INTRODUCTION

This is an easy repair. My WiFi wasn't working anymore, it seemed like the power supply wouldn't work. Actually it did, only the connector was dead. This router stays in a shoe closet and never moves, so we're not sure how it could have broken down...

Anyway, here is a quick repair !

TOOLS:

- [Soldering Iron \(1\)](#)
- [64 Bit Driver Kit \(1\)](#)

To reassemble your device, follow these instructions in reverse order.
