# INTRODUCTION

As this replacement guide works on an internal component of the Xoom Wifi, completion of prior steps to remove external parts is necessary.
## 🔧 TOOLS:

- T5 Torx Screwdriver (1)

## ⚙ PARTS:

- Motorola Xoom ear phone port (1)

## Step 1 — Back Cover Disassembly

- There are two 6.6 mm screws that hold ports into place as well as the back panel. Remove these with a T5 Torx screwdriver.

## Step 2

- Apply light pressure with hand and slide the back plate till it stops in this position.

- There is a flex clip on both sides that need to be pushed down in order for the plate to slide off completely. Use a plastic opening tool to release the flex clips. They are located under the back cover near the sides.

- As soon as the clips are released the back should slide off.

## Step 3

- Remove last two 4.2 mm screws from the remaining back piece with a T5 Torx screwdriver.

- Once both screws are taken out, lift the rest of the backing out of the way.

## Step 4 — Earphone Port

- Remove one screw with a T-5 bit.

- Lift the black casing off of the ports.

- Remove earphone port from the motherboard.

To reassemble your device, follow these instructions in reverse order.
