

# iPad Display Assembly 4 Pc. Adhesive Application

Apply display assembly adhesive to properly seal your iPad after repair.

Written By: Tarun Thiruma

## INTRODUCTION

This guide shows how to apply display assembly adhesive to an opened iPad. Use it to prepare your display assembly before resealing your device during a repair.

### TOOLS:

- [iFixit Opening Tools](#) (1)
- [Tweezers](#) (1)
- [Spudger](#) (1)
- [Isopropyl Alcohol](#) (1)

## Step 1 — iPad Display Assembly 4 Pc. Adhesive Application

- Before installing new adhesive, thoroughly clean the display assembly and the frame of all residue.
- Use tweezers to pull up sections of tape residue.
- Use an opening tool or a spudger to scrape residue off. You can use high concentration (over 90%) isopropyl alcohol to soften the adhesive.
- Remove the residue by wiping in one direction to prevent smearing.

⚠ Do not scrape with a metal tool, or you will scratch the display assembly's surface.

## Step 2

- Lay out the replacement adhesive strips around the display assembly so that they correspond to the correct sides.

## Step 3

- ① Each adhesive strip is encased in four layers of plastic—three on top and one on the bottom.
  - Peel and remove the topmost plastic cling layer from the left adhesive strip.
  - Peel and remove the bottom plastic liner from the strip.
- ② The top of the adhesive strip should still be covered by a colored plastic layer as well as a clear plastic stiffening layer.
- ③ The bottom of the adhesive strip should now be exposed and sticky.

## Step 4

- If there are extra bits of adhesive on the strips that are not required for your particular model of iPad, remove them now.

## Step 5

- Align the left adhesive strip to the left edge of the display assembly.
- Beginning from one corner, lay the adhesive strip onto the display assembly and press the strip into place.
- If necessary, [use a spudger](#) to press down the narrow parts of the adhesive strip.

## Step 6

*(i)* Repeat the process with the right adhesive strip.

- Peel and remove the topmost cling layer from the strip.
- Peel and remove the bottom liner layer from the strip.
- Align the adhesive strip to the right edge of the display assembly.
- Starting from one corner, lay the adhesive strip onto the display assembly and press in place.

## Step 7

*(i)* Repeat the process for the top adhesive strip.

- Peel and remove the topmost cling layer from the strip.
- Peel and remove the bottom liner from the strip.
- Align the strip to the top of the display assembly such that the straight adhesive line bridges the gap between the left and right strips.
- Press the strip in place.

## Step 8

① Repeat the process for the bottom adhesive strip.

- Peel and remove the topmost cling layer from the strip.
- Peel and remove the bottom liner from the strip.
- Align the strip to the bottom of the display assembly such that the straight adhesive line bridges the gap between the left and right strips.
- Press the strip in place.

## Step 9

- Peel and remove the clear plastic stiffening layer from all four adhesive strip sections.

## Step 10

- Continue with the reassembly process until you are ready to seal the device.

## Step 11

- Peel and remove the four colored plastic liners to expose the adhesive.
- Close the device and place something heavy, such as a stack of large books, on top for thirty minutes to help the new adhesive bond.
