INTRODUCTION

Removal and replacement of the RAM module

TOOLS:

- New Item (1)

Step 1 — Remove the battery

- Save your work.
- Turn off the computer. The LED Power must not light up anymore.

⚠ Disconnect all cables and devices connected to the computer.

- Close the screen and place the computer face down as shown in the picture.
- Slide the safety latch (on the left side of the picture) to the unlocked position (to the left) to activate the release.
- Slide the battery release (pictured on the right) to the right side and hold it to release the battery and remove the battery from the back of the computer.

Step 2 — Remove RAM cover

- Remove the screw with a Phillips # 1 screwdriver securing the memory module cover. To remove the cover, use the recess below the screw and lift the cover upwards.
- Now you see the RAM module in its socket. Carefully push the two metal clips outwards until the module is free and jumps upwards by about 30 degrees.

Step 3 — Remove RAM

- Remove the RAM module by grasping it at the corners and pulling it to the right out of the socket.
- ⚠ Do not touch the gold contacts of the RAM module with your hand so as not to damage it.
- Place the RAM module securely on the work surface.

Repeat the steps in reverse order to reassemble your device.
