

Disassembly an old keyboard

This is going to show you how to take apart a keyboard.

Written By: michael lynn

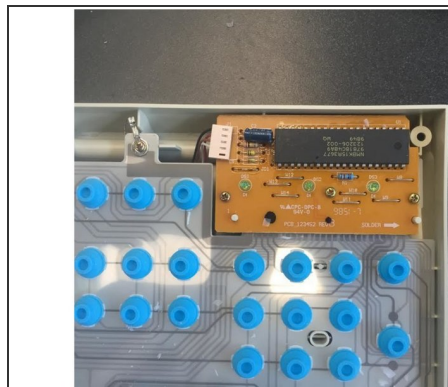

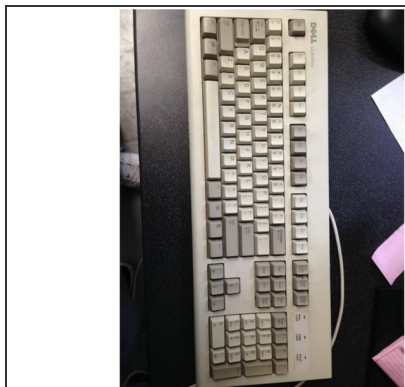

TOOLS:

- [Essential Electronics Toolkit](#) (1)
-

Step 1 — Disassembly an old keyboard

- Flip the keyboard to its back.
- Unscrew all the screws then flip the keyboard back over and take the top piece off.
- Then unscrew the three screws on the chip and also unscrew the metal piece that's by its self.
- Then lift the chip up carefully because the wires are under the motherboard.
- Then take the plastic piece with the blue bottoms off, then take the clear piece with the holes on it off, then the last plastic piece with the lines comes off.
- And the metal piece now comes off and you're done.

To reassemble your device, follow these instructions in reverse order.
