Step 1 — Battery

- ⓘ Ensure your computer is shut down. Removing the battery while the laptop is still on may corrupt your files. Remove any power adapters and cords connected to the laptop body.

- ● Slide the switch to the left until the release clicks.

Step 2

- ● Remove the battery.

- ⓘ The release switch may need to be held down while removing the battery.
Step 3 — RAM

- Remove the one 4mm Phillips screw from the RAM cover using a Phillips #00 screwdriver.

Step 4

- Remove the RAM cover to reveal the module's underneath.

Step 5

⚠ Make sure to ground yourself before touching the RAM modules; they are very sensitive to static electricity.

● Push the two metal tabs on the side of the RAM module outwards, towards the battery and CMOS compartments (up and down).

● Once the module is released, gently pull the module upwards.

● Repeat for the RAM module underneath the first one.
