Step 1 — Open housing
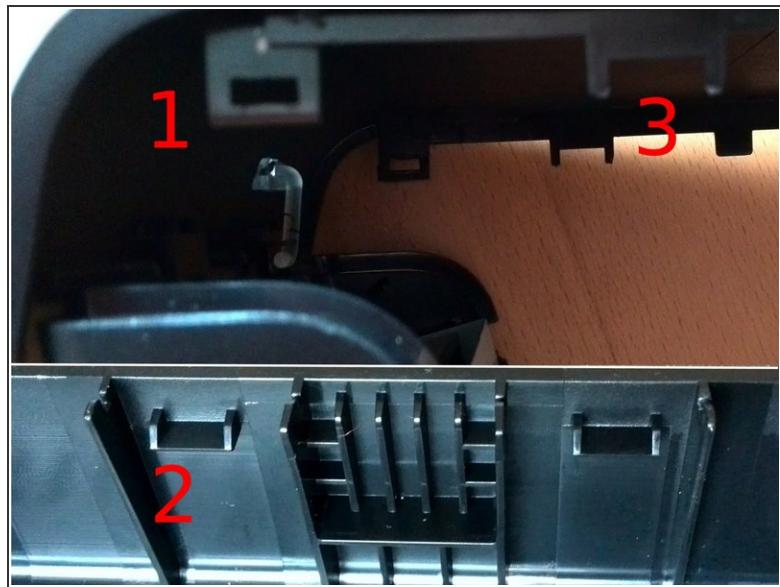

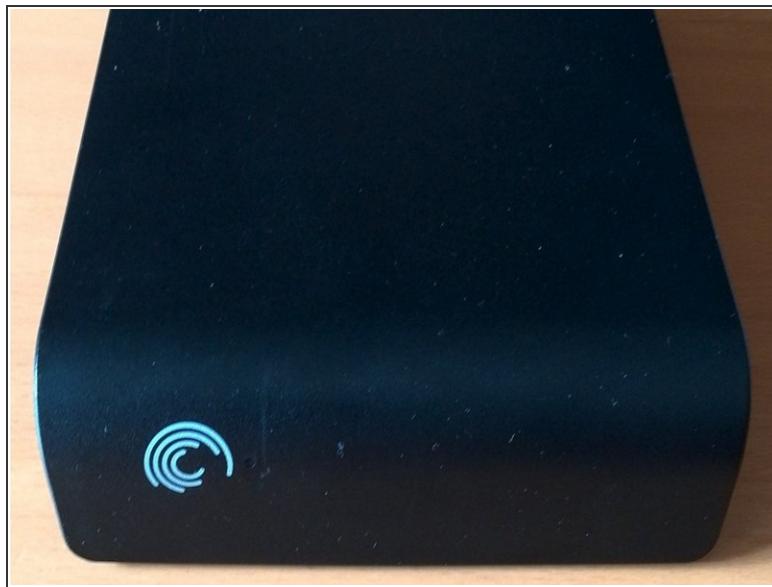

- It is best to open the case at the rear of the connectors.

- The lid has lugs (1) made of plastick which are hardened in the bottom pan (2). By pressing the bottom pan to the outside they can be solved. Best with a flat screwdriver or similar tool.

- The manufacturer does not seem to have intended the opening, so some shrinkage at the entanglement can not be excluded. (3)

Step 2 — Lift out hard disk carriage

- The Fetplatte can now be lifted out of the plastic housing. It is not attached any further.

Step 3 — Remove the hard disk from the hard disk carriages

- Unscrew the side screws.

- Remove permanently attached cables and stickers from the grease plate.

- Then pull the hard drive backwards with a little force.

Repeat the steps in order to reassemble your device.
