🔧 TOOLS:

- Fingers (2)

Thumbs

I hope you at least have two fingers even if they aren't thumbs :D

- Phillips #0 Screwdriver (1)

Step 1 — Remove the eyepiece cap

- Pull up on both sides of the the eyepiece cap. It should come off with little pressure.

Step 2 — Remove screws from under the eyepiece cap

- Remove the two screws hidden under the viewfinder eyepiece cap.

## Step 3 — Remove hidden screw and other visible screw

- Peel off the rubber grip on the back by grasping one of the corners and pulling out.

- Once removed, a hidden screw is revealed.

- Remove both visible screws from the rear of the camera.

Step 4 — Remove bottom screws

- Remove both labeled screws from the bottom of the camera.

Step 5 — Lift and remove the rear panel

⚠️ When lifting the panel, make sure not to lift it too high, since you'll run the risk of tearing the cable, or damaging the connector on the board.

● Flip the lock on the flex cable connector up with a spudger.

● The front panel should pop off now that the cable has been disconnected.

ⓘ When reassembling the device, make sure to insert the left side of the front panel first, since it has a small lip that needs to fit under the left part of the camera case.

To reassemble your device, follow these instructions in reverse order.
