NET_AAL1
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

**Note:** Following are the Warning Messages provided to the user for a tuple in Table NETBRDGE having a Non-Unique 'Display' field:

During TABXFR, the tuple will be transferred and the warning generated:

“DISPLAY field of table NETBRDGE for a Bridge Pool CLLI is not unique  
Change the DISPLAY field value to be unique after RESTORE.”

During TABAUDIT,

“DISPLAY field of table NETBRDGE for a Bridge Pool CLLI is not unique  
Change the DISPLAY field value to be unique.”

**2.9.9.2.2 Tuple Change Failure with Non-unique DISPLAY field**

Attempting to change a tuple to table NETBRDGE which includes a DISPLAY field value which is already used by an existing tuple in the table will be rejected as shown below. Assume existing NETBRDGE tuple as shown in 12.8.9.2.1.

```

>pos ENET_TO_AAL2

TUPLE TO BE CHANGED:
      ENET_TO_AAL2 CORE_BRDGE      E_A1 TDM_ENET NET_AAL1
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

```

**Note:** Following are the Warning Messages provided to the user for a tuple in Table NETBRDGE having a Non-Unique 'Display' field:

During TABXFR, the tuple will be transferred and the warning generated:

“DISPLAY field of table NETBRDGE for a Bridge Pool CLLI is not unique  
Change the DISPLAY field value to be unique after RESTORE.”

During TABAUDIT,

“DISPLAY fields in Table NETBRDGE are not unique  
Change the DISPLAY field values to be unique.”

### 2.9.9.2.3 Tuple Addition Failure with Empty DISPLAY field

Attempting to add a tuple to table NETBRDGE which includes an empty DISPLAY field value will be rejected as shown below.

```
>add enet_to_aal4
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>Y
BRDGTTYPE:
>CORE_BRDGE
DISPLAY:
>$
BEARNETS:
>TDM_ENET NET_AAL1
DISPLAY field of NETBRDGE tuple cannot be empty
TUPLE TO BE ADDED:
      ENET_TO_AAL4 CORE_BRDGE          $ TDM_ENET NET_AAL1
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>Y
```

**Note:** Following are the Warning Messages provided to the user for a tuple in Table NETBRDGE having a Empty 'Display' field:

During TABXFR, the tuple will be transferred and the warning generated:

“DISPLAY fields of table NETBRDGE tuples are empty  
Change the DISPLAY field value to be non-empty after RESTORE.”

During TABAUDIT,

“DISPLAY fields of table NETBRDGE tuples are empty  
Change the DISPLAY field value to be non-empty.”

### 2.9.9.2.4 Bridge Pool Creation Failure

If, when attempting to add a tuple to table NETBRDGE, the attempt to create a Bridge Pool fails, the tuple will be rejected. The following warning will be displayed to the user.

“Bridge Pool Creation Failed for CLI”

### 2.9.9.2.5 NETBRDGE Tuple Deletion Success

When a tuple from table NETBRDGE is deleted successfully, the following message will be displayed to the user.

“DELETING BRIDGE POOL OBJECT”

### 2.9.9.3 Table MNNODE

Bridge Pool Creation / Deletion no longer happens during addition / deletion of IW SPM(BRGD\_ONLY)SPM Tuples in MNNODE table

The following message is no longer seen during deletion of MNNODE tuples for IW BRDG\_ONLY SPMs:

“DELETING BRIDGE POOL OBJECT”

## 2.10 OSSGate Interface Changes

Functionality changes described in Section 9.9 of this Section, i.e. Enhancements to Line Query Commands. Functionality changes Turning ON/OFF is controlled using a newly introduced table OFCVAR Parm OSS\_PROV\_VERSION. The enhancements are effective only when this Office Parameter has a value greater than SN07.

## 2.11 Security

Not Applicable.

# 3: Performance for A00006780

## 3.1 Performance management strategy

TRK2NET2 and TRK2NET1 OM tuples are allocated for all bearer networks provisioned in table BEARNETS, for each Trunk Group datafilled in table TRKGRP, i.e., even if there are no Trunk Members datafilled in table TRKMEM against the Trunk Group in a bearer network.

By allocating OM tuples for each bearer network of each trunk group, attempts to use a trunk group member of a particular bearer network fabric not provisioned for that trunk group will be pegged. This is done to assist in evaluating provisioning and engineering in a Trimodal Call Server environment.

## 3.2 Performance management tools and utilities

The TRK2NET2 and TRK2NET1 OM tuples can be seen by executing the following commands, when the value of table OFCVAR field MULTINET\_DISPLAY\_ACTIVE is set to Y:

- CI>omshow TRK2NET1 ACTIVE
- CI>omshow TRK2NET2 ACTIVE

## 3.3 Performance Measurements (PM), Operational Measurements (OM), and stats

The following is a list of the enhanced OM groups for the SN08 Trimodal Call Server feature A00006780:

- TRK2NET1
- TRK2NET2

### 3.3.1 PM, OM, and stats format

#### 3.3.1.1 TRK2NET1

**Component:** Trunks

**Performance Measurement Name:** TRK2NET1

**Description:** TRK2NET1 OM Group provides information for per-trunk group traffic analysis per bearer network. The OM group is modeled after group TRK. The TRK2NET1 OM group provides information on trunk traffic for each trunk group. The registers in TRK2NET1 count the following:

- routing attempts
- seizure attempts
- seize failures
- total trunk use
- busy state use

**History:**

This OM was created in SN08 under Feature ACT.A00003487.

The OM tuples creation/deletion mechanism for this OM Group is enhanced in SN08, under feature ACT.A00006780.

#### 3.3.1.2 TRK2NET2

**Component:** Trunks

**Performance Measurement Name:** TRK2NET2

**Description:** TRK2NET2 OM Group provides information for per-trunk group traffic analysis per bearer network. It contains extension registers for registers found in OM Group TRK2NET1.

**History:**

This OM was created in SN08 under Feature ACT.A00003487.

The OM tuples creation/deletion mechanism for this OM Group is enhanced in SN08, under feature ACT.A00006780.

### 3.3.2 TRK2NET1 OM Group

#### 3.3.2.1 OM description

TRK2NET1 OM Group provides information for per trunk group traffic analysis per bearer network. The OM group is modeled after group TRK. The TRK2NET1 OM group provides information on trunk traffic for each trunk group. The registers in TRK2NET1 count the following:

- routing attempts
- seizure attempts
- seize failures
- total trunk use
- busy state use

The OM groups OFZ and OTS provide office-wide traffic summaries for trunks. The OM groups OFZ2NET1 and OFZ2NET2 provide office-wide per bearer network traffic summaries for trunks.

### 3.3.2.2 Release history update

#### 3.3.2.2.1 Enhancement in Release SN07

TRK2NET1 OM group is new in SN07.

The addition of this new TRK2NET1 OM group is controlled by the value of a new SN07 office parameter, MULTINET\_DISPLAY\_ACTIVE. If this parameter is set to 'Y', then the tuples of the new TRK2NET1 OM group are displayed. If the parameter is set to 'N', then the tuples of the TRK2NET1 OM group are not displayed. The tuples of this OM group are created when the office parameter MULTINET\_DISPLAY\_ACTIVE is set to Y for the first time.

#### 3.3.2.2.2 Enhancement in Release SN08

In SN07, the tuples for TRK2NET1 OM Groups are allocated only for the bearer networks of the trunk group members data filled in table TRKMEM.

In SN08, TRK2NET1 OM tuples are allocated for all bearer networks provisioned in table BEARNETS for each Trunk Group datafilled in table TRKGRP, i.e., even if there are no Trunk Members against the Trunk Group in a bearer network.

- When a Bearer Network is datafilled in table BEARNETS, a TRK2NET1 OM tuple is added for every Trunk Group datafilled in table TRKGRP.
- When a Bearer Network is deleted from table BEARNETS, all corresponding TRK2NET1 OM tuples are deleted. This functionality is delivered in SN08.
- When a Trunk Group is added in table TRKGRP, a TRK2NET1 OM tuple is added for every Bearer Network datafilled in table BEARNETS.
- When a Trunk Group is deleted from table TRKGRP, all corresponding TRK2NET1 OM tuples are deleted.
- TRK2NET1 OM tuple creation and deletion does not happen during tuple addition/deletion in tables TRKOPTS and TRKMEM.
- The TRK2NET1 OM group is ignored by table OMKEYORD.

### 3.3.3 TRK2NET2 OM Group

#### 3.3.3.1 OM description

TRK2NET2 OM Group provides information for per trunk group traffic analysis per bearer network. It contains extension registers for registers found in OM Group TRK2NET1.

#### 3.3.3.2 Release history update

##### 3.3.3.2.1 Enhancements in Release SN07

TRK2NET2 OM group is new in SN07.

The addition of this new TRK2NET2 OM group is controlled by the value of a new SN07 office parameter, MULTINET\_DISPLAY\_ACTIVE. If this parameter is set to 'Y', then the new TRK2NET2 OM group is displayed. If the parameter is set to 'N', then the TRK2NET2 OM group is not displayed.

##### 3.3.3.2.2 Enhancements in Release SN08

In SN07, the tuples for TRK2NET2 OM Groups are allocated only for the bearer networks of the trunk group members data filled in table TRKMEM.

In SN08, TRK2NET2 OM tuples are allocated for all bearer networks provisioned in table BEARNETS, for each Trunk Group datafilled in table TRKGRP, i.e., even if there are no Trunk Members against the Trunk Group in a bearer network

- When a Bearer Network is datafilled in table BEARNETS, a TRK2NET2 OM tuple is added for every Trunk Group datafilled in table TRKGRP.
- When a Bearer Network is deleted from table BEARNETS, all corresponding TRK2NET2 OM tuples are deleted. This functionality is delivered in SN08.
- When a Trunk Group is added in table TRKGRP, a TRK2NET2 OM tuple is added for every Bearer Network datafilled in table BEARNETS.
- When a Trunk Group is deleted from table TRKGRP, all corresponding TRK2NET2 OM tuples are deleted.
- TRK2NET2 OM tuple creation and deletion does not happen during tuple addition/deletion in tables TRKOPTS and TRKMEM.
- The TRK2NET1 OM group is ignored by table OMKEYORD.

#### 3.3.4 Special Scenarios(SN08 Enhancement)

- Before associating TRK2NET2&TRK2NET1 OM Tuples against a Bearer Network (When a table BEARNETS tuple is added) or associating TRK2NET2&TRK2NET1 OM Tuples against a Trunk Group (When adding a table TRKGRP Tuple):

- A check is made in software to check if there is space left to be able to associate the required number of OM Tuples (Refer to Limitation Section in FN)
- If the above check fails i.e. there is not enough space left, then not even a single TRK2NET2 or TRK2NET1 OM Tuple is associated with the Bearer Network or Trunk Group (as the case may be)
- An appropriate Warning is given to the User (Refer to Limitation Section of FN document). This tells user how much is the space needed and how much of space is actually available
- This gives the User an option of freeing up required space, given that user knows the requirement. User can free up space as per his/her discretion, by deleting table BEARNETS or TRKGRP tuples.
- The SN08 Enhancement gives the User an option of doing a NIL Change on the BEARNETS or TRKGRP tuple (During addition of which User faced the OM Tuple space availability issue). This particular enhancement causes the Feature code to re-attempt trying to associate required number of TRK2NET2/TRK2NET1 OM Tuple against Bearer Network or Trunk Group (as case maybe). This re-attempt would succeed, if User has freed up space by deleting TRKGRP or BEARNETS tuples before attempting NIL Change
  - NIL Change operation on a Tuple means trying a REPLACE command on Tuple with none of the fields of TUPLE having a changed value.
  - *Note: Above enhancement in software of re-attempting association of the OM Tuples, is run even if it is a normal Tuple CHANGE operation and not a NIL Change operation only.*
- When an ONP is done from a SN07 or SN08 load (Without feature code) to a SN08 load (With feature code): Then the TRK2NET2 and TRK2NET1 OM Tuples found associated with Bearer networks and Trunk Groups *will be different* from those associated on DUMP side. *In some cases, TRK2NET2/TRK2NET1 OM Tuples existing on DUMP side for a Bearer network and Trunk Group, will be found missing after TABXFR on the RESTORE side.*
  - An example is:-
    - When we have 5 Bearer Networks provisioned on DUMP side and 4000 Trunk Groups datafilled in TRKGRP.
    - Without the feature code, we have TRK2NET2/TRK2NET1 OM Tuples associated with each of the Bearer Networks *only* for those Trunk Groups (say there are 4000 Trunk Groups) which have Members physically belonging to a Bearer Network. Due to this, the Max OM Tuple limit per OM Group is not hit.

- Now when TABXFR of table BEARNETS happens to a load with feature code: When the first 4 BEARNETS tuples are TABXFRed,  $4 * 4000 = 16000$  (Max OM Tuple limit per OM Group) is reached for TRK2NET2&TRK2NET1 OM Groups.
- When the 5th table BEARNETS tuple is TABXFRed, the feature code detects that there is no space to associate even a single TRK2NET2/TRK2NET1 OM Tuple against Bearer Network. Hence on RESTORE side, not even a single TRK2NET2/TRK2NET1 OM tuple exists for Bearer Network corresponding to 5th table BEARNETS tuple.
- Table OMKEYORD will ignore the TRK2NET1 and TRK2NET2 OM groups during an ONP. This means that table OMKEYORD cannot be used to reorder the TRK2NET1 and TRK2NET2 tuples for EADAS.
- During ONP, the HOLE tuples from the OM groups TRK2NET1 and TRK2NET2 are not transferred to the Table OMKEYORD. TRK2NET1 and TRK2NET2 related OMKEYORD tuples are ignored.

# SN08 Feature Deltas

***Product = CS 2000***

## **A00006893--TLS Support for NGSS**

### ***Functional Description***

TLS = Transport Level Security, a security protocol that enables secure data transmission between two communicating applications.

NGSS = Next Generation Session Server, a SIP CallP Server in Nortel's Succession Networks portfolio of products.

### **1.1 Applicable Solution(s)**

UA-IP, PT-AAL2

### **1.2 Description**

The SIP RFC (3261) stipulates that TLS version 1.0 (RFC 2246) should be utilized for secure SIP message communication between two SIP enabled devices. This feature is meant to implement this functionality for the NGSS for Peer to Peer communication (i.e. Inter-call server communication). With the support of TLS by the NGSS, connections to a SIP enabled server can be secured over a non-secure network.

**Figure 1 Functional Behavior Diagram: SN08**

The TLS feature will allow the NGSS to establish TLS sessions with a remote Call Server that is SIP and TLS aware. Transport Layer Security (TLS) protocol provides secure communications over non-secured networks (like the internet). The protocol allows client/server applications to communicate with privacy, integrity, and communication. Beyond a simple implementation of TLS for the NGSS, capacity degradation is mitigated through connection throttling.

Provisioning decisions will enable non-TLS UDP or TCP connections to be established and utilized as required as well UDP or TCP.

On top of developing support for the TLS RFC, this feature will implement certain logs, OMs, and alarms for scenarios including security failures, attacks, and session establishment. It will also develop provisioning interfaces for

security-related provisioning. See the configuration (CN) and fault management (FM) sections for details on these interfaces.

### 1.3 Hardware Requirements or Dependencies

No new hardware dependencies are introduced in SN08.

### 1.4 Software Requirements or Dependencies

This feature requires only the standard SN08 load on the NGSS.

### 1.5 Limitations and restrictions

The following limitations exist for this feature:

#### Provisioning

- NGSS CallP must be restarted anytime a new server certificate is provisioned (CallP is not required to be restarted if remote servers' certificates are provisioned).
- NGSS CallP must be restarted for new values of many security-related parameters to take effect.
- Self-Signed Certificates from other servers must be datafilled on the NGSS in order to have the NGSS recognize those certificates.
- Any Self-Signed Certificate from the current NGSS must be datafilled on other NGSS'es -- and other SIP servers in general -- in order to have the remote servers recognize those certificates.

**Note:** Restarting NGSS CallP means restarting the SIP gateway application.

#### Provisioning: FQDN requirement for TLS.

- FQDN stands for "Fully Qualified Domain Name", a domain name that completely describes the address of a computer on the internet. It consists of at least a machine identifier (at the start) plus a top level domain (at the end). It may contain one or more subdomains in the middle. Example: www.nortel.com
- FQDNs are required to provision certificates for TLS under certain circumstances. According to RFC 3280, an FQDN must be no longer than 64 characters.
- Therefore the following limitations have been imposed on domain names for remote server provisioning on the NGSS in SN08:
  - New server names must be 64 or less characters (previous limit: 127 characters).
  - Previously provisioned server names cannot be longer than 64 characters if their provisioning is changed to use TLS. I.E. to use TLS, when the old server name is longer than 64 characters, the server must be renamed.

- The MGC server name on the NGSS Config Data page now has a size limit of 64 characters.

#### Performance

- Client-side session caching will not be supported on the NGSS. Server-side session-caching is supported. This will mean that session caching cannot be utilized between two SN08 NGSS units. Performance during mass session establishment events may be degraded as a result.

#### Cryptography

- Only RSA and AES ciphers will be enabled for use on the NGSS by default. These will be the only ciphers supported by Nortel on the NGSS. Specifically, the supported ciphers will be:
  - TLS1\_TXT\_RSA\_WITH\_AES\_128\_SHA and
  - TLS1\_TXT\_RSA\_WITH\_AES\_256\_SHA.
- RSA keys used on the NGSS will require a minimum of 1024 bits. RSA keys of smaller sizes are generally considered to be vulnerable to cracking.
- AES keys used on the NGSS will require a minimum of 128 bits.
- Imported certificates will be expected to be in PKCS #12 format, and coded in PEM, in order to be imported for use by the NGSS.

#### Licensing

- Licenses apply to certain open-source code (OpenSSL, Cryptlib) that we are using in the NGSS implementation of TLS. Terms of use require acknowledgement of the various authors in customer documentation materials etc. Please see appendix for full licenses of open-source code used within this product.

## 1.6 Glossary

| Term | Description                                                                                                                 |
|------|-----------------------------------------------------------------------------------------------------------------------------|
| FQDN | Fully Qualified Domain Name, a domain name that completely describes the address of a computer on the internet              |
| TLS  | Transport Level Security, a security protocol that enables secure data transmission between two communicating applications. |
| NGSS | Next Generation Session Server, a SIP CallP Server in Nortel's Succession Networks portfolio of products.                   |

Although not required under the terms of the GPL, it would still be nice if you could make any changes available to the author to allow a consistent code base to be maintained \*/

## ***Fault Management for A00006893***

### **2.1 Fault management strategy**

The TLS security feature for the SIP Gateway application on the NGSS (Next Generation Session Server) includes new logs and alarms to be defined. This section details the logs and alarms that the TLS security feature has defined.

An alarm monitoring process will be used to compare thresholds values with current operating conditions. As alarmable conditions occur, the process will ensure that the appropriate alarm is raised.

## 2.2 Fault management tools and utilities

This feature utilizes the current log and alarm display mechanisms in use by the NGSS. There will be new alarms and logs defined, but there will not be any new display mechanisms. Refer the to documented activity (in pls fmdoc) A00003933 (Succession Communication Server (SCS) 2000 - Session Server 2000 - SIP Gateway application) for the overall log and alarm tools and utilities.

This feature generates logs and alarms under the purview of the SIP Gateway application Call Processing. These logs and alarms are only generated and reported on the SIP Gateway application.

They can be viewed via the SIP Gateway Maintenance web browser interface on the Session Server - SIP Gateway application web page. The body of log formats shown in this document are the format for the Session Server logs if viewed from the IEMS (Integrated Element Manager System). Log formats may differ if logs are viewed from the Session Server Web Interface. The content will not differ, just the format and/or the headers.

## 2.3 Logs

There are two logs associated with the certificate management (cert\_mgnt/cert\_mgmt) tool:

- CRTM700 - New private key requested
- CRTM701 - Self signed certificate requested

All other logs and associated alarms will have the name start with SIPS (for SIP Security).

The following log events will be defined in this section:

- SIPS601 - A TLS authentication failure (error reason)
- SIPS305 - Initialization - TLS initialization critical logs
- SIPS605 - Initialization - TLS security initialization completed
- SIPS604 - Initialization - A TLS information log for the Local Certificate expiration date
- SIPS600 - TLS connection request dropped reason
- SIPS606 - TLS attempt to add trusted CA failed
- SIPS607 - TLS connection request failed

The following logs are associated with alarms:

- SIPS300 - TLS dropped number of requests over time
- SIPS301 - TLS failed certificate authentications over time
- SIPS302 - TLS Local certificate is expiring soon

## 2.3.1 CRTM700: New private key requested

### 2.3.1.1 Formats

#### 2.3.1.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> cert_mgnt:CRTM700 <Severity>
<Type>CERT_MGNT<Log Message>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (NONE).
- <Type>: The type of log (INFO)
- <Log Message>:
  - none/info: “^M      User requested new private key.^M      Existing key moved to /opt/base/share/ssl/server.key.<HHMM>\_<DDMMYY>^M”

#### Example:

```
Nov 11 14:12:14 comit.ngss.unit0 cert_mgnt: CRTM700 NONE INFO CERT_MGNT ^M
User requested new private key.^M      Existing key moved to
/opt/base/share/ssl/server.key.1412_11112004^M
```

### 2.3.1.2 Explanation

During the execution of the cert\_mgnt tool either option 1 or option 2, the user requested a new private key. The existing private key is backed up within the /opt/base/share/ssl. The new private key is placed in /opt/base/share/ssl/server.key

### 2.3.1.3 Field descriptions

**Table 1: Field descriptions**

| Field         | Value             | Description                         |
|---------------|-------------------|-------------------------------------|
| <DATE>        | <Mon> <DD>        | Current date when the log occurred. |
| <Time>        | <HH>:<MM>:<SS>    | Current time when the log occurred. |
| <DeviceName>  |                   | Name of the session server.         |
| <Severity>    | NONE              | Severity level of the log           |
| <Type>        | INFO              | informational                       |
| <Log Message> | see bulleted list | Log message text.                   |

### 2.3.1.4 Action

On an info log, no immediate action is required.

### 2.3.1.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

### 2.3.1.6 Additional information

See tool output and TLS initialization logs to ensure that the new key and certificate was provisioned properly.

## 2.3.2 CRTM701: Self signed certificate requested

### 2.3.2.1 Formats

#### 2.3.2.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> cert_mgnt:CRTM701 <Severity>  
<Type>CERT_MGNT<Log Message>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (NONE).
- <Type>: The type of log (INFO)

- <Log Message>:
  - none/info: “^M User accepted disclaimer for generating self-signed certificates^M”

#### Example:

```
Nov 12 09:54:50 comit.ngss.unit0 cert_mgnt: CRTM701 NONE INFO CERT_MGNT ^M
User accepted disclaimer for generating self-signed certificates^M
```

### 2.3.2.2 Explanation

During the execution of the cert\_mgnt tool in option 1, the user selected to generate a self-signed certificate. Self-signed certificates carry a security risk because they are not signed by a trusted certificate authority and therefore cannot be authenticated by a certificate authority.

### 2.3.2.3 Field descriptions

**Table 2: Field descriptions**

| Field         | Value             | Description                         |
|---------------|-------------------|-------------------------------------|
| <DATE>        | <Mon> <DD>        | Current date when the log occurred. |
| <Time>        | <HH>:<MM>:<SS>    | Current time when the log occurred. |
| <DeviceName>  |                   | Name of the session server.         |
| <Severity>    | NONE              | Severity level of the log           |
| <Type>        | INFO              | informational                       |
| <Log Message> | see bulleted list | Log message text.                   |

### 2.3.2.4 Action

On an info log, no immediate action is required.

### 2.3.2.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

### 2.3.2.6 Additional information

See tool output and TLS initialization logs to ensure that the new key and certificate was provisioned properly.

## 2.3.3 SIPS601 - A TLS authentication failure (error reason)

### 2.3.3.1 Formats

#### 2.3.3.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> <process> SIPS601 <Severity> <Type> TLS  
certificate common name: <Common Name>, reason: <Log Message>

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <process>: process class that raised the log (sigpgwyappln:)
- <Severity>: The Severity of the log (MINOR).
- <Type>: The type of log (INFO)
- <Common Name>: The common name in the X.509 certificate that the remote side is presenting
- <Log Message>: “<message>”, where <message> is one of:
  - unable to get issuer certificate
  - unable to get certificate CRL
  - unable to decrypt certificate’s signature
  - unable to decrypt CRL’s signature
  - unable to decode issuer public key
  - certificate signature failure
  - CRL signature failure
  - certificate is not yet valid
  - CRL is not yet valid
  - certificate has expired
  - CRL has expired
  - format error in certificate’s notBefore field
  - format error in certificate’s notAfter field
  - format error in CRL’s lastUpdate field
  - format error in CRL’s nextUpdate field
  - out of memory
  - self signed certificate
  - self signed certificate in certificate chain
  - unable to get local issuer certificate

- unable to verify the first certificate
- certificate chain too long
- certificate revoked
- invalid CA certificate
- path length constraint exceeded
- unsupported certificate purpose
- certificate not trusted
- certificate rejected
- application verification failure
- subject issuer mismatch
- authority and subject key identifier mismatch
- authority and issuer serial number mismatch
- key usage does not include certificate signing
- unable to get CRL issuer certificate
- unhandled critical extension
- key usage does not include CRL signing
- unhandled critical CRL extension

**Example:**

```
Oct  8 16:36:56 comit.ngss.unit1 sipgwyappln: SIPS601 MINOR INFO TLS certificate  
common name: 47.129.118.195, reason: self signed certificate
```

**2.3.3.2 Explanation**

The SIPS601 log is generated during authentication failure events. The INFO log indicates the reason for the authentication failures.

**2.3.3.3 Field descriptions****Table 3: Field descriptions**

| Field        | Value          | Description                         |
|--------------|----------------|-------------------------------------|
| <DATE>       | <Mon> <DD>     | Current date when the log occurred. |
| <Time>       | <HH>:<MM>:<SS> | Current time when the log occurred. |
| <DeviceName> |                | Name of the session server.         |
| <Severity>   | MINOR          | Severity level of the log           |

**Table 3: Field descriptions**

| Field         | Value             | Description       |
|---------------|-------------------|-------------------|
| <Type>        | INFO              | informational     |
| <Log Message> | see bulleted list | Log message text. |

**2.3.3.4 Action**

On an info log, no immediate action is required.

**2.3.3.5 Associated Operational Measurements or Performance Measurements**

OM registers “TLS\_CONNECTION\_REQUESTS\_FAILED” and “TLS\_HANDSHAKE\_AUTHENTICATION\_FAILED” in group “SIPGW\_TLS”

**2.3.3.6 Additional information**

An excessive amount of authentication failures may have associated alarms. Verify alarms and OMs

**2.3.4 SIPS305: TLS Initialization logs****2.3.4.1 Formats****2.3.4.1.1 Syslog**

Following is the format of the log:

```
<Date> <Time> <DeviceName> siggyappln: SIPS305 <Severity> <Type>
TLS <Log Message>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (CRIT).
- <Type>: The type of log (INIT)
- <Log Message>:
  - crit/init: “^M TLS Local Key and Cert do not match^M”
  - crit/init: “^M TLS Failed client init^M”
  - crit/init: “^M TLS Local Key and Cert do not match^M”
  - crit/init: “^M TLS Failed Server init^M”
  - crit/init: “^M TLS Failed to load Certificate^M”

- crit/init: “^M TLS Failed to load Key^M”
- crit/init: “^M TLS Failed to Init^M”
- crit/init: “^M TLS Failed to get pointer^M”
- crit/init: “^M TLS Failed to create thread^M”

**Example:**

```
Feb  9 13:11:39 comit.ngss.unit1 sipgwyappln: SIPS305 CRIT INIT TLS ^M TLS
Failed to load Key^M
```

**2.3.4.2 Explanation**

The SIPS305 log is generated during the initialization of the Call Processing application (i.e. during the unlock). If one of the critical logs come out, it means that there is a problem with the initialization, and the application is unable to start.

**2.3.4.3 Field descriptions****Table 4: Field descriptions**

| Field         | Value             | Description                         |
|---------------|-------------------|-------------------------------------|
| <DATE>        | <Mon> <DD>        | Current date when the log occurred. |
| <Time>        | <HH>:<MM>:<SS>    | Current time when the log occurred. |
| <DeviceName>  |                   | Name of the session server.         |
| <Severity>    | CRIT              | Severity level of the log           |
| <Type>        | INIT              | initialization log.                 |
| <Log Message> | see bulleted list | Log message text.                   |

**2.3.4.4 Action**

On a critical severity log, check to ensure that the Certificate and Key provided to the call processing application are in the correct directory (as pointed to by the Database entry). Then ensure that the Certificate and Key files themselves are not corrupted or tampered with. Ensure that the certificate and key files are meant to be together (by running the cert\_mgnt tool). Alternatively contact the next level of support.

Once the problem is resolved, and the user ‘unlocks’ the application again, there will be 3 logs indicating resolution.

- SIPM500

```
Feb  9 13:15:40 comit.ngss.unit1 sipgwymtc: SIPM500 NONE INFO SIP Gateway
Application Maintenance State Change ^M      [Administrative : Locked      -
> Unlocked      ]^M      [Operational   : Enabled      -> Enabled      ]^M
[Control        : Not Suspended   -> Not Suspended   ]^M      [Procedural      :
Not Terminating -> Not Terminating]^M      [User Requested : Yes]^M      [Reason
: Unlock command issued]^M      [Web User ID      : mtc]^M
```

- SIPS605
- SIPS604

### 2.3.4.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

### 2.3.4.6 Additional information

Normally, the cert\_mgnt CLI will provision the certificate and key files properly. If this interface has not been run prior to the attempt to bring the call processing application in service, or has been run improperly, unexpected results could occur. Extra information as to the cause of the problem will likely reside in the initialization trace logs provided in the /opt/apps/logs directory (look for siptrace.<date>.server.<pid>).

## 2.3.5 SIPS605: TLS Initialization logs

### 2.3.5.1 Formats

#### 2.3.5.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> sipgwyappln: SIPS605 <Severity> <Type>
TLS <Log Message>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (NONE).
- <Type>: The type of log (INFO)
- <Log Message>:
  - none/info: “^M TLS Security Enabled^M”

#### Example:

```
Oct  8 15:17:07 comit.ngss.unit1 sipgwyappln: SIPS605 NONE INFO TLS ^M      TLS
Security Enabled^M
```

### 2.3.5.2 Explanation

The SIPS605 log is generated during the initialization of the Call Processing application (i.e. during the unlock). This log indicates that TLS has been enabled. Expect a SIPS604 log along with this log.

### 2.3.5.3 Field descriptions

**Table 5: Field descriptions**

| Field         | Value             | Description                         |
|---------------|-------------------|-------------------------------------|
| <DATE>        | <Mon> <DD>        | Current date when the log occurred. |
| <Time>        | <HH>:<MM>:<SS>    | Current time when the log occurred. |
| <DeviceName>  |                   | Name of the session server.         |
| <Severity>    | NONE              | Severity level of the log           |
| <Type>        | INFO              | informational.                      |
| <Log Message> | see bulleted list | Log message text.                   |

### 2.3.5.4 Action

On an info log, no immediate action is required.

### 2.3.5.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

### 2.3.5.6 Additional information

None.

## 2.3.6 SIPS604: TLS Initialization logs

### 2.3.6.1 Formats

#### 2.3.6.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> sipgwyappln: SIPS604 <Severity> <Type>
TLS <Log Message>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server

- <Severity>: The Severity of the log (NONE).
- <Type>: The type of log (INFO)
- <Log Message>:
  - none/info: “^M Local Certificate Expires: Year=<YYYY>, Month = <MM>, Day = <DD>^M”

#### Example:

Oct 8 15:17:07 comit.ngss.unit1 sipgwyappln: SIPS604 NONE INFO TLS ^M Local Certificate Expires: Year=2005, Month = 10, Day = 8^M

### 2.3.6.2 Explanation

The SIPS604 log is generated during the initialization of the Call Processing application (i.e. during the unlock). This log indicates when the current local certificate will expire.

### 2.3.6.3 Field descriptions

**Table 6: Field descriptions**

| Field         | Value             | Description                         |
|---------------|-------------------|-------------------------------------|
| <DATE>        | <Mon> <DD>        | Current date when the log occurred. |
| <Time>        | <HH>:<MM>:<SS>    | Current time when the log occurred. |
| <DeviceName>  |                   | Name of the session server.         |
| <Severity>    | NONE              | Severity level of the log           |
| <Type>        | INFO              | informational.                      |
| <Log Message> | see bulleted list | Log message text.                   |

### 2.3.6.4 Action

On an info log, no immediate action is required.

### 2.3.6.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

### 2.3.6.6 Additional information

None.

## 2.3.7 SIPS600 - TLS connection request dropped reason

### 2.3.7.1 Formats

#### 2.3.7.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> sipgwyappln: SIPS600 MINOR INFO TLS
<Log Message>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Log Message>:
  - “^M Dropped TLS Handshake request, monitor OMs^M”
  - “^M Dropped TLS Handshake request, TLS is not enabled. ^M”
  -

#### Example:

```
Oct 8 15:17:07 comit.ngss.unit1 sipgwyappln: SIPS600 MINOR INFO TLS ^M Dropped
TLS Handshake request, monitor OMs^M
```

### 2.3.7.2 Explanation

The SIPS600 log is generated during the connection set up of the Call Processing application. When the ‘monitor OMs’ log comes out, ensure that the threshold levels set for connection throttling are reasonable for the size of the office. If the ‘TLS is not enabled’ message comes out, ensure that the initialization of the call processing application worked correctly.

### 2.3.7.3 Field descriptions

Table 7: Field descriptions

| Field         | Value             | Description                         |
|---------------|-------------------|-------------------------------------|
| <DATE>        | <Mon> <DD>        | Current date when the log occurred. |
| <Time>        | <HH>:<MM>:<SS>    | Current time when the log occurred. |
| <DeviceName>  |                   | Name of the session server.         |
| <Log Message> | see bulleted list | Log message text.                   |

#### 2.3.7.4 Action

If the log comes out once or twice, it is likely a transient problem. Monitor the OM register “TLS\_CONN\_REQ\_DROP” in group “SIPGW\_TLS” and ensure that the event doesn’t continuously recur. If it does, check to ensure the threshold values for the TLS connections are set properly for the number of connections expected in the time period. If they are, check to ensure the integrity of the office LAN (as there might be an intruder on the network).

#### 2.3.7.5 Associated Operational Measurements or Performance Measurements

TLS\_CONNECTION\_REQUESTS\_DROPPED in OM group SIPGW\_TLS

#### 2.3.7.6 Additional information

None.

### 2.3.8 SIPS606 - TLS attempt to add trusted CA failed

#### 2.3.8.1 Formats

##### 2.3.8.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> sipgwyappln: SIPS606 NONE INFO TLS  
^M Failed to add Trusted CA name <name>^M
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <name>: Unique name used to indicate which trusted certificate provisioned via the web interface is having trouble loading.

##### Example:

```
Oct 8 13:41:47 comit.ngss.unit1 sipgwyappln: SIPS606 NONE INFO TLS ^M Failed  
to add Trusted CA name server^M
```

#### 2.3.8.2 Explanation

The SIPS606 log is generated when there is a problem importing the trusted certificate provisioned via the web interface in the database.

### 2.3.8.3 Field descriptions

**Table 8: Field descriptions**

| Field        | Value                                                                                         | Description                         |
|--------------|-----------------------------------------------------------------------------------------------|-------------------------------------|
| <DATE>       | <Mon> <DD>                                                                                    | Current date when the log occurred. |
| <Time>       | <HH>:<MM>:<SS>                                                                                | Current time when the log occurred. |
| <DeviceName> |                                                                                               | Name of the session server.         |
| <name>       | Trusted certificate name from the database, Table SECURITYCONFIGCERTS, item SECURITYCERTNAME. | Unique name from the database.      |

#### 2.3.8.4 Action

Since the certificate is not correct (i.e. it is unable to be loaded), try to re-provision the certificate (using a different name) or delete the certificate <name> and re-add it via the 'Add Remote Trusted Certificate' web interface.

#### 2.3.8.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

#### 2.3.8.6 Additional information

If this log comes out, and then authentication logs come out, it is likely due to the failure to provision the trusted certificate for the remote server. Retrieve the remote servers' public self-signed certificate and add it to the database via the web interface.

### 2.3.9 SIPS607 - TLS Connection Request Failed

#### 2.3.9.1 Formats

##### 2.3.9.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> sipgwyappln: SIPS607 NONE INFO TLS
Connection Request Failed: Server: <Server Name>, IP Address: <IP
Address>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date

- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Server Name>: The name of the remote certificate
- <IP Address>: The IP address of the remote server

**Example:**

```
Feb 16 09:53:44 comit.ngss.unit1 sipgwyappln: SIPS607 NONE INFO TLS Connection
Request Failed: Server: AURUM, IP Address: 47.129.118.195
```

**2.3.9.2 Explanation**

The SIPS607 log supplements the SIPS601 log. The SIPS607 is generated to provide details into which remote server is not able to connect with the local server.

**2.3.9.3 Field descriptions****Table 9: Field descriptions**

| Field         | Value                                                                                                                                                                                                                   | Description                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <DATE>        | <Mon> <DD>                                                                                                                                                                                                              | Current date when the log occurred.                                                                       |
| <Time>        | <HH>:<MM>:<SS>                                                                                                                                                                                                          | Current time when the log occurred.                                                                       |
| <DeviceName>  |                                                                                                                                                                                                                         | Name of the session server.                                                                               |
| <Server name> | Name of the remote server as it is provisioned in the Remote SIP Server web page.<br><br>Table SIPSERVER, field: SERVERNAME where the corresponding field IPADDRESS1 matches the <IP Address> field in the SIPS607 log. | If this value is NULL, then there is no remote server name provisioned corresponding to the <IP Address>. |
| <IP Address>  | IP address of the remote server that is unable to connect with the local server.                                                                                                                                        | IP address of the remote server.                                                                          |

**2.3.9.4 Action**

No immediate action is required.

### 2.3.9.5 Associated Operational Measurements or Performance Measurements

OM registers “TLS\_CONNECTION\_REQUESTS\_FAILED” in group “SIPGW\_TLS”

### 2.3.9.6 Additional information

If the value of the server name is NULL, this log, together with the SIPS601 log indicates that the remote server is not provisioned locally.

If the value of the server name is not NULL, this log, together with the SIPS601 log, indicates the reason which remote server is not able to connect with the local server, and the reason why the remote server is not able to connect.

Verify provisioning of the remote server’s certificate on the remote side and on the local side.

If there is an excessive amount of SIPS601 and SIPS607 logs, monitor OMs and alarms.

## 2.3.10 SIPS300 - TLS dropped number of requests over time

### 2.3.10.1 Formats

#### 2.3.10.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> alarmd: SIPS300 <Severity> TBL TLS  
Dropped Connection Request NCGL=<DeviceName>;Unit=<Unit#>;SIPS  
<alarmmessage>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (NONE, MINOR, MAJOR, or CRIT).
- <Unit#>: The unit number assigned (either 0 or 1)
- <alarmmessage>: One of:
  - Dropped <number> Connections requests
  - Automatically cleared due to alarm generator process death
- <number>: The number of dropped requests.

**Example:**

Oct 6 20:19:53 comit.ngss.unit1 alarmd: SIPS300 MINOR TBL TLS Dropped Connection Request NCGL=comit.ngss.unit1;Unit=1;SIPS Dropped 10 Connections requests

### 2.3.10.2 Explanation

The SIPS300 log is generated during the alarming of dropped connection requests (due to either the threshold being crossed for throttling connections, or due to attempting to use TLS when TLS is not enabled). The severity of the alarm indicates the threshold that was crossed, 10 dropped connection requests in a minute for a MINOR, 50 dropped requests for a MAJOR, and 100 dropped requests (or more) for a critical. The alarm is raised for a minimum of 30 minutes.

### 2.3.10.3 Field descriptions

**Table 10: Field descriptions**

| Field          | Value                      | Description                                                                       |
|----------------|----------------------------|-----------------------------------------------------------------------------------|
| <DATE>         | <Mon> <DD>                 | Current date when the log occurred.                                               |
| <Time>         | <HH>:<MM>:<SS>             | Current time when the log occurred.                                               |
| <DeviceName>   |                            | Name of the session server.                                                       |
| <Severity>     | NONE, MINOR, MAJOR or CRIT | Severity level of the log                                                         |
| <Unit#>        | 0 or 1                     | The unit number of the platform                                                   |
| <alarmmessage> | see bulleted list          | Alarm log message text.                                                           |
| <number>       | internally generated.      | The number of dropped connections in the last time period (currently one minute). |

### 2.3.10.4 Action

If the log comes out monitor the OM register “TLS\_CONN\_REQ\_DROP” in group “SIPGW\_TLS” and ensure that the event doesn’t continuously recur. If it does, check to ensure the threshold values for the TLS connections are set properly for the number of connections expected in the time period. If they are, check to ensure the integrity of the office LAN (as there might be an intruder on the network). The log/alarm will be raised at least 30 minutes, and if the problem has ceased, the clear alarm log will be generated.

### 2.3.10.5 Associated Operational Measurements or Performance Measurements

OM register “TLS\_CONN\_REQ\_DROP” in group “SIPGW\_TLS”

### 2.3.10.6 Additional information

See “SIPS600 - TLS connection request dropped reason” on page 931.

## 2.3.11 SIPS301 - TLS failed certificate authentications over time

### 2.3.11.1 Formats

#### 2.3.11.1.1 Syslog

Following is the format of the log:

```
<Date> <Time> <DeviceName> <process> SIPS301 <Severity> TBL TLS  
Failed Authentication NCGL=<DeviceName>;Unit=<Unit#>;SIPS  
<alarmmessage>
```

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <process>: process class that raised the log (either sipgwyappln: or alarmd:)
- <Severity>: The Severity of the log (NONE, MINOR, MAJOR or CRIT).
- <Unit#>: The Unit number.
- <alarmmessage>:
  - Failed <number> certificate authentications
    - <number>: The number of times this event occurred in the last minute before the alarm was raised.
  - Automatically cleared due to alarm generator process death

#### Example:

```
Feb 9 13:03:50 comit.ngss.unit1 alarmd: SIPS301 CRIT TBL TLS Failed  
Authentication NCGL=yin;Unit=0;SIPS Failed 28 certificate authentications  
Feb 9 13:08:10 yin alarmd: SIPS301 NONE TBL TLS Failed Authentication  
NCGL=yin;Unit=0;SIPS Automatically cleared due to alarm generator process death
```

#### 2.3.11.2 Explanation

The SIPS301 log is generated during authentication failure events. The alarmd process log indicates the level of trouble (CRIT indicates a very serious problem, MINOR may be transient or the beginning of a series of authentication failures).

### 2.3.11.3 Field descriptions

**Table 11: Field descriptions**

| Field          | Value                       | Description                                                                       |
|----------------|-----------------------------|-----------------------------------------------------------------------------------|
| <DATE>         | <Mon> <DD>                  | Current date when the log occurred.                                               |
| <Time>         | <HH>:<MM>:<SS>              | Current time when the log occurred.                                               |
| <DeviceName>   |                             | Name of the session server.                                                       |
| <Severity>     | NONE, MINOR, MAJOR, or CRIT | Severity level of the log                                                         |
| <Unit#>        | 0 or 1                      | The unit number of the platform                                                   |
| <number>       | internally generated.       | The number of dropped connections in the last time period (currently one minute). |
| <alarmmessage> | see bulleted list           | Alarm log message text.                                                           |
| <Log Message>  | see bulleted list           | Log message text.                                                                 |

### 2.3.11.4 Action

On a critical severity log, check to ensure that the Certificate and Key provided to the call processing application are in the correct directory (as pointed to by the Database entry). Then ensure that the Certificate and Key files themselves are not corrupted or tampered with. Ensure that the certificate and key files are meant to be together (by running the cert\_mgnt tool). Alternatively contact the next level of support.

On an info log, no immediate action is required.

### 2.3.11.5 Associated Operational Measurements or Performance Measurements

OM registers “TLS\_CONNECTION\_REQUESTS\_FAILED” and “TLS\_HANDSHAKE\_AUTHENTICATION\_FAILED” in group “SIPGW\_TLS”

### 2.3.11.6 Additional information

To determine the exact subject, use of the sp2ktrace tool would be warranted. This type of activity should be undertaken with the supervision of Nortel Technical Support.

## 2.3.12 SIPS302 - TLS Local certificate is expiring soon

### 2.3.12.1 Formats

#### 2.3.12.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> alarmd: SIPS302 <Severity> TBL TLS

<Date> <Time> <DeviceName> alarmd: SIPS302 <Severity> TBL Local Certificate is Expiring Soon NCGL=<DeviceName>;Unit=<Unit#>;SIPS Local Certificate is Expiring Soon

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (NONE, MINOR, MAJOR or CRIT).

#### Example:

```
Oct 8 13:14:17 comit.ngss.unit0 alarmd: SIPS302 MINOR TBL TLS Local Certificate  
is Expiring Soon NCGL=comit.ngss.unit0;Unit=0;SIPS TLS Local Certificate is  
Expiring Soon
```

### 2.3.12.2 Explanation

The SIPS302 log is generated as a result of the alarm process check to ensure the Local Server certificate continues to be valid. The expiration date contained in the certificate is checked on a daily basis, and when the expiration of the certificate will occur within 31 days (MINOR), 15 days (MAJOR), or 5 days (CRIT), the alarm is raised, with this log. For certificates that have already expired, the CRIT alarm and log is generated, and authentication failures will be output for any connections that are attempted.

### 2.3.12.3 Field descriptions

Table 12: Field descriptions

| Field        | Value                      | Description                         |
|--------------|----------------------------|-------------------------------------|
| <DATE>       | <Mon> <DD>                 | Current date when the log occurred. |
| <Time>       | <HH>:<MM>:<SS>             | Current time when the log occurred. |
| <DeviceName> |                            | Name of the session server.         |
| <Severity>   | NONE, MINOR, MAJOR or CRIT | Severity level of the log           |

### 2.3.12.4 Action

With the cert\_mngt tool, create a new self-signed certificate (if using self-signed certificates) or generate a certificate signing request and then provision the result. Once this is done, lock/unlock the callp application (or perform a SWACT after locking/unlocking the inactive with the new certificate).

### 2.3.12.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

### 2.3.12.6 Additional information

None.

## 2.4 Alarms

The following list of alarms will be provided:

- TLS connection request comes in above the connection throttle limit (and above the threshold for the alarm - the defined thresholds are: 10 for minor, 50 for major, and 100 for critical)
- TLS connection handshake failures (the thresholds are: 1 for minor, 2 for major, and 5 for critical)
- TLS local certificate expiration (expiry in 31 days or less - minor, 15 days or less - major, and 5 days or less - critical)

### 2.4.1 Connection Requests Dropped Alarm

#### 2.4.1.1 Integrated Element Manager GUI Fields

For each new log, populate the following table with the values displayed in the IEMS Alarm Manager GUI. (Non-legacy logs only).

**Table 13: IEMS Alarm GUI Field descriptions**

| Field           | Value                                             |
|-----------------|---------------------------------------------------|
| Severity        | NONE, MINOR, MAJOR, or CRIT                       |
| Category        | <i>APC_Communications</i>                         |
| LogName         | SIPS                                              |
| LogNumber       | 300                                               |
| EventType       | TBL                                               |
| EventLabel      | TBL                                               |
| ProbableCause   | <i>thresholdCrossed</i>                           |
| SpecificProblem | TLS Dropped Connection Request                    |
| BodyText        | Dropped <number> Connections requests<updatetext> |

BodyText explanation: The BodyText entry for the log will contain “Dropped <number> Connections requests”. However, over time, other events may occur, and the alarm BodyText will be updated with “Dropped <number> Connections requests in the last minute<updatetext>”, where <updatetext> is one of:

- “, <numberminor> Minor events since alarm creation” for Minor alarms
- “, <numbermajor> Major, <numberminor> Minor events since alarm creation” for Major alarms or
- “, <numbercritical> Critical, <numbermajor> Major, <numberminor> Minor events since alarm creation” for Critical alarms.

The original alarm log is not refreshed.

#### 2.4.1.2 Explanation

Description: The SIPS300 log is generated during the alarming of dropped connection requests (due to either the threshold being crossed for throttling connections, or due to attempting to use TLS when TLS is not enabled). The severity of the alarm indicates the threshold that was crossed, 10 dropped connection requests in a minute for a MINOR, 50 dropped requests for a MAJOR, and 100 dropped requests (or more) for a critical. The alarm is raised for a minimum of 30 minutes. See also the SIPS600 log for an associated log.

Severity: Escalating severity, Minor for 10 or more connection requests dropped, Major for 50 or more requests dropped, and Critical for 100 or more connection requests dropped.

### 2.4.1.3 Action

If the alarm comes out monitor the OM register “TLS\_CONN\_REQ\_DROP” in group “SIPGW\_TLS” and ensure that the event doesn’t continuously recur. If it does, check to ensure the threshold values for the TLS connections are set properly for the number of connections expected in the time period. If they are, check to ensure the integrity of the office LAN (as there might be an intruder on the network). The log/alarm will be raised at least 30 minutes, and if the problem has ceased, the clear alarm log will be generated.

### 2.4.1.4 Corresponding Clear Log

Log Title: SIPS300 with severity NONE.

## 2.4.2 Connection Authentication Failures Alarm

### 2.4.2.1 Integrated Element Manager GUI Fields

For each new log, populate the following table with the values displayed in the IEMS Alarm Manager GUI. (Non-legacy logs only).

**Table 14: IEMS Alarm GUI Field descriptions**

| Field           | Value                                                   |
|-----------------|---------------------------------------------------------|
| Severity        | NONE, MINOR, MAJOR, or CRIT                             |
| Category        | <i>APC_Communications</i>                               |
| LogName         | SIPS                                                    |
| LogNumber       | 301                                                     |
| EventType       | TBL                                                     |
| EventLabel      | TBL                                                     |
| ProbableCause   | <i>authenticationFailure</i>                            |
| SpecificProblem | Too many authentication failures over time.             |
| BodyText        | Failed <number> certificate authentications<updatetext> |

BodyText explanation: The BodyText entry for the log will contain “Failed <number> certificate authentications”. However, over time, other events may occur, and the alarm BodyText will be updated with “Failed <number> certificate authentications in the last minute<updatetext>”, where <updatetext> is one of:

- “, <numberminor> Minor events since alarm creation” for Minor alarms
- “, <numbermajor> Major, <numberminor> Minor events since alarm creation” for Major alarms or
- “, <numbercritical> Critical, <numbermajor> Major, <numberminor> Minor events since alarm creation” for Critical alarms.

The original alarm log is not refreshed.

#### 2.4.2.2 Explanation

Description: See “SIPS301 - TLS failed certificate authentications over time” on page 937.

Severity: See “SIPS301 - TLS failed certificate authentications over time” on page 937.

#### 2.4.2.3 Action

See “SIPS301 - TLS failed certificate authentications over time” on page 937.

#### 2.4.2.4 Corresponding Clear Log

Log Title: SIPS301 with severity NONE.

### 2.4.3 Local Certificate Expiry Alarm

#### 2.4.3.1 Integrated Element Manager GUI Fields

For each new log, populate the following table with the values displayed in the IEMS Alarm Manager GUI. (Non-legacy logs only).

**Table 15: IEMS Alarm GUI Field descriptions**

| Field           | Value                                                 |
|-----------------|-------------------------------------------------------|
| Severity        | NONE, MINOR, MAJOR, or CRIT                           |
| Category        | <i>APC_Communications</i>                             |
| LogName         | SIPS                                                  |
| LogNumber       | 302                                                   |
| EventType       | TBL                                                   |
| EventLabel      | TBL                                                   |
| ProbableCause   | <i>keyExpired</i>                                     |

#### 2.4.3.2 Explanation

Description: See “SIPS302 - TLS Local certificate is expiring soon” on page 939.

Severity: See “SIPS302 - TLS Local certificate is expiring soon” on page 939.

**2.4.3.3 Action**

See “SIPS302 - TLS Local certificate is expiring soon” on page 939.

**2.4.3.4 Corresponding Clear Log**

Log Title: SIPS302 with severity NONE.

**2.5 Related documentation**

n/a

***Configuration for A00006893*****3.1 Hardware and Software Requirements**

Hardware/software required is a standard NGSS with a standard SN08 software load.

**3.2 Initial Configuration**

A standard SN07 load is the initial configuration for TLS-enabled NGSS.

**3.3 Office/Subnet parameters (OP/SP) (CM & SESM)**

Not Applicable. NGSS-only feature.

**3.4 Upgrade Considerations****3.4.1 Dump and Restore (CM)**

None.

**3.4.2 Element Management Upgrade**

Additional steps will be required to provision a new single certificate for the NGSS Sip application, Apache (NCGL), and Tomcat (NGSS). This tool must be executed manually.

**3.4.3 Downgrade impact**

None.

**3.5 Data schema (DS) (CM, MIBS, RDB)**

Not applicable.

**3.6 Service Orders (SO) (CM & SESM)**

Not applicable.

**3.7 Software optionality control (SOC)**

Not applicable. TLS will be standard on all SN08+ NGSS loads.

## 3.8 Element Management

### 3.8.1 New/modified GUIs

Table 12 New or modified GUIs

| GUI name               | NEW, CHANGED, or DELETED |
|------------------------|--------------------------|
| NGSS Tomcat Web Server | Changed                  |

### 3.8.2 GUI information

#### 3.8.2.1 GUI: NGSS Tomcat Web Server

This GUI is an NGSS-specific management tool.

The changes made to this GUI consist of:

- The addition of a Security menu under the provisioning menu
- The addition of Security configuration parameters web page
- The addition of a Certificates menu
- The addition of the Display local server certificate web page
- The addition of the Display Trusted certificates web page
- The addition of the Add Trusted certificate web page

##### 3.8.2.1.1 Functional description

Changes to the NGSS Tomcat GUI are as follows:

- A new “Security” subfolder has been added to the Provisioning folder of the Tomcat GUI.
- Under the “Security” subfolder a “Config Data” option has been added.
- Clicking on the “Security Params” option brings up the Security Params configuration page (see “Security Parameter Configuration Page” on page 946).
- Under the “Security” subfolder, a new “Certificates” subfolder has been added.
- Under the “Certificates” subfolder, the “Server Certificate”, “Remote Trusted Certificate”, and “Add Remote Trusted Certificates” options have been added.
- Clicking on the “Server Certificate” option brings up the Display Local Server Certificate page.
- Clicking on the “Remote Trusted Certificates” option brings up the Certificates Provisioned page.
- Clicking on the “Add Remote Trusted Certificates” option brings up the Add Trusted Certificate page.

- Changes to the “Add Server” and “Modify Server” section of the SIP Gateway GUI allow for the provisioning of servers using the TLS protocol, in addition to the TCP and UDP protocols.

### 3.8.2.1.2 GUI usage and implications

The purpose of the new Security Parameter Configuration Page is to change the values of the customer-accessible security parameters. From the table listed in the figure below, customers can choose to alter any of the visible parameters.

**Figure 2 Security Parameter Configuration Page**

This can be done in the following way:

- Clicking on any parameter option brings up a change screen for that parameter (see Figure 3 “Sample Pull-down Menu for Parameter Provisioning” on page 947, Figure 4 “Sample Text Input for Parameter Provisioning” on page 948, and Figure 5 “Sample Checklist Input for Parameter Provisioning” on page 949 below).
- Clicking on the “change” button on the change screen changes the value of that parameter in the NGSS SOLID database.

- Note that certain parameters (marked as Change Time = “CallP Restart” on the Configurable Parameters screen) require a restart of the NGSS CallP engine to effect the new parameter value.

A warning will be generated any time a security parameter is changed.

## Security Configuration Data

### Configure Security Properties and Settings

Enter new value for MaxTLSSessions:

---

**NOTE:** If a value is filled in for these fields, it must be a valid value for that field. The valid values for each parameter are documented in the SIP Session Server documentation. Contact Technical Support for more information.

**NOTE:** Modifications to this field do not take effect until the next SIP Gateway application restart.

Done

This GUI has default values set for the parameters that will allow the NGSS to operate properly with no datafill operations after the upgrade. Customers can change these values as needed.

**Figure 5 Sample Checklist Input for Parameter Provisioning.**

The parameters on these pages materially affect the behavior of TLS CallP and NGSS security. Changes to them can cause problems for the NGSS up to and including an outage, and/or leaving NGSS signalling data open to capture and/or attack. It is advised that only knowledgeable customer or Nortel representatives recommend changes to these values.

The purpose of the Display local server certificate web page is to provide an interface to retrieve the local certificate and drop it into a remote server's trusted certificate list (in the case of self-signed certificates). From the "Security" submenu, then the "Certificates" submenu, click the "Display Certificate" option (see Figure 6 "Display local server certificate web page" on page 950). Here, with a web page view to the Remote server, you could copy the certificate text as shown in the Display Certificate page, and paste it into the appropriate Remote Server's 'add trusted certificate' interface.

**Figure 6 Display local server certificate web page**

The purpose of the Display Trusted certificates web page is to provide an interface to view the current list of remote trusted certificates, and provide a way to remove them should the occasion arise. From the “Security” submenu, then the “Certificates” submenu, click the “Remote Trusted Certificates” option (see Figure 7 “Remote Trusted Certificates web page” on page 951). Each name in the list is unique, and to remove an item from the list, select the “Delete” option, at which point the craftperson would be asked to confirm the deletion and the request would then take place. If the confirmation is not granted, no action is taken.

**Figure 7 Remote Trusted Certificates web page**

**Certificates Provisioned**

This is a list of configured trusted certificates.

Deleting these certificates will take effect on the next application restart. Please contact Technical Support for assistance if needed.

| Certificate Name     | Certificate PEM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Delete                 |

The purpose of the Add Trusted certificate web page is to provide an interface to add to the current list of Remote Server Certificates that are trusted. From the “Security” submenu, then the “Certificates” submenu, click the “Add Remote Trusted Certificate” option (see Figure 8 “Add Remote Trusted Certificate web page” on page 952). When attempting to add a certificate to the list of trusted certificates, the name of the certificate must be unique, and the “-----BEGIN CERTIFICATE-----” and “-----END CERTIFICATE-----” lines must follow the example below. Instead of the word “CERTIFICATE”, the word “TRUSTED” could be used as well. Note that only PEM formatted (i.e. base64 encoded) certificates are acceptable.

The following figures demonstrate how to provision and/or modify a server so that it utilizes the TLS protocol rather than TCP or UDP.

Figure 9 "Adding a SIP Server using the TLS protocol." on page 953 demonstrates how to add a SIP server using TLS protocol. The difference between this method and the new method is small: the user simply selects "TLS" in the protocol field beside the IP address in question to enable the use of TLS. Then complete and submit the datafill as required.

Figure 10 "Modifying a SIP server to use TLS protocol." on page 954 demonstrates how to modify a SIP server to use the TLS protocol. The user chooses to modify the SIP server as is done normally. Using the drop-down menu of the protocol field next to the IP address in question, select "TLS". Then complete and submit the datafill changes as required.

**Figure 9 Adding a SIP Server using the TLS protocol.**

**Figure 10** Modifying a SIP server to use TLS protocol.

### 3.8.2.1.3 GUI Fields

The following table lists fields for the NGSS Tomcat Webserver Security Params GUI.

**Table 13** Security Parameters in Tomcat WebServer

| Parameter   | <b>maxTlsSessions</b>                       | Type          | Integer |
|-------------|---------------------------------------------|---------------|---------|
| Description | The Maximum number of TLS sessions allowed. | Default Value | 256     |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                      |            |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|------------|
| Effect of Change           | Changes the maximum number of TLS sessions allowed.<br>Important: NGSS callp must be locked/suspended and unsus-pended/unlocked to activate changes made on the web page.<br>Until the callp lock/suspend is performed, the displayed value will be inconsistent with the operational value.                                                                                                                                                                                                                                                                                                                                          | Minimum=<br>Maximum= | 10<br>2048 |
| Adverse Effects            | Setting the value lower than the number of clients trying to connect will freeze some clients out. In SN08, the clients are peer servers to the NGSS, so this means remote servers will be denied a secure connection to the NGSS.                                                                                                                                                                                                                                                                                                                                                                                                    |                      |            |
| Countering Adverse Effects | Set the value of the parameter as high as the maximum number of peer servers connected to this NGSS.<br>The network should be engineered so that fewer than 2048 peer servers need to connect to a single NGSS at once.                                                                                                                                                                                                                                                                                                                                                                                                               |                      |            |
| Parameter                  | <b>SessionCacheEnabled</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Type                 | Y/N        |
| Description                | Determines whether session caching is enabled or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Default Value        | Y          |
| Effect of Change           | Enabling the session cache speeds up the performance of TLS connection requests for enabled clients. Note that, if few or no peer servers to the NGSS have session-caching enabled clients, then little or no performance increase will be observed for TLS connection requests. (Note that peer servers to the NGSS are considered clients when they initiate a connection request.)<br><b>Important:</b> NGSS callp must be locked/suspended and unsus-pended/unlocked to activate changes made on the web page.<br>Until the callp lock/suspend is performed, the displayed value will be inconsistent with the operational value. |                      |            |
| Adverse Effects            | Activating session caching will allocate memory for the session cache. See the <b>SessionCacheSize</b> parm for details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                      |            |
| Countering Adverse Effects | See the <b>SessionCacheSize</b> parm for details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                      |            |
| Parameter                  | <b>SessionCacheSize</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Type                 | Integer    |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |               |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|---------------|
| Description                | The size of the TLS session cache. The session cache increases system performance by allowing clients that support session caching to bypass the time-consuming TLS handshake procedure after one handshake is done.                                                                                                                                                                                                               | Default Value  | 10            |
| Effect of Change           | A larger session cache speeds up the performance of TLS connection requests for enabled clients.<br><b>Important:</b> NGSS callp must be locked/suspended and unsuspended/unlocked to activate changes made on the web page. Until the callp lock/suspend is performed, the displayed value will be inconsistent with the operational value.                                                                                       | Allowed Values | 10, 100, 1000 |
| Adverse Effects            | The largest session cache setting (1000) consumes 1 MB of memory on the NGSS.                                                                                                                                                                                                                                                                                                                                                      |                |               |
| Countering Adverse Effects | In the event that 1MB of memory cannot be devoted to the session cache, memory can be reclaimed by reducing the size of the cache. This will reduce system performance if a relatively large number of clients were session-caching enabled. Remember to lock/suspend NGSS callp to enable the change.                                                                                                                             |                |               |
| Parameter                  | SessionCacheValidDuration                                                                                                                                                                                                                                                                                                                                                                                                          | Type           | Time          |
| Description                | The duration for which sessions are stored in the session cache. The session data is expunged from the cache either 24 hours or 7 days from when it was first inserted into the cache.<br><b>Important:</b> NGSS callp must be locked/suspended and unsuspended/unlocked to activate changes made on the web page. Until the callp lock/suspend is performed, the displayed value will be inconsistent with the operational value. | Default Value  | 7_Days        |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|---------------------|
| Effect of Change           | Every connecting client will be forced to do a full handshake on the first connection after its session is expunged from the cache. Changing this value changes the frequency with which this may happen. (Clients that typically stay connected for longer than 7 days will notice no difference.)<br><b>Important:</b> NGSS callp must be locked/suspended and unsuspended/unlocked to activate changes made on the web page. Until the callp lock/suspend is performed, the displayed value will be inconsistent with the operational value. | Allowed Values | 24_Hours;<br>7_Days |
| Adverse Effects            | Systems that have large numbers of clients making frequent connection requests may notice performance issues on the 24_Hours setting. In SN08, this should be rare.                                                                                                                                                                                                                                                                                                                                                                             |                |                     |
| Countering Adverse Effects | Increase the value of the SessionCacheValidDuration parameter to 7_Days, and lock/suspend NGSS callp to enable the change.                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                     |
| Parameter                  | localTLSPort                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Type           | Integer             |
| Description                | The port number TLS uses on the local NGSS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Default Value  | 5061                |
| Effect of Change           | Changes the port that TLS uses.<br><b>Important:</b> NGSS callp must be locked/suspended and unsuspended/unlocked to activate changes made on the web page. Until the callp lock/suspend is performed, the displayed value will be inconsistent with the operational value.                                                                                                                                                                                                                                                                     |                |                     |
| Adverse Effects            | Remote clients or remote peer servers may require intervention to connect properly to TLS working under a changed port number.                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                     |
| Countering Adverse Effects | Don't change the TLS port number unless absolutely necessary. 5061 is the default port number specified in the TLS standard (RFC 2246); we recommend that the TLS standard be followed.                                                                                                                                                                                                                                                                                                                                                         |                |                     |
| Parameter                  | TlsAllowedCipherSuites                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Type           | Checklist           |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|---------------------------|
| Description                | The cipher suites that TLS is allowed to use in secure communication.                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Default Value  | AES128-SHA                |
| Effect of Change           | Changes the set of ciphers that TLS is allowed to use. In SN08, only two ciphers are allowed; of those, AES128-SHA is mandatory. The NGSS will always accept TLS connections requested with the AES128-SHA cipher (providing, of course, that TLS is enabled in the first place).<br><b>Important:</b> NGSS callp must be locked/suspended and unsuspended/unlocked to activate changes made on the web page. Until the callp lock/suspend is performed, the displayed value will be inconsistent with the operational value. | Allowed Values | AES128-SHA;<br>AES256-SHA |
| Adverse Effects            | The only other choice available is AES256-SHA. This cipher uses larger (256-bit) keys. The user may notice a performance degradation with AES256-SHA allowed when compared to the default setting (AES128-SHA only).                                                                                                                                                                                                                                                                                                          |                |                           |
| Countering Adverse Effects | If a performance degradation is attributable to allowing AES256-SHA ciphers in TLS connections, then uncheck AES256-SHA and lock/suspend NGSS callp to enable the change.                                                                                                                                                                                                                                                                                                                                                     |                |                           |

#### 3.8.2.1.4 Usage example

The following example shows sample datafill selection for the NGSS Tomcat Security Params Configuration Web Page. Please refer to the figures cited below for examples.

Example:

1. Customer enters the NGSS EM web page.
2. Customer enters the NGSS Tomcat CallP Application webpage.
3. Customer clicks on the Provisioning Tab on the Menu Frame (see "Security Parameter Configuration Page" on page 946).
4. Customer clicks on the Security Tab.
5. Customer clicks on the Security Params link, which brings up the Security Configurable Parameters page.

6. Customer clicks on the “Modify” link beside the SessionCacheValid-Duration parameter. This brings up the Modify page for that parameter (see “Sample Pull-down Menu for Parameter Provisioning” on page 947).
7. Customer chooses between one of three options on the pull-down menu.
8. Customer can press “Change” to accept their newly chosen value, or click on another link to abort the change operation.

#### **3.8.2.1.5 GUI release history update**

For the NGSS Tomcat Application Web Server GUI, the following was added in SN08 due to this feature:

- The Security Folder, under the Provisioning folder.
- The Security Params Config page, under the Security folder.
- The Individual Security Parm Change page, accessible via per-parameter links from the Security Params Config page.

Note: The parameters displayed on the pages above are derived from entries entered in to the SOLID SQL database at loadbuild time.

- The Certificates Folder, under the Security Folder.
- The Server Certificate page, accessible via the Certificates Folder.
- The Remove Trusted Certificates page, accessible via the Certificates Folder.
- The Add Remote Trusted Certificate page, accessible via the Certificates Folder.

#### **3.8.2.1.6 Context sensitive launching information**

This GUI is accessed from a series of links starting on the NGSS main web page. The normal instructions for launching the NGSS Application Web Server can be followed for the new web pages described herein.

#### **3.8.2.1.7 Supplementary information**

All of the parameters described above require a NGSS CallP Restart in order to have the value active in the CallP Application. These parameters are marked by an orange text color on the Security Parm Configuration page (see Figure 2 “Security Parameter Configuration Page” on page 946), and also by a warning on the page where the parameter value is changed (see Figure 4 “Sample Text Input for Parameter Provisioning” on page 948).

The act of removing a trusted certificate from the list of trusted certificates will not be reflected until a CallP Restart as well. However, adding to the list of trusted certificates via the “Add Remote Trusted Certificate” web page will take effect immediately (assuming the certificate presented passes the applicable checks).

### 3.8.3 CLI Interface

#### 3.8.3.1 Certificate Management Tool (`cert_mgnt` or `cert_mgmt`)

The certificate management tool is a customer-visible tool that provides a common interface for provisioning certificates for use by Apache, Tomcat, and the NGSS Sip application.

As of SN08, all three applications use the same certificate.

The certificate management tool is located in `/sbin/cert_mgnt` or `/sbin/cert_mgmt`, and is executable only by the root user. Since `/sbin` is in the path, `cert_mgnt` can be executed from anywhere.

The certificate management tool provides three functions

- Create a new self-signed certificate for the host
- Create a certificate signing request. The craftsman would manually send the signing request to the Certificate Authority (CA) where it will be signed.
- Provision a trusted certificate (CAcertificate) and a CA-signed certificate produced from the signing request.

RSA encryption with SHA-1 only is supported by the three applications.

The tool makes permissions on private key files and the certificate keystore file to be read/write by the root user.

The `server.crt` contains the local server certificate. The `trusted.crt` file contains the certificate chain (for CA-signed certificates only) for the local server certificate. Both these files are read/write by the root user and readable by other users.

Anytime the certificate management tool is run to successful completion, the host must be rebooted, or the three applications that use the certificate must be stopped/ started.

To reboot the host as a root user: at the command prompt: `reboot`

If rebooting is not appropriate, then stopping/starting each application is necessary.

To stop/start Apache: locate the executable “`apachectl`” in the directory structure and type: `apachectl stop`. Once this is successful, type `apachectl start`

To stop/start Tomcat: locate the executable “`tomcatd`” in the directory structure and type: `tomcatd stop`. Once this is successful, type `tomcatd start`.

To stop the NGSS SIP application, the application must be locked and disabled and then enabled and unlocked using the NGSS GUI.

#### **3.8.3.1.1 Certificate Management**

Upon installation of the NGSS, the customer can either furnish their own certificates or use the certificate management tool.

If the customer furnishes their own certificates, they will be required to perform their own certificate management.

#### **3.8.3.1.2 Files used by the Certificate Management Tool**

**The directory /opt/base/share/ssl is the recommended directory to store all certificates, keys, and related files. The cert\_mgnt tool performs this automatically.**

**The tool is run only on 1 host, and the files are not synced/reflected to the other mate host in SN08. Therefore, the files must be manually copied to the other mate host using a secure method such as scp after the tool runs successfully.**

server.crt - Only the local server certificate is in this file. In the self-signed certificate option, this file is created automatically by the tool. In the CA-signed option, this file will be provided by the customer, and placed in a temporary directory for import by the tool.

trusted.crt - The certificate chain leading up to the root CA certificate is placed in this file. This file is provided by the customer, and placed in a temporary directory for import by the tool.

server.key - This file contains the private key corresponding to the certificate in server.crt

certificate.keystore - This file contains an encoded version of the server.crt, trusted.crt, and server.key file. This file is created automatically by the tool and is used by Tomcat.

The directory /opt/base/share/ssl should be backed up on a regular basis using a secure method in a physically and logically secure environment. This will help prevent unauthorized access to the private keys.

There are two files (cert\_gen.txt and assign\_cert.txt) that are placed in the /opt/base/share/ssl directory. These files are used by the tool and should not be removed.

#### **3.8.3.1.3 Certificate and Key revocation**

Not applicable.

#### 3.8.3.1.4 Self Signed Certificates

In this case, the craftsperson has chosen to use self-signed certificates.

- 1 In the case of self-signed certificates, the craftsperson selects option 1 in Figure 11 "Choose a Certificate Type" on page 964.
- 2 In order to proceed, the craftsperson must accept the disclaimer and the notice as indicated in:
  - Figure 12 "Disclaimer for Self-Signed Certificates (1 of 4)" on page 965,
  - Figure 13 "Disclaimer for Self-Signed Certificates (2 of 4)" on page 965,
  - Figure 14 "Disclaimer for Self-Signed Certificates (3 of 4)" on page 966, and
  - Figure 15 "Disclaimer for Self-Signed Certificates (4 of 4)" on page 967.

A customer log is generated logging the user's acceptance of the disclaimer.
- 3 Going back at any time will display the previous panel. Selecting proceed will only work if the craftsperson has entered the required information.
- 4 The craftsperson selects an RSA key size in Figure 13 "Disclaimer for Self-Signed Certificates (2 of 4)" on page 965. The key size can be 1024/1536/2048 bits. The higher the key size, the stronger the private key. There may be a performance impact to using higher key sizes due to additional encryption requirements.
  - If the key already exists in the /opt/base/share/ssl/ directory, the tool will prompt to reuse it or delete it and recreate a new key.
  - If the craftsperson wishes to reuse the key, the tool will always accept the key's current size. This is illustrated in Figure 17 "Key Already Exists" on page 969
  - If in Figure 17 "Key Already Exists" on page 969, the craftsperson select 'n' that they do not want to proceed, then the tool prompts for key deletion in Figure 18 "Remove Existing Key" on page 969.
  - If in Figure 17 "Key Already Exists" on page 969, the craftsperson select 'y' that they do want to proceed, then the tool will reuse the existing key and move on to step 5.

- If in Figure 18 "Remove Existing Key" on page 969, the craftsperson selects 'n' that they do want to proceed, the tool will then abort the current operation and return to the top of this step.
  - If in Figure 18 "Remove Existing Key" on page 969, the craftsperson selects 'y' that they do want to proceed, the tool will then make a backup of the existing key to another file in the same directory. A customer log is generated for this case.
- 5 The user must also select a length of time for which the certificate is valid. This is specified in Figure 19 "Expiry Days" on page 970. This is the number of days from the current date for which the certificate is valid.
  - 6 The craftsperson selects a country, state, and city name in Figure 20 "Country Name" on page 971, Figure 21 "State Name" on page 972, Figure 22 "Locality Name" on page 973. These fields are optional. Although they are optional, they help to identify the NGSS to a remote entity.
  - 7 The craftsperson selects an organizational name, and an organizational unit name in Figure 23 "Organizational Name" on page 974, and Figure 24 "Organizational Unit Name" on page 975. These fields optional. Although they are optional, they help to identify the NGSS to a remote entity.
  - 8 In Figure 25 "Common Name" on page 976, the craftsperson identifies the mandatory common name. In the case of the NGSS, this must be the IP address of the active NGSS host. This is used for mutual authentication and is necessary for the correct operation of the NGSS. There is no validation at this stage of the common name.
  - 9 In Figure 26 "Email Address" on page 977, the craftsperson identifies the optional email address of the local contact. There is no validation of the email address.
  - 10 Once all the information is entered, the tool displays a summary in Figure 27 "Summary for Self Signed Certificates" on page 978. Selecting "proceed" will generate the self signed certificate. The following message will be displayed on success:

```
Exporting certificate/key pair to PKCS#12 keystore
Certificate/key pair has been successfully exported to PKCS#12
format
Changing permissions on key file
Changing permissions on keystore file
```

If this message is displayed, the tool was successful at creating the self-signed certificate.

If the tool is successful in creating the self-signed certificate:

Server.crt will contain the local certificate

Server.key will contain the private key corresponding to the local certificate.

Trusted.crt will be an empty file if it did not already exist before the tool was run.

Certificate.keystore will contain the private key and local certificate.

Here is an example of the server. server.crt file respectively.

Certificate:

Data:

Version: 3 (0x2)

Serial Number: 0 (0x0)

Signature Algorithm: sha1WithRSAEncryption

Issuer: CN=10.66.18.72

Validity

Not Before: Nov 12 14:57:21 2004 GMT

Not After: Dec 12 14:57:21 2004 GMT

Subject: CN=10.66.18.72

Subject Public Key Info:

### Public Key Algorithm: rsaEncryption

RSA Public Key: (1024 bit)

Modulus (1024 bit):

```

### 3.8.3.1.5 Certificate Signing Request

- 1 In the case of a certificate signing request, the craftsperson selects option 2 in Figure 11 "Choose a Certificate Type" on page 964.
- 2 Going back at any time will display the previous panel. Selecting proceed will only work if the craftsperson has entered the required information.
- 3 The craftsperson selects an RSA key size in Figure 13 "Disclaimer for Self-Signed Certificates (2 of 4)" on page 965. The key size can be 1024/1536/2048 bits. The higher the key size, the stronger the private key. There may be a performance impact to using higher key sizes due to additional encryption requirements.
  - If the key already exists in the /opt/base/share/ssl/ directory, the tool will prompt to reuse it or delete it and recreate a new key.
  - If the craftsperson wishes to reuse the key, the tool will always accept the key's current size. This is illustrated in Figure 17 "Key Already Exists" on page 969
  - If in Figure 17 "Key Already Exists" on page 969, the craftsperson select 'n' that they do not want to proceed, then the tool prompts for key deletion in Figure 18 "Remove Existing Key" on page 969.
  - If in Figure 17 "Key Already Exists" on page 969, the craftsperson select 'y' that they do want to proceed, then the tool will reuse the existing key and move on to step 4.
  - If in Figure 18 "Remove Existing Key" on page 969, the craftsperson selects 'n' that they do want to proceed, the tool will then abort the current operation and return to the top of this step 3.
- 4 The craftsperson selects a country, state, and city name in Figure 20 "Country Name" on page 971, Figure 21 "State Name" on page 972, Figure 22 "Locality Name" on page 973. These fields are optional. Although they are optional, they help to identify the NGSS to a remote entity.
- 5 The craftsperson selects an organizational name, and an organizational unit name in Figure 23 "Organizational Name" on page 974, and Figure 24 "Organizational Unit Name" on page 975. These fields optional. Although they are optional, they help to identify the NGSS to a remote entity.

- 6 In Figure 25 "Common Name" on page 976, the craftsperson identifies the mandatory common name. In the case of the NGSS, this must be the IP address of the active NGSS host. This is used for mutual authentication and is necessary for the correct operation of the NGSS. There is no validation at this stage of the common name.
- 7 In Figure 26 "Email Address" on page 977, the craftsperson identifies the optional email address of the local contact. There is no validation of the email address.
- 8 In Figure 28 "Challenge Password" on page 982, the tool queries for a challenge password. This password is used by the tool only.
- 9 Once all the information is entered, the tool displays a summary Figure 29 "Certificate Signing Request Summary" on page 982. Selecting "proceed" will generate the self signed certificate. The following message will be displayed on success.

Generating Certificate Signing Request

Creating Certificate Signing Request

Certificate Signing Request has been successfully generated

Changing permissions on key file

- 10 The certificate signing request is sent to the Certificate Authority for signing and certificate generation. Once that is done, the certificate authority's certificate and the signed certificate are used to Validate the certificate chain in option 3 of the tool.

### 3.8.3.1.6 Validate Certificate Chain

In this case, the craftsperson wishes to provision the CA-signed certificate from the signing request in option 2.

The same private key that was generated in option 2 must be the same private stored in /opt/base/share/ssl at this time. The tool will verify that the certificate provided as the user certificate matches the private key file server.key in /opt/base/share/ssl.

- 1 In Figure 31 "CA certificate - trusted certificate" on page 989, the craftsperson supplies the full path and filename where the CA certificates can be found. The tool will not proceed unless the file exists. The root CA certificate and the chained certificate if applicable are added to this file. There are some guidelines as to the structure of this file.
  - Root CAs that do not correspond to the local server certificate are not placed in this file. They are added to the NGSS SIP application GUI under Add Trusted Certificates.
  - Only the Root CA corresponding to the local certificate is placed in this file, followed by the CA chain. For example, if the local certificate is signed by one of the global public root CAs, then that root CA certificate is placed in this file.

Here is an example of the file which is provided. In this case, it is a chain composed of a root CA, followed by 3 (three) intermediate chain CA.

At the top of the file is certificate of the Certificate Authority (CA), followed by each intermediate chain CA, followed by that last CA which ultimately signed the local certificate.

**Figure 30 Structure of trusted.crt file**

```

It is recommended that this file be placed in a temporary directory such as /tmp/. When the tool validates the file, it will copy the file to /opt/base/share/ssl/trusted.crt. The file in /tmp can then be deleted once the tool completes successfully.

- 2 In Figure 32 "Server Certificate - CA signed certificate" on page 990, the craftsperson supplies the full path and filename where the signed certificate can be found. The tool will not proceed unless the file exists. Only the local server/user certificate is placed in this file.

It is recommended that this file be placed in a temporary directory such as /tmp/. When the tool validates the file, it will copy the file to /opt/base/share/ssl/server.crt. The file in /tmp can then be deleted once the tool completes successfully.

- 3 In Figure 33 "Validation Summary" on page 991, once the craftsperson has provisioned both files, then the tool validates the certificates chain and the trusted certificate files. Upon success, the tool will display the following lines:

```

Provisioning CA Certificate
Verifying certificate/key pair
server.crt: OK

```

**Figure 33 Validation Summary**

```

**3.8.3.1.7 New Installation**

On a new installation, if there are no previous certificate files, then the craftsperson can initiate cert\_mgnt without issues of retaining old keys or certificates. The key file, certificate files (server.crt for the certificate file, and trusted.crt for the CA certificate), and certificate.keystore are created by default in the /opt/base/share/ssl directory and it is recommended to leave the files in that location.

The cert\_mgnt is run only on 1 unit of the NGSS, not on both. The files in /opt/base/share/ssl will have to be manually copied to the other NGSS host.

Cert\_mgnt tool is executed after the base NCGL installation and before the NGSS InstallApps script. Although technically, the cert\_mgnt tool can be run anytime, one of two actions must take place before any changes can take effect: 1) reboot machine, or 2) restart the Apache, Tomcat, and NGSS SIP application.

The craftsperson must also add the new certificate to the list of Remote Trusted Certificates on remote NGSS units.

#### **3.8.3.1.8 Upgrade using existing certificate and key files**

On an OS/application upgrade that will be using existing, the contents of /opt/base/share/ssl will have to be backed up to a safe storage (regular backups of this directory is recommended). Once the base OS upgrade is complete, then the contents of /opt/base/share/ssl are restored to the same directory. The NGSS application upgrade can then be executed. This will have to be done on both units.

When the 07 to 08 NCGL upgrade is complete, the use of certificates depends on whether the user wants to use certificates from 07.

In the case of re-using self-signed certificates, the files server.key, server.crt and certificate.keystore must be present in the /opt/base/share/ssl directory. The applications Apache, Tomcat, and Sipgwyappln should be either stopped/started, or the unit rebooted.

In the case of re-using CA signed certificates, run cert\_mgnt to re-import the server.crt and trusted.crt and to create the certificate.keystore file. This is necessary if trusted.crt, server.crt, server.key, and certificate.keystore do not already exist.

If the user wants to use new certificates after upgrading to 08, the user can run cert\_mgnt.

#### **3.8.3.1.9 Existing installation with new certificates or keys**

If the existing certificate has expired or the craftsperson wishes to use a new key, the cert\_mgnt tool will have to be executed again. The resulting files will need to be copied to the other NGSS host.

A reboot will be required for the changes to take effect.

If a remote server has a new key and or certificate, it is important for the craftsperson to remove the old certificate from the list of Remote Trusted Certificates on remote NGSS units. See section 3.8.2 "GUI information" on page 945.

The craftsperson must also add the new certificate to the list of Remote Trusted Certificates on remote NGSS units.

#### **3.8.3.1.10 Expired Certificates or Certificate Revocation**

There is no support for Certificate Revocation Lists in SN08. This is handled in the same manner as section 3.8.3.1.9 "Existing installation with new certificates or keys" on page 992.

#### **3.8.3.1.11 Copying certificate and key files to NGSS mate host**

The cert\_mgnt tool is executed only on 1 host of the NGSS, not both. The contents of /opt/base/share/ssl must be manually copied to the other NGSS

host. Please note that the key files and certificate files should be protected with proper root permissions only (this is done by the tool), and copied over using a secure copy protocol such as 'scp'.

#### **3.8.3.1.12 After provisioning a new certificate**

Once the new certificate/key pair is in place, the Apache, Tomcat, and SIPGWYAPPLN applications must be restarted to ensure they are using the new certificate. This can be handled by rebooting the unit on which the new certificate was provisioned on, or by just stopping and starting the individual applications.

### **3.9 OSSGate Interface Changes**

Not applicable.

### **3.10 Security**

The primary intent of this feature is to provide security on the signalling paths between the NGSS and its peer servers.

#### **3.10.1 Network configuration**

Network configurations should not be changed as a result of this feature.

#### **3.10.2 Key management**

Key management will be done automatically as part of certificate management procedures. Keys will thus be managed internally by the NGSS web server and/or CLI tools. No customer interface dealing with keys will be implemented.

#### **3.10.3 Protocol**

This activity is not making changes to protocols that are used to manage security.

This activity *is* introducing the use of the TLS protocol for inter-nodal CallP signalling communications between the NGSS and its peer servers and IP phone clients.

#### **3.10.4 Authentication**

This activity eliminates the need for different certificates for the Apache and Tomcat webservers. The only change that is obvious for the user is that, when using self-signed or unsigned certificates, the user will have to approve the use of only one certificate instead of two as is currently done.

### **3.11 Configuration Walkthrough**

See [“Element Management” on page 945](#).

# SN08 Feature Deltas

*Product = CS 2000*

## **A00006979--Synchronized Backup Restore Manager**

### *Functional Description*

#### **1.1 Applicable Solution(s)**

PT-IP, UA-IP, IAW

#### **1.2 Naming Conventions**

Throughout this document, the backup restore functionality delivered under this feature will be referred to in 3 distinct ways:

**Synchronous Backup Restore Manager (SBRM)** refers specifically to the IEMS launched synchronized backup/restore software. The SRBM will control/synchronize the backup related activities across other components/devices which contain related backup software.

**Device Backup Restore Manager (DBRM)** refers specifically to the component/device level backup software which is controlled by the SBRM.

**Backup Restore Manager** is a generic term encompassing both SBRM and DBRM functionalities and in general simply refers to the software which is common to both.

#### **1.3 Description**

The feature provides a centralized mechanism allowing the user to initiate a synchronous backup for the core components of the Succession Call Server. Providing this capability reduces the possibility of error caused by manual backup procedures on the various component platforms spread across the Succession Call Server solution.

In SN08, the Synchronous Backup Restore Manager will provide synchronous centralized control of the backup functionality resident within the following Succession Call Server components:

- CallServer 2000 Management Tools (CSMT) server
- MG9000 Element Manager (MG9KEM) server
- Supernode Data Manager (SDM) / Core Billing Manager (CBM) server.  
The software on the SDM/CBM acts only to allow control of the XACore/3PC backup. No SDM/CBM data is backed up via the Backup Restore Manager software.
- Integrated Element Management System (IEMS) server

**Note:** The IEMS may reside with the CSMT (and other applications) on the CSMT server.

**Figure 34 High Level Functional Overview of Backup Restore Manager Functionality**

#### Functional Description:

From the IEMS GUI, the user launches the Synchronous Backup Restore Manager command line interface and initiates a backup for the core components of the Succession Call Server. The Synchronous Backup Restore Manager receives the user request, and subsequently initiates a backup command sequence (using CLI commands over SSH) to execute a synchronous backup of the components. Once the backup is complete, the backup files are stored locally on each component.

## 1.4 Hardware Requirements or Dependencies

None.

## 1.5 Software Requirements or Dependencies

All platforms requiring Synchronous Backup Restore Manager driven imaging are required to package, install and configure the Backup Restore Manager software. This software should be incorporated within the specific build process of each individual platform.

All platforms requiring Backup Restore Manager software functionality should be Java compatible and should provide a resident Java runtime system (installation).

## 1.6 Limitations and restrictions

- **Restore of generated synchronized backup images is NOT supported in the SN08 Synchronous Backup Restore Manager software. Existing manual restore procedures must be followed in order to utilize the backup images produced by the Backup Restore Manager.**
- **The Backup Restore Manager system does not perform automatic spooling of backup data/image files to secure/redundant servers. Customers are required to manage their own secure server archiving capabilities. The Backup Restore Manager system will publish data/image files in pre-determined/configurable directories on various servers:**
  - **SSPSF Platform data/image file location: /data/bkresmgr/backup**
  - **XACore/3PC data/image file location: *Configurable* - see the CN section of this feature document.**
- Backup of program store and associated patches is not covered as part of the functionality associated with Synchronous Backup Restore Manager. If a customer needs to completely 'restore' a server/component, they will need to reinstall their applications and reapply the associated patches.
- The backup “abort” command may require manual cleanup/removal of some backup files. The user will be notified at “abort” command completion time if this is the case.
- The backup process itself can not be executed while certain constructive/destructive system audits are in progress (e.g. SESM’s CS2K Data Integrity Audit). In general, if a backup is attempted while these audits are in progress, the backup attempt will be rejected. However, some constructive/destructive audits will be postponed when a backup request is received (e.g. MG9KEM Network Element Audit). The architecture of the system in question determines the appropriate behavior. In general, any

system rejections of the backup request will result in an appropriate message being displayed to the Synchronous Backup Restore Manager client user. See section “1.7 Interactions” on page 998 for a full description of system interaction limitations.

- No system wide coordination between Synchronous Backup Restore Manager and other applications (e.g. UpgradeManager, CS2K Audits, CM dump scheduling, etc.) is delivered in SN08. All application activity interdependencies must be manually managed by the user. For example, scheduled activities such as audits should be stopped during system backup. Also, any automated CM image dumps should be cancelled since the Synchronous Backup Restore Manager will be used to drive the dump within a synchronized system wide backup window.
- APS and NPM queries will be disallowed during backup. This is due to the applications being shut down during backup. Active clients will be informed of the application shutdown.
- Backup of the MG9KEM in isolation is not recommended due the CSMT platform data dependency. The MG9KEM database is hosted on the CSMT server.
- Synchronous Backup Restore Manager user authorization only controls the launch of the CLI. CLI Command specific authorization is not provided, therefore only users authorized to actually launch the Synchronous Backup Restore Manager CLI will be allowed to perform query commands at the Synchronous Backup Restore Manager CLI.
- The software on the SDM/CBM acts only to allow control of the XACore/3PC backup. No SDM/CBM data is backed up via the Backup Restore Manager software.

## 1.7 Interactions

During the period when the backup is executing, user's of the various GUI and command line provisioning interfaces will be restricted from attempting actions which result in configuration and provisioning data changes. These restrictions include, but are not limited to the following:

- Adding/deleting/updating GWCs at the Call Server Management Tools (CSMT) GUI or OSSGate interface.
- Adding/deleting/updating gateways at the CSMT GUI or OSSGate interface.
- Adding/deleting/updating line service at the at the CSMT OSSGate interface.
- Manually invoking (or running via the scheduler) the various audits at the CSMT GUI.
- Adding/deleting/updating objects in the Integrated Element Management Server (IEMS) topology via the IEMS client.

- Adding/modifying collection jobs via the IEMS client.
- Using the Runtime Administration interface at the IEMS client to perform OSS configuration.
- Using the Security Administration interface at the IEMS client to add/delete Users/Groups/Operations.
- Using the Security Administration interface at the IEMS client to change a user password.
- Adding/deleting/updating Trunks/Carriers via the CSMT
- Node provisioning/deprovisioning via the SAM21EM
- ATM connection set provisioning/deprovisioning via the SAM21EM

## 1.8 Glossary

| Term   | Definition                                |
|--------|-------------------------------------------|
| CSMT   | Call Server Management Tools              |
| MG9KEM | Media Gateway 9000 Element Manager        |
| SDM    | Supernode Data Manager                    |
| CBM    | Core Billing Manager                      |
| IEMS   | Integrated Element Management System      |
| SESM   | Succession Element and Subelement Manager |
| OSS    | Operations Support System                 |

## *Fault Management for A00006979*

### 2.1 Fault management strategy

Synchronized Backup Manager will generate two customer logs:

- BKM600 if a system backup completes successfully.
- BKM601 if a system backup fails.
- Synchronized Backup Manager will generate one security log if a user without the correct permissions attempts to invoke the Backup Manager.

### 2.2 Fault management tools and utilities

#### 2.2.1 Faults, Alarms and Logs

Existing SSPFS customerlog and securitylog facilities.

### 2.3 Logs

#### Log Title/Log ID: BKM600

### 2.3.1 Formats

**2.5 Related documentation*****Configuration for A00006979*****3.1 Naming Conventions**

Throughout this document, the backup restore functionality delivered under this feature will be referred to in 3 distinct ways:

**Synchronous Backup Restore Manager (SBRM)** refers specifically to the IEMS launched synchronized backup/restore software. The SBRM will control/synchronize the backup related activities across other components/devices which contain related backup software.

**Device Backup Restore Manager (DBRM)** refers specifically to the component/device level backup software which is controlled by the SBRM.

**Backup Restore Manager** is a generic term encompassing both SBRM and DBRM functionalities and in general simply refers to the software which is common to both.

**3.2 Hardware and Software Requirements**

Backup Restore Manager functionality requires that the appropriate software is resident and configured in all platforms which require synchronized imaging. The Backup Restore Manager software itself will be included in various platform software packages such as the SSPFS and SDM. SSPFS Backup Restore Manager functionality will be used for integration of Call Server Management Tools (CSMT), the Media Gateway 9000 Element Manager (MG9KEM), the Integrated Element Manager Server (IEMS), and the Core Billing Manager (CBM). The software on the SDM/CBM acts only to allow control of the XACore/3PC backup. No SDM/CBM data is backed up via the Backup Restore Manager software.

On the SDM, ensure the Java Runtime Environment (JRE) 1.3 package is installed. This package is not installed by default on the SDM. At the sdmmtc swim, level look for the following packages and install them in given order

First apply,

*Java Runtime Environment Executables 1.3.0.0*

*Java Runtime Environment Libraries 1.3.0.0*

Now, apply the following packages,

*Java Runtime Environment Executables 1.3.0.15*

*Java Runtime Environment Libraries 1.3.0.15*

### 3.3 Initial Configuration

1. Install Backup Restore Manager as part of the various platform software package installations (e.g. CSMT, IEMS, etc.).
2. Configure the Secure Shell (SSH) users and keys on the various platforms. See “3.8.2 Configuring SSH Between the Various Backup Restore Manager servers” on page 1010. Also, ensure the bkmgrusr is created on SDM platforms See “12.8.1.1”
3. Configure the automated Synchronous Backup Restore Manager scheduler if automated system backups are required. See “Automated Synchronous Backup Restore Manager service” on page 1019.
4. Configure the specific Backup Restore Manager installations, setting the appropriate properties for the Synchronous Backup Restore Manager which resides in IEMS and the individual component level Backup Restore Managers which reside in the other platforms (e.g. CSMT, SDM, etc.).
5. Configure the CM telnet users and Logical volume information on SDM/CBM machines. See “Configuring CM access information for Backup” on page 1027.

### 3.4 Upgrade Considerations

The centralized, Synchronous Backup Restore Manager functionality at IEMS will be blocked until the time that all affected components (CSMT, SDM, CBM, MG9KEM) are upgraded to SN08 load levels.

#### 3.4.1 Dump and Restore (CM)

Not affected. Existing Dump and Restore will continue to function.

## 3.4.2 Element Management Upgrade

### 3.4.2.1 IEMS Database Table Spaces

In order to allow backup of only configuration data (as opposed to transient event and fault data) stored by IEMS, the Oracle database definitions are split into separate table spaces when IEMS is upgraded. A configuration table space and a runtime table space are created and existing tables are assigned to either space depending on the nature of the table data. Only the configuration table space is registered for backup.

### 3.4.3 Downgrade impact

None.

## 3.5 Element Management

### 3.5.1 New/modified GUIs

Table 14 New or modified GUIs

| GUI name                                  | NEW, CHANGED, or DELETED |
|-------------------------------------------|--------------------------|
| Request disallowed due to backup process. | NEW                      |

### 3.5.2 GUI information

#### 3.5.2.1 GUI name: IEMS System Backup Command Rejection Error Dialog

##### 3.5.2.1.1 Functional description

IEMS will present the user with a general error dialog when the user attempts to perform actions which are incompatible with Synchronous Backup Restore Manager activity.

##### 3.5.2.1.2 GUI usage and implications

No usage or implications for this GUI. It is simply an error response dialog.

##### 3.5.2.1.3 GUI size

Table 15 New or modified GUIs

| Abbreviated GUI name | Minimum instances | Maximum instances | Information on memory |
|----------------------|-------------------|-------------------|-----------------------|
| Backup Error         | 0                 | NA                | NA                    |

##### 3.5.2.1.4 GUI fields

The following table lists fields for GUI or pull down menu Backup Error.

**Table 16 GUI field descriptions**

| Field       | New or Changed | Subfield | Entry | Explanation and action           | Associated MIB entry |
|-------------|----------------|----------|-------|----------------------------------|----------------------|
| Text Reason | NEW            | NA       | NA    | User must accept error response. | NA                   |

**3.5.2.1.5 Usage example**

The following example shows sample datafill or menu selection for GUI Backup Error:

**3.5.2.1.6 GUI release history update**

Not applicable.

**3.5.2.1.7 Context sensitive launching information**

Not applicable.

**3.5.2.1.8 Supplementary information**

GUI Screen shot example (many other actions can be rejected with a similar error dialog):

**3.5.3 CLUI Interface**

The Synchronous Backup Restore Manager is invoked via a CLUI. The CLUI is started by IEMS. Once the user has entered the CLUI, only Synchronous Backup Restore Manager Commands are available to the user. The command prompt within the CLUI is “bkmgr>”. The following table shows the available commands and provides a brief description of each.

**Table 17 Synchronous Backup Restore Manager Supported Commands**

| Command  | Description                                        |
|----------|----------------------------------------------------|
| commands | Displays a list of commands available to the user. |

| Command         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| help [command]  | Displays help text. If the optional command name is omitted, help text for all commands will be displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| exit            | Exits the Synchronous Backup Restore Manager CLUI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| quit            | Exits the Synchronous Backup Restore Manager CLUI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| backup full     | <p>Performs all steps of a backup sequence.</p> <p>If a failure is encountered or an abort is issued, the backup stops at the completion of the current step in the backup sequence.</p> <p>Example: User issues the 'backup full' command. So the first thing the Synchronous Backup Restore Manager does is issue the command 'precheck' to all the Device Synchronous Backup Restore Managers on the supported nodes currently provisioned in IEMS. As the Device Backup Restore Managers are executing the precheck, the user issues the 'bkmgr abort'. AFTER the Device Backup Restore Managers are done with the prechecks it will stop the backup sequence and return all components to their initial states (e.g. startprov).</p> |
| backup auto     | <p>Performs all steps of a backup sequence.</p> <p>Note: This is a "hidden" command only to be invoked by the Synchronous Backup Restore Manager scheduler.</p> <p>If a failure is encountered or an abort is issued, the backup stops at the completion of the current step in the backup sequence and the system will be restored to it's pre-backup state.</p> <p>This does not imply a 'rollback'. It simply means if the Device Backup Restore Managers have executed the 'stopprov' command the 'startprov' command will be issued to ensure provisioning can proceed.</p>                                                                                                                                                          |
| backup abort    | Aborts a backup after completion of the current step. Returns all applications to a startprov state if required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| query status    | <p>Display the status of the backup on a high level.</p> <p>Example: Backup in progress. Backup failed, etc.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| query history   | <p>Display information about previous backups.</p> <p>Example: Last backup executed &lt;date&gt; &lt;time&gt; successful.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| query inventory | Displays the components available for backup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| precheck        | <p>Perform basic sanity checks to ensure the system is in a state to perform a backup.</p> <p>Example: Check disk space and possibly subtending component (application) health</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| stopprov        | Stops provisioning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| dumpdata        | Backup the critical data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| startprov       | Start provisioning (if stopped).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| verify          | <p>Checks the validity of the backed up data.</p> <p>Example: Validate DB data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Command     | Description                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------|
| activatenew | Marks the new backup data as the current backup.<br>Example: Move current backup to permanent location. |

All commands executed within the CLUI are synchronous commands. The command prompt will not be returned to the user until the requested command completes. Therefore, if the user wishes to perform an operation such as “query status” or “backup abort” while a command is executing, another CLUI instance must be started from IEMS, and the new command executed from the second CLUI instance.

Additionally, the Synchronous Backup Restore Manager allows only one backup related command to be running at a time. If a backup, or one of the commands that executes a backup step (precheck, stopprov, dumpdata, verify, startprov, activatenew), is invoked while a backup (or backup step) is in progress, the request will be rejected.

### 3.5.3.1 Execution of Backup Steps at Component Level

As the backup process, or steps of the backup process, are invoked from the CLUI, the Synchronous Backup Restore Manager distributes the commands to the various components/servers to be backed up. In rare instances, it may necessary to run various portions of the backup process on the individual components/servers themselves. This capability is provided, and is implemented as a CLUI interface as well.

This CLUI interface can be invoked by logging into the appropriate component via a Telnet session, and performing the following commands.

```
>cd /opt/nortel/bkresmgr/cbm  
>bkmgr
```

At this point, most of the commands listed in “Table 17 Synchronous Backup Restore Manager Supported Commands” on page 1005 can be used. The commands NOT available when running at this component level are as follows.

- backup full
- backup auto
- backup abort

This capability should be used only in rare circumstances, and care should be taken to keep the Synchronous Backup Restore Manager and this Device Backup Restore Manager in sync.

## 3.6 OSSGate Interface Changes

### 3.6.1 OSSGate Changes

No existing Service Order formats or logic is affected by Backup Restore Manager. However, when Backup Restore Manager is executing a synchronized backup of CSMT, non-query OSSGate commands will be rejected with an error indicating that commands are disallowed during system backup. All modes (CI, XML, TL1) of OSSGate will support the error response. The error response will be formatted as follows:

“SERVICE ORDERS NOT ALLOWED. SYSTEM BACKUP IS IN PROGRESS. COMMANDS MAY BE REATTEMPTED FOLLOWING COMPLETION OF THE SYSTEM BACKUP.”

## 3.7 Security

### 3.7.1 Key management

SSH common key authorization based on user ID is used to screen activity between the various Backup Restore Managers. A common encrypted key is defined for the bkmgrusr user ID and distributed to all Backup Restore Manager platforms for the bkmgrusr user ID (see “Configuring the bkmgrusr user ID and Password for SSH Common Key Authorization” on page 1009 and “3.8.2 Configuring SSH Between the Various Backup Restore Manager servers” on page 1010)

### 3.7.2 Authentication

SSH common key authorization based on user ID is used to screen activity between the various Backup Restore Managers. A common encrypted key is defined for the bkmgrusr user ID and distributed to all Backup Restore Manager platforms for the bkmgrusr user ID (see “Configuring the bkmgrusr user ID and Password for SSH Common Key Authorization” on page 1009 and “3.8.2 Configuring SSH Between the Various Backup Restore Manager servers” on page 1010). The SSH connections between the IEMS based Synchronous Backup Restore Manager and the various Device Backup Restore Managers in the subtending application servers (CSMT, MG9KEM, etc.) are authenticated using this common key for the bkmgrusr user ID.

The launch of the Synchronous Backup Restore Manager from the IEMS GUI is authenticated using existing user based screening. Only users permitted to perform system level configuration changes will be allowed to launch the Synchronous Backup Restore Manager CLI from IEMS. Once launched, all commands (both query and non-query) are available. No further command level authentication is provided.

## 3.8 Configuration Walkthrough

### 3.8.1 Configuring the bkmgrusr user ID and Password for SSH Common Key Authorization

Before configuring SSH between the Backup Restore Manager servers the bkmgrusr user ID and password must be configured on all Backup Restore Manager Servers.

#### 3.8.1.1 Configuring the bkmgrusr user ID and Password for SSH Common Key Authorization on SSPFS Based Platforms

On SSPFS based platforms, the bkmgrusr user ID is configured by default without a password. The bkmgrusr user ID password must be configured on all SSPFS based Backup Restore Manager servers using the Integrated EMS Central Security Server. Refer to section “Changing user password” in NN10336-611 Integrated EMS Security Administration.

Refer to section “Configuring the Integrated EMS central security server in the network” in NN10336-611 Integrated EMS Security Administration for configuring the Integrated EMS Central Security Server, and section “Configuring a central security client” in NN10336-611 Integrated EMS Security Administration for configuring an Integrated EMS Central Security client.

#### 3.8.1.2 Configuring the bkmgrusr user ID and Password for SSH Common Key Authorization on SDM Based Platforms

On the SDM AIX platform, the bkmgrusr user ID and password needs to be configured in order for the SBRM to communicate with the DBRM.

1. Login to the DBRM (AIX/SDM box) by typing

>telnet <server> and pressing the Enter key. Where the server is the IP address or hostname of the SDM-AIX server where the Synchronous Backup Restore Manager is installed.

2. When prompted, login as root by entering root and password for root.
3. After login, create the user by typing

```
mkuser bkmgrusr
```

4. Now create the groups emsmtc, emsadm, emsrw by typing

```
mkgroup emsmtc
```

```
mkgroup emsadm
```

```
mkgroup emsrw
```

5. Now, make this user **bkmgrusr** belong to primary group **maint** and secondary group **emsmtc, emsadm, emsrw**

**chuser pgrp=maint groups=emsmtc,emsadm,emsrw home=/home/bkmgrusr  
admin=true shell=/bin/ksh bkmgrusr**

6. You can now confirm that the user bkmgrusr belongs to the groups maint, emsmtc, emsadm, emsrw by typing

**groups bkmgrusr**

and it will display the groups associated with this user.

7. Set the password for this user bkmgrusr by typing

**passwd bkmgrusr**

This new user is 'locked out' i.e. disabled until the password is set.

8. Logout as root and re login back to the AIX/SDM server as bkmgrusr. It would prompt the user to change password. After changing password the user would be logged in to the server. Go to the home directory if not already there

**cd /home/bkmgrusr**

**mkdir.ssh**

**chmod 700.ssh**

### 3.8.2 Configuring SSH Between the Various Backup Restore Manager servers

1. Telnet to the IEMS server where the Synchronous Backup Restore Manager is installed by typing  
> **telnet <server>** and pressing the Enter key. Where the server is the IP address or hostname of the IEMS server where the Synchronous Backup Restore Manager is installed.
2. When prompted, enter your user ID and password.
3. Change to the root user by typing  
\$ **su - root** and pressing the Enter key.
4. When prompted, enter the root password.

5. If you are setting up SSH for the first time, or are changing the SSH keys follow the procedures outlined in “Generate SSH key and transfer to Device Backup Restore Manager server” on page 1011. If you need to transfer an existing SSH key to a new or existing DBRM follow the procedures outline in “Transfer Existing SSH key to Device Backup Restore Manager server” on page 1015.

### 3.8.2.1 Generate SSH key and transfer to Device Backup Restore Manager server

1. Run the Backup Restore Manager configuration to setup SSH between the Synchronous Backup Restore Manager and various Device Backup Restore Managers:

- a. Change directory to the Backup Restore Manager configuration location and run the Backup Restore manager configuration:

```
$ cd /opt/bkresmgr/admin/bin
```

```
$ ./configure
```

Example response:

Backup Restore Manager Configuration

1 - Backup Restore Manager SSH Setup

2 - Automated Synchronous Backup Restore  
Manager Service

X - exit

select - [X, 1-2]

- b. When prompted select 1 for Backup Restore Manager SSH Setup.

Example Response:

SSH Setup for Synchronous Backup Restore Manager

1 - Generate SSH key and transfer to Device  
Backup Restore Manager servers

2 - Transfer existing SSH key to Device Backup  
Restore Manager servers

X - exit

select - [X, 1-2]

- c. When prompted select 1 for Generate SSH key and transfer to Device Backup Restore Manager servers.

Example Response:

Generate SSH key for Synchronous Backup Restore Manager and transfer to Device Backup Restore Manager servers.

WARNING: Running this script will generate a new SSH key for the bkmgrusr.

This new SSH key must be transferred to all existing and new Device Backup Restore Manager servers.

Do you want to continue? [y/n]:

- d. When prompted, enter Y to continue.

Example response:

Generating SSH key for bkmgrusr.

Sun Microsystems Inc. SunOS 5.9 Generic  
May 2002

Generating public/private rsa key pair.

Enter file in which to save the key  
(/export/home/bkmgrusr/.ssh/id\_rsa):

- e. When prompted, press the Enter key to accept default location of key file.

Example response:

Your identification has been saved in  
/export/home/bkmgrusr/.ssh/id\_rsa.

Your public key has been saved in  
/export/home/bkmgrusr/.ssh/id\_rsa.pub.

The key fingerprint is:

33:99:17:f0:ac:2a:3a:86:a9:d9:76:65:e6:70:4b:6  
8 bkmgrusr@comp5iems

Synchronizing files IF clustered node

Transfer existing SSH key to Device Backup  
Restore Manager servers

WARNING: You must have the password for the  
bkmgrusr on the Device Backup Restore Manager  
server to transfer the SSH key.

Do you want to transfer the SSH key? [y/n]:

- f. When prompted, enter Y to transfer the SSH key.

Example response:

```
Setting up to transfer SSH key to DBRM server.
```

```
Enter hostname or IP address of DBRM server to  
transfer the SSH key to:
```

- g. When prompted, enter the DBRM server hostname or IP address.

Example response:

```
Platform type of DBRM server to transfer SSH  
key to:
```

```
1 - SSPFS
```

```
2 - SDM
```

```
Enter platform type of DBRM server to transfer  
SSH key to - [1-2]:
```

- h. When prompted, enter 1 if DBRM server is a SSPFS based server or 2 if DBRM server is a SDM based server.

Example response:

```
Sun Microsystems Inc.   SunOS 5.9           Generic  
May 2002
```

```
The authenticity of host 'comp5iems  
(47.142.128.85)' can't be established.
```

```
RSA key fingerprint is  
ff:eb:a8:87:14:d0:82:28:5c:43:70:5a:ab:af:e6:f  
d.
```

```
Are you sure you want to continue connecting  
(yes/no)?:
```

- i. When prompted, enter yes to continue connecting.

Example response:

```
Warning: Permanently added  
'comp5iems,47.142.128.85' (RSA) to the list of  
known hosts.
```

```
Password:
```

- j. When prompted, enter the password for the bkmgrusr on the DBRM server.

Example response:

```
Transfer of SSH key to comp5iems complete.
```

- k. At this point, SSH will be set up for two alternate names of the server. Responses will vary depending on whether a server name or IP address was entered in the above steps, or if the server had been set up previously. Input may be required for either, both, or neither alternate name. The following examples provide one response requiring input, and one response that does not require input.

Example response:

```
Verifying SSH setup for  
'comp5iems.us.nortel.com'
```

```
The authenticity of host  
'comp5iems.us.nortel.com (47.142.128.85)' can't  
be established.
```

```
RSA key fingerprint is  
ff:eb:a8:87:14:d0:82:28:5c:43:70:5a:ab:af:e6:f  
d.
```

```
Are you sure you want to continue connecting  
(yes/no)?:
```

When prompted, enter yes.

```
Warning: Permanently added  
'comp5iems.us.nortel.com' (RSA) to the list of  
known hosts.
```

```
Successful
```

```
Verifying SSH setup for '47.142.128.85'
```

```
Successful
```

```
Is DBRM comp5iems a High Availability (HA)  
server? [y/n]:
```

2. If DBRM server is a HA server, enter Y. Otherwise enter N and proceed to Step 3.

**Note:** You need to know the password for the root user on the NBRM server to complete the following steps.

- a. Synchronize the SSH data on the NBRM server:

Example response:

```
WARNING: On HA DBRM servers, SSH setup is not
complete unless one of the following steps is
performed.
```

- a) The HA DBRM server comp5iems is cloned.
- b) The SSH data on HA DBRM comp5iems is manually synched.

```
WARNING: Choosing this option requires
the root password for comp5iems.
```

```
Do you want to manually synchronize the SSH
data on DBRM comp5iems now [y/n]
```

- b. When prompted, enter Y to manually synchronize the SSH data:

Example response:

```
Password:
```

- c. When prompted, enter the password for the root user on the NBRM server.

Example response:

```
Synchronization of SSH data on DBRM comp5iems
complete.
```

3. Repeat Step 1 f through 2 for each DBRM server.

**Note:** The SSH key must be transferred within the server it is created on. This is due to the configuration where both a SBRM and DBRM reside on the same server and use SSH to communicate within the server.

To transfer the SSH key within the server it is created on, simply enter the name (or IP address) of the server in step 1 g.

### 3.8.2.2 Transfer Existing SSH key to Device Backup Restore Manager server

1. Run the Backup Restore Manager configuration to setup SSH between the Synchronous Backup Restore Manager and various Device Backup Restore Managers:
  - a. Change directory to the Backup Restore Manager configuration location and run the Backup Restore manager configuration:  
**\$ cd /opt/bkresmgr/admin/bin**

```
$ ./configure
```

Example response:

Backup Restore Manager Configuration

- 1 - Backup Restore Manager SSH Setup
- 2 - Automated Synchronous Backup Restore Manager Service

X - exit

select - [X, 1-2]

- b. When prompted select 1 for Backup Restore Manager SSH Setup.

Example Response:

SSH Setup for Synchronous Backup Restore Manager

- 1 - Generate SSH key and transfer to Device Backup Restore Manager servers
- 2 - Transfer existing SSH key to Device Backup Restore Manager servers

X - exit

select - [X, 1-2]

- c. When prompted select 2 for Transfer existing SSH key to Device Backup Restore Manager servers.

Example Response:

Transfer existing SSH key to Device Backup Restore Manager servers

WARNING: You must have the password for the bkmgrusr on the Device Backup Restore Manager server to transfer the SSH key.

Do you want to transfer the SSH key? [y/n]:

- d. When prompted, enter Y to transfer the SSH key.

Example response:

Setting up to transfer SSH key to DBRM server.

Enter hostname or IP address of DBRM server to transfer the SSH key to:

- e. When prompted, enter the DBRM server hostname or IP address.

Example response:

```
Platform type of DBRM server to transfer SSH
key to:
```

```
1 - SSPFS
```

```
2 - SDM
```

```
Enter platform type of DBRM server to transfer
SSH key to - [1-2]:
```

- f. When prompted, enter 1 if DBRM server is a SSPFS based server or 2 if DBRM server is a SDM based server.

Example response:

```
Sun Microsystems Inc.   SunOS 5.9           Generic
May 2002
```

```
The authenticity of host 'comp5iems
(47.142.128.85)' can't be established.
```

```
RSA key fingerprint is
ff:eb:a8:87:14:d0:82:28:5c:43:70:5a:ab:af:e6:f
d.
```

```
Are you sure you want to continue connecting
(yes/no)?:
```

- g. When prompted, enter yes to continue connecting.

Example response:

```
Warning: Permanently added
'comp5iems,47.142.128.85' (RSA) to the list of
known hosts.
```

```
Password:
```

- h. When prompted, enter the password for the bkmgrusr on the DBRM server.

Example response:

```
Transfer of SSH key to comp5iems complete.
```

- i. At this point, SSH will be set up for two alternate names of the server. Responses will vary depending on whether a server name or IP address

was entered in the above steps, or if the server had been set up previously. Input may be required for either, both, or neither alternate name. The following examples provide one response requiring input, and one response that does not require input.

Example response:

```
Verifying SSH setup for  
'comp5iems.us.nortel.com'
```

```
The authenticity of host  
'comp5iems.us.nortel.com (47.142.128.85)' can't  
be established.
```

```
RSA key fingerprint is  
ff:eb:a8:87:14:d0:82:28:5c:43:70:5a:ab:af:e6:f  
d.
```

```
Are you sure you want to continue connecting  
(yes/no)?:
```

When prompted, enter yes.

```
Warning: Permanently added  
'comp5iems.us.nortel.com' (RSA) to the list of  
known hosts.
```

```
Successful
```

```
Verifying SSH setup for '47.142.128.85'
```

```
Successful
```

```
Is DBRM comp5iems a High Availability (HA)  
server? [y/n]:
```

2. If DBRM server is a HA server, enter Y. Otherwise enter N and proceed to Step 3.

**Note:** You need to know the password for the root user on the NBRM server to complete the following steps.

- a. Synchronize the SSH data on the NBRM server:

Example response:

```
WARNING: On HA DBRM servers, SSH setup is not  
complete unless one of the following steps is  
performed.
```

- a) The HA DBRM server comp5iems is cloned.
- b) The SSH data on HA DBRM comp5iems is manually synched.

WARNING: Choosing this option requires the root password for comp5iems.

Do you want to manually synchronize the SSH data on DBRM comp5iems now [y/n]

- b. When prompted, enter Y to manually synchronize the SSH data:

Example response:

Password:

- c. When prompted, enter the password for the root user on the NBRM server.

Example response:

Synchronization of SSH data on DBRM comp5iems complete.

- 3. You will be prompted to transfer the SSH key to another DBRM server. Enter Y to transfer SSH key to another DBRM server. Enter N if you do not want to transfer SSH key to another DBRM server. If you enter N you have completed the procedure.

Example response:

WARNING: You must have the password for the bkmgrusr on the Device Backup Restore Manager server to transfer the SSH key.

Do you want to transfer the SSH key to another DBRM server? [y/n]:

- 4. Repeat Step 1 d through 3 for each DBRM server you want to transfer the SSH key to.

### 3.8.3 Automated Synchronous Backup Restore Manager service

#### 3.8.3.1 Configuring the Automated Synchronous Backup Restore Manager service

- 1. Telnet to the IEMS server where the Synchronous Backup Restore Manager is installed by typing  
> **telnet <server>** and pressing the Enter key. Where the server is the IP address or hostname of the IEMS server where the Synchronous Backup Restore Manager is installed.

2. When prompted, enter your user ID and password.
3. Change to the root user by typing  
\$ **su - root** and pressing the Enter key.
4. When prompted, enter the root password.
5. Run the Backup Restore Manager configuration. Change directory to the Backup Restore Manager configuration location and run the Backup Restore manager configuration:  
\$ **cd /opt/bkresmgr/admin/bin**

\$ **./configure**

Example response:

Backup Restore Manager Configuration

```
1 - Backup Restore Manager SSH Setup
2 - Automated Synchronous Backup Restore
  Manager Service
X - exit
select - [X, 1-2]
```

6. When prompted select 2 for Automated Synchronous Backup Restore Manager Service.

Example Response:

Automated Synchronous Backup Restore Manager Service

```
1 - Configure Automated Synchronous Backup Restore
  Manager Service
2 - Start the Automated Synchronous Backup Restore
  Manager Service
3 - Stop the Automated Synchronous Backup Restore
  Manager Service
4 - View the Automated Synchronous Backup Restore
  Manager Service Configuration
X - exit
select - [X, 1-4]
```

7. When prompted select 1 for Configure Automated Synchronous Backup Restore Manager Service.

Example Response:

Automated Synchronous Backup Restore Manager Service Configuration

Configuring the Automated Synchronous Backup Restore Manager Service does not START the service. Return to the previous menu and select 'Start the Automated Synchronous Backup Restore Manager Service' to start the service.

Day of week to run the Synchronous Backup Restore Manager:

This is day of the week the Synchronous Backup Restore Manager will execute a full backup.

- 1 - MONDAY
- 2 - TUESDAY
- 3 - WEDNESDAY
- 4 - THURSDAY
- 5 - FRIDAY
- 6 - SATURDAY
- 7 - SUNDAY

Enter day of week to run the Synchronous Backup Restore Manager (default: SUNDAY):

8. When prompted enter the number corresponding to the day of the week.

Example Response:

Hour to run the Synchronous Backup Restore Manager based on 24 hour clock:

Example 1 is 1 AM, 12 is noon, and 24 is midnight.

This is the hour on the SATURDAY the Synchronous Backup Restore print Manager will execute a full backup.

Enter hour to run the Synchronous Backup Restore Manager (default: 24)

9. When prompted enter a number corresponding to the time on the day of the week (based on a 24 hour clock).

Example Response:

Automated Synchronous Backup Restore Manager Service Configuration complete.

10. You have completed this procedure. To start the Automated Synchronous Backup Restore Manager Service refer to.

### 3.8.3.2 Starting the Automated Synchronous Backup Restore Manager service

1. Telnet to the IEMS server where the Synchronous Backup Restore Manager is installed by typing  
> **telnet <server>** and pressing the Enter key. Where the server is the IP address or hostname of the IEMS server where the Synchronous Backup Restore Manager is installed.
2. When prompted, enter your user ID and password.
3. Change to the root user by typing  
\$ **su - root** and pressing the Enter key.
4. When prompted, enter the root password.
5. Run the Backup Restore Manager configuration. Change directory to the Backup Restore Manager configuration location and run the Backup Restore manager configuration:  
\$ **cd /opt/bkresmgr/admin/bin**

\$ **./configure**

Example response:

Backup Restore Manager Configuration

```
1 - Backup Restore Manager SSH Setup
2 - Automated Synchronous Backup Restore
    Manager Service
X - exit
select - [X, 1-2]
```

6. When prompted select 2 for Automated Synchronous Backup Restore Manager Service.

Example Response:

Automated Synchronous Backup Restore Manager Service

```
1 - Configure Automated Synchronous Backup Restore
    Manager Service
2 - Start the Automated Synchronous Backup Restore
    Manager Service
3 - Stop the Automated Synchronous Backup Restore
    Manager Service
4 - View the Automated Synchronous Backup Restore
    Manager Service Configuration
X - exit
```

```
select - [X, 1-4]
```

7. When prompted select 2 for Start the Automated Synchronous Backup Restore Manager Service.

Example Response:

```
Start the Automated Synchronous Backup Restore  
Manager Service
```

```
WARNING: Running this script will start the  
Automated Synchronous Backup Restore Manager  
Service
```

```
Starting the service does not initiate a backup  
until the day and time configured.
```

```
Do you want to continue? - [y/n]:
```

8. When prompted enter Y to start the Automated Synchronous Backup Restore Manager Service.

Example Response:

```
Registering with SERVMAN.
```

```
Starting the Automated Synchronous Backup Restore  
Manager Service.
```

```
Starting AUTO_BACKUP_MANAGER through servstart  
AUTO_BACKUP_MANAGER Started
```

9. You have completed this procedure.

### 3.8.3.3 Stopping the Automated Synchronous Backup Restore Manager service

1. Telnet to the IEMS server where the Synchronous Backup Restore Manager is installed by typing  
> **telnet <server>** and pressing the Enter key. Where the server is the IP address or hostname of the IEMS server where the Synchronous Backup Restore Manager is installed.
2. When prompted, enter your user ID and password.
3. Change to the root user by typing  
\$ **su - root** and pressing the Enter key.
4. When prompted, enter the root password.

5. Run the Backup Restore Manager configuration. Change directory to the Backup Restore Manager configuration location and run the Backup Restore manager configuration:

```
$ cd /opt/bkresmgr/admin/bin
```

```
$ ./configure
```

Example response:

```
Backup Restore Manager Configuration
```

```
1 - Backup Restore Manager SSH Setup
```

```
2 - Automated Synchronous Backup Restore  
    Manager Service
```

```
X - exit
```

```
select - [X, 1-2]
```

6. When prompted select 2 for Automated Synchronous Backup Restore Manager Service.

Example Response:

```
Automated Synchronous Backup Restore Manager  
Service
```

```
1 - Configure Automated Synchronous Backup Restore  
    Manager Service
```

```
2 - Start the Automated Synchronous Backup Restore  
    Manager Service
```

```
3 - Stop the Automated Synchronous Backup Restore  
    Manager Service
```

```
4 - View the Automated Synchronous Backup Restore  
    Manager Service Configuration
```

```
X - exit
```

```
select - [X, 1-4]
```

7. When prompted select 3 for Stop the Automated Synchronous Backup Restore Manager Service.

Example Response:

```
Stop the Automated Synchronous Backup Restore  
Manager Service
```

```
WARNING: Running this script will stop the  
Automated Synchronous Backup Restore Manager  
Service
```

Stopping the service does not abort a backup in progress.

Do you want to continue? - [y/n]:

8. When prompted enter Y to stop the Automated Synchronous Backup Restore Manager Service.

Example Response:

Stopping the Automated Synchronous Backup Restore Manager Service.

Stopping group using servstop  
AUTO\_BACKUP\_MANAGER Stopped

Deregistering with SERVMAN

9. You have completed this procedure.

#### 3.8.3.4 Viewing the Automated Synchronous Backup Restore Manager service configuration

1. Telnet to the IEMS server where the Synchronous Backup Restore Manager is installed by typing  
> **telnet <server>** and pressing the Enter key. Where the server is the IP address or hostname of the IEMS server where the Synchronous Backup Restore Manager is installed.
2. When prompted, enter your user ID and password.
3. Change to the root user by typing  
\$ **su - root** and pressing the Enter key.
4. When prompted, enter the root password.
5. Run the Backup Restore Manager configuration. Change directory to the Backup Restore Manager configuration location and run the Backup Restore manager configuration:  
\$ **cd /opt/bkresmgr/admin/bin**  
\$ **./configure**

Example response:

Backup Restore Manager Configuration  
1 - Backup Restore Manager SSH Setup

```
2 - Automated Synchronous Backup Restore
    Manager Service
```

```
X - exit
```

```
select - [X, 1-2]
```

6. When prompted select 2 for Automated Synchronous Backup Restore Manager Service.

Example Response:

```
Automated Synchronous Backup Restore Manager
Service
```

```
1 - Configure Automated Synchronous Backup Restore
    Manager Service
```

```
2 - Start the Automated Synchronous Backup Restore
    Manager Service
```

```
3 - Stop the Automated Synchronous Backup Restore
    Manager Service
```

```
4 - View the Automated Synchronous Backup Restore
    Manager Service Configuration
```

```
X - exit
```

```
select - [X, 1-4]
```

7. When prompted select 4 for View the Automated Synchronous Backup Restore Manager Service Configuration.

Example Response:

```
The Automated Synchronous Backup Restore Manager
Service is running
```

```
Automated Synchronous Backup Restore Manager
Service Configuration Settings
```

```
Backup Enabled                               : Y
```

```
Backup Day                                   : SATURDAY
```

```
Backup Hour                                  : 23
```

8. You have completed this procedure.

### 3.8.4 Configuring CM access information for Backup

Before the software can automatically back up image on CM, the user needs to configure information to access CM. This section covers the necessary steps which needs to be done, before CM backup will be successful when initiated through the Synchronous Backup Restore Manager. On the SDM (AIX), as soon as the software is installed, this configuration script will be run automatically by SWIM. However on Core Billing Manager machine (Solaris), the user has to manually do the steps (1 - 6)

1. 1. telnet to Core Billing Manager machine, one of which would have been chosen in the network to interface with the CM by typing

```
#telnet <server>
```

2. When prompted, enter your user ID and password.
3. Change to the root user by typing  
\$ **su - root** and pressing the Enter key.
4. When prompted, enter the root password.
5. cd to /opt/nortel/bkresmgr/cbm/scripts directory
6. Run the configure script by typing

```
#./bkmgr_config.sh and hit the <enter> key
```

This script will prompt the following information

- a. user name: This is the user name which will be used to login to CM to initiate image dump. The script restricts you to have user name of 16 characters. First permit this user on the CM before doing this configuration. See Section 12.12.2.1 Setting user id on CM
- b. password: This is the password for the user entered above. The script restricts you to have password of 16 characters. First permit this user on CM before doing this configuration. See Section 12.12.2.1 Setting user id on CM
- c. Logical Volume: This is the device in which the image dump will be stored. User should ensure that this device has enough space for backup
- d. CM type: The type of CM, whether it is Xacore or Compact. This information is needed so the software knows whether CM will have Message Switch load also.

Shown below is screen output running this configure script.

```
# ./bkmgr_config.sh
Backup Restore Manager Configuration
```

---

Enter the CM user name: bkuser

Enter the password for bkuser:

Enter the Logical volume where backup is to be stored: sd01image

Enter the type of CM 1.XA-Core 2. Compact [1/2]: 2

Please wait while storing configuration information...

### 3.8.4.1 Setting user id on CM

#### At the CI prompt on the switch

```
> permit <backup-user> <password> 4 10000 ENGLISH ALL
```

where,

<backup-user> is the user name for user which will be used by Backup Restore Manager to login

<password> is the password for the <backup-user>

4 is the priority

10000 is the stacksize

and language is ENGLISH

privilege is ALL

The type of operations done by this user are shown below

- i. Set dump\_restore\_in\_progress field in ofcstd table
- ii. start image dump
- iii. should be able to run itocci command set
- iv. should be able to do diskut commands

**Note 1:** If Enhanced Password control is in effect on CM, the password should be atleast 6 characters long.

**Note 2:** If Enhanced Password control is in effect on CM, after the user is permitted on the switch, login to CM manually with this user first. The CM will prompt you to change the password at first login after being permitted. Change the password and then do the configuration on SDM/CBM with the

user and the changed password. Backup Restore Manager software does not have ability to manage passwords. Hence, the customer needs to ensure that when the passwords expire and change on CM for this 'backup-user', CBM/SDM configuration should be re-run to ensure the Device Backup Restore Manager has password in sync with CM.

## ***Product = CS 2000***

### **A00007024--Core Element Manager (CEM) Patching** ***Functional Description***

#### **1.1 Applicable Solution(s)**

PT-IP, UA-IP, IAC, PT-AAL2

#### **1.2 Description**

In SN08, the CEM will be integrated with the Integrated Element Management System (IEMS) on Solaris. IEMS is patched via the Network Patch Manager (NPM). It is required that one patch management system be used with all applications on the same node. Therefore, the CEM integrated with IEMS will also be patched by the NPM.

**Figure 35 CEM Integrated with IEMS**

##### **1.2.1 Incremental Cumulative Patching**

CEM patches are incrementally cumulative. Each patch contains the fixes that prior patches introduced, but only the fix content that has been introduced since the final compile version of the CEM load is included in each patch.

This allows a customer to apply only the latest patch if desired, since it will contain all of the fix content included in previous patches. CEM patches are delivered by RPS. There is only one Released patch at any given point in time, unless it is the first patch for the load which can be at Verified or Released status. After a patch is Released, all previous patches are set to Superseded in RPS and will no longer be delivered.

NPM is the patch management system to apply and remove CEM patches and perform maintenance patching activities on the CEM. All patching functionality available in NPM is available for CEM patching.

With this methodology of patching, if 3 patches have been released and all 3 have been downloaded to a customer site, the customer can choose to physically apply patch 1, patch 2, and patch 3, or the customer can choose to apply patch 3 only. If only patch 3 is applied, this essentially results in having patch 1, patch 2, and patch 3 applied. If only patch 3 is applied, patch 1 and patch 2 cannot be removed individually. If only patch 3 is applied, when patch 3 is removed, patch 2 and patch 1 are also removed.

## 1.2.2 Patching Maintenance

When the new NPM patchable CEM application is installed, the NPM automatically becomes aware of it. CEM appears in reports and the device list of the GUI. The following functions that exist for other targets are now available for CEM:

- apply
- remove
- audit
- restart
- set/report creation
- plans/automation
- alarms

### 1.2.2.1 CEM Patch Application and Removal

Like existing OAM Java-based applications such as SESM, SAM21EM, or IEMS components, the CEM requires 2 steps for application and 2 steps for removal of patches.

Application:

- apply command from the NPM GUI or CLUI (sets patch to applied/disabled)
- restart command from the NPM GUI or CLUI on IEMS (sets patch to applied/enabled)

Removal:

- remove command from the NPM GUI or CLUI (sets patch to removed/enabled)
- restart command from the NPM GUI or CLUI on IEMS to disable the patch (sets patch to removed/disabled)

When CEM is running in a clustered configuration, the 2 step application and removal of patches is necessary only on the active side of the SSPFS-based machine. A restart from the NPM GUI or CLUI on the inactive instance of the CEM application is not required to enable or disable patches. When a patch is applied or removed on the inactive CEM application, the patch is automatically enabled or disabled since the CEM application is not running on the inactive SSPFS-based machine.

The apply and restart operations from the NPM GUI and CLUI can be automatically scheduled via NPM plans (autoapply and autorestart).

### 1.2.3 Patchid Modification

The patchid has been modified to allow greater than 8 character patchids. The patchid format for CEM patches can have up to 32 alpha-numeric characters. The CEM patchid does not contain records that identify the target or release to which the patch is applicable. An example CEM patchid is CEM\_PATCH.17.1-20040901.

In SN08, CEM will be the only product to take advantage of the expanded patchid. The current 8 character patchid format will remain for all other products for which NPM manages patches.

### 1.2.4 Patch File Format Modifications

The patch file format is modified with this feature to implement the incremental cumulative nature of CEM patching. The following additions and changes have been made:

- A new **H** record is introduced to track included patches. This new record is stored in the ADM section of the patch file and is included only in CEM patches. Zero to many of these records can exist. The record format is:

**H INCLUDED\_PATCH <patchid>**

where patchid is the name of the patch included

- A new **V** record is introduced to track the patch file format version. This record is added to all NPM managed patches.
- The **I** record is enhanced. If a patchid is greater than 8 characters it will not fit in the normal patchid position of the I record. The placement for patchid will be filled with 8 characters of something other than the real patchid, and the E record will contain the actual patchid.

### 1.3 Hardware Requirements or Dependencies

None.

### 1.4 Software Requirements or Dependencies

The GEM18 CEM load is required to interact with NPM.

### 1.5 Limitations and restrictions

None

### 1.6 Interactions

Feature A00007304 - CEM I & C on IEMS

### 1.7 Glossary

| Term | Description             |
|------|-------------------------|
| NPM  | Network Patch Manager   |
| CEM  | Core Element Manager    |
| RPS  | Regional Patch Selector |

***Product = CS 2000***

## **A00007071--Third-party GW Interop Profiles**

### ***Functional Description***

#### **1.1 Applicable Solution(s)**

IAW

#### **1.2 Description**

This document describes provisioning aspects associated with the 3rd Party Gateway (GW) Interop activity which is introduced into the SN08 release. GW profiles are used as a means of defining various aspects of a GW such as the number of Endpoints (EP), Protocol, etc. These attributes and others are updated on the Call Server 2000 Management Tools (CMT) platform and distributed to the GWC and XaCore platforms.

Prior to this activity, introducing a new profile was a cumbersome task that required software updates and typically required the formal process of creating

a new “feature.” As a result, turnaround time to introduce a new profile was excessive.

Starting in SN08, many new 3rd Party GWs will be “Interop Tested” with the Nortel Succession Hardware and Software. Interop testing is a process where a vendor makes their product available (a GW in this case) and Nortel Networks personnel test to insure that the equipment integrates into the system and functions correctly.

To facilitate the rapid introduction of new profiles, this activity will make updates that allow Interop personnel to introduce a new profile by creating a file and putting it in a predefined location on the CMT platform. Creation of the file is accomplished by including a list of predefined attributes that will uniquely describe a profile. In theory, all attributes that a vendor needs to define the new profile are made available for inclusion in the profile. The file that describes the profile has been given the generic label of “Certificate” and will be referenced as such in subsequent sections of this document and other associated documents.

The diagram below depicts the major components of the 3rd Party Profiles feature and the general functionality. For specific details for creation and installation of a new Certificate refer to the accompanying documentation in the Configuration.

In order to provide these new functionalities, the customer will see changes in the following areas:

- **SESM**

Certificates which define a profile are read into the system and made available for provisioning.

- **GWC**

Spare profiles numbers are made available and should be used for new profiles.

- **Core**

Table LGRPINV is a Core table which is (with only minor exceptions) auto-provisioned from the SESM. A new optional field is added by this feature. While this field will be visible, it will not be provisionable until a later release. For details on this optional field, refer to Data Base Schema Information which is located in the Configuration section of this design document.

**Figure 36 General 3rd Party Profile Functionality**

### 1.3 Hardware Requirements or Dependencies

There are no hardware dependencies required to execute this feature.

### 1.4 Software Requirements or Dependencies

Each of the following components must be at the specific software load for this feature to function properly:

- SESM - SN08 release
- GWC - SN08 release
- CORE - SN08 release (BCS 56) or later

## 1.4.1 Limitations and restrictions

### 1.4.1.1 CMT

- The Succession system is set up so that the upgrade of the CMT is performed prior to the upgrade of the GWC and XaCore. If an attempt is made to add a new 3rd Party Certificate prior to the upgrade of the XaCore, the request will fail. This is because a new field value for the LGRPINV table is introduced by this activity and this value is not valid until XaCore software is upgraded to SN08. In addition, if the GWCs are at a pre-SN08 version attempts to use a “spare” GWC profile number introduced in the SN08 stream will fail also.
- If a GW needs modification to a profile, only limited manipulation of the Certificate is allowed (e.g., name format changes); to accomplish some changes (like a change in protocol), a new Certificate should be added and the Change GW Profile operation should be used.
- This activity has removed the Protocol and Version field from the Associate MG OSSGate command. Therefore, existing Associate MG XML documents must be modified to remove these fields.

### 1.4.1.2 GWC

Limitation on the number of spare profiles are:

- 25 spare profiles for each existing unique GW profile of small line GW type,
- 25 spare profiles for each existing unique GW profile of large line GW type,
- 25 spare profiles for each existing unique GW profile of trunk GW type,
- 20 spare profiles for each existing unique GW profile of H.323 GW type.

The setting of flags of the spare profiles are pre-defined, so that if none of the spare profile supports the requirements of the new gateway, then it is expected that the GW will be modified to work correctly with one of the pre-defined spare profiles. In addition, the spare profiles flags could be updated via a patch.

### 1.4.1.3 CORE

Even though a new optional field GTWYKEY is visible in table LGRPINV with this feature, datafilling this value is blocked until a later release.

## 1.5 Interactions

The following are the feature interactions for the A00007071 feature:

- Features which A00007071 is dependent on:
  - none
- Feature which are dependent on A00007071:

## A00007072 - 3RD PARTY GW INTEROP PREPROVISIONING

— A00007072 required the new Logical GroupType to be defined in the Core. This new GroupType is provided by A00007071.

- Features which have an interaction with A00007071:
  - none

## 2: Fault Management for A00007071

### 2.1 Fault management strategy

This activity is responsible for providing a flexible system that allows users to define Gateway (GW) profiles without making software updates. To this end, a certificate (XML document) polling strategy is being developed that will scan the SSPFS file system for new or removed certificates. With this strategy, the potential for error situations arise, and need to be handled without using an interactive interface. Therefore, this activity will amend the alarm system to include new alarms that are related to the importation and removal of certificates (profiles). The alarms are triggered from functionality included in the GWCEM part of the CMT.

The following conditions require amendments to the alarm system:

- Syntax errors are encountered when a new certificate is polled
- Field incompatibility problems are present when a new certificate is polled
- A certificate is deleted and GWs exist that are still using this profile

### 2.2 Fault management tools and utilities

There are two CMT alarm GUIs. One shows active alarms on the managed devices and the other shows the alarm history. This activity will update alarms associated with the GWCEM Network Element.

### 2.3 Alarms

At least two new alarms will be introduced with the introduction of this feature. The following properties are included:

- Network Element: gwcem
- Category: Processing Error
- Severity: Minor
- Probable Cause: Certificate corruption
- Duration: Remains active until the alarm condition is cleared
- Action for new certificate: Replace the certificate with a new version without syntax or content problems
- Action for deleted certificate: Remove GWs that use the deleted certificate or replace deleted certificate
- Interfaces: This alarm is generated by the certificate poller on the CMT

#### 2.3.1 GWCEM Certificate Alarms

An example of a GWCEM Certificate Alarm is listed below. This alarm is realized when an issue is discovered that is related to a problem with a Certificate or existing Profile.

**Figure 37 Example of a GWCEM Certificate Alarm Body**

### 2.3.1.1 Corrupt Certificate Alarm

A Corrupt Certificate Alarm is realized when the syntax error is recognized in a Certificate. Certificate syntax must conform to rules enforced by the XML schema. This schema is located in the /opt/nortel/NTsesm/xsd/certificateif directory and should be used as a guideline for certificate creation. If the rules for creating a certificate are violated then a Corrupt Alarm is raised.

In addition to syntax, some rules have been built into software that disallow combinations of some fields. In general, only blatantly incorrect combinations are tagged and it is the responsibility of the Certificate creator to define valid Certificates. However, some combinations will cause Corrupt Alarms to be generated.

#### 2.3.1.1.1 Clearing a Corrupt Alarm

A Corrupt Alarm is cleared by updating the Certificate file so that the problem listed is no longer present. In addition, Certificate files that have not been

successfully imported into the system can be removed without realizing additional alarms.

**Figure 38 GWCEM Corrupt Certificate Alarm Detail**

### 2.3.1.2 Duplicate Certificate Alarm

A Duplicate Certificate Alarm is realized when more than one Certificate with the same name is detected in the Nortel or Third Party certificate directories. Duplicating a certificate name is not allowed. Certificate names are case insensitive so the name XYZ.certificate is treated as a duplicate of the name xyz.certificate. In addition, duplicates span both the Nortel and the Third Party directories. Therefore, the XYZ.certificate can not co-exist in both the Nortel and Third Party directories.

#### 2.3.1.2.1 Clearing a Duplicate Alarm

A Duplicate Alarm is cleared by simply removing the Certificate file that caused the duplication.

**Figure 39 GWCEM Duplicate Certificate Alarm Detail**

### 2.3.1.3 Delete Certificate Alarm

Third Party Certificates/Profiles can be removed from the system by removing the associated Certificate File. If a Certificate file is removed that has GWs associated with it a Delete Alarm is raised. For this case, the corresponding profile is not removed from the system.

### 2.3.1.3.1 Clearing a Delete Alarm

A Delete Certificate Alarm is cleared by replacing the Certificate file. In addition, all of the GWs can be removed for the system that are associated with the Certificate and the alarm will be cleared. This action will also remove the Certificate.

**Figure 40 GWCEM Delete Certificate Alarm**

### 2.3.1.4 Certificate Changed Alarm

A Change Certificate Alarm is realized when an existing profile is changed and one or more of the fields that are changed are not allowed.

#### 2.3.1.4.1 Clearing a Changed Alarm

A Changed Alarm is cleared by replacing the field that has been changed to the original value.

**Figure 41 GWCEM Changed Certificate Alarm Detail**

### 2.3.1.5 Missing Certificate Alarm

A Missing Certificate Alarm is realized when a Nortel Certificate has been removed from the Nortel directory or changed to a different name. Software updates are the only supported means to alter or remove Nortel Certificates.

#### 2.3.1.5.1 Clearing a Missing Alarm

A Missing Alarm is cleared by replacing the Nortel Certificate that was removed.

**Figure 42 GWCEM Missing Certificate Alarm Details**

## 2.4 Logs

MI2 Logs are affected by this activity for two of the alarms listed above. Corrupt alarms and Changed alarms list additional detail when the Minor (MNR) alarms logging level is set. The alarms are raised when the syntax or settings of a certificate is incorrect. In addition, when an invalid change is made to a certificate one of these alarms may be realized. For these cases, addition information is listed with detailed information concerning the nature of the problem. An example of this condition follows:

```
04.10.07 13:55:25.903 MNR (EM) [Thread-25] *** CERTIFICATE  
CORRUPT ALARM *** - Profile name = CISCO_2600
```

```
04.10.07 13:55:25.905 MNR (EM) [Thread-25] The problem is: Element type  
"MxEndpoints" must be declared.
```

As previously mentioned, details concerning the "corrupt and changed" certificate alarms are listed in the CMT minor (MNR) log files. These files can be viewed at the following location  
"/opt/nortel/NTsesm/admin/logs/ptmdebuglog1.mi2.

Restricting the logs to list MNR and above logs only can be accomplished using the MI2Admin tool. This tool is located in the /opt/nortel/NTsesm/bin directory.

## 2.5 Related documentation

- <http://ptm->Documentation->SN06->AlarmLoggingDSUM.doc>
- <http://ptm->Documentation->SN08->Third Party Interop FN>

- <http://ptm->Documentation->SN08->Third Party Interop CN>

## **3: Configuration for A00007071**

### **3.1 Hardware and Software Requirements**

The typical Succession hardware needs to be in place and functional prior to exercising the software provided by this feature. Some related specifics are:

Hardware requirements:

- CORE - available on the XACore (powerpc processor) or SuperNode (88k processor). Not available on the 68k processor or NT40 CMs.

Software requirements:

- CMT - SN08 release or later
- GWC - SN08 release or later
- CORE - SN08 release or later

### **3.2 Initial Configuration**

As a provisioning component of the Succession program, much of this functionality performs as designed with the “typical” hardware being in place. The software loads mentioned above should be installed.

Once the hardware/software is installed and brought into service, the software for this feature is available. Now the ability to provision third party gateways is possible.

### **3.3 Office/Subnet parameters (OP/SP) (CM & SESM)**

N/A

### **3.4 Upgrade Impact**

#### **3.4.1 Dump and Restore (CM)**

CORE - No impact to DUMP and Restore mechanisms. This data is preserved via the existing TabXfr mechanism available to all Core Table Control tables.

#### **3.4.2 Element Management Upgrade**

This activity will affect CMT data profiles that were previously created prior to the SN08 release. Existing profiles have the potential to have multiple protocols assigned to the same profile. This activity will modify these profiles so that a separate and unique profile is listed for each protocol. This modification is performed during installation of the SN08 software and there is no requirement for users to take any action to realize these changes. The

following list of profiles are converted and list the new name and unique protocol assigned:

- NUERA\_GX
  - NUERA\_GX\_ASPEN
  - NUERA\_GX\_MEGACO
- PVG\_7K
  - PVG\_7K\_ASPEN
  - PVG\_7K\_MEGACO
- PVG15K
  - PVG15K\_ASPEN
  - PVG15K\_MEGACO
- PVG15K\_1000
  - PVG15K\_1000\_ASPEN
  - PVG15K\_1000\_MEGACO
- PVG15K\_PARTIAL
  - PVG15K\_PARTIAL\_ASPEN
  - PVG15K\_PARTIAL\_MEGACO
- PVG\_VSP3
  - PVG\_VSP3\_ASPEN
  - PVG\_VSP3\_MEGACO
- PVG\_APG\_VSP3
  - PVG\_APG\_VSP3\_ASPEN
  - PVG\_APG\_VSP3\_MEGACO
- PVG\_APG
  - PVG\_APG\_ASPEN
  - PVG\_APG\_MEGACO

### 3.4.3 Downgrade impact

CORE - From the Core's perspective, there exists two scenarios:

1. Using the existing AbortSwact mechanism, only valid while the Core is still in split mode but after the Swact.

If 3rd party gateways were not provisioned, then no problems using the AbortSwact mechanism. However, if 3rd party gateways were provisioned, then the preswact check for the AbortSwact procedure will

fail because new Lgrp nodes have been provisioned on the “new side” which does not exist on the “old side”. To correct this condition the user is required to match up the “old” and “new” sides. This can be accomplished one of two ways:

- a. delete any newly provisioned 3rd party gateways on the “new side”
  - b. add these 3rd party gateways to the “old side”
2. Sync-ing the Core - assuming the Core is still in split mode and a Swact has not occurred.

This is the simpler case, no new provisioning of 3rd party gateways have occurred due to the fact the Swact has not occurred. So just sync the switch. There is no impact for this case.

CMT - Downgrades of the CMT are accomplished by reinstalling the desired release of software and importing the Oracle data base data that was saved against that version. This activity has not affected current downgrade procedures.

## 3.5 Data schema (DS) (CM, MIBS, RDB)

### 3.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| LGRPINV        | Changed                  | Unchanged                          |

### 3.5.2 Table LGRPINV Database Schema information

#### 3.5.2.1 Name: LGRPINV

Long table name: Logical GRoup INventory

##### 3.5.2.1.1 Functional description

Table LGRPINV is where Logical Groups (Lgrps) are provisioned. Generally speaking Logical Groups are the Cores representation of gateway line concentrating devices (gateway LCDs).

This feature will provide:

- new value for existing field GRPTYPE
- the new optional field, GTWYKEY, will be visible not provisionable.

##### 3.5.2.1.2 Usage sequence and implications (CM Only)

No change to the current datafill sequence, this is Table LGRPINV:

- must be datafilled after table SERVRINV. Table SERVRINV is where the gateway controllers are provisioned.
- must be datafilled prior to table LNINV. Table LNINV is where LENs for this Lgrp are provisioned.

### 3.5.2.1.3 Size

No change in the maximum number of tuples for table LGRPINV.

**Table 2 Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                                            |
|------------------------|----------------|----------------|----------------------------------------------------------------------------------|
| LGRPINV                | 0              | 1000           | Memory is automatically allocated in increments of 20 LCDs at a time up to 1000. |

### 3.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for LGRPINV.

### 3.5.2.1.5 Datafill example

**Table 3 TableLGRPINV field descriptions**

| Field    | New or Changed | Subfield or refinement                                         | Entry         | Explanation and action                                                               |
|----------|----------------|----------------------------------------------------------------|---------------|--------------------------------------------------------------------------------------|
| GRPTYPE  | Changed        | Added new value to existing field                              | GRPTYPE       | This field specifies the type of Logical group: {S,M,C, <b>LL_3rdpty</b> }           |
| LGRPOPTS | Changed        | Added new refinement, GTWYKEY - identifies the hosting gateway | GTWY_TY<br>PE | This field specifies the type of gateway: {NLGW,ABI,CICM,GW,ITP,PVG,UAS}             |
|          |                |                                                                | GTWY_NO       | This field specifies a unique gateway of a certain gateway type: Integer {0 TO 9999} |

The following example illustrates the prompting sequence for the new value for GRPTYPE and new GTWYKEY option in table LGRPINV.

**Figure 43 Prompting sequence for GRPTYPE and option Gateway Key**

```

**Key****3.5.2.1.6 Table release history update**

SN08 Feature A00007071:

Modified field: LGRPOPTS

- adding a new GTWYKEY refinement. For more information see “TableLGRPINV field descriptions” on page 1047.

**3.5.2.1.7 Supplementary information**

Limitations:

- The new optional field, GTWYKEY, is only visible not provisionable in SN08.

**3.5.2.1.8 Translation verification and other tools**

Table LGRPINV does not impact translations. Therefore TABAUDIT is the tool used to verify the contents of table LGRPINV. The following figure shows the output from TABAUDIT when it is used to verify Table LGRPINV.

**Figure 46 Sample Tabaudit output for Verifying LGRPINV Table Datafill**

```

>tabaudit
TABAUDIT:
>include lgrpinv

>execute

## 3.8 Element Management

### 3.8.1 New/modified GUIs

**Table 4 New or modified GUIs**

| GUI name  | NEW, CHANGED, or DELETED |
|-----------|--------------------------|
| Change GW | Changed                  |

### 3.8.2 GUI information

This activity updates the Change Gateway GUI with a new item in the “pick” list as shown below.

### 3.8.2.1 GUI name: Change Gateway (Profile)

### 3.8.2.2 GUI name: Change Gateway (Profile) expansion

#### 3.8.2.2.1 Functional description

The Change GW dialog is displayed by selecting one or more GWs when in the Provisioning/Gateways Panel of the CMT GUI. This activity adds the "Change gateway profile" item to the pick list of changeable attributes.

Changing a GW from one profile to another is not an operation that is supported for all of the certificate fields, and some fields can only be changed under certain conditions (e.g., you cannot reduce the maximum number of endpoints below the number of endpoints already allocated to the Gateway). A pre-condition for being able to change a GW's profile is that the Compatible Profiles field is set for the profile being changed to. In other words, if you are changing a GW from profile A to profile B, the profile B's "Compatible Profiles" field must have profile A in its list.

Changing a GW to a different profile is a potentially risky operation. Interop personnel should test thoroughly prior to creating a Certificate with the Compatible Profiles field set to a profile other than itself. While some error checking is performed, it is the responsibility of the Certificate creator to make the final decisions concerning if one profile is truly compatible with another.

The user has the ability to change (with limitations) a profile assigned to a Gateway with the following attributes having different values:

- Maximum Endpoints
- Supported Protocol
- Reserve Terminal Mandatory
- Display Physical Location
- Service Type
- Compatible Profiles
- Gateway Name Format
- Endpoint Name Format

#### **3.8.2.2.2 GUI usage and implications**

The Change GW Profiles transaction should be used when a user wants to move a GW from one profile to another. Note that this is the supported method for changing profiles. In contrast, changing the certificate file to realize profile changes is not supported.

## **3.9 User Interface**

### **3.9.1 Defining GW Profiles Using XML Schemas and Certificates**

A profile is the method used by the Nortel Succession products to describe certain behaviors of a GW. With the introduction of this activity, two categories of profiles are defined for use by customers; Nortel profiles and Third Party profiles. Both categories use certificate files to describe their attributes. As previously mentioned, a certificate is an XML document used to uniquely describe all of the behaviors of one profile. Certificate files are made available to the system by existence in the certificate directories. The name given to the certificate file is the unique identifier for the profile. For example,

a certificate file named “UAS.certificate” defines that a UAS profile exists. Using the “certificate” extension is mandatory for all profiles. Details concerning the certificate directories are described in subsequent sections of this document.

The Nortel defined certificates are built into CMT software and are automatically populated in the “Nortel” certificate directory. These profiles are not user modifiable. Because these profiles are built into the Nortel CMT package, they are immediately available for use when the CMT is upgraded to the SN08 release. Availability means that the profile is selectable from the CMT Associate GW GUI and as a profile field value when using the OSSGate Associate GW interface.

Third party certificates are defined and created by Nortel Interop personnel. These profiles are flexible within the bounds of predefined fields and values. In other words, the current set of behaviors is made available to users by defining an XML document, referred to as a “Certificate”, that dictate the features that are appropriate for the GW in question. In subsequent sections of this document, these fields and values are described in detail.

#### **3.9.1.1 Profile Field Definitions and Values**

The following list of GW attributes are made available in the SN08 release and are user definable. Some attributes are obvious concerning their impact, and others, less so. A detailed description of each attribute is provided in the following sections. Where applicable, a GUI capture of the fields affected is listed.

- Maximum Endpoints
- Category
- EndpointType
- GenerateLGRP
- ResvTermMandatory
- ChangeIPAvailable
- DispPhyLocation
- InventroyRole
- InventoryType
- SupportedProtocol
- GWCPProfileNumber
- EPIDGenDesc
- ServiceTypeList
- CompatibleGWProfile

- BearerFormatList
- GatewayNameFormatList
- EndpointNameFormatList

**Note:** For some of the field descriptions below datafill values are listed. These values are included as an aid to understanding and may not accurately reflect actual allowed values. For specifics concerning acceptable field values refer to the schema definition where the CMT application is installed at directory location /opt/nortel/NTsesm/xsd/certificateif.

#### 3.9.1.1.1 MaxEndpoints Field

The maximum endpoints field is used to limit the number of EPs that can be assigned to a GW. For most GWs, this field is used as the default value if the user chooses to omit this value. If a user tries to populate more EPs then this field is set for on a GW, then software restrictions will kick in and disallow the operation.

#### 3.9.1.1.2 Category Field

The category field is a field that dictates endpoint lookup algorithms used in the GWC device. Different endpoint lookup algorithms are used for efficiency. Four categories are available:

- small - This category should be used for GWs with small capacities, 31 or less is suggested.
- large - This category should be used for GWs with large capacities, more than 31 endpoints is suggested.
- audio - This category is a special purpose category used with audio GWs. These GWs use pools of endpoints.
- APG - This is another special purpose category used for APG GWs. It uses virtual TID space that have unique mapping.

Although datafill for this field is defined as enumerated types, these types are mapped to integers and stored with the representation listed below in the database. The following list of mappings is provided for informational purposes only and is subject to change.

**Table 5 Category Mappings**

| Element Value | Database Value |
|---------------|----------------|
| large         | 1              |
| small         | 2              |

| Element Value | Database Value |
|---------------|----------------|
| audio         | 3              |
| APG           | 4              |

### 3.9.1.1.3 Endpoint Type Field

The Endpoint Type field determines how endpoints are managed within succession products. This field affects the ability of a GW to pre-provision endpoints and alters where and when endpoints are provisioned. For the CMT product, some settings auto populate endpoints within the database, and subsequently send these endpoints to the GWC. For the XaCore, this field manages which value, “S”, “M”, “C” or the newly introduced “LL\_3RDPTY” that is datafilled in LGRPTYPE field of LGRPINV table. For a detailed discussion concerning this field, refer to the Data Schema section of this document.

Although datafile for this field is defined as enumerated types, these types are mapped to integers and stored with the representation listed below in the database. The following list of mappings is provided for informational purposes only and is subject to change.

**Table 6 EndpointType Mappings**

| Element Value                 | Database Value | Comments                                 |
|-------------------------------|----------------|------------------------------------------|
| managedLens                   | 1              | Line GWs with managed LGRPs              |
| ue9000Lens                    | 2              | UE9000 GW unique processing              |
| cicmLens                      | 3              | CICM GW unique processing                |
| carrierTrksGwcNN              | 4              | Trunks, no LGRPs                         |
| carrierTrksSubNN              | 5              | Trunks, no LGRPs                         |
| nocarrierTrkGwcNN             | 6              | H.323 GWs                                |
| asynchronousBridgingInterface | 7              | ABI                                      |
| thirdPartyLens                | 8              | Large Line Third Party unique processing |

### 3.9.1.1.4 Generate LGRP Field
