

Keurig K155 Disassembly

I purchased a bad Keurig K155 off of Ebay. Turns out it had a bad Boiler (Percolator). This Coffee Maker is SUPER EASY to disassemble!

INTRODUCTION

Ok... I took photos AFTER I figured out how to disassemble. First, remove all the screws from the bottom of the Unit. Next, There are (6) screws on the BACK of the unit. These are covered by Screw Caps. Remove the Screw Caps then the screws. Next open up the front loader and remove the screws that hold the top cover. Then remove the Handle. After you remove the top and handle, you should be able to CAREFULLY pop off the front panel! From here the Sides and Top pop right off!! I'll try and get some photos as I reassemble. Thanks.
