Project:

 **TOOLS:**

- [iFixit Opening Tools \(1\)](#)
- [iFixit Opening Picks set of 6 \(1\)](#)
- [iSesamo Opening Tool \(1\)](#)

Step 1 — Display

- I recommend you wear eye protection to avoid glass getting into the eyes.
- It is important to heat the edges of the display well with a hair dryer/ heat gun so that the adhesive on the screen loosens up and you can insert a pry tool to lift the screen.
- Insert the blade between the body and the glass and begin to separate the display from the body. I recommend you start from the top and work your way down but be careful.
- The connectors are located at the bottom (in case you need to open the device for further repairs).

Step 2

- Lift the display.

Step 3

- Release the black plastic door that locks the display connector.
- Disconnect the display connector.
- Remove the old display and place the double-sided tape to install the new display.

To reassemble your device, follow these instructions in reverse order.
