 **TOOLS:**

- 64 Bit Driver Kit (1)
- Phillips #0 Screwdriver (1)

Step 1 — Disassembling Toshiba NB205 N330PK Back Panels

- Using the Phillips #0 in the bit driver, carefully loosen and remove the single 5mm screw.
- With the retaining screw removed, lift the panel upwards to separate it from the netbook.

Step 2

- To replace the panel, do step 1 in reverse:
 - Align the panel slots in the appropriate grooves and set in place.
 - With the bit driver, replace the screw to secure the RAM panel.

Step 3

- Using the bit driver and the Phillips bit, remove both of the panel's retaining screws.
- With the screws removed, lift the panel in the designated direction, as depicted in photo, for removal.
- The hard drive is located beneath this cover and is now accessible.

Step 4

- To replace the hard drive panel, do step 3 in reverse:
 - Place the panel back in its original position and press down.
 - If the hard drive was removed or replaced during this process, improper installation may prevent the hard drive panel from sitting in the slots properly.
 - With the bit driver and Phillips bit, replace the two retaining screws to secure the cover plate in place.

To reassemble your device, follow these instructions in reverse order.
