Step 1 — SSD Drive

- Remove all 10 bottom case screws.
 - Seven 14 mm screws.
 - Three 4 mm screws.

Step 2

- After screws are removed, turn computer over to regular position and open up computer flap.
 - ⓘ It is important to do this gently as pieces are loose.

Step 3

- After screen is open, take a flat head driver and pry open a gap between the keyboard and the lower piece. This will uncover all the internals in the laptop itself.

Step 4

- Once the internals are exposed, on the lower right hand corner, there should be a small box in the corner. This is the hard drive. Slide the hard drive out of its position and allow room for the new one. Once this is out, be sure to make certain the area is clean and that no debris got into the slot.

Step 5

- Once the area is clean and old drive is removed, take the new drive and side it into the same spot as the old drive. This should complete the hard drive installation.

To reassemble your device, follow these instructions in reverse order.
