Step 1 — RAM

- Flip device onto backside.

- Remove back-plate by unscrewing the two screws on either side of the back-plate.
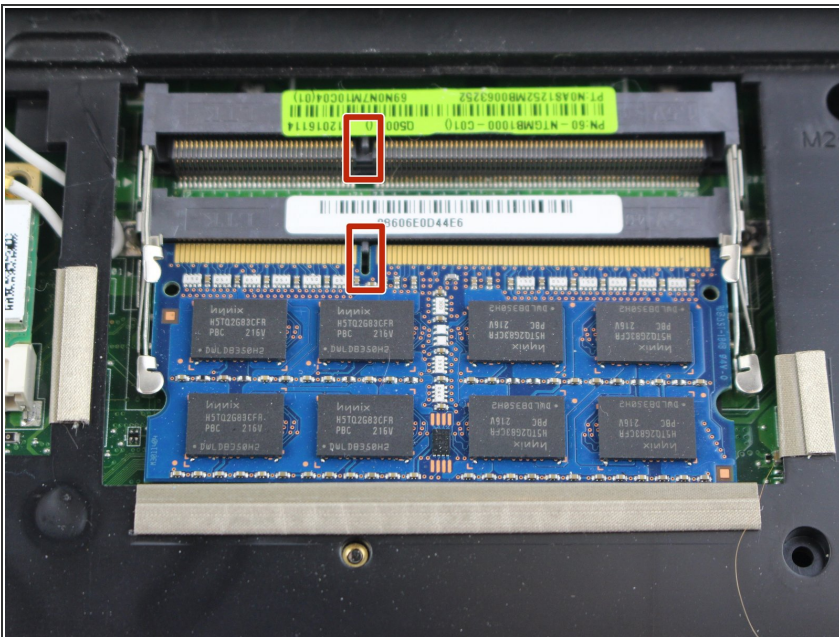

Step 2

- Depending on the model of the device there will either be one or two sticks of ram.

- There are two metal brackets holding each ram stick in.

- Next we need to unlock the ram. To do this we need to move the metal brackets.

Step 3

- Now simply remove the ram.
  - ⓘ A set of pliers is recommended if this is difficult.

Step 4

- To insert the ram line up the hole on the ram stick and the slot. Then push it into the slot.

- Next you will have to push the ram down, it will make a snap sound.
  - ⚠ Be careful not to do this too hard, as it can break the ram.

  - However it will require some force to actually lock in.

- 📌 Make sure the ram is secure in its slot before moving on to the next piece of ram or replacing the back-plate.

To reassemble your device, follow these instructions in reverse order.
