

Motorola Xoom Wifi Display Replacement

This step-by-step replacement guide will help you remove the existing wifi display and, in the process, shows you the steps for putting on a new one.

Written By: William Prins

INTRODUCTION

As this replacement guide works on an internal component of the Xoom Wifi, completion of prior steps to remove external parts is necessary.

TOOLS:

- [T5 Torx Screwdriver](#) (1)
- [iFixit Opening Tools](#) (1)
- [T6 Torx Screwdriver](#) (1)
- [Spudger](#) (1)

PARTS:

- [Motorola Xoom Display](#) (1)

Step 1 — Back Cover Disassembly

- There are two 6.6 mm screws that hold ports into place as well as the back panel. Remove these with a T5 Torx screwdriver.

Step 2

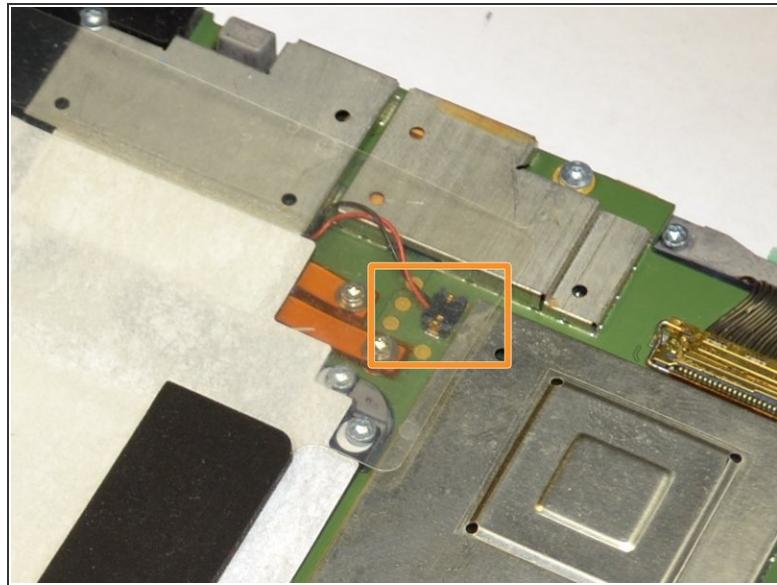

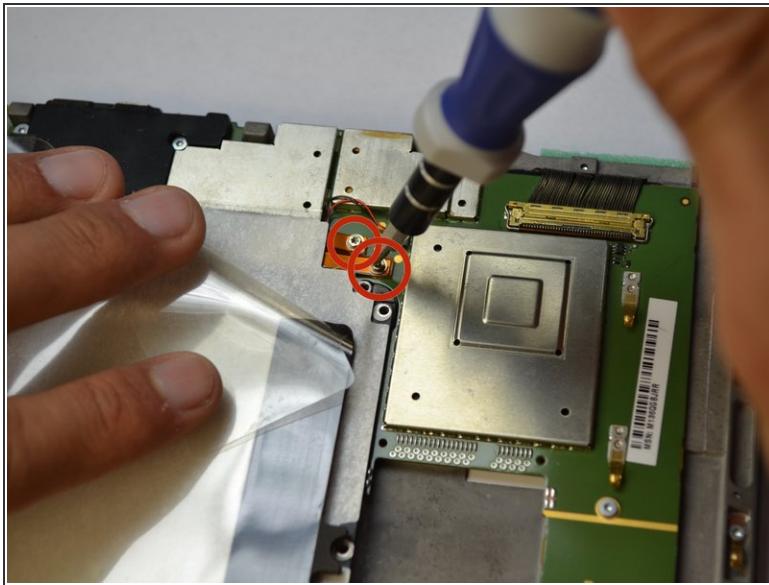

- Apply light pressure with hand and slide the back plate till it stops in this position.
- There is a flex clip on both sides that need to be pushed down in order for the plate to slide off completely. Use a plastic opening tool to release the flex clips. They are located under the back cover near the sides.
- As soon as the clips are released the back should slide off.

Step 3

- Remove last two 4.2 mm screws from the remaining back piece with a T5 Torx screwdriver.
- Once both screws are taken out, lift the rest of the backing out of the way.

Step 4 — Battery

- Remove the two battery leads with a T-5 Torx screwdriver.
- Grab the red and black wires with your fingers and gently lift to disconnect black wire connector from the motherboard.

Step 5

- All that holds the battery in are twelve screws. Remove them with a T-6 Torx screwdriver.
- The battery should lift out easily.

Step 6 — Speakers

- Use a plastic opening tool to pop out the speaker. Make sure to carefully pull off the wire as well.
- Replace speaker if necessary.

Step 7 — Motherboard

- Take a plastic opening tool and carefully pry off the touch screen controller connection.
- Be careful with the black cover under the connection.

Step 8

- There are two relay wires that must be disconnected.
- Pull both relay wires out of their connection ports.

(i) Make sure to flip up the small black tab before you pull out the wire.

Step 9

- Using a plastic opener, lift the metal bar clasping the wire harness to the motherboard.

Step 10

- There are eight 3.5mm screws that hold the motherboard in. Use a T-5 Torx screwdriver to take the screws loose. These screws are outlined in a gold color on the motherboard.
- Two gold colored screws with brackets are located in the orange circles. A T-5 Torx screwdriver is needed to take these 3.1mm screws.
- Motherboard should lift out easily and completely.

Step 11 — Display

- Use a T-6 screw driver to take out 17-4mm screws. They are located around the perimeter of the tablet.
- Take the display out of the screen and the back panel.

Step 12

- Flip the display so it is facing up. There are screws around the outer edge of the display.
- A T-5 screwdriver will take the 12-4.1mm screws out.
- Use a plastic opening tool to carefully split the display case open. The display should come free.

To reassemble your device, follow these instructions in reverse order.
