INTRODUCTION

This guide will help you replace a motherboard step by step. From beginning to end this guide will take you from beginner to expert in easy efficient fashion.

TOOLS:

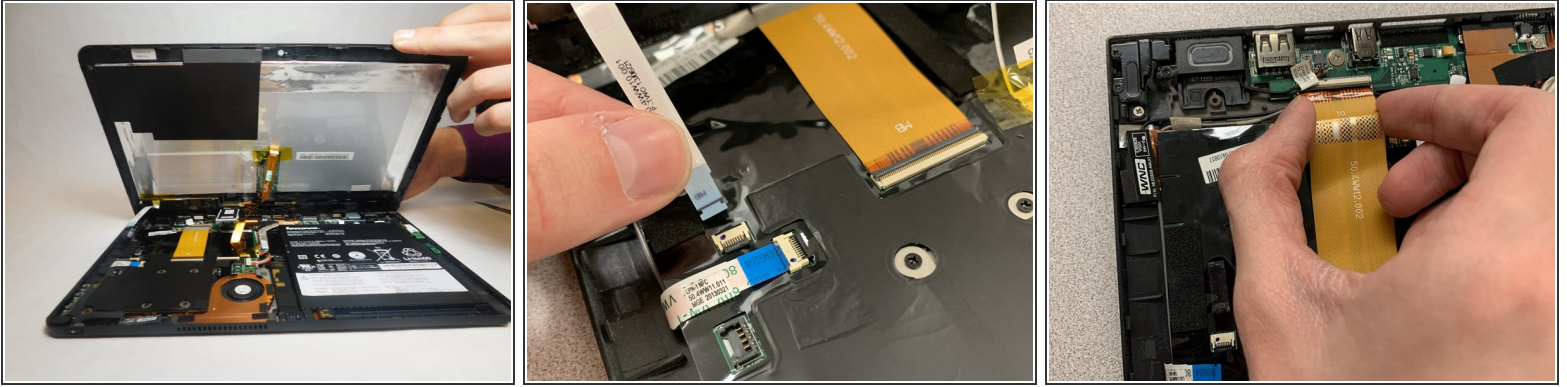

- [iFixit Opening Tools](#) (1)
 - [Phillips #00 Screwdriver](#) (1)
-

Step 1 — Screen

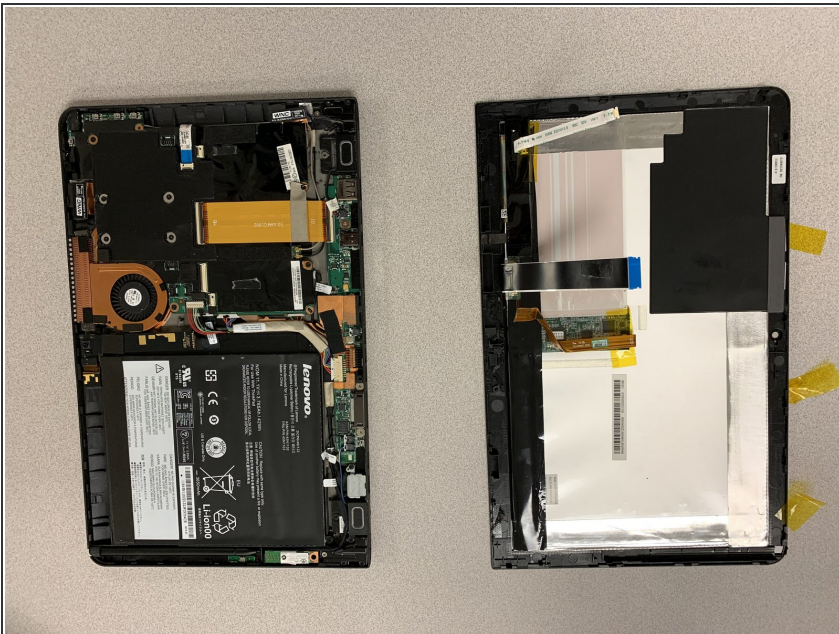

- Using a plastic opening tool or opening pick, gently pry the screen off.
- ⚠ If possible, use plastic tools to pry the screen, as the metal tool as shown in the image can potentially damage your device.
- ⓘ You will need to use a little bit of force to pry it open. There is little indent that goes around the tablet. You will insert your tool between this indent and pry it open.
- Once you're able to lift a little bit of the screen away from the tablet, work your way around until screen is separated from tablet. Stop for step two.

Step 2

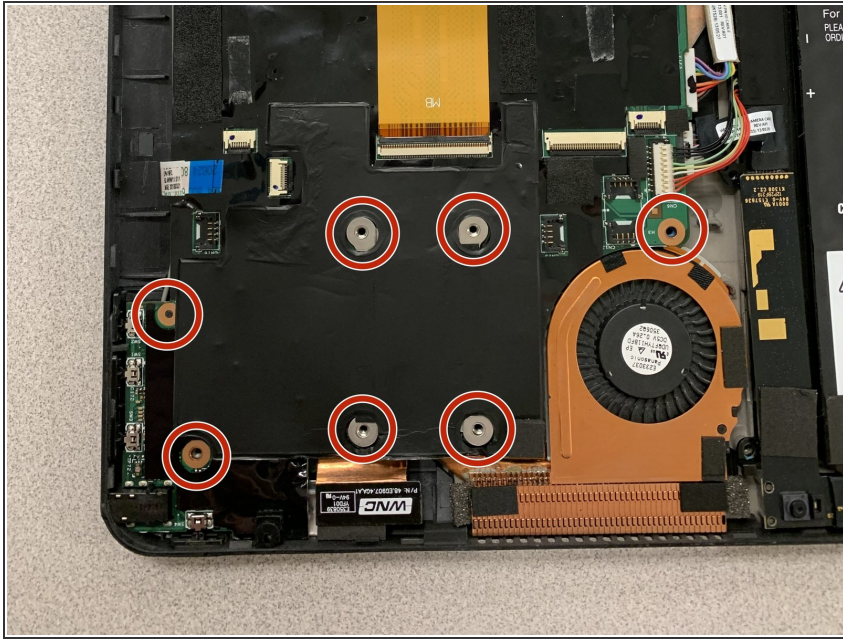

- Lift the screen up slowly.
- ⓘ Once separated, you can not fully take it off due to some cable connections.
- Open the clips of the ZIF connectors and gently grab the cable to pull it out.

Step 3

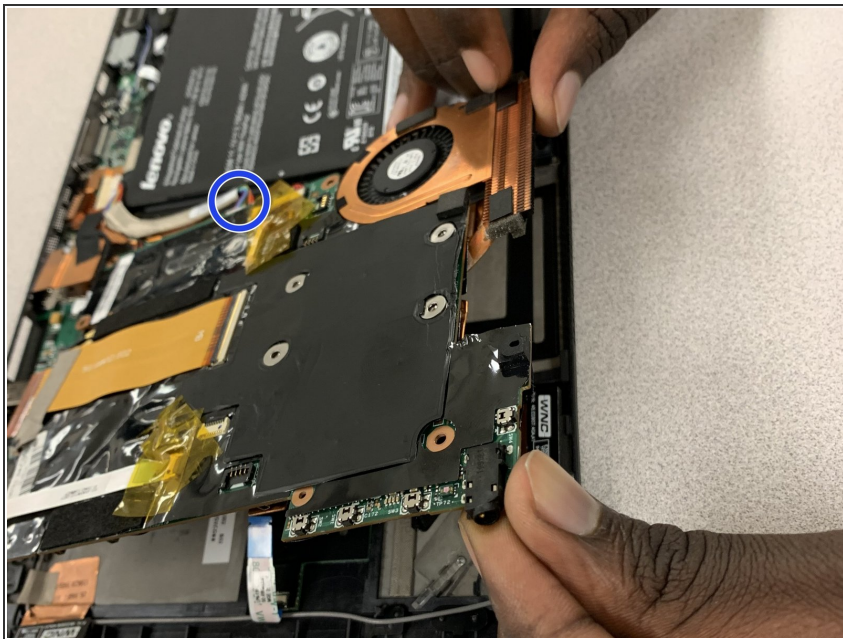

- Once the cables are disconnected, remove the screen.

Step 4 — Motherboard

- Remove the seven, 3mm, Phillips #00 screws attaching motherboard to the back cover.

Step 5

- Remove the white clips, then gently pull out both the motherboard and fan.

To reassemble your device, follow these instructions in reverse order.
