

# Dell Chromebook 11 CB1C13 Letter & Number Key Replacement

Replacing letter or number keys.

Written By: Jon

 **TOOLS:**

- Tweezers (1)

 **PARTS:**

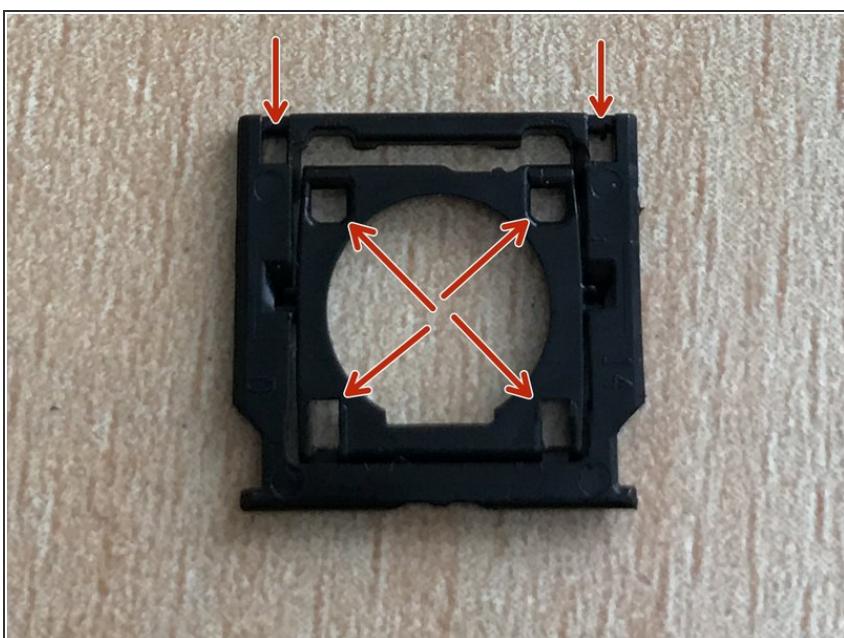

- Dell Chromebook Palmrest WR67C (replacement keys) (1)

## Step 1 — Check Metal Clips & Rubber Spring/Membrane for Damage

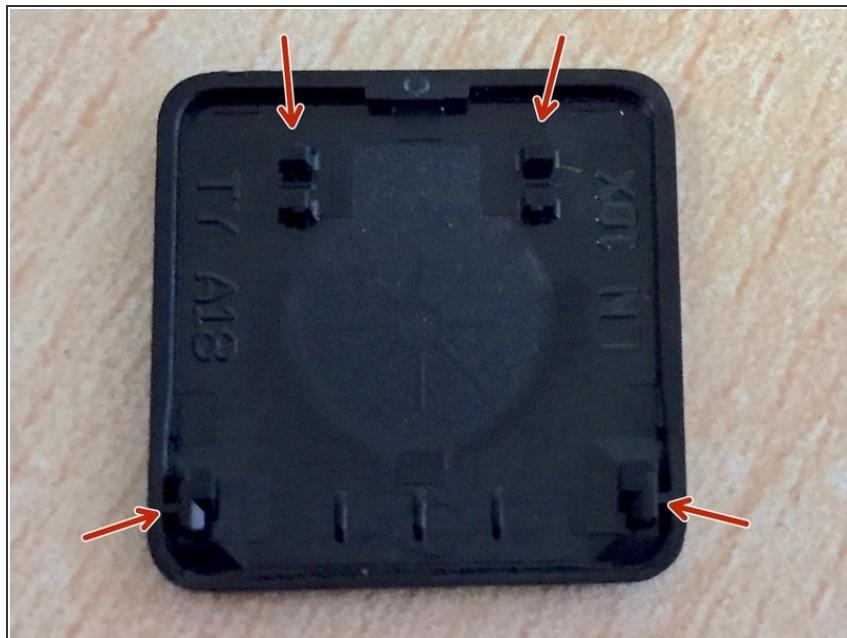

- Check the 4 metal clips that are attached to the palmrest. Look for damaged or missing clips.
- If any of the 4 clips are missing, you will not be able to proceed and will have to replace the entire palmrest.
- Check the condition of the rubber spring/membrane. If it is torn or missing, you will not be able to proceed and will have to replace the entire palmrest.
- If any clips are bent, carefully use your tweezer to bend them back in their original upright position. (See video)

## Step 2 — Check Plastic Bracket

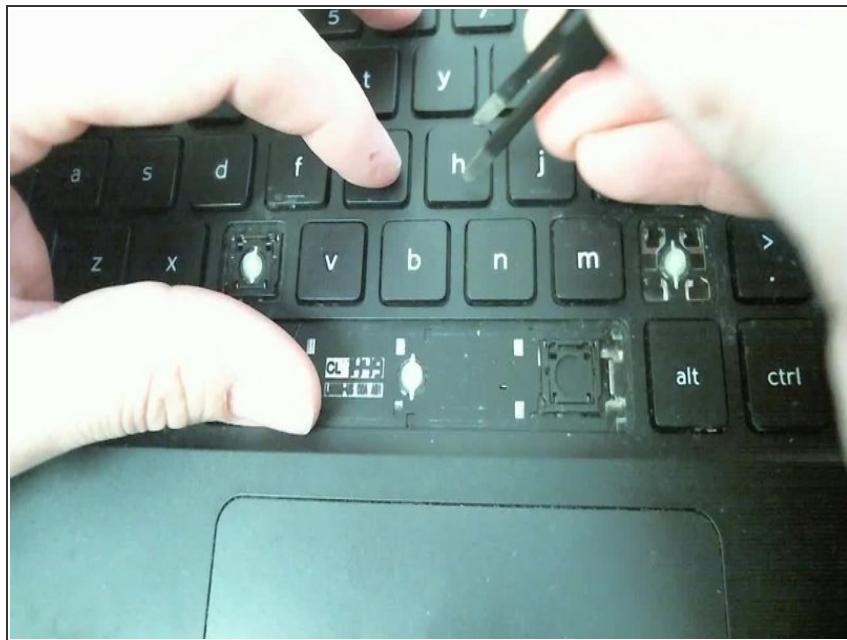

- Check the plastic bracket for damage in these 6 areas.

## Step 3 — Check Key for damage

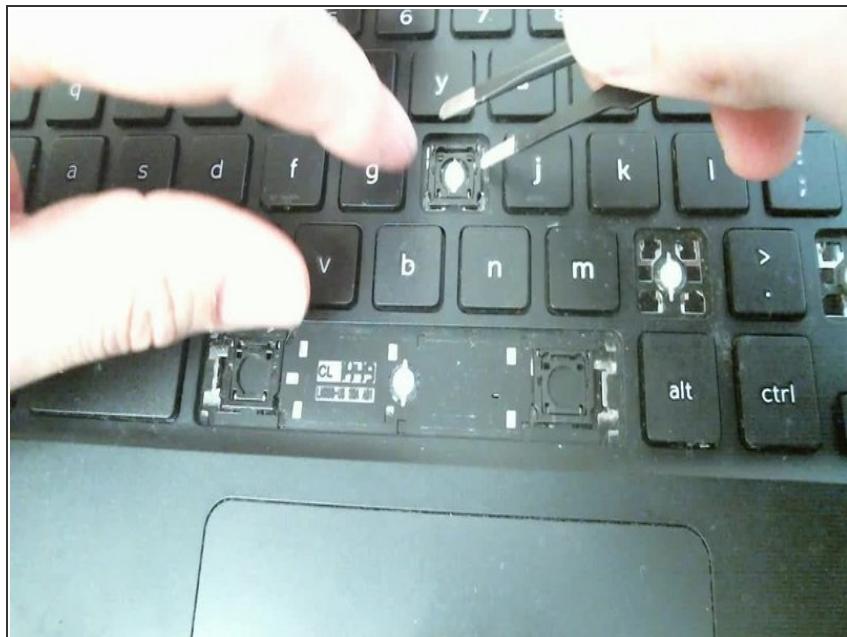

- Check the 4 main points of the key for damage.
- Any damage in these areas will not allow the key to stay connected to the plastic bracket which sits underneath the key

## Step 4 — Remove Key from old Palmrest

- While using tweezers, remove just the actually key (top layer only) . You want to try and remove the key without also removing the plastic bracket that sits right underneath the key.
- Try to slightly pick at the corner of the key. This helps remove the key separately from the plastic bracket.

## Step 5 — Remove Plastic Bracket

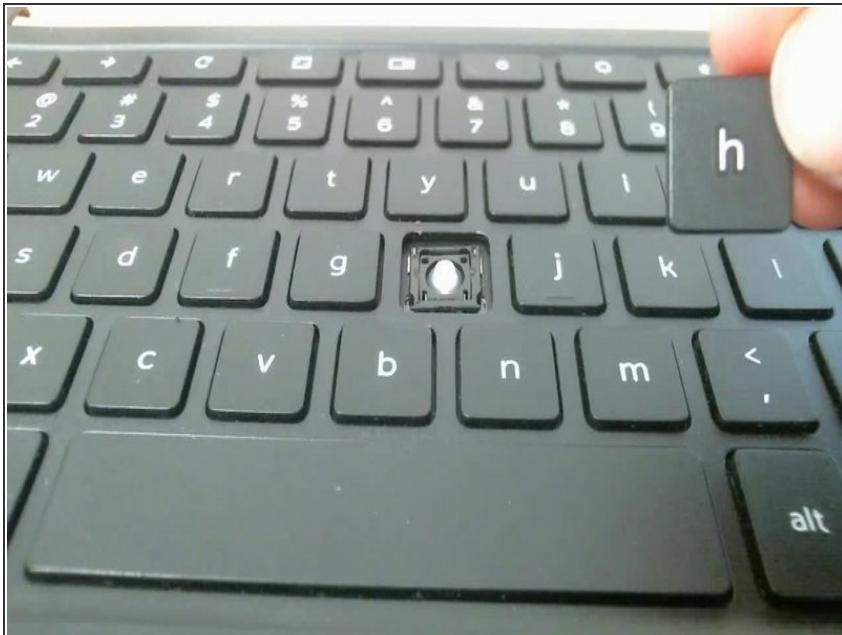

- With tweezers, carefully start picking near the four corners where the 4 metal clips are securing the plastic bracket.

## Step 6 — Replace Plastic Bracket

- Line up the 2 outer corners and the bottom inner corners of the plastic bracket with the 4 metal clips connected to the palmrest.

## Step 7 — Replace Key

- Place the key on top of the plastic bracket and press down. If the plastic bracket is on correctly and

securely, the key should easily snap into place.

- Check if the key is secure by tapping around all sides of the key. This is a good test to make sure the metal clips are properly securing the plastic bracket and making sure that the plastic bracket can hold the key correctly.
