# INTRODUCTION

A step-by-step guide to removing and installing a vibration motor

---

## TOOLS:

- [Phillips #000 Screwdriver](#) (1)
  - [Heavy-Duty Spudger](#) (1)
  - [Magnetic Project Mat](#) (1)
  - [iFixit Opening Tools](#) (1)
  - [T5 Torx Screwdriver](#) (1)
  - [Tweezers](#) (1)
  - [Soldering Iron](#) (1)
-

## Step 1 — Watch Strap Removal

- On the strap there is a knob. Sliding this knob towards the opposite side of the strap releases the tension on the spring bar, allowing you to pull the strap out..

## Step 2 — Battery

- Use the T5 Torx driver to remove the four screws on the case.
- ⓘ Use the magnetic pad to keep all your parts easily contained!
- The case will pry easily off with just gentle hand pressure

## Step 3

- Using the tweezers, gently remove the fabric protecting the battery connection.
- ⚠ Take care when removing the fabric. Too much force may damage the contact with the metal tweezers.
- Use the heavy duty spudger to gently push the contact towards the top of the case.

## Step 4

- Gently pry the battery up with the plastic pry tools

## Step 5 — Motherboard

- With the metal tweezers gently remove the fabric covering the connection on bottom right
  - Using the heavy duty plastic spudger pry up on the connection ribbon.
- ⚠ There are two connection ports on the single ribbon. Do not use too much force as you may tear ribbon!

## Step 6

- The protective plate is now ready to be safely removed.
  - With the heavy duty spudger pry up on the metal plate, in a counter-clockwise pattern
- i* There are tiny notches on plate making it simple to pull up on each side.
- i* A small strip of adhesive is on back of plate as well.
- Remove loosened plate and set aside.

## Step 7

- With the 000 Philips screwdriver remove the screw and plastic retainer clips

## Step 8

- With heavy duty spudger lift up on final connection ribbon located on left corner.

## Step 9

- With all the connections disconnected the motherboard can be gently pried up and out of the watch case.

## Step 10 — Vibration motor

- With a flat metal spudger pry back the little metal clamps that hold the motor secure.

⚠ Do not bend these too far as they can easily break off!

## Step 11

- With the soldering iron, heat the two solder tabs on back of motor.
- Use metal tweezers to pull up and remove motor.

⚠ A soldering iron gets hot! Take care not to burn yourself or place it on any other part of the board.

To reassemble your device, follow these instructions in reverse order.
