INTRODUCTION

Tripped over your power cord? At least you don't have to replace the entire logic board.

🔧 TOOLS:

- T6 Torx Screwdriver (1)
- T8 Torx Screwdriver (1)

⚙ PARTS:

- G4 Titanium DVI DC-In Board (1)

Step 1 — Battery

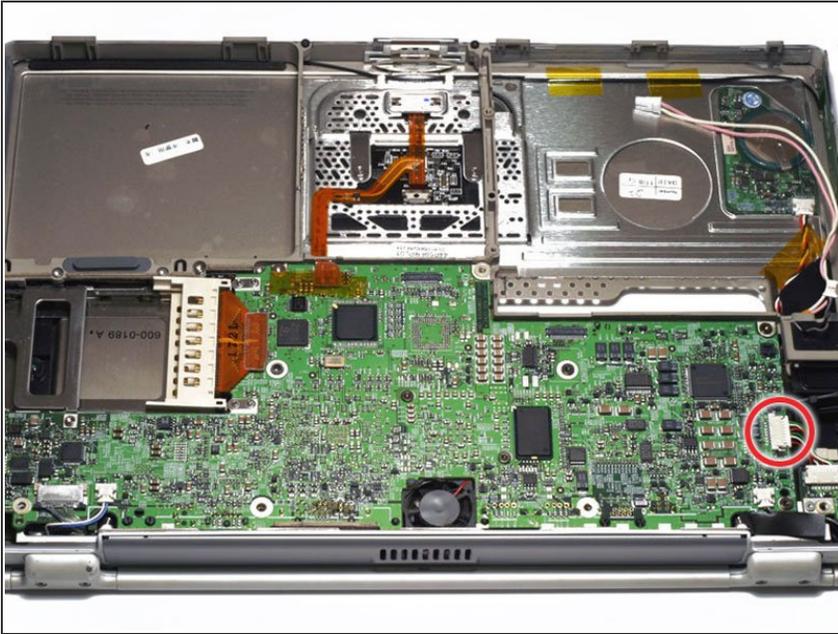

- Locate the battery release tab on the underside of the G4.

- Slide the battery release tab to the left and lift the battery out of the computer.

Step 2 — Lower Case

- Remove the seven T8 Torx screws from the lower case.

- Using your thumbs, slide the lower case toward the front of the computer.

- The lower case may stick in the front on a tab just above the center of the optical drive. Be careful as you work the case off, or you may break the thin strip of plastic just above the drive.

- Lift the lower case off.

Step 3 — DC-In Board

● Disconnect the large DC-In connector from the right side of the logic board.

Step 4

● Remove the two T6 Torx screws from the DC-In board.

Step 5

- Lift the DC-In board out of the computer by pulling up and away from you.

- (i) If you don't have a 667 MHz computer, there is a fan in this location which makes it a bit difficult to remove the DC-In board.

- If there is a fan present, rotate the DC-In board slightly clockwise before easing it out at a slight angle in order to clear the fan clamp on top of it.

To reassemble your device, follow these instructions in reverse order.
