

Protocol Dronium 3x Prop Blades Replacement

How to replace the prop blades on the Protocol Dronium 3x.

Written By: Alexander George

INTRODUCTION

The Protocol Dronium 3x Prop Blades are responsible for spinning and thus lifting the drone into the air. The prop blades themselves are sturdy, however, be extremely careful as not to lose or strip any of the screws associated with the prop blades. Doing so could cause the prop to malfunction or not work altogether.

TOOLS:

- Phillips #0 Screwdriver (1)

Step 1 — Prop Blades

- Ensure the drone is powered off and set the drone upright.
- Using a Phillips #0 screwdriver, remove the 6 mm screw from the center of each rotor blade.
- Lift the prop blade from the arm and set aside.

To reassemble your device, follow these instructions in reverse order.
