Step 3

- Continue prying along each edge of the device until back cover is free.

Step 4

- On the back cover, find the location where the volume/power button is held.

⚠ The volume/power button is not held securely after back is removed so it may fall out of place while removing the back cover from the device.

Step 5

- Remove the old button and replace it with the new one.

Once the above steps have been successfully competed, power on the device. Enjoy your newly replaced volume/power control button.
