 **TOOLS:**

- [iFixit Opening Tools \(1\)](#)

## Step 1 — Battery Compartment Cover

- Remove all five screws found on the outer shell of the camera. You will find three along the bottom (see picture #1) and two more up one side (the side closest to the LCD screen).
- You will find three more under the USB port flap and one more under the memory card flap. Remove these four as well.
- Once all screws are removed, use a blue iPod opening tool (seen in picture #3) to carefully pry the back outer shell away from the rest of the camera.

## Step 2

- Completely separate the back cover from the rest of the camera. Set the back cover aside.
- Remove 4 screws from the front outer cover to the camera (see image #2 for screw locations).
- Use a Spudger to pry the front outer cover away from the camera. Do this gently to avoid damaging the yellow and black wires connecting the front outer cover to the camera.

## Step 3

- Unplug the yellow and black wires connecting the front outer cover of the camera to the rest of the camera, as shown in image #2. This can be done by gently unplugging the end of the wire connected to the inner casing of the camera.
- *(i)* The front outer cover should now be completely separated from the rest of the camera.

## Step 4

- Carefully set aside the front outer cover of the camera. Then, locate the two screws attaching the battery compartment cover to the rest of the camera (see picture #2).
- Remove the 2 screws attaching the battery compartment cover to the rest of the camera.
- *(i)* Once both screws are removed, the back hinge of the battery compartment cover will flip up (see picture #3).

## Step 5

- Your battery compartment cover should now be completely removed and ready for repair or replacement.

To reassemble your device, follow these instructions in reverse order.
