 **TOOLS:**

- [Phillips #00 Screwdriver \(1\)](#)

 **PARTS:**

- [New Item \(1\)](#)

Step 1 — Display

- Open all 7 screws with a fitting philips screwdriver.

Step 2

- The backbody is lose now, remove it carefully and it reveals the controls and the display

Step 3

- Remove the green board with the controls first.
- DON'T USE FORCE, it should get lose easily. Don't bend the cables too much.
- Remove the cable from the control board
- Lift the display off, don't bed the cable too much.
- Open the connector of the cable carefully. Don't scratch the board and don't use too much force. Ideally, use a plastic spudger of the ifixit-kit
- The display got removed, not just fit the new display in reveresed order.

Do the steps backwards to build the Camera together again.
